4. In the **Properties** pane, click **Virtual I/O** > **Virtual Networks**. The **Virtual Networks** page opens. You can use the left and right arrow key buttons to switch between **Network(s)** and **Adapter(s)** views. The **Network(s)** view is the default view.
5. In the **Virtual Networks** work pane, click the right arrow key button to select **Adapter(s)** view. The currently available virtual Ethernet adapters and trunk adapters for the partition are listed in a table.
6. Click **Create Trunk Adapter**. The **Create Trunk Adapter** page is displayed. You can add a trunk adapter to an IBM i logical partition.
7. Optional: Click **View Existing Virtual Networks** to view the list of all existing virtual networks on the managed system.
8. In the **Port VLAN ID** field, enter the VLAN ID on which the trunk adapter must be created.
9. In the **Virtual Switch** field, select a virtual switch that can be assigned to the trunk adapter from the list of virtual switches that are configured on the managed system.
10. In the **Trunk Priority** field, set the trunk priority for the trunk adapters to either 1 or 2.
11. In the **MAC Address** field, enter the MAC address.
12. In the **OS MAC Address Restrictions** field, specify the MAC address restrictions. The available values are **Allow all**, **Deny all**, and **Allow Specified**.

13. In the **QoS Settings** section, select the **Enable QoS Setting** option, if you want to provide different priorities to different applications, users, or data flows to maintain the performance of the network. The value for the priority level ranges in the range 0 - 7.
14. In the **IEEE Settings** section, select **IEEE 802.11q Compatibility** if you need additional VLANs to be supported on an Ethernet network. Alternatively, you can clear the **IEEE 802.1q Compatibility** check box if you do not need additional VLANs for the trunk adapter.

    If you select **IEEE 802.1q Compatibility**, the **802.11q VLAN ID** field is displayed. You can select additional VLAN IDs.
15. Click **OK**.

Managing virtual network connections in network view

You can manage the PowerVM virtual network connections that are assigned to a partition in the network view by using the Hardware Management Console (HMC).

About this task

To manage the virtual network connections in the network view by using the HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Virtual Networks**. The **Virtual Networks** page is displayed. You can use the left and right arrow key buttons to switch between **Network(s)** and **Adapter(s)** views. The **Network(s)** view is the default view. The currently available virtual network connections for the partition are listed in a table, with the details about the virtual network name, VLAN ID, virtual switch, virtual network bridge, and virtual Ethernet adapter ID that are associated with each virtual network. You can attach new virtual networks by clicking **Attach Virtual Network**. You can also detach an existing virtual network by selecting the virtual network that you want to remove and by using the **Action** menu.
5. To attach a virtual network click **Attach Virtual Network**. All virtual networks that are discovered by the managed system are displayed in a table. The table lists all the assigned virtual networks, the VLAN ID, the virtual switch, the network bridge name to which the virtual network is attached.
6. To attach an existing virtual network to a partition, complete the following steps:
   a) Select **Show and attach new virtual Ethernet adapters**.
   b) Select the check box near the name of the virtual network that you want to connect to the logical partition.
   c) In the **Virtual Ethernet Adapter ID** field, enter the virtual Ethernet adapter ID.
   d) Click **OK**.
7. To remove a virtual network from the partition, complete the following steps:
   a) In the **Virtual Networks** table, select the virtual network that you want to remove and click **Action** > **Detach**. Alternatively, you can right-click the virtual network and select **Detach**. The **Detach Virtual Network** page is displayed.
   b) In the **Virtual Ethernet Adapters** table, select the check box near the name of the virtual network that you want to remove.
   c) Click **OK**.

Managing virtual storage for a partition

Learn about managing virtual storage for a partition.

You can use the Hardware Management Console (HMC) to complete the following storage tasks on a partition:

- Managing virtual storage for a partition in Adapter view.
  - Creating virtual SCSI and virtual Fibre Channel adapters
  - Removing virtual SCSI and virtual Fibre Channel adapters
- Managing virtual storage for a partition in Storage view.
  - Managing virtual SCSI resources for a partition
  - Viewing virtual Fibre Channel assignment
  - Optical device assignment

Managing virtual storage for a partition in adapter view

You can create, view, and manage virtual storage allocated to a partition by using the Hardware Management Console (HMC).

You can add the required virtual storage resources to a partition. In the **Virtual Storage** work pane, you can use the left and right arrow key buttons to switch between **Storage View** and **Adapter View**. Click the right arrow key button to select **Adapter View**. In the **Adapter View**, you can view the adapter configuration of the virtual storage devices that are allocated for the logical partition. The **Adapter View** provides a mapping of the adapters to the physical storage device in a logical partition.

In the **Adapter View**, you can create, view, and manage the properties of virtual Small Computer Serial Interface (SCSI) and Virtual Fibre Channel (VFC) adapters for the partition on the managed system. You can also add different types of storage devices to the logical partition. To launch the **Add Virtual SCSI Device** page, select an adapter from the list available in the table and click **Action** > **Add Client Device**. Alternatively, you can right-click the adapter and select **Add Client Device**. For more information, see "Managing virtual SCSI resources for a partition" on page 93.

Creating IBM i or Virtual I/O Server hosted Virtual SCSI adapters

When the Hardware Management Console (HMC is at version 8.7.0, or later, you can view and manage the IBM i or Virtual I/O Server hosted virtual SCSI adapters for the partition.

To add an IBM i or Virtual I/O Server hosted virtual SCSI adapter, complete the following steps:

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select a system and click **Actions** > **View System Partitions**. In the **Partitions** page, you can view all the partitions that belong to the system.
4. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
5. In the **Properties** pane, click **Virtual I/O** > **Virtual Storage**.
6. In the **Virtual Storage** work pane, click the right arrow key button to select **Adapter View**. The **Virtual SCSI Adapters** tab is displayed by default.
7. In the **IBM i / Virtual I/O Server Virtual SCSI Adapters** section, click **Create Adapter**. The **Create Virtual SCSI Adapter** window is displayed.
8. From the **Remote Partition Type** option, select **IBM i** or **Virtual I/O Server**.
9. In the **Adapter ID** field, enter the adapter ID.

Note: If you do not want to specify an adapter ID, you can continue the procedure with the adapter ID that is populated automatically in the **Adapter ID** field. The adapter ID displayed in this field is the next available slot ID for the virtual SCSI client adapter that is being created.

10. From the **Remote Partition** list, select an IBM i or Virtual I/O Server partition to which the virtual SCSI client adapter connects.
    - If you have selected IBM i from the **Remote Partition Type** option, select an IBM i partition from the **Remote Partition** list. The list displays all the IBM i partitions that are available in the managed system for creating the virtual SCSI adapter.
    - If you have selected **Virtual I/O Server** from the **Remote Partition Type** option, select a virtual I/O server partition from the **Remote Partition** list. The list displays all the VIOS partitions that are available in the managed system for creating the virtual SCSI adapter.
11. By default, the **Remote Adapter** check box is enabled which means both the client and the server adapters are created. If you want to create only the client adapter, clear the **Remote Adapter** check box.
12. If the client partition is an IBM i partition, and you want to create only the server adapter, you can select the adapter type. From the **Adapter Type** option, select **Client** or **Server**. The **Remote Partition Type** is disabled if you select **Server** from the **Adapter Type** option.
13. From the **Remote Adapter ID** list, select the remote adapter ID. The remote slot number of the selected IBM i or Virtual I/O Server partition is displayed in the **Remote Partition ID** field. This field is populated automatically with the next available slot ID, which is based on the IBM i or Virtual I/O Server partition that is selected for creating the virtual SCSI server adapter. Alternatively, you can click **Populate existing usable Remote Adapter IDs**. All server adapters that exist in the selected IBM i or Virtual I/O Server partition, and which are not connected to any logical partition, are displayed in the **Remote Adapter ID** field.
14. Click **OK** to apply the changes. Alternatively, you can click **Cancel** to reject the changes and to close the window.

You can remove the virtual SCSI adapter that is configured for a logical partition. Select the virtual SCSI adapter that you want to remove from the **Virtual SCSI Adapters** list, and click **Action** > **Remove**. Click **OK** when prompted.

Creating Virtual I/O Server hosted Virtual Fibre Channel Adapter

To create a Virtual I/O Server hosted Virtual Fibre Channel (VFC) adapter, complete the following steps:

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select a system and click **Actions** > **View System Partitions**. In the **Partitions** page, you can view all the partitions that belong to the system.
4. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
5. In the **Properties** pane, click **Virtual I/O** > **Virtual Storage**.
6. In the **Virtual Storage** work pane, click the right arrow key button to select **Adapter View**. The **Virtual SCSI Adapters** tab is displayed by default.
7. Select **Virtual Fibre Channel Adapters** tab. A list of virtual Fibre Channel assignments to a partition is displayed.
8. In the **Virtual FC Adapters** section, click **Create Adapter**. The **Create Virtual Fibre Channel Adapter** window is displayed.
9. In the **Adapter ID** field, enter the adapter ID.

Note: If you do not want to specify an adapter ID, you can continue the procedure with the adapter ID that is populated automatically in the **Adapter ID** field. The adapter ID displayed in this field is the next available slot ID for the virtual Fibre Channel adapter that is being created.

10. From the **Remote Partition** list, select a Virtual I/O Server partition to which the virtual Fibre Channel adapter connects. The list displays all the VIOS partitions that are available in the managed system for creating the virtual Fibre Channel adapter.
11. From the **Remote Adapter ID** list, select the remote adapter ID. The remote slot number of the selected Virtual I/O Server partition is displayed in the **Remote Partition ID** field. This field is populated automatically with the next available slot ID, which is based on the Virtual I/O Server partition that is selected for creating the virtual Fibre Channel adapter. Alternatively, you can click **Populate existing usable Remote Adapter IDs**. All server adapters that exist in the selected Virtual I/O Server partition, and which are not connected to any logical partition, are displayed in the **Remote Adapter ID** field.
12. Click **OK** to apply the changes. Alternatively, you can click **Cancel** to reject the changes and to close the window.

You can remove the virtual Fibre Channel adapter that is configured for a logical partition. Select the virtual Fibre Channel adapter that you want to remove from the **Virtual FC Adapters** list, and click **Action** > **Remove**. Click **OK** when prompted.

Managing virtual storage for a partition in storage view

You can create, view, and manage virtual storage allocated to a partition by using the Hardware Management Console (HMC).

You can add the required virtual storage resources to a partition. In the **Virtual Storage** work pane, you can use the left and right arrow key buttons to switch between the **Storage View** and **Adapter View**. Click the left arrow key button to select **Storage View**. In the **Storage View**, you can view and manage the storage capability of the logical partition. The **Storage View** is the default view.

In the **Storage View**, you can view and manage the virtual SCSI adapters, VFC adapters, and the virtual optical devices that are configured to a logical partition.

Managing virtual SCSI resources for a partition

You can assign virtual Small Computer Serial Interface (SCSI) resources to a partition by using the Hardware Management Console (HMC).

Using the virtual SCSI adapter, client partitions can share disk storage and optical devices that are assigned to the Virtual I/O Server (VIOS) partition.

You can add different types of virtual storage to the PowerVM® configuration such as, **Physical Volume**, **Shared Storage Pool Volume**, or **Logical Volume**. By default, the **Physical Volume** table is displayed.

You can view the device mapping details of the storage devices in a logical partition. Right-click on the storage device and select View Device Mapping. The storage device details and the connected Virtual I/O Server details are displayed.

You can also add the Virtual I/O Server to provide an adapter connection. Click Edit Connections and select the Virtual I/O Server and the server adapters to provide the adapter connection.

The Virtual SCSI tab displays the end to end mapping for the virtual SCSI that includes the server adapter, client adapter, and the storage that is used by the virtual SCSI adapter that is configured for a particular logical partition. You can also remove the client or server adapter that is configured for the particular partition.

Adding virtual SCSI devices

You can add different types of virtual storage, such as a physical volume, a shared storage pool volume, or a logical volume from the Virtual SCSI tab in the Storage View. Only the virtual storage devices assigned to the PowerVM configuration are displayed here.

Adding a Physical Volume

To add a physical volume, complete the following steps:

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select a system and click **Actions** > **View System Partitions**. In the **Partitions** page, you can view all the partitions that belong to the system.
4. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
5. In the **Properties** page, click **Virtual I/O** > **Virtual Storage**.
6. In the **Virtual SCSI** tab, click **Add Physical Volume**. The **Add Physical Volume** page opens and the physical volumes table is displayed.
7. Select physical volumes from the list available in the table.

   Note: You can select the **Show in use physical volumes** check box to see the assigned physical volumes. You can also click **Run ConfigDevice** to refresh the list of physical volumes
8. Specify the Target Name for the physical volume that you want to add to the partition.
9. Click **Edit Connection** if you want to change the server Adapter ID and client Adapter ID that are assigned to the physical volume. The **Edit Connection** page opens. You can enter a server Adapter ID and client Adapter ID.
10. Select the **Virtual I/O servers** to provide an adapter connection. You can select up to three Virtual I/O Servers.
11. Enter a **Server Adapter ID** and a **Client Adapter ID** that you want to assign for the adapter connection, or click **Use Existing Adapters** to select a server adapter ID from the list.

    Note: If you clicked **Use Existing Adapters**, you cannot modify the client Adapter ID as the client Adapter ID is automatically assigned to the VIOS.
12. Click **OK** to assign the physical volume to the partition.

Adding a Shared Storage Pool Volume

To add a Shared Storage Pool volume, complete the following steps:

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select a system and click **Actions** > **View System Partitions**. In the **Partitions** page, you can view all the partitions that belong to the system.
4. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
5. In the **Properties** page, click **Virtual I/O** > **Virtual Storage**.
6. In the **Virtual SCSI** tab, click **Shared Storage Pool Volume**. The **Shared Storage Pool Volumes** table is displayed.
7. Click **Add Shared Storage Pool Volume**. The **Add Shared Storage Pool Volume** page is displayed.
8. Select a **Storage Cluster** from the list.
9. Select **Add new Shared Storage Pool Volume** to add a Shared Storage Pool volume or select **Add existing Shared Storage Pool volume**.

- If you chose to add a new Shared Storage Pool volume, select the tier to which the new SSP volume is associated and enter a device name and size. Select the VIOS connections that are assigned to the PowerVM configuration.
- If you chose to add an existing Shared Storage Pool (SSP) volume, select an existing SSP volume. Select the VIOS connections that are assigned to the PowerVM configuration.

10. Click **Edit Connection** if you want to change the server Adapter ID and client Adapter ID that are assigned to the shared storage pool volume. The **Edit Connection** page opens. You can enter a server Adapter ID and client Adapter ID.
11. Select the **Virtual I/O servers** to provide an adapter connection. You can select up to three Virtual I/O Servers.
12. Enter a **Server Adapter ID** and a **Client Adapter ID** that you want to assign for the adapter connection, or click **Use Existing Adapters** to select a server adapter ID from the list.

    Note: If you clicked **Use Existing Adapters**, you cannot modify the client Adapter ID as the client Adapter ID is automatically assigned to the VIOS.
13. Select **Shared Storage Pool Volumes** to view the SSP volumes that are already assigned to the existing logical partition
14. Click **OK** to assign the Shared Storage Pool volume to the partition.

Adding a Logical Volume

To add a Logical volume, complete the following steps:

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select a system and click **Actions** > **View System Partitions**. In the **Partitions** page, you can view all the partitions that belong to the system.
4. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
5. In the **Properties** page, click **Virtual I/O** > **Virtual Storage**.
6. In the **Virtual SCSI** tab, click **Logical Volume**. The **Logical Volume** table is displayed.
7. Click **Add Logical Volume** to add logical volumes to a partition. The **Add Logical Volume** page is displayed.
8. Select a volume group from the table.
9. Select **Add new logical volume** to add a logical volume or select **Add an existing logical volume**.
    - If you chose to add a new logical volume, enter a device name and size.
    - If you chose to add an existing logical volume, select an existing device name.
10. Click **Edit Connection** if you want to change the server Adapter ID and client Adapter ID that are assigned to the logical volume. The **Edit Connection** page opens. You can enter a server Adapter ID and client Adapter ID.
11. Select the **Virtual I/O servers** to provide an adapter connection. You can select up to three Virtual I/O Servers.
12. Enter a **Server Adapter ID** and a **Client Adapter ID** that you want to assign for the adapter connection, or click **Use Existing Adapters** to select a server adapter ID from the list.

    Note: If you clicked **Use Existing Adapters**, you cannot modify the client Adapter ID as the client Adapter ID is automatically assigned to the VIOS.
13. Click **OK** to assign the Logical volume to the partition.

Viewing virtual Fibre Channel assignments to a partition
You can view the virtual Fibre Channel resources that are assigned to a partition by using the Hardware Management Console (HMC).

About this task

To view the virtual Fibre Channel resources that are assigned to a partition by using the HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Virtual Storage**. The **Virtual Storage** page is displayed.
5. Click the **Virtual Fibre Channel** tab. The **Virtual Fibre Channel** page opens. You can use the left and right arrow key buttons to switch between the **Storage View** and **Adapter View**. The **Storage View** view is the default view. The table displays all the virtual Fibre Channel resources assigned to the partition. Only the virtual Fibre Channel resources assigned to the PowerVM configuration are displayed.
6. In the **Virtual Storage** work pane, click the right arrow key button to select **Adapter View**.
7. Select **Virtual Fibre Channel Adapters** tab. A list of virtual Fibre Channel assignments to a partition is displayed.

Assigning virtual Fibre Channel storage to a partition
You can assign virtual Fibre Channel storage to a partition by using the Hardware Management Console (HMC).

About this task

To assign virtual Fibre Channel storage to a partition by using an HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Virtual Storage**. The **Virtual Storage** page opens.
5. Click the **Virtual Fibre Channel** tab. The **Virtual Fibre Channel** page opens in **Storage View**.
6. Click **Add Virtual Storage**. The **Add Virtual Fibre Channel** page opens.
7. Select a Virtual storage type from the **Virtual I/O Server** list.
8. Select Fibre Channel ports from the **Fibre Channel port** list available in the selected **VIOS**.

   Note: You can click **Edit connection** to manually configure the **Virtual Fibre Channel** adapter settings for the connection. Enter the **WWPN** details and the **Server Adapter ID**.
9. Click **Save**. The Fibre Channel port is assigned to the partition.

Optical device assignment

You can manage the optical devices that are assigned to partitions by using the Hardware Management Console (HMC).

Viewing physical optical devices

You can view the physical optical devices that can be assigned to a partition by using the Hardware Management Console (HMC).

About this task

To view the physical optical devices by using an HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Virtual Storage**. The **Virtual Storage** page opens.
5. Click the **Physical Optical Device** tab. A list of physical optical devices that can be assigned to the selected partition is displayed.
6. To view the mapping of a physical optical device, click on a physical optical device and select **View Device Mapping**.

   In the **Physical Optical Device** area, you can view details like the device name, description, and the physical location. In the **Virtual I/O Server** area, you can view the client adapter name, and the server adapter name.
7. Click **Close**.

Adding physical optical devices

You can add physical optical devices to a partition by using the Hardware Management Console (HMC).

About this task

To add physical optical devices by using an HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Virtual Storage**. The **Virtual Storage** page opens.
5. Click the **Physical Optical Device** tab.
6. Click the **Add Virtual Storage** tab. The **Add Physical Optical Device** page opens.
7. Select the physical optical device to be added to the PowerVM configuration. Click **OK**.

   Only devices that are assigned through the PowerVM configuration are displayed and you can select a device only from the displayed list.

8. To edit the properties of the device, click **Edit Connections**. You can select up to three Virtual I/O Servers to provide an adapter connection.
9. For each Virtual I/O Server, select a value from the **Server Adapter ID** list.
10. Click **OK**. The physical optical device is added to the partition.
11. Click **Close**.

Removing physical optical devices

You can remove a physical optical devices that is assigned to a partition by using the Hardware Management Console (HMC).

About this task

To remove a physical optical device by using an HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Virtual Storage**. The **Virtual Storage** page opens.
5. Click the **Physical Optical Device** tab.
6. Select a physical device and click **Remove**.
7. When the device to be removed is assigned to a running partition, you are prompted with a message verifying whether you want to continue to remove the device.
8. Click **OK** to remove the device, or click **Cancel** to exit the operation.
9. Click **Close**.

Viewing virtual optical devices

You can view the virtual optical devices that can be assigned to a partition by using the Hardware Management Console (HMC).

About this task

To view the virtual optical devices by using an HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Virtual Storage**. The **Virtual Storage** page opens.
5. Click the **Virtual Optical Device** tab. A list of virtual optical devices that are assigned to the selected partition is displayed.
6. To view the mapping of a virtual optical device, click a virtual optical device and select **View Device Mapping**.

In the **Virtual Optical Device** area, you can view details such as the device name, the media file, and the size in GB. In the **Virtual I/O Server** area, you can view the client adapter name and the server adapter name.

7. Click **Close**.

Adding virtual optical devices

You can add virtual optical devices to a partition by using the Hardware Management Console (HMC).

About this task

To add a virtual optical device, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Virtual Storage**. The **Virtual Storage** page opens.
5. Click the **Virtual Optical Device** tab.
6. Click the **Add Virtual Storage** tab. The **Add Virtual Storage** page opens.
7. In the **Device Name** field, enter the device name and select the Virtual I/O Server from the table.
8. Click **OK**.
9. Optional:
10. You can select the server adapter ID to provide an adapter connection. Otherwise, the next available server adapter ID is used.
    a) To select the server adapter ID, click **Edit Connections**.
    b) From the **Server Adapter ID** list, select the server adapter ID.
11. Click **OK**. The virtual optical device is added to the partition.
12. Click **Close**.

Removing virtual optical devices

You can remove a virtual optical device that is assigned to a partition by using the Hardware Management Console (HMC).

About this task

To remove a virtual optical device by using an HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Virtual Storage**. The **Virtual Storage** page opens.
5. Click the **Virtual Optical Device** tab.

6. Select a virtual device and click **Remove** When the device to be removed is assigned to a running partition, you are prompted with a message to verify whether you want to continue to remove the device.
7. Click **OK** to remove the device, or click **Cancel** to exit the operation.
8. Click **Close**.

Loading and unloading media files

You can load or unload media files to or from virtual optical devices by using the Hardware Management Console (HMC).

About this task

To load or unload a media file to or from a virtual optical device by using an HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Virtual Storage**. The **Virtual Storage** page opens.
5. Click the **Virtual Optical Device** tab.
6. Select a virtual device and click **Load**.
7. Select the media file to assign to partition and click **OK**.

   Note: If there is a mount error, a message is displayed.
8. Click **Close**.
9. To remove a media file that is assigned to a partition, select the virtual optical device and click **Unload**.

Managing hardware virtualized I/O adapters

You can view and change the settings of hardware virtualized I/O adapters, such as single root I/O virtualization (SR-IOV) port adapters and logical host Ethernet adapters (LHEA) for a partition by using the Hardware Management Console (HMC).

SR-IOV logical port settings

You can add, change, and remove single root I/O virtualization (SR-IOV) logical ports that are configured on a partition by using the Hardware Management Console (HMC).

Adding SR-IOV logical ports

You can add single root I/O virtualization (SR-IOV) logical ports to a partition by using the Hardware Management Console (HMC).

Before you begin

About this task

To add an SR-IOV port to a partition by using an HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Hardware Virtualized I/O**. The **Hardware Virtualized I/O** page opens.
5. On the **SR-IOV** tab, click **Add Port**. The **Add SR-IOV Logical Port** page opens.
6. In the **Add SR-IOV Logical Port** page, select **Ethernet** or **RoCE** from the **Select Logical Port Type** option button.
7. Click **Select an SR-IOV physical port**. The **Physical Ports** page is displayed.
8. In the **Physical Ports** page, select a physical port from the list of available physical ports, and click **OK**.
9. In the **Logical port capacity** field, enter the capacity value in percentage for the logical port.

   Note: The sum of percentage of capacity values for all the configured logical ports on a physical port must be less than or equal to 100%. To minimize the configuration effort when you add more logical ports, you can reserve some capacity for the additional logical ports.
10. Expand **Advanced settings** to view the advanced setting options for the SR-IOV adapter.
11. Select the **Promiscuous Mode** check box, if you want to enable the settings for the SR-IOV port. These settings are disabled by default.

    Note: You must select the **Promiscuous Mode** checkbox, if you want to virtualize the logical port even further, such as, if you want to use the logical port as the network adapter for shared Ethernet adapter (SEA).
12. Select the **Migratable** check box to configure SR-IOV logical ports in a client partition and to mark the SR-IOV logical port as migratable by creating a new backup device, which can either be a virtual Ethernet adapter or a virtual NIC adapter.

    a) Select the **Configure a new back backup device** option to configure a new backup device. By default, this setting is enabled.

       i) Select **Virtual Ethernet Adapter** or **Virtual NIC Adapter** from the **Backup Device Type** option. By default, the **Virtual NIC Adapter** option is enabled.

       ii) Click **Configure backup device**. The **Configure Virtual NIC Backing Device** page is displayed.

       - In the **Physical Port Location Code** tab, select a physical port that you want as a backup port for the migratable logical port from the list.
       - In the **Hosting Partition** tab, select a hosting VIOS from the hosting partition list.
       - In the **Capacity** tab, select the appropriate capacity from the capacity list.
       - Click **OK** to apply the changes. Alternatively, click **Cancel** to reject the changes and to close the window.

       iii) Optional: If you have selected **Virtual Ethernet Adapter** from the **Backup Device Type** option, the **Attach Virtual Network** page is displayed.

       - Select a virtual network that you want as a backup network for the migratable logical port from the list of available virtual networks.
       - Click **OK** to apply the changes. Alternatively, click **Cancel** to reject the changes and to close the window.

    Note: When the HMC is at Version 9.1.940.x, and when the firmware is at level FW940, the Migratable option for the Hybrid Network Virtualization capability is available as a Technology Preview only and is not intended for production deployments. However, when the HMC is at Version

9.1.941.0, or later, and when the firmware is at level FW940.10, or later, the Migratable option for the Hybrid Network Virtualization capability is supported.

13. From the **OS MAC Address Restrictions** list, select an option for the OS MAC address restrictions.
14. From the **VLAN ID Restrictions** list, select an option for the OS VLAN ID restrictions.
15. In the **Port VLAN ID** field, enter a value. The valid range is 2 - 4094.

    Note: The default value of Port VLAN ID is 0. If you enter a non-zero value in the Port VLAN ID field, the 802.1Q Priority field becomes available.
16. In the **802.1Q Priority** field, enter any value from 0 - 7, where 0 indicates the lowest priority and 7 indicates the highest priority value.
17. Click **OK**. The SR-IOV port is added to the partition.

Changing SR-IOV logical ports

You can change the settings of single root I/O virtualization (SR-IOV) logical ports on a partition by using the Hardware Management Console (HMC).

About this task

To change the settings of an SR-IOV port by using an HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Hardware Virtualized I/O**. The **Hardware Virtualized I/O** page opens.
5. Click the **SR-IOV** tab. A list of SR-IOV logical ports that are configured for the selected partition is displayed.
6. Right click an SR-IOV logical port that you want to change and select **Modify Logical Port**. The **Modify SR-IOV Logical Port** page opens.

   Note: Diagnostic mode can be set only if other logical ports are not associated with the physical port.
7. Select the **Diagnostic Mode** check box to enable or disable the setting.
8. If the **OS MAC Address Restrictions** option indicates **Allow Specified**, you can add MAC addresses to the **Specify allowed MAC Addresses** list.
9. If the **VLAN ID Restrictions** option indicates **Allow Specified**, you can add VLAN IDs to the **Specified VLAN IDs or range** list.
10. In the **Port VLAN ID** field, enter a value to change the existing value. The valid range is 2 - 4094.

    Note: The default value of Port VLAN ID is 0. If you enter a non-zero value in the Port VLAN ID field, the 802.1Q Priority field becomes available.
11. In the **802.1Q Priority** field, enter any value from 0 - 7, where 0 indicates the lowest priority and 7 indicates the highest priority value.
12. Click **OK** to save the changes that you made for the SR-IOV logical port settings.

Removing SR-IOV logical ports

You can remove single root I/O virtualization (SR-IOV) logical ports from a partition by using the Hardware Management Console (HMC).

About this task

To remove an SR-IOV port by using an HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Hardware Virtualized I/O**. The **Hardware Virtualized I/O** page opens.
5. Click the **SR-IOV** tab. A list of SR-IOV logical ports that are configured for the selected partition is displayed.
6. Right-click an SR-IOV logical port that you want to remove and select **Remove Logical Port** > **OK**.

   Note: If the selected partition is powered on, the SR-IOV logical port needs to be deconfigured in the selected partition before being removed.

Results

The selected SR-IOV logical port is removed.

Logical host Ethernet adapter (LHEA) settings

You can view, add, change, and remove logical host Ethernet adapters (LHEAs) that are configured on a partition by using the Hardware Management Console (HMC).

An LHEA is a representation of a physical HEA on a partition. An LHEA appears to the operating system as a physical Ethernet adapter, just as a virtual Ethernet adapter appears as a physical Ethernet adapter. Each partition can have one LHEA for each physical HEA on the managed system. Each LHEA can have one or more logical ports, and each logical port can connect to a physical port on the HEA.

Adding logical host Ethernet adapters

You can add logical host Ethernet adapters (LHEAs) to a partition by using the Hardware Management Console (HMC).

About this task

You can select an LHEA from the list and add it to the partition with the required settings.

Procedure

To add an LHEA adapter to a partition, complete the following steps:

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.

4. In the **Properties** pane, click **Virtual I/O** > **Hardware Virtualized I/O**. The **Hardware Virtualized I/O** page opens.
5. Click the **HEA** tab.
6. Click **Add Adapter**. The **Add LHEA Adapter** page opens.
7. From the list of physical ports, select the physical port to associate with the LHEA adapter. The list of physical ports is not displayed if there are no available ports.
8. Expand **Advanced Settings**.
9. From **MAC Address settings** option, select the MAC address settings.
10. From **VLAN ID Settings** option, select the VLAN ID settings .

    Note: The advanced settings are available only if the partition is QoS capable.
11. Click **OK**.

Results

The LHEA adapter is added to the partition.

Modifying logical host Ethernet adapter ports

You can change the settings of logical host Ethernet adapter (LHEA) ports on a partition by using the Hardware Management Console (HMC).

About this task

You can select an LHEA from the list and change it with the required settings.

Procedure

To change LHEA port settings, complete the following steps:

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Hardware Virtualized I/O**. The **Hardware Virtualized I/O** page opens.
5. Click the **HEA** tab. A list of LHEAs configured for the selected partition is displayed.
6. Right-click an LHEA adapter that you want to change and select **Modify Port**. The **Modify Logical Host Ethernet Adapter Port** page opens.
7. Select the **Dedicated Mode** check box if you want to make the LHEA port dedicated to the assigned partition.
8. From the **MAC Address Settings** list, change the MAC address settings.
9. From the **VLAN ID Settings** list, change the VLAN ID settings.
10. Click **OK** to save the changes for the LHEA port.

Results

The LHEA port settings are saved.

Removing logical host Ethernet adapter ports

You can remove logical host Ethernet adapter (LHEA) ports from a partition by using the Hardware Management Console (HMC).

About this task

You can select an LHEA from the list and remove it from the partition.

Procedure

To remove an LHEA port, complete the following steps:

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Hardware Virtualized I/O**. The **Hardware Virtualized I/O** page opens.
5. Click the **HEA** tab. A list of LHEA ports that are configured for the selected partition is displayed.
6. Right-click an LHEA port and select **Remove Port**.
7. Click **OK**. The selected LHEA port is removed after confirmation.

Results

The selected LHEA port is removed.

Managing host channel adapters on a partition

Host channel adapters (HCAs) provide port connections from a managed system to other devices. You can connect the port to another HCA, a partition, or a switch that redirects the incoming data from one port to a device that is attached to another port.

About this task

You can view a list of the HCAs on a partition that is managed by the Hardware Management Console (HMC). You can select an HCA from the list to display the current partition usage for the HCA.

Procedure

To manage HCA settings, complete the following steps:

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**. The **All Systems** page is displayed.
3. In the work pane, select the partition for which you want to view or change the properties and capabilities and click **Actions** > **View Partition Properties**. The **Properties** page is displayed. You can view and change the properties that are listed under the **Properties** area.
4. In the **Properties** pane, click **Virtual I/O** > **Hardware Virtualized I/O**. The **Hardware Virtualized I/O** page opens.
5. In the work pane, click the **HCA** tab.
6. Click **Launch Manage Host Channel Adapters**. A window opens with the list of HCAs in a table.
7. From the table, select an HCA to display the current partition usage.
8. Click **OK**.

Viewing topology diagrams of a system

Learn how to view all the topology diagrams of a system.

You can use the Hardware Management Console (HMC) to view the topology diagrams of a system.

Viewing virtual networking diagrams

You can view the end-to-end network configuration for the selected system, by using the HMC. The view of the virtual networks begins with the physical adapter cards and the physical ports that are connected to them. As you scroll down, you can see the defined virtual bridges, link aggregation devices, virtual switches, virtual networks, and partitions in the VIOS.

About this task

You can click a resource and drag to pan across the diagram. You can also double-click a resource to highlight that resource and the relationship between its various virtual and physical components in the network. To remove the highlighting, double-click in an empty area of the network diagram. To view more detailed information about a resource, you can right-click a resource and additional information is displayed in a click card. Alternatively, you can hover over the label of a resource area to display the name of the resource as a tooltip.

To view the end-to-end network configuration for the selected system by using the HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**.

   The **All Systems** page is displayed.
3. In the work pane, select the system in which the partition is located and click **Actions** > **View System Partitions**. The configuration page opens. You can view the configuration details of the system you selected.
4. In the navigation pane, click **Topology** > **Virtual Networking Diagram** to view the end-to-end network configuration for the selected system.
5. Right-click a resource for the selected system to view more detailed information in a click card. You can also hover over the label of a resource area to display the name of the resource as a tooltip.
6. In the upper-right corner of the work pane, click the **zoom in** and **zoom out** icons to achieve the required level of magnification.

   Note: You can also zoom in and zoom out by using the scroll wheel on the mouse from within the diagram.
7. In the upper-right corner of the work pane, click the **Legend** icon to view an explanation of the symbols used in the virtual networking diagram.

Viewing virtual storage diagrams

Two types of virtual storage diagrams are available - systems storage and partition storage. You can view the virtual storage configuration for the selected system, including the physical and virtual components of system storage, by using the HMC. You can also view the virtual storage configuration for a single partition in a particular system, including the physical and virtual components of storage assigned to that particular partition, by using the HMC.

About this task

This diagram displays a high-level overview of the contents of the system or a single partition, and not specific component relationships. You can click a resource and drag to pan across the diagram. You can also double-click a resource to highlight that resource and the relationship between its various virtual and physical components in the network. To remove the highlighting, double-click in an empty area of the storage diagram. To view more detailed information about a resource, you can right-click a resource and additional information is displayed in a click card. Alternatively, you can hover over the label of a resource area to display the name of the resource as a tooltip.

To view the virtual storage configuration for the selected system or a single partition by using the HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**.

   The **All Systems** page is displayed.
3. In the work pane, select the system in which the partition is located and click **Actions** > **View System Partitions**. The configuration page opens. You can view the configuration details of the system you selected.
4. In the navigation pane, click **Topology** > **Virtual Storage Diagram** to view the virtual storage configuration for the selected system.

   Note: To view the virtual storage diagrams of a single partition in a particular system, select the partition of your choice and then click **Topology** > **Partition Virtual Storage Diagram**.
5. Right-click a resource for the selected system to view more detailed information in a click card. You can also hover over the label of a resource area to display the name of the resource as a tooltip.
6. In the upper-right corner of the work pane, click the **zoom in** and **zoom out** icons to achieve the required level of magnification.

   Note: You can also zoom in and zoom out by using the scroll wheel on the mouse from within the diagram.
7. In the upper-right corner of the work pane, click the **Legend** icon to view an explanation of the symbols used in the virtual storage diagram.

Viewing SR-IOV and vNIC diagrams

You can view the SR-IOV and virtual Network Interface Controllers (vNIC) configuration for the selected system, including the physical and virtual components, by using the HMC.

About this task

This diagram displays the relationships between SR-IOV adapters and other virtual components, such as vNIC. You can click a resource and drag to pan across the diagram. You can also double-click a resource to highlight that resource and the relationship between its various virtual and physical components in the network. To remove the highlighting, double-click in an empty area of the SR-IOV and vNIC diagram. To view more detailed information about a resource, you can right-click a resource and additional information is displayed in a click card. Alternatively, you can hover over the label of a resource area to display the name of the resource as a tooltip.

To view the SR-IOV and vNIC configuration for the selected system by using the HMC, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**.

   The **All Systems** page is displayed.
3. In the work pane, select the system in which the partition is located and click **Actions** > **View System Partitions**. The configuration page opens. You can view the configuration details of the system you selected.
4. In the navigation pane, click **Topology** > **SR-IOV and vNIC Diagram** to view the SR-IOV and vNIC configuration for the selected system.
5. Right-click a resource for the selected system to view more detailed information in a click card. You can also hover over the label of a resource area to display the name of the resource as a tooltip.
6. In the upper-right corner of the work pane, click the **zoom in** and **zoom out** icons to achieve the required level of magnification.

   Note: You can also zoom in and zoom out by using the scroll wheel on the mouse from within the diagram.
7. In the upper-right corner of the work pane, click the **legend** icon to view an explanation of the symbols used in the SR-IOV and vNIC diagram.

Accessibility features for IBM Power Systems servers

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Power Systems servers include the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Power Systems servers use the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with US Section 508 (www.access-board.gov/guidelines-and-standards/communications-and-it/about-the-section-508-standards/section-508-standards) and Web Content

Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the IBM Power Systems servers.

The IBM Power Systems servers online product documentation in IBM Knowledge Center is enabled for accessibility. The accessibility features of IBM Knowledge Center are described in the Accessibility section of the IBM Knowledge Center help (www.ibm.com/support/knowledgecenter/doc/kc_help.html#accessibility).

Keyboard navigation

This product uses standard navigation keys.

Interface information

The IBM Power Systems servers user interfaces do not have content that flashes 2 - 55 times per second.

The IBM Power Systems servers web user interface relies on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

The IBM Power Systems servers web user interface includes WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Power Systems servers include certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Privacy policy considerations

IBM Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as the customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM’s Privacy Policy at http://www.ibm.com/privacy and IBM’s Online Privacy Statement at http://www.ibm.com/privacy/details/us/en/ in the section entitled “Cookies, Web Beacons and Other Technologies”.

Programming interface information

This Managing the virtualization environment publication documents intended Programming Interfaces that allow the customer to write programs to obtain the services of IBM AIX Version 7.2, IBM AIX Version 7.1, IBM AIX Version 6.1, IBM i 7.4, and IBM Virtual I/O Server Version 3.1.2.

Power Systems

Monitoring the virtualization environment

Note

Before using this information and the product it supports, read the information in “Notices” on page 19.

This edition applies to IBM® AIX® Version 7.2, to IBM AIX Version 7.1, to IBM AIX Version 6.1, to IBM i 7.4 (product number 5770-SS1), to IBM Virtual I/O Server Version 3.1.1, and to all subsequent releases and modifications until otherwise indicated in new editions. This version does not run on all reduced instruction set computer (RISC) models nor does it run on CISC models.

Contents

Monitoring the virtualization environment by using the Performance and Capacity Monitor function

The Performance and Capacity Monitor function collects allocation and usage data for virtualized server resources. When the Hardware Management Console is at version 8.6.0, or later, you can also export data metrics that are collected for the specified time. It displays data in the form of graphs and tables, which are viewable from the Performance and Capacity Monitor home page. The Performance and Capacity Monitor function is available in the Hardware Management Console (HMC) Version 8, Release 8.1.0, or later.

The Performance and Capacity Monitor function gathers and displays capacity reporting data and performance monitoring data. You can monitor processor, memory, virtual storage, and virtual network resource usage. This data can help you better understand how managed systems and logical partitions are using resources, and whether resources are under-used or over-used. It can also help you identify and fix performance bottlenecks. By using the Performance and Capacity Monitor, you can manage current capacity and plan for future requirements.

What's new in Monitoring the virtualization environment

Read about new or significantly changed information in Monitoring the virtualization environment since the previous update of this topic collection.

October 2019

- The following topics were updated with information about the support for the persistent memory:
  - "Current Resource Utilization graphs" on page 4
  - "The Resource Utilization table" on page 7
  - "Memory breakdown table" on page 10

August 2018

The following updates have been made to the content:

- Added information about PCM status and adapter statistics in the "Troubleshooting the Performance and Capacity Monitor" on page 14 topic.
- Removed or updated obsolete information in various topics.

Getting started

Learn how to use the Performance and Capacity Monitor.

To use the Performance and Capacity Monitor, refer to the following topics.

Enabling data collection

Server resource utilization monitoring starts after you enable data collection and continues until you disable it. Server utilization data is stored on the Hardware Management Console (HMC).

About this task

The number of servers that can be monitored is determined by the HMC. You can view the number of managed servers that can be monitored by accessing the Performance and Capacity Monitor preferences REST API at the following uniform resource identifier:

```
https://your_hmc_ip_address:12443/rest/api/pcm/preferences
```

To enable data collection for one or more servers, complete the following steps:

Procedure

1. In the navigation pane, click the **HMC Management** icon .

   a) Click **Console Settings**. The **Console Settings** page is displayed.

   b) In the **Performance Settings** area, click **Change Performance Monitor Settings**.

   Note: Alternatively, if you try to launch the Performance and Capacity Monitor function for a system on which data collection is disabled, a message is displayed in the Current Resource Utilization area of the Settings for Performance Monitoring page. To enable data collection for the required server, set **Collection** to **On**.

2. Specify the number of days for which you want to store performance data by typing in a number in the range 1 - 366. Otherwise, click the up or down arrows next to **Number of days to store performance data** under **Performance Data Storage**.

   Note: By default, the HMC is set to store data for 180 days. The maximum number of days for which it can store data is 366.

3. Click the toggle switch in the **Collection** column, next to the name of the server, for which you want to collect data. Otherwise, click **All On** to enable data collection for all of the servers that the HMC manages.

   Note: If you request to monitor a number of managed servers that exceed the maximum number of managed servers that can be monitored by the HMC, the HMC displays an error.

4. Click **OK** to apply the changes and close the window.

   The **HMC Management** topic pane is displayed in the main window. You can now review the collected data by accessing the Performance and Capacity Monitor home page.

Accessing the Performance and Capacity Monitor home page

After you enable data collection for a server, the Performance and Capacity Monitor function plots the data in graphs and summarizes the information in tables. You can view the graphs and tables from the Performance and Capacity Monitor home page, which is accessible from the Hardware Management Console (HMC).

About this task

To access the Performance and Capacity Monitor home page, complete the following steps:

Procedure

In the navigation pane, click the **Resources** icon .

a) Click **All Systems**. The All Systems page is displayed.

b) Select the server for which you want to view the performance data.

c) Click **Actions**.

d) Select **View Performance Dashboard**.

The Performance and Capacity Monitor home page is displayed with the information for that system.

The Performance and Capacity Monitor home page

The Performance and Capacity Monitor home page contains charts and graphs that represent the data that is collected from the server.

The home page is divided into the following sections:

- The **Current Resource Utilization** graphs appear at the upper section of the Performance and Capacity Monitor home page. These graphs indicate current processor usage and memory assignment as a portion of available capacity. The Virtual I/O network traffic and storage bandwidth graphs indicate their current usage against their historical maximum bandwidth consumption that was recorded on that HMC after the performance monitoring function was enabled. You can change the chart auto-update interval. To view a larger version of a graph, click the icon that resembles a magnifying glass with a plus sign. To view help information for a graph, click the question mark icon.
- The **Views** topic pane appears on the right side of the home page and includes a list of server resources for which you can view performance data. The views include **Server Overview**, **Processor Utilization Trend**, **Memory Utilization Trend**, **Network Utilization Trend**, **Storage Utilization Trend**, and **SR-IOV Port Counters**.
- The details section occupies the remaining space on the Performance and Capacity Monitor home page. The details section displays the graphs and charts that are associated with the view that you selected from the **Views** topic pane.

Changing Performance and Capacity Monitor home page settings

You can change the time interval settings for the graphs on the Performance and Capacity Monitor home page.

Changing the automatic update frequency of Current Resource Utilization graphs

The **Current Resource Utilization** graphs default to an auto-update value of 1 minute; however, you can specify a longer time interval, if required.

To change the duration of time between updates, complete the following steps:

1. In the upper-right corner of the **Current Resource Utilization** section, click the menu next to **Auto-update in**.
2. Select one of the following preset values: **1 minute**, **5 minutes**, **10 minutes**, or **15 minutes**.

   The data in the graphs refreshes according to the time interval you chose.

Changing the time interval of the data that is displayed in the details pane

The home page defaults to a 4-hour time interval for the data in the details section. However, you can specify a longer time interval. You can also specify custom dates and times. The minimum time interval is 4 hours, and the maximum time interval is one year from the current date and time.

The details section refreshes and displays the updated content that is based on the time interval you choose. After the window refreshes, the latest entry for the data ends with the current time. The Performance and Capacity Monitor displays the data in this interval, every time you refresh the view, unless you change the interval again.

To change the time interval, complete the following steps:

1. Click the menu in the upper-right corner of the details section.
2. Select one of the following preset values: **Last 4 Hours**, **Last Day**, **Last Week**, **Last Month**, or **Last Year**. Otherwise, select **Custom**.

If you selected **Custom**, a window is displayed. Continue to the next step.

3. Specify the date and time information in the **Start Date** and **End Date** fields, or click the calendar icon to choose the start date from the calendar.
4. Click **OK** to apply your changes.

Note: If you change the time interval of one view, then the interval change applies only to that view. For example, if you change the time interval for the **Server Overview** page to **Last Week**, the time interval for the Processor Trend view remains at **Last 4 Hours**.

Current Resource Utilization graphs

The upper section of the Performance and Capacity Monitor home page includes the **Current Resource Utilization** information. These graphs depict how the system's processor usage, memory assignment, virtual I/O network, and storage traffic compare against the available capacities or against their maximum historic highs. If the overall server usage is consistently high, activate more processors, move workloads to other servers, or buy more servers, processors, or memory.

The **Current Resource Utilization** information includes the following graphs: **Processor Usage/Peak**, **Memory Assignment**, **Network Traffic**, and **Storage Traffic**.

Processor Usage/Peak

The **Processor Usage/Peak** graph shows the average processor usage that is measured in processor cores and is represented by the blue horizontal bar. The black vertical bar indicates the maximum number of processors that the system used during the most recent monitoring period. The gray shading indicates the percentage of total active physical processors used. Light gray indicates that zero to 50% of the available processors were used. Medium gray indicates that 51% - 90% of the available processors were used. Dark gray indicates that 91% - 100% of the available processors were used. This graph indicates how the current and recent peak utilization compares against the total number of processors available on the server.

Click the **Click to Enlarge** button in the **Processor Usage/Peak** area. The table displays information about the Installed, Activated, Allocated, Available, Utilized, Peak, and Minimum usage data of processor usage.

Memory Assignment

The **Memory Assignment** graph shows the average memory assignment that is measured in MB or GB and is represented by the blue horizontal bar. The black vertical bar indicates the maximum amount of memory that the system used. The gray shading indicates the percentage of total active memory used. Light gray indicates that 0% - 50% of active memory was used. Medium gray indicates that 51% - 90% of active memory was used. Dark gray indicates that 91% - 100% of active memory was used. This graph indicates how the current and recent peak utilization compares against the total amount of memory available on the server.

Click the **Click to Enlarge** button in the **Memory Assignment** area. The table displays information about the Installed, Activated, Allocated, Available, Utilized, Peak, and Minimum memory assignment. You can also view information about the Assigned Virtual Persistent Memory. The persistent memory is available only when the Hardware Management Console (HMC) is at Version 9.1.940, or later, and when the firmware is at level FW940, or later. The persistent memory is a virtualization feature in which persistent memory volumes are created by using the existing DRAM (Dynamic Random Access Memory), where data persistence is maintained across applications, and the operating systems even when the logical partition has been restarted.

Network Traffic

The **Network Traffic** graph shows the average amount of traffic (measured in KB/s or GB/s and is represented by the blue horizontal bar) that flows through the network adapters that are assigned to the Virtual I/O Server. The gray shading indicates the maximum amount of traffic that was measured in the time that elapsed since the console was started. The black vertical bar indicates the maximum amount of network bandwidth that the system used. This graph indicates how the average network traffic compares against the maximum amount of network bandwidth that the system used.

Click the **Click to Enlarge** button in the **Network Traffic** area. The table displays information about traffic utilization that is measured per second (measured in KB/s or GB/s), the maximum amount of network bandwidth that the system used, the number of Virtual I/O Servers, and the number of Physical Adapters.

Storage Traffic

The **Storage Traffic** graph shows the average amount of traffic (measured in KB/s or GB/s and is represented by the blue horizontal bar) that is processed through the storage adapters and assigned to the Virtual I/O Server. The gray shading indicates the maximum amount of traffic that was measured in the time that elapsed since the console was started. The black vertical bar indicates the maximum amount of storage I/O bandwidth that the system used. This graph indicates how the average storage traffic compares against the maximum amount of storage I/O bandwidth that the system used.

Click the **Click to Enlarge** button in the **Storage Traffic** area. The table displays information about storage utilization that is measured per second (measured in KB/s or GB/s), maximum amount of storage I/O bandwidth that the system used, the number of Virtual I/O Servers, and the number of Physical Adapters.

The Server Overview section

The **Server Overview** section contains graphs that summarize data from virtualized server resources. This information indicates how physical processor and memory resources are allocated among the partitions on your server. Additionally, the information indicates whether partitions are using more or less than their entitled capacity for these resources. By default, the Performance and Capacity Monitor displays the data in the Details section of the home page.

The **Server Overview** section includes two general graphs: **Capacity Distribution by Processor** and **Capacity Distribution by Memory**. These graphs indicate general information about the capacity distribution for processors and memory.

The **Top Resource Consumers** graph displays information about partitions, Virtual I/O Servers, or processor pools. The **Resource Utilization** table shows detailed information about individual partitions, such as the number of processor cores and the amount of memory.

By default, the graphs and table show data that was collected for the previous 4 hours. For more information on displaying data for a longer amount of time, see "Changing Performance and Capacity Monitor home page settings" on page 3.

Note: When the firmware is at level 7.8, or later, and VIOS version is at 2.2.3, or later, you can view all the performance metrics. For more information about the limitations of the performance monitor metrics based on the firmware level and VIOS version, see HMC Integrated Performance Monitor Metrics based on Firmware and VIOS level.

The Capacity Distribution by Processor graph

The **Capacity Distribution by Processor** graph shows the percentage and number of partitions whose processor usage is high, medium, or low relative to the partitions' entitled processor capacity. The Performance and Capacity Monitor designates processor utilization as high if the percentage is 91% or greater, medium if the percentage is in the range 50% - 90%, and low if the percentage is 50% or lower.

No additional configurations are available for this graph. However, you can view a more detailed version. For more information, see "Accessing and reviewing the Detailed Spread graphs" on page 6.

The Capacity Distribution by Memory graph

The **Capacity Distribution by Memory** graph displays the percentage and number of partitions whose memory is high, medium, and low capacity relative to the partitions' entitled memory capacity. The Performance and Capacity Monitor designates memory usage as high, if the percentage is 91% or greater, as medium, if the percentage is in the range of 50% - 90%, and low if the percentage is 50% or lower.

No additional configurations are available for this graph. However, you can view a more detailed version. For more information, see "Accessing and reviewing the Detailed Spread graphs" on page 6 for more information.

Accessing and reviewing the Detailed Spread graphs

The **Detailed Spread** graphs provide details about the partition metrics that are shown in the **Capacity Distribution by Processor** and by Memory graphs. The graphs show dots that represent individual partitions whose current processor usage (vertical axis) is plotted against entitlement (horizontal axis). The diagonal lines have slopes of 0.5, 0.9, and 1.0, which represent usage, relative to entitlement of 50%, 90%, and 100%. If a partition is positioned above the 1.0 line, the partition is using more than 100% of its entitled capacity. You can hover your mouse pointer over a marker on the graph to view the name of the associated partition.

About this task

To access and review the Detailed Spread graphs, complete the following steps:

Procedure

1. On the Performance and Capacity Monitor home page, in the Server Overview section click **Show Detailed Spread**.

   The **All Partitions Spread** window is displayed.
2. Click **More Graphs** to switch between the **Processor Usage vs Entitlement** and the **Memory Usage vs Assigned** views.

The Top Resource Consumers graph

The **Top Resource Consumers** graph displays up to 10 partitions or Virtual I/O Servers that are using the highest number of units of the resource you chose.

Each vertical line represents a single partition, Virtual I/O Server, or processor pool. The top of each vertical line corresponds to the maximum number of resource units that are used, and the bottom of each line represents the minimum number of resource units.

The horizontal lines that bisect the vertical lines represent the average utilization of the resource.

The Resource ID appears along the bottom of the graph directly below the vertical line of the partition, Virtual I/O Server, or processor pool that the line represents. You can hover your mouse pointer over this area of the graph to view numeric values for minimum, maximum, and average utilization.

Changing the Top Resource Consumers graph

The **Top Resource Consumers** graph defaults to show up to 10 partitions that are using the most processors. However, you can change the graph to show the 10 partitions that are using the most memory, network, or storage resources. You can also choose to view the 10 highest processor pools.

About this task

To change the Top Resource Consumers graph to another graph, complete the following steps:

Procedure

1. On the Performance and Capacity Monitor home page, click **More Graphs**.
2. Select one of the following options:

   - **Partitions**
   - **Virtual I/O Servers**
   - **Processor Pools**

   If you chose **Partitions** or **Virtual I/O Servers**, continue with the next step. If you chose **Processor Pools**, there are no additional selections; the graph refreshes and shows the top 10 partitions that are using the processor pools.

3. Select one of the following resources:

   - **Processor**
   - **Memory**
   - **Network**
   - **Storage**

   The graph refreshes and shows the top 10 partitions or Virtual I/O Servers that are using the resource that you chose.

   Note: If you have fewer than 10 partitions or Virtual I/O Servers, the graph shows all of them.

The Resource Utilization table

The **Resource Utilization** table shows the amount of server resources, such as processor or memory, that is used by each partition. You can sort and filter the table. You can click the partition names in the Resource Utilization table to view the configuration information about the partition.

The **Resource Utilization** table also shows information about the Assigned Virtual Persistent Memory. The persistent memory is available only when the Hardware Management Console (HMC) is at Version 9.1.940, or later, and when the firmware is at level FW940, or later.

Sorting the Resource Utilization table

You can sort the **Resource Utilization** table by clicking the up or down chevron next to the name of the column that you want to sort. You might choose to sort the columns so that you can view the entries ranking from the lowest to the highest, or from the highest to the lowest.

You can select which columns are displayed in the **Resource Utilization** table. To change which columns are displayed, click the arrow in the header row of the table.

Filtering the Resource Utilization table

You can search for specific entries such as the partition name within the table. The search shows all table rows that contain text in any cell that matches the filter text.

The Processor Utilization view

The **Processor Utilization** view includes historical data and trends that reflect the usage of virtualized or shared processors over time. A graph shows the processor utilization on the physical server. Another aggregated graph shows the usage per resource, which includes the system firmware, Virtual I/O Servers, and client partitions. The table lists more detailed information about averages and trends.

You can access this view by clicking **Processor Utilization Trend** in the **Views** window.

The **Processor Utilization** view includes a trend graph. You can change the graph options to show processor utilization for the server and aggregated levels.

The **Resource Utilization** table shows detailed information for individual partitions and pools, such as the number of entitled and used units.

By default, the graphs and tables show data that was collected for the previous 4 hours. For more information about displaying data for a longer amount of time, see "Changing Performance and Capacity Monitor home page settings" on page 3.

Processor trend graphs

The Performance and Capacity Monitor home page includes trend graphs that show processor utilization data that is plotted against a default time interval of 4 hours.

By default, the trend graph shows server level data; however, you can change the view to display aggregated level data. To switch from one view to another view, click **More Graphs** and choose **Server Level Utilization** or **Aggregated Level Utilization**.

Processor trend graph: Server Level Utilization view

The **Server Level Utilization** view indicates the number of processors that the server is using at the times indicated along the horizontal axis. The lower shaded area represents the total number of activated physical processors on the server, and the upper shaded area indicates how many more processors are available for activation. The line shows how the total processor usage on the physical server varies over the selected time period, in comparison with the available processor capacity.

Processor trend graph: Aggregated Level Utilization view

The **Aggregated Level Utilization** view shows the total number of processors that the server is using. You can compare whether the processors are being used by the system firmware, Virtual I/O Servers, or client partitions by viewing the shading for each processor.

Processor breakdown tables

The processor breakdown tables list information that is based on partitions or pools over the selected time period. The following breakdown tables are available: **Breakdown by Partitions** and **Breakdown by Pools**.

The processor Breakdown by Partitions table

The **Breakdown by Partitions** table shows processor utilization data for logical partitions. Each row indicates whether a partition is using dedicated or shared processor resources. If the partition is using shared processor resources, the **Pool** column indicates the shared processor pool from which the resources are drawn.

In addition, you can view the number of processors or processor pools that the partition is entitled to use, is using, and the maximum number the partition used. The **Usage Trend** column shows the overall usage trend for the logical partition for the time interval you selected.

The table lists the total number of partitions for your system. The **Donated Units** column indicates whether the partition is donating unused processor resources to its shared processor pool. The **Dispatch Wait Time** column indicates the mount of time for which partitions are waiting for processor resources to be available.

The processor Breakdown by Pools table

The **Breakdown by Pools** table shows processor utilization within individual processor pools. You can view the total processor entitlement of all partitions that use resources from the pool and the number of processors the pool borrowed. You can also view the number of processors the pool is using and the maximum number of processors the pool used.

The **Usage Trend** column shows a high-level trend view for an individual pool.

Sorting the processor breakdown tables

You can sort the table by clicking the up or down chevron next to the name of the column that you want to sort. You might choose to sort the columns so that you can view the entries, ranking from the lowest to the highest, or vice versa.

You can select which columns are displayed in the **Processor Breakdown** tables. To change which columns are displayed, click the arrow in the header row of the table.

Filtering the processor breakdown tables

You can search for specific entries such as the partition name within the table. The search shows all table rows that contain text in any cell that matches the filter text.

The Memory Utilization view

The **Memory Utilization** view includes historical data and trends that reflect the amount of dedicated memory that is allocated, or shared among logical partitions, over time. The graph shows memory usage that is divided by the total, allocated, and assigned usage. The table lists more detailed information about averages and trends.

You can access this view by clicking **Memory Utilization Trend** in the **Views** window.

The **Memory Utilization** view includes a trend graph. You can change the graph options to show server level, aggregated level, or Active Memory Sharing (AMS) level memory utilization.

The **Resource Utilization** table shows detailed information for individual partitions. The information includes the amount of memory that the firmware is using and the amount of memory in the shared memory pool that partitions are entitled to use.

By default, the graphs and table show data that was collected over the last 4 hours. To display data for a longer amount of time, refer to "Changing Performance and Capacity Monitor home page settings" on page 3.

Memory trend graphs

The Performance and Capacity Monitor home page includes trend graphs that show memory utilization data that is plotted against a default time interval of 4 hours.

By default, the trend graph shows server level data; however, you can change the view to display aggregated or Active Memory Sharing (AMS) level data. To switch from one view to another view, click **More Graphs** and choose **Server Level Utilization**, **Aggregated Level Utilization**, or **AMS Level Utilization**.

Memory trend graph: Server Level Utilization view

The **Server Level Utilization** view shows the memory usage for the server. Shaded areas indicate the amount of memory that is assigned to the server, the amount of memory that is allocated for use by the server, and the total memory available for use. You can compare the shaded areas to determine whether you maximized the memory allocation for your server.

Memory trend graph: Aggregated Level Utilization view

The **Aggregated Level Utilization** view shows the collective memory usage for the partitions on that server. Shaded areas indicate the amount of memory that is allocated to the system firmware, the amount of memory that is used by all Virtual I/O Servers, and the amount of memory available for all partitions. You can compare the trend lines to determine whether you allocated more memory or less memory for the partitions on your server.

Memory trend graph: AMS Level Utilization view

The **AMS Level Utilization** view shows the amount of memory that is used by Active Memory Sharing (AMS). The shaded area indicates the amount of memory that is used by the system firmware at the times that are displayed along the horizontal axis. You can review this information periodically to determine whether your system benefits from using memory from Active Memory Sharing. If you are not using Active Memory Sharing, this information is not available.

Memory breakdown table

The memory **Breakdown by Partitions** table lists information that is based on partitions over the selected time period. The memory breakdown table is displayed at the bottom of the main window.

The Memory Breakdown by Partitions table

The **Breakdown by Partitions** table shows memory utilization data for logical partitions. Each row indicates whether the partition is configured for dedicated or shared access to memory resources. In addition, you can view the size of the memory available, the amount of memory that is assigned, and the maximum amount of memory that is assigned to the memory pool for that partition. The **Assigned Trend** column shows the overall usage trend for the assigned memory over the time interval you selected. The **Breakdown by Partitions** table also lists the total number of partitions for that system.

The **Breakdown by Partitions** table also shows information about the Assigned Virtual Persistent Memory. The persistent memory is available only when the Hardware Management Console (HMC) is at Version 9.1.940, or later, and when the firmware is at level FW940, or later.

Sorting the memory breakdown table

You can sort the table by clicking the up or down chevron next to the name of the column that you want to sort. You might choose to sort the columns so that you can view the entries, ranking from the lowest to the highest, or vice versa.

You can select which columns are displayed in the **Memory Breakdown** table. To change which columns are displayed, click the arrow in the header row of the table.

Filtering the memory breakdown table

You can search for specific entries such as the partition name within the table. The search shows all table rows that contain text in any cell that matches the filter text.

The Network Utilization view

The **Network Utilization** view includes historical data and trends that show how logical partitions use physical network resources, or virtual local area network resources, over time. This view contains a graph that shows the network traffic per Virtual I/O Server. The table lists more detailed information about the averages and trends.

You can access this view by clicking **Network Utilization Trend** in the **Views** window.

The **Network Utilization** view includes a trend graph.

The **Resource Utilization** table shows detailed information for individual partitions and network bridges, such as the amount of traffic that is processed by the physical resources.

By default, the graphs and tables show data that was collected for the previous 4 hours. To display data for a longer amount of time, refer to "Changing Performance and Capacity Monitor home page settings" on page 3.

Network trend graphs

The Performance and Capacity Monitor home page includes a trend graph that shows network utilization data that is plotted against a default time interval of 4 hours.

By default, the trend graph shows network bridge level data; however, you can change the view to display Single root I/O virtualization (SR-IOV) adapters traffic data. To switch from one view to another view, click **More Graphs** and choose **Network Bridges Traffic** or **SR-IOV Adapters Traffic**.

Network trend graph: Network Bridges Traffic trend view

The **Network Bridges Traffic** view shows the traffic that is flowing over network bridges at the times indicated along the horizontal axis. The shaded areas indicate the amount of internal virtual traffic (measured in GB per second) that is tagged by a Virtual I/O Server and is processed by shared Ethernet adapters. The dotted line indicates the amount of physical traffic that is routed to a physical NIC for sharing outside of the virtual network. You can compare the shaded areas to determine how much virtual traffic is sent to one Virtual I/O Server versus another. Similarly, you can view the dotted line to compare the amount of physical traffic versus the amount of virtual traffic.

Network breakdown tables

The network breakdown tables list information about network traffic for the selected time period. The following breakdown tables are available: **Breakdown by Partitions** and **Breakdown by Network Bridges**.

The network Breakdown by Partitions table

The **Breakdown by Partitions** table shows network traffic data for logical partitions. Each row indicates the ID of the network bridge with which that partition is associated. The rows also indicate the number of Virtual I/O Servers that are associated with the partition, and the amount of virtual and physical traffic that is processed through the partition. The **Traffic Trend** column shows the overall network traffic for the logical partition for the time interval you selected.

Click a network bridge ID to display network traffic information, such as the number of packets that were sent and received and the speeds at which packets were sent or received, for the bridge.

The network Breakdown by Network Bridges table

The **Breakdown by Network Bridges** table shows the network traffic for network bridges. Each row indicates the name of the network bridge, the number of partitions that are sending traffic across that bridge, the name of the Virtual I/O Server that hosts the network bridge, and the amount of virtual and physical traffic that is processed through the bridge. The **Traffic Trend** column shows the overall network traffic on the network bridge for the time interval you selected.

Click a network bridge ID to display network traffic information, such as the number of packets that were sent and received and the speeds at which packets were sent or received, for the bridge.

Click one of the numbers in the **Partitions Using** column to view the names of the partitions that are using that network bridge.

Sorting the network breakdown tables

You can sort the table by clicking the up or down chevron next to the name of the column that you want to sort. You might choose to sort the columns so that you can view the entries, ranking from the lowest to the highest, or vice versa.

You can select which columns are displayed in the **network breakdown** table. To change which columns are displayed, click the arrow in the header row of the table.

Filtering the network breakdown tables

You can search for specific entries such as the partition name within the table. The search shows all table rows that contain text in any cell that matches the filter text.

The Storage Utilization view

The **Storage Utilization** view includes historical data and trends that show the amount of physical storage I/O bandwidth that each Virtual I/O Server uses and allows logical partitions to use through Small Computer System Interface (SCSI) connections, for a specific duration of time. The data also shows the virtualized storage I/O bandwidth that the logical partitions use from logical ports that are provided by an N_Port ID Virtualization (NPIV) adapter. The table lists detailed information about averages and trends.

You can access this view by clicking **Storage Utilization Trend** in the **Views** window.

The **Storage Utilization** view includes a trend graph. You can change the graph options to show **vSCSI Adapter usage** or **NPIV traffic**.

The **Resource Utilization** table shows detailed information for individual partitions and physical adapters, such as the total traffic used.

By default, the graphs and tables show data that was collected for the previous 4 hours. For more information about displaying data for a longer amount of time, see "Changing Performance and Capacity Monitor home page settings" on page 3.

Storage trend graphs

The Performance and Capacity Monitor home page includes trend graphs that show storage utilization data that is plotted against a default time interval of 4 hours.

By default, the trend graph shows data for virtual Small Computer System Interface (SCSI) adapters; however, you can change the view to display N_Port ID Virtualization (NPIV) traffic data. To switch from one view to another, click **Graph Options** and choose **vSCSI Adapaters Usage** or **NPIV Traffic**.

Storage trend graph: vSCSI Adapters Usage view

The **vSCSI Adapters Usage** view shows the I/O bandwidth for a Virtual I/O Server (VIOS) that is using physical storage space on SCSI adapters at the times indicated along the horizontal axis. Each of the shaded areas represents one VIOS. You can compare the shaded areas with one another to determine which VIOS is using the most storage bandwidth, and you can compare individual VIOS usage against the total usage.

Storage trend graph: NPIV Traffic view

The **NPIV Traffic** view shows the I/O bandwidth for a VIOS that is using physical storage space through logical ports that are provided by an NPIV adapter at the times indicated along the horizontal axis. Each of the shaded areas represents one VIOS. You can compare the shaded areas with one another to determine which VIOS is using the most storage bandwidth, and you can compare individual VIOS usage against the total usage.

Storage breakdown table

The storage breakdown tables list information that is based on partitions or physical Fibre Channel (FC) adapters over the selected time period. The following breakdown tables are available: **Breakdown by Partitions** and **Breakdown by Pools**.

The storage Breakdown by Partitions table

The **Breakdown by Partitions** table shows the amount of traffic that is passing through the physical storage adapter that is associated with the logical partition. Each row indicates the name of the Virtual I/O Server and Virtual Host that is associated with the partition. The **Traffic Trend** column shows the overall traffic trend for the physical adapter over the time interval you selected.

The table lists the total number of partitions for that system.

The storage Breakdown by Physical FC table

The **Breakdown by Physical FC** table shows the amount of traffic that is passing through the physical storage adapter that is associated with the Physical FC. Each row indicates the name of the Virtual I/O Server and Virtual Host that is associated with the Physical FC. The **Traffic Trend** column shows the overall traffic trend for the physical adapter over the time interval you selected.

Sorting the storage breakdown tables

You can sort the table by clicking the up or down chevron next to the name of the column that you want to sort. You might choose to sort the columns so that you can view the entries, ranking from the lowest to the highest, or vice versa.

You can select which columns are displayed in the **storage breakdown** tables. To change which columns are displayed, click the arrow in the header row of the table.

Filtering the storage breakdown tables

You can search for specific entries such as the partition name within the table. The search shows all table rows that contain text in any cell that matches the filter text.

Viewing SR-IOV port counters

You can view SR-IOV port counters in the Hardware Management Console (HMC) version 8.7.0, or later. The **SR-IOV Port Counters** page displays the details of logical ports and physical ports that are configured for a selected SR-IOV adapter. You can use the **SR-IOV Port Counters** page to view port counters for a logical port or a physical port that is configured for a selected SR-IOV adapter.

About this task

To view the SR-IOV port counters, by using the Hardware Management Console (HMC), complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
2. Click **All Systems**.

   The **All Systems** page is displayed.
3. Select the server for which you want to view the performance data.
4. Click **Actions**.
5. Select **View Performance Dashboard**.
6. In the **Views** topic pane, click **SR-IOV Port Counters**.

   The **SR-IOV Port Counters** page is displayed. The **SR-IOV Adapters** list displays the details of the SR-IOV adapters that are configured for the selected system.
7. From the **SR-IOV Adapters** list, select an SR-IOV adapter.

   The status, mode, owner, maximum logical ports, and the configured logical ports of the selected SR-IOV adapter are displayed.
8. Select **Physical Ports** or **Logical Ports** to view the list of physical or logical ports that are configured for the SR-IOV adapter.

   - If you want to view the list of physical ports that are configured for the SR-IOV adapter, select **Physical Ports**. The **Physical Ports** table is displayed, with the details about the physical ports such as ID, location code, type, link status, label, and sub label of the port.

     Note: If the selected SR-IOV adapter does not have any physical ports that are attached to it, the **Physical Ports** table does not display any details about the physical ports.

     To view the list of port counters, complete the following steps:

     a. From the **Physical Ports** table, select a physical port to view the list of port counters. The **Port Counters** table is displayed, with the name and value of port counters for the selected physical port.

     b. Click **Reset Statistics** to reset the port counter statistics of the selected physical port.

- If you want to view the list of logical ports that are configured for the SR-IOV adapter, select **Logical Ports**. The **Logical Ports** table is displayed, with the details about the logical ports such as adapter ID, physical port ID, location code, type, partition, and connected partition for the port.

  Note: If the selected SR-IOV adapter does not have any logical ports that are attached to it, the **Logical Ports** table does not display any details about the logical ports.

  To view the list of port counters, complete the following steps:

  a. From the **Logical Ports** table, select a logical port to view the list of port counters. The **Port Counters** table is displayed, with the name and value of port counters for the selected logical port.
  b. Click **Reset Statistics** to reset the port counter statistics of the selected logical port.

Troubleshooting the Performance and Capacity Monitor

Review the common troubleshooting issues and their solutions.

How can I determine whether performance data is being collected?

The Performance and Capacity Monitor home page includes a **Data Collection** status indicator on the home page. If the status is **On**, the Performance and Capacity Monitor function is collecting data from that server. If the status is **Off**, the Performance and Capacity Monitor function is not collecting data from that server. For more information about collecting data from your system, see "Enabling data collection" on page 2.

What permission do I need to view the managed system utilization data?

You must have **List Utilization Data** access permission for the managed system to view the performance data for that server. For more information about user roles and permissions, see HMC tasks, user roles, IDs, and associated commands .

What happens if I power off the system while Performance and Capacity Monitor is still enabled?

If you power off a PCM-enabled system, Performance and Capacity Monitor does not get disabled automatically. Instead, the Performance and Capacity Monitor data collection that happens in the background is stopped. However, the status of Performance and Capacity Monitor for the PCM-enabled system is still displayed as **On** in the graphical user interface (GUI) and in Representational State Transfer (REST). When the system is powered on again, Performance and Capacity Monitor restarts data collection, as usual.

Why was data not collected for my server even though I enabled data collection?

You can enable data collection for servers that are in any state. However, the Performance and Capacity Monitor collects data in the Hardware Management Console (HMC) only when the server is in running or in the operational state. The Performance and Capacity Monitor automatically disables collection, if the server is not in running or operational state for 30 minutes or longer.

Why does the home page not display data even though I enabled data collection?

If you access the Performance and Capacity Monitor home page before the initial data is collected, the Performance and Capacity Monitor displays a status message. The status message indicates that data is not yet available and recommends that you go to the home page again later. The initial time that is required to collect the information is about 15 minutes.

Why is my physical adapter not displayed under the PCM data?

If a storage adapter is not connected to a device, that adapter does not appear under the Performance and Capacity Monitor data, as there is no utilization for that adapter.

Why are the Performance and Capacity Monitor graphs not displayed, and instead I see only the "Fetching PCM Data" message?

You must clear the browser cache and cookies, and then try again.

Why is the home page not showing data for the entire length of time I chose?

The Performance and Capacity Monitor home page can show only the amount of data that the server stored since you enabled data collection. For example, if you want to collect data for 250 days and if you immediately access the home page, you can view only the data that represents the minute or minutes that passed since you enabled data collection.

In addition, the maximum number of days for which the Performance and Capacity Monitor collects data is 366. As a result, the Performance and Capacity Monitor shows a maximum of 366 days of data only.

Why do I see gaps in the data that is displayed in the collection graphs?

If you disable the data collection and re-enable it, or if the server stopped collecting data because the server stopped running, or it is no longer operational, the Performance and Capacity Monitor shows gaps that represent the missing time intervals.

Can I see utilization data after I disable the data collection?

Yes, the Performance and Capacity Monitor maintains utilization data after data collection is disabled. You can view the historic data from the Performance and Capacity Monitor home page of your server. For more information, see "Accessing the Performance and Capacity Monitor home page" on page 2.

Why do I receive a message that indicates that network or storage resources are not available to display?

If you dedicate network and storage resources to a single partition on your server, network and storage utilization data is not available. Network and storage utilization data shows how each of the partitions on your server is using network and storage resources that are managed by Virtual I/O Servers. You can compare the data among partitions to determine whether a partition is overloaded or under-used. However, if a single partition is entitled to dedicated network and storage resources, there is no data to compare. In addition, you can also check whether you have the required Virtual I/O Server version. The Performance and Capacity Monitor requires Virtual I/O Server Version 2.2.3, or later to display the Network and Storage data.

Why do I see only a single partition or Virtual I/O Server listed in the Top Resource Consumers graph?

The **Top Resource Consumers** graph displays up to 10 partitions or Virtual I/O Servers that are using the highest number of units of the resource you chose. However, if you dedicate all of your resources to a single partition or Virtual I/O Server, no other partitions or servers can compete for the resources. As a result, only the partition or Virtual I/O Server for which you dedicated all resources is displayed in the **Top Resource Consumers** graph.

Similarly, if you have fewer than 10 partitions or Virtual I/O Servers, the **Top Resource Consumers** graph includes a vertical line for each of your partitions or Virtual I/O Servers. A maximum of 10 partitions or Virtual I/O Servers are included in the **Top Resource Consumers** graph. If fewer than 10 partitions or Virtual I/O Servers exist, all the partitions or Virtual I/O Servers are displayed.

Disabling data collection

The Performance and Capacity Monitor function captures data only for the servers for which you enabled data collection. However, you can disable data collection if you no longer need performance and capacity monitoring information for that server.

About this task

To disable data collection, complete the following steps:

Procedure

1. In the navigation pane, click the **HMC Management** icon .
2. Click **Console Settings**. The **Console Settings** page is displayed.
3. In the **Performance Settings** area, click **Change Performance Monitor Settings**.

   Note: Alternatively, if you try to launch the Performance and Capacity Monitor function for a system on which data collection is disabled, a message is displayed in the Current Resource Utilization area of the **Settings for Performance Monitoring** page. To enable data collection for the required server, set **Collection** to **On**.
4. Click the toggle switch in the **Collection** column next to the name of the server for which you want to disable data collection or click **All Off** to disable data collection for all of the servers in your environment.
5. Click **OK** to apply the changes and close the window.

   The **HMC Management** content is displayed in the main window.

Exporting data

The Export Data option exports the Performance and Capacity Monitor (PCM) data metrics that are collected for the specified time. You can export the Performance and Capacity Monitor data metrics that is displayed in the dashboard into a folder on your local system.

About this task

You can export data metrics by accessing the HMC.

To export data metrics for one or more servers, complete the following steps:

Procedure

1. In the navigation pane, click the **Resources** icon .
   a) Click **All Systems**. The All Systems page is displayed.
   b) Select the server for which you want to view the performance data.
   c) Click **Actions**.
   d) Select **Performance Data Collection** > **Export Data**.

   The Performance and Capacity Monitor home page is displayed with the information for that system.
2. In the upper-right corner of the Performance and Capacity Monitor section, click the **Data Collection** menu.
3. Click **Export Data**.

   The **Export Data** page is displayed.

4. The data collection can be turned on or turned off using the toggle switch in the **Data Collection** menu.
5. Select the feed by which you want to export the performance metrics.

   PCM metrics have the following rollup or aggregation frequency and retention period:

   - Tier 0 level - The aggregation frequency is 30 seconds and the retention period is 2 hours.
   - Tier 1 level - The aggregation frequency is 5 minutes and the retention period is 24 hours.
   - Tier 2 level - The aggregation frequency is 2 hours and the retention period is 7 days.
   - Tier 3 level - The aggregation frequency is 24 hours and the retention period is 180 days.

   When you select the feed as **By Source**, multiple data files that contain overall resource level data are exported for each managed system, logical partition, and Virtual I/O Server (VIOS). When you select the feed type as **By Tier**, the maximum tier level is calculated based on the time duration that is specified in start time stamp and end time stamp, and the data for corresponding level is exported.

   Note:

   If you select the feed type as **By Tier** and the export format is CSV, two files are created, one for the managed system and one for the logical partition, as compared to a single file in the JavaScript Object Notation (JSON) format.
6. Select the export format as either JavaScript Object Notation (**JSON**) or comma-separated values (**CSV**).

   The CSV file represents data of JSON file content in the CSV format.
7. Click the calendar icon to choose the **Start Date** and **End Date**.

   By default, the time stamp in the **Start Date** is set to 4 hours before the current time, and the current time is set as the time stamp in the **End Date**. You can choose to export data for this duration. Otherwise, to specify specific time interval, you must enter the time within the Performance and Capacity Monitor data retention period, which is 180 days by default. The time stamp of the last data export is displayed in gray.
8. Click **OK**. The **Confirm Download** dialog box is displayed with the name of the file that contains the exported data.
9. Click **OK** to download the exported data in a compressed format.
10. Depending on your browser setting, you can choose the destination folder in which the exported data must be saved.

Notices

Accessibility features for IBM Power Systems servers

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Power Systems servers include the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Power Systems servers use the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with US Section 508 (www.access-board.gov/guidelines-and-standards/communications-and-it/about-the-section-508-standards/section-508-standards) and Web Content

Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the IBM Power Systems servers.

The IBM Power Systems servers online product documentation in IBM Knowledge Center is enabled for accessibility. The accessibility features of IBM Knowledge Center are described in the Accessibility section of the IBM Knowledge Center help (www.ibm.com/support/knowledgecenter/doc/kc_help.html#accessibility).

Keyboard navigation

This product uses standard navigation keys.

Interface information

The IBM Power Systems servers user interfaces do not have content that flashes 2 - 55 times per second.

The IBM Power Systems servers web user interface relies on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

The IBM Power Systems servers web user interface includes WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Power Systems servers include certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Programming interface information

This Monitoring the Virtualization Environment publication documents intended Programming Interfaces that allow the customer to write programs to obtain the services of IBM AIX Version 7.2, IBM AIX Version 7.1, IBM AIX Version 6.1, IBM i 7.4, and IBM Virtual I/O Server Version 3.1.1.

Privacy policy considerations

IBM Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as the customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at http://www.ibm.com/privacy and IBM's Online Privacy Statement at http://www.ibm.com/privacy/details the section entitled "Cookies, Web Beacons and Other Technologies" and the "IBM Software Products and Software-as-a-Service Privacy Statement" at http://www.ibm.com/software/info/product-privacy.

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information.

Java™ and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Terms and conditions

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Personal Use: You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative works of these publications, or any portion thereof, without the express consent of IBM.

Commercial Use: You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights: Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

Power Systems

Beginning troubleshooting and problem analysis

Note

Before using this information and the product it supports, read the information in “Safety notices” on page v, “Notices” on page 131, the *IBM Systems Safety Notices* manual, G229-9054, and the *IBM Environmental Notices and User Guide*, Z125–5823.

This edition applies to IBM® Power Systems servers that contain the POWER9™ processor and to all associated models.

Contents

Safety notices

Safety notices may be printed throughout this guide:

- **DANGER** notices call attention to a situation that is potentially lethal or extremely hazardous to people.
- **CAUTION** notices call attention to a situation that is potentially hazardous to people because of some existing condition.
- **Attention** notices call attention to the possibility of damage to a program, device, system, or data.

World Trade safety information

Several countries require the safety information contained in product publications to be presented in their national languages. If this requirement applies to your country, safety information documentation is included in the publications package (such as in printed documentation, on DVD, or as part of the product) shipped with the product. The documentation contains the safety information in your national language with references to the U.S. English source. Before using a U.S. English publication to install, operate, or service this product, you must first become familiar with the related safety information documentation. You should also refer to the safety information documentation any time you do not clearly understand any safety information in the U.S. English publications.

Replacement or additional copies of safety information documentation can be obtained by calling the IBM Hotline at 1-800-300-8751.

German safety information

Das Produkt ist nicht für den Einsatz an Bildschirmarbeitsplätzen im Sinne § 2 der Bildschirmarbeitsverordnung geeignet.

Laser safety information

IBM servers can use I/O cards or features that are fiber-optic based and that utilize lasers or LEDs.

Laser compliance

IBM servers may be installed inside or outside of an IT equipment rack.

DANGER: When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard:

- If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product.
- Do not open or service any power supply assembly.
- Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.
- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords.
  - For AC power, disconnect all power cords from their AC power source.
  - For racks with a DC power distribution panel (PDP), disconnect the customer's DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected.
  - For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate.

  - For racks with a DC power distribution panel (PDP), connect the customer’s DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.

- Connect any equipment that will be attached to this product to properly wired outlets.
- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements.
- Do not continue with the inspection if any unsafe conditions are present.
- Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.

⚠ **DANGER:**

- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

  To Disconnect:

  1. Turn off everything (unless instructed otherwise).
  2. For AC power, remove the power cords from the outlets.
  3. For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source.
  4. Remove the signal cables from the connectors.
  5. Remove all cables from the devices.

  To Connect:

  1. Turn off everything (unless instructed otherwise).
  2. Attach all cables to the devices.
  3. Attach the signal cables to the connectors.
  4. For AC power, attach the power cords to the outlets.
  5. For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP.
  6. Turn on the devices.

  Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

(R001 part 1 of 2):

⚠ **DANGER:** Observe the following precautions when working on or around your IT rack system:

- Heavy equipment–personal injury or equipment damage might result if mishandled.
- Always lower the leveling pads on the rack cabinet.
- Always install stabilizer brackets on the rack cabinet if provided, unless the earthquake option is to be installed..
- To avoid hazardous conditions due to uneven mechanical loading, always install the heaviest devices in the bottom of the rack cabinet. Always install servers and optional devices starting from the bottom of the rack cabinet.

- Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack mounted devices and do not use them to stabilize your body position (for example, when working from a ladder).

- Stability hazard:
  - The rack may tip over causing serious personal injury.
  - Before extending the rack to the installation position, read the installation instructions.
  - Do not put any load on the slide-rail mounted equipment mounted in the installation position.
  - Do not leave the slide-rail mounted equipment in the installation position.
- Each rack cabinet might have more than one power cord.
  - For AC powered racks, be sure to disconnect all power cords in the rack cabinet when directed to disconnect power during servicing.
  - For racks with a DC power distribution panel (PDP), turn off the circuit breaker that controls the power to the system unit(s), or disconnect the customer's DC power source, when directed to disconnect power during servicing.
- Connect all devices installed in a rack cabinet to power devices installed in the same rack cabinet. Do not plug a power cord from a device installed in one rack cabinet into a power device installed in a different rack cabinet.
- An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (R001 part 1 of 2)

(R001 part 2 of 2):

CAUTION:

- Do not install a unit in a rack where the internal rack ambient temperatures will exceed the manufacturer's recommended ambient temperature for all your rack-mounted devices.
- Do not install a unit in a rack where the air flow is compromised. Ensure that air flow is not blocked or reduced on any side, front, or back of a unit used for air flow through the unit.
- Consideration should be given to the connection of the equipment to the supply circuit so that overloading of the circuits does not compromise the supply wiring or overcurrent protection. To provide the correct power connection to a rack, refer to the rating labels located on the equipment in the rack to determine the total power requirement of the supply circuit.
- *(For sliding drawers.)* Do not pull out or install any drawer or feature if the rack stabilizer brackets are not attached to the rack or if the rack is not bolted to the floor. Do not pull out more than one drawer at a time. The rack might become unstable if you pull out more than one drawer at a time.

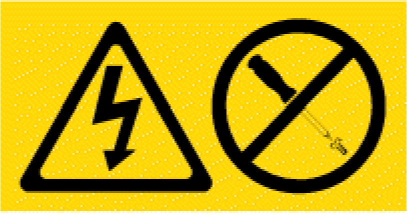
- *(For fixed drawers.)* This drawer is a fixed drawer and must not be moved for servicing unless specified by the manufacturer. Attempting to move the drawer partially or completely out of the rack might cause the rack to become unstable or cause the drawer to fall out of the rack. (R001 part 2 of 2)

⚠ **CAUTION:** Removing components from the upper positions in the rack cabinet improves rack stability during relocation. Follow these general guidelines whenever you relocate a populated rack cabinet within a room or building.

- Reduce the weight of the rack cabinet by removing equipment starting at the top of the rack cabinet. When possible, restore the rack cabinet to the configuration of the rack cabinet as you received it. If this configuration is not known, you must observe the following precautions:
  - Remove all devices in the 32U position and above.
  - Ensure that the heaviest devices are installed in the bottom of the rack cabinet.
  - Ensure that there are little-to-no empty U-levels between devices installed in the rack cabinet below the 32U level, unless the received configuration specifically allowed it.
- If the rack cabinet you are relocating is part of a suite of rack cabinets, detach the rack cabinet from the suite.
- If the rack cabinet you are relocating was supplied with removable outriggers they must be reinstalled before the cabinet is relocated.
- Inspect the route that you plan to take to eliminate potential hazards.
- Verify that the route that you choose can support the weight of the loaded rack cabinet. Refer to the documentation that comes with your rack cabinet for the weight of a loaded rack cabinet.
- Verify that all door openings are at least 760 x 2083 mm (30 x 82 in.).
- Ensure that all devices, shelves, drawers, doors, and cables are secure.
- Ensure that the four leveling pads are raised to their highest position.
- Ensure that there is no stabilizer bracket installed on the rack cabinet during movement.
- Do not use a ramp inclined at more than 10 degrees.
- When the rack cabinet is in the new location, complete the following steps:
  - Lower the four leveling pads.
  - Install stabilizer brackets on the rack cabinet or in an earthquake environment bolt the rack to the floor.
  - If you removed any devices from the rack cabinet, repopulate the rack cabinet from the lowest position to the highest position.
- If a long-distance relocation is required, restore the rack cabinet to the configuration of the rack cabinet as you received it. Pack the rack cabinet in the original packaging material, or equivalent. Also lower the leveling pads to raise the casters off of the pallet and bolt the rack cabinet to the pallet.

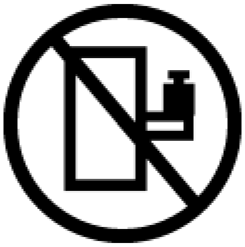
(R002)

(L001)



⚠ **DANGER:** Hazardous voltage, current, or energy levels are present inside any component that has this label attached. Do not open any cover or barrier that contains this label. (L001)

(L002)

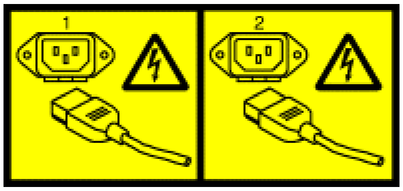


DANGER: Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack-mounted devices and do not use them to stabilize your body position (for example, when working from a ladder). Stability hazard:

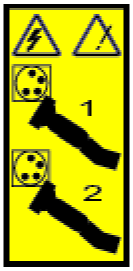
- The rack may tip over causing serious personal injury.
- Before extending the rack to the installation position, read the installation instructions.
- Do not put any load on the slide-rail mounted equipment mounted in the installation position.
- Do not leave the slide-rail mounted equipment in the installation position.

(L002)

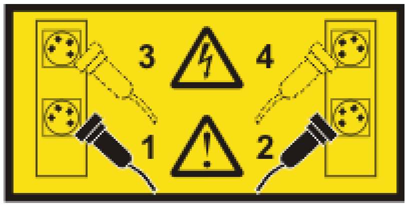
(L003)



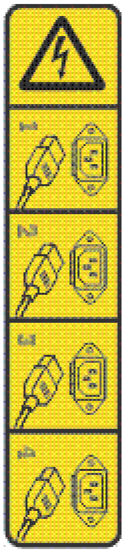
or



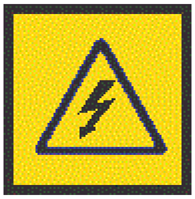
or

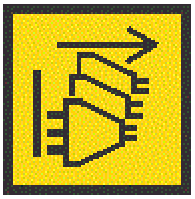


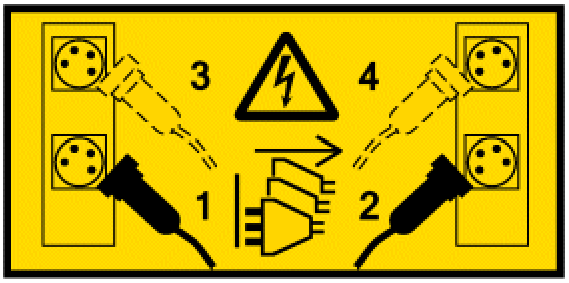
or

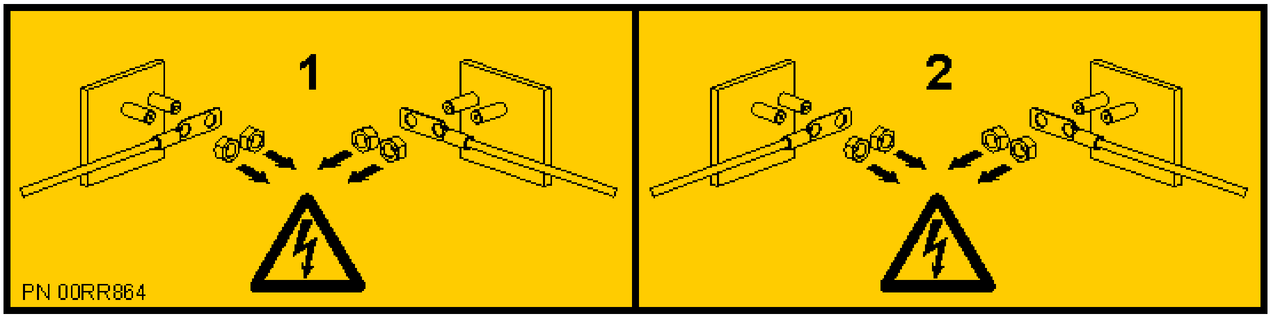


or







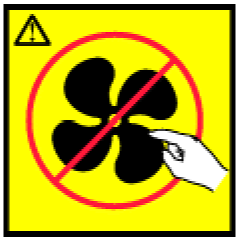


DANGER: Multiple power cords. The product might be equipped with multiple AC power cords or multiple DC power cables. To remove all hazardous voltages, disconnect all power cords and power cables. (L003)

(L007)

CAUTION: A hot surface nearby. (L007)

(L008)



⚠ **CAUTION:** Hazardous moving parts nearby. (L008)

All lasers are certified in the U.S. to conform to the requirements of DHHS 21 CFR Subchapter J for class 1 laser products. Outside the U.S., they are certified to be in compliance with IEC 60825 as a class 1 laser product. Consult the label on each part for laser certification numbers and approval information.

⚠ **CAUTION:** This product might contain one or more of the following devices: CD-ROM drive, DVD-ROM drive, DVD-RAM drive, or laser module, which are Class 1 laser products. Note the following information:

- Do not remove the covers. Removing the covers of the laser product could result in exposure to hazardous laser radiation. There are no serviceable parts inside the device.
- Use of the controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

(C026)

⚠ **CAUTION:** Data processing environments can contain equipment transmitting on system links with laser modules that operate at greater than Class 1 power levels. For this reason, never look into the end of an optical fiber cable or open receptacle. Although shining light into one end and looking into the other end of a disconnected optical fiber to verify the continuity of optic fibers may not injure the eye, this procedure is potentially dangerous. Therefore, verifying the continuity of optical fibers by shining light into one end and looking at the other end is not recommended. To verify continuity of a fiber optic cable, use an optical light source and power meter. (C027)

⚠ **CAUTION:** This product contains a Class 1M laser. Do not view directly with optical instruments. (C028)

⚠ **CAUTION:** Some laser products contain an embedded Class 3A or Class 3B laser diode. Note the following information:

- Laser radiation when open.
- Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam. (C030)

(C030)

⚠ **CAUTION:** The battery contains lithium. To avoid possible explosion, do not burn or charge the battery.

Do Not:

- Throw or immerse into water
- Heat to more than 100 degrees C (212 degrees F)
- Repair or disassemble

Exchange only with the IBM-approved part. Recycle or discard the battery as instructed by local regulations. In the United States, IBM has a process for the collection of this battery. For information, call 1-800-426-4333. Have the IBM part number for the battery unit available when you call. (C003)

⚠ **CAUTION:** Regarding IBM provided VENDOR LIFT TOOL:

- Operation of LIFT TOOL by authorized personnel only.

- LIFT TOOL intended for use to assist, lift, install, remove units (load) up into rack elevations. It is not to be used loaded transporting over major ramps nor as a replacement for such designated tools like pallet jacks, walkies, fork trucks and such related relocation practices. When this is not practicable, specially trained persons or services must be used (for instance, riggers or movers).
- Read and completely understand the contents of LIFT TOOL operator's manual before using. Failure to read, understand, obey safety rules, and follow instructions may result in property damage and/or personal injury. If there are questions, contact the vendor's service and support. Local paper manual must remain with machine in provided storage sleeve area. Latest revision manual available on vendor's web site.
- Test verify stabilizer brake function before each use. Do not over-force moving or rolling the LIFT TOOL with stabilizer brake engaged.
- Do not raise, lower or slide platform load shelf unless stabilizer (brake pedal jack) is fully engaged. Keep stabilizer brake engaged when not in use or motion.
- Do not move LIFT TOOL while platform is raised, except for minor positioning.
- Do not exceed rated load capacity. See LOAD CAPACITY CHART regarding maximum loads at center versus edge of extended platform.
- Only raise load if properly centered on platform. Do not place more than 200 lb (91 kg) on edge of sliding platform shelf also considering the load's center of mass/gravity (CoG).
- Do not corner load the platforms, tilt riser, angled unit install wedge or other such accessory options. Secure such platforms -- riser tilt, wedge, etc options to main lift shelf or forks in all four (4x or all other provisioned mounting) locations with provided hardware only, prior to use. Load objects are designed to slide on/off smooth platforms without appreciable force, so take care not to push or lean. Keep riser tilt [adjustable angling platform] option flat at all times except for final minor angle adjustment when needed.
- Do not stand under overhanging load.
- Do not use on uneven surface, incline or decline (major ramps).
- Do not stack loads.
- Do not operate while under the influence of drugs or alcohol.
- Do not support ladder against LIFT TOOL (unless the specific allowance is provided for one following qualified procedures for working at elevations with this TOOL).
- Tipping hazard. Do not push or lean against load with raised platform.
- Do not use as a personnel lifting platform or step. No riders.
- Do not stand on any part of lift. Not a step.
- Do not climb on mast.
- Do not operate a damaged or malfunctioning LIFT TOOL machine.
- Crush and pinch point hazard below platform. Only lower load in areas clear of personnel and obstructions. Keep hands and feet clear during operation.
- No Forks. Never lift or move bare LIFT TOOL MACHINE with pallet truck, jack or fork lift.
- Mast extends higher than platform. Be aware of ceiling height, cable trays, sprinklers, lights, and other overhead objects.
- Do not leave LIFT TOOL machine unattended with an elevated load.
- Watch and keep hands, fingers, and clothing clear when equipment is in motion.
- Turn Winch with hand power only. If winch handle cannot be cranked easily with one hand, it is probably over-loaded. Do not continue to turn winch past top or bottom of platform travel. Excessive unwinding will detach handle and damage cable. Always hold handle when lowering, unwinding. Always assure self that winch is holding load before releasing winch handle.
- A winch accident could cause serious injury. Not for moving humans. Make certain clicking sound is heard as the equipment is being raised. Be sure winch is locked in position before releasing handle. Read instruction page before operating this winch. Never allow winch to unwind freely.

Freewheeling will cause uneven cable wrapping around winch drum, damage cable, and may cause serious injury.

- This TOOL must be maintained correctly for IBM Service personnel to use it. IBM shall inspect condition and verify maintenance history before operation. Personnel reserve the right not to use TOOL if inadequate. (C048)

Power and cabling information for NEBS (Network Equipment-Building System) GR-1089-CORE

The following comments apply to the IBM servers that have been designated as conforming to NEBS (Network Equipment-Building System) GR-1089-CORE:

The equipment is suitable for installation in the following:

- Network telecommunications facilities
- Locations where the NEC (National Electrical Code) applies

The intrabuilding ports of this equipment are suitable for connection to intrabuilding or unexposed wiring or cabling only. The intrabuilding ports of this equipment *must not* be metallically connected to the interfaces that connect to the OSP (outside plant) or its wiring. These interfaces are designed for use as intrabuilding interfaces only (Type 2 or Type 4 ports as described in GR-1089-CORE) and require isolation from the exposed OSP cabling. The addition of primary protectors is not sufficient protection to connect these interfaces metallically to OSP wiring.

Note: All Ethernet cables must be shielded and grounded at both ends.

The ac-powered system does not require the use of an external surge protection device (SPD).

The dc-powered system employs an isolated DC return (DC-I) design. The DC battery return terminal *shall not* be connected to the chassis or frame ground.

The dc-powered system is intended to be installed in a common bonding network (CBN) as described in GR-1089-CORE.

Beginning troubleshooting and problem analysis

This information provides a starting point for analyzing problems.

This information is the starting point for diagnosing and repairing servers. From this point, you are guided to the appropriate information to help you diagnose server problems, determine the appropriate repair action, and then perform the necessary steps to repair the server. A system attention light, an enclosure fault light, or a system information light indicates there is a serviceable event (an SRC in the control panel or in one of the serviceable event views) on the system. This information guides you through finding the serviceable event.

Beginning problem analysis

You can use problem analysis to gather information that helps you determine the nature of a problem encountered on your system. This information is used to determine if you can resolve the problem yourself or to gather sufficient information to communicate with a service provider and quickly determine the service action that needs to be taken.

If you are using this information because of a problem with your Hardware Management Console (HMC), see Managing the HMC.

To begin analyzing the problem, complete the following steps:

1. Do you have a direct indication of a hardware error (such as an automated email that notified you of a hardware error or a fault indicator on a system unit or expansion unit)?

   - **Yes:** Continue with the next step.
   - **No:** Go to "Detecting problems" on page 63.

2. How do you manage the system that is failing? If you do not know how the failing system is managed, ask the system administrator.

System management	Problem analysis
Hardware Management Console (HMC)	Go to the section "Hardware Management Console (HMC) problem analysis" on page 1.
Operating system (AIX®, Linux®, or IBM i)	Go to the problem analysis topic for your operating system. • If you are having a problem with an AIX or Linux system unit, go to "AIX and Linux problem analysis" on page 3. • If you are having a problem with an IBM i system unit, go to " IBM i problem analysis" on page 7.

Hardware Management Console (HMC) problem analysis

To perform beginning problem analysis on a system that is managed by Hardware Management Console (HMC), complete the following steps:

1. Is the management console functional and connected to the hardware?

   - **Yes:** Continue with the next step.
   - **No:** Start the management console and attach it to the system unit. Then return here and continue with the next step.

2. On the management console that is used to manage the system unit, complete the following steps:

   Note: If you are unable to locate the reported problem, and there is more than one open problem near the time of the reported failure, use the earliest problem in the log.

   a. In the navigation area, click the **Serviceability** icon, and then click **Serviceable Events Manager**. The Manage Serviceable Events window is displayed.
   b. In the Event Criteria area, for **Serviceable Event Status**, select **Open**. For all other criteria, select **ALL**, then click **OK**.

   Scroll through the log and verify that there is a problem with the status of Open to correspond with the failure.

   Do you find a serviceable event, or an open problem near the time of the failure?

   - **Yes:** Continue with the next step.
   - **No:** Contact your hardware service provider. **This ends the procedure.**

---

3. The reference code description might provide information or an action that you can take to correct the failure.

   Use the search function of IBM Knowledge Center to find the reference code details. The search function is located in the upper-left corner of IBM Knowledge Center. Read the reference code description and return here. Do not take any other action at this time.

   For more information about reference codes, see Reference codes.

   Was there a reference code description that enabled you to resolve the problem?

   - **Yes: This ends the procedure.**
   - **No:** Continue with the next step.

---

4. Service is required to resolve the error. Collect as much error data as possible and record it. You and your service provider will develop a corrective action to resolve the problem based on the following guidelines:

- If a FRU location code is provided in the serviceable event view or control panel, use that location to determine which FRU to replace.
- If an isolation procedure is listed for the reference code in the reference code lookup information, include the isolation procedure as a corrective action even if it is not listed in the serviceable event view or control panel.
- If any FRUs are marked for block replacement, replace all FRUs in the block replacement group at the same time.

From the Repair Serviceable Event window, complete the following steps:

a. Record the problem management record (PMR) number for the problem if one is listed.
b. Select the serviceable event from the list.
c. Click **Selected and View Details**.
d. In the Serviceable Event Details page, locate details such as the reference code and FRU list and record this information.
e. If a Problem Management Hardware (PMH) number was found for the problem on the Serviceable Event Overview panel, the problem has already been reported. If there was no PMH number for the problem, contact your service provider.

This ends the procedure.

AIX and Linux problem analysis

You can use this procedure to find information about a problem with your server hardware when service is managed by the AIX or Linux operating system.

Remember the following points while troubleshooting problems:

- Has an external power outage or momentary power loss occurred?
- Has the hardware configuration changed?
- Has system software been added?
- Have any new programs or program updates (including PTFs) been installed recently?

Before you use this procedure, ensure that you completed the steps in "Beginning problem analysis" on page 1.

After you review these considerations, complete the following steps:

1. Is the operating system operational?
   - **Yes:** Continue with the next step.
   - **No:** Go to step "11" on page 5.

2. Are any messages (for example, a device is not available or reporting errors) related to this problem displayed on the system console or sent to you in email that provides a reference code?

   Note: A reference code can be an 8 character system reference code (SRC) or a service request number (SRN) of 5, 6, or 7 characters, with or without a hyphen.

   - **Yes:** Continue with the next step.
   - **No:** Go to step "4" on page 4.

3. The reference code description might provide information or an action that you can take to correct the failure.

Use the search function of IBM Knowledge Center to find the reference code details. The search function is located in the upper-left corner of IBM Knowledge Center. Read the reference code description and return here. Do not take any other action now.

For more information about reference codes, see Reference codes.

If the reference code description provides information to resolve the problem without replacing FRUs in the failing item list, complete the steps.

Were you able to resolve the problem?

- **Yes: This ends the procedure.**
- **No:** Continue with the next step.

4. Are you running the Linux operating system?

   - **Yes:** Continue with the next step.
   - **No:** Go to step "6" on page 4.

5. To locate the error information in a system or logical partition that is running the Linux operating system, complete the following steps:

   Note: Before you proceed with this step, ensure that the diagnostics package is installed on the system.

   a. Log in as root user.
   b. At the command line, type `grep RTAS /var/log/platform` and press **Enter**.
   c. Look for the most recent entry that contains a reference code.

   Continue with step "8" on page 4.

6. To locate the error information in a system or logical partition that is running the AIX operating system, complete the following steps:

   a. Log in to the AIX operating system as root user, or use CE login. If you need help, contact the system administrator.
   b. Type `diag` to load the diagnostic controller, and display the online diagnostic menus.
   c. From the Function selection menu, select **Task selection**.
   d. From the Task selection list menu, select **Display previous diagnostic results**.
   e. From the Previous diagnostic results menu, select **Display diagnostic log summary**.

   Continue with the next step.

7. A display diagnostic log is shown with a time ordered table of events from the error log.

   Look in the T column for the most recent entry that has an S entry. Press **Enter** to select the row in the table and then select **Commit**.

   The details of this entry from the table are shown. Look for the SRN entry near the end of the entry and record the information that is shown.

   Continue with the next step.

8. Do you find a serviceable event or an open problem near the time of the failure?

   - **Yes:** Continue with the next step.
   - **No:** Contact your hardware service provider. **This ends the procedure.**

9. The reference code description might provide information or an action that you can take to correct the failure.

   Use the search function of IBM Knowledge Center to find the reference code details. The search function is located in the upper-left corner of IBM Knowledge Center. Read the reference code description and return here. Do not take any other action now.

   For more information about reference codes, see Reference codes.

   Was there a reference code description that helped you to resolve the problem?

   - **Yes: This ends the procedure.**
   - **No:** Continue with the next step.

10. Service is required to resolve the error. Collect as much error data as possible and record it. You and your service provider will develop a corrective action to resolve the problem based on the following guidelines:

    - If a field-replaceable unit (FRU) location code is provided in the serviceable event view or control panel, use that location to determine which FRU to replace.
    - If an isolation procedure is listed for the reference code in the reference code lookup information, include it as a corrective action even if it is not listed in the serviceable event view or control panel.
    - If any FRUs are marked for block replacement, replace all FRUs in the block replacement group at the same time.

    From the Error Event Log view, complete the following steps:

    a. Record the reference code.
    b. Record the error details.
    c. Contact your service provider.

    This ends the procedure.

11. Details about errors that occur when the operating system is not running or when the operating system is now not accessible can be found in the control panel or in the Advanced System Management Interface (ASMI).

    Do you choose to look for error details by using ASMI?

    - **Yes:** Go to step “13” on page 5.
    - **No:** Continue with the next step.

12. At the control panel, complete the following steps.

    a. Press the increment or decrement button until the number 11 is displayed in the upper-left corner of the display.
    b. Press **Enter** to display the contents of function 11.
    c. Look for a reference code in the upper-right corner.

    Is a reference code displayed on the control panel in function 11?

    - **Yes:** Go to step “14” on page 6.
    - **No:** Contact your hardware service provider. **This ends the procedure.**

13. On the console that is connected to the ASMI, complete the following steps.

    Note: If you are unable to locate the reported problem, and there is more than one open problem near the time of the reported failure, use the earliest problem in the log.

a. Log in with a user ID that has an authority level as general, administrator, or authorized service provider.
b. In the navigation area, expand **System Service Aids** and click **Error/Event Logs**. If log entries exist, a list of error and event log entries is displayed in a summary view.
c. Scroll through the log under **Serviceable Customer Attention Events** and verify that there is a problem to correspond with the failure.

For information about the ASMI, see Managing the Advanced System Management Interface.

Do you find a serviceable event, or an open problem near the time of the failure?

- **Yes:** Continue with the next step.
- **No:** Contact your hardware service provider. **This ends the procedure.**

14. The reference code description might provide information or an action that you can take to correct the failure.

    Use the search function of IBM Knowledge Center to find the reference code details. The search function is located in the upper-left corner of IBM Knowledge Center. Read the reference code description and return here. Do not take any other action now.

    For more information about reference codes, see Reference codes.

    Was there a reference code description that helped you to resolve the problem?

    - **Yes: This ends the procedure.**
    - **No:** Continue with the next step.

15. Service is required to resolve the error. Collect as much error data as possible and record it. You and your service provider will develop a corrective action to resolve the problem based on the following guidelines:

    - If a field-replaceable unit (FRU) location code is provided in the serviceable event view or control panel, use that location to determine which FRU to replace.
    - If an isolation procedure is listed for the reference code in the reference code lookup information, include the isolation procedure as a corrective action even if it is not listed in the serviceable event view or control panel.
    - If any FRUs are marked for block replacement, replace all FRUs in the block replacement group at the same time.

    To find error details on the control panel, complete the following steps:

    a. Press **Enter** to display the contents of function 14. If data is available in function 14, the reference code has a FRU list.
    b. Record the information in functions 11 through 20 on the control panel.
    c. Contact your service provider and report the reference code and other information.

    To find error details on the ASMI, complete the following steps from the Error Event Log view:

    a. Record the reference code.
    b. Select the corresponding check box on the log and click Show details.
    c. Record the error details.
    d. Contact your service provider.

    This ends the procedure.

IBM i problem analysis

You can use this procedure to find information about a problem with your server hardware when service is managed by the IBM i operating system.

If you experience a problem with your system or logical partition, try to gather more information about the problem to either solve it, or to help your next level of support or your hardware service provider to solve it more quickly and accurately.

This procedure refers to the IBM i control language (CL) commands that provide a flexible means of entering commands on the IBM i logical partition or system. You can use CL commands to control most of the IBM i functions by entering them from either the character-based interface or the IBM Navigator for i Web console. While the CL commands might be unfamiliar at first, the commands follow a consistent syntax, and IBM i includes many features to help you use them easily. The Programming navigation category in IBM i Knowledge Center includes a complete CL reference and a CL Finder to look up specific CL commands.

Remember the following points while troubleshooting problems:

- Has an external power outage or momentary power loss occurred?
- Has the hardware configuration changed?
- Has system software been added?
- Have any new programs or program updates (including PTFs) been installed recently?

To make sure that your IBM software was correctly installed, use the Check Product Option (CHKPRDOPT) command.

- Have any system values changed?
- Has any system tuning been done?

Before you use this procedure, ensure that you completed the steps in “Beginning problem analysis” on page 1.

After you review these considerations, follow these steps:

1. Is the IBM i operating system up and running?

   - **Yes:** Continue with the next step.
   - **No:** Go to step “19” on page 10.

2. Are you experiencing problems with the Operations Console?

   - **Yes:** See Troubleshooting Operations Console.
   - **No:** Continue with the next step.

3. Does the console show a Main Storage Dump Manager display?

   - **Yes:** Go to Copying a dump.
   - **No:** Continue with the next step.

4. Is the console that was in use when the problem occurred (or any console) operational?

   Note: The console is operational if a sign-on display or a command line is present. If another console is operational, use it to resolve the problem.

- **Yes:** Continue with the next step.
- **No:** Choose from the following options:
  - If your console does not show a sign-on display or a menu with a command line, go to Recovering when the console does not show a sign-on display or a menu with a command line.
  - For all other workstations, see the Troubleshooting navigation category in IBM i Knowledge Center.

---

5. Is a message related to this problem shown on the console?

   - **Yes:** Continue with the next step.
   - **No:** Go to step "10" on page 8.

---

6. Is this a system operator message?

   Note: It is a system operator message if the display indicates that the message is in the QSYSOPR message queue. Critical messages can be found in the QSYSMSG message queue. For more information, see the *Create message queue QSYSMSG for severe messages* topic in the Troubleshooting navigation category of IBM i Knowledge Center.

   - **Yes:** Continue with the next step.
   - **No:** Go to step "8" on page 8.

---

7. Is the system operator message highlighted, or does it have an asterisk (*) next to it?

   - **Yes:** Go to step "17" on page 9.
   - **No:** Go to step "12" on page 9.

---

8. Move the cursor to the message line and press F1 (Help). Does the Additional Message Information display appear?

   - **Yes:** Continue with the next step.
   - **No:** Go to step "10" on page 8.

---

9. Record the additional message information on the appropriate problem reporting form. For details, see "Problem reporting form" on page 22.

   Follow the recovery instructions on the Additional Message Information display.

   Did this solve the problem?

   - **Yes: This ends the procedure**.
   - **No:** Continue with the next step.

---

10. To display system operator messages, type `dspmsg qsysopr` on any command line and then press **Enter**.

    Did you find a message that is highlighted or has an asterisk (*) next to it?

    - **Yes:** Go to step "17" on page 9.
    - **No:** Continue with the next step.

    Note: The message monitor in the IBM Navigator for i Web console can also inform you when a problem has developed. For details, see the *Scenario: Message monitor topic in the Systems Management navigation category* of IBM i Knowledge Center.

---

11. Did you find a message with a date or time that is at or near the time the problem occurred?

Note: Move the cursor to the message line and press F1 (Help) to determine the time that a message occurred. If the problem is shown to affect only one console, you might be able to use information from the JOB menu to diagnose and solve the problem. To find this menu, type **GO JOB** and press **Enter** on any command line.

- **Yes:** Continue with the next step.
- **No:** Go to step "14" on page 9.

---

12. Complete the following steps:

    a. Move the cursor to the message line and press F1 (Help) to display additional information about the message.

    b. Record the additional message information on the appropriate problem reporting form. For details, see "Problem reporting form" on page 22.

    c. Follow any recovery instructions that are shown.

    Did this solve the problem?

    - **Yes: This ends the procedure**.
    - **No:** Continue with the next step.

---

13. Did the message information indicate to look for additional messages in the system operator message queue (QSYSOPR)?

    - **Yes:** Press F12 (Cancel) to return to the list of messages and look for other related messages. Then, return to step "10" on page 8.
    - **No:** Continue with the next step.

---

14. Do you know which input/output device is causing the problem?

    - **Yes:** Continue with step "16" on page 9.
    - **No:** Continue with the next step.

---

15. If you do not know which input/output device is causing the problem, describe the problems that you observed by completing the following steps:

    a. Type `GO USERHELP` on any command line and then press **Enter**.

    b. Select option 10 (Save information to help resolve a problem).

    c. Type a brief description of the problem and then press **Enter**. If you specify the default **Y** in the **Enter notes about problem** field, you can enter more text to describe your problem.

    d. Report the problem to your hardware service provider.

---

16. Complete the following steps:

    a. Type ANZPRB on the command line and then press **Enter**. For details, see *Using the Analyze Problem (ANZPRB) command* in the Troubleshooting navigation category in IBM i Knowledge Center.

    b. Contact your next level of support. **This ends the procedure**.

    Note: To describe your problem in greater detail, see *Using the Analyze Problem (ANZPRB) command* in the Troubleshooting navigation category in IBM i Knowledge Center. This command can also run a test to further isolate the problem.

---

17. Complete the following steps:

a. Move the cursor to the message line and press F1 (Help) to display additional information about the message.

b. Press F14, or use the Work with Problem (WRKPRB) command. For details, see *Work with Problem (WRKPRB)* in the Troubleshooting navigation category in IBM i Knowledge Center.

c. If this does not solve the problem, see the Symptom and recovery actions.

---

18. Choose from the following options:

- If reference codes appear on the control panel or the management console, record them. Then, go to the Reference code finder to see if additional details are available for the code you received.
- If no reference codes appear on the control panel or the management console, a serviceable event is indicated by a message in the problem log. Use the WRKPRB command. For details, see *Work with Problem (WRKPRB)* in the Troubleshooting navigation category in IBM i Knowledge Center.

---

19. Details about errors that occur when IBM i is not running or when IBM i is now not accessible can be found in the control panel or in the Advanced System Management Interface (ASMI).

Do you choose to look for error details by using ASMI?

- **Yes:** Go to step “21” on page 10.
- **No:** Continue with the next step.

---

20. At the control panel, complete the following steps.

a. Press the increment or decrement button until the number 11 is displayed in the upper-left corner of the display.

b. Press **Enter** to display the contents of function 11.

c. Look for a reference code in the upper-right corner.

Is there a reference code displayed on the control panel in function 11?

- **Yes:** Go to step “22” on page 10.
- **No:** Contact your hardware service provider. **This ends the procedure.**

---

21. On the console that is connected to the ASMI, complete the following steps.

Note: If you are unable to locate the reported problem, and there is more than one open problem near the time of the reported failure, use the earliest problem in the log.

a. Log in with a user ID that has an authority level as general, administrator, or authorized service provider.

b. In the navigation area, expand **System Service Aids** and click **Error/Event Logs**. If log entries exist, a list of error and event log entries is displayed in a summary view.

c. Scroll through the log under **Serviceable Customer Attention Events** and verify that there is a problem to correspond with the failure.

For more detailed information on the ASMI, see Managing the Advanced System Management Interface.

Do you find a serviceable event, or an open problem near the time of the failure?

- **Yes:** Continue with the next step.
- **No:** Contact your hardware service provider. **This ends the procedure.**

---

22. The reference code description might provide information or an action that you can take to correct the failure.

Use the search function of IBM Knowledge Center to find the reference code details. The search function is located in the upper-left corner of IBM Knowledge Center. Read the reference code description and return here. Do not take any other action now.

For more information about reference codes, see Reference codes.

Was there a reference code description that helped you to resolve the problem?

- **Yes: This ends the procedure.**
- **No:** Continue with the next step.

23. Service is required to resolve the error. Collect as much error data as possible and record it. You and your service provider will develop a corrective action to resolve the problem based on the following guidelines:

    - If a field-replaceable unit (FRU) location code is provided in the serviceable event view or control panel, use that location to determine which FRU to replace.
    - If an isolation procedure is listed for the reference code in the reference code lookup information, include the isolation procedure as a corrective action even if it is not listed in the serviceable event view or control panel.
    - If any FRUs are marked for block replacement, replace all FRUs in the block replacement group at the same time.

    To find error details on the control panel, complete the following steps:

    a. Press **Enter** to display the contents of function 14. If data is available in function 14, the reference code has a FRU list.
    b. Record the information in functions 11 through 20 on the control panel.
    c. Contact your service provider and report the reference code and other information.

    To find error details on the ASMI, complete the following steps from the Error Event Log view:

    a. Record the reference code.
    b. Select the corresponding check box on the log and click Show details.
    c. Record the error details.
    d. Contact your service provider.

    This ends the procedure.

Light path diagnostics on Power Systems

Light path diagnostics is a simplified approach for repair actions on Power Systems hardware that provides fault indicators to identify parts that need to be replaced.

Light path diagnostics is a system of light-emitting diodes (LEDs) on the control panel and on various internal components of the Power Systems hardware. When an error occurs, LEDs are lit throughout the system to help identify the source of the error.

With light path diagnostics, the fault LED for the FRUs to be replaced will be active when the unit is powered on. The failing FRUs can be attached to another FRU, which must be first removed to access the failing FRUs. For those cases, light path diagnostics provides a blue switch on the FRU that has to be removed first. When the first FRU is removed, you can press and hold the light path diagnostics switch to light the LEDs and locate the failing part. In most of the situations, the switch will have enough power stored to activate the LEDs for two hours after the unit has been powered off. However, this can vary significantly and therefore the switch should be used as soon as possible. The amber LEDs can normally be kept active for 30 seconds, however, this can also vary. Associated with the light path diagnostics switch is a green LED that will be activated when the switch is used and there is enough power stored to activate the amber LEDs. If the green LED does not activate when the switch is pressed then there is not enough power remaining to activate any amber LEDs on that FRU. If that happens then light path diagnostics and FRU identify function cannot be used for replacing the failing FRUs. Perform the repair action using the location codes in the error log or if determined by problem analysis as if the unit did not have light path diagnostics and did not have functioning identify LEDs.

At the core of light path diagnostics is a set of fault indicators that are implemented as amber LEDs. These LEDs provide a way for the diagnostics to identify which field-replaceable unit (FRU) needs to be replaced. Service labels, color-coded touch points for the FRUs, and a no tools required design for FRU removal and installation are all elements of light path diagnostics.

With light path diagnostics, at the same time that the diagnostics create an error log for the problem, it also activates the fault indicator when a FRU has a failed or failing component. This includes predictive failure analysis (PFA). The FRU fault LED is turned on solid (not flashing). Whenever a fault indicator is activated the enclosure's external Fault indicator on the operator panel is also turned on solid. The enclosure fault indicator on the panel means that inside the unit one or more FRU fault indicators is on. The error log shows the part number and location code of the FRU that must be replaced along with other FRUs or procedures to follow if replacing the first FRU does not resolve the problem.

If the diagnostics determine that the problem is firmware related, configuration related, or not isolated to a specific FRU then no fault indicator is activated. For these kinds of problems the amber System Info indicator on the operator panel is activated. The error log shows the procedures to follow and the possible FRUs that could be causing the problem.

During the repair action, the service label on the service access cover shows the FRUs and the steps required to remove or install the FRUs. Therefore, the basic flow of the repair is that the LEDs show which part to replace, the color-coded touch points indicate if the unit must be powered off to remove or install the part, and the service label shows the steps needed on the touch points. The FRU fault LED is not an indication that the FRU is ready to be replaced. To replace the FRU, some preparation steps might be necessary, such as removing the resource from use or powering off the unit. The service label and the touch point colors give the initial guidance for FRU removal.

When a FRU has been replaced, the fault indicator automatically turns off either when the new FRU is installed, or when the power is restored to the new FRU. This automatic shut off might take several seconds to a minute as the new FRU is powered on, brought online and tested by the system. When there are no more FRU fault indicators on in an enclosure then the enclosure's Fault indicator on the operator panel turns off automatically.

In addition to the fault indicators, there are also amber identify indicators for each FRU. The identify indicators flash when activated. Identify indicators are used to help a servicer identify where a location is. The location may be occupied or empty. The servicer can turn them on and off from a user interface either during a repair action or during the installation of new parts or when removing parts. The identify indicator visually confirms where a location code is. Whenever an identify indicator is activated, the enclosure's blue *locate* or *beacon* LED on the operator panel is also activated (flashing).

The same amber LED on a FRU can be used for both fault and identify indications. Whenever the LED is on solid for a fault, the LED switches to flashing when the FRU identify function is turned on. When identify function is turned off, the LED returns to fault (solid on) if that was the previous state of the LED.

Replacing FRUs by using enclosure fault indicators

After you obtain a replacement part, use this procedure to identify the location of the part that needs to be replaced.

About this task

To identify and locate the part that requires replacement, complete the following steps.

Procedure

1. Before you move the unit into the service position, refer to the service label. It might be necessary to identify and remove cables that are attached to the FRU you are about to exchange. Go to “Service labels” on page 14 to locate the service label for your system. Use the FRU location code and the service label to determine whether there are any actions before you move the unit into the service position. Complete those actions and return to the next step in this procedure.

2. Identify the unit with the active enclosure fault indicator. Use the service label that is affixed to the service access cover and the amber light-emitting diode (LED) on the FRU to find the failing FRU. Move the unit into the service position, but do not remove the service access cover.

   - If the unit is rack-mounted, the service label is visible on the service access cover. Continue with the next step.
   - If the unit is a stand-alone system, the exterior cover must be removed to view the service label. Remove the exterior cover by using the procedure found in the following table and then return to the next step in this procedure.

   Table 1. Exterior cover removal procedures for the stand-alone servers

Machine type and model	Removal procedure
9009-41A	Removing the service access cover from a stand-alone 9009-41A system.

3. Using the service label, determine whether the FRU you are replacing can be exchanged without removing the service access cover. Is the FRU fault LED visible externally and active (on solid, not flashing) and does the service label show that the service access cover does not need to be removed to exchange the FRU? (Choose No if you are unsure.)

   Note: If you used the identify function in a user interface to help locate the FRU, then the amber LED is flashing. Otherwise, the amber LED is solid (not flashing).

   - **Yes:** Go to step “6” on page 13.
   - **No:** To identify which FRU to exchange, you must remove the service access cover and locate the FRU that has an active FRU fault indicator (amber LED on). Continue with the next step.

4. Remove the service access cover and locate the FRU that has an active fault indicator (amber LED on, not flashing). Use the following table to determine whether you must power off the unit before you remove the cover.

   Note: You can remove the service access cover while the unit is powered on.

5. Search for the FRU to be replaced by locating the active amber LED.

   Notes:

   - If you used the identify function in a user interface to help locate the FRU, then the amber LED is flashing. Otherwise, the amber LED is solid (not flashing).
   - Some FRUs might be an integral part of another FRU. This might make it difficult to see the FRU that you need to exchange or the amber LED that designates the FRU that needs to be exchanged. If so, remove all FRUs that are associated with the failing FRU.

   Do you need to remove another FRU to replace the FRU designated by the amber LED?

   - **Yes:** Go to step “9” on page 14.
   - **No:** Continue with the next step.

6. For the FRU you located with its fault LED active, was it replaced for this problem or service action?

   - **Yes:** The FRU replaced for the original problem did not resolve the problem. Go back to the serviceable event for the original problem and address the remaining FRUs that are listed.

     Note: If the fault indicator for the replaced FRU is turned on, use the Advanced System Management Interface (ASMI) to turn off the fault indicator.

     This ends the procedure.

   - **No:** Continue with the next step.

7. For the FRU you located with the active fault LED, compare the location code that you recorded for the replacement FRU of the problem you are working on with the location code of the active fault indicator. If they do not match, you are working a problem from the log that is different from the problem that activated the fault indicators. Do the location codes match?

- **Yes:** You are working the same problem that activated the fault indicators. Continue with the next step.
- **No:** If you have the correct replacement FRU for where the fault indicator is active, you can continue with this repair action. When you replace the FRU, record the location codes of the active fault indicators for use later to identify which problem to close when the repair is complete, then continue with the next step. Otherwise, contact your service provider to obtain the replacement part for the FRU with an active fault indicator and begin problem analysis again. **This ends the procedure.**

8. If you have not already done so, record the location of the FRU you are about to exchange either by where the service label shows the FRU or where it is in the unit by the location labeling. For information on part locations and location codes, see Part locations and location codes. In the locations and addresses information for your system, locate the FRU and the corresponding FRU exchange procedure. The exchange procedure provides the steps necessary to exchange the FRU. If the FRU can be replaced while the unit is powered on, the exchange procedure provides that option and the necessary instructions. If the enclosure fault indicator turns on again within a few minutes of completing the replacement and returning to normal use of the unit, then begin problem analysis again. Otherwise, close the problem. **This ends the procedure.**
9. If you have not already done so, record the location of the FRU that you plan to remove either by where the service label shows the FRU or by the location labeling where it is in the unit. For information on part locations and location codes, see Part locations and location codes.

   In the locations and addresses information, locate the FRU and the corresponding FRU exchange procedure. The exchange procedure provides the steps necessary to remove this FRU. If the FRU can be removed while the unit is powered on, the exchange procedure provides that option and the necessary instructions. When you remove this FRU, the fault indicator for the associated FRU you are exchanging turns off. This FRU has an LED activation button that you can press that powers the amber indicator of the FRU you are exchanging. Use the button to locate the FRU you are exchanging. Go to step “8” on page 14.

   Note: If the button's green LED does not activate, there is not enough charge in the switch to activate the amber fault LED. To identify the failing FRU, use the FRU location code either from the error log or as determined by problem analysis.
10. For the FRU you located that has its fault LED active, were any of them replaced for this problem or service action?

    - **Yes:** The FRU replaced for the original problem did not resolve the problem. Go back to the serviceable event for the original problem and work the remaining FRUs listed. Use ASMI to turn off the fault indicator for the FRU. **This ends the procedure.**
    - **No:** Use the information on the service label to exchange the FRU. When the FRU is exchanged, use the service label to guide you in reassembling the unit. Power on the unit. The FRU fault indicator is turned off during the power-on process if it was not already turned off. If the enclosure fault indicator turns on again within a few minutes of powering on the unit, then begin problem analysis again. Otherwise, close this problem. **This ends the procedure.**

Service labels

Use this information to view the service labels on system models or expansion units.

Service label for the 5105-22E

Service labels identify service locations on system models or expansion units.

General Service Information

Terra Cotta on the callout or part indicates the system may not be required to be powered off to perform service. This is dependant on system configuration and preparatory steps may be required before the service action is taken on the system.

Blue on the callout or part indecates that the procedure may require the unit to be shut down before servicing. Check your service procedure before attempting repair.

All cards are sensitive to static electricity discharge. If an antistatic wrist strap is available, use it while handling cards. If not, first ground yourself by touching the metal frame of the system.

Toutes les cartes sont sensibles à l'électricité statique. Si vous disposez d'un bracelet antistatique, utilisez–le lorsque vous manipulez les cartes. Sinon, faites votre propre mise à la terre en touchant le châssis métallique du système.

Alle Karten sind gegenüber statischer Elektrizität sehr empfindlich. Falls ein Antistatik–Armband zur Verfügung steht, ist es während des Handhabens der Karten zu tragen. Falls nicht, erden Sie sich zuerst, indem Sie den Metallrahmen des Systems berühren.

Tutte le schede sono sensibili all'elettrostatica. Se desponete di polsino antistatico, indossatelo prima di adoperare le scede. Altrimenti, ricordatevi di scaricare la vostra elettricità sulla struttura metallica del sistema prima di toccare le schede.

Todas las tarjetas son sensibles a la electricidad estática. Si dispone de una muñequera antiestática, úsela mientras esté manipulando las tarjetas. De lo contrario, primero conéctese a tierra tocando el chasis metálico del sistema.

Problem reporting form

Use the problem reporting form to record information about your server that will assist you in problem analysis.

Collect as much information as possible in the tables below, using either the control panel or the management console to gather the information.

Table 2. Customer, system, and problem information

Customer information and problem description	
Your name	
Telephone number	
IBM customer number, if available	
Date and time that the problem occurred	
Describe the problem	
System Information	
Machine type	
Model	
Serial number	
IPL type	
IPL mode	
Message information	
Message ID	
Message text	
Service request number (SRN)	
In which mode were IBM hardware diagnostics run?	___ Online or ___ stand-alone ? ___ Service mode or ___ concurrent mode?

Go to the management console or the control panel and indicate whether the following lights are on.

Starting a repair action

This is the starting point for repair actions. All repair actions must begin with this procedure. From this point, you are guided to the appropriate information to help you perform the necessary steps to repair the server.

Note: In this topic, **control panel** and **operator panel** are synonymous.

Before beginning, record information to help you return the server to the same state that the customer typically uses. Examples follow:

- The IPL type that the customer typically uses for the server.
- The IPL mode that is used by the customer on this server.
- How the server is configured or partitioned.

1. Has problem analysis been performed by using the procedures in Beginning problem analysis?
   - **Yes:** Continue with the next step.
   - **No:** Perform problem analysis by using the procedures in Beginning problem analysis.
2. Is the failing server managed by a management console?
   - **Yes:** Continue with step "5" on page 25.
   - **No:** Continue with the next step.
3. Do you have an action plan to perform an isolation procedure?
   - **Yes:** Go to Isolation procedures.
   - **No:** Continue with the next step.
4. Do you have a field replaceable unit (FRU), location code, and an action plan to replace a failing FRU?

- **Yes:** Go to the removal and replacement procedures for the system you are servicing.
- **No:** Go to Part locations and location codes to find the part that you need, and then go to the removal and replacement procedures for the system you are servicing.

This ends the procedure.

5. Is the management console connected and functional?
   - **Yes:** Continue with the next step.
   - **No:** Start the management console and attach it to the server. When the management console is connected and functional, continue with the next step.
6. Were you directed here by support to replace a FRU by using Exchange FRU on the HMC?
   - **Yes:** Go to Exchange FRU.
   - **No:** Continue with the next step.
7. Perform the following steps from the management console that is used to manage the server. During these steps, refer to the service data that was gathered earlier.

   Note: If you are unable to locate the reported problem and there is more than one open problem near the time of the reported failure, use the earliest problem in the list.

   a. In the navigation area, click the **Serviceability** icon 🛠, and then click **Serviceable Events Manager**. The Manage Serviceable Events window is displayed.
   b. From the **Serviceable event status** list, click **Open**.
   c. Select **ALL** for every other selection and click **OK**.
   d. Scroll through the list to determine whether a problem has a status of **Open** and to determine whether it corresponds with the problem reported by the customer.
   e. Do you find the reported problem or an open problem near the time of the reported problem?
      - **Yes:** Continue with the next step.
      - **No:** Go to step "4" on page 24, or if a serviceable event was not found, see the appropriate problem analysis procedure for the operating system you are using.
        - If the server or partition is running the AIX or Linux operating system, see AIX and Linux problem analysis.
        - If the server or partition is running the IBM i operating system, see IBM i problem analysis.
8. To perform a repair operation from the HMC, complete the following steps:

   a. Select the serviceable event that you want to repair, and click **Repair** from the selected menu.
   b. Follow the instructions that are displayed on the HMC.

   After you complete the repair procedure, the system automatically closes the serviceable event. **This ends the procedure.**

Reference information for problem determination

The problem determination reference information is provided as an additional resource for problem detection and analysis when you are directed here by your service representative.

All repair actions should start with "Beginning problem analysis" on page 1 and be followed by "Starting a repair action" on page 24 before you use these tools and techniques for problem determination.

Symptom index

Use this symptom index only when you are guided here by your service representative.

Note: If you were not guided here by your service representative, go to "Beginning problem analysis" on page 1.

Review the symptoms in the left column. Look for the symptom that most closely matches the symptoms on the server that you are troubleshooting. When you find the matching symptom, perform the appropriate action as described in the right column.

Table 5. Determining symptom types

Symptom	What you should do:
You do not have a symptom.	Go to the Starting a repair action.
The symptom or problem is on a server or a partition running IBM i.	Go to "IBM i server or IBM i partition symptoms" on page 26.
The symptom or problem is on a server or a partition running AIX.	Go to "AIX server or AIX partition symptoms" on page 30.
The symptom or problem is on a server or a partition running Linux.	Go to "Linux server or Linux partition symptoms" on page 44.

IBM i server or IBM i partition symptoms

Use the following tables to find the symptom you are experiencing. If you cannot find your symptom, contact your next level of support.

- General symptoms
- Symptoms occurring when the system is not operational
- Symptoms related to a logical partition on a server that has multiple logical partitions
- Obvious physical symptoms
- Time-of-day symptoms

Table 6. General IBM i server or IBM i partition symptoms

Symptom	Service action
You have an intermittent problem or you suspect that the problem is intermittent.	Go to "Intermittent problems" on page 105.
DST/SST functions are available on the logical partition console and: • The customer reports reduced system function. • There is a server performance problem. • There are failing, missing, or inoperable server resources.	On most servers with logical partitions, it is common to have one or more missing or non-reporting system bus resource's under Hardware Service Manager (see Hardware Service Manager for more information).
Operations Console, or the remote control panel is not working properly.	Contact Software Support.
The system has a processor or memory problem.	Use the Service action log to check for a reference code or any failing items. See Service action log for instructions, replacing any hardware FRUs if necessary.

Table 6. General IBM i server or IBM i partition symptoms (continued)

Symptom	**Service action**
The system has detected a bus problem. An SRC of the form B600 69*xx* or B700 69*xx* will be displayed on the control panel or management console.	Go to Service action log.

Table 7. Symptoms occurring when the system is not operational

Symptom	**Service action**
A bouncing or scrolling ball (moving row of dots) remains on the operator panel display, or the operator panel display is filled with dashes or blocks.	Verify that the operator panel connections to the system backplane are connected and properly seated. Also, reseat the Service Processor card. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Operator panel assembly. 2. Service processor.

Table 7. Symptoms occurring when the system is not operational (continued)

Symptom	**Service action**
You have a blank display on the operator panel. Other LEDs on the operator panel appear to behave normally.	Verify that the operator panel connections to the system backplane are connected and properly seated. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Control (operator) panel assembly. 2. Service processor.
There is an IPL problem, the system attention light is on, and blocks of data appear for 5 seconds at a time before moving to the next block of data for 5 seconds, and so on until 5 seconds of a blank control panel is displayed at which time the cycle repeats.	These blocks of data are functions 11 through 20. The first data block after the blank screen is function 11, the second block is function 12, and so on. Use this information to fill out the Problem reporting forms. Then go to Reference codes.
You have a power problem, the system or an attached unit will not power on or will not power off, or there is a 1*xxx*-*xxxx* reference code.	Go to Power problems.
There is an SRC in function 11.	Look up the reference code (see Reference codes).
There is an IPL problem.	Go to “IPL problems” on page 111.
There is a `Device Not Found` message during an installation from an alternate installation device.	Go to TUPIP06.

Table 8. Symptoms related to a logical partition on a server that has multiple logical partitions

Symptom	**Service action**
The console is not working for a logical partition.	See Recovering when the console does not show a sign-on display or a menu with a command line.

Table 8. Symptoms related to a logical partition on a server that has multiple logical partitions (continued)

Symptom	**Service action**
• There is an SRC on the panel of an I/O expansion unit owned by a logical partition. • You suspect a power problem with resources owned by a logical partition. • There is an IPL problem with a logical partition and there is an SRC on the management console. • The logical partition's operations have stopped or the partition is in a loop and there is an SRC on the management console.	• Search Service Focal Point for a serviceable event. • If you do not find a serviceable event in Service Focal Point, then record the partition's SRC from the Operator Panel Values field in the management console. 1. In the navigation area, click the **Resources** icon , and then select **All Systems**. 2. In the content pane, select the required system or click on the server name and then select the required partition. 3. Use that SRC and look up the reference code. For more information, see Reference codes.
The logical partition's console is functioning, but the state of the partition in the management console is "Failed" or "Unit Attn" and there is an SRC.	Use the logical partition's SRC. From the partition's console search for that SRC in the partition's Service Action Log. See Service action log.
There is an IPL problem with a logical partition and there is no SRC displayed in the management console.	Perform the following to look for the panel value for the partition in the management console. 1. In the navigation area, click the **Resources** icon , and then select **All Systems**. 2. In the content pane, select the required system or click on the server name and then select the required partition. 3. In the navigation area, click **Serviceability** > **Reference Code Log** and view the codes. 4. When finished, click **Cancel**. Go to Reference codes. If no reference code can be found, contact your next level of support.
The partition's operations have stopped or the partition is in a loop and there is no SRC displayed on the management console.	Perform function 21 from the management console. If this fails to resolve the problem, contact your next level of support.
One or more of the following was reported: • There is a system reference code or message on the logical partition's console. • The customer reports reduced function in the partition. • There is a logical partition performance problem. • There are failing, missing, or inoperable resources.	From the partition's console search the partition's Service Action Log. Go to Service action log. **Note:** On most systems with logical partitions, it is common to have one or more "Missing or Non-reporting" system bus resource's under Hardware Service Manager. See Hardware Service Manager for details.

Table 8. Symptoms related to a logical partition on a server that has multiple logical partitions (continued)

Symptom	Service action
There is a `Device Not Found` message during an installation from an alternate installation device.	Go to TUPIP06.
There is a problem with a guest partition. **Note:** These are problems reported from the operating system (other than IBM i) running in a guest partition or reported from the hosting partition of a guest partition.	If there are serviceable events in the logical partition or hosting partition, work on these problems first. If there are no SAL entries in the logical partition and no SAL entries in the hosting partition, contact your next level of support.

Table 9. Obvious physical symptoms

Symptom	Service action
A power indicator light, display on the system unit control panel, or an attached I/O unit is not working correctly.	Perform PWR1920.
One or more of the following was reported: • Noise • Smoke • Odor	Go to the system safety inspection procedures for your specific system.
A part is broken or damaged.	Go to the System parts to get the part number. Then go to the remove and replace procedures for your specific system to exchange the part.

Table 10. Time-of-day problems

Symptom	Service action
System clock loses or gains more than 1 second per day when the system is connected to utility power.	Replace the service processor. See symbolic FRU SVCPROC.
System clock loses or gains more than 1 second per day when the system is disconnected from utility power.	Replace the time-of-day battery on the service processor. Go to symbolic FRU TOD_BAT.

AIX server or AIX partition symptoms

Use the following tables to find the symptom you are experiencing. If you cannot find your symptom, contact your next level of support.

Choose the description that best describes your situation:

- You have a service action to complete
- An LED is not operating as expected
- Control (operator) panel problems
- Reference codes
- Management consoles
- There is a display or monitor problem (for example, distortion or blurring)
- Power and cooling problems

- Other symptoms or problems

You have a service action to complete

Symptom	What you should do:
You have an open service event in the service action event log.	Go to Starting a repair action.
You have parts to exchange or a corrective action to complete.	1. Go to the remove and replace procedures for your specific server. 2. Go to Close of call procedure.
You need to verify that a part exchange or corrective action corrected the problem.	1. Go to Verifying the repair. 2. Go to the Close of call procedure.
You need to verify correct system operation.	1. Go to Verifying the repair. 2. Go to Close of call procedure.

An LED is not operating as expected

Symptom	What you should do:
The system attention LED on the control panel is on.	Go to Starting a repair action.
The rack indicator LED does not turn on, but a drawer identify LED is on.	1. Make sure that the rack indicator LED is properly mounted to the rack. 2. Make sure that the rack identify LED is properly cabled to the bus bar on the rack and to the drawer identify LED connector. 3. Replace the following parts one at a time: • Rack LED to bus bar cable • LED bus bar to drawer cable • LED bus bar 4. Contact your next level of support.

Control (operator) panel problems

Symptom	What you should do:
01 does not appear in the upper-left corner of the operator panel display after the power is connected and before you press the power-on button. Other symptoms appear in the operator panel display or LEDs before the power on button is pressed.	Go to Power problems.

Symptom	What you should do:
A bouncing or scrolling ball (moving row of dots) remains on the operator panel display, or the operator panel display is filled with dashes or blocks.	Verify that the operator panel connections to the system backplane are connected and properly seated. Also, reseat the service processor card. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. See Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. See Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Operator panel assembly. 2. Service processor.

Symptom	What you should do:
You have a blank display on the operator panel. Other LEDs on the operator panel appear to behave normally.	Verify that the operator panel connections to the system backplane are connected and properly seated. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. See Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. See Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Control (operator) panel assembly. 2. Service processor.
You have a blank display on the operator panel. Other LEDs on the operator panel are off.	Go to Power problems.

Reference codes

Symptom	What you should do:
An 8-digit error code is displayed.	Look up the reference code in the Reference codes section of IBM Knowledge Center. **Note:** If the repair for this code does not involve replacing a FRU (for instance, running an AIX command that fixes the problem or changing a hot-pluggable FRU), then update the AIX error log after the problem is resolved by completing the following steps: 1. In the online diagnostics, select **Task Selection** > **Log Repair Action**. 2. Select resource **sysplanar0**. On systems with a fault indicator LED, this changes the fault indicator LED from the fault state to the normal state.

Symptom	What you should do:
The system stops with an 8-digit error code displayed when you boot.	Look up the reference code in the Reference codes section of IBM Knowledge Center.
The system stops and a 4-digit code displays on the control panel that does **not** begin with 0 or 2.	Look up the reference code in the Reference codes section of IBM Knowledge Center.
The system stops and a 4-digit code displays on the control panel that begins with 0 or 2.	Record SRN 101-*xxxx*, where *xxxx* is the 4-digit code that is displayed in the control panel. Then, look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN.
The system stops and a 3-digit number is displayed on the control panel.	Add 101– to the left of the three digits to create an SRN, then look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN. If a location code is displayed under the 3-digit error code, look at the location to see whether it matches the failing component that the SRN pointed to. If they do not match, complete the action that is given in the error code table. If the problem still exists, replace the failing component from the location code. If a location code is displayed under the 3-digit error code, record the location code. Record SRN 101-*xxx*, where *xxx* is the 3-digit number that is displayed in the operator panel display, then look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN.

Management consoles

Symptom	What you should do:
The management console cannot be used to manage a managed system, or the connection to the managed system is failing.	If the managed system is operating normally (that is, there are no error codes or other symptoms) the management console might have a problem, or the connection to the managed system might be damaged or incorrectly cabled. Complete the following steps: 1. Check the connections between the management console and the managed system. Correct any cabling errors, if found. If another cable is available, connect it in place of the existing cable and refresh the management console interface. You might have to wait up to 30 seconds for the managed system to reconnect. 2. Verify that any connected management console is connected to the managed system. **Note:** The managed system must have power that is connected, and either be waiting for a power-on instruction (that is, `01` is in the upper-left corner of the operator panel) or be running. If the managed system does not appear in the navigation area of the management console management environment, the management console or the connection to the managed system might be failing. 3. Go to the entry MAP: • Go to: Managing the HMC section. 4. If there is a problem with the service processor card or the system backplane, complete the following steps. • If you cannot fix the problem by using the HMC tests in the Managing the HMC section: a. Replace the service processor card. See the remove and replace procedures for your specific system. b. Replace the system backplane if not already replaced in substep a. See the remove and replace procedures for your specific system.

Symptom	What you should do:
The management console (HMC only) cannot call out by using the attached modem and the customer's telephone line.	If the managed system is operating normally (that is, there are no error codes or other symptoms), the management console might have a problem, or the connection to the modem and telephone line might have a problem. Complete the following steps: 1. Check the connections between the management console, the modem, and the telephone line. Correct any cabling errors, if found. 2. Go to the entry MAP in the Managing your server using the Hardware Management Console section.

There is a display problem (for example, distortion or blurring)

Symptom	What you should do:
All display problems.	1. If you are using the HMC: Go to the Managing the HMC section. 2. If you are using a graphics display, complete the following steps: a. Go to the problem determination procedures for the display. b. If you do not find a problem, complete the following steps, one at a time, until the problem is resolved: 1) Replace the graphics display adapter. See the remove and replace procedures for your specific system. 2) Replace the backplane into which the card is plugged. See the remove and replace procedures for your specific system. 3. If you are using an ASCII terminal, complete the following steps: a. Make sure that the ASCII terminal is connected to S1. b. If problems persist, go to the problem determination procedures for the terminal. c. If you do not find a problem, replace the service processor. See the remove and replace procedures for your specific system.
There appears to be a display problem (distortion, blurring, and so on).	Go to the problem determination procedures for the display.

Power and cooling problems

Symptom	What you should do:
The system does not power on and no error codes are available.	Go to Power problems.
The power LEDs on the operator panel and the power supply do not come on or stay on.	1. Check the service processor error log. 2. Go to Power problems.
The power LEDs on the operator panel and the power supply come on and stay on, but the system does not power on.	1. Check the service processor error log. 2. Go to Power problems.
A rack or a rack-mounted unit will not power on.	1. Check the service processor error log. 2. Go to Power problems.
The cooling fans do not come on, or come on but do not stay on.	1. Check the service processor error log. 2. Go to Power problems.
The system attention LED on the operator panel is on and there is no error code displayed.	1. Check the service processor error log. 2. Go to Power problems.

Other symptoms or problems

Symptom	What you should do:
The system stopped and a code is displayed on the operator panel.	Go to Starting a repair action.
`01` is displayed in the upper-left corner of the operator panel and the fans are off.	The service processor is ready. The system is waiting for power-on. Boot the system. If the boot is unsuccessful, and the system returns to the default display (indicated by `01` in the upper-left corner of the operator panel), go to MAP 0200: Problem determination procedure.
The operator panel displays STBY.	The service processor is ready. The server was shut down by the operating system and is still powered on. This condition can be requested by a privileged system user with no faults. Go to Starting a repair action. **Note:** See the service processor error log for possible operating system fault indications.
All of the system power-on self-test (POST) indicators are displayed on the firmware console, the system pauses and then restarts. The term *POST indicators* refers to the device mnemonics (the words `memory`, `keyboard`, `network`, `scsi`, and `speaker`) that appear on the firmware console during the POST.	Go to Problems with loading and starting the operating system.

Symptom	What you should do:
The system stops and all of the POST indicators are displayed on the firmware console. The term *POST indicators* refers to the device mnemonics (the words `memory`, `keyboard`, `network`, `scsi`, and `speaker`) that appear on the firmware console during the power-on self-test (POST).	Go to Problems with loading and starting the operating system.
The system stops and the message `starting software please wait...`is displayed on the firmware console.	Go to Problems with loading and starting the operating system.
The system does not respond to the password that you entered or the system login prompt is displayed when you boot in service mode.	1. If the password is being entered from HMC: Go to the Managing the HMC. 2. If the password is being entered from a keyboard that is attached to the system, the keyboard or its controller might be faulty. In this case, replace these parts in the following order: a. Keyboard b. Service processor 3. If the password is being entered from an ASCII terminal, use the problem determination procedures for the ASCII terminal. Make sure that the ASCII terminal is connected to S1. If the problem persists, replace the service processor. If the problem is fixed, go to "MAP 0410: Repair checkout" on page 41.
The system stops with a prompt to enter a password.	Enter the password. You cannot continue until a correct password is entered. After you enter a valid password, go to the beginning of this table and wait for one of the other conditions to occur.
The system does not respond when the password is entered.	Go to Step 1020-2.
No codes are displayed on the operator panel within a few seconds of turning on the system. The operator panel is blank before the system is powered on.	Reseat the operator panel cable. If the problem is not resolved, replace in the following order: 1. Operator panel assembly. See the remove and replace procedures for your specific system. 2. Service processor. See the remove and replace procedures for your specific system. If the problem is fixed, go to "MAP 0410: Repair checkout" on page 41. If the problem is still not corrected, go to MAP 0200: Problem determination procedure.

Symptom	What you should do:
The SMS configuration list or boot sequence selection menu shows more SCSI devices that are attached to a controller or an adapter than are actually attached.	A device might be set to use the same SCSI bus ID as the control adapter. Note the ID being used by the controller or adapter (this can be checked or changed through an SMS utility), and verify that no device that is attached to the controller is set to use that ID. If settings do not appear to be in conflict, complete the following steps: 1. Go to MAP 0200: Problem determination procedure. 2. Replace the SCSI cable. 3. Replace the device. 4. Replace the SCSI adapter **Note:** In a **twin-tailed** configuration where there is more than one initiator device (normally another system) attached to the SCSI bus, it might be necessary to use SMS utilities to change the ID of the SCSI controller or adapter.
You have a problem that does not prevent the system from booting. The operator panel is functional and the rack indicator LED operates as expected.	Go to MAP 0200: Problem determination procedure.
All other symptoms.	Go to MAP 0200: Problem determination procedure.
All other problems.	Go to MAP 0200: Problem determination procedure.
You do not have a symptom.	Go to MAP 0200: Problem determination procedure.
You have parts to exchange or a corrective action to complete.	1. Go to Starting a repair action. 2. Go to Close of call procedure.
You need to verify that a part exchange or corrective action corrected the problem.	Go to "MAP 0410: Repair checkout" on page 41.
You need to verify correct system operation.	Go to "MAP 0410: Repair checkout" on page 41.

Symptom	What you should do:
The system stopped. A POST indicator is displayed on the system console and an eight-digit error code is not displayed.	If the POST indicator represents: 1. Memory, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 2. Keyboard a. Replace the keyboard. b. Replace the service processor, location: model dependent. c. Go to PFW 1548: Memory and processor subsystem problem isolation procedure. 3. Network, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 4. SCSI, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 5. Speaker a. Replace the control panel. The location depends on the model. b. Replace the service processor. The location depends on the model. c. Go to PFW 1548: Memory and processor subsystem problem isolation procedure.
The diagnostic operating instructions are displayed.	Go to MAP 0200: Problem determination procedure.
The system login prompt is displayed.	If you are loading the diagnostics from a CD-ROM, you might not have pressed the correct key or you might not have pressed the key soon enough when you were trying to indicate a service mode IPL of the diagnostic programs. If so, try to boot the CD-ROM again and press the correct key. **Note:** Complete the system shutdown procedure before you turn off the system. If you are sure that you pressed the correct key in a timely manner, go to Step 1020-2. If you are loading diagnostics from a Network Installation Management (NIM) server, check for the following items: • The bootlist on the client might be incorrect. • Cstate on the NIM server might be incorrect. • Network problems might be preventing you from connecting to the NIM server. Verify the settings and the status of the network. If you continue to have problems see Problems with loading and starting the operating system and follow the steps for network boot problems.

Symptom	What you should do:
The System Management Services (SMS) menu is displayed when you were trying to boot stand-alone AIX diagnostics.	If you are loading diagnostics from the CD-ROM, you might not have pressed the correct key when you were trying to indicate a service mode IPL of the diagnostic programs. If so, try to boot the CD-ROM again and press the correct key. If you are sure that you pressed the correct key, the device or media you are attempting to boot from might be faulty. 1. Try to boot from an alternate boot device that is connected to the same controller as the original boot device. If the boot succeeds, replace the original boot device (for removable media devices, try the media first). If the boot fails, go to Problems with loading and starting the operating system. 2. Go to PFW 1548: Memory and processor subsystem problem isolation procedure.
The SMS boot sequence selection menu or remote IPL menu does not show all of the bootable devices in the partition or system.	If an AIX or Linux partition is being booted, verify that the devices that you expect to see in the list are assigned to this partition. If they are not, use the management console to reassign the required resources. If they are assigned to this partition, go to Problems with loading and starting the operating system to resolve the problem.

MAP 0410: Repair checkout

Use this MAP to check out the server after a repair is completed.

Purpose of this MAP

Use this MAP to check out the server after a repair is completed.

Note: Only use standalone diagnostics for repair verification when no other diagnostics are available on the system. Standalone diagnostics do not log repair actions.

If you are servicing an SP system, go to the End-of-call MAP in the *SP System Service Guide*.

If you are servicing a clustered system, go to the End of Call MAP in the *Clustered eServer Installation and Service Guide*.

- **Step 0410-1**

  Did you use an AIX diagnostics service aid hot-swap operation to change the FRU?

  No
  Go to Step 0410-2.

  Yes
  Go to Step 0410-4.

- **Step 0410-2**

  Note: If the system backplane or battery has been replaced and you are loading diagnostics from a server over a network, it may be necessary for the customer to set the network boot information for this system before diagnostics can be loaded. The system time and date information should also be set when the repair is completed.

Do you have any FRUs (for example cards, adapters, cables, or devices) that were removed during problem analysis that you want to put back into the system?

No
Go to Step 0410-3.

Yes
Reinstall all of the FRUs that were removed during problem analysis. Go to Step 0410-3.

- **Step 0410-3**

  Is the system or logical partition that you are performing a repair action on running the AIX operating system?

  No
  Go to Step 0410-5.

  Yes
  Go to Step 0410-4.

- **Step 0410-4**

  Does the system or logical partition you are performing a repair action on have AIX installed?

  Note: Answer **No** to this question if you have just replaced a hard disk in the root volume group.

  No
  Go to Step 0410-5.

  Yes
  Go to Step 0410-6.

- **Step 0410-5**

  Run standalone diagnostics from either a CD ROM or from a NIM server.

  Did you encounter any problems?

  No
  Go to Step 0410-14.

  Yes
  Go to MAP 0020: Problem determination procedure.

- **Step 0410-6**

  1. Power on the system.
  2. Wait until the AIX operating system login prompt displays or until system activity on the operator panel or display apparently has stopped.

  Did the AIX Login Prompt display?

  No
  Go to MAP 0020: Problem determination procedure.

  Yes
  Go to Step 0410-7.

- **Step 0410-7**

  If the **Resource Repair Action** menu is already displayed, go to Step 0410-10; otherwise, complete the following steps:

  1. Log into the operating system either with root authority (if needed, ask the customer to enter the password) or use the CE login.
  2. Enter the `diag -a` command and check for missing resources. Follow any instructions that display. If an SRN displays, suspect a loose card or connection. If no instructions display, no resources were detected as missing. Continue on to Step 0410-8

- **Step 0410-8**

  1. Enter `diag` at the command prompt.

2. Press Enter.
3. Select the **Diagnostics Routines** option.
4. When the DIAGNOSTIC MODE SELECTION menu displays, select **Problem determination**.
5. When the ADVANCED DIAGNOSTIC SELECTION menu displays, select the **All Resources** option or test the FRUs you exchanged, and any devices that are attached to the FRUs you exchanged, by selecting the diagnostics for the individual FRU.

Did the RESOURCE REPAIR ACTION menu (801015) display?

No
Go to Step 0410-9.

Yes
Go to Step 0410-10.

- **Step 0410-9**

  Did the TESTING COMPLETE, no trouble was found menu (801010) display?

  No
  There is still a problem. Go to MAP 0020: Problem determination procedure.

  Yes
  Use the **Log Repair Action** option, if not previously logged, in the TASK SELECTION menu to update the AIX error log. If the repair action was reseating a cable or adapter, select the resource associated with that repair action.

  If the resource associated with your action is not displayed on the resource list, select **sysplanar0**.

  Note: If the check log indicator is on, this will set it back to the normal state.

  Go to Step 0410-12.

- **Step 0410-10**

  When a test is run on a resource in system verification mode, and that resource has an entry in the AIX error log, if the test on the resource was successful, the RESOURCE REPAIR ACTION menu displays.

  After replacing a FRU, you must select the resource for that FRU from the RESOURCE REPAIR ACTION menu. This updates the AIX error log to indicate that a system-detectable FRU has been replaced.

  Note: If the check log indicator is on, this action will set it back to the normal state.

  Complete the following steps:

  1. Select the resource that has been replaced from the RESOURCE REPAIR ACTION menu. If the repair action was reseating a cable or adapter, select the resource associated with that repair action. If the resource associated with your action is not displayed on the resource list, select **sysplanar0**.
  2. Press **Commit** after you make your selections.

  Did another Resource Repair Action (801015) display?

  No
  If the No Trouble Found menu displays, go to Step 0410-12.

  Yes
  Go to Step 0410-11.

- **Step 0410-11**

  The parent or child of the resource you just replaced may also require that you run the RESOURCE REPAIR ACTION service aid on it.

  When a test is run on a resource in system verification mode, and that resource has an entry in the AIX error log, if the test on the resource was successful, the RESOURCE REPAIR ACTION menu displays.

  After replacing that FRU, you must select the resource for that FRU from the RESOURCE REPAIR ACTION menu. This updates the AIX error log to indicate that a system-detectable FRU has been replaced.

Note: If the check log indicator is on, this action will set it back to the normal state.

Complete the following steps:

1. From the RESOURCE REPAIR ACTION menu, select the parent or child of the resource that has been replaced . If the repair action was reseating a cable or adapter, select the resource associated with that repair action. If the resource associated with your action is not displayed on the resource list, select **sysplanar0**.
2. Press COMMIT after you make your selections.
3. If the No Trouble Found menu displays, go to Step 0410-12.

- **Step 0410-12**

  If you changed the service processor or network settings, as instructed in previous MAPs, restore the settings to the value they had prior to servicing the system. If you ran standalone diagnostics from CD-ROM, remove the standalone diagnostics CD-ROM from the system.

  Did you perform service on a RAID subsystem involving changing of the PCI RAID adapter cache card or changing the configuration?

  No
  Go to Step 0410-14.

  Yes
  Go to Step 0410-13.

- **Step 0410-13**

  Use the **Recover Options** selection to resolve the RAID configuration. To do this, complete the following steps:

  1. On the PCI SCSI Disk Array Manager screen, select **Recovery options**.
  2. If a previous configuration exists on the replacement adapter, this must be cleared. Select **Clear PCI SCSI Adapter Configuration**. Press F3.
  3. On the Recovery Options screen, select **Resolve PCI SCSI RAID Adapter Configuration**.
  4. On the Resolve PCI SCSI RAID Adapter Configuration screen, select **Accept Configuration on Drives**.
  5. On the PCI SCSI RAID Adapter selections menu, select the adapter that you changed.
  6. On the next screen, press Enter.
  7. When you get the Are You Sure selection menu, press Enter to continue.
  8. You should get an OK status message when the recover is complete. If you get a `Failed` status message, verify that you selected the correct adapter, then repeat this procedure. When recover is complete, exit the operating system.
  9. Go to Step 0410-14.

- **Step 0410-14**

  If the system you are servicing has a management console, go to the end-of-call procedure for systems with Service Focal Point.

This completes the repair; return the server to the customer.

Linux server or Linux partition symptoms

Use the following tables to find the symptom you are experiencing. If you cannot find your symptom, contact your next level of support.

Choose the description that best describes your situation:

- You have a service action to complete
- An LED is not operating as expected
- Control (operator) panel problems
- Reference codes

- Management consoles
- There is a display or monitor problem (for example, distortion or blurring)
- Power and cooling problems
- Other symptoms or problems

You have a service action to complete

Symptom	What you should do:
You have an open service event in the service action event log.	Go to Starting a repair action.
You have parts to exchange or a corrective action to complete.	1. Go to the remove and replace procedures for your specific system. 2. Go to Close of call procedure.
You need to verify that a part exchange or corrective action corrected the problem.	1. Go to Verifying the repair. 2. Go to the Close of call procedure.
You need to verify correct system operation.	1. Go to Verifying the repair. 2. Go to the Close of call procedure.

An LED is not operating as expected

Symptom	What you should do:
The system attention LED on the control panel is on.	Go to “Linux fast-path problem isolation” on page 55.
The rack identify LED does not operate properly.	Go to the “Linux fast-path problem isolation” on page 55.
The rack indicator LED does not turn on, but a drawer identify LED is on.	1. Make sure that the rack indicator LED is properly mounted to the rack. 2. Make sure that the rack identify LED is properly cabled to the bus bar on the rack and to the drawer identify LED connector. 3. Replace the following parts one at a time: • Rack LED to bus bar cable • LED bus bar to drawer cable • LED bus bar 4. Contact your next level of support.

Control (operator) panel problems

Symptom	What you should do:
01 does not appear in the upper-left corner of the operator panel display after the power is connected and before you press the power-on button. Other symptoms appear in the operator panel display or LEDs before the power on button is pressed.	Go to Power problems.

Symptom	What you should do:
A bouncing or scrolling ball (moving row of dots) remains on the operator panel display, or the operator panel display is filled with dashes or blocks.	Verify that the operator panel connections to the system backplane are connected and properly seated. Also, reseat the service processor card. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Operator panel assembly. 2. Service processor.

Symptom	What you should do:
You have a blank display on the operator panel. Other LEDs on the operator panel appear to behave normally.	Verify that the operator panel connections to the system backplane are connected and properly seated. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Control (operator) panel assembly. 2. Service processor.
You have a blank display on the operator panel. Other LEDs on the operator panel are off.	Go to Power problems.

Reference codes

Symptom	What you should do:
An 8-digit error code is displayed.	Look up the reference code in the Reference codes section of IBM Knowledge Center. **Note:** If the repair for this code does not involve replacing a FRU (for instance, running an AIX command that fixes the problem or changing a hot-pluggable FRU), then update the AIX error log after the problem is resolved by completing the following steps: 1. In the online diagnostics, select **Task SelectionLog Repair Action**. 2. Select resource **sysplanar0**. On systems with a fault indicator LED, this changes the "fault indicator" LED from the "fault" state to the "normal" state.

Symptom	What you should do:
The system stops with an 8-digit error code displayed when you boot.	Look up the reference code in the Reference codes section of IBM Knowledge Center.
The system stops and a 4-digit code displays on the control panel that does **not** begin with 0 or 2.	Look up the reference code in the Reference codes section of IBM Knowledge Center.
The system stops and a 4-digit code displays on the control panel that begins with 0 or 2 is displayed in the operator panel display.	Record SRN 101-*xxxx*, where *xxxx* is the 4-digit code that is displayed in the control panel, then look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN.
The system stops and a 3-digit number is displayed on the control panel.	Add 101– to the left of the three digits to create an SRN, then look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN. If a location code is displayed under the 3-digit error code, look at the location to see whether it matches the failing component that the SRN pointed to. If they do not match, complete the action that is given in the error code table. If the problem still exists, then replace the failing component from the location code. If a location code is displayed under the 3-digit error code, record the location code. Record SRN 101-*xxx*, where *xxx* is the 3-digit number that is displayed in the operator panel display, then look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN.

Management consoles

Symptom	**What you should do:**
The management console cannot be used to manage a managed system, or the connection to the managed system is failing.	If the managed system is operating normally (no error codes or other symptoms), the management console might have a problem, or the connection to the managed system might be damaged or incorrectly cabled. Complete the following steps: 1. Check the connections between the management console and the managed system. Correct any cabling errors if found. If another cable is available, connect it in place of the existing cables and refresh the management console interface. You might need to wait up to 30 seconds for the managed system to reconnect. 2. Verify that any connected management console is connected to the managed system by checking the Management Environment of the management console. **Note:** The managed system must have power that is connected and the system running, or waiting for a power-on instruction (`01` is in the upper-left corner of the operator panel). If the managed system does not appear in the Navigation area of the management console Management Environment, the management console or the connection to the managed system might be failing. 3. Go to the Managing the HMC section. 4. There might be a problem with the service processor card or the system backplane. If you cannot fix the problem by using the HMC tests in the Managing the HMC section, complete the following steps, one at a time, until the problem is resolved: a. Replace the service processor card. Refer to the remove and replace procedures for your specific system. b. Replace the management console system backplane. Refer to the remove and replace procedures for your specific system.

Symptom	What you should do:
The management console (HMC only) cannot call out using the attached modem and the customer's telephone line.	If the managed system is operating normally (no error codes or other symptoms), the management console might have a problem, or the connection to the modem and telephone line might have a problem. Complete the following steps: 1. Check the connections between the management console, the modem, and the telephone line. Correct any cabling errors, if found. 2. Go to the Managing your server using the Hardware Management Console section.

There is a display problem (for example, distortion or blurring)

Symptom	What you should do:
All display problems.	1. Go to the Managing the HMC section. 2. If you are using a graphics display, complete the following steps: a. Go to the problem determination procedures for the display. b. If you do not find a problem, complete the following steps, one at a time, until the problem is resolved: 1) Replace the graphics display adapter. Refer to the remove and replace procedures for your specific system. 2) Replace the backplane into which the graphics display adapter is plugged. Refer to the remove and replace procedures for your specific system.
There appears to be a display problem (distortion, blurring, and so on).	Go to the problem determination procedures for the display.

Power and cooling problems

Symptom	What you should do:
The system does not power on and no error codes are available.	Go to Power problems.
The power LEDs on the operator panel and the power supply do not come on or stay on.	1. Check the service processor error log. 2. Go to Power problems.
The power LEDs on the operator panel and the power supply come on and stay on, but the system does not power on.	1. Check the service processor error log. 2. Go to Power problems.
A rack or a rack-mounted unit will not power on.	1. Check the service processor error log. 2. Go to Power problems.

Symptom	What you should do:
The cooling fans do not come on, or come on but do not stay on.	1. Check the service processor error log. 2. Go to Power problems.
The system attention LED on the operator panel is on and no error code is displayed.	1. Check the service processor error log. 2. Go to Power problems.

Other symptoms or problems

Symptom	What you should do:
The system stopped and a code is displayed on the operator panel.	Go to Starting a repair action.
`01` is displayed in the upper-left corner of the operator panel and the fans are off.	The service processor is ready. The system is waiting for power-on. Boot the system. If the boot is unsuccessful, and the system returns to the default display (indicated by `01` in the upper-left corner of the operator panel), go to MAP 0020: Problem determination procedure.
The operator panel displays STBY.	The service processor is ready. The server was shut down by the operating system and is still powered on. This condition can be requested by a privileged system user with no faults. Go to Starting a repair action. **Note:** See the service processor error log for possible operating system fault indications.
All of the system POST indicators are displayed on the firmware console, the system pauses and then restarts. The term *POST indicators* refers to the device mnemonics (the words `memory`, `keyboard`, `network`, `scsi`, and `speaker`) that appear on the firmware console during the power-on self-test (POST).	Go to Problems with loading and starting the operating system.
The system stops and all of the POST indicators are displayed on the firmware console. The term *POST indicators* refers to the device mnemonics (the words `memory`, `keyboard`, `network`, `scsi`, and `speaker`) that appear on the firmware console during the power-on self-test (POST).	Go to Problems with loading and starting the operating system.
The system stops and the message `starting software please wait...`is displayed on the firmware console.	Go to Problems with loading and starting the operating system.

Symptom	What you should do:
The system does not respond to the password that was entered or the system login prompt is displayed when you boot the system in service mode.	1. Go to the Managing the HMC. 2. If the password is being entered from a keyboard that is attached to the system, the keyboard or its controller might be faulty. In this case, replace these parts in the following order: a. Keyboard b. Service processor If the problem is fixed, go to "MAP 0410: Repair checkout" on page 41.
The system stops with a prompt to enter a password.	Enter the password. You cannot continue until a correct password is entered. After you enter a valid password, go to the beginning of this table and wait for one of the other conditions to occur.
The system does not respond when the password is entered.	Go to Step 1020-2.
No codes are displayed on the operator panel within a few seconds of turning on the system. The operator panel is blank before the system is powered on.	Reseat the operator panel cable. If the problem is not resolved, replace in the following order: 1. Operator panel assembly. Refer to the remove and replace procedures for your specific system. 2. Service processor. Refer to the remove and replace procedures for your specific system. If the problem is fixed, go to "MAP 0410: Repair checkout" on page 41. If the problem is still not corrected, go to MAP 0020: Problem determination procedure.
The SMS configuration list or boot sequence selection menu shows more SCSI devices that are attached to a controller/adapter than are actually attached.	A device might be set to use the same SCSI bus ID as the control adapter. Note the ID being used by the controller/adapter (this can be checked or changed through an SMS utility), and verify that no device that is attached to the controller is set to use that ID. If settings do not appear to be in conflict, complete the following steps: 1. Go to MAP 0020: Problem determination procedure. 2. Replace the SCSI cable. 3. Replace the device. 4. Replace the SCSI adapter. **Note:** In a "twin-tailed" configuration where there is more than one initiator device (normally another system) attached to the SCSI bus, it might be necessary to use SMS utilities to change the ID of the SCSI controller or adapter.

Symptom	What you should do:
You suspect a cable problem.	Go to Adapters, Devices and Cables for Multiple Bus Systems.
You have a problem that does not prevent the system from booting. The operator panel is functional and the rack indicator LED operates as expected.	Go to MAP 0020: Problem determination procedure.
All other symptoms.	Go to MAP 0020: Problem determination procedure.
All other problems.	Go to MAP 0020: Problem determination procedure.
You do not have a symptom.	Go to MAP 0020: Problem determination procedure.
You have parts to exchange or a corrective action to complete.	1. Go to Starting a repair action. 2. Go to Close of call procedure.
You need to verify that a part exchange or corrective action corrected the problem.	Go to "MAP 0410: Repair checkout" on page 41.
You need to verify correct system operation.	Go to "MAP 0410: Repair checkout" on page 41.
The system stopped. A POST indicator is displayed on the system console and an eight-digit error code is not displayed.	If the POST indicator represents: 1. Memory, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 2. Keyboard a. Replace the keyboard. b. Replace the service processor. The location depends on the model. c. Go to PFW 1548: Memory and processor subsystem problem isolation procedure. 3. Network, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 4. SCSI, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 5. Speaker a. Replace the control panel. The location depends on the model. b. Replace the service processor. The location depends on the model. c. Go to PFW 1548: Memory and processor subsystem problem isolation procedure.
The diagnostic operating instructions are displayed.	Go to MAP 0020: Problem determination procedure.

Symptom	What you should do:
The system login prompt is displayed.	If you are loading the diagnostics from a CD-ROM, you might not have pressed the correct key or you might not have pressed the key soon enough when you were trying to indicate a service mode IPL of the diagnostic programs. If so, start again at the beginning of this step. **Note:** Complete the system shutdown procedure before you turn off the system. If you are sure that you pressed the correct key in a timely manner, go to Step 1020-2. If you are loading diagnostics from a Network Installation Management (NIM) server, check for the following items: • The bootlist on the client might be incorrect. • Cstate on the NIM server might be incorrect. • There might be network problems that are preventing you from connecting to the NIM server. Verify the settings and the status of the network. If you continue to have problems refer to Problems with loading and starting the operating system and follow the steps for network boot problems.
The System Management Services (SMS) menu is displayed when you were trying to boot stand-alone diagnostics.	If you are loading diagnostics from the CD-ROM, you might not have pressed the correct key when you were trying to indicate a service mode IPL of the diagnostic programs. If so, try to boot the CD-ROM again and press the correct key. If you are sure that you pressed the correct key, the device or media you are attempting to boot from might be faulty. 1. Try to boot from an alternate boot device that is connected to the same controller as the original boot device. If the boot succeeds, replace the original boot device (for removable media devices, try the media first). If the boot fails, go to problems with loading and starting the operating system. 2. Go to PFW 1548: Memory and processor subsystem problem isolation procedure.
The SMS boot sequence selection menu or remote IPL menu does not show all of the bootable devices in the partition or system.	If an AIX or Linux partition is being booted, verify that the devices that you expect to see in the list are assigned to this partition. If they are not, use the management console to reassign the required resources. If they are assigned to this partition, go to Problems with loading and starting the operating system to resolve the problem.

Linux fast-path problem isolation

Use this information to help you isolate a hardware problem when you use the Linux operating system.

Linux fast path table

Locate the problem in the following table and then go to the action indicated for the problem.

Symptoms	Action
You have an eight-digit reference code.	Go to Reference codes, and do the listed action for the eight-digit reference code.
You are trying to isolate a problem on a Linux server or a partition that is running Linux operating system.	**Note:** This procedure is used to help display an eight-digit reference code by using system log information. Before you use this procedure, if you are having a problem with a media device such as a tape or DVD-ROM drive, continue through this table and follow the actions for the appropriate device. Go to "Linux problem isolation procedure" on page 58.
You suspect a problem with your server but you do not have any specific symptom.	Go to MAP 0020: Problem determination procedure for problem determination procedures.
You need to run the eServer™ stand-alone diagnostics.	Go to AIX and Linux diagnostics and service aids
SRNs	
You have an SRN.	Look up the SRN in the Service request numbers and do the listed action.
An SRN is displayed when you run the eServer stand-alone diagnostics.	1. Record the SRN and location code. 2. Look up the SRN in the Service request numbers and do the listed action.
Tape Drive Problems	
You suspect a tape drive problem.	1. Refer to the tape drive documentation and clean the tape drive. 2. Refer to the tape drive documentation and do any listed problem determination procedures. 3. Go to MAP 0020: Problem determination procedure for problem determination procedures. **Note:** Information on tape cleaning and tape-problem determination is normally either in the tape drive operator guide or the system operator guide.
Optical Drive Problems	
You suspect an optical drive problem.	1. Refer to the optical documentation and do any listed problem determination procedures. 2. Before you service an optical drive, ensure that it is not in use and that the power connector is correctly attached to the drive. If the load or unload operation does not function, replace the optical drive. 3. Go to MAP 0020: Problem determination procedure for problem determination procedures. **Note:** If the optical drive has its own user documentation, follow any problem determination for the optical drive.

Symptoms	Action
SCSI Disk Drive Problems	
You suspect a disk drive problem. Disk problems are logged in the error log and are analyzed when the stand-alone disk diagnostics are run in problem determination mode. Problems are reported if the number of errors is above defined thresholds.	Go to MAP 0020: Problem determination procedure for problem determination procedures.
Token-Ring Problems	
You suspect a token-ring adapter or network problem.	1. Check with the network administrator for known problems. 2. Go to MAP 0020: Problem determination procedure for problem determination procedures.
Ethernet Problems	
You suspect an Ethernet adapter or network problem.	1. Check with the network administrator for known problems. 2. Go to MAP 0020: Problem determination procedure for problem determination procedures.
Display Problems	
You suspect a display problem.	1. If your display is connected to a KVM switch, go to Troubleshooting the keyboard, video, and mouse (KVM) switch for the 1x8 and 2x8 console manager. If you are still having display problems after you complete the KVM switch procedures, come back here and continue with step 2. 2. Go to the Managing your server using the Hardware Management Console section. 3. If you are using a graphics display, complete the following steps: a. Go to the problem determination procedures for the display. b. If you do not find a problem, complete the following steps, one at a time, until the problem is resolved: 1) Replace the graphics display adapter. Refer to the remove and replace procedures for your specific system. 2) Replace the backplane into which the graphics display adapter is plugged. Refer to the remove and replace procedures for your specific system.
Keyboard or Mouse	

Symptoms	Action
You suspect a keyboard or mouse problem.	If your keyboard is connected to a KVM switch, go to Troubleshooting the keyboard, video, and mouse (KVM) switch for the 1x8 and 2x8 console manager. If you are still having keyboard problems after you complete the KVM switch procedures, come back here and continue to the next paragraph. Go to MAP 0020: Problem determination procedure for problem determination procedures. If you are unable to run diagnostics because the system does not respond to the keyboard, replace the keyboard or system backplane. **Note:** If the problem is with the keyboard, it might be caused by the mouse device. To check, unplug the mouse and then recheck the keyboard. If the keyboard works, replace the mouse.
System Messages	
A System Message is displayed.	1. If the message describes the cause of the problem, attempt to correct it. 2. Look for another symptom to use.
System Hangs or Loops when you run the OS or Diagnostics	
The system hangs in the same application.	Suspect the application. To check the system, complete the following steps: 1. Power off the system. 2. Go to MAP 0020: Problem determination procedure for problem determination procedures. 3. If an SRN is displayed at anytime, record the SRN and location code. 4. Look up the SRN in the Service request numbers and do the listed action.
The system hangs in various applications.	1. Power off the system. 2. Go to MAP 0020: Problem determination procedure for problem determination procedures. 3. If an SRN is displayed at anytime, record the SRN and location code. 4. Look up the SRN in the Service request numbers and do the listed action.
The system hangs when you run diagnostics.	Replace the resource that is being tested.
Exchanged FRUs Did Not Fix the Problem	
A FRU or FRUs you exchanged did not fix the problem.	Go to MAP 0020: Problem determination procedure for problem determination procedures.
You Cannot Find the Symptom in This Table	
All other problems.	Go to MAP 0020: Problem determination procedure for problem determination procedures.

Linux problem isolation procedure
Use this procedure when servicing a Linux partition or a server that has Linux as its only operating system.

About this task

DANGER: When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard:

- If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product.
- Do not open or service any power supply assembly.
- Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.
- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords.
  - For AC power, disconnect all power cords from their AC power source.
  - For racks with a DC power distribution panel (PDP), disconnect the customer’s DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected.
  - For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate.
  - For racks with a DC power distribution panel (PDP), connect the customer’s DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.
- Connect any equipment that will be attached to this product to properly wired outlets.
- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements.
- Do not continue with the inspection if any unsafe conditions are present.
- Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.

DANGER:

- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

  To Disconnect:

  1. Turn off everything (unless instructed otherwise).
  2. For AC power, remove the power cords from the outlets.
  3. For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source.
  4. Remove the signal cables from the connectors.
  5. Remove all cables from the devices.

To Connect:

1. Turn off everything (unless instructed otherwise).
2. Attach all cables to the devices.
3. Attach the signal cables to the connectors.
4. For AC power, attach the power cords to the outlets.
5. For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP.
6. Turn on the devices.

Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

These procedures define the steps to take when servicing a Linux partition or a server that has Linux as its only operating system.

Before continuing with this procedure it is recommended that you review the additional software available to enhance your Linux solutions. See Service and productivity tools for PowerLinux servers (http://www14.software.ibm.com/webapp/set2/sas/f/lopdiags).

Note: If the server is attached to a management console, the various codes that might display on the management console are all listed as reference codes by Service Focal Point (SFP). Use the following table to help you identify the type of error information that might be displayed when you are using this procedure.

Number of digits in reference code	Reference code	Name or code type
Any	Contains # (number sign)	Menu goal
Any	Contains - (hyphen)	Service request number (SRN)
5	Does not contain # or -	SRN
8	Does not contain # or -	system reference code (SRC)

Procedure

1. Is the server managed by a management console that is running Service Focal Point (SFP)?

   No
   Go to step “3” on page 59.

   Yes
   Go to step “2” on page 59.
2. Servers with Service Focal Point

   Look at the service action event log in SFP for errors. Focus on those errors with a timestamp near the time at which the error occurred. Follow the steps indicated in the error log entry to resolve the problem. If the problem is not resolved, continue with step “3” on page 59.
3. Look for and record all reference code information or software messages on the operator panel and in the service processor error log (which is accessible by viewing the ASMI menus).
4. Choose a Linux partition that is running correctly (preferably the partition with the problem).

   Is Linux usable in any partition with Linux installed?

   No
   Go to step “10” on page 60.

   Yes
   Go to step “5” on page 59.
5. Diagnose the RTAS events. For instructions, see Diagnosing RTAS events.

6. Record any RTAS events found in the Linux system log

   If the system is configured with more than one logical partition with Linux installed, repeat step “5” on page 59 and step “6” on page 60 for all logical partitions that have Linux installed.
7. Examine the Linux boot (IPL) log by logging in to the system as the root user and entering the following command:

   ```
   cat /var/log/boot.msg |grep RTAS |more
   ```

   Linux boot (IPL) error messages are logged into the **boot.msg** file under **/var/log**. An example of the Linux boot error log:

   ```
   RTAS daemon started
   RTAS: -------- event-scan begin --------
   RTAS: Location Code: U0.1-F3
   RTAS: WARNING: (FULLY RECOVERED) type: SENSOR
   RTAS: initiator: UNKNOWN target: UNKNOWN
   RTAS: Status: bypassed new
   RTAS: Date/Time: 20020830 14404000
   RTAS: Environment and Power Warning
   RTAS: EPOW Sensor Value: 0x00000001
   RTAS: EPOW caused by fan failure
   RTAS: -------- event-scan end ----------
   ```
8. Record any RTAS events found in the Linux boot (IPL) log in step “7” on page 60.

   Ignore all other events in the Linux boot (IPL) log. If the system is configured with more than one logical partition with Linux installed, repeat step “7” on page 60 and step “8” on page 60 for all logical partitions that have Linux installed.
9. Record any extended data found in the Linux system log in Step “5” on page 59 or the Linux boot (IPL) log in step “7” on page 60.

   Note: The lines in the Linux extended data that begin with `<4>RTAS: Log Debug: 04` contain the reference code listed in the next 8 hexadecimal characters. In the previous example, `4b27 26fb` is a reference code. The reference code is also known as word 11. Each 4 bytes after the reference code in the Linux extended data is another word (for example, `04a0 0011` is word 12, and `702c 0014` is word 13, and so on).

   If the system is configured with more than one logical partition with Linux installed, repeat step “9” on page 60 for all logical partitions that have Linux installed.
10. Were any reference codes or checkpoints recorded in steps “3” on page 59, “6” on page 60, “8” on page 60, or “9” on page 60?

    No

    Go to step “11” on page 60.

    Yes

    Go to the Linux fast-path problem isolation with each reference code that was recorded. Perform the indicated actions one at a time for each reference code until the problem has been corrected. If all recorded reference codes have been processed and the problem has not been corrected, go to step “11” on page 60.
11. If no additional error information is available and the problem has not been corrected, complete the following steps:

    a) Shut down the system.

    b) If a management console is not attached, see Managing your server using the Advanced System Management Interface for instructions to access the ASMI.

    Note: The ASMI functions can also be accessed by using a personal computer connected to system port 1.

    You need a personal computer capable of connecting to system port 1 on the system unit. (The Linux login prompt cannot be seen on a personal computer connected to system port 1.) If the ASMI functions are not otherwise available, use the following procedure:

    1) Attach the personal computer and cable to system port 1 on the system unit.

2) With 01 displayed in the operator panel, press a key on the virtual terminal on the personal computer. The service ASMI menus are available on the attached personal computer.

3) If the service processor menus are not available on the personal computer, perform the following steps:

a) Examine and correct all connections to the service processor.

b) Replace the service processor.

Note: The service processor might be contained on a separate card or board; in some systems, the service processor is built into the system backplane. Contact your next level of support for help before replacing a system backplane.

c) Examine the service processor error log.

Record all reference codes and messages written to the service processor error log. Go to step “12” on page 61.

12. Were any reference codes recorded in step “11” on page 60?

No

Go to step “20” on page 63.

Yes

Go to the Linux fast-path problem isolation with each reference code or symptom you have recorded. Perform the indicated actions, one at a time, until the problem has been corrected. If all recorded reference codes have been processed and the problem has not been corrected, go to “20” on page 63.

13. Reboot the system and bring all partitions to the login prompt.

If Linux is not usable in all partitions, go to step “17” on page 62.

14. Use the `lscfg` command to list all resources assigned to all partitions.

Record the adapter and the partition for each resource.

15. To determine whether any devices or adapters are missing, compare the list of partition assignments, and resources found, to the customer's known configuration. Record the location of any missing devices.

Also record any differences in the descriptions or the locations of devices.

You may also compare this list of resources that were found to an earlier version of the device tree as follows:

Note: At the Linux command prompt, type `vpdupdate`, and press Enter. The device tree is stored in the `/var/lib/lsvpd/` directory in a file with the file name device-tree-YYYY-MM-DD-HH:MM:SS, where YYYY is the year, MM is the month, DD is the day, and HH, MM, and SS are the hour, minute and second, respectively, of the date of creation.

- At the command line, type the following:

```
cd /var/lib/lsvpd/
```

- At the command line, type the following:

```
lscfg -vpz /var/lib/lsvpd/<file_name>
```

Where, *<file_name>* is the .gz file name that contains the database archive.

The **diff** command offers a way to compare the output from a current **lscfg** command to the output from an older **lscfg** command. If the files names for the current and old device trees are **current.out** and **old.out**, respectively, type: `diff old.out current.out`. Any lines that exist in the old, but not in the current will be listed and preceded by a less-than symbol (<). Any lines that exist in the current, but not in the old will be listed and preceded by a greater-than symbol (>). Lines that are the same in both files are not listed; for example, files that are identical will produce no output from the diff command. If the location or description changes, lines preceded by both < and > will be output.

If the system is configured with more than one logical partition with Linux installed, repeat “14” on page 61 and “15” on page 61 for all logical partitions that have Linux installed.

16. Was the location of one and only one device recorded in “15” on page 61?

    No

    If you previously answered Yes to step “16” on page 62, return the system to its original configuration. **This ends the procedure**.

    Go to MAP 0410: Repair checkout.

    If you did not previously answer Yes to step “16” on page 62, go to step “17” on page 62.

    Yes

    Complete the following steps one at a time. Power off the system before each step. After each step, power on the system and go to step “13” on page 61.

    a. Check all connections from the system to the device.
    b. Replace the device (for example, tape or DASD).
    c. If applicable, replace the device backplane.
    d. Replace the device cable.
    e. Replace the adapter.
       - If the adapter resides in an I/O drawer, replace the I/O backplane.
       - If the device adapter resides in the CEC, replace the I/O riser card, or the CEC backplane in which the adapter is plugged.
    f. Call service support. Do not go to step “13” on page 61.

17. Does the system appear to stop or hang before reaching the login prompt or did you record any problems with resources in step “15” on page 61?

    Note: If the system console or VTERM window is always blank, choose NO. If you are sure the console or VTERM is operational and connected correctly, answer the question for this step.

    No

    Go to step “18” on page 62.

    Yes

    There may be a problem with an I/O device. Go to PFW1542: I/O problem isolation procedure. When instructed to boot the system, boot a full system partition.

18. Boot the eServer standalone diagnostics, refer to Running the online and stand-alone diagnostics.

    Run diagnostics in problem determination mode on all resources. Be sure to boot a full system partition. Ensure that diagnostics were run on all known resources. You may need to select each resource individually and run diagnostics on each resource one at a time.

    Did standalone diagnostics find a problem?

    No

    Go to step “22” on page 63.

    Yes

    Go to the Reference codes and perform the actions for each reference code you have recorded. For each reference code not already processed in step “16” on page 62, repeat this action until the problem has been corrected. Perform the indicated actions, one at a time. If all recorded reference codes have been processed and the problem has not been corrected, go to step “22” on page 63.

19. Does the system have Linux installed on one or more partitions?

    No

    Return to the Start a repair action.

    Yes

    Go to step “3” on page 59.

20. Were any location codes recorded in steps “3” on page 59, “6” on page 60, “8” on page 60, “9” on page 60, “10” on page 60, or “11” on page 60?

    No

    Go to step “13” on page 61.

    Yes

    Replace, one at a time, all parts whose location code was recorded in steps “3” on page 59, “6” on page 60, “8” on page 60, “9” on page 60, “10” on page 60, or “11” on page 60 that have not been replaced. Power off the system before replacing a part. After replacing the part, power on the system to check if the problem has been corrected. Go to step “21” on page 63 when the problem has been corrected, or all parts in the location codes list have been replaced.

21. Was the problem corrected in step “20” on page 63?

    No

    Go to step “13” on page 61.

    Yes

    Return the system to its original configuration. **This ends the procedure**.

    Go to MAP 0410: Repair checkout.

22. Were any other symptoms recorded in step “3” on page 59?

    No

    Call support.

    Yes

    Go to the Start a repair action with each symptom you have recorded. Perform the indicated actions for all recorded symptoms, one at a time, until the problem has been corrected. If all recorded symptoms have been processed and the problem has not been corrected, call your next level of support.

Detecting problems

Provides information on using various tools and techniques to detect and identify problems.

IBM i problem determination procedures

There are several tools you can use to determine a problem with an IBM i system or partition.

These include:

Searching the service action log

Use this procedure to search for an entry in the service action log (SAL) that matches the time, reference code, or resource of the reported problem.

Procedure

1. On the command line, enter the Start System Service Tools (STRSST) command. If you cannot get to system service tools (SST), use function 21 to get to dedicated service tools (DST).
2. On the Start Service Tools Sign On display, type in a user ID with QSRV authority and password.
3. Select **Start a Service Tool** > **Hardware Service Manager** > **Work with service action log**.
4. On the Select Timeframe display, change the From: **Date** and **Time** fields to a date and time before the customer reported having the problem.
5. Search for an entry that matches one or more conditions of the problem:
    - Reference code
    - Resource
    - Time
    - Failing item list
6. Perform the following actions:
    - Choose **Display the failing item information** to display the service action log entry.

- Use the **Display details** option to display part location information.

  All new entries in the service action log represent problems that require a service action. It might be necessary to handle any problem in the log even if it does not match the original problem symptom.

  The information that is displayed in the date and time fields are the **Date** and **Time** for the first occurrence of the specific reference code for the resource that is displayed during the time range selected.

7. Did you find an entry in the service action log?

   - **Yes:** Continue with the next step.
   - **No:** Go to "Problems with noncritical resources" on page 105. **This ends the procedure.**

8. Is `See the service information system reference code tables for further problem isolation` shown near the top of the display or are there procedures in the field replaceable unit (FRU) list?

   - **Yes:** Perform the following steps:

     a. Go to the list of reference codes and use the reference code that is indicated in the log to find the correct reference code table and unit reference code.

     b. Perform all actions in the Description/Action column before you replace failing items.

        Note: When you replace failing items, use the part numbers and locations that are found in the service action log entry.

        This ends the procedure.

   - **No:** Display the failing item information for the service action log entry. Items at the top of the failing item list are more likely to fix the problem than items at the bottom of the list.

     Notes:

     a. Some failing items must be replaced in groups until the problem is solved.

     b. Other failing items are flagged as mandatory exchanges and must be replaced before the service action is complete, even if the problem appears to be repaired.

     c. Use the **Part Action Code** field in the Service Action Log display to determine whether failing items are to be replaced in groups or as mandatory exchanges.

     d. Unless the **Part Action Code** of a FRU indicates a group or mandatory exchange, exchange the failing items one at a time until the problem is repaired. Use the help function to determine the meaning of part action codes.

     Continue with the next step.

9. Perform the following steps to help resolve the problem:

   a) To display location information, choose the function key for **Additional details**.

      If location information is available, go to Part locations and location codes for the model you are working on to determine what removal and replacement procedure to perform. To turn on the failing item's identify light, use the indicator-on option.

      Note: In some cases where the failing item does not contain a physical identify light, a higher level identify light is activated (for example, the backplane or the unit that contains the failing item). Use the location information to locate the actual failing item.

   b) If the failing item is Licensed Internal Code, contact your next level of support for the correct fix to apply.

10. After you exchange an item, perform the following steps:

    a) Go to Verifying a repair.

    b) If the failing item indicator was turned on during the removal and replacement procedure, use the indicator-off option to turn off the indicator.

    c) If all problems are resolved for the partition, use the Acknowledge all errors function at the bottom of the service action log display.

   d) Close the log entry by selecting **Close a NEW entry** on the Service Action Log Report display. **This ends the procedure.**

Using the product activity log

This procedure can help you learn how to use the product activity log (PAL).

Procedure

1. To locate a problem, find an entry in the product activity log for the symptom you are seeing.
   a) On the command line, enter the Start System Service Tools (SST) command:

   ```
   STRSST
   ```

   If you cannot get to SST, select DST.

   Note: Do not perform an IPL on the system or partition to get to DST.

   b) On the Start Service Tools Sign On display, type a user ID with service authority and password.

   c) From the System Service Tools display, select **Start a Service Tool** > **Product activity log** > **Analyze log**.

   d) On the Select Subsystem Data display, select the option to view **All Logs**.

   Note: You can change the From: and To: Dates and Times from the 24-hour default if the time that the customer reported having the problem was more than 24 hours ago.

   e) Use the defaults on the Select Analysis Report Options display by pressing the Enter key.

   f) Search the entries on the Log Analysis Report display.

   Note: For example, a 6380 Tape Unit error would be identified as follows:

   System Reference Code: 6380CC5F
   Class: Perm
   Resource Name: TAP01

2. Find an SRC from the product activity log that best matches the time and type of the problem the customer reported.

   Did you find an SRC that matches the time and type of problem the customer reported?

   Yes: Use the SRC information to correct the problem. **This ends the procedure.**
   No: Contact your next level of support. **This ends the procedure**.

Using the problem log

Use this procedure to find and analyze a problem log entry that relates to the problem reported.

About this task

Note: For on-line problem analysis (WRKPRB), ensure that you are logged on with QSRV authority. During problem isolation, this will allow access to test procedures that are not available under any other log-on.

Procedure

1. On the command line, enter the Work with Problems command:

   ```
   WRKPRB
   ```

   Note: Use F4 to change the WRKPRB parameters to select and sort on specific problem log entries that match the problem. Also, F11 displays the dates and times the problems were logged by the system.

   Was an entry that relates to the problem found?

   Note: If the WRKPRB function was not available answer NO.

   Yes: Continue with the next step.

   No: Go to Problems with noncritical resources. **This ends the procedure**.

2. Select the problem entry by moving the cursor to the problem entry option field and entering option 8 to work with the problem.

   Is Analyze Problem (option 1) available on the Work with Problem display?

   No: Perform the following:

   a. Return to the initial problem log display (F12).
   b. Select the problem entry by moving the cursor to the problem entry option field and selecting the option to display details.
   c. Select the function key to display possible causes.

      Note: If this function key is not available, use the customer reported symptom string for customer perceived information about this problem. Then, go to "Using the product activity log" on page 65.
   d. Use the list of possible causes as the FRU list and go to step "5" on page 66.

   Yes: Run Analyze Problem (option 1) from the Work with Problem display.

   Notes:

   a. For SRCs starting with 6112 or 9337, use the SRC and go to the Reference codes topic.
   b. If the message on the display directs you to use SST (System Service Tools), go to COMIP01.

   Was the problem corrected by the analysis procedure?

   No: Continue with the next step.

   Yes: **This ends the procedure**.

3. Did problem analysis send you to another entry point in the service information?

   No: Continue with the next step.

   Yes: Go to the entry point indicated by problem analysis. **This ends the procedure**.

4. Was the problem isolated to a list of failing items?

   Yes: Continue with the next step.

   No: Go to Problems with noncritical resources. **This ends the procedure**.

5. Exchange the failing items one at a time until the problem is repaired.

   Notes:

   a. For Symbolic FRUs, see Symbolic FRUs.
   b. When exchanging FRUs, go to the remove and replace procedures for your specific system.

   Has the problem been resolved?

   No: Contact your next level of support. **This ends the procedure**.

   Yes: **This ends the procedure**.

Problem determination procedure for AIX or Linux servers or partitions

This procedure helps to produce or retrieve a service request number (SRN) if the customer or a previous procedure did not provide one.

If your server is running AIX or Linux, use one of the following procedures to test the server or partition resources to help you determine where a problem might exist.

If you are servicing a server running the AIX operating system, go to MAP 0020: Problem determination procedure.

If you are servicing a server running the Linux operating system, go to the Linux problem isolation procedure.

System unit problem determination

Use this procedure to obtain a reference code if the customer did not provide you with one, or you are unable to load server diagnostics.

If you are able to load the diagnostics, go to Problem determination procedure for AIX or Linux servers or partitions.

The service processor may have recorded one or more symptoms in its error log. Examine this error log before proceeding (For more information, see Managing your server using the Advanced System Management Interface). The server may have been set up by using the management console. Check the Service Action Event (SAE) log in the Service Focal Point. The SAE log may have recorded one or more symptoms in the Service Focal Point. To avoid unnecessary replacement of the same FRU for the same problem, it is necessary to check the SAE log for evidence of prior service activity on the same subsystem.

The service processor may have been set by the user to monitor system operations and to attempt recoveries. You can disable these actions while you diagnose and service the system. If the system maintenance policies were saved by using the save/restore hardware maintenance policies, all the settings of the service processor (except language) were saved and you can use the same service aid to restore the settings at the conclusion of your service action.

If you disable the service processor settings, note their current settings so that you can restore when you are done.

If the system is set to power on using one of the parameters in the following table, disconnect the modem to prevent incoming signals that could cause the system to power on.

Following are the service processor settings. For more information about the service processor settings, see Managing your server using the Advanced System Management Interface.

Table 11. Service processor settings

Setting	Description
Monitoring (also called surveillance)	From the ASMI menu, expand the **System Configuration**, then click on **Monitoring**. Disable both types of surveillance.
Auto power restart (also called unattended start mode)	From the ASMI menu, expand **Power/Restart Control**, then click on **Auto Power Restart**, and set it to disabled.
Wake on LAN	From the ASMI menu, expand **Wake on LAN**, and set it to disabled
Call out	From the ASMI menu, expand the **Service Aids**, then click on **Call-Home/Call-In Setup**. Set the call-home system port and the call-in system port to disabled.

Step 1020-1

Be prepared to record code numbers to help analyze a problem.

Analyze a failure to load the diagnostic programs

Follow these steps to analyze a failure to load the diagnostic programs.

Note: Be prepared to answer questions regarding the control panel and to perform certain actions based on displayed POST indicators. Observer these conditions.

1. Run diagnostics on any partition. Find your symptom in the following table, then follow the instructions given in the Action column. If no fault is identified, continue to the next step.
2. Run diagnostics on the failing partition. Find your symptom in the following table, then follow the instructions given in the Action column. If no fault is identified, continue to the next step.
3. Power off the system.

4. Load the standalone diagnostics in service mode to test the full system partition. For more information, see Running the online and stand-alone diagnostics.
5. Wait until the diagnostics are loaded or the system appears to stop. If you receive an error code or if the system stops before diagnostics are loaded, find your symptom in the following table, then follow the instructions given in the Action column. If no fault is identified, continue to the next step.
6. Run the standalone diagnostics on the entire system. Find your symptom in the following table, then follow the instructions given in the Action column. If no fault is identified, call service support for assistance.

Symptom	**Action**
One or more logical partitions does not boot.	a. Check service processor error log. If an error is indicated, go to Starting a repair action. b. Check the Serviceable action event log, go to Starting a repair action. c. Go to Problems with loading and starting the operating system.
The rack identify LED does not operate properly.	Go to Starting a repair action.
The system stopped and a system reference code is displayed on the operator panel.	Go to Starting a repair action.
The system stops with a prompt to enter a password.	Enter the password. You cannot continue until a correct password has been entered. When you have entered a valid password, go to the beginning of this table and wait for one of the other conditions to occur.
The diagnostic operating instructions are displayed.	Go to MAP 0020: AIX or Linux problem determination procedure.
The power good LED does not come on or does not stay on, or you have a power problem.	Go to Power problems.
The system login prompt is displayed.	You may not have pressed the correct key or you may not have pressed the key soon enough when you were to trying to indicate a service mode IPL of the diagnostic programs. If this is the case, start again at the beginning of this step. **Note:** Perform the system shutdown procedure before turning off the system. If you are sure you pressed the correct key in a timely manner, go to Step 1020-2.
The system does not respond when the password is entered.	Go to Step 1020-2.

Symptom	Action
The system stopped. A POST indicator is displayed on the system console and an eight-digit error code is not displayed.	If the POST indicator represents: a. Memory, go to PFW 1548: Memory and processor subsystem problem isolation procedure. b. Keyboard 1) Replace the keyboard cable. 2) Replace the keyboard. 3) Replace the service processor. Location is model dependent. 4) Go to PFW1542: I/O problem isolation procedure. c. Network, go to PFW1542: I/O problem isolation procedure. d. SCSI, go to PFW1542: I/O problem isolation procedure. e. Speaker 1) Replace the operator panel. Location is model dependent. 2) Replace the service processor. Location is model dependent. 3) Go to PFW1542: I/O problem isolation procedure.
The System Management Services menu is displayed.	Go to PFW1542: I/O problem isolation procedure.
All other symptoms.	If you were directed here from the Entry MAP, go to PFW1542: I/O problem isolation procedure. Otherwise, find the symptom in the Starting a repair action.

Step 1020-2

Use this procedure to analyze a keyboard problem.

Find the type of keyboard you are using in the following table; then follow the instructions given in the Action column.

Keyboard Type	Action
Type 101 keyboard (U.S.). Identified by the size of the Enter key. The Enter key is in only one horizontal row of keys.	Record error code M0KB D001; then go to Step 1020-3.
Type 102 keyboard (W.T.). Identified by the size of the Enter key. The Enter key extends into two horizontal rows.	Record error code M0KB D002; then go to Step 1020-3.
Type 106 keyboard. (Identified by the Japanese characters.)	Record error code M0KB D003; then go to Step 1020-3.
ASCII terminal keyboard	Go to the documentation for this type of ASCII terminal and continue with problem determination.

Step 1020-3

Perform the following steps:

1. Find the 8-digit error code in Reference codes.

   Note: If you do not locate the 8-digit code, look for it in one of the following places:

   - Any supplemental service manuals for attached devices
   - The diagnostic problem report screen for additional information
   - The Service Hints service aid
   - The CEREADME file
2. Perform the action listed.

Management console machine code problems

The support organization uses the *pesh* command to look at the management console internal machine code to determine how to fix a machine code problem. Only a service representative or support representative can access this feature.

Launching an xterm shell

About this task

You may need to launch an xterm shell to perform directed support from the support center. This may be required if the support center needs to analyze a system dump in order to better understand machine code operations at the time of a failure. To launch an xterm shell, perform the following:

Procedure

1. Open a terminal by right-clicking the background and selecting **Terminals** > **rshterm**.
2. Type the *pesh* command followed by the serial number of the management console and press Enter.
3. You will be prompted for a password, which you must obtain from your next level of support.

Results

Additional information: “Viewing the management console logs” on page 70.

Viewing the management console logs

The console logs display error and information messages that the console has logged while running commands.

About this task

The service representative can use this information to learn more about what caused an error and how to resolve it. The management console classifies log entries as either an informational message or an error message. Log entries are identified with an *I* or *E*, respectively. The management console lists these log entries chronologically, with the most recent shown at the top of the list.

Use the management console Log to view a record of management console system events. System events are activities that indicate when processes begin and end. These events also indicate whether the attempted action was successful.

To view the HMC log, perform the following:

1. Launch an xterm shell (see “Launching an xterm shell” on page 70).
2. When you have entered the password, use the *showLog* command to launch the HMC log window.

The log includes the following information:

- The event's unique ID code
- The date the event occurred
- The time the event occurred
- The log's type
- The name of the attempted action
- The log's reference code
- The status of the log

View a particular event

About this task

To view a particular event, perform the following steps:

Procedure

1. Select an event by clicking once on it.
2. Press Enter to get to a summary of the log you selected. From here, you must select a Block ID to display. The blocks are listed next to the buttons and include the following options:
   - Standard Data Block
   - Secondary Data Block
   - Microcode Reason / ID Error Information
3. Select the data block you want to view.
4. Press Enter. The extended information shown for the data blocks you selected includes the following items:
   - Program name
   - Current process ID
   - Parent process ID
   - Current thread priority
   - Current thread ID
   - Screen group
   - Subscreen group
   - Current foreground screen process group
   - Current background screen process group

Problem determination procedures

Problem determination procedures are provided by power-on self-tests (POSTs), service request numbers, and maintenance analysis procedures (MAPs). Some of these procedures use the service aids that are described in the user or maintenance information for your system SCSI attachment.

Disk drive module power-on self-tests

The disk drive module Power-on Self-Tests (POSTs) start each time that the module is switched on, or when a Send Diagnostic command is received. They check whether the disk drive module is working correctly. The POSTs also help verify a repair after a Field Replaceable Unit (FRU) has been exchanged.

The tests are POST-1 and POST-2.

POST-1 runs immediately after the power-on reset line goes inactive, and before the disk drive module motor starts. POST-1 includes the following tests:

- Microprocessor
- ROM
- Checking circuits

If POST-1 completes successfully, POST-2 is enabled.

If POST-1 fails, the disk drive module is not configured into the system.

POST-2 runs after the disk drive module motor has started. POST-2 includes the following tests:

- Motor control
- Servo control
- Read and write on the diagnostic cylinder (repeated for all heads)
- Error checking and correction (ECC).

If POST-2 completes successfully, the disk drive module is ready for use with the system.

If POST-2 fails, the disk drive module is not configured into the system.

SCSI card power-on self-tests

The SCSI card Power-On Self Tests (POSTs) start each time power is switched on, or when a Reset command is sent from the using system SCSI attachment. They check only the internal components of the SCSI card; they do not check any interfaces to other FRUs.

If the POSTs complete successfully, control passes to the functional microcode of the SCSI card. This microcode checks all the internal interfaces of the I/O enclosure, and reports failures to the host system.

If the POSTs fail, one of the following events occur:

- The SCSI card check LED and the enclosure check LED come on.
- If the SCSI was configured for high availability using a dual initiator card the error will be reported. However, the functional operation of the enclosure is not affected. For example, the customer still has access to all the disk drive modules.

The failure is reported when:

- the failure occurs at system bring-up time, the host system might detect that the enclosure is missing, and reports an error.
- the failure occurs at any time other than system bring-up time, the hourly health check reports the failure.

Analyzing problems

Use these instructions and procedures to help you determine the cause of the problem.

Problems with loading and starting the operating system (AIX and Linux)

If the system is running partitions from partition standby (LPAR), the following procedure addresses the problem in which one partition does not boot AIX or Linux while other partitions boot successfully and run the operating system successfully.

About this task

It is the customer's responsibility to move devices between partitions. If a device must be moved to another partition to run stand-alone diagnostics, contact the customer or system administrator. If the optical drive must be moved to another partition, all SCSI devices that are connected to that SCSI adapter must be moved because moves are done at the slot level, not at the device level.

Depending on the boot device, a checkpoint might be displayed on the operator panel for an extended period while the boot image is retrieved from the device. This is particularly true for tape and network boot attempts. If you are booting from an optical drive or tape drive, watch for activity on the drive's LED indicator. A flashing LED indicates that the loading of either the boot image or additional information that is required by the operating system that is being booted is still in progress. If the checkpoint is displayed for an extended period and the drive LED is not indicating any activity, there might be a problem with loading the boot image from the device.

Notes:

1. For network boot attempts, if the system is not connected to an active network or if the target server is inaccessible (which can also result from incorrect IP parameters), the system still attempts to boot. Because time-out durations are necessarily long to accommodate retries, the system might appear to be hung. Refer to checkpoint CA00 E174.
2. If the partition hangs with a 4-character checkpoint in the display, the partition must be deactivated, then reactivated before you attempt to reboot.
3. If a BA06 000x error code is reported, the partition is already deactivated and in the error state. Reboot by activating the partition. If the reboot is still not successful, go to step “3” on page 73.

This procedure assumes that a diagnostic CD-ROM and an optical drive from which it can be booted are available, or that diagnostics can be run from a NIM (Network Installation Management) server. Booting the diagnostic image from an optical drive or a NIM server is referred to as running stand-alone diagnostics.

Procedure

1. Is a management console attached to the managed system?

   Yes: Continue with the next step.
   No: Go to step "3" on page 73.
2. Look at the service action event error log on the management console.

   Complete the actions necessary to resolve any open entries that affect devices in the boot path of the partition or that indicate problems with I/O cabling. Then, try to reboot the partition. Does the partition reboot successfully?

   Yes: This ends the procedure.
   No: Continue with the next step.
3. Boot to the SMS main menu. Then, choose from the following options:

   - If you are rebooting a partition from partition standby (LPAR), go to the properties of the partition and select **Boot to SMS**, then activate the partition.
   - If you are rebooting from platform standby, access the ASMI. See Setting up and accessing the ASMI. Select **Power/Restart Control**, then **Power On/Off System**. In the AIX/Linux partition mode boot box, select **Boot to SMS menu** > **Save Settings and Power On**.

   At the SMS main menu, select **Select Boot Options** and verify whether the intended boot device is correctly specified in the boot list. Is the intended load device correctly specified in the boot list?

   - **Yes:** Complete the following steps:

     a. Remove all removable media from devices in the boot list from which you do not want to load the operating system.
     b. If you are attempting to load the operating system from a network, go to step "4" on page 73.
     c. If you are attempting to load the operating system from a disk drive or an optical drive, go to step "7" on page 74.
     d. **No:** Go to step "5" on page 73.
4. If you are attempting to load the operating system from the network, complete the following steps:

   - Verify that the IP parameters are correct.
   - Use the SMS ping utility to attempt to ping the target server. If the ping is not successful, have the network administrator verify the server configuration for this client.
   - Check with the network administrator to ensure that the network is up. Also, ask the network administrator to verify the settings on the server from which you are trying to load the operating system.
   - Check the network cabling to the adapter.

   Restart the partition and try loading the operating system. Does the operating system load successfully?

   Yes: This ends the procedure.
   No: Go to step "7" on page 74.
5. Use the SMS menus to add the intended boot device to the boot sequence.

   Can you add the device to the boot sequence?

   Yes: Restart the partition. **This ends the procedure.**
   No: Continue with the next step.

6. Ask the customer or system administrator to verify that the device you are trying to load from is assigned to the correct partition.

   Then, select **List All Devices** and record the list of bootable devices that displays. Is the device from which you want to load the operating system in the list?

   Yes: Go to step "7" on page 74.
   No: Go to step "10" on page 74.

7. Try to load and run stand-alone diagnostics against the devices in the partition, particularly against the boot device from which you want to load the operating system.

   You can run stand-alone diagnostics from an optical drive or a NIM server. To boot stand-alone diagnostics, follow the detailed procedures in Running the online and stand-alone diagnostics.

   Note: When you attempt to load diagnostics on a partition from partition standby, the device from which you are loading stand-alone diagnostics must be made available to the partition that is not able to load the operating system, if it is not already in that partition. Contact the customer or system administrator if a device must be moved between partitions to load stand-alone diagnostics.

   Did stand-alone diagnostics load and start successfully?

   Yes: Go to step "8" on page 74.
   No: Go to step "14" on page 75.

8. Was the intended boot device present in the output of the option **Display Configuration and Resource List** that is run from the Task Selection menu?

   - **Yes:** Continue with the next step.
   - **No:** Go to step "10" on page 74.

9. Did running diagnostics against the intended boot device result in a **No Trouble Found** message?

   Yes: Go to step "12" on page 75.
   No: Go to the list of service request numbers and complete the repair actions for the SRN reported by the diagnostics. After you complete the repair actions, go to step "13" on page 75.

10. Complete the following actions:

    a) Complete the first item in the action list below. In the list of actions below, choose SCSI or IDE based on the type of device from which you are trying to boot the operating system.

    b) Restart the system or partition.

    c) Stop at the SMS menus and select **Select Boot Options**.

    d) Is the device that was not appearing previously in the boot list now present?

       Yes: Go to Verifying a repair. **This ends the procedure.**
       No: Perform the next item in the action list and then return to step "10.b" on page 74. If no more items are in the action list, go to step "11" on page 75.

    Action list:

    Note: See Part locations and location codes for part numbers and links to exchange procedures.

    a) Verify that the SCSI or IDE cables are properly connected. Also, verify that the device configuration and address jumpers are set correctly.

    b) Choose from the following options:

       - **SCSI boot device**: If you are attempting to boot from a SCSI device, remove all hot-swap disk drives (except the intended boot device, if the boot device is a hot-swap drive).If the boot device is present in the boot list after you boot the system to the SMS menus, add the hot-swap disk drives back in one at a time, until you isolate the failing device.
       - **IDE boot device**: If you are attempting to boot from an IDE device, disconnect all other internal SCSI or IDE devices. If the boot device is present in the boot list after you boot the system to the SMS menus, reconnect the internal SCSI or IDE devices one at a time, until you isolate the failing device or cable.

    c) Replace the SCSI or IDE cables.

d) Replace the SCSI backplane (or IDE backplane, if present) to which the boot device is connected.

e) Replace the intended boot device.

f) Replace the system backplane.

11. Choose from the following options:

    - If the intended boot device is not listed, go to "PFW1548: Memory and processor subsystem problem isolation procedure" on page 81. **This ends the procedure.**
    - If an SRN is reported by the diagnostics, go to the list of service request numbers and follow the action that is listed. **This ends the procedure.**

12. Have you disconnected any other devices?

    Yes: Reinstall each device that you disconnected, one at a time. After you reinstall each device, reboot the system. Continue this procedure until you isolate the failing device. Replace the failing device. Then, go to step "13" on page 75.

    No: Perform an operating system-specific recovery process or reinstall the operating system. **This ends the procedure.**

13. Is the problem corrected?

    Yes: Go to Verifying a repair. **This ends the procedure.**

    No: If the replacement of the indicated FRUs did not correct the problem, or if the previous steps did not address your situation, go to "PFW1548: Memory and processor subsystem problem isolation procedure" on page 81. **This ends the procedure.**

14. Is a SCSI boot failure (where you cannot boot from a SCSI-attached device) also occurring?

    - **Yes:** Go to "PFW1548: Memory and processor subsystem problem isolation procedure" on page 81. **This ends the procedure.**
    - **No:** Continue to the next step.

15. Complete the following actions to determine whether another adapter is causing the problem:

    a) Remove all adapters except the one to which the optical drive is attached and the one used for the console.

    b) Reload the stand-alone diagnostics. Can you successfully reload the stand-alone diagnostics?

    - **Yes:** Complete the following steps:

        1) Reinstall the adapters that you removed (and attach devices as applicable) one at a time. After you reinstall each adapter, try the boot operation again until the problem recurs.

        2) Replace the adapter or device that caused the problem.

        3) Go to Verifying a repair. **This ends the procedure.**

    - **No:** Continue with the next step.

16. The graphics adapter (if installed), optical drive, IDE or SCSI cable, or system board is most likely defective.

    Is a PCI graphics adapter installed in the system?

    Yes: Continue with the next step.

    No: Go to step "18" on page 75.

17. Complete the following steps to determine whether the graphics adapter is causing the problem:

    a) Remove the graphics adapter.

    b) Attach a TTY terminal to the system port.

    c) Try to reload stand-alone diagnostics. Do the stand-alone diagnostics load successfully?

    Yes: Replace the graphics adapter. **This ends the procedure.**

    No: Continue with the next step.

18. Replace the following (if not already replaced), one at a time, until the problem is resolved:

    a) Optical drive

b) IDE or SCSI cable that goes to the optical drive.

c) System board that contains the integrated SCSI or IDE adapters.

If this resolves the problem, go to Verifying a repair. If the problem still persists or if the previous descriptions did not address your particular situation, go to “PFW1548: Memory and processor subsystem problem isolation procedure” on page 81.

This ends the procedure.

PFW1540: Problem isolation procedures

The PFW1540 procedures are used to locate problems in the processor subsystem or I/O subsystem.

If a problem is detected, these procedures help you isolate the problem to a failing unit. Find the symptom in the following table; then follow the instructions given in the Action column.

Problem Isolation Procedures

Symptom/Reference Code/Checkpoint	Action
You have or suspect an I/O card or I/O subsystem failure.You received one of the following SRNs or reference codes: 101-000, 101-517, 101-521, 101-538, 101-551 to 101-557, 101-559 to 101-599, 101-662, 101-727, 101-c32, 101-c33, 101-c70	Go to “PFW1542: I/O problem isolation procedure” on page 77.
You have or suspect a memory or processor subsystem problem. You received the following SRN or reference code: 101-185	Go to “PFW1548: Memory and processor subsystem problem isolation procedure” on page 81.
If you were directed to the PFW1540 procedure by an SRN and that SRN is not listed in this table.	Go to “PFW1542: I/O problem isolation procedure” on page 77.

FRU identify LEDs

Your system is configured with an arrangement of LEDs that help identify various components of the system. These include but are not limited to:

- Rack identify beacon LED (optional rack status beacon)
- Processor subsystem drawer identify LED
- I/O drawer identify LED
- FRU identify LED
- Power subsystem FRUs
- Processor subsystem FRUs
- I/O subsystem FRUs
- I/O adapter identify LED
- DASD identify LED

The identify LEDs are arranged hierarchically with the FRU identify LED at the bottom of the hierarchy, followed by the corresponding processor subsystem or I/O drawer identify LED, and the corresponding rack identify LED to locate the failing FRU more easily. Any identify LED in the system may be flashed; see Managing the Advanced system Management Interface (ASMI).

Any identify LED in the system may also be flashed by using the AIX diagnostic programs task "Identify and Attention Indicators". The procedure to use the AIX diagnostics task "Identify and Attention Indicators" is outlined in "diagnostic and service aids" in Running the online and stand-alone diagnostics.

PFW1542: I/O problem isolation procedure

This I/O problem-determination procedure isolates I/O card and I/O subsystem failures. When I/O problem isolation is complete, all cables and cards that are failing will have been replaced or reseated.

For more information about failing part numbers, location codes, or removal and replacement procedures, see Part locations and location codes (http://www.ibm.com/support/knowledgecenter/POWER9/p9ecs/p9ecs_locations.htm). Select your machine type and model number to see applicable procedures for your system.

Notes:

1. To avoid damage to the system or subsystem components, unplug the power cords before removing or installing a part.
2. This procedure assumes either of the following items:
   - An optical drive is installed and connected to the integrated EIDE adapter, and a stand-alone diagnostic CD-ROM is available.
   - Stand-alone diagnostics can be booted from a NIM server.
3. If a power-on password or privileged-access password is set, you are prompted to enter the password before the stand-alone diagnostic CD-ROM can load.
4. The term POST indicators refers to the device mnemonics that appear during the power-on self-test (POST).
5. The service processor might have been set by the user to monitor system operations and to attempt recoveries. You might want to disable these options while you diagnose and service the system. If these settings are disabled, make notes of their current settings so that they can be restored before the system is turned back over to the customer.

   The following settings may be of interest.

   Monitoring
   (also called surveillance) From the ASMI menu, expand the System Configuration menu, then click **Monitoring**. Disable both types of surveillance.

   Auto power restart
   (also called unattended start mode) From the ASMI menu, expand **Power/Restart Control**, then click **Auto Power Restart**, and set it to disabled.

   Wake on LAN
   From the ASMI menu, expand **Wake on LAN**, and set it to disabled.

   Call Out
   From the ASMI menu, expand the Service Aids menu, then click **Call-Home/Call-In Setup**. Set the call-home system port and the call-in system port to disabled.
6. Verify that the system has not been set to boot to the SMS menus or to the open firmware prompt. From the ASMI menu, expand **Power/Restart Control** to view the menu, then click **Power On/Off System**. The AIX/Linux partition mode boot indicates **Continue to Operating System**.

Use this procedure to locate defective FRUs not found by normal diagnostics. For this procedure, diagnostics are run on a minimally configured system. If a failure is detected on the minimally configured system, the remaining FRUs are exchanged one at a time until the failing FRU is identified. If a failure is not detected, FRUs are added back until the failure occurs. The failure is then isolated to the failing FRU.

Perform the following procedure:

- **PFW1542-1**
  1. Ensure that the diagnostics and the operating system are shut down.
  2. Turn off the power.
  3. Turn on the power.
  4. Insert the stand-alone diagnostic CD-ROM into the optical drive.

  Does the optical drive appear to operate correctly?

No
Go to “Problems with loading and starting the operating system (AIX and Linux)” on page 72.

Yes
Continue to PFW1542-2.

- **PFW1542-2**

 1. When the keyboard indicator is displayed (the word "keyboard"), if the system or partition gets that far in the IPL process, press the 5 key on the firmware console.
 2. If you are prompted to do so, enter the appropriate password.

 Is the "Please define the System Console" screen displayed?

 No
 Continue to PFW1542-3.

 Yes
 Go to PFW1542-4.

- **PFW1542-3**

 The system is unable to boot stand-alone diagnostics.

 Did powering on the system generate a different error code or partition firmware hang from the one that originally sent you to PFW1542?

 No
 If you were sent here by an error code, and the error code did not change as the result of powering on the system, you have a processor subsystem problem. Go to “PFW1548: Memory and processor subsystem problem isolation procedure” on page 81. If you were sent here because the system is hanging on a partition firmware checkpoint, and the hang condition did not change as a result of powering on the system, go to PFW1542-5.

 Yes
 Look up the new error code in the reference code index and perform the listed actions.

- **PFW1542-4**

 The system stopped with the **Please define the System Console** prompt on the system console. Stand-alone diagnostics can be booted. Perform the following steps:

 1. Follow the instructions on the screen to select the system console.
 2. When the DIAGNOSTIC OPERATING INSTRUCTIONS screen is displayed, press Enter.
 3. If the terminal type has not been defined, you must use the option **Initialize Terminal** on the FUNCTION SELECTION menu to initialize the AIX operating system environment before you can continue with the diagnostics. This is a separate operation from selecting the firmware console.
 4. Select **Advanced Diagnostic Routines**.
 5. When the DIAGNOSTIC MODE SELECTION menu displays, select **System Verification** to run diagnostics on all resources.

    Did running diagnostics produce a different symptom?

    No
    Continue with the following sub-step.

    Yes
    Return to the Problem Analysis procedures with the new symptom.
 6. Record any devices missing from the list of all adapters and devices. Continue with this procedure. When you have fixed the problem, use this record to verify that all devices appear when you run system verification.

    Are there any devices missing from the list of all adapters and devices?

No
Reinstall all remaining adapters, if any, and reconnect all devices. Return the system to its original configuration. Go to Verifying a repair.

Yes
The boot attempts that follow will attempt to isolate any remaining I/O subsystem problems with missing devices. Ignore any codes that may display on the operator panel unless stated otherwise. Continue to PFW1542-5.

- **PFW1542-5**

  Are there any adapters in the PCI slots in the base system?

  No
  Go to PFW1542-6.

  Yes
  Go to PFW1542-8.

- **PFW1542-6**

  Replace the system backplane, U*n*-P1. Continue to PFW1542-7.

- **PFW1542-7**

  1. Boot stand-alone diagnostics from CD.
  2. If the "Please define the System Console" screen is displayed, follow directions to select the system console.
  3. Use the Display Configuration and Resource List to list all adapters and attached devices.
  4. Check that all adapters and attached devices are listed.

  Did the "Please define the System Console" screen display and are all attached devices and adapters listed?

  No
  Go to PFW1542-11.

  Yes
  Go to PFW1542-12.

- **PFW1542-8**

  1. If it is not already off, turn off the power.
  2. Label and record the location of any cables attached to the adapters.
  3. Record the slot number of the adapters.
  4. Remove all adapters from slots 1, 2, 3, 4, 5, and 6 in the base system that are not attached to the boot device.
  5. Turn on the power to boot stand-alone diagnostics from CD-ROM.
  6. If the ASCII terminal displays **Enter 0 to select this console**, press the 0 key on the ASCII terminal's keyboard.
  7. If the "Please define the System Console" screen is displayed, follow directions to select the system console.
  8. Use the option **Display Configuration and Resource List** to list all adapters and attached devices.
  9. Check that all adapters and attached devices are listed.

  Did the "Please define the System Console" screen display and are all attached devices and adapters listed?

  No
  Go to PFW1542-11.

  Yes
  Continue to PFW1542-9.

- **PFW1542-9**

  If the "Please define the System Console" screen does display and all adapters and attached devices are listed, the problem is with one of the adapters or devices that was removed or disconnected from the base system.

  1. Turn off the power.
  2. Reinstall one adapter and device that was removed. Use the original adapters in their original slots when reinstalling adapters.
  3. Turn on the power to boot stand-alone diagnostics from the optical drive.
  4. If the "Please define the System Console" screen is displayed, follow the directions to select the system console.
  5. Use the Display Configuration and Resource List to list all adapters and attached devices.
  6. Check that all adapters and attached devices are listed.

  Did the "Please define the System Console" screen display and are all attached devices and adapters listed?

  No
  Continue to PFW1542-10.

  Yes
  Return to the beginning of this step to continue reinstalling adapters and devices.

- **PFW1542-10**

  Replace the adapter you just installed with a new adapter and try the boot to stand-alone diagnostics from CD-ROM again.

  1. If the "Please Define the System Console" screen is displayed, follow directions to select the system console.
  2. Use the option **Display Configuration and Resource List** to list all adapters and attached devices.
  3. Check that all adapters and attached devices are listed.

  Did the "Please define the System Console" screen display and are all attached devices and adapters listed?

  No
  Go to PFW1542-6.

  Yes
  The adapter you just replaced was defective. Go to PFW1542-12.

- **PFW1542-11**

  1. Turn off the power.
  2. Disconnect the base system power cables.
  3. Replace the following parts, one at a time, in the sequence listed:
     a. Optical drive
     b. Removable media backplane and cage assembly
     c. Disk drive backplane and cage assembly
     d. System backplane, location U*n*-P1
     e. Service processor
  4. Reconnect the base system power cables.
  5. Turn on the power.
  6. Boot stand-alone diagnostics from CD.
  7. If the "Please define the System Console" screen is displayed, follow directions to select the system console.

8. Use the option **Display Configuration and Resource List** to list all adapters and attached devices.
9. Check that all adapters and attached devices are listed.

Did the "Please define the System Console" screen display and are all adapters and attached devices listed?

No

Replace the next part in the list and return to the beginning of this step. Repeat this process until a part causes the Please define the System Console screen to be displayed and all adapters and attached devices to be listed. If you have replaced all the items listed above and the Please define the System Console screen does not display or all adapters and attached devices are not listed, check all external devices and cabling. If you do not find a problem, contact your next level of support for assistance.

Yes

Go to PFW1542-12.

- **PFW1542-12**

  The item you just replaced fixed the problem.

  1. Turn off the power.
  2. If a display adapter with keyboard and mouse were installed, reinstall the display adapter, keyboard, and mouse.
  3. Reconnect the tape drive (if previously installed) to the internal SCSI bus cable.
  4. Plug in all adapters that were previously removed but not reinstalled.
  5. Reconnect the I/O subsystem power cables that were previously disconnected.

  Return the system to its original condition. Go to Verifying a repair.

PFW1548: Memory and processor subsystem problem isolation procedure

Use this problem isolation procedure to aid in solving memory and processor problems that are not found by normal diagnostics.

Notes:

1. To avoid damage to the system or subsystem components, unplug the power cords before removing or installing any part.
2. This procedure assumes that either:
   - An optical drive is installed and connected to the integrated EIDE adapter, and a stand-alone diagnostic CD-ROM is available.

     OR
   - Stand-alone diagnostics can be booted from a NIM server.
3. If a power-on password or privileged-access password is set, you are prompted to enter the password before the stand-alone diagnostic CD-ROM can load.
4. The term POST indicators refers to the device mnemonics that appear during the power-on self-test (POST).
5. The service processor might have been set by the user to monitor system operations and to attempt recoveries. You might want to disable these options while you diagnose and service the system. If these settings are disabled, make notes of their current settings so that they can be restored before the system is turned back over to the customer. The following settings may be of interest.

   Monitoring

   (also called surveillance) From the ASMI menu, expand the **System Configuration** menu, then click **Monitoring**. Disable both types of surveillance.

   Auto power restart

   (also called unattended start mode) From the ASMI menu, expand **Power/Restart Control**, then click **Auto Power Restart**, and set it to disabled.

Wake on LAN
From the ASMI menu, expand **Wake on LAN**, and set it to disabled.

Call Out
From the ASMI menu, expand the **Service Aids** menu, then click **Call-Home/Call-In Setup**. Set the call-home system port and the call-in system port to disabled.

6. Verify that the system has not been set to boot to the System Management Services (SMS) menus or to the open firmware prompt. From the ASMI menu, expand **Power/Restart Control** to view the menu, then click **Power On/Off System**. The AIX/Linux partition mode boot should say "Continue to Operating System".
7. The service processor might have recorded one or more symptoms in its error/event log. Use the Advanced System Management Interface (ASMI) menus to view the error/event log.

   - Look for a possible new error that occurred during power on of the system. If there is a new error, and its actions call for a FRU replacement, perform those actions. If this does not resolve the problem, go to PFW1548-1.
   - If powering on the system did not yield a new error code, look at the error that occurred just before the original error. Perform the actions associated with that error. If this does not resolve the problem, go to PFW1548-1.
   - If powering on the system results in the same error code, and there are no error codes before the original error code, go to PFW1548-1.

Perform the following procedure:

- **PFW1548-1**

  1. Ensure that the diagnostics and the operating system are shut down.

     Is the system at "service processor standby", indicated by 01 in the control panel?

     No
     Replace the system backplane. Return to the beginning of this step.

     Yes
     Continue with substep 2.

  2. Turn on the power using either the white button or the ASMI menus.

     If an HMC is attached, does the system reach hypervisor standby as indicated on the management console? If a management console is not attached, does the system reach an operating system login prompt, or if booting the stand-alone diagnostic CD-ROM, is the Please define the System Console screen displayed?

     No
     Go to PFW1548-3.

     Yes
     Go to PFW1548-2.

  3. Insert the stand-alone diagnostic CD-ROM into the optical drive.

     Note: If you cannot insert the diagnostic CD-ROM, go to PFW1548-2.

  4. When the word *keyboard* is displayed on an ASCII terminal, a directly attached keyboard, or management console, press the number 5 key.
  5. If you are prompted to do so, enter the appropriate password.

     Is the "Please define the System Console" screen displayed?

     No
     Go to PFW1548-2.

     Yes
     Go to PFW1548-14.

- **PFW1548-2**

Insert the stand-alone diagnostic CD-ROM into the optical drive.

Note: If you cannot insert the stand-alone diagnostic CD-ROM, go to step PFW1548-3.

Turn on the power using either the white button or the ASMI menus. (If the stand-alone diagnostic CD-ROM is not in the optical drive, insert it now.) If a management console is attached, after the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the stand-alone diagnostic CD-ROM.

If you are prompted to do so, enter the appropriate password.

Is the "Please define the System Console" screen displayed?

No
Go to PFW1548-3.

Yes
Go to PFW1548-14.

- **PFW1548-3**

1. Turn off the power.
2. If you have not already done so, configure the service processor (using the ASMI menus) with the instructions in note 6 at the beginning of this procedure, then return here and continue.
3. Exit the service processor (ASMI) menus and remove the power cords.
4. Disconnect all external cables (parallel, system port 1, system port 2, keyboard, mouse, USB devices, SPCN, Ethernet, and so on). Also disconnect all of the external cables attached to the service processor except the Ethernet cable going to the management console, if a management console is attached.

Go to the next step.

- **PFW1548-4**

Perform the following steps:

1. Place the drawer into the service position and remove the service access cover.
2. Record the slot numbers of the PCI adapters and I/O expansion cards if present. Label and record the locations of all cables attached to the adapters. Disconnect all cables attached to the adapters and remove all of the adapters.
3. Slide the media or disk drive enclosure out approximately three centimeters.
4. Remove and label the disk drives from the media or disk drive enclosure assembly.
5. Remove all memory DIMMs except for one pair.
6. Plug in the power cords and wait for 01 in the upper-left corner of the control panel display.
7. Turn on the power using either the management console or the white button.

- **PFW1548-5**

Were any memory DIMMs removed from system backplane?

No
Go to PFW1548-8.

Yes
Go to the next step.

- **PFW1548-6**

1. Turn off the power, and remove the power cords.
2. Replug the memory DIMMs that were removed in PFW1548-4 in their original locations.
3. Plug in the power cords and wait for 01 in the upper-left corner of the control panel display.
4. Turn on the power using either the management console or the white button.

If a management console is attached, does the managed system reach power on at hypervisor standby as indicated on the management console? If a management console is not attached, does the system reach an operating system login prompt, or if booting the stand-alone diagnostic CD-ROM, is the Please define the System Console screen displayed?

No:

A memory DIMM in the pair you just replaced in the system is defective. Turn off the power, remove the power cords, and exchange the memory DIMM pair with new or previously removed memory DIMM pair. Repeat this step until the defective memory DIMM pair is identified, or all memory DIMM pairs have been replaced.

If your symptom did not change and all the memory DIMM pairs have been exchanged, call your service support person for assistance. If the symptom changed, check for loose cards and obvious problems.

If you do not find a problem, go to Problem Analysis and follow the instructions for the new symptom.

Yes:

Go to PFW1548-7.1.

- **PFW1548-7.1**

  No failure was detected with this configuration.

  1. Turn off the power and remove the power cords.
  2. Reinstall the next DIMM pair.
  3. Plug in the power cords and wait for 01 in the upper-left corner of the control panel display.
  4. Turn on the power using either the management console or the white button.

  If a management console is attached, does the managed system reach power on at hypervisor standby as indicated on the management console? If a management console is not attached, does the system reach an operating system login prompt, or if booting the stand-alone diagnostic CD-ROM, is the Please define the System Console screen displayed?

  No:

  One of the FRUs remaining in the system is defective. Exchange the FRUs (that have not already been changed) in the following order:

  a. Memory DIMMs (if present). Exchange the DIMM pairs, one at a time, with new or previously removed DIMM pairs.
  b. System backplane
  c. Power supplies
  d. Processor modules

  Repeat the FRU replacement steps until the defective FRU is identified or all the FRUs have been exchanged.

  If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

  If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to Problem Analysis and follow the instructions for the new symptom.

  Yes:

  If all of the processor cards have been reinstalled, go to step PFW1548-8. Otherwise, repeat this step.

- **PFW1548-8**

  1. Turn off the power.
  2. Reconnect the system console.

  Notes:

   a. If an ASCII terminal has been defined as the firmware console, attach the ASCII terminal cable to the S1 connector on the rear of the system unit.
   b. If a display attached to a display adapter has been defined as the firmware console, install the display adapter and connect the display to the adapter. Plug the keyboard and mouse into the keyboard connector on the rear of the system unit.
3. Turn on the power using either the management console or the white button. (If the stand-alone diagnostic CD-ROM is not in the optical drive, insert it now.) If a management console is attached, after the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the stand-alone diagnostic CD-ROM.
4. If the ASCII terminal or graphics display (including display adapter) is connected differently from the way it was previously, the console selection screen appears. Select a firmware console.
5. Immediately after the word *keyboard* is displayed, press the number 1 key on the directly attached keyboard, an ASCII terminal or management console. This activates the system management services (SMS).
6. Enter the appropriate password if you are prompted to do so.

Is the SMS screen displayed?

No

One of the FRUs remaining in the system unit is defective.

If you are using an ASCII terminal, go to the problem determination procedures for the display. If you do not find a problem, replace the system backplane.

Yes

Go to the next step.

- **PFW1548-9**

1. Make sure the stand-alone diagnostic CD-ROM is inserted into the optical drive.
2. Turn off the power and remove the power cords.
3. Use the cam levers to reconnect the disk drive enclosure assembly to the I/O backplane.
4. Reconnect the removable media or disk drive enclosure assembly.
5. Plug in the power cords and wait for 01 in the upper-left corner of the operator panel display.
6. Turn on the power using either the management console or the white button. (If the stand-alone diagnostic CD-ROM is not in the optical drive, insert it now.) If a management console is attached, after the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the stand-alone diagnostic CD-ROM.
7. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or an ASCII terminal keyboard.
8. Enter the appropriate password if you are prompted to do so.

Is the "Please define the System Console" screen displayed?

No:

One of the FRUs remaining in the system unit is defective.

Exchange the FRUs in the order listed that have not been exchanged.

1. Optical drive
2. Removable media enclosure
3. System backplane

Repeat this step until the defective FRU is identified or all the FRUs have been exchanged.

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to Problem Analysis and follow the instructions for the new symptom.

Yes:
Go to the next step.

- **PFW1548-10**

  The system is working correctly with this configuration. One of the disk drives that you removed from the disk drive backplanes may be defective.

  1. Make sure the stand-alone diagnostic CD-ROM is inserted into the optical drive.
  2. Turn off the power and remove the power cords.
  3. Install a disk drive in the media or disk drive enclosure assembly.
  4. Plug in the power cords and wait for the OK prompt to display on the operator panel display.
  5. Turn on the power.
  6. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or an ASCII terminal keyboard.
  7. Enter the appropriate password if you are prompted to do so.

  Is the "Please define the System Console" screen displayed?

  No
  Exchange the FRUs in the order listed that have not been exchanged.

  1. Last disk drive installed
  2. Disk drive backplane

  Repeat this step until the defective FRU is identified or all the FRUs have been exchanged.

  If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

  If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to Problem Analysis and follow the instructions for the new symptom.

  Yes
  Repeat this step with all disk drives that were installed in the disk drive backplane.

  After all of the disk drives have been reinstalled, go to the next step.

- **PFW1548-11**

  The system is working correctly with this configuration. One of the devices that was disconnected from the system backplane may be defective.

  1. Turn off the power and remove the power cords.
  2. Attach a system backplane device (for example: system port 1, system port 2, USB, keyboard, mouse, Ethernet) that had been removed.

     After all of the I/O backplane device cables have been reattached, reattached the cables to the service processor one at a time.
  3. Plug in the power cords and wait for 01 in the upper-left corner on the operator panel display.
  4. Turn on the power using either the management console or the white button. (If the stand-alone diagnostic CD-ROM is not in the optical drive, insert it now.) If a management console is attached, after the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the stand-alone diagnostic CD-ROM.
  5. If the Console Selection screen is displayed, choose the system console.
  6. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or on an ASCII terminal keyboard.
  7. Enter the appropriate password if you are prompted to do so.

Is the "Please define the System Console" screen displayed?

No

The last device or cable that you attached is defective.

To test each FRU, exchange the FRUs in the order listed.

1. Device and cable (last one attached).
2. System backplane

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to Problem Analysis and follow the instructions for the new symptom.

Yes

Repeat this step until all of the devices are attached. Go to the next step.

- **PFW1548-12**

The system is working correctly with this configuration. One of the FRUs (adapters) that you removed may be defective.

1. Turn off the power and remove the power cords.
2. Install a FRU (adapter) and connect any cables and devices that were attached to the FRU.
3. Plug in the power cords and wait for the OK prompt to display on the operator panel display.
4. Turn on the power using either the management console or the white button. (If the stand-alone diagnostic CD-ROM is not in the optical drive, insert it now.) If a management console is attached, after the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the stand-alone diagnostic CD-ROM.
5. If the Console Selection screen is displayed, choose the system console.
6. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or on an ASCII terminal keyboard.
7. Enter the appropriate password if you are prompted to do so.

Is the "Please define the System Console" screen displayed?

No

Go to the next step.

Yes

Repeat this step until all of the FRUs (adapters) are installed. Go to Verifying a repair.

- **PFW1548-13**

The last FRU installed or one of its attached devices is probably defective.

1. Make sure the stand-alone diagnostic CD-ROM is inserted into the optical drive.
2. Turn off the power and remove the power cords.
3. Starting with the last installed adapter, disconnect one attached device and cable.
4. Plug in the power cords and wait for the 01 in the upper-left corner on the operator panel display.
5. Turn on the power using either the management console or the white button. (If the stand-alone diagnostic CD-ROM is not in the optical drive, insert it now.) If a management console is attached, after the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the Advanced activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the stand-alone diagnostic CD-ROM.
6. If the Console Selection screen is displayed, choose the system console.
7. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or on an ASCII terminal keyboard.

8. Enter the appropriate password if you are prompted to do so.

Is the "Please define the System Console" screen displayed?

No

Repeat this step until the defective device or cable is identified or all devices and cables have been disconnected.

If all the devices and cables have been removed, then one of the FRUs remaining in the system unit is defective.

To test each FRU, exchange the FRUs in the order listed.

1. Adapter (last one installed)
2. System backplane

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to the Problem Analysis and follow the instructions for the new symptom.

Yes

The last device or cable that you disconnected is defective. Exchange the defective device or cable then go to the next step.

- **PFW1548-14**

1. Follow the instructions on the screen to select the system console.
2. When the DIAGNOSTIC OPERATING INSTRUCTIONS screen is displayed, press Enter.
3. Select **Advanced Diagnostics Routines**.
4. If the terminal type has not been defined, you must use the option **Initialize Terminal** on the FUNCTION SELECTION menu to initialize the diagnostic environment before you can continue with the diagnostics. This is a separate operation from selecting the console display.
5. If the NEW RESOURCE screen is displayed, select an option from the bottom of the screen.

   Note: Adapters and devices that require supplemental media are not shown in the new resource list. If the system has adapters or devices that require supplemental media, select option 1.
6. When the DIAGNOSTIC MODE SELECTION screen is displayed, press Enter.
7. Select **All Resources**. (If you were sent here from step PFW1548-18, select the adapter or device that was loaded from the supplemental media).

Did you get an SRN?

No

Go to step PFW1548-16.

Yes

Go to the next step.

- **PFW1548-15**

Look at the FRU part numbers associated with the SRN.

Have you exchanged all the FRUs that correspond to the failing function codes (FFCs)?

No

Exchange the FRU with the highest failure percentage that has not been changed.

Repeat this step until all the FRUs associated with the SRN have been exchanged or diagnostics run with no trouble found. Run diagnostics after each FRU is exchanged. Go to Verifying a repair.

Yes

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

- **PFW1548-16**

  Does the system have adapters or devices that require supplemental media?

  No
  Go to step the next step.

  Yes
  Go to step PFW1548-18.

- **PFW1548-17**

  Consult the PCI adapter configuration documentation for your operating system to verify that all adapters are configured correctly.

  Go to Verifying a repair.

  If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

- **PFW1548-18**

  1. Select **Task Selection**.
  2. Select **Process Supplemental Media** and follow the on-screen instructions to process the media. Supplemental media must be loaded and processed one at a time.

  Did the system return to the TASKS SELECTION SCREEN after the supplemental media was processed?

  No
  Go to the next step.

  Yes
  Press F3 to return to the FUNCTION SELECTION screen. Go to step PFW1548-14 substep 4.

- **PFW1548-19**

  The adapter or device is probably defective.

  If the supplemental media is for an adapter, replace the FRUs in the following order:

  1. Adapter
  2. System backplane

  If the supplemental media is for a device, replace the FRUs in the following order:

  1. Device and any associated cables
  2. The adapter to which the device is attached

  Repeat this step until the defective FRU is identified or all the FRUs have been exchanged.

  If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

  If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to Problem Analysis and follow the instructions for the new symptom.

  Go to Verifying a repair.

  This ends the procedure.

PFW1548: Memory and processor subsystem problem isolation procedure when a management console is attached

This procedure is used to locate defective FRUs not found by normal diagnostics. For this procedure, diagnostics are run on a minimally configured system. If a failure is detected on the minimally configured system, the remaining FRUs are exchanged one at a time until the failing FRU is identified. If a failure is not detected, FRUs are added back until the failure occurs. The failure is then isolated to the failing FRU.

Perform the following procedure:

- **PFW1548-1**

  1. Ensure that the diagnostics and the operating system are shut down.

     Is the system at "service processor standby", indicated by 01 in the control panel?

     No
     Replace the system backplane, location: U*n*-P1. Return to step PFW1548-1.

     Yes
     Continue with substep “2” on page 90.
  2. Turn on the power using either the white button or the ASMI menus.

     Does the system reach hypervisor standby as indicated on the management console?

     No
     Go to PFW1548-3.

     Yes
     Go to PFW1548-2.
  3. Insert the stand-alone diagnostic CD-ROM into the optical drive.

     Note: If you cannot insert the diagnostic CD-ROM, go to PFW1548-2.
  4. When the word *keyboard* is displayed on an ASCII terminal, a directly attached keyboard, or management console, press the number 5 key.
  5. If you are prompted to do so, enter the appropriate password.

     Is the "Please define the System Console" screen displayed?

     No
     Go to PFW1548-2.

     Yes
     Go to PFW1548-14.
- **PFW1548-2**

  Insert the stand-alone diagnostic CD-ROM into the optical drive.

  Note: If you cannot insert the diagnostic CD-ROM, go to step PFW1548-3.

  Turn on the power using either the white button or the ASMI menus. (If the diagnostic CD-ROM is not in the optical drive, insert it now.) After the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the diagnostic CD-ROM.

  If you are prompted to do so, enter the appropriate password.

  Is the "Please define the System Console" screen displayed?

  No
  Go to PFW1548-3.

  Yes
  Go to PFW1548-14.
- **PFW1548-3**

  1. Turn off the power.
  2. If you have not already done so, configure the service processor (using the ASMI menus), follow the instructions in note 6 located in “PFW1548: Memory and processor subsystem problem isolation procedure” on page 81 and then return here and continue.
  3. Exit the service processor (ASMI) menus and remove the power cords.
  4. Disconnect all external cables (parallel, system port 1, system port 2, keyboard, mouse, USB devices, SPCN, Ethernet, and so on). Also disconnect all of the external cables attached to the service processor except the Ethernet cable going to the management console.

Go to the next step.

- **PFW1548-4**

  1. If this is a deskside system, remove the service access cover. If this is a rack-mounted system, place the drawer into the service position and remove the service access cover. Also remove the front cover.
  2. Record the slot numbers of the PCI adapters and I/O expansion cards if present. Label and record the locations of all cables attached to the adapters. Disconnect all cables attached to the adapters and remove all of the adapters.
  3. Remove the removable media or disk drive enclosure assembly by pulling out the blue tabs at the bottom of the enclosure, then sliding the enclosure out approximately three centimeters.
  4. Remove and label the disk drives from the media or disk drive enclosure assembly.
  5. Remove one of the two memory DIMM pairs.
  6. Plug in the power cords and wait for 01 in the upper-left corner of the control panel display.
  7. Turn on the power using either the management console or the white button.

  Does the managed system reach power on at hypervisor standby as indicated on the management console?

  No
  Go to PFW1548-7.

  Yes
  Go to the next step.

- **PFW1548-5**

  Were any memory DIMMs removed from system backplane?

  No
  Go to PFW1548-8.

  Yes
  Go to the next step.

- **PFW1548-6**

  1. Turn off the power, and remove the power cords.
  2. Replug the memory DIMMs that were removed from system backplane in PFW1548-2 in their original locations.
  3. Plug in the power cords and wait for 01 in the upper-left corner of the control panel display.
  4. Turn on the power using either the management console or the white button.

  Does the managed system reach power on at hypervisor standby as indicated on the management console?

  No
  A memory DIMM in the pair you just replaced in the system is defective. Turn off the power, remove the power cords, and exchange the memory DIMM pair with new or previously removed memory DIMM pair. Repeat this step until the defective memory DIMM pair is identified, or both memory DIMM pairs have been exchanged.

  If your symptom did not change and both the memory DIMM pairs have been exchanged, call your service support person for assistance.

  If the symptom changed, check for loose cards and obvious problems. If you do not find a problem, go to the Problem Analysis procedures and follow the instructions for the new symptom.

  Yes
  Go to the next step.

- **PFW1548-7**

  One of the FRUs remaining in the system unit is defective.

Note: If a memory DIMM is exchanged, ensure that the new memory DIMM is the same size and speed as the original memory DIMM.

1. Turn off the power, remove the power cords, and exchange the following FRUs, one at a time, in the order listed:

   a. Memory DIMMs. Exchange one pair at a time with new or previously removed DIMM pairs

   b. System backplane, location: U*n*-P1

   c. Power supplies, locations: U*n*-E1 and U*n*-E2.

2. Plug in the power cords and wait for 01 in the upper-left corner of the control panel display.
3. Turn on the power using either the management console or the white button.

Does the managed system reach power on at hypervisor standby as indicated on the management console?

No

Reinstall the original FRU.

Repeat the FRU replacement steps until the defective FRU is identified or all the FRUs have been exchanged.

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to the Problem Analysis procedures and follow the instructions for the new symptom.

Yes

Go to Verifying a repair.

- **PFW1548-8**

1. Turn off the power.
2. Reconnect the system console.

   Notes:

   a. If an ASCII terminal has been defined as the firmware console, attach the ASCII terminal cable to the S1 connector on the rear of the system unit.

   b. If a display attached to a display adapter has been defined as the firmware console, install the display adapter and connect the display to the adapter. Plug the keyboard and mouse into the keyboard connector on the rear of the system unit.

3. Turn on the power using either the management console or the white button. (If the diagnostic CD-ROM is not in the optical drive, insert it now.) After the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the diagnostic CD-ROM.
4. If the ASCII terminal or graphics display (including display adapter) is connected differently from the way it was previously, the console selection screen appears. Select a firmware console.
5. Immediately after the word *keyboard* is displayed, press the number 1 key on the directly attached keyboard, an ASCII terminal or management console. This activates the system management services (SMS).
6. Enter the appropriate password if you are prompted to do so.

Is the SMS screen displayed?

No

One of the FRUs remaining in the system unit is defective.

Exchange the FRUs that have not been exchanged, in the following order:

1. If you are using an ASCII terminal, go to the problem determination procedures for the display. If you do not find a problem, replace the system backplane at location U*n*-P1.
2. If you are using a graphics display, go to the problem determination procedures for the display. If you do not find a problem, complete the following steps:

   a. Replace the display adapter.

   b. Replace the backplane in which the graphics adapter is plugged.

      Repeat this step until the defective FRU is identified or all the FRUs have been exchanged.

      If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

      If the symptom changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to the Problem Analysis procedures and follow the instructions for the new symptom.

Yes
Go to the next step.

- **PFW1548-9**

1. Make sure the diagnostic CD-ROM is inserted into the optical drive.
2. Turn off the power and remove the power cords.
3. Use the cam levers to reconnect the disk drive enclosure assembly to the I/O backplane.
4. Reconnect the removable media or disk drive enclosure assembly by sliding the media enclosure toward the rear of the system, then pressing the blue tabs.
5. Plug in the power cords and wait for 01 in the upper-left corner of the operator panel display.
6. Turn on the power using either the management console or the white button. (If the diagnostic CD-ROM is not in the optical drive, insert it now.) After the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the diagnostic CD-ROM.
7. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or an ASCII terminal keyboard.
8. Enter the appropriate password if you are prompted to do so.

Is the "Please define the System Console" screen displayed?

No
One of the FRUs remaining in the system unit is defective.

Exchange the FRUs that have not been exchanged, in the following order:

1. Optical drive
2. Removable media enclosure.
3. System backplane, U*n*-P1.

Repeat this step until the defective FRU is identified or all the FRUs have been exchanged.

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to Problem Analysis procedures and follow the instructions for the new symptom.

Yes
Go to the next step.

- **PFW1548-10**

The system is working correctly with this configuration. One of the disk drives that you removed from the disk drive backplanes may be defective.

1. Make sure the diagnostic CD-ROM is inserted into the optical drive.
2. Turn off the power and remove the power cords.
3. Install a disk drive in the media or disk drive enclosure assembly.
4. Plug in the power cords and wait for the OK prompt to display on the operator panel display.
5. Turn on the power.
6. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or an ASCII terminal keyboard.
7. Enter the appropriate password if you are prompted to do so.

Is the "Please define the System Console" screen displayed?

No

Exchange the FRUs that have not been exchanged, in the following order:

1. Last disk drive installed
2. Disk drive backplane.

Repeat this step until the defective FRU is identified or all the FRUs have been exchanged.

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to Problem Analysis procedures and follow the instructions for the new symptom.

Yes

Repeat this step with all disk drives that were installed in the disk drive backplane.

After all of the disk drives have been reinstalled, go to the next step.

- **PFW1548-11**

The system is working correctly with this configuration. One of the devices that was disconnected from the system backplane may be defective.

1. Turn off the power and remove the power cords.
2. Attach a system backplane device (for example: system port 1, system port 2, USB, keyboard, mouse, Ethernet) that had been removed.

   After all of the device cables have been reattached, reattached the cables to the service processor one at a time.
3. Plug in the power cords and wait for 01 in the upper-left corner on the operator panel display.
4. Turn on the power using either the management console or the white button. (If the diagnostic CD-ROM is not in the optical drive, insert it now.) After the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the diagnostic CD-ROM.
5. If the Console Selection screen is displayed, choose the system console.
6. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or on an ASCII terminal keyboard.
7. Enter the appropriate password if you are prompted to do so.

Is the "Please define the System Console" screen displayed?

No

The last device or cable that you attached is defective.

To test each FRU, exchange the FRUs in the following order:

1. Device and cable (last one attached)
2. System backplane, location: U*n*-P1.

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to Problem Analysis procedures and follow the instructions for the new symptom.

Yes

Repeat this step until all of the devices are attached. Go to the next step.

- **PFW1548-12**

  The system is working correctly with this configuration. One of the FRUs (adapters) that you removed may be defective.

  1. Turn off the power and remove the power cords.
  2. Install a FRU (adapter) and connect any cables and devices that were attached to the FRU.
  3. Plug in the power cords and wait for the OK prompt to display on the operator panel display.
  4. Turn on the power using either the management console or the white button. (If the diagnostic CD-ROM is not in the optical drive, insert it now.) After the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the diagnostic CD-ROM.
  5. If the Console Selection screen is displayed, choose the system console.
  6. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or on an ASCII terminal keyboard.
  7. Enter the appropriate password if you are prompted to do so.

  Is the "Please define the System Console" screen displayed?

  No

  Go to the next step.

  Yes

  Repeat this step until all of the FRUs (adapters) are installed. Go to Verifying a repair.

- **PFW1548-13**

  The last FRU installed or one of its attached devices is probably defective.

  1. Make sure the diagnostic CD-ROM is inserted into the optical drive.
  2. Turn off the power and remove the power cords.
  3. Starting with the last installed adapter, disconnect one attached device and cable.
  4. Plug in the power cords and wait for the 01 in the upper-left corner on the operator panel display.
  5. Turn on the power using either the management console or the white button. (If the diagnostic CD-ROM is not in the optical drive, insert it now.) After the system has reached hypervisor standby, activate a Linux or AIX partition by clicking the **Advanced** button on the Advanced activation screen. On the Advanced activation screen, select **Boot in service mode using the default boot list** to boot the diagnostic CD-ROM.
  6. If the Console Selection screen is displayed, choose the system console.
  7. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or on an ASCII terminal keyboard.
  8. Enter the appropriate password if you are prompted to do so.

  Is the "Please define the System Console" screen displayed?

  No

  Repeat this step until the defective device or cable is identified or all devices and cables have been disconnected.

  If all the devices and cables have been removed, then one of the FRUs remaining in the system unit is defective.

To test each FRU, exchange the FRUs in the following order:

1. Adapter (last one installed)
2. System backplane, location: U*n*-P1.

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to the Problem Analysis procedures and follow the instructions for the new symptom.

Yes

The last device or cable that you disconnected is defective. Exchange the defective device or cable then go to the next step.

- **PFW1548-14**

1. Follow the instructions on the screen to select the system console.
2. When the DIAGNOSTIC OPERATING INSTRUCTIONS screen is displayed, press Enter.
3. Select **Advanced Diagnostics Routines**.
4. If the terminal type has not been defined, you must use the option **Initialize Terminal** on the FUNCTION SELECTION menu to initialize the stand-alone diagnostic environment before you can continue with the diagnostics. This is a separate operation from selecting the console display.
5. If the NEW RESOURCE screen is displayed, select an option from the bottom of the screen.

   Note: Adapters and devices that require supplemental media are not shown in the new resource list. If the system has adapters or devices that require supplemental media, select option 1.
6. When the DIAGNOSTIC MODE SELECTION screen is displayed, press Enter.
7. Select **All Resources**. (If you were sent here from step PFW1548-18, select the adapter or device that was loaded from the supplemental media).

Did you get an SRN?

No

Go to step PFW1548-16.

Yes

Go to the next step.

- **PFW1548-15**

Look at the FRU part numbers associated with the SRN.

Have you exchanged all the FRUs that correspond to the failing function codes (FFCs)?

No

Exchange the FRU with the highest failure percentage that has not been changed.

Repeat this step until all the FRUs associated with the SRN have been exchanged or diagnostics run with no trouble found. Run diagnostics after each FRU is exchanged. Go to Verifying a repair.

Yes

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

- **PFW1548-16**

Does the system have adapters or devices that require supplemental media?

No

Go to step the next step.

Yes

Go to step PFW1548-18.

- **PFW1548-17**

Consult the PCI adapter configuration documentation for your operating system to verify that all adapters are configured correctly.

Go to Verifying a repair.

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

- **PFW1548-18**

  1. Select **Task Selection**.
  2. Select **Process Supplemental Media** and follow the on-screen instructions to process the media. Supplemental media must be loaded and processed one at a time.

  Did the system return to the TASKS SELECTION SCREEN after the supplemental media was processed?

  No
  Go to the next step.

  Yes
  Press F3 to return to the FUNCTION SELECTION screen. Go to step PFW1548-14, substep "4" on page 96.

- **PFW1548-19**

  The adapter or device is probably defective.

  If the supplemental media is for an adapter, replace the FRUs in the following order:

  1. Adapter
  2. System backplane, location: U*n*-P1.

  If the supplemental media is for a device, replace the FRUs in the following order:

  1. Device and any associated cables
  2. The adapter to which the device is attached

  Repeat this step until the defective FRU is identified or all the FRUs have been exchanged.

  If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

  If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to the Problem Analysis procedures and follow the instructions for the new symptom.

  Go to Verifying a repair.

  This ends the procedure.

PFW1548: Memory and processor subsystem problem isolation procedure without a management console attached

This procedure is used to locate defective FRUs not found by normal diagnostics. For this procedure, diagnostics are run on a minimally configured system. If a failure is detected on the minimally configured system, the remaining FRUs are exchanged one at a time until the failing FRU is identified. If a failure is not detected, FRUs are added back until the failure occurs. The failure is then isolated to the failing FRU.

Perform the following procedure:

- **PFW1548-1**

  1. Ensure that the diagnostics and the operating system are shut down.

     Is the system at "service processor standby", indicated by 01 in the control panel?

     No
     Replace the system backplane, location: U*n*-P1. Return to step PFW1548-1.

     Yes
     Continue with substep "2" on page 98.

2. Turn on the power using either the white button or the ASMI menus.

   Does the system reach an operating system login prompt, or if booting the stand-alone diagnostic CD-ROM, is the "Please define the System Console" screen displayed?

   No
   Go to PFW1548-3.

   Yes
   Go to PFW1548-2.

3. Insert the stand-alone diagnostic CD-ROM into the optical drive.

   Note: If you cannot insert the diagnostic CD-ROM, go to PFW1548-2.

4. When the word *keyboard* is displayed on an ASCII terminal or a directly attached keyboard, press the number 5 key.
5. If you are prompted to do so, enter the appropriate password.

   Is the "Please define the System Console" screen displayed?

   No
   Go to PFW1548-2.

   Yes
   Go to PFW1548-14.

- **PFW1548-2**

  1. Insert the stand-alone diagnostic CD-ROM into the optical drive.

     Note: If you cannot insert the diagnostic CD-ROM, go to step PFW1548-3.

  2. Turn on the power using either the white button or the ASMI menus. If the diagnostic CD-ROM is not in the optical drive, insert it now. If you are prompted to do so, enter the appropriate password.

  Is the "Please define the System Console" screen displayed?

  No
  Go to PFW1548-3.

  Yes
  Go to PFW1548-14.

- **PFW1548-3**

  1. Turn off the power.
  2. If you have not already done so, configure the service processor (using the ASMI menus) with the instructions in note “6” on page 82 at the beginning of this procedure, then return here and continue.
  3. Exit the service processor (ASMI) menus and remove the power cords.
  4. Disconnect all external cables (parallel, system port 1, system port 2, keyboard, mouse, USB devices, SPCN, Ethernet, and so on). Also disconnect all of the external cables attached to the service processor.

  Go to the next step.

- **PFW1548-4**

  1. If this is a deskside system, remove the service access cover. If this is a rack-mounted system, place the drawer into the service position and remove the service access cover. Also remove the front cover.
  2. Record the slot numbers of the PCI adapters and I/O expansion cards if present. Label and record the locations of all cables attached to the adapters. Disconnect all cables attached to the adapters and remove all of the adapters.
  3. Remove the removable media or disk drive enclosure assembly by pulling out the blue tabs at the bottom of the enclosure, then sliding the enclosure out approximately three centimeters.
  4. Remove and label the disk drives from the media or disk drive enclosure assembly.

5. Remove a memory DIMM pair.
6. Plug in the power cords and wait for 01 in the upper-left corner of the control panel display.
7. Turn on the power using the white button.

Does the system reach an operating system login prompt, or if booting the stand-alone diagnostic CD-ROM, is the "Please define the System Console" screen displayed?

No
Go to PFW1548-7.

Yes
Go to the next step.

- **PFW1548-5**

  Were any memory DIMMs removed from system backplane?

  No
  Go to PFW1548-8.

  Yes
  Go to the next step.

- **PFW1548-6**

  1. Turn off the power, and remove the power cords.
  2. Replug the memory DIMMs that were removed from the system backplane in PFW1548-2 in their original locations.
  3. Plug in the power cords and wait for 01 in the upper-left corner of the control panel display.
  4. Turn on the power using the white button.

  Does the system reach an operating system login prompt, or if booting the stand-alone diagnostic CD-ROM, is the "Please define the System Console" screen displayed?

  No
  A memory DIMM in the pair you just replaced in the system is defective. Turn off the power, remove the power cords, and exchange the memory DIMMs pair with new or previously removed memory DIMM pair. Repeat this step until the defective memory DIMM pair is identified, or both memory DIMM pairs have been exchanged.

  If your symptom did not change and both the memory DIMM pairs have been exchanged, call your service support person for assistance.

  If the symptom changed, check for loose cards and obvious problems. If you do not find a problem, go to the Problem Analysis procedures and follow the instructions for the new symptom.

  Yes
  Go to the next step.

- **PFW1548-7**

  One of the FRUs remaining in the system unit is defective.

  Note: If a memory DIMM is exchanged, ensure that the new memory DIMM is the same size and speed as the original memory DIMM.

  1. Turn off the power, remove the power cords, and exchange the following FRUs, one at a time, in the order listed:
     a. Memory DIMMs. Exchange one pair at a time with new or previously removed DIMM pairs.
     b. System backplane, location: U*n*-P1
     c. Power supplies, locations: U*n*-E1 and U*n*-E2.
  2. Plug in the power cords and wait for 01 in the upper-left corner of the control panel display.
  3. Turn on the power using the white button.

Does the system reach an operating system login prompt, or if booting the stand-alone diagnostic CD-ROM, is the "Please define the System Console" screen displayed?

No

Reinstall the original FRU.

Repeat the FRU replacement steps until the defective FRU is identified or all the FRUs have been exchanged.

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to the Problem Analysis procedures and follow the instructions for the new symptom.

Yes

Go to Verifying a repair.

- **PFW1548-8**

1. Turn off the power.
2. Reconnect the system console.

   Notes:

   a. If an ASCII terminal has been defined as the firmware console, attach the ASCII terminal cable to the S1 connector on the rear of the system unit.

   b. If a display attached to a display adapter has been defined as the firmware console, install the display adapter and connect the display to the adapter. Plug the keyboard and mouse into the keyboard connector on the rear of the system unit.
3. Turn on the power using the white button. (If the diagnostic CD-ROM is not in the optical drive, insert it now.)
4. If the ASCII terminal or graphics display (including display adapter) is connected differently from the way it was previously, the console selection screen appears. Select a firmware console.
5. Immediately after the word *keyboard* is displayed, press the number 1 key on the directly attached keyboard, or an ASCII terminal. This action activates the system management services (SMS).
6. Enter the appropriate password if you are prompted to do so.

Is the SMS screen displayed?

No

One of the FRUs remaining in the system unit is defective.

Exchange the FRUs that have not been exchanged, in the following order:

1. If you are using an ASCII terminal, go to the problem determination procedures for the display. If you do not find a problem, replace the system backplane at location U*n*-P1.
2. If you are using a graphics display, go to the problem determination procedures for the display. If you do not find a problem, complete the following steps:

   a. Replace the display adapter.

   b. Replace the backplane in which the graphics adapter is plugged.

      Repeat this step until the defective FRU is identified or all the FRUs have been exchanged.

      If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

      If the symptom changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to the Problem Analysis procedures and follow the instructions for the new symptom.

Yes

Go to the next step.

- **PFW1548-9**

  1. Make sure the diagnostic CD-ROM is inserted into the optical drive.
  2. Turn off the power and remove the power cords.
  3. Use the cam levers to reconnect the disk drive enclosure assembly to the I/O backplane.
  4. Reconnect the removable media or disk drive enclosure assembly by sliding the media enclosure toward the rear of the system, then pressing the blue tabs.
  5. Plug in the power cords and wait for 01 in the upper-left corner of the operator panel display.
  6. Turn on the power using the white button. (If the diagnostic CD-ROM is not in the optical drive, insert it now.)
  7. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or an ASCII terminal keyboard.
  8. Enter the appropriate password if you are prompted to do so.

  Is the "Please define the System Console" screen displayed?

  No

  One of the FRUs remaining in the system unit is defective.

  Exchange the FRUs that have not been exchanged, in the following order:

  1. Optical drive
  2. Removable media enclosure.
  3. System backplane, U*n*-P1.

  Repeat this step until the defective FRU is identified or all the FRUs have been exchanged.

  If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

  If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to Problem Analysis procedures and follow the instructions for the new symptom.

  Yes

  Go to the next step.

- **PFW1548-10**

  The system is working correctly with this configuration. One of the disk drives that you removed from the disk drive backplanes may be defective.

  1. Make sure the diagnostic CD-ROM is inserted into the optical drive.
  2. Turn off the power and remove the power cords.
  3. Install a disk drive in the media or disk drive enclosure assembly.
  4. Plug in the power cords and wait for the OK prompt to display on the operator panel display.
  5. Turn on the power.
  6. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or an ASCII terminal keyboard.
  7. Enter the appropriate password if you are prompted to do so.

  Is the "Please define the System Console" screen displayed?

  No

  Exchange the FRUs that have not been exchanged, in the following order:

  1. Last disk drive installed
  2. Disk drive backplane.

  Repeat this step until the defective FRU is identified or all the FRUs have been exchanged.

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to Problem Analysis procedures and follow the instructions for the new symptom.

Yes

Repeat this step with all disk drives that were installed in the disk drive backplane.

After all of the disk drives have been reinstalled, go to the next step.

- **PFW1548-11**

  The system is working correctly with this configuration. One of the devices that was disconnected from the system backplane may be defective.

  1. Turn off the power and remove the power cords.
  2. Attach a system backplane device (for example: system port 1, system port 2, USB, keyboard, mouse, Ethernet) that had been removed.

     After all of the device cables have been reattached, reattached the cables to the service processor one at a time.
  3. Plug in the power cords and wait for 01 in the upper-left corner on the operator panel display.
  4. Turn on the power using the white button. (If the diagnostic CD-ROM is not in the optical drive, insert it now.)
  5. If the Console Selection screen is displayed, choose the system console.
  6. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or on an ASCII terminal keyboard.
  7. Enter the appropriate password if you are prompted to do so.

  Is the "Please define the System Console" screen displayed?

  No

  The last device or cable that you attached is defective.

  To test each FRU, exchange the FRUs in the following order:

  1. Device and cable (last one attached)
  2. System backplane, location: U*n*-P1.

  If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

  If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to Problem Analysis procedures and follow the instructions for the new symptom.

  Yes

  Repeat this step until all of the devices are attached. Go to the next step.

- **PFW1548-12**

  The system is working correctly with this configuration. One of the FRUs (adapters) that you removed may be defective.

  1. Turn off the power and remove the power cords.
  2. Install a FRU (adapter) and connect any cables and devices that were attached to the FRU.
  3. Plug in the power cords and wait for the OK prompt to display on the operator panel display.
  4. Turn on the power using the white button. (If the diagnostic CD-ROM is not in the optical drive, insert it now.)
  5. If the Console Selection screen is displayed, choose the system console.
  6. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or on an ASCII terminal keyboard.

7. Enter the appropriate password if you are prompted to do so.

Is the "Please define the System Console" screen displayed?

No
Go to the next step.

Yes
Repeat this step until all of the FRUs (adapters) are installed. Go to Verifying a repair.

- **PFW1548-13**

  The last FRU installed or one of its attached devices is probably defective.

  1. Make sure the diagnostic CD-ROM is inserted into the optical drive.
  2. Turn off the power and remove the power cords.
  3. Starting with the last installed adapter, disconnect one attached device and cable.
  4. Plug in the power cords and wait for the 01 in the upper-left corner on the operator panel display.
  5. Turn on the power using either the white button. (If the diagnostic CD-ROM is not in the optical drive, insert it now.)
  6. If the Console Selection screen is displayed, choose the system console.
  7. Immediately after the word *keyboard* is displayed, press the number 5 key on either the directly attached keyboard or on an ASCII terminal keyboard.
  8. Enter the appropriate password if you are prompted to do so.

  Is the "Please define the System Console" screen displayed?

  No
  Repeat this step until the defective device or cable is identified or all devices and cables have been disconnected.

  If all the devices and cables have been removed, then one of the FRUs remaining in the system unit is defective.

  To test each FRU, exchange the FRUs in the following order:

  1. Adapter (last one installed)
  2. System backplane, location: U*n*-P1.

  If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

  If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to the Problem Analysis procedures and follow the instructions for the new symptom.

  Yes
  The last device or cable that you disconnected is defective. Exchange the defective device or cable and then go to the next step.

- **PFW1548-14**

  1. Follow the instructions on the screen to select the system console.
  2. When the DIAGNOSTIC OPERATING INSTRUCTIONS screen is displayed, press Enter.
  3. Select **Advanced Diagnostics Routines**.
  4. If the terminal type has not been defined, you must use the option **Initialize Terminal** on the FUNCTION SELECTION menu to initialize the stand-alone diagnostic environment before you can continue with the diagnostics. This is a separate operation from selecting the console display.
  5. If the NEW RESOURCE screen is displayed, select an option from the bottom of the screen.

     Note: Adapters and devices that require supplemental media are not shown in the new resource list. If the system has adapters or devices that require supplemental media, select option 1.
  6. When the DIAGNOSTIC MODE SELECTION screen is displayed, press Enter.

7. Select **All Resources**. If you were sent here from step PFW1548-18, select the adapter or device that was loaded from the supplemental media.

Did you get an SRN?

No
Go to step PFW1548-16.

Yes
Go to the next step.

- **PFW1548-15**

Look at the FRU part numbers associated with the SRN.

Have you exchanged all the FRUs that correspond to the failing function codes (FFCs)?

No
Exchange the FRU with the highest failure percentage that has not been changed.

Repeat this step until all the FRUs associated with the SRN have been exchanged or diagnostics run with no trouble found. Run diagnostics after each FRU is exchanged. Go to Verifying a repair.

Yes
If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

- **PFW1548-16**

Does the system have adapters or devices that require supplemental media?

No
Go to step the next step.

Yes
Go to step PFW1548-18.

- **PFW1548-17**

Consult the PCI adapter configuration documentation for your operating system to verify that all adapters are configured correctly.

Go to Verifying a repair.

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

- **PFW1548-18**

1. Select **Task Selection**.
2. Select **Process Supplemental Media** and follow the on-screen instructions to process the media. Supplemental media must be loaded and processed one at a time.

Did the system return to the TASKS SELECTION SCREEN after the supplemental media was processed?

No
Go to the next step.

Yes
Press F3 to return to the FUNCTION SELECTION screen. Go to step PFW1548-14, substep “4” on page 103.

- **PFW1548-19**

The adapter or device is probably defective.

If the supplemental media is for an adapter, replace the FRUs in the following order:

1. Adapter
2. System backplane, location: U*n*-P1.

If the supplemental media is for a device, replace the FRUs in the following order:

1. Device and any associated cables
2. The adapter to which the device is attached

Repeat this step until the defective FRU is identified or all the FRUs have been exchanged.

If the symptom did not change and all the FRUs have been exchanged, call service support for assistance.

If the symptom has changed, check for loose cards, cables, and obvious problems. If you do not find a problem, go to the Problem Analysis procedures and follow the instructions for the new symptom.

Go to Verifying a repair.

This ends the procedure.

Problems with noncritical resources

Use this procedure to help you determine the cause of problems with noncritical resources.

Procedure

1. Is there an SRC in an 8-character format available on the problem summary form?

   Note: If the operator has not filled out the problem summary form, go to the problem reporting procedure for the operating system in use.

   No: Continue with the next step.
   Yes: Perform problem analysis using the SRC. **This ends the procedure**.
2. Does the problem involve a workstation resource?
   - **No**: Continue with the next step.
   - **Yes**: Perform the following steps:
     - Check that the workstation is operational.
     - Verify that the cabling and addressing for the workstation is correct.
     - Perform any actions indicated in the system operator message.

   If you need further assistance, contact your next level of support. **This ends the procedure**.
3. Does the problem involve a removable media resource?

   No: Continue with the next step.
   Yes: Go to “Using the product activity log” on page 65 to resolve the problem. **This ends the procedure**.
4. Does the problem involve a communications resource?
   - **No**: Contact your next level of support. **This ends the procedure**.
   - **Yes**: Are there any system operator messages that indicate a communications-related problem has occurred?
     - **No**: Contact your next level of support. **This ends the procedure**.
     - **Yes**: Perform any actions indicated in the system operator message. If you need further assistance, contact your next level of support. **This ends the procedure**.

Intermittent problems

An intermittent problem is a problem that occurs for a short time, and then goes away.

About this task

The problem may not occur again until some time in the future, if at all. Intermittent problems cannot be made to appear again easily.

Some examples of intermittent problems are:

- A reference code appears on the control panel (the system attention light is on) but disappears when you power off, then power on the system. An entry does not appear in the Product Activity Log.
- An entry appears in the problem log when you use the Work with Problems (WRKPRB) command. For example, an expansion unit becomes powered off, but starts working again when you power it on.
- The workstation adapter is in a hang condition but starts working normally when it gets reset.

Note: You can get equipment for the following conditions from your branch office or installation planning representative:

- If you suspect that the air at the system site is too hot or too cold, you need a thermometer to check the temperature.
- If you suspect the moisture content of the air at the system site is too low or too high, use a wet/dry bulb to check the humidity. See "General intermittent problem checklist" on page 107 for more information.
- If you need to check AC receptacles for correct wiring, you need an ECOS tester, Model 1023-100, or equivalent tester. The tester lets you quickly check the receptacles. If you cannot find a tester, use an analog multimeter instead. Do not use a digital multimeter.

Follow the steps below to correct an intermittent problem:

Procedure

1. Read the information in "About intermittent problems" on page 106 before you attempt to correct an intermittent problem.

   Then, continue with the next step of this procedure.
2. Perform *all* steps in the "General intermittent problem checklist" on page 107.

   Then, continue with the next step of this procedure.
3. Did you correct the intermittent problem?

   Yes: This ends the procedure.

   No: Go to "Analyzing intermittent problems" on page 109. **This ends the procedure.**

About intermittent problems

An intermittent problem can show many different symptoms, so it might be difficult for you to determine the real cause without completely analyzing the failure.

To help with this analysis, you should determine as many symptoms as possible.

- The complete reference code is necessary to determine the exact failing area and the probable cause.
- Product activity log (PAL) information can provide time and device relationships.
- Information about environmental conditions when the failure occurred can be helpful (for example, an electrical storm occurring when the failure happened).

Note: If you suspect that an intermittent problem is occurring, increase the log sizes to the largest sizes possible. Select the PAL option on the Start a Service Tool display (see Using the product activity log for details).

Types of intermittent problems

Following are the major types of intermittent problems:

- Code (PTFs):
  - Licensed Internal Code
  - IBM i
  - Licensed program products
  - Other application software
- Configuration:

  - Non-supported hardware that is used on the system
  - Non-supported system configurations
  - Non-supported communication networks
  - Model and feature upgrades that are not performed correctly
  - Incorrectly configured or incorrectly cabled devices
- Environment:
  - Power line disturbance (for example, reduced voltage, a pulse, a surge, or total loss of voltage on the incoming AC voltage line)
  - Power line transient (for example, lightning strike)
  - Electrical noise (constant or intermittent)
  - Defective grounding or a ground potential difference
  - Mechanical vibration
- Intermittent hardware failure

General intermittent problem checklist

Use the following procedure to correct intermittent problems.

About this task

Performing these steps removes the known causes of most intermittent problems.

Procedure

1. Discuss the problem with the customer.

   Look for the following symptoms:

   - A reference code that goes away when you power off and then power on the system.
   - Repeated failure patterns that you cannot explain. For example, the problem occurs at the same time of day or on the same day of the week.
   - Failures that started after system relocation.
   - Failures that occurred during the time specific jobs or software were running.
   - Failures that started after recent service or customer actions, system upgrade, addition of I/O devices, new software, or program temporary fix (PTF) installation.
   - Failures occurring only during high system usage.
   - Failures occur when people are close to the system or machines are attached to the system.
2. Recommend that the customer install the latest cumulative PTF package, since code PTFs have corrected many problems that seem to be hardware failures.

   The customer can order the latest cumulative PTF package electronically through Electronic Customer Support or by calling the Software Support Center.
3. If you have not already done so, use the maintenance package to see the indicated actions for the symptom described by the customer.

   Attempt to perform the on-line problem analysis procedure first. If this is not possible, such as when the system is down, go to the Starting a repair action.

   Use additional diagnostic tools, if necessary, and attempt to recreate the problem.

   Note: Ensure that the service information you are using is at the same level as the operating system.
4. Check the site for the following environmental conditions:

   a) Any electrical noise that matches the start of the intermittent problems. Ask the customer such questions as:

      - Have any external changes or additions, such as building wiring, air conditioning, or elevators been made to the site?

    - Has any arc welding occurred in the area?
    - Has any heavy industrial equipment, such as cranes, been operating in the area?
    - Have there been any thunderstorms in the area?
    - Have the building lights become dim?
    - Has any equipment been relocated, especially computer equipment?

    If there was any electrical noise, find its source and prevent the noise from getting into the system.

   b) Site temperature and humidity conditions that are within the system specifications.

    See temperature and humidity design criteria in the Planning for the system topic relevant for your system.

   c) Poor air quality in the computer room:

    - Look for dust on top of objects. Dust particles in the air cause poor electrical connections and may cause disk unit failures.
    - Smell for unusual odors in the air. Some gases can corrode electrical connections.

   d) Any large vibration (caused by thunder, an earthquake, an explosion, or road construction) that occurred in the area at the time of the failure.

    Note: A failure that is caused by vibration is more probable if the server is on a raised floor.

5. Ensure that all ground connections are tight.

   These items reduce the effects of electrical noise. Check the ground connections by measuring the resistance between a conductive place on the frame to building ground or to earth ground. The resistance must be 1.0 ohm or less.

6. Ensure proper cable retention is used, as provided.

   If no retention is provided, the cable should be strapped to the frame to release tension on cable connections.

   Ensure that you pull the cable ties tight enough to fasten the cable to the frame bar tightly. A loose cable can be accidentally pulled with enough force to unseat the logic card in the frame to which the cable is attached. If the system is powered on, the logic card could be destroyed.

7. Ensure that all workstation and communications cables meet hardware specifications:

   - All connections are tight.
   - Any twinaxial cables that are not attached to devices must be removed.
   - The lengths and numbers of connections in the cables must be correct.
   - Ensure that lightning protection is installed on any twinaxial cables that enter or leave the building.

8. Perform the following:

   a) Review recent repair actions.

    Contact your next level of support for assistance.

   b) Review entries in the problem log (WRKPRB).

    Look for problems that were reported to the user.

   c) Review entries in the PAL, SAL, and service processor log. Look for a pattern:

    - SRCs on multiple adapters occurring at the same time
    - SRCs that have a common time-of-day or day-of-week pattern
    - Log is wrapping (hundreds of recent entries and no older entries)

    Check the PAL sizes and increase them if they are smaller than recommended.

   d) Review entries in the history log (`Display Log (DSPLOG)`).

    Look for a change that matches the start of the intermittent problems.

   e) Ensure that the latest engineering changes are installed on the system and on all system I/O devices.

9. Ensure that the hardware configuration is correct and that the model configuration rules have been followed.

   Use the **Display hardware configuration** service function (under SST or DST) to check for any missing or failed hardware.
10. Was a system upgrade, feature, or any other field bill of material or feature field bill of material installed just before the intermittent problems started occurring?

    No: Continue with the next step.

    Yes: Review the installation instructions to ensure that each step was performed correctly. Then, continue with the next step of this procedure.
11. Is the problem associated with a removable media storage device?

    No: Continue with the next step.

    Yes: Ensure that the customer is using the correct removable media storage device cleaning procedures and good storage media. Then, continue with the next step of this procedure.
12. Perform the following to help prevent intermittent thermal checks:

    - Ensure that the AMDs are working.
    - Exchange all air filters as recommended.
13. If necessary, review the intermittent problems with your next level of support and installation planning representative.

    Ensure that all installation planning checks were made on the system. Because external conditions are constantly changing, the site may need to be checked again. **This ends the procedure.**

Analyzing intermittent problems

This procedure enables you to begin analyzing an intermittent problem.

About this task

Use this procedure only after you have first reviewed the information in "About intermittent problems" on page 106 and gone through the "General intermittent problem checklist" on page 107.

Procedure

1. Is a reference code associated with the intermittent problem?

   No: Continue with the next step.

   Yes: Go to Reference codes. If the actions in the reference code tables do not correct the intermittent problem, return here and continue with the next step.
2. Is a symptom associated with the intermittent problem?

   No: Continue with the next step.

   Yes: Go to "Intermittent symptoms" on page 109. If the information there does not help to correct the intermittent problem, return here and continue with the next step.
3. Go to "Failing area intermittent isolation procedures" on page 110.

   If the information there does not help to correct the intermittent problem, return here and then, continue with the next step.
4. Send the data you have collected to your next level of support so that an Authorized Program Analysis Report (APAR) can be written.

   This ends the procedure.

Intermittent symptoms

Use the table below to find the symptom and description of the intermittent problem. Then perform the corresponding intermittent isolation procedures.

Although an isolation procedure may correct the intermittent problem, use your best judgment to determine if you should perform the remainder of the procedure shown for the symptom.

Note: If the symptom for the intermittent problem you have is not listed, go to "Failing area intermittent isolation procedures" on page 110.

Table 12. Intermittent symptoms

Symptom	Description	Isolation procedure
System powered off.	The system was operating correctly, then the system powered off. A 1xxx SRC may occur when this happens, and this SRC info should be logged in the service processor log.	INTIP09
System stops.	The system is powered on but is not operating correctly. No SRC is displayed. The system attention light is off and the processor activity lights may be on or off. Noise on the power-on reset line can cause the processor to stop.	INTIP18
System or subsystem runs slow.	The system or the subsystem is not processing at its normal speed.	INTIP20

Failing area intermittent isolation procedures

This procedure helps you determine how to resolve intermittent problems when you do not have a system reference code (SRC) or cannot determine the symptom.

About this task

Use this table only if you do not have a system reference code (SRC), or cannot find your symptom in "Intermittent symptoms" on page 109.

Procedure

1. Perform all of the steps in "General intermittent problem checklist" on page 107 for all failing areas.

   Then, continue with the next step.
2. Refer to the table below, and perform the following:
   a) Find the specific area of failure under **Failing area**.
   b) Look down the column of the area of failure until you find an X.
   c) Look across to the **Isolation procedure** column and perform the procedure indicated.
   d) If the isolation procedure does not correct the intermittent problem, continue down the column of the area of failure until you have performed all of the procedures shown for the failing area.
3. Although an isolation procedure may correct the intermittent problem, use your best judgment to determine if you should perform the remainder of the procedures shown for the failing area.

Results

Table 13. Failing area intermittent isolation procedures

Failing area						Isolation procedure to perform:
Power	**Work station I/O processor**	**Disk unit adapter**	**Comm-unication**	**Processor bus**	**Tape optical**	**Perform all steps in:**
X	X	X	X	X	X	"General intermittent problem checklist" on page 107
X	X			X		INTIP05

Table 13. Failing area intermittent isolation procedures (continued)

Failing area						Isolation procedure to perform:
Power	**Work station I/O processor**	**Disk unit adapter**	**Comm-unication**	**Processor bus**	**Tape optical**	**Perform all steps in:**
	X	X	X	X	X	INTIP07

X						INTIP14
		X				INTIP16
X	X	X	X	X	X	INTIP18
	X	X	X	X	X	INTIP20

IPL problems

Use these scenarios to help you diagnose your IPL problem.

Cannot perform IPL from the control panel (no SRC)

Use this procedure when you cannot perform an IBM i IPL from the control panel (no SRC).

About this task

DANGER: An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (D004)

Procedure

1. Perform the following:
   a) Verify that the power cable is plugged into the power outlet.
   b) Verify that power is available at the customer's power outlet.
2. Start an IPL by doing the following:
   a) Select Manual mode and IPL type A or B on the control panel. See Control panel functions for details.
   b) Power on the system. See Powering on and off.

   Does the IPL complete successfully?

   No: Continue with the next step.
   Yes: **This ends the procedure.**
3. Have all the units in the system become powered on that you expected to become powered on?

   Yes: Continue with the next step.
   No: Go to Power problems and find the symptom that matches the problem. **This ends the procedure.**
4. Is an SRC displayed on the control panel?

   - **Yes**: Go to Power problems and use the displayed SRC to correct the problem. **This ends the procedure.**

- **No**: For all models, exchange the following FRUs, one at a time. Refer to the remove and replace procedures for your specific system for additional information.

  a) SPCN card unit. See symbolic FRU TWRCARD.

  b) Power Supply. See symbolic FRU PWRSPLY. **This ends the procedure.**

Cannot perform IPL at a specified time (no SRC)

Use this procedure when you cannot perform an IBM i IPL at a specified time (no SRC). To correct the IPL problem, perform this procedure until you determine the problem and can perform an IPL at a specified time.

About this task

DANGER: An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (D004)

Procedure

1. Verify the following:

   a) The power cable is plugged into the power outlet.

   b) That power is available at the customer's power outlet.

2. Power on the system in normal mode. See Powering on and off.

   Does the IPL complete successfully?

   Yes: Continue with the next step.
   No: Go to the Starting a repair action procedure. **This ends the procedure.**

3. Have all the units in the system become powered on that you expected to become powered on?

   Yes: Continue with the next step.
   No: Go to Starting a repair action and find the symptom that matches the problem. **This ends the procedure.**

4. Verify the requested system IPL date and time by doing the following:

   a) On the command line, enter the Display System Value command:

   ```
   DSPSYSVAL QIPLDATTIM
   ```

   Observe the system value parameters.

   Note: The system value parameters are the date and time the system operator requested a timed IPL.

   ```
   +--------------------------------------------------------------------------------+
   |Display System Value                                                            |
   |System:  S0000000                                                               |
   |System value . . . . . . . . . . :  QIPLDATTIM                                  |
   |                                                                                |
   |Description  . . . . . . . . . . :  Date and time to automatically IPL         |
   |                                                                                |
   |                                                                                |
   |IPL date     . . . . . . . . . . :  MM/DD/YY                                    |
   |IPL time     . . . . . . . . . . :  HH:MM:SS                                    |
   +--------------------------------------------------------------------------------+
   ```

   Figure 1. Display for QIPLDATTIM

   b) Verify the system date. On the command line, enter the Display System Value command:

   ```
   DSPSYSVAL QDATE
   ```

   Check the system values for the date.

```
+--------------------------------------------------------------------------------+
|Display System Value                                                            |
|System:  S0000000                                                               |
|System value . . . . . . . . . :  QDATE                                         |
|                                                                                |
|Description  . . . . . . . . . :  System date                                   |
|                                                                                |
|Date          . . . . . . . . . :  MM/DD/YY                                     |
+--------------------------------------------------------------------------------+
```

Figure 2. Display for QDATE

Does the operating system have the correct date?

- **Yes**: Continue with this step.
- **No**: Set the correct date by doing the following:

  1) On the command line, enter the Change System Value command (`CHGSYSVAL QDATE VALUE('mmddyy')`).
  2) Set the date by entering

     mm=month
     dd=day
     yy=year

  3) Press **Enter**.

c) Verify the system time. On the command line, enter the Display System Value command: `DSPSYSVAL QTIME`

Check the system values for the time.

```
+--------------------------------------------------------------------------------+
|Display System Value                                                            |
|System:  S0000000                                                               |
|System value . . . . . . . . . :  QTIME                                         |
|                                                                                |
|Description  . . . . . . . . . :  Time of day                                   |
|                                                                                |
|Time         . . . . . . . . . :  HH:MM:SS                                      |
+--------------------------------------------------------------------------------+
```

Figure 3. Display for QTIME

Does the operating system have the correct time?

- **Yes**: Continue with this step.
- **No**: Set the correct time by doing the following:

  1) On the command line, enter the Change System Value command (`CHGSYSVAL QTIME VALUE('hhmmss')`).
  2) Set the time by entering

     hh=24 hour time clock
     mm=minutes
     ss=seconds

  3) Press **Enter** and then, continue with the next step.

5. Verify that the system can perform an IPL at a specified time by doing the following:

   a) Set the IPL time to 5 minutes past the present time by entering the Change System Value command (`CHGSYSVAL SYSVAL(QIPLDATTIM) VALUE('mmddyy hhmmss')`) on the command line.

   mm = month to power on
   dd = day to power on
   yy = year to power on
   hh = hour to power on

mm = minute to power on
ss = second to power on

b) Power off the system by entering the Power Down System Immediate command (`PWRDWNSYS *IMMED`) on the command line.

c) Wait 5 minutes.

Does the IPL start at the time you specified?

No: Continue with the next step.
Yes: **This ends the procedure.**

6. Power on the system in normal mode. See Powering on and off.

   Does the IPL complete successfully?

   Yes: Continue with the next step.
   No: Go to Starting a repair action. **This ends the procedure.**

7. Find an entry in the Service Action Log that matches the time, SRC, and/or resource that compares to the reported problem.

   a) On the command line, enter the Start System Service Tools command:

   ```
   STRSST
   ```

   If you cannot get to SST, select DST. See Dedicated service tools (DST) for details.

   Note: Do not IPL the system or partition to get to DST.

   b) On the Start Service Tools Sign On display, type in a user ID with service authority and password.

   c) Select **Start a Service Tool** > **Hardware Service Manager** > **Work with service action log**.

   d) On the Select Timeframe display, change the From: Date and Time to a date and time prior to when the customer reported having the problem.

   e) Find an entry that matches one or more conditions of the problem:

   - SRC
   - Resource
   - Time
   - FRU list (choose **Display the failing item information** to display the FRU list).

   Notes:

   a. All entries in the service action log represent problems that require a service action. It may be necessary to handle any problem in the log even if it does not match the original problem symptom.

   b. The information displayed in the date and time fields are the time and date for the first occurrence of the specific system reference code (SRC) for the resource displayed during the time range selected.

   Did you find an entry in the Service Action Log?

   No: Continue with the next step.
   Yes: Go to step "9" on page 115.

8. Exchange the following parts one at a time.

   See the remove and replace procedures for your specific system. After exchanging each part, return to step "5" on page 113 to verify that the system can perform an IPL at a specified time.

   Note: If you exchange the control panel or the system backplane, you must set the correct date and time by performing step "4" on page 112.

   ⚠ **Attention:** Before exchanging any part, power off the system. See Powering on and off.

   - System unit backplane (see symbolic FRU SYSBKPL)

- System control panel
- System control panel cable

Did the IPL complete successfully after you exchanged all of the parts listed above?

No: Contact your next level of support. **This ends the procedure.**
Yes: Continue with the next step.

9. Was the entry isolated (is there a Y in the Isolated column)?

   - **No**: Go to Reference codes and use the SRC indicated in the log. **This ends the procedure.**
   - **Yes**: Display the failing item information for the Service Action Log entry. Items at the top of the failing item list are more likely to fix the problem than items at the bottom of the list.

     Exchange the failing items one at a time until the problem is repaired. After exchanging each one of the items, verify that the item exchanged repaired the problem.

     Notes:

     a. For symbolic FRUs see Symbolic FRUs.
     b. When exchanging FRUs, refer to the remove and replace procedures for your specific system.
     c. After exchanging an item, go to Verifying the repair.

     After the problem has been resolved, close the log entry by selecting **Close a NEW entry** on the Service Actions Log Report display. **This ends the procedure.**

Cannot automatically perform an IPL after a power failure

Use this procedure when you cannot automatically perform an IBM i IPL after a power failure.

Procedure

1. Normal or Auto mode on the control panel must be selected when power is returned to the system.

   Is Normal or Auto mode on the control panel selected?

   Yes: Continue with the next step.
   No: Select **Normal** or **Auto** mode on the control panel. **This ends the procedure.**
2. Use the Display System Value command (DSPSYSVAL) to verify that the system value under QPWRRSTIPL on the Display System Value display is equal to 1.

   Is QPWRRSTIPL equal to 1?

   Yes: Contact your next level of support.
   No: Use the Change System Value command (CHGSYSVAL) to set QPWRRSTIPL equal to 1. **This ends the procedure.**

Power problems

Use the following table to learn how to begin analyzing a power problem.

Table 14. Analyzing power problems

Symptom	What you should do
The system unit does not power on.	See "Cannot power on system unit" on page 116.
The system unit does not power off.	See "Cannot power off system unit" on page 124.
The system does not remain powered on during a loss of incoming AC voltage and has an uninterruptible power supply (UPS) installed.	See the UPS user's guide that was provided with your unit.

Cannot power on system unit

Complete this procedure to correct the problem and power on the system.

About this task

For important safety information before you continue with this procedure, see “Power isolation procedures” on page 118.

Procedure

1. Attempt to power on the system. For more information about powering on your system, see Starting a system.

   Does the system power on, and is the system power status indicator light on continuously?

   Note: The system power status indicator flashes at the slower rate (one flash per two seconds) while powered off, and at the faster rate (one flash per second) during a normal power-on sequence.

   No: Continue with the next step.
   Yes: Go to step “13” on page 118.
2. Are there any characters displayed on the control panel (a scrolling dot might be visible as a character)?

   No: Continue with the next step.
   Yes: Go to step “5” on page 116.
3. Are the mainline AC power cables from the power supply, power distribution unit, or external uninterruptible power supply (UPS) to the customer's AC power outlet connected and seated correctly at both ends?

   Yes: Continue with the next step.
   No: Connect the mainline AC power cables correctly at both ends and go to step “1” on page 116.
4. Complete the following steps:
   a) Verify that the UPS is powered on (if it is installed).

      If the UPS will not power on, follow the service procedures for the UPS to ensure proper line voltage and UPS operation.

   b) Disconnect the mainline AC power cable or AC power jumper cable from the system's AC power connector at the system.
   c) Use a multimeter to measure the AC voltage at the system end of the mainline AC power cable or AC power jumper cable.

      Note: Some system models have more than one mainline AC power cable or AC power jumper cable. For these models, disconnect all the mainline AC power cables or AC power jumper cables and measure the AC voltage at each cable before you continue with the next step.

      Is the AC voltage 200 - 240 V AC, or 100 - 127 V AC?

      No: Go to step “8” on page 117.
      Yes: Continue with the next step.
5. Complete the following steps:
   a) Disconnect the mainline AC power cables from the power outlet.
   b) Exchange the system unit control panel and control panel cable (if present). See Part locations and location codes.
   c) Reconnect the mainline AC power cables to the power outlet.
   d) Attempt to power on the system.

   Does the system power on?

   No: Continue with the next step.
   Yes: The system unit control panel or control panel cable (if present) was the failing item. **This ends the procedure.**

6. Complete the following steps:
   a) Disconnect the mainline AC power cables from the power outlet.
   b) Exchange the power supply or supplies (U*n*-E1, U*n*-E2). See Part locations and location codes.
   c) Reconnect the mainline AC power cables to the power outlet.
   d) Attempt to power on the system. See Starting a system.

   Does the system power on?

   No: Continue with the next step.
   Yes: The power supply was the failing item. **This ends the procedure.**
7. Complete the following steps:
   a) Disconnect the mainline AC power cables.
   b) Replace the system backplane (U*n*-P1). See Part locations and location codes.
   c) Reconnect the mainline AC power cables to the power outlet.
   d) Attempt to power on the system.

   Does the system power on?

   No: Continue with the next step.
   Yes: The system backplane was the failing item. **This ends the procedure.**
8. Are you working with a system unit with a power distribution unit with tripped breakers?
   - **No:** Continue with the next step.
   - **Yes:** Complete the following steps:
     a. Reset the tripped power distribution breaker.
     b. Verify that the removable AC power cable is not the problem. Replace the cord if it is defective.
     c. If the breaker continues to trip, install a new power supply in each location until the defective one is found. **This ends the procedure.**
9. Does the system have an external UPS installed?

   Yes: Continue with the next step.
   No: Go to step “11” on page 117.
10. Use a multimeter to measure the AC voltage at the external UPS outlets. Is the AC voltage 200 - 240 V or 100 - 127 V AC?

    No: The UPS needs service. For 9910 type UPS, call IBM Service Support. For all other UPS types, have the customer call the UPS provider. In the meantime, go to step “12” on page 117 to bypass the UPS.
    Yes: Replace the AC power cable. See System parts for FRU part number. **This ends the procedure.**
11. Complete the following steps:
    a) Disconnect the mainline AC power cable from the customer's AC power outlet.
    b) Use a multimeter to measure the AC voltage at the customer's AC power outlet.

       Note: Some system models have more than one mainline AC power cable. For these models, disconnect all the mainline AC power cables and measure the AC voltage at all AC power outlets before you continue with this step.

       Is the AC voltage 200 - 240 V AC or 100 - 127 V AC?

       Yes: Exchange the mainline AC power cable. See System parts for the FRU part number. Then, go to step “1” on page 116.
       No: Inform the customer that the AC voltage at the power outlet is not correct. When the AC voltage at the power outlet is correct, reconnect the mainline AC power cables to the power outlet. **This ends the procedure.**
12. Complete the following steps to bypass the UPS unit:

a) Power off your system and the UPS unit.

b) Remove the signal cable that is used between the UPS and the system.

c) Remove any power jumper cords that are used between the UPS and the attached devices.

d) Remove the country or region-specific power cord that is used from the UPS to the wall outlet.

e) Use the correct power cord (the original country or region-specific power cord that was provided with your system) and connect it to the power inlet on the system. Plug the other end of this cord into a compatible wall outlet.

f) Attempt to power on the system.

Does the power-on standby sequence complete successfully?

Yes: Go to Verifying a repair. **This ends the procedure.**
No: Go to step "5" on page 116.

13. Display the selected IPL mode on the system unit control panel.

    Is the selected mode the same mode that the customer was using when the power-on failure occurred?

    No: Go to step "15" on page 118.
    Yes: Continue with the next step.

14. Is a function 11 reference code displayed on the system unit control panel?

    No: Go to step "16" on page 118.
    Yes: Return to Starting a repair action. **This ends the procedure.**

15. Complete the following steps:

    a) Power off the system. For more information about powering on and off your system, see Stopping a system.

    b) Select the mode on the system unit control panel that the customer was using when the power-on failure occurred.

    c) Attempt to power on the system.

    Does the system power on?

    Yes: Continue with the next step.
    No: Exchange the system unit control panel. See Part locations and location codes. **This ends the procedure.**

16. Continue the IPL. Does the IPL complete successfully?

    Yes: This ends the procedure.
    No: Return to Starting a repair action. **This ends the procedure.**

Power isolation procedures

Use power isolation procedures for isolating a problem in the power system. Use isolation procedures if there is not a management console attached to the server. If the server is connected to a management console, use the procedures that are available on the management console to continue FRU isolation.

Some field replaceable units (FRUs) can be replaced with the unit powered on. Follow the instructions in Part locations and location codes when directed to remove, exchange, or install a FRU.

The following safety notices apply throughout the power isolation procedures. Read all safety procedures before servicing the system and observe all safety procedures when performing a procedure.

⚠ **DANGER:** When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard:

- If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product.
- Do not open or service any power supply assembly.

- Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.
- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords.
  - For AC power, disconnect all power cords from their AC power source.
  - For racks with a DC power distribution panel (PDP), disconnect the customer’s DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected.
  - For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate.
  - For racks with a DC power distribution panel (PDP), connect the customer’s DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.
- Connect any equipment that will be attached to this product to properly wired outlets.
- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements.
- Do not continue with the inspection if any unsafe conditions are present.
- Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.

⚠ **DANGER:**

- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

  To Disconnect:

  1. Turn off everything (unless instructed otherwise).
  2. For AC power, remove the power cords from the outlets.
  3. For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source.
  4. Remove the signal cables from the connectors.
  5. Remove all cables from the devices.

  To Connect:

  1. Turn off everything (unless instructed otherwise).
  2. Attach all cables to the devices.
  3. Attach the signal cables to the connectors.
  4. For AC power, attach the power cords to the outlets.
  5. For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP.
  6. Turn on the devices.

Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

Cannot power on SPCN-controlled I/O expansion unit

You are here because an SPCN-controlled I/O expansion unit cannot be powered on, and might be displaying a 1*xxx*C62E reference code.

About this task

For important safety information before you continue with this procedure, see "Power isolation procedures" on page 118.

Procedure

1. Power on the system.
2. Start from SPCN 0 or SPCN 1 on the system unit. See Part locations and location codes, then go to the first unit in the SPCN frame-to-frame cable sequence that does not power on.

   Is the Data display background light on, or is the power-on LED flashing, or are there any characters displayed on the I/O expansion unit display panel?

   Note: The background light is a dim yellow light in the Data area of the display panel.

   Yes: Go to step "12" on page 122.
   No: Continue with the next step.
3. Use a multimeter to measure the AC voltage at the customer's AC power outlet.

   Is the AC voltage 200 - 240 V AC, or 100 - 127 V AC?

   - **Yes:** Continue with the next step.
   - **No:** Inform the customer that the AC voltage at the power outlet is not correct.

     This ends the procedure.
4. Is the mainline AC power cable from the AC module, power supply, or power distribution unit to the customer's AC power outlet connected and seated correctly at both ends?

   - **Yes:** Continue with the next step.
   - **No:** Connect the mainline AC power cable correctly at both ends.

     This ends the procedure.
5. Complete the following steps:

   a) Disconnect the mainline AC power cable from the AC module, power supply, or power distribution unit.

   b) Use a multimeter to measure the AC voltage at the AC module, power supply, or power distribution unit end of the mainline AC power cable.

   Is the AC voltage 200 - 240 V AC, or 100 - 127 V AC?

   No: Continue with the next step.
   Yes: Go to step "7" on page 121.
6. Are you working on a power distribution unit with tripped breakers?

   - **No:** Replace the mainline AC power cable or power distribution unit.

     This ends the procedure.
   - **Yes:** Complete the following steps:

     a. Reset the tripped power distribution breaker.
     b. Verify that the removable AC line cord is not the problem. Replace the cord if it is defective.
     c. Install a new power supply (one with the same part number as the one that is currently installed) in all power locations until the defective one is found.

This ends the procedure.

7. Does the unit that you are working on have AC power jumper cables installed?

   Note: The AC power jumper cables connect from the AC module, or the power distribution unit, to the power supplies.

   Yes: Continue with the next step.
   No: Go to step “11” on page 121.

8. Are the AC power jumper cables connected and seated correctly at both ends?

   - **Yes:** Continue with the next step.
   - **No:** Connect the AC power jumper cables correctly at both ends.

   This ends the procedure.

9. Complete the following steps:

   a) Disconnect the AC power jumper cables from the AC module or power distribution unit.

   b) Use a multimeter to measure the AC voltage at the AC module or power distribution unit (that goes to the power supplies).

   Is the AC voltage at the AC module or power distribution unit 200 - 240 V AC, or 100 - 127 V AC?

   - **Yes:** Continue with the next step.
   - **No:** Replace the following items (see System parts for location and part number information):
     - AC module
     - Power distribution unit

   This ends the procedure.

10. Complete the following steps:

    a) Connect the AC power jumper cables to the AC module, or power distribution unit.

    b) Disconnect the AC power jumper cable at the power supplies.

    c) Use a multimeter to measure the voltage input that the power jumper cables provide to the power supplies.

    Is the voltage 200 - 240 V AC or 100 - 127 V AC for each power jumper cable?

    - **No:** Exchange the power jumper cable.

    This ends the procedure.

    - **Yes:** Replace the following parts one at a time:
      a. I/O backplane
      b. Display unit
      c. Power supply 1
      d. Power supply 2
      e. Power supply 3

    This ends the procedure.

11. Complete the following steps:

    a) Disconnect the mainline AC power cable (to the expansion unit) from the customer's AC power outlet.

    b) Exchange the following FRUs, one at a time:

       - Power supply
       - I/O backplane

    c) Reconnect the mainline AC power cables (from the expansion unit) into the power outlet.

    d) Attempt to power on the system.

Does the expansion unit power on?

- **Yes:** The unit you exchanged was the failing item.

  This ends the procedure.

- **No:** Repeat this step and exchange the next FRU in the list. If you exchanged all of the FRUs in the list, ask your next level of support for assistance.

  This ends the procedure.

12. Is there a reference code displayed on the display panel for the I/O unit that does not power on?

    - **Yes:** Continue with the next step.
    - **No:** Replace the I/O backplane.

      This ends the procedure.

13. Is the reference code 1*xxxxx*2E?

    - **Yes:** Continue with the next step.
    - **No:** Use the new reference code and return to Start of call.

      This ends the procedure.

14. Do the SPCN optical cables (A) connect the failing unit (B) to the preceding unit in the chain or loop?

```
.---------.      (A) SPCN
| System  |  Optical Cables -.      .----- SPCN
| Unit    |                 |       V   Optical Adapter
| SPCN 0  |        .-.      V    .-.
'----.----'        | +------------+ |
     |             | +------------+ |
.----'----. .-------'-+    .-------'-+ .---------.
|  J15    | |Sec   J16|    |Sec   J15| |    Sec  |
|Sec Unit +-+UNIT  J15|    |Unit  J16+-+J15 Unit |
|  1      | |  2      |    |  3      | |      4  |
'---------' '---------'    '---------' '---------'
                               ^
                               |
                               '---- (B) Failing Unit
```

    Yes: Continue with the next step.

    No: Go to step “18” on page 123.

15. Remove the SPCN optical adapter (A) from the frame that precedes the frame that cannot become powered on.

```
.---------.          .--- (A) SPCN Optical Adapter
| System  |          |
| Unit    |          V
| SPCN 0  |         .-.           .-.
'----.----'         | +------------+ |
    322             | +------------+ |
.----'----. .-------'-+    .-------'-+ .---------.
|   J15   | |Sec   J16|    |Sec   J15| |    Sec  |
|Sec Unit +-+Unit  J15|    |Unit  J16+-+J15 Unit |
|  1      | |  2      |    |  3      | |      4  |
'---------' '---------'    '---------' '---------'
                                 ^
                                 |
                                 '-- Failing Unit
```

16. Complete the following steps:

    Notes:

    a. The cable might be connected to either J15 or J16.
    b. Use an insulated probe or jumper when you measure the voltage readings.

    a) Connect the negative lead of a multimeter to the system frame ground.

    b) Connect the positive lead of a multimeter to pin 2 of the connector from which you removed the SPCN optical adapter in the previous step of this procedure.

    c) Note the voltage reading on pin 2.

    d) Move the positive lead of the multimeter to pin 3 of the connector or SPCN card.

e) Note the voltage reading on pin 3.

Is the voltage on both pin 2 and pin 3 1.5 - 5.5 V DC?

- **Yes:** Continue with the next step.
- **No:** Exchange the I/O backplane.

  This ends the procedure.

17. Exchange the following FRUs, one at a time:

    a) In the failing unit (first frame with a failure indication), replace the I/O backplane.

    b) In the preceding unit in the string, replace the I/O backplane.

    c) SPCN optical adapter (A) in the preceding unit in the string.

    d) SPCN optical adapter (B) in the failing unit.

    e) SPCN optical cables (C) between the preceding unit in the string and the failing unit.

    This ends the procedure.

```
      (A) SPCN
       Optical            .----- (C) SPCN
       Adapter ----.      |      Optical Cables
                   |      |
                   |      |      .-- (B) SPCN
.---------.        |      |      |      Optical
| System  |        |      |      |      Adapter
| Unit    |        V      |      V
| SPCN 0  |      .-.      V     .-.
'----.----'      | +------------+ |
     |           | +------------+ |
.----'----. .-------'-+  .-------'-+ .---------.
|Sec J15  | |  Sec J16|  |Sec   J15| |    Sec  |
|Unit  J16+-+J15 Unit |  |Unit  J16+-+J15 Unit |
|  1      | |      2  |  |  3      | |      4  |
'---------' '---------'  '---------' '---------'
                               ^
                               |
                               |
                               '--- Failing Unit
```

18. Complete the following steps:

    a) Power off the system.

    b) Disconnect the SPCN frame-to-frame cable from the connector of the first unit that cannot be powered on.

    c) Connect the negative lead of a multimeter to the system frame ground.

    d) Connect the positive lead of the multimeter to pin 2 of the SPCN cable.

    Note: Use an insulated probe or jumper when you measure the voltage readings.

    e) Note the voltage reading on pin 2.

    f) Move the positive lead of the multimeter to pin 3 of the SPCN cable.

    g) Note the voltage reading on pin 3.

    Is the voltage on both pin 2 and pin 3 1.5 - 5.5 V DC?

    - **No:** Continue with the next step.
    - **Yes:** Exchange the following FRUs one at a time:

      a. In the failing unit, replace the I/O backplane.

      b. In the preceding unit in the string, replace the I/O backplane.

      c. SPCN frame-to-frame cable.

      This ends the procedure.

19. Complete the following steps:

    a) Follow the SPCN frame-to-frame cable back to the preceding unit in the string.

b) Disconnect the SPCN cable from the connector.

c) Connect the negative lead of a multimeter to the system frame ground.

d) Connect the positive lead of a multimeter to pin 2 of the connector.

Note: Use an insulated probe or jumper when you measure the voltage readings.

e) Note the voltage reading on pin 2.

f) Move the positive lead of the multimeter to pin 3 of the connector.

g) Note the voltage reading on pin 3.

Is the voltage on both pin 2 and pin 3 1.5 V - 5.5 V DC?

- **Yes:** Exchange the following FRUs one at a time:

  a. SPCN frame-to-frame cable.

  b. In the failing unit, replace the I/O backplane.

  c. In the preceding unit in the string, replace the I/O backplane.

  This ends the procedure.

- **No:** Exchange the I/O backplane from the unit from which you disconnected the SPCN cable in the previous step of this procedure.

This ends the procedure.

Cannot power off system unit

Use this procedure to analyze a failure of the normal command and control panel procedures to power off the system unit.

About this task

⚠ **Attention:** To prevent loss of data, ask the customer to verify that no interactive jobs are running before you complete this procedure.

For important safety information before you continue with this procedure, see "Power isolation procedures" on page 118.

Procedure

1. Attempt to power off the system.

   Does the system unit power off, and is the power indicator light flashing slowly?

   No: Continue with the next step.

   Yes: The system is not responding to normal power off procedures, which might indicate a Licensed Internal Code problem. Contact your next level of support. **This ends the procedure.**

2. Attempt to power off the system by using ASMI.

   Does the system power off?

   Yes: The system is not responding to normal power off procedures, which might indicate a Licensed Internal Code problem. Contact your next level of support. **This ends the procedure.**

   No: Continue with the next step.

3. Attempt to power off the system by using the control panel power button.

   Does the system power off?

   Yes: Continue with the next step.

   No: Go to step "5" on page 125.

4. Is there a reference code logged in the ASMI, the control panel, or the management console that indicates a power problem?

   Yes: Complete problem analysis for the reference code in the log. **This ends the procedure.**

   No: Contact your next level of support. **This ends the procedure.**

5. Ensure that no jobs are running on the system or partition, and verify that an uninterruptible power supply (UPS) is not powering the system. Then, continue with the next step.
6. Complete the following steps:
   a) Remove the system unit AC power cord from the external UPS or, if an external UPS is not installed, from the customer's AC power outlet.

      If the system unit has more than one AC line cord, disconnect all the AC line cords.

   b) Exchange the following FRUs one at a time. For more information about FRU locations and parts for the system that you are servicing, see Part locations and location codes and System parts.

      If the system unit is failing:

      1) Power supply. Go to step “7” on page 125.
      2) Service processor
      3) System control panel

      This ends the procedure.
7. A power supply might be the failing item.

   Attention: When you replace a redundant power supply, a 1*xxx*1504, 1*xxx*1514, 1*xxx*1524, or 1*xxx*1534 reference code might be logged in the error log. If you just removed and replaced the power supply in the location that is associated with this reference code, and the power supply came ready after the install, disregard this reference code. If you did not previously remove and replace a power supply, the power supply did not come ready after installation, or there are repeated fan fault errors after the power supply replacement, continue to follow these steps.

   Is the reference code 1*xxx*15*xx*?

   No: Continue with the next step.
   Yes: Complete the following steps:

   a) Find the unit reference code in one of the following tables to determine the failing power supply.
   b) Ensure that the power cables are properly connected and seated.
   c) Is the reference code 1*xxx*1500, 1*xxx*1510, 1*xxx*1520, or 1*xxx*1530 and is the failing unit configured with a redundant power supply option (or dual line cord feature)?
      - **Yes:** Complete “PWR1911” on page 126 before you replace parts.
      - **No:** Continue with step “7.d” on page 125.
   d) For more information about FRU locations for the system that you are servicing, see Part locations and location codes.
   e) Replace the failing power supply (see the following table to determine which power supply to replace).
   f) If the new power supply does not fix the problem, complete the following steps:
      1) Reinstall the original power supply.
      2) Try the new power supply in each of the other positions that are listed in the table.
      3) If the problem still is not fixed, reinstall the original power supply and go to the next FRU in the list.
      4) For reference codes 1*xxx*1500, 1*xxx*1510, 1*xxx*1520, and 1*xxx*1530, exchange the power distribution backplane if a problem persists after you replace the power supply.

Table 15. System unit

Unit reference code	Power supply
1510, 1511, 1512, 1513, 1514, 7110	E1
1520, 1521, 1522, 1523, 1524, 7120	E2

⚠ **Attention:** For reference codes 1500, 1510, 1520, and 1530, complete "PWR1911" on page 126 before you replace parts.

This ends the procedure.

8. Is the reference code 1*xxx*2600, 1*xxx*2603, 1*xxx*2605, or 1*xxx*2606?
   - **No:** Continue with the next step.
   - **Yes:** Complete the following steps:

   a) For more information about FRU locations for the system you are servicing, see Part locations and location codes.

   b) Replace the failing power supply.

   c) If the new power supply does not fix the problem, complete the following steps:

      1) Reinstall the original power supply.

      2) Try the new power supply in each of the other positions that are listed in the table.

      3) If the problem still is not fixed, reinstall the original power supply and go to the next FRU in the list.

      ⚠ **Attention:** Do not install power supplies P00 and P01 AC jumper cables on the same AC input module.

Table 16. Failing power supplies

System or feature code	**Failing power supply**
System unit	U*n*-E1, U*n*-E2

This ends the procedure.

9. Is the reference code 1*xxx*8455 or 1*xxx*8456?
   - **No:** Return to Starting a repair action. **This ends the procedure.**
   - **Yes:** One of the power supplies is missing, and must be installed. Use the following table to determine which power supply is missing, and install the power supply. For more information about FRU locations for the system you are servicing, see Part locations and location codes.

Table 17. Missing power supplies

Reference code	**Missing power supply**
1*xxx*8455	U*n*-E1
1*xxx*8456	U*n*-E2

This ends the procedure.

PWR1911
You are here because of a power problem on a system with more than one line cord. If the failing unit does not have more than one line cord, return to the procedure that sent you here or go to the next item in the FRU list.

About this task

The following steps are for the system unit, unless other instructions are given. For important safety information before you service the system, see "Power isolation procedures" on page 118.

Procedure

1. If an uninterruptible power supply is installed, verify that it is powered on before proceeding.
2. Are all the units powered on?

- **Yes:** Go to step “7” on page 128.
- **No:** On the unit that does not power on, complete the following steps:

  a. Disconnect the line cords from the unit that does not power on.

  b. Use a multimeter to measure the voltage at the system end of the line cords.

  Table 18. Correct voltage

Model or expansion drawer	**Correct AC voltage**	**Correct DC voltage**
5105-22E, 9008-22L, 9009-22A, 9009-22G, 9009-41A, 9009-41G, 9009-42A, 9009-42G, 9223-22H, 9223-22S, 9223-42H, or 9223-42S	100 - 127 V or 200 - 240 V	-37.5 - -60 V or 192 - 400 V
9040-MR9	200 - 240 V	192 - 400 V
9080-M9S	200 - 240 V	192 - 400 V
EMX0 PCIe3 expansion drawer	100 - 127 V or 200 - 240 V	192 - 400 V

  c. Is the voltage correct (see Table 18 on page 127)?

  Yes: Continue with the next step.
  No: Go to step “5” on page 127.

3. Complete the following steps:

   a. Reconnect the line cords.

   b. Verify that the failing unit fails to power on.

   c. Replace the failing power supply. Use the following table to determine which power supply needs to be replaced, and then see Part locations and location codes for location, part number, and exchange procedure information.

   Table 19. Failing power supply for systems models and expansion drawers

Reference code	**System unit or expansion drawer**	**Failing item name**
1510	System unit	Power supply 1
	Expansion drawer	Power supply 1
1520	System unit	Power supply 2
	Expansion drawer	Power supply 2
1530	System unit	Power supply 3
1540	System unit	Power supply 4

   This ends the procedure.

4. Is the system a 9080-M9S?

   Yes: Continue with the next step.
   No: Go to step “6” on page 128.

5. Complete the following steps at the rear of the system:

   a) Disconnect the line cords from the connectors on the line cord conduit for the unit that does not power on.

   b) Use a multimeter to measure the voltage at the system end of the line cords.

c) Is the voltage correct (see Table 18 on page 127)?

Yes: Replace the line cord conduit. **This ends the procedure.**
No: Continue with the next step.

6. Complete the following steps:

   a) Disconnect the line cords from the customer's power outlet.

   b) Use a multimeter to measure the voltage at the customer's power outlet.

   Is the voltage correct (see Table 18 on page 127)?

   - **Yes:** Exchange the failing line cord.

     This ends the procedure.

   - **No:** Complete the following steps:

     a. Inform the customer that the voltage at the power outlet is not correct.

     b. Reconnect the line cords to the power outlet after the voltage at the power outlet is correct.

        This ends the procedure.

7. Is the reference code 1xxx00AC?

   - **No:** Continue with the next step.
   - **Yes:** This reference code might be caused by an outage. If the system will power on without an error, no parts need to be replaced.

     This ends the procedure.

8. Is the reference code 1xxx15x0?

   - **No:** Complete Problem Analysis by using the reference code.

     This ends the procedure.

   - **Yes:** Complete the following steps:

     a. Use the following table to locate the failing parts. For more information about locations, see Part locations and location codes.

Table 20. Power reference code table

System unit or expansion drawer	**Reference code**	**Locate these parts**
System unit	1xxx 1510	Power supply E1 and line cord 1
	1xxx 1520	Power supply E2 and line cord 2
	1xxx 1530	Power supply E3 and line cord 3
	1xxx 1540	Power supply E4 and line cord 4
Expansion drawer	1xxx 1510	Power supply 1 and line cord 1
	1xxx 1520	Power supply 2 and line cord 2

     b. Locate the line cord or the jumper cable for the reference code you are working on.

     c. Go to step “9” on page 128.

9. Complete the following steps:

   ⚠ **Attention:** Do not disconnect the other system line cords or the other jumper cables when powered on.

   a) For the reference code you are working on, disconnect either the jumper cable or the line cord from the power supply.

b) Use a multimeter to measure the voltage at the power supply end of the jumper cable **or** the line cord.

Is the voltage correct (see Table 18 on page 127)?

No: Continue with the next step.

Yes: Exchange the failing power supply. See Table 19 on page 127 for its position, and then see Part locations and location codes for part numbers and directions to the correct exchange procedures. **This ends the procedure.**

10. Complete the following steps:

a) Disconnect the line cords from the power outlet.

b) Use a multimeter to measure the voltage at the customer's power outlet.

Is the voltage correct (see Table 18 on page 127)?

- **Yes:** Exchange the following items, one at a time:
  - Failing line cord
  - Failing jumper cable (if installed)

  This ends the procedure.
- **No:** Complete the following steps:
  a. Inform the customer that the voltage at the power outlet is not correct.
  b. Reconnect the line cords to the power outlet after the voltage at the power outlet is correct.

  This ends the procedure.

Notices

This information was developed for products and services offered in the US.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation

INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some jurisdictions do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM websites are provided for convenience only and do not in any manner serve as an endorsement of those websites. The materials at those websites are not part of the materials for this IBM product and use of those websites is at your own risk.

IBM may use or distribute any of the information you provide in any way it believes appropriate without incurring any obligation to you.

The performance data and client examples cited are presented for illustrative purposes only. Actual performance results may vary depending on specific configurations and operating conditions.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

All IBM prices shown are IBM's suggested retail prices, are current and are subject to change without notice. Dealer prices may vary.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to actual people or business enterprises is entirely coincidental.

If you are viewing this information in softcopy, the photographs and color illustrations may not appear.

The drawings and specifications contained herein shall not be reproduced in whole or in part without the written permission of IBM.

IBM has prepared this information for use with the specific machines indicated. IBM makes no representations that it is suitable for any other purpose.

IBM's computer systems contain mechanisms designed to reduce the possibility of undetected data corruption or loss. This risk, however, cannot be eliminated. Users who experience unplanned outages, system failures, power fluctuations or outages, or component failures must verify the accuracy of operations performed and data saved or transmitted by the system at or near the time of the outage or failure. In addition, users must establish procedures to ensure that there is independent data verification before relying on such data in sensitive or critical operations. Users should periodically check IBM's support websites for updated information and fixes applicable to the system and related software.

Homologation statement

This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Contact an IBM representative or reseller for any questions.

Accessibility features for IBM Power Systems servers

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Power Systems servers include the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Power Systems servers use the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with US Section 508 (www.access-board.gov/guidelines-and-standards/communications-and-it/about-the-section-508-standards/section-508-standards) and Web Content Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the IBM Power Systems servers.

The IBM Power Systems servers online product documentation in IBM Knowledge Center is enabled for accessibility. The accessibility features of IBM Knowledge Center are described in the Accessibility section of the IBM Knowledge Center help (www.ibm.com/support/knowledgecenter/doc/kc_help.html#accessibility).

Keyboard navigation

This product uses standard navigation keys.

Interface information

The IBM Power Systems servers user interfaces do not have content that flashes 2 - 55 times per second.

The IBM Power Systems servers web user interface relies on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

The IBM Power Systems servers web user interface includes WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Power Systems servers include certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as the customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at http://www.ibm.com/privacy and IBM's Online Privacy Statement at http://www.ibm.com/privacy/details/us/en/ in the section entitled "Cookies, Web Beacons and Other Technologies".

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information.

The registered trademark Linux is used pursuant to a sublicense from the Linux Foundation, the exclusive licensee of Linus Torvalds, owner of the mark on a worldwide basis.

Electronic emission notices

Class A Notices

The following Class A statements apply to the IBM servers that contain the POWER9 processor and its features unless designated as electromagnetic compatibility (EMC) Class B in the feature information.

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

Canada Notice

CAN ICES-3 (A)/NMB-3(A)

European Community and Morocco Notice

This product is in conformity with the protection requirements of Directive 2014/30/EU of the European Parliament and of the Council on the harmonization of the laws of the Member States relating to electromagnetic compatibility. IBM cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-IBM option cards.

This product may cause interference if used in residential areas. Such use must be avoided unless the user takes special measures to reduce electromagnetic emissions to prevent interference to the reception of radio and television broadcasts.

Warning: This equipment is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

Germany Notice

Deutschsprachiger EU Hinweis: Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit

Dieses Produkt entspricht den Schutzanforderungen der EU-Richtlinie 2014/30/EU zur Angleichung der Rechtsvorschriften über die elektromagnetische Verträglichkeit in den EU-Mitgliedsstaatenund hält die Grenzwerte der EN 55022 / EN 55032 Klasse A ein.

Um dieses sicherzustellen, sind die Geräte wie in den Handbüchern beschrieben zu installieren und zu betreiben. Des Weiteren dürfen auch nur von der IBM empfohlene Kabel angeschlossen werden. IBM übernimmt keine Verantwortung für die Einhaltung der Schutzanforderungen, wenn das Produkt ohne Zustimmung von IBM verändert bzw. wenn Erweiterungskomponenten von Fremdherstellern ohne Empfehlung von IBM gesteckt/eingebaut werden.

EN 55032 Klasse A Geräte müssen mit folgendem Warnhinweis versehen werden:

"Warnung: Dieses ist eine Einrichtung der Klasse A. Diese Einrichtung kann im Wohnbereich Funk-Störungen verursachen; in diesem Fall kann vom Betreiber verlangt werden, angemessene Maßnahmen zu ergreifen und dafür aufzukommen."

Deutschland: Einhaltung des Gesetzes über die elektromagnetische Verträglichkeit von Geräten

Dieses Produkt entspricht dem “Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) “. Dies ist die Umsetzung der EU-Richtlinie 2014/30/EU in der Bundesrepublik Deutschland.

Zulassungsbescheinigung laut dem Deutschen Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) (bzw. der EMC Richtlinie 2014/30/EU) für Geräte der Klasse A

Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen.

Verantwortlich für die Einhaltung der EMV Vorschriften ist der Hersteller:
International Business Machines Corp.
New Orchard Road
Armonk, New York 10504

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Responsible Party:
International Business Machines Corporation
New Orchard Road
Armonk, NY 10504

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult an IBM-authorized dealer or service representative for help.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions:

(1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Terms and conditions

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Personal Use: You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative works of these publications, or any portion thereof, without the express consent of IBM.

Commercial Use: You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights: Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

IBM

Note

Before using this information and the product it supports, read the information in “Safety notices” on page v, “Notices” on page 135, the *IBM Systems Safety Notices* manual, G229-9054, and the *IBM Environmental Notices and User Guide*, Z125–5823.

This edition applies to IBM® Hardware Management Console Version 9 Release 2 Maintenance Level 950 and to all subsequent releases and modifications until otherwise indicated in new editions.

Contents

Safety notices

Safety notices may be printed throughout this guide:

- **DANGER** notices call attention to a situation that is potentially lethal or extremely hazardous to people.
- **CAUTION** notices call attention to a situation that is potentially hazardous to people because of some existing condition.
- **Attention** notices call attention to the possibility of damage to a program, device, system, or data.

World Trade safety information

Several countries require the safety information contained in product publications to be presented in their national languages. If this requirement applies to your country, safety information documentation is included in the publications package (such as in printed documentation, on DVD, or as part of the product) shipped with the product. The documentation contains the safety information in your national language with references to the U.S. English source. Before using a U.S. English publication to install, operate, or service this product, you must first become familiar with the related safety information documentation. You should also refer to the safety information documentation any time you do not clearly understand any safety information in the U.S. English publications.

Replacement or additional copies of safety information documentation can be obtained by calling the IBM Hotline at 1-800-300-8751.

German safety information

Das Produkt ist nicht für den Einsatz an Bildschirmarbeitsplätzen im Sinne § 2 der Bildschirmarbeitsverordnung geeignet.

Laser safety information

IBM servers can use I/O cards or features that are fiber-optic based and that utilize lasers or LEDs.

Laser compliance

IBM servers may be installed inside or outside of an IT equipment rack.

DANGER: When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard: If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product. Do not open or service any power supply assembly. Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.

- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords. For AC power, disconnect all power cords from their AC power source. For racks with a DC power distribution panel (PDP), disconnect the customer's DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected. For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate. For racks with a DC power distribution panel (PDP), connect the customer's DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.
- Connect any equipment that will be attached to this product to properly wired outlets.

- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- When performing a machine inspection: Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements. Do not attempt to switch power to the machine until all possible unsafe conditions are corrected. Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.
- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

  To Disconnect: 1) Turn off everything (unless instructed otherwise). 2) For AC power, remove the power cords from the outlets. 3) For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source. 4) Remove the signal cables from the connectors. 5) Remove all cables from the devices.

  To Connect: 1) Turn off everything (unless instructed otherwise). 2) Attach all cables to the devices. 3) Attach the signal cables to the connectors. 4) For AC power, attach the power cords to the outlets. 5) For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP. 6) Turn on the devices.
-  Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

(R001 part 1 of 2):

DANGER: Observe the following precautions when working on or around your IT rack system:

- Heavy equipment–personal injury or equipment damage might result if mishandled.
- Always lower the leveling pads on the rack cabinet.
- Always install stabilizer brackets on the rack cabinet if provided, unless the earthquake option is to be installed.
- To avoid hazardous conditions due to uneven mechanical loading, always install the heaviest devices in the bottom of the rack cabinet. Always install servers and optional devices starting from the bottom of the rack cabinet.
- Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack mounted devices and do not use them to stabilize your body position (for example, when working from a ladder).

- Stability hazard:
  - The rack may tip over causing serious personal injury.
  - Before extending the rack to the installation position, read the installation instructions.
  - Do not put any load on the slide-rail mounted equipment mounted in the installation position.
  - Do not leave the slide-rail mounted equipment in the installation position.
- Each rack cabinet might have more than one power cord.
  - For AC powered racks, be sure to disconnect all power cords in the rack cabinet when directed to disconnect power during servicing.

  - For racks with a DC power distribution panel (PDP), turn off the circuit breaker that controls the power to the system unit(s), or disconnect the customer’s DC power source, when directed to disconnect power during servicing.
- Connect all devices installed in a rack cabinet to power devices installed in the same rack cabinet. Do not plug a power cord from a device installed in one rack cabinet into a power device installed in a different rack cabinet.
- An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (R001 part 1 of 2)

(R001 part 2 of 2):

⚠ **CAUTION:**

- Do not install a unit in a rack where the internal rack ambient temperatures will exceed the manufacturer's recommended ambient temperature for all your rack-mounted devices.
- Do not install a unit in a rack where the air flow is compromised. Ensure that air flow is not blocked or reduced on any side, front, or back of a unit used for air flow through the unit.
- Consideration should be given to the connection of the equipment to the supply circuit so that overloading of the circuits does not compromise the supply wiring or overcurrent protection. To provide the correct power connection to a rack, refer to the rating labels located on the equipment in the rack to determine the total power requirement of the supply circuit.
- *(For sliding drawers.)* Do not pull out or install any drawer or feature if the rack stabilizer brackets are not attached to the rack or if the rack is not bolted to the floor. Do not pull out more than one drawer at a time. The rack might become unstable if you pull out more than one drawer at a time.

- *(For fixed drawers.)* This drawer is a fixed drawer and must not be moved for servicing unless specified by the manufacturer. Attempting to move the drawer partially or completely out of the rack might cause the rack to become unstable or cause the drawer to fall out of the rack. (R001 part 2 of 2)

⚠ **CAUTION:** Removing components from the upper positions in the rack cabinet improves rack stability during relocation. Follow these general guidelines whenever you relocate a populated rack cabinet within a room or building.

- Reduce the weight of the rack cabinet by removing equipment starting at the top of the rack cabinet. When possible, restore the rack cabinet to the configuration of the rack cabinet as you received it. If this configuration is not known, you must observe the following precautions:
  - Remove all devices in the 32U position and above.
  - Ensure that the heaviest devices are installed in the bottom of the rack cabinet.

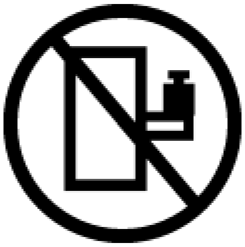
  - Ensure that there are little-to-no empty U-levels between devices installed in the rack cabinet below the 32U level, unless the received configuration specifically allowed it.
- If the rack cabinet you are relocating is part of a suite of rack cabinets, detach the rack cabinet from the suite.
- If the rack cabinet you are relocating was supplied with removable outriggers they must be reinstalled before the cabinet is relocated.
- Inspect the route that you plan to take to eliminate potential hazards.
- Verify that the route that you choose can support the weight of the loaded rack cabinet. Refer to the documentation that comes with your rack cabinet for the weight of a loaded rack cabinet.
- Verify that all door openings are at least 760 x 2083 mm (30 x 82 in.).
- Ensure that all devices, shelves, drawers, doors, and cables are secure.
- Ensure that the four leveling pads are raised to their highest position.
- Ensure that there is no stabilizer bracket installed on the rack cabinet during movement.
- Do not use a ramp inclined at more than 10 degrees.
- When the rack cabinet is in the new location, complete the following steps:
  - Lower the four leveling pads.
  - Install stabilizer brackets on the rack cabinet or in an earthquake environment bolt the rack to the floor.
  - If you removed any devices from the rack cabinet, repopulate the rack cabinet from the lowest position to the highest position.
- If a long-distance relocation is required, restore the rack cabinet to the configuration of the rack cabinet as you received it. Pack the rack cabinet in the original packaging material, or equivalent. Also lower the leveling pads to raise the casters off of the pallet and bolt the rack cabinet to the pallet.

(R002)

(L001)

⚠ **DANGER:** Hazardous voltage, current, or energy levels are present inside any component that has this label attached. Do not open any cover or barrier that contains this label. (L001)

(L002)



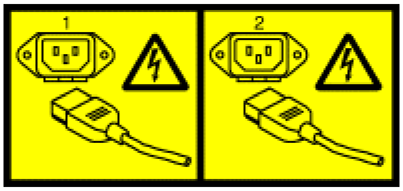
⚠ **DANGER:** Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack-mounted devices and do not use them to stabilize your body position (for example, when working from a ladder). Stability hazard:

- The rack may tip over causing serious personal injury.
- Before extending the rack to the installation position, read the installation instructions.

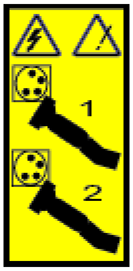
- Do not put any load on the slide-rail mounted equipment mounted in the installation position.
- Do not leave the slide-rail mounted equipment in the installation position.

(L002)

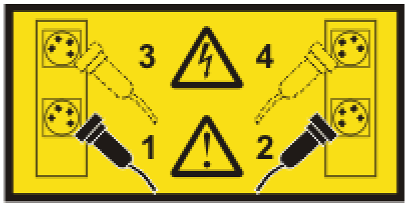
(L003)



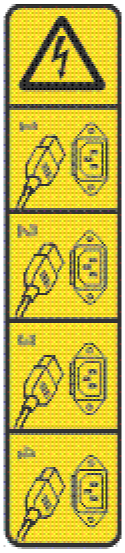
or



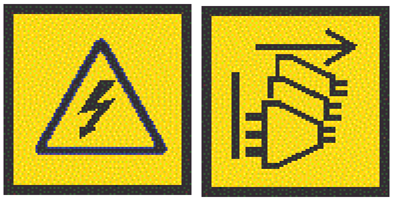
or

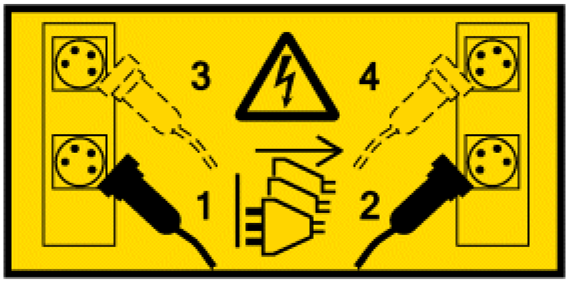


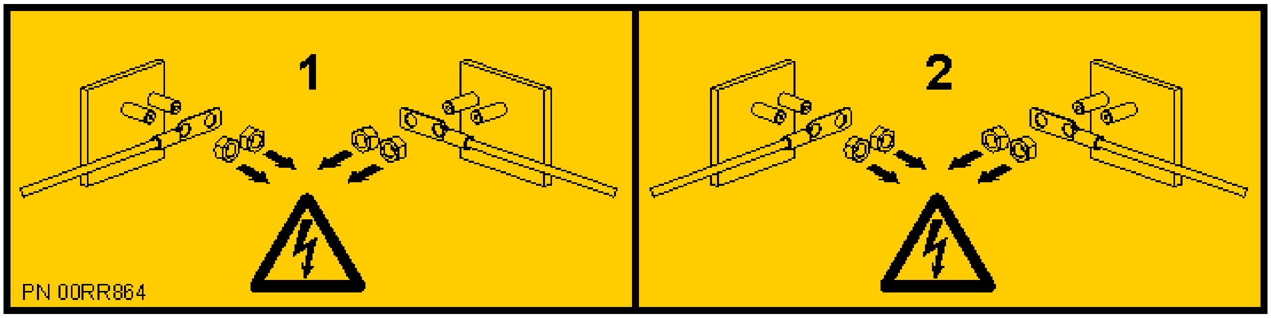
or



or





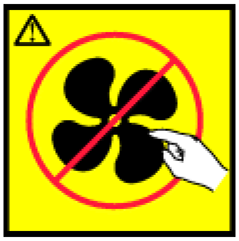


DANGER: Multiple power cords. The product might be equipped with multiple AC power cords or multiple DC power cables. To remove all hazardous voltages, disconnect all power cords and power cables. (L003)

(L007)

CAUTION: A hot surface nearby. (L007)

(L008)



CAUTION: Hazardous moving parts nearby. (L008)

All lasers are certified in the U.S. to conform to the requirements of DHHS 21 CFR Subchapter J for class 1 laser products. Outside the U.S., they are certified to be in compliance with IEC 60825 as a class 1 laser product. Consult the label on each part for laser certification numbers and approval information.

CAUTION: This product might contain one or more of the following devices: CD-ROM drive, DVD-ROM drive, DVD-RAM drive, or laser module, which are Class 1 laser products. Note the following information:

- Do not remove the covers. Removing the covers of the laser product could result in exposure to hazardous laser radiation. There are no serviceable parts inside the device.
- Use of the controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

(C026)

CAUTION: Data processing environments can contain equipment transmitting on system links with laser modules that operate at greater than Class 1 power levels. For this reason, never look into the end of an optical fiber cable or open receptacle. Although shining light into one end and looking into the other end of a disconnected optical fiber to verify the continuity of optic fibers may not injure the eye, this procedure is potentially dangerous. Therefore, verifying the continuity of optical fibers by shining light into one end and looking at the other end is not recommended. To verify continuity of a fiber optic cable, use an optical light source and power meter. (C027)

CAUTION: This product contains a Class 1M laser. Do not view directly with optical instruments. (C028)

CAUTION: Some laser products contain an embedded Class 3A or Class 3B laser diode. Note the following information:

- Laser radiation when open.
- Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam. (C030)

(C030)

CAUTION: The battery contains lithium. To avoid possible explosion, do not burn or charge the battery.

Do Not:

- Throw or immerse into water
- Heat to more than 100 degrees C (212 degrees F)
- Repair or disassemble

Exchange only with the IBM-approved part. Recycle or discard the battery as instructed by local regulations. In the United States, IBM has a process for the collection of this battery. For information, call 1-800-426-4333. Have the IBM part number for the battery unit available when you call. (C003)

CAUTION: Regarding IBM provided VENDOR LIFT TOOL:

- Operation of LIFT TOOL by authorized personnel only.
- LIFT TOOL intended for use to assist, lift, install, remove units (load) up into rack elevations. It is not to be used loaded transporting over major ramps nor as a replacement for such designated tools like pallet jacks, walkies, fork trucks and such related relocation practices. When this is not practicable, specially trained persons or services must be used (for instance, riggers or movers).
- Read and completely understand the contents of LIFT TOOL operator's manual before using. Failure to read, understand, obey safety rules, and follow instructions may result in property damage and/or personal injury. If there are questions, contact the vendor's service and support. Local paper manual must remain with machine in provided storage sleeve area. Latest revision manual available on vendor's web site.
- Test verify stabilizer brake function before each use. Do not over-force moving or rolling the LIFT TOOL with stabilizer brake engaged.
- Do not raise, lower or slide platform load shelf unless stabilizer (brake pedal jack) is fully engaged. Keep stabilizer brake engaged when not in use or motion.
- Do not move LIFT TOOL while platform is raised, except for minor positioning.
- Do not exceed rated load capacity. See LOAD CAPACITY CHART regarding maximum loads at center versus edge of extended platform.
- Only raise load if properly centered on platform. Do not place more than 200 lb (91 kg) on edge of sliding platform shelf also considering the load's center of mass/gravity (CoG).
- Do not corner load the platforms, tilt riser, angled unit install wedge or other such accessory options. Secure such platforms -- riser tilt, wedge, etc options to main lift shelf or forks in all four (4x or all other provisioned mounting) locations with provided hardware only, prior to use. Load objects are designed to slide on/off smooth platforms without appreciable force, so take care not

to push or lean. Keep riser tilt [adjustable angling platform] option flat at all times except for final minor angle adjustment when needed.

- Do not stand under overhanging load.
- Do not use on uneven surface, incline or decline (major ramps).
- Do not stack loads.
- Do not operate while under the influence of drugs or alcohol.
- Do not support ladder against LIFT TOOL (unless the specific allowance is provided for one following qualified procedures for working at elevations with this TOOL).
- Tipping hazard. Do not push or lean against load with raised platform.
- Do not use as a personnel lifting platform or step. No riders.
- Do not stand on any part of lift. Not a step.
- Do not climb on mast.
- Do not operate a damaged or malfunctioning LIFT TOOL machine.
- Crush and pinch point hazard below platform. Only lower load in areas clear of personnel and obstructions. Keep hands and feet clear during operation.
- No Forks. Never lift or move bare LIFT TOOL MACHINE with pallet truck, jack or fork lift.
- Mast extends higher than platform. Be aware of ceiling height, cable trays, sprinklers, lights, and other overhead objects.
- Do not leave LIFT TOOL machine unattended with an elevated load.
- Watch and keep hands, fingers, and clothing clear when equipment is in motion.
- Turn Winch with hand power only. If winch handle cannot be cranked easily with one hand, it is probably over-loaded. Do not continue to turn winch past top or bottom of platform travel. Excessive unwinding will detach handle and damage cable. Always hold handle when lowering, unwinding. Always assure self that winch is holding load before releasing winch handle.
- A winch accident could cause serious injury. Not for moving humans. Make certain clicking sound is heard as the equipment is being raised. Be sure winch is locked in position before releasing handle. Read instruction page before operating this winch. Never allow winch to unwind freely. Freewheeling will cause uneven cable wrapping around winch drum, damage cable, and may cause serious injury.
- This TOOL must be maintained correctly for IBM Service personnel to use it. IBM shall inspect condition and verify maintenance history before operation. Personnel reserve the right not to use TOOL if inadequate. (C048)

Power and cabling information for NEBS (Network Equipment-Building System) GR-1089-CORE

The following comments apply to the IBM servers that have been designated as conforming to NEBS (Network Equipment-Building System) GR-1089-CORE:

The equipment is suitable for installation in the following:

- Network telecommunications facilities
- Locations where the NEC (National Electrical Code) applies

The intrabuilding ports of this equipment are suitable for connection to intrabuilding or unexposed wiring or cabling only. The intrabuilding ports of this equipment *must not* be metallically connected to the interfaces that connect to the OSP (outside plant) or its wiring. These interfaces are designed for use as intrabuilding interfaces only (Type 2 or Type 4 ports as described in GR-1089-CORE) and require isolation from the exposed OSP cabling. The addition of primary protectors is not sufficient protection to connect these interfaces metallically to OSP wiring.

Note: All Ethernet cables must be shielded and grounded at both ends.

The ac-powered system does not require the use of an external surge protection device (SPD).

The dc-powered system employs an isolated DC return (DC-I) design. The DC battery return terminal *shall not* be connected to the chassis or frame ground.

The dc-powered system is intended to be installed in a common bonding network (CBN) as described in GR-1089-CORE.

Installing and configuring the Hardware Management Console

Learn how to install the Hardware Management Console (HMC) hardware, connect it to your managed system, and configure it for use. You can perform these tasks yourself, or contact a service provider to perform these tasks for you. You might be charged a fee by the service provider for this service.

What's new in Installing and configuring the HMC

Read about new or significantly changed information in the Installing and configuring the HMC topic since the previous update of the topic collection.

April 2021

- Added the following topics:
  - "Installing the IBM Power Systems HMC (7063-CR2) into a rack" on page 4
  - "Prerequisites for installing the rack-mounted 7063-CR2 system" on page 4
  - "Completing inventory for your system" on page 5
  - "Determining and marking the location in the rack for the 7063-CR2 system" on page 5
  - "Attaching the adjustable rails to the system chassis and to the rack" on page 7
  - "Attaching the fixed rails to the system chassis and to the rack" on page 8
  - "Installing the system into the rack and connecting and routing power cables" on page 10
  - "Cabling the rack-mounted 7063-CR2 HMC" on page 10
  - "Configuring the 7063-CR2 HMC" on page 12

November 2020

- Updated the following topics:
  - "Installation and configuration tasks" on page 2
  - "Installing the 7042-CR9 HMC into a rack" on page 23
  - "Securing the HMC" on page 123
  - "HMC port locations" on page 130

July 2020

- Updated the following topics:
  - "Installing the HMC virtual appliance " on page 38
  - "HMC port locations" on page 130

October 2019

- Updated the following topics:
  - "Installing the HMC virtual appliance " on page 38
  - "Securing the HMC" on page 123

February 2019

- Added the following topics:

  - “Securing the HMC” on page 123
  - “Enhanced password policy” on page 125
  - “Solving common problems while securing the HMC” on page 126
  - “Security profiles: Global Data Protection Regulation (GDPR) and Payment Card Industry Data Security Standard (PCI-DSS) ” on page 128

August 2018

- Updated the following topics:
  - “Configuring the 7063-CR1 HMC” on page 21
  - “HMC port locations” on page 130

December 2017

- Added information for IBM Power Systems servers that contain the POWER9 processor.

Installation and configuration tasks

Learn about the tasks that are associated with different HMC installation and configuration tasks.

Learn about, at a high level, the tasks you must complete when you install and configure your HMC. You can install and configure your HMC in different ways. Find the situation that best matches the task that you want to complete.

Notes:

- If you are managing POWER9™ processor-based servers, the HMC must be at Version 9.1.0, or later. For more information, see “Determining your HMC machine code version and release” on page 113.
- Hardware Management Console Version 9.2.950, or later is not supported on the HMC 7042 Machine Type. For more information about the HMC versions for your 7042 HMC, see the HMC release notes that is available in the Fix Central website.

Installing and configuring a new HMC with a new server

Learn more about the high-level tasks you must complete when you install and configure a new HMC with a new server.

Table 1. Tasks that you need to complete when you install and configure a new HMC with a new server

Task	Where to find related information
1. Gather information and complete the Preinstallation Configuration worksheet.	“Preinstallation configuration worksheet for the HMC” on page 60 “Preparing for HMC configuration” on page 59
2. Unpack the hardware.	
3. Cable the HMC hardware.	For 7063-CR2 HMC:“Cabling the rack-mounted 7063-CR2 HMC” on page 10 For 7063-CR1 HMC: “Cabling the rack-mounted 7063-CR1 HMC” on page 19
4. Power on the HMC by pressing the power button.	
5. Log in and start the HMC web application.	
6. Use the HMC menus to configure the HMC.	“Configuring the HMC by using the menus ” on page 67

Table 1. Tasks that you need to complete when you install and configure a new HMC with a new server (continued)

Task	Where to find related information
7. Attach the server to the HMC.	

Updating and upgrading your HMC code

Learn more about the high-level tasks you must complete when you update and upgrade your HMC code.

If you have an existing HMC and want to update or upgrade your HMC code, you must complete the following high-level tasks:

Table 2. Tasks that you need to complete when you update or upgrade HMC code

Task	Where to find related information
1. Obtain the upgrade.	“Upgrading your HMC software” on page 118
2. View the existing HMC machine code level.	
3. Back up the managed system’s profile data.	
4. Back up HMC data.	
5. Record the current HMC configuration information.	
6. Record remote command status.	
7. Save upgrade data.	
8. Upgrade the HMC software.	
9. Verify that the HMC machine code upgrade installed successfully	

Adding a second HMC to an existing installation

Learn more about the high-level tasks you must complete when you add a second HMC to your managed system.

If you have an existing HMC and managed system and want to add a second HMC to this configuration, complete the following steps:

Table 3. Tasks that you need to complete when you add a second HMC to an existing installation

Task	Where to find related information
1. Ensure that your HMC hardware supports HMC Version 7 code.	
2. Gather information and complete the Preinstallation Configuration worksheet.	“Preinstallation configuration worksheet for the HMC” on page 60
3. Unpack the hardware.	
4. Cable the HMC hardware.	For 7063-CR2 HMC:“Cabling the rack-mounted 7063-CR2 HMC” on page 10 For 7063-CR1 HMC: “Cabling the rack-mounted 7063-CR1 HMC” on page 19
5. Power on the HMC by pressing the power button.	

Table 3. Tasks that you need to complete when you add a second HMC to an existing installation (continued)

Task	Where to find related information
6. Log in to the HMC.	
7. The HMC code levels must match. Change the code on one of the HMCs to match the code on the other.	"Determining your HMC machine code version and release" on page 113 "Upgrading your HMC software" on page 118
8. Access the Guided setup wizard or use the HMC menus to configure the HMC.	"Configuring the HMC by using the menus " on page 67
9. Configure this HMC for service by using the Call-Home Setup wizard.	"Configuring the HMC so that it can connect to service and support by using the call-home setup wizard" on page 106
10. Attach the server to the HMC.	

Setting up the HMC

You must set up the HMC hardware before you configure the HMC software. Learn more about setting up a desk-side HMC or a rack-mounted HMC.

Installing the IBM Power Systems HMC (7063-CR2) into a rack

Learn how to install the IBM Power Systems HMC (7063-CR2) into a rack.

You can view the online installation documentation, or you can print the PDF version of the same information. To view or print the PDF version, see Installing and configuring the Hardware Management Console.

Prerequisites for installing the rack-mounted 7063-CR2 system

Use the information to understand the prerequisites that are required for installing the system.

About this task

⚠ **CAUTION:** This part or unit is heavy but has a weight smaller than 18 kg (39.7 lb). Use care when lifting, removing, or installing this part or unit. (C008)

You might need to read the following documents before you begin to install the server:

- The latest version of this document is maintained online, see Installing the 7063-CR2 into a rack (http://www.ibm.com/support/knowledgecenter/POWER9/p9hai/p9hai_install7063cr2_kickoff.htm).
- To plan your server installation, see Site and hardware planning.

Procedure

1. Ensure that you have the following items before starting your installation:
   - Size 2 Phillips screwdriver
   - Flat-head screwdriver
   - T25 screwdriver
   - Box cutter
   - Electrostatic discharge (ESD) wrist strap
   - Rack with one Electronic Industries Association (EIA) unit (1U) of space.

Notes:

- If you do not have a rack that is installed, install the rack. For instructions, see Racks and rack features (http://www.ibm.com/support/knowledgecenter/POWER9/p9hbf/p9hbf_9xx_kickoff.htm).
- The power supply ratings are 100 to 127 V ac, 9 A (x2), 200 to 240 V ac, 4.5 A (x2); 50 or 60 Hz.

2. Remove the shipping brackets on the system.
3. Continue with "Completing inventory for your system" on page 5.

Completing inventory for your system

Use this information to complete inventory for your system.

Procedure

1. Verify that you received all the boxes you ordered.
2. Unpack the server components as needed.
3. Complete a parts inventory and verify that you have received all the parts that you ordered before you install each server component.

   Note:

   Your order information is included with your product. You can also obtain order information from your marketing representative or the IBM Business Partner.

   If you have incorrect, missing, or damaged parts, consult any of the following resources:

   - Your IBM reseller.
   - IBM Rochester manufacturing automated information line at 1-800-300-8751 (United States only).
   - The Directory of worldwide contacts website (http://www.ibm.com/planetwide). Select your location to view the service and support contact information.
4. Continue with "Determining and marking the location in the rack for the 7063-CR2 system" on page 5.

Determining and marking the location in the rack for the 7063-CR2 system

You need to determine where to install the system unit into the rack.

Procedure

1. Read the Rack safety notices (http://www.ibm.com/support/knowledgecenter/POWER9/p9hbf/p9hbf_racksafety.htm).
2. Determine where to place the system unit in the rack. As you plan for installing the system unit in a rack, consider the following information:
   - Organize larger and heavier units into the lower part of the rack.
   - Plan to install system units into the lower part of the rack first.
   - Record the Electronic Industries Alliance (EIA) locations in your plan.
3. If necessary, remove the filler panels to allow access to the inside of the rack enclosure where you plan to place the unit, as shown in Figure 1 on page 6.

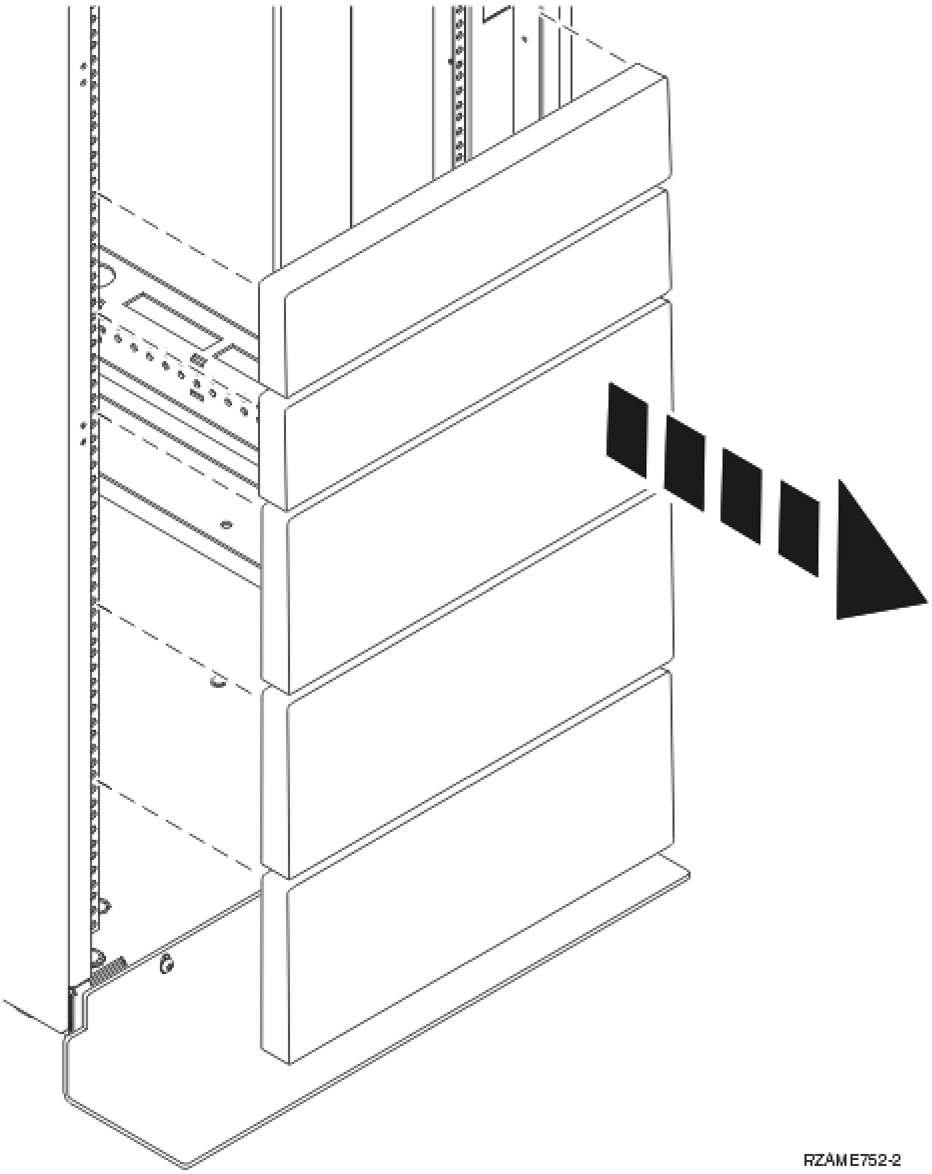


Figure 1. Removing the filler panels

4. Determine where to place the system in the rack. Record the EIA location.
5. Facing the front of the rack and working from the right side, use tape, a marker, or pencil to mark the lower hole of each EIA unit.
6. Repeat step “5” on page 6 for the corresponding holes located on the left side of the rack.
7. Go to the rear of the rack.
8. On the right side, find the EIA unit that corresponds to the bottom EIA unit marked on the front of the rack.
9. Mark the bottom EIA unit.
10. Mark the corresponding holes on the left side of the rack.
11. Continue with “Attaching the adjustable rails to the system chassis and to the rack” on page 7 to attach the adjustable rails or continue with “Attaching the fixed rails to the system chassis and to the rack” on page 8 to attach the fixed rails.

Attaching the adjustable rails to the system chassis and to the rack

You must install the rails onto the chassis and into the rack. Use this procedure to perform this task.

About this task

⚠ **Attention:** To avoid rail failure and potential danger to yourself and to the unit, ensure that you have the correct rails and fittings for your rack. If your rack has square support flange holes or screw-thread support flange holes, ensure that the rails and fittings match the support flange holes that are used on your rack. Do not install mismatched hardware by using washers or spacers. If you do not have the correct rails and fittings for your rack, contact your IBM reseller.

Note: The 1 EIA units in racks are measured in vertical increments of 44.45 mm (1.75 in.) each. Each 44.45 mm (1.75 in.) increment is called an “EIA.” In some countries, the same increment can be referred to as a “U.”

Note: The system requires 1 EIA rack unit (1U) of space.

Ensure that you have the necessary parts to install the rails. The following parts are included with the rail kit:

- 4 - Philips 6.35 mm (0.25 in.) screws
- 2 - rack and slide bracket rail assemblies
- 2 - HMC slide brackets
- 10 - nut clips for square EIA mounting holes
- 10 - nut clips for round EIA mounting holes
- 10 - M5 hex flange screws

Procedure

1. Remove the rail pieces from the packaging and put them on a work surface.
2. Identify 1U space in the rack of the HMC.
3. To attach the slide brackets to the HMC, perform the following tasks:
   a. Identify the right slide bracket.
   b. Align the holes on the right slide bracket with the slide bracket pins located on the right side of the HMC. Ensure that all the pins are aligned with the bracket holes.
   c. Push the HMC slide bracket toward the rear side of the HMC until it is fully locked into position.
   d. Secure the right slide bracket to the right side of the HMC workstation by installing two Philips 6.35 mm (0.25 in.) screws into the screw holes.
   e. Repeat the steps “3.a” on page 7 - “3.d” on page 7 to install the left slide bracket to the left side of the HMC workstation.
4. Move to the front of the rack.
   a. On the left side, install three nut clips into the three holes on the front edge of the rack in the 1U slot that is designated for the HMC.

      Note: The rail kit includes nut clips for both square and round rack holes. Ensure that you use appropriate nut clips that match the holes in the rack.
   b. Repeat step “4.a” on page 7 on the right side of the rack.
5. Move to the rear of the rack.
   a. On the left side, install two nut clips into the upper and lower holes on the front edge of the rack in the 1U slot that is designated for the HMC.

      Note: The middle hole must remain empty.
   b. Repeat step “5.a” on page 7 on the right side of the rack.

6. To install the HMC slide rails into the rack, perform the following steps:

    a. Measure the depth of the rack. The depth must be between 558.8 mm (22 in.) and 863.6 mm (34 in.).

    b. Place the HMC slide rails on a flat surface and locate the preinstalled screws.

       Note: The slide rails have four screw holes.

    c. Loosen the preinstalled screws on the slide rails enough that the rails can be moved in and out easily.

    d. Based on the depth of the rack measured in step "6.a" on page 8, you must adjust the screws on the rails.

       i) If the depth of the rack is between 558.8 mm (22 in.) and 698.5 mm (27.5 in.), attach the screws to the first and the third holes.

       ii) If the depth of the rack is between 698.5 mm (27.5 in.) and 863.6 mm (34 in.), attach the screws to the second and the fourth holes.

       Notes:

       - The first hole is always the hole closest to the end of the slide rail. The third and fourth holes are located close together.
       - Ensure that the screws are loose enough so that the length of the slide rail can be slightly adjusted while it is being installed in the rack.

7. At the front of the rack, install the HMC slide rails into the rack by performing the following steps:

    a. Locate the left slide rail assembly.

    b. Orient the rail assembly so that the end with the closest screw hole (the first hole) goes into the rack first. Ensure that the screw heads face the inside of the rack. The open slot of the rail assembly is closest to the front of the rack.

    c. On the left side of the rack, connect the flange on the end of the slide rail to the front edge of the rack by using two M5 screws, leaving the middle hole open. Ensure that the rail assembly is left slightly loose on the front of the rack to allow for the HMC to be inserted.

8. At the rear of the rack, on the right side, pull the free end of the slide rail toward the rear and secure the flange of the slide rail to the rack by using two M5 screws, leaving the middle screw hole open.

9. Repeat the step "7" on page 8 and step "8" on page 8 to install the right slide rail assembly on the right side of the rack.

10. In front of the rack, install the HMC workstation into the rack by performing the following steps:

    a. Holding the HMC workstation level, insert the slide brackets into the HMC slide rails that you installed in the previous step. Push the HMC forward until the flanges on the front of the HMC are flush with the open screw holes on the front of the rack.

    b. Connect the HMC to the left side of the frame using one M5 screw. Repeat this step on the right side of the rack.

11. Continue with "Installing the system into the rack and connecting and routing power cables" on page 10.

Attaching the fixed rails to the system chassis and to the rack

You must install the rails onto the chassis and into the rack. Use this procedure to perform this task.

About this task

⚠ **Attention:** To avoid rail failure and potential danger to yourself and to the unit, ensure that you have the correct rails and fittings for your rack. If your rack has square support flange holes or screw-thread support flange holes, ensure that the rails and fittings match the support flange holes that are used on your rack. Do not install mismatched hardware by using washers or spacers. If you do not have the correct rails and fittings for your rack, contact your IBM reseller.

Note: The 1 EIA unit in racks are measured in vertical increments of 44.45 mm (1.75 in.) each. Each 44.45 mm (1.75 in.) increment is called an “EIA.” In some countries, the same increment can be referred to as a “U.”

Note: The system requires 1 EIA rack unit (1U) of space.

Ensure that you have the necessary parts to install the rails. The following parts are included with the rail kit:

- 4 - Philips 6.35 mm (0.25 in.) screws
- 2 - Inner rails
- 2 - HMC support rails
- 2 - Nut clips for square EIA mounting holes
- 2 - Nut clips for round EIA mounting holes
- 8 - M5 hex flange screws

Procedure

1. Remove the rail pieces from the packaging and put them on a work surface.
2. Identify 1U space in the rack of the HMC.
3. To attach the inner rails to the HMC, perform the following tasks:
    a. Identify the right inner rail.
    b. Align the holes on the right inner rail with the inner rail pins located on the right side of the HMC. Ensure that all the pins are aligned with the inner rail holes.
    c. Push the HMC inner rail toward the front side of the HMC until it is fully locked into position.
    d. Secure the right inner rail to the right side of the HMC workstation by installing two Philips 6.35 mm (0.25 in.) screws into the screw holes.
    e. Repeat the steps 3.a - “3.d” on page 9 to install the left inner rail to the left side of the HMC workstation.
4. Move to the front of the rack. On the left side, install one nut clips into the hole on the front edge of the rack in the 1U slot that is designated for the HMC.

    Note: The rail kit includes nut clips for both square and round rack holes. Ensure that you use appropriate nut clips that match the holes in the rack.
5. Move to the rear of the rack. On the left side, install one nut clips into the middle hole on the front edge of the rack in the 1U slot that is designated for the HMC.
6. At the front of the rack, install the HMC support rails into the rack by performing the following steps:
    a. Align the pins of the support rails above and below the nut clip you installed in the previous step..
    b. On the right side of the rack, connect the flange on the end of the support rail to the front edge of the rack by using two M5 screws into the upper and lower screw holes, leaving the middle screw hole open. Ensure that the rail assembly is left slightly loose on the front of the rack to allow for the HMC to be inserted.
7. At the rear of the rack, on the right side, pull the free end of the support rail toward the rear and secure the flange of the support rail to the rack by using two M5 screws, leaving the middle screw hole open.
8. Repeat the step “6” on page 9 and step “7” on page 9 to install the right support rail assembly on the right side of the rack.
9. In front of the rack, install the HMC workstation into the rack by performing the following steps:
    a. Holding the HMC workstation level, insert the inner rails into the HMC support rails that you installed in the previous step. Push the HMC forward until the flanges on the front of the HMC are flush with the open screw holes on the front of the rack.

b. Connect the HMC to the left side of the frame using one M5 screw. Repeat this step on the right side of the rack.

Note: If present, remove the orange shipping brackets that are attached to the rear of the system and reinstall the screw back in.

10. Continue with “Installing the system into the rack and connecting and routing power cables” on page 10.

Installing the system into the rack and connecting and routing power cables

Install the system onto the rails and connect and route power cables.

About this task

⚠ **CAUTION:** This part or unit is heavy but has a weight smaller than 18 kg (39.7 lb). Use care when lifting, removing, or installing this part or unit. (C008)

Procedure

1. Plug the power cords into the power supplies.

   Note: Do not connect the other end of the power cord to the power source now.

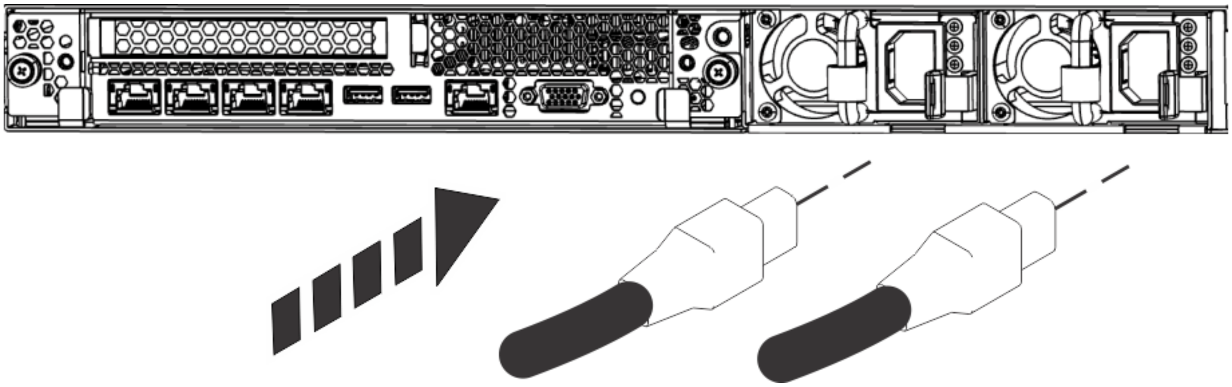

Figure 2. Plugging the power cords into the power supplies

2. Fasten the hook-and-loop fasteners to secure the power cords.
3. Continue with “Cabling the rack-mounted 7063-CR2 HMC” on page 10.

Cabling the rack-mounted 7063-CR2 HMC

Learn how to physically install your rack-mounted Hardware Management Console (HMC).

Procedure

1. Ensure that the HMC is installed into a rack and the power cords are plugged into the power supplies. For more information, see “Installing the system into the rack and connecting and routing power cables” on page 10. After you install the HMC into a rack, continue with the next step.
2. Connect the keyboard, monitor, and mouse.

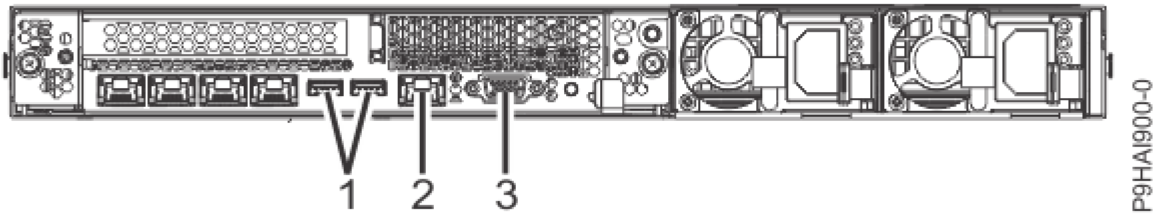

Figure 3. Rear ports

Table 4. Input and output ports

Identifier	Description
1	USB 2.0 used for keyboard and mouse
2	Ethernet Intelligent Platform Management Interface (IPMI)
3	Video Graphics Array (VGA) that is used for the monitor. Only the 1024 x 768 at 60 Hz VGA setting is supported. Only up to a 3-meter cable is supported.

Note: The system has two front USB ports that you can use.

3. Connect the Ethernet Intelligent Platform Management Interface (IPMI) port to a network.

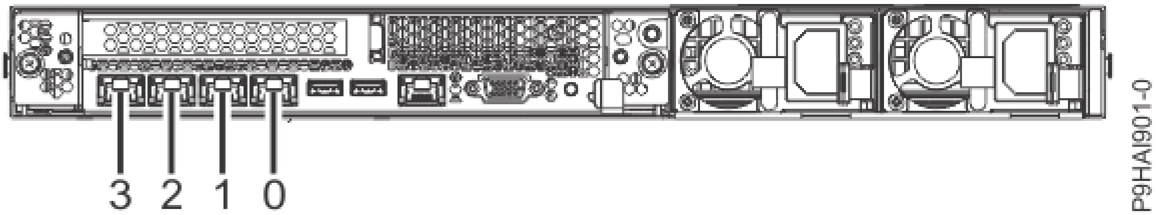

Figure 4. Ethernet ports

Table 5. Ethernet ports

Identifier	Description
0	Shared Ethernet Intelligent Platform Management Interface (IPMI) and HMC Network Connection
1, 2, and 3	HMC network connection

Notes:

- When the HMC is equipped with an optional 10 Gb PCI Express (PCIe) adapter, two additional ethernet ports are available.
- This connection is required to access the baseboard management controller (BMC) on the HMC. Access to the BMC is required for service tasks and to maintain the HMC firmware. For more information, see “Types of HMC network connections” on page 52.

Warning: This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Please contact IBM for more information.

4. Connect the Ethernet cable that is intended for the connection to the managed system or systems.

Notes:

- If you are using a shared connection for IPMI and HMC, a single cable to port 0 in Figure 2 can satisfy both requirements for IPMI and HMC.
- To learn more about the HMC network connections, see “HMC network connections” on page 51.

5. If your managed system is already installed, you can verify that the Ethernet cable connection is active by observing the green status lights at both the HMC and managed system Ethernet ports as your installation progresses.
6. Plug the system power cords and the power cords for any other attached devices into the alternating current (AC) power source.

7. Verify the power status by using the power supply LEDs as indicators. For more information, see LEDs on the 7063-CR2 systemLEDs on the 7063-CR2 system.
8. Press the power button to start the system. The power-on light stops flashing and remains on, indicating that the system power is on.

Results

Next, you need to install and configure your HMC software. Continue with “Configuring the 7063-CR2 HMC” on page 12.

Configuring the 7063-CR2 HMC

Learn how to install and configure the Hardware Management Console (HMC).

Check the HMC version that is shipped with your HMC. To find out how to view the HMC machine code version and release, see Check the HMC version that is shipped with your HMC. You can download the latest HMC version that is available from the Fix Central website. Use removable media (such as a DVD or USB) to create a bootable ISO file from the HMC package (ISO image).

Note: The following table describes the predefined (default) login information for the HMC and BMC interfaces.

Table 6.

Console or Interface	Default ID	Default Password	Description
BMC (OpenBMC)	`root`	`0penBmc`	The root user ID and password are used to log in to the BMC for the first time.
HMC	`hscroot`	`abc123`	The hscroot user ID and password are used to log in to the HMC for the first time. They are case-sensitive and can only be used by a member of the super administrator role.
HMC	`root`	`passw0rd`	The root user ID and password are used by the service provider to perform maintenance procedures. They cannot be used to log in to the HMC.

Note: The following installations are shown as examples.

Installing the HMC by using USB flash drive

To install the HMC by using USB flash drive, complete the following steps for Linux® systems:

Note: For examples in different operating systems, see:

- Windows: USB flash installation media (Windows)
- Mac: USB flash installation media (macOS)

1. Download the HMC version that you want from the Fix Central website.
2. Run the following command to identify the device name of the USB drive when it is plugged in: **`lsblk`**.

For example: **`/dev/sdb`** (where **sdb** is the name of the USB drive)

3. Run the following command to wipe the USB drive: **`wipefs --all /dev/sdX`**.

   For example: **`wipefs --all /dev/sdb`**

4. Run the following command to verify the size of the disk under the SIZE column: **`lsblk`**.

   For example: When a 16 GB USB drive shows as 14.3 GB, round it down to 14 GB for the next step "5" on page 13.

5. Run the following command to format the disk and create a partition: **`parted /dev/sdX`**

   From the parted utility, run the following three commands:

   ```
   mklabel gpt
   mkpart primary ext3 1MiB <size>GiB
   quit
   ```

   Note: size is the size of the USB drive obtained in the step "4" on page 13.

   For example:

   ```
   parted /dev/sdb
   mklabel gpt
   mkpart primary ext3 1MiB 14GiB
   quit
   ```

6. Run the following command to copy the ISO onto the partition: **`cat HMC-Recovery-ppc64le.iso > /dev/sdX1`**.

   For example: **`cat HMC-9.2.950.0-2103300827-ppc64le.iso > /dev/sdb1`**

7. Insert the USB drive, and power on the system.

   Note: The USB drive must be at least 8 GB. Certain USB drives might be too wide to fit properly into the USB port at the rear of the system. Test the fit of your USB drive before you proceed.

8. When the Petitboot menu is displayed, select the **Install Hardware Management Console** option that is located under **USB**.

Installing the HMC by using virtual media from the BMC

To install the HMC by using virtual media from the BMC, complete the following steps:

1. Open a supported web browser. In the address bar, enter the IP address of the BMC that you want to connect to. For example, you can use the format `https://<BMC IP>` in the address bar of the web browser.
2. From the **OpenBMC logon** window, enter the **Host** address of the BMC and the **Username** and **Password** that is assigned to you.

   Note: The default user ID is `root` and the default password is `0penBmc`.

   If you are using firmware level OP940.01, or later, the root password is expired by default. You must change the default password before you can access the BMC. For more information about changing the expired default password, see Setting the password.

   If you forgot your password, you can perform a factory reset of the system to restore the default password. To reset the system, see Performing a factory reset.
3. Click **Log in**.
4. Select **Server control**.
5. Select **Virtual Media**.
6. Click **Choose file**.
7. Locate the HMC Recovery media ISO and click **Open**.

8. Click **Start**.
9. Power on the system.
10. When the Petitboot menu is displayed, select the **Install Hardware Management Console** option that is located under **USB**.

Installing the HMC by using an external USB attached DVD drive

To install the HMC by using an external USB attached DVD drive, complete the following steps:

1. Download the HMC recovery version that you want from the Fix Central website.
2. Burn the HMC recovery DVD image to a DVD-R DL media as an image.
3. Power off the HMC.
4. Connect the external USB DVD drive to the HMC and insert the HMC recovery DVD.

   Note: You might need to connect the USB DVD drive to an external power source or use a USB Y cable to connect to an extra USB port to provide sufficient power to the DVD drive.
5. Power on the HMC.

   Note: The display monitor might show no signal during startup. The process might take 2 or 3 minutes before the display monitor shows any status.
6. When the Petitboot bootloader starts, navigate to stop the automatic boot.

   Note: A 10-second timeout is enforced. If no action is taken within 10 seconds, the system attempts to boot from the hard disk drive.
7. Wait until the **CD/DVD** device appears in the Petitboot menu.

   Note: This process can take up to a minute.
8. Select the **Install Hardware Management Console** option that is located under **CD/DVD**.

Installing the 7063-CR1 into a rack

Learn how to install the 7063-CR1 Hardware Management Console (HMC) into a rack.

You can view the online installation documentation, or you can print the PDF version of the same information. To view or print the PDF version, see Installing and configuring the Hardware Management Console.

Prerequisites for installing the rack-mounted 7063-CR1 system

Use the information to understand the prerequisites that are required for installing the system.

About this task

⚠

CAUTION:  or 
or 
The weight of this part or unit is between 18 and 32 kg (39.7 and 70.5 lb). It takes two persons to safely lift this part or unit. (C009)

You might need to read the following documents before you begin to install the server:

- The latest version of this document is maintained online, see Installing the 7063-CR1 into a rack (http://www.ibm.com/support/knowledgecenter/POWER9/p9hai/p9hai_install7063_kickoff.htm).
- To plan your server installation, see Site and hardware planning.

Procedure

Ensure that you have the following items before starting your installation:

- Size 2 Phillips screwdriver
- Flat-head screwdriver
- Box cutter
- Electrostatic discharge (ESD) wrist strap
- Rack with one Electronic Industries Association (EIA) unit (1U) of space.

Note: If you do not have a rack that is installed, install the rack. For instructions, see Racks and rack features (http://www.ibm.com/support/knowledgecenter/POWER9/p9hbf/p9hbf_9xx_kickoff.htm).

Completing inventory for your system

Use this information to complete inventory for your system.

Procedure

1. Verify that you received all the boxes you ordered.
2. Unpack the server components as needed.
3. Complete a parts inventory and verify that you have received all the parts that you ordered before you install each server component.

   Note:

   Your order information is included with your product. You can also obtain order information from your marketing representative or the IBM Business Partner.

   If you have incorrect, missing, or damaged parts, consult any of the following resources:

   - Your IBM reseller.
   - IBM Rochester manufacturing automated information line at 1-800-300-8751 (United States only).
   - The Directory of worldwide contacts website (http://www.ibm.com/planetwide). Select your location to view the service and support contact information.

Determining and marking the location in the rack for the 7063-CR1 system

You might need to determine where to install the system unit into the rack.

Procedure

1. Read the Rack safety notices (http://www.ibm.com/support/knowledgecenter/POWER9/p9hbf/p9hbf_racksafety.htm).
2. Determine where to place the system unit in the rack. As you plan for installing the system unit in a rack, consider the following information:

   - Organize larger and heavier units into the lower part of the rack.
   - Plan to install system units into the lower part of the rack first.
   - Record the Electronic Industries Alliance (EIA) locations in your plan.
3. If necessary, remove the filler panels to allow access to the inside of the rack enclosure where you plan to place the unit, as shown in Figure 5 on page 16.

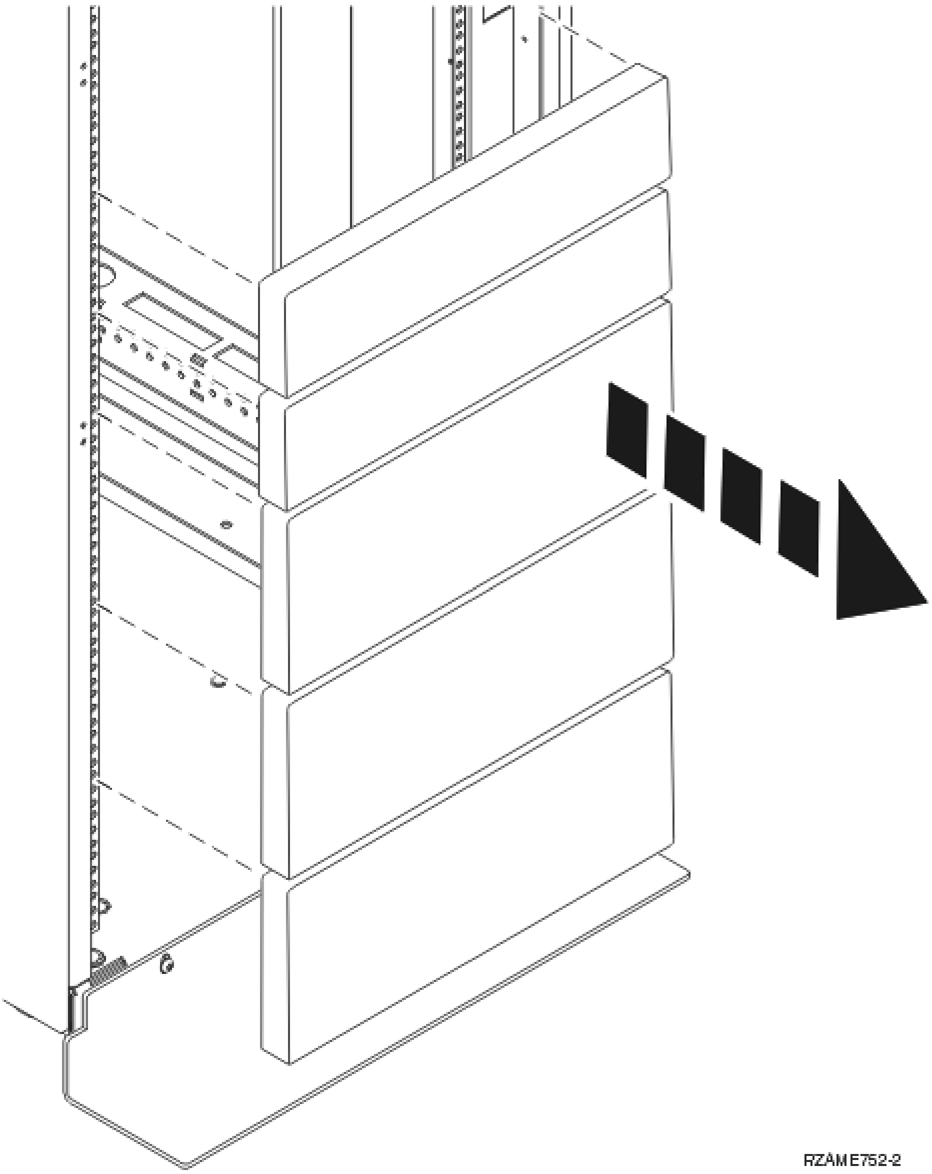

Figure 5. Removing the filler panels

4. Determine to place the system in the rack. Record the EIA location.
5. Facing the front of the rack and working from the right side, use tape, a marker, or pencil to mark the lower hole of each EIA unit.
6. Repeat step “5” on page 16 for the corresponding holes located on the left side of the rack.
7. Go to the rear of the rack.
8. On the right side, find the EIA unit that corresponds to the bottom EIA unit marked on the front of the rack.
9. Mark the bottom EIA unit.
10. Mark the corresponding holes on the left side of the rack.

Attaching the fixed rails to the system chassis and to the rack

You must install the rails onto the chassis and into the rack. Use this procedure to perform this task.

About this task

⚠ **Attention:** To avoid rail failure and potential danger to yourself and to the unit, ensure that you have the correct rails and fittings for your rack. If your rack has square support flange holes or screw-thread support flange holes, ensure that the rails and fittings match the support flange holes that are used on your rack. Do not install mismatched hardware by using washers or spacers. If you do not have the correct rails and fittings for your rack, contact your IBM reseller.

Note: The system requires 1 EIA rack unit (1U) of space.

Ensure that you have the necessary parts to install the rails. The following parts are included with the rail kit:

- Slide rail screws, used to attach the two parts of each slide rail
- Slide rail rack screws, used to secure the rails to the rack
- Rails
- 10 - 32 x 0.635 cm (0.25 in.) screws, used to attach the rails to system chassis

Procedure

1. Remove the rail pieces from the packaging and put them on a work surface.
2. Replace the rail rack square pins (**A**) and (**D**) with the rail rack round pins.
3. Connect the two parts of each rack slide rail. To connect the two parts of the rack slide rail, perform the following tasks:
   a. Identify the two pieces of the left rack slide rail. Align the short and long pieces (**C**). Ensure that the rack rail pins are pointing in the same direction (**A**) and (**D**).

   b. The shorter piece of the rack slide rail has a metal pin. Insert the pin into the hole in the longer piece of the rack slide rail (**B**). Slide the shorter piece of the rack rail into the longer piece of the rack rail.
   c. Align the holes in the two pieces of the rack slide rails. Using a Philips-head screwdriver, attach the two parts by loosely screwing two threaded rail screws through the holes in the rack slide rail.

   Note: Do not tighten the rack slide rail screws.

   d. Repeat these steps for the right slide rail.

4. Install the rack slide rails into the rack.

   a. Move to the front of the rack.

   b. Select the left rack slide rail, and locate the EIA unit that you previously marked. Each slide rail is also marked **Back**, to designate the rear of the rack. Ensure that you are holding the front end of the rack slide rail.

   c. Extend the rail from the front of the rack to the back of the rack and align the rack slide rail pins with the holes in the rack flange that you previously marked.

   d. Push the rack rail pins into the rear rack flange until the rear rack rail latch clicks into place.

   e. Pull the front of the rack rail toward the front of the rack rail flange. Align the slide rail pins with the holes in the rail flange and pull them until the rail latch clicks into place.

   f. Using a screwdriver, tighten the rail screws that you installed in step 2.

   Note: You might need 2U of space to access and tighten the rail screws.

   g. Repeat steps 4a - 4f for the right slide rail.

Installing the system into the rack and connecting and routing power cables

Install the system onto the rails and connect and route power cables.

About this task

CAUTION:  or 
or 
The weight of this part or unit is between 18 and 32 kg (39.7 and 70.5 lb). It takes two persons to safely lift this part or unit. (C009)

Procedure

1. Remove the protective plastic film from the top of the system chassis.
2. Move to the front of the rack.
3. Using two people, one on each side of the system, lift the system and align the system chassis rails on each side of the chassis with the rack slide rails.
4. Gently push the system toward the rear of the rack.
5. Secure the system to the rack by screwing a screw with washer through the handles on each side of the system chassis.

   Note: You must use washers with the screws. Slide a washer onto to each of the two longer screws (1.5 cm (0.59 in.)) that is included with the rail kit. Screw the screw with the washer through the right and left side of the system in the front.

6. Plug the power cords into the power supplies.

   Note: Do not connect the other end of the power cord to the power source now.

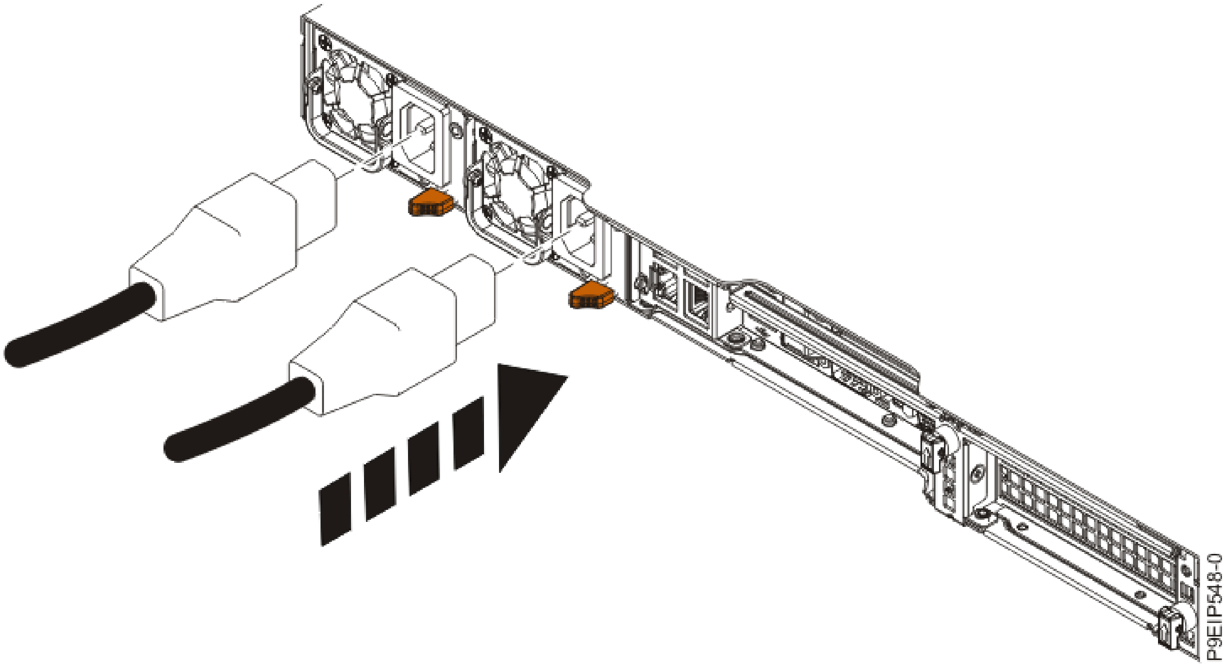

Figure 6. Plugging the power cords into the power supplies

7. Continue with "Cabling the rack-mounted 7063-CR1 HMC" on page 19.

Cabling the rack-mounted 7063-CR1 HMC

Learn how to physically install your rack-mounted Hardware Management Console (HMC).

Procedure

1. Ensure that the HMC is installed into a rack and the power cords are plugged into the power supplies. For more information, see "Installing the system into the rack and connecting and routing power cables" on page 18. After you install the HMC into a rack, continue with the next step.

   Note: If a plug is covering a port that you need to use on the rear of the system, remove and discard it. The port covers ensure that you are reminded that you must reset the Administrator password on your managed system upon initial system IPL.

2. Connect the keyboard, monitor, and mouse.

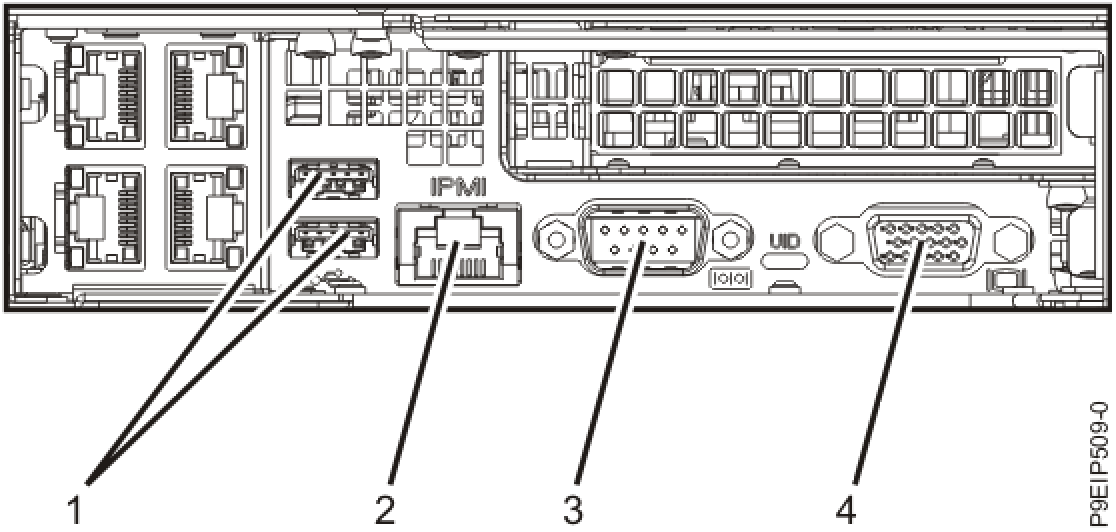

Figure 7. Rear ports

Table 7. Input and output ports

Identifier	Description
1	USB 2.0 used for keyboard and mouse
2	Ethernet Intelligent Platform Management Interface (IPMI)
3	Serial IPMI
4	Video Graphics Array (VGA) that is used for the monitor. Only the 1024 x 768 at 60 Hz VGA setting is supported. Only up to a 3-meter cable is supported.

Note: The system has two front USB ports that you can use. The front serial port is non-functional.

3. Connect the Ethernet cable that is intended for the connection to the managed system or systems.

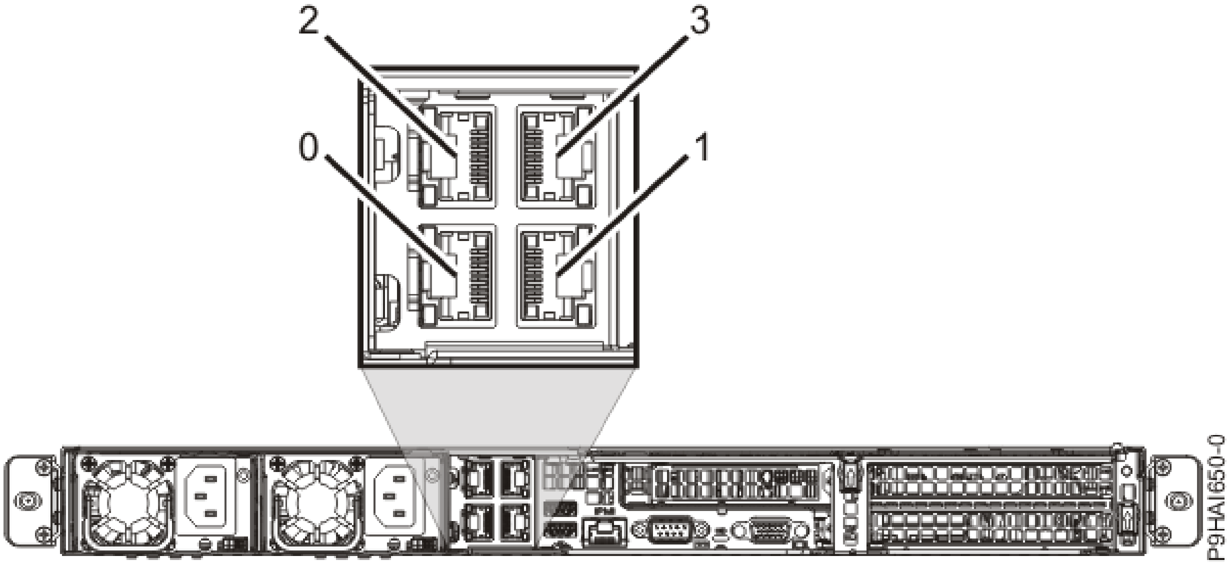

Figure 8. Ethernet ports

Note: To learn more about the HMC network connections, see "HMC network connections" on page 51.

4. If your managed system is already installed, you can verify that the Ethernet cable connection is active by observing the green status lights at both the HMC and managed system Ethernet ports as your installation progresses.
5. Connect the Ethernet Intelligent Platform Management Interface (IPMI) port to a network.

   Note: This connection is required to access the baseboard management controller (BMC) on the HMC. Access to the BMC is required for service tasks and to maintain the HMC firmware. For more information, see "Types of HMC network connections" on page 52.

6. Plug the system power cords and the power cords for any other attached devices into the alternating current (AC) power source.
7. Verify the power status by using the power supply LEDs as indicators. For more information, see LEDs on the 7063-CR1 systemLEDs on the 7063-CR1 system.

Results

Next, you need to install and configure your HMC software. Continue with "Configuring the 7063-CR1 HMC" on page 21.

Configuring the 7063-CR1 HMC

Learn how to install and configure the Hardware Management Console (HMC).

Check the HMC version that is shipped with your HMC. You can download the latest HMC version that is available from the Fix Central website. Use removable media (such as a DVD or USB) to create a bootable ISO file from the HMC package (ISO image).

Note: The following table describes the predefined (default) login information for the HMC and BMC interfaces.

Table 8.

Console or Interface	Default ID	Default Password	Description
BMC	ADMIN	ADMIN	The ADMIN user ID and password are used to log in to the BMC for the first time.
HMC	hscroot	abc123	The hscroot user ID and password are used to log in to the HMC for the first time. They are case-sensitive and can only be used by a member of the super administrator role.
HMC	root	passw0rd	The root user ID and password are used by the service provider to perform maintenance procedures. They cannot be used to log in to the HMC.

Note: The following installations are shown as examples.

Installing the HMC by using USB flash drive

To install the HMC by using USB flash drive, complete the following steps for Linux systems:

Note: For examples in different operating systems, see:

- Windows: USB flash installation media (Windows)
- Mac: USB flash installation media (macOS)

1. Download the HMC version that you want from the Fix Central website.
2. Run the following command: **`dd bs=4M if=/path/to/HMC_ISO_FILE.iso of=/dev/sdx status=progress && sync`** (where **sdx** is the name of the USB drive).

   Note: You can run the Linux command `lsblk` to determine the device name of the USB drive when it is plugged in.
3. Insert the USB drive, and power on the system.

   Note: The USB drive must be at least 4 GB. Certain USB drives might be too wide to fit properly into the USB port at the rear of the system. Test the fit of your USB drive before you proceed.
4. When the Petitboot menu is displayed, select the **Install Hardware Management Console** option that is located under **USB**.

Installing the HMC by using remote media from the console viewer

To install the HMC by using remote media from the console viewer, complete the following steps:

1. Log in to the BMC web interface (`http://<bmc-ip>`).
2. Select **Remote Control**.
3. Select **Console Redirection**.
4. Click **Launch Console**.
5. In the Java™ iKVM Viewer, select **Virtual Media** > **Virtual Storage**.
6. Under **Logical Drive Type**, select **ISO File**.
7. Click **Open Image** and locate the ISO file on your system.
8. Press **Plugin** to mount the ISO file.
9. Power on the system.
10. When the Petitboot menu is displayed, select the **Install Hardware Management Console** option that is located under **CD/DVD**.

Installing the HMC by using an external USB attached DVD drive

To install the HMC by using an external USB attached DVD drive, complete the following steps:

1. Download the HMC recovery version that you want from the Fix Central website.
2. Burn the HMC recovery DVD image to a DVD-R media as an image. Alternatively, you can order the recovery media on DVD.
3. Power off the HMC.
4. Connect the external USB DVD drive to the HMC and insert the HMC recovery DVD.

   Note: You might need to connect the USB DVD drive to an external power source or use a USB Y cable to connect to an extra USB port to provide sufficient power to the DVD drive.
5. Power on the HMC.

   Note: The display monitor might show no signal during startup. The process might take 2 or 3 minutes before the display monitor shows any status.
6. When the Petitboot bootloader starts, navigate to stop the automatic boot.

   Note: A 10-second timeout is enforced. If no action is taken within 10 seconds, the system attempts to boot from the hard disk drive.
7. Wait until the **CD/DVD** device appears in the Petitboot menu.

   Note: This process can take up to a minute.
8. Select the **Install Hardware Management Console** option that is located under **CD/DVD**.

Installing the HMC by using remote media that is hosted by an SMB file server

To install the HMC by using remote media that is hosted by a Server Message Block (SMB) file server, complete the following steps:

1. Copy the recovery ISO file to a share host on your SMB-compliant file server.

   Note: Server Message Block version 3 (SMBv3) is not supported.
2. Log in to the BMC web interface (`http://<bmc-ip>`).
3. Select **Virtual Media**.
4. Select **CD-ROM Image**.
5. Complete the following information:

Share host

The IP of the SMB host. If you are using the host name, ensure that the domain name system (DNS) on the BMC is correctly configured.

Path to image

The SMB path to the system. For example: `/<share name>/<rest of path>/<name of iso>.iso`

User (optional)

The user name that is used to log in to the SMB host.

Password (optional)

The password for the user.

6. Click **Save**.
7. Click **Mount**.
8. Device 1 now shows the following message: **There is an iso file mounted.**

   Note: If the message does not appear, recheck the information and repeat steps 6 - 8.
9. Power on the system.
10. When the Petitboot menu is displayed, select the **Install Hardware Management Console** option that is located under **CD/DVD**.

Optional: Update the HMC firmware level by using the included USB memory key

Note: If your configuration included an HMC firmware update on a USB memory key, complete the following steps to update the HMC firmware level.

To update the HMC firmware level by using the included USB memory key, complete the following steps:

1. Insert the USB memory key drive into the USB port at the rear of the system.
2. Power on the system and log on to the HMC.
3. In the navigation area, click the **HMC Management** icon , and then select **Console Management**.
4. In the content pane, click **Update the Hardware Management Console**.
5. Follow the onscreen instructions in the Install HMC Corrective Service wizard.

Next, you need to configure your HMC software. For instructions, see “Configuring the HMC” on page 51.

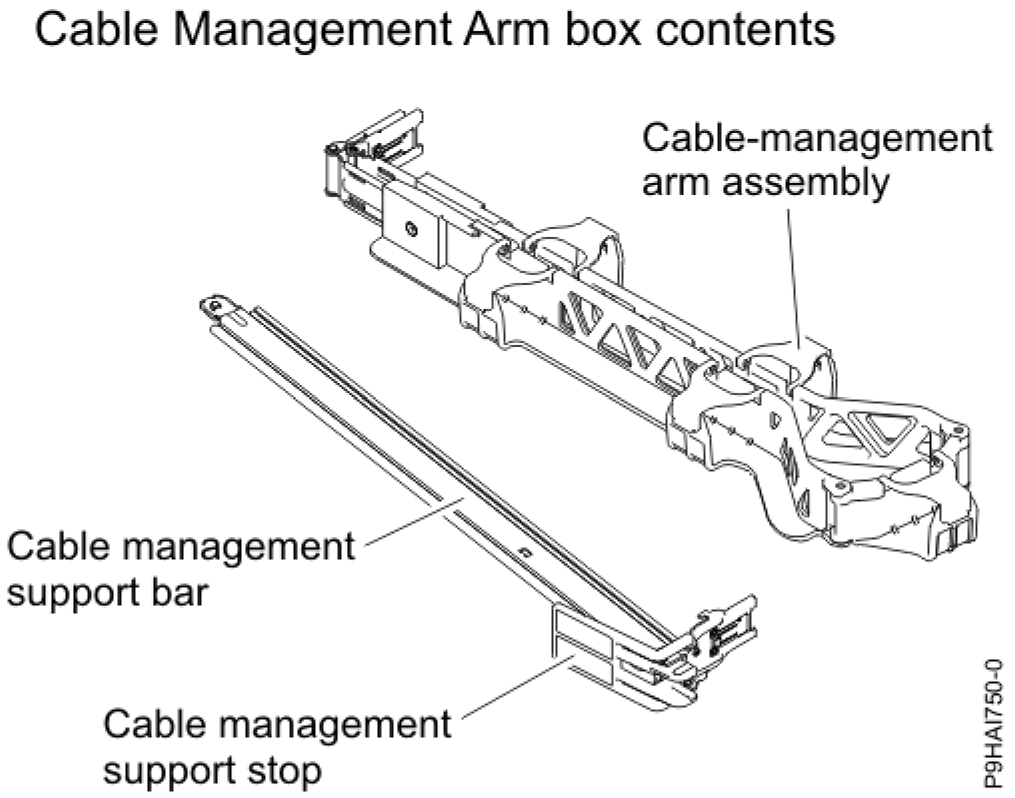
Installing the 7042-CR9 HMC into a rack

Learn how to install the 7042-CR9 Hardware Management Console (HMC) into a rack.

Before you begin

Complete a parts inventory. The following illustrations show the items that you need to install the server in the rack cabinet. If any items are missing or damaged, contact your place of purchase.



Cable Management Arm box contents
Cable-management arm assembly
Cable management support bar
Cable management support stop

Inner slide member (left)
Outer slide member (right)
R
Inner slide member (right)
M5 screws (2)
(for shipping and vibration-prone areas)
P9HAI751-0

Figure 10. Rail box contents

Note: You need both the slide rail box and the cable management arm box for this installation.

About this task

To install a 7042-CR9 HMC into a rack, complete the following steps:

Procedure

1. Select an available space (depending on the server you are installing) in your rack to install your server.

   
   Figure 11. Identifying a rack space

   Note: You need one unit (1 U) of space and the slide rails are installed in the bottom unit (U) of the one unit of space.
2. Extend the outer slide member all the way back until you hear an audible click. The rear rack mount bracket is now rotated into the unlocked position.

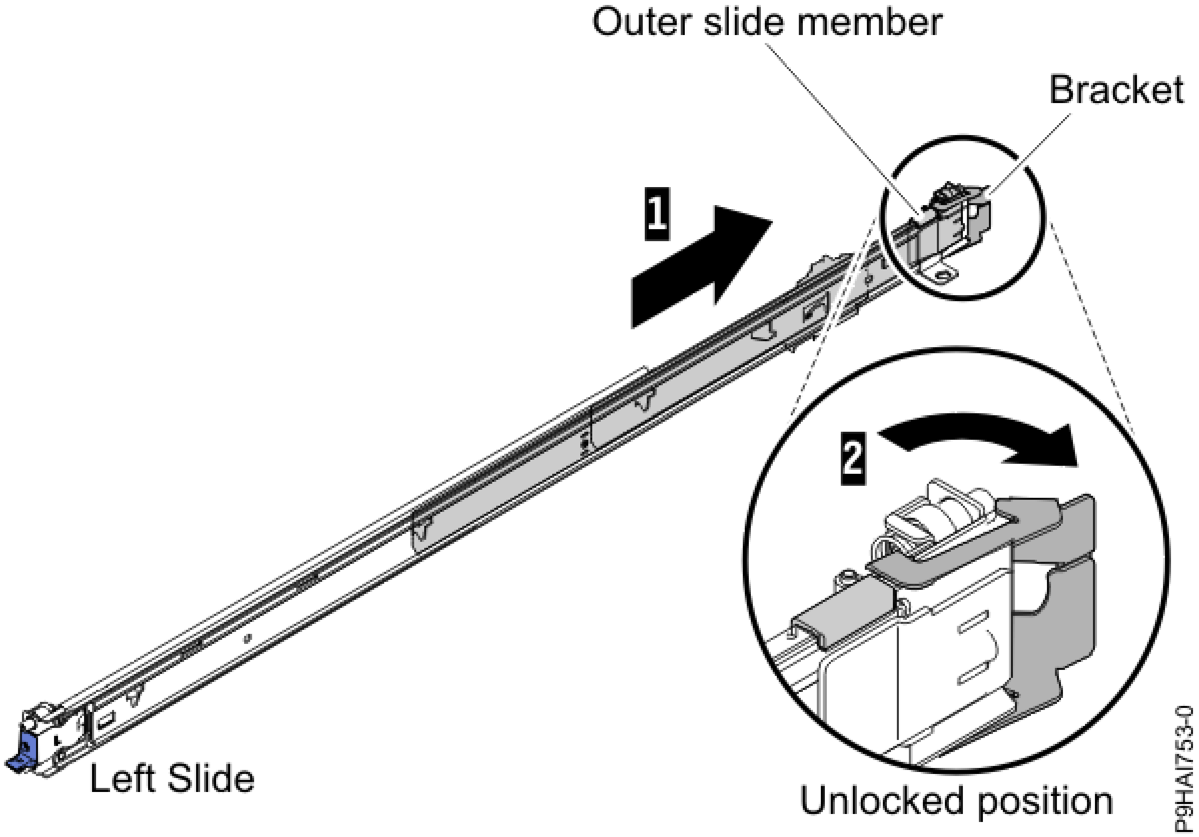

Figure 12. Slide rail and the outer slide member

Note: Each slide rail is marked as **R (right)** or **L (left)** on its end.

3. Align the rear end of the outer slide member against the holes on the rear of the rack. Line up the pins and push the slide in so that the pins go into the holes. The two slide pins protrude through the top and bottom holes on the EIA flange. Push the slide towards the rear of the rack until the rear rack mount bracket locks into place.

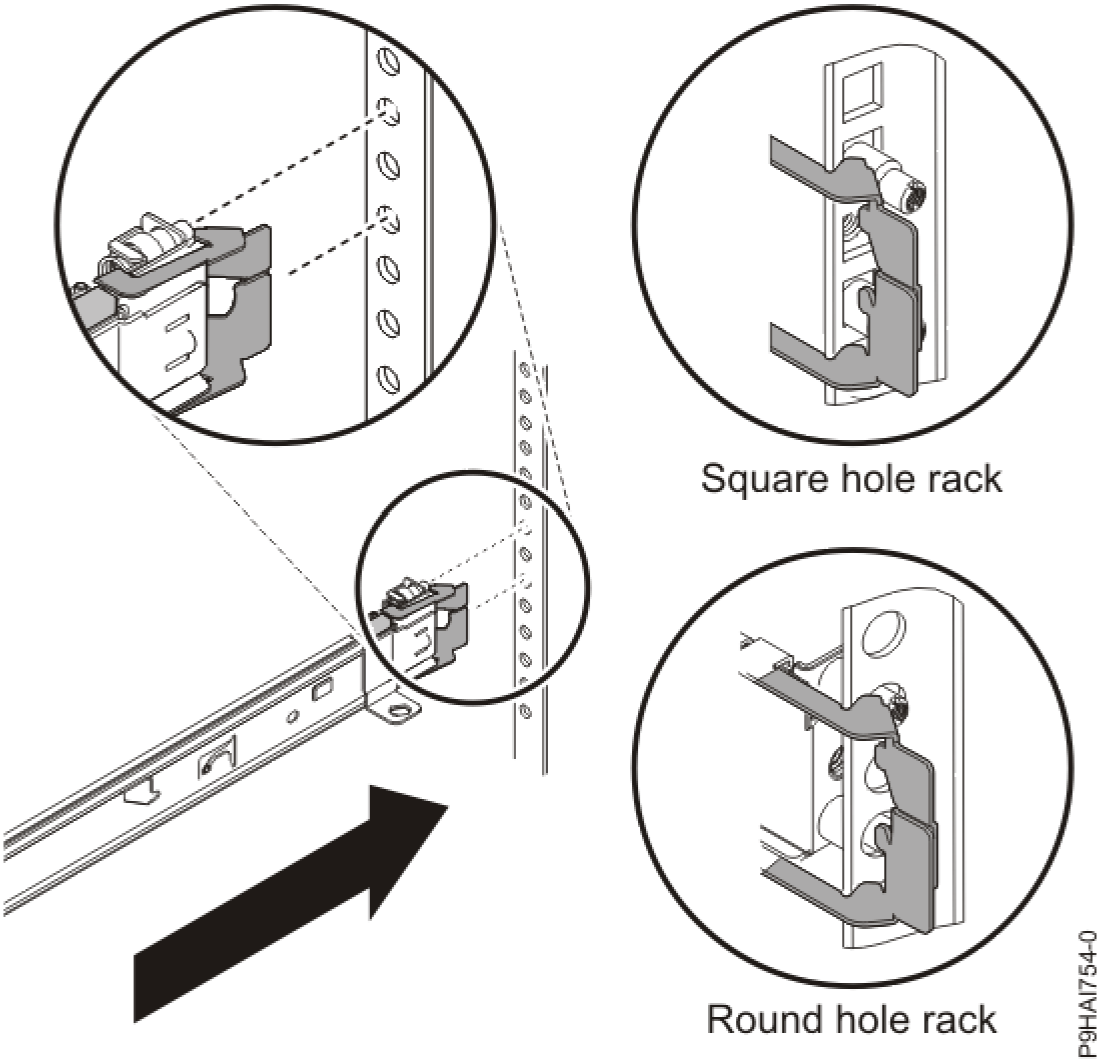

Figure 13. Align the pins with the holes in the rear of the rack

4. Rotate the front latch to the open position and align the front end of the outer slide member against the holes on the front of the rack. Line up the pins with holes in the EIA flanges and pull the slide forward so that the pins protrude through the holes. Lock the front of the slide by allowing the front latch to rotate to the closed position. Repeat steps 2- 4 for the other outer slide member.

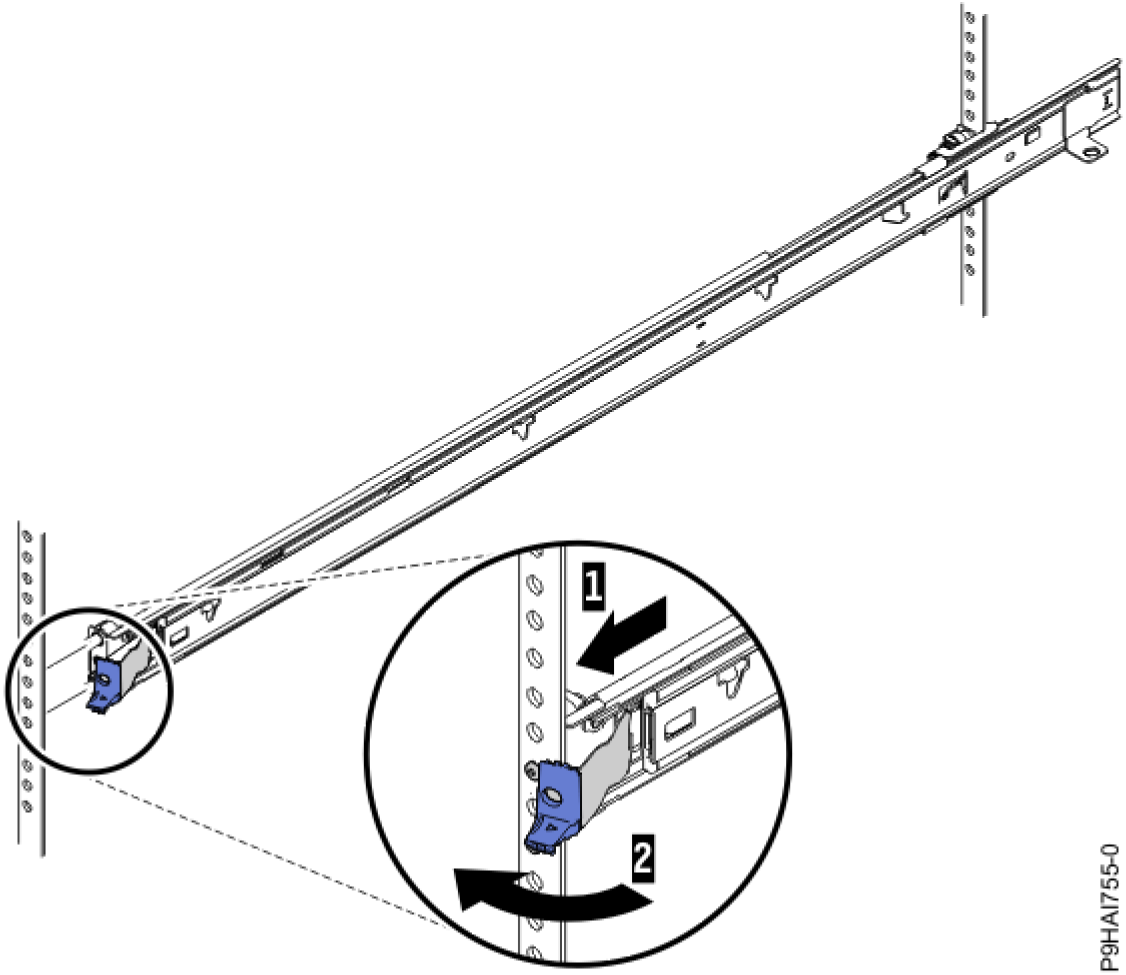

Figure 14. Front slide rail latch

5. Press on the release latches **(1)**. When you move the rack cabinet, or if you install the rack cabinet in a vibration-prone area, tighten the captive M5 screws **(2)** in the front of the server.

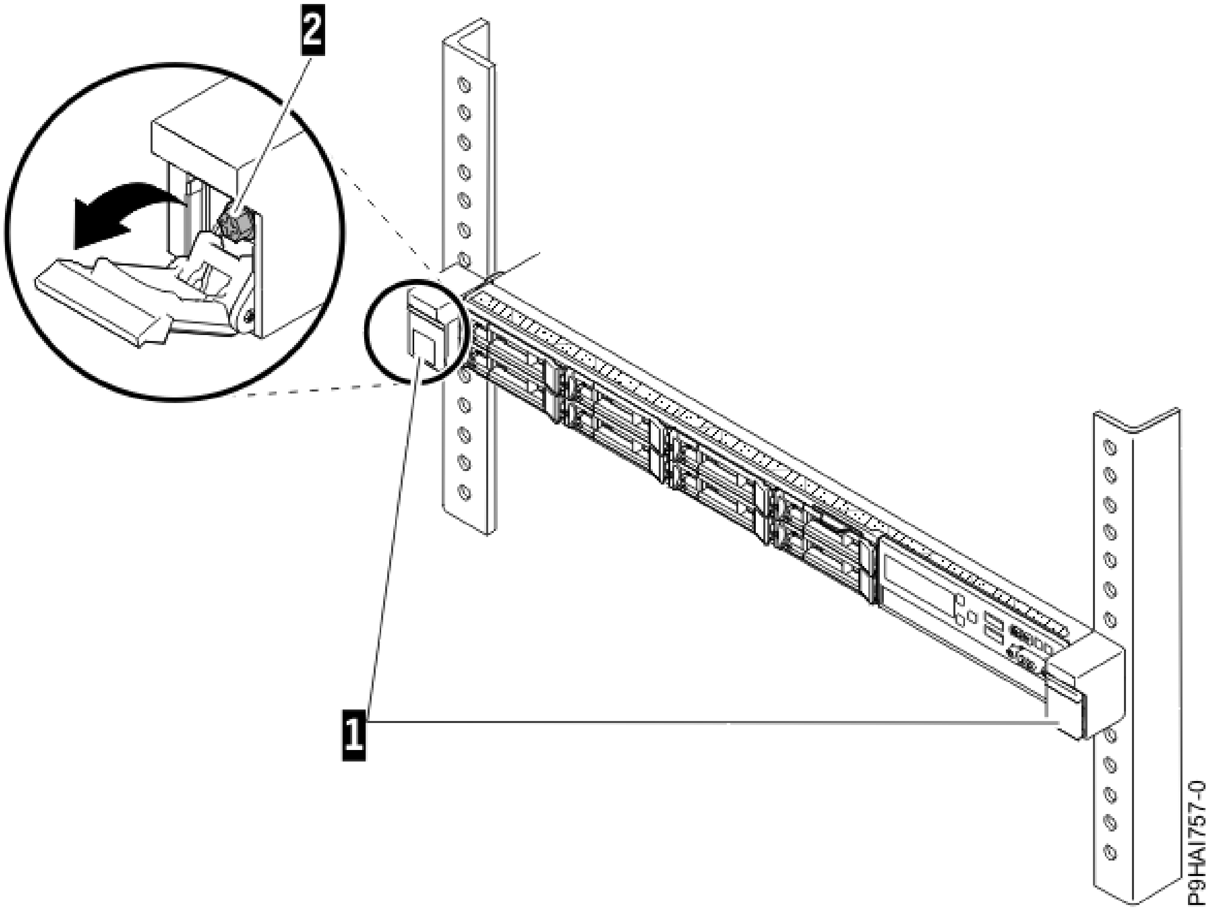

Figure 15. Rack front rail and pins

6. Pull the slide rails forward **(1)** until they click, twice, into place. Carefully lift the server and tilt it into position over the slide rails so that the rear nail heads **(2)** on the server line up with the slots in the slide rails. Lower the server down until the rear nail heads slide into the two rear slots, and then slowly lower the front of the server **(3)** until the other nail heads go into the other slots on the slide rails. Ensure that the front latch covers the front nail head so that the system is secured to the slide rails.

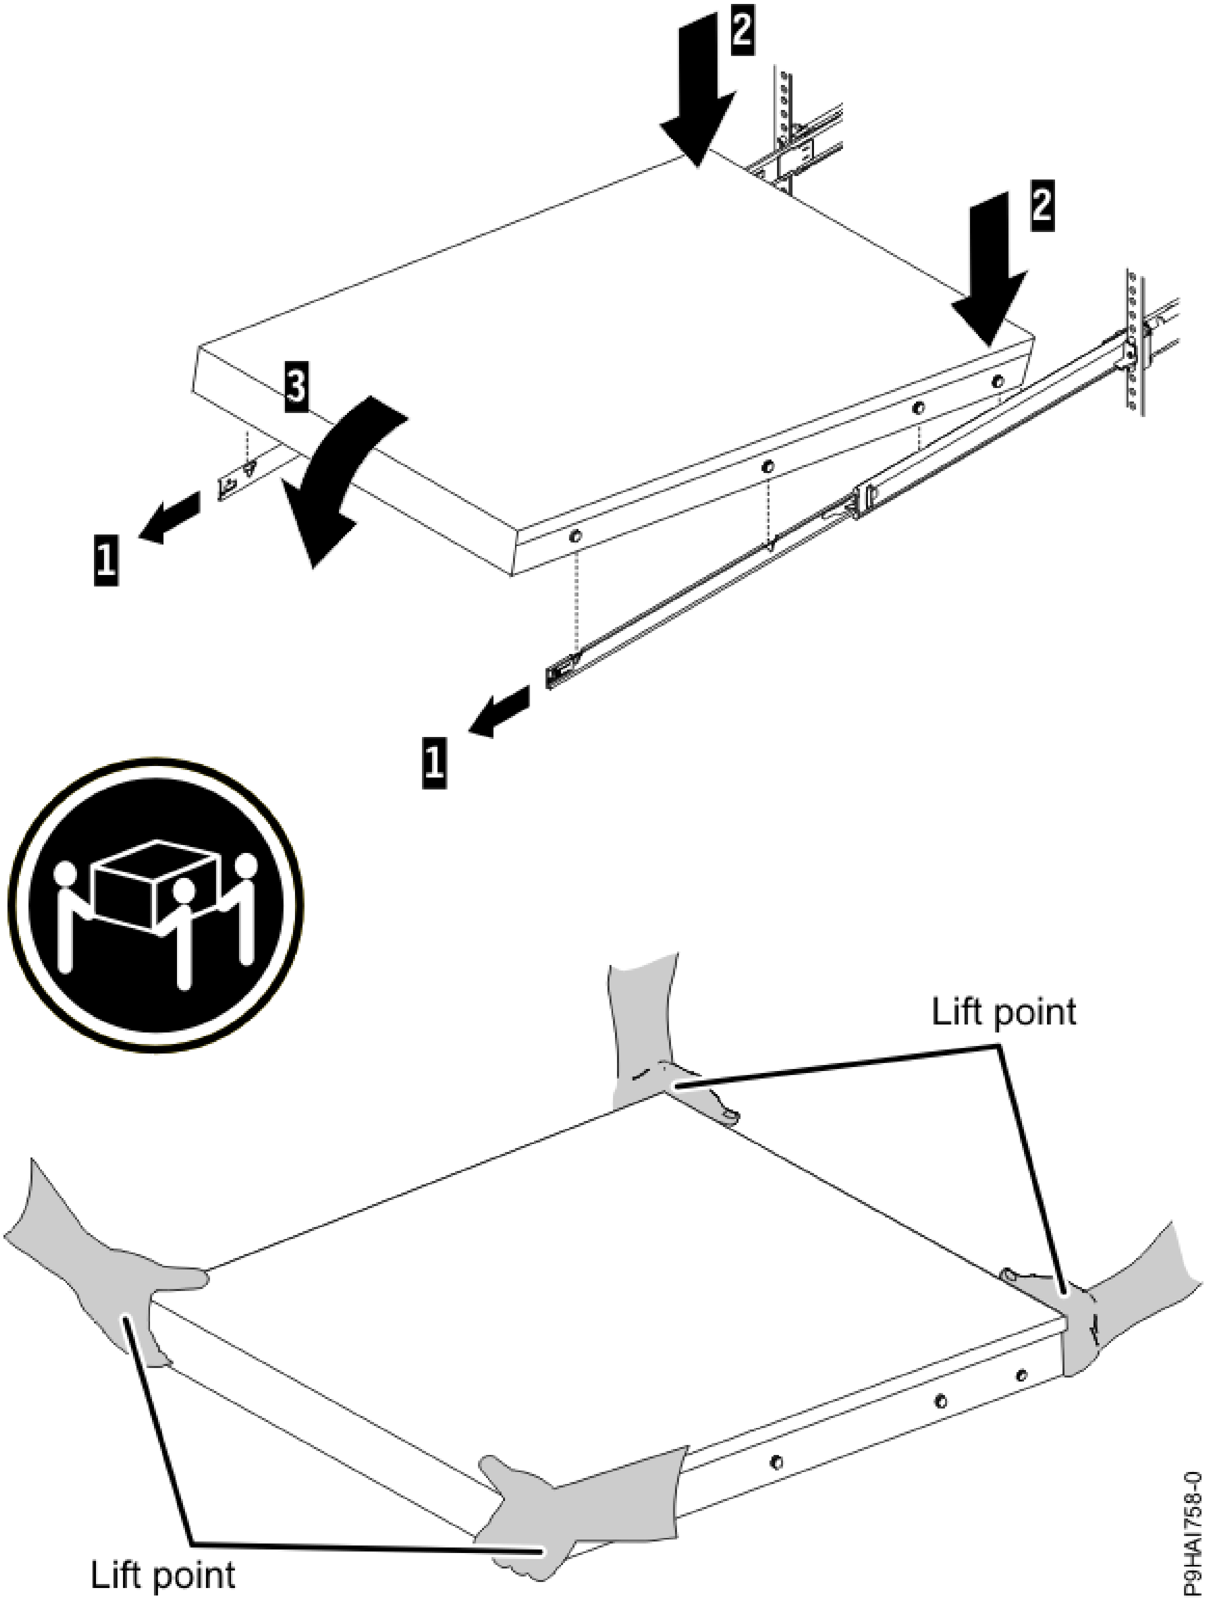

Figure 16. Slide rails extended, server nail heads aligned with slots in rail, and lift points

Note: Use safe practices while lifting. If you are installing a 1 U server, ensure that you have two people when you lift the server. Their hands must be positioned as illustrated in Figure 16 on page 30.

7. Lift the locking levers **(1)** on the slide rails and push the server **(2)** all the way into the rack until it clicks into place.

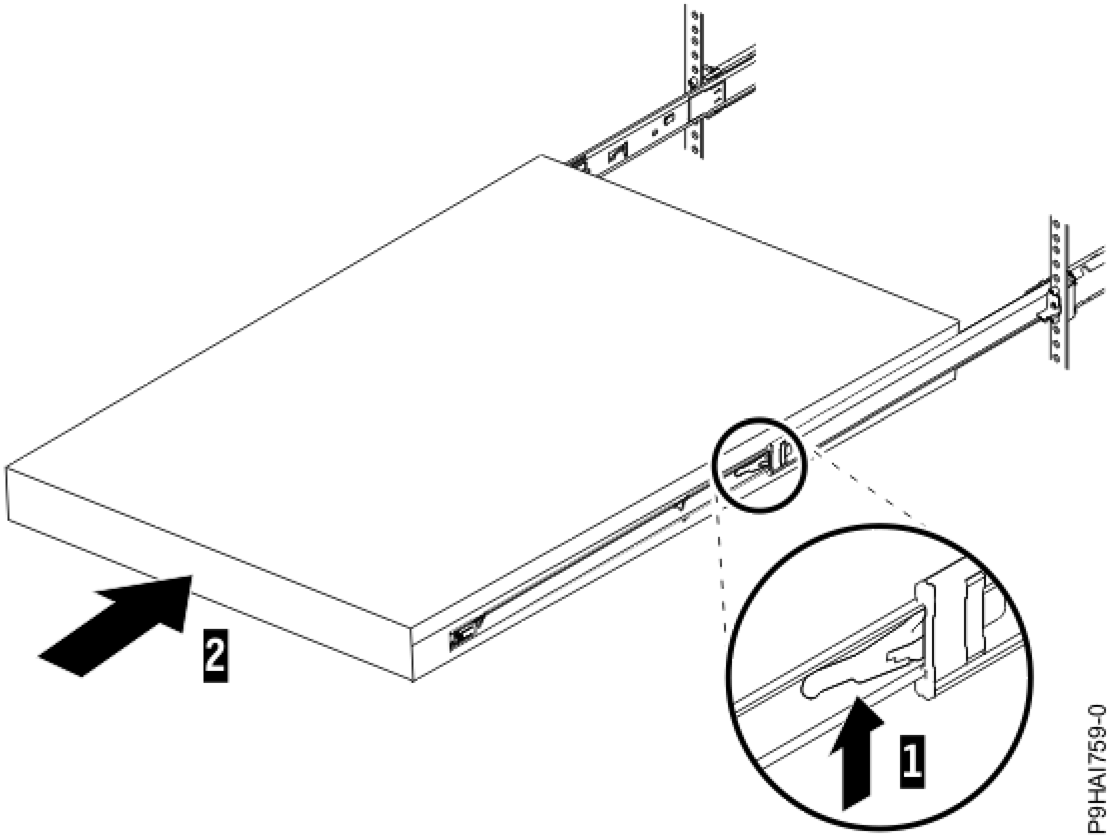

Figure 17. Release latches and server

8. The cable-management arm can be installed on either side of the server. Figure 18 on page 32 shows it being installed on the left side. It is best to install the cable-management arm so that it hinges on the side opposite to the power supplies to provide access to the power supplies. To install the cable-management arm on the right side, follow the instructions and install the hardware on the opposite side. Place the pin down **(1)** into the horizontal slot on the rear of the slide rails. Then rotate the other end of the bar toward the rack **(2)** toward the rack.

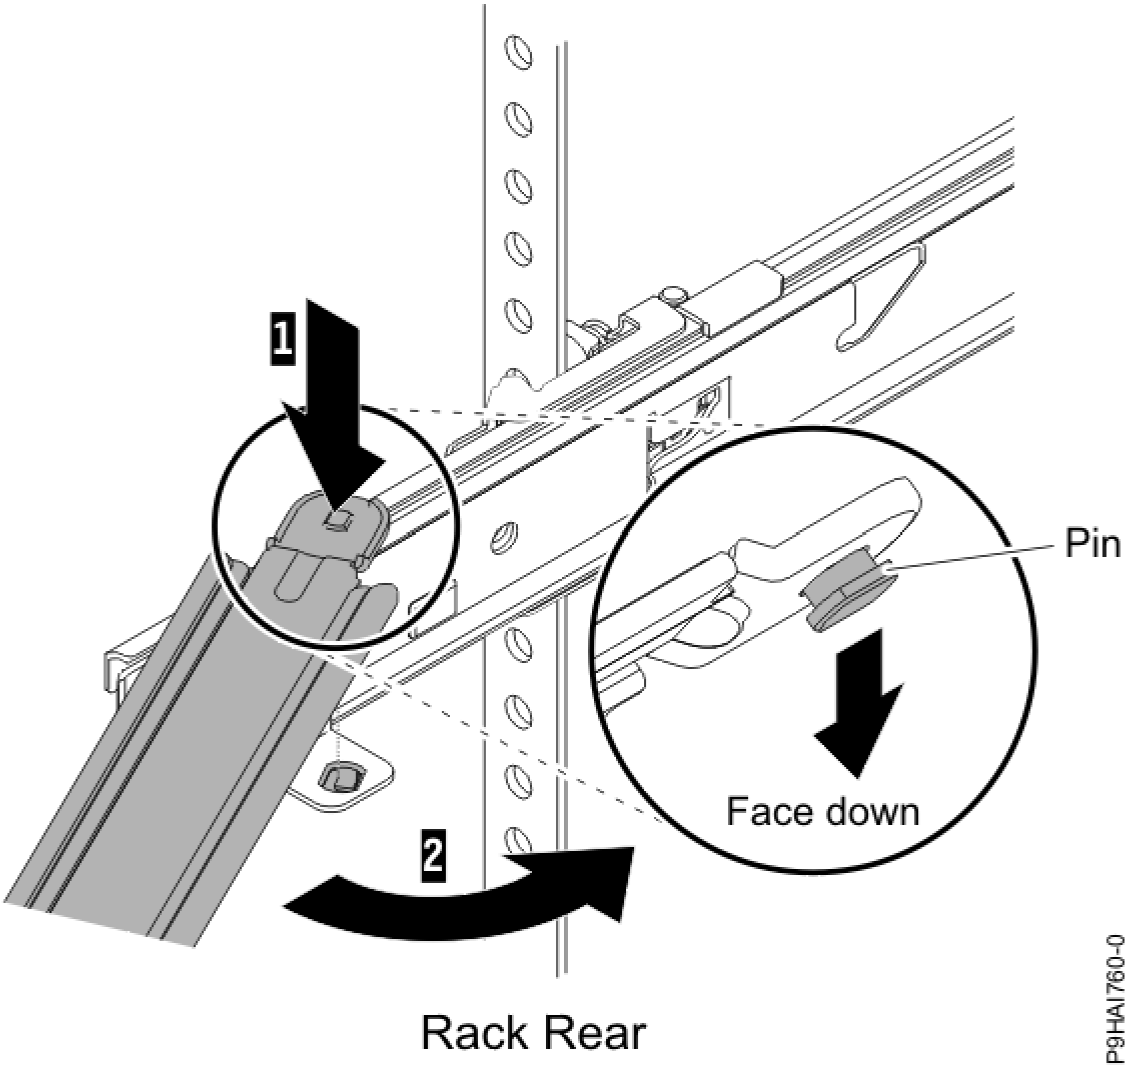

Figure 18. Support arm connection

Note: The cable management support bar must be on top of the slide tab to work correctly.

9. Install the cable management stop bracket (with capital letter **O**) on the unattached end of the support arm. Ensure that the support arm is securely installed.

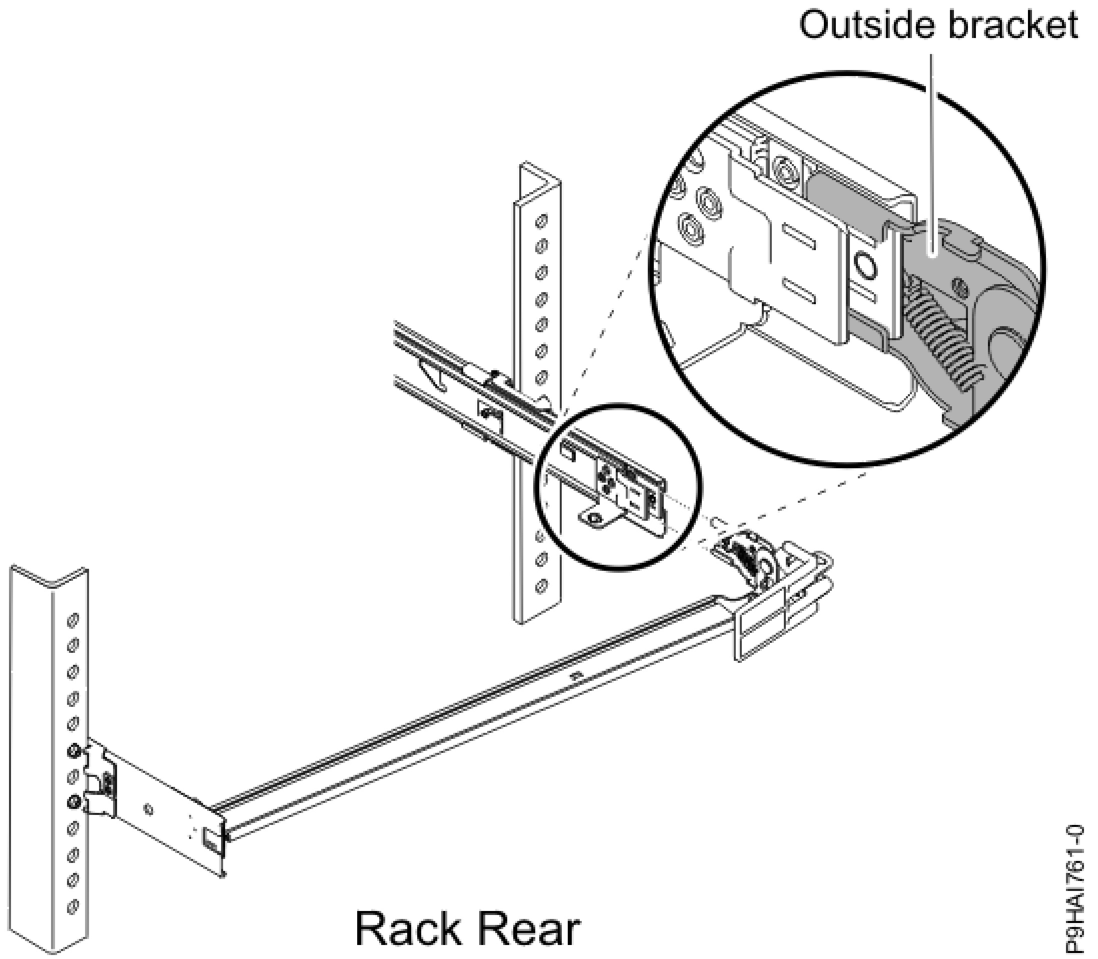

Figure 19. Connecting the stop bracket to the slide rail

Note: The capital letter **O** is marked on cable management arm pins to identify the outside pins.

10. Place the cable-management arm on the support arm. Slide the cable management arm tabs into both the inside and the outside slots of the slide rail. Push the tabs until they snap into place.

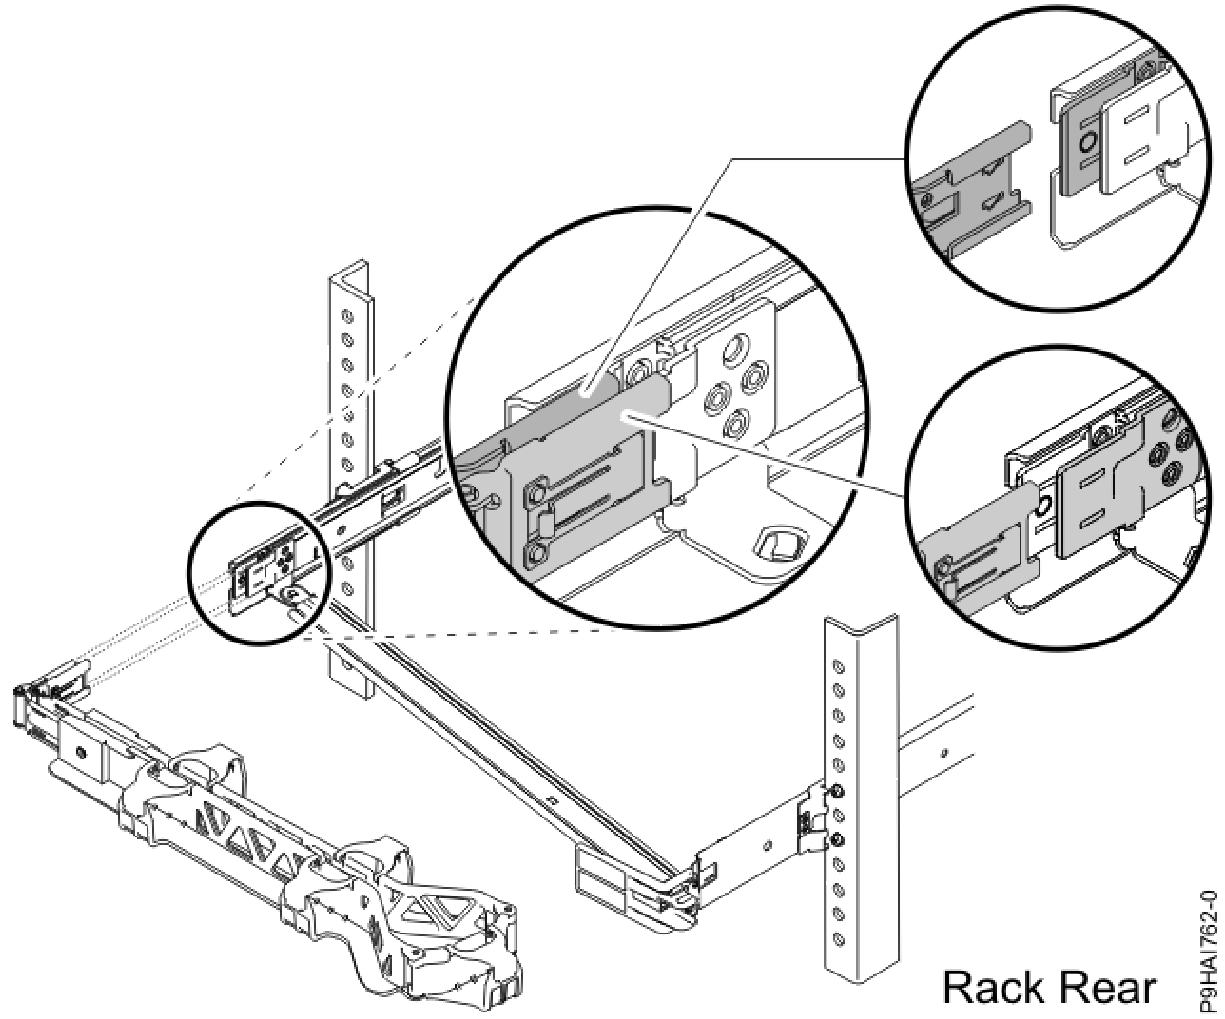

Figure 20. Cable-management arm connection

11. To make it easier to rotate the cable management arm on and off the cable management support arm, you can open the stop bracket by pushing the tabs above and below the cable management support.

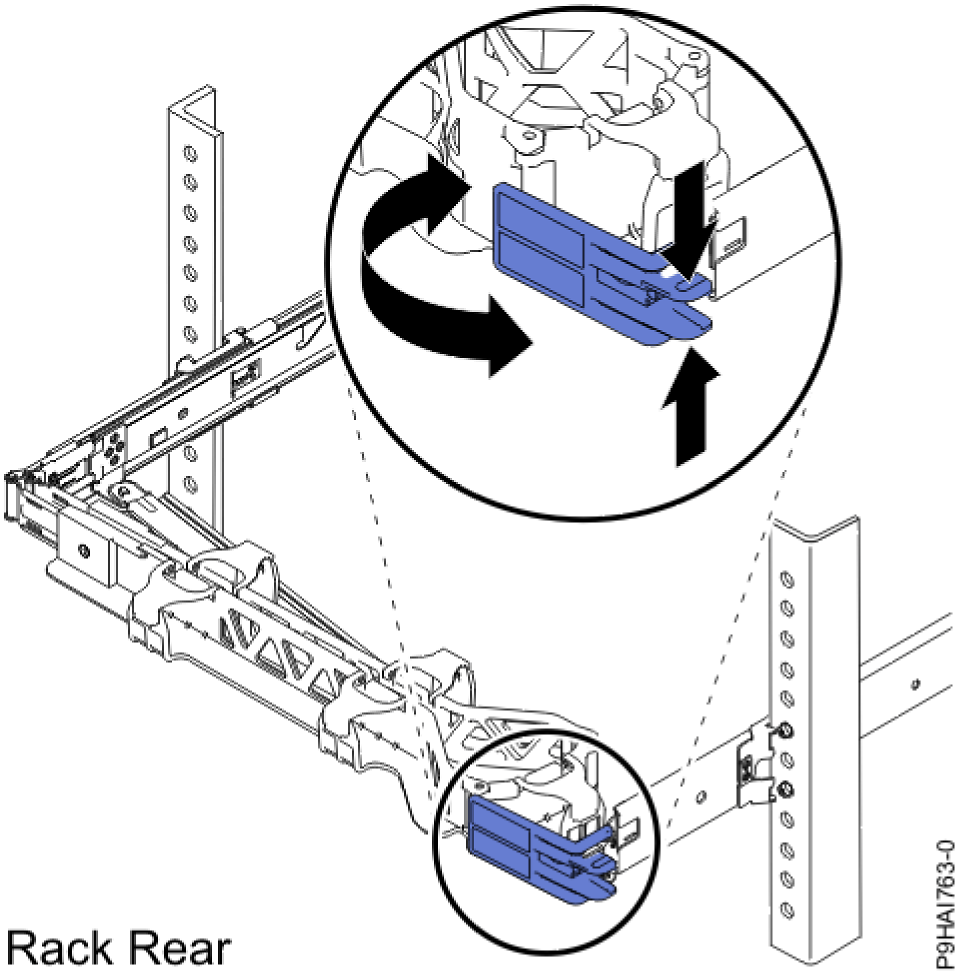

Figure 21. Cable management support stop bracket

12. Attach the power cords and other cables to the rear of the server (including keyboard, monitor, and mouse cables, if required). Route the cables and power cords on the cable-management arm and secure them with cable ties or hook-and-loop fasteners.

    Note: The location of the cable straps might be slightly different in different systems. Use the cable straps that are provided on the rear of the system to retain the cables and prevent them from sagging.

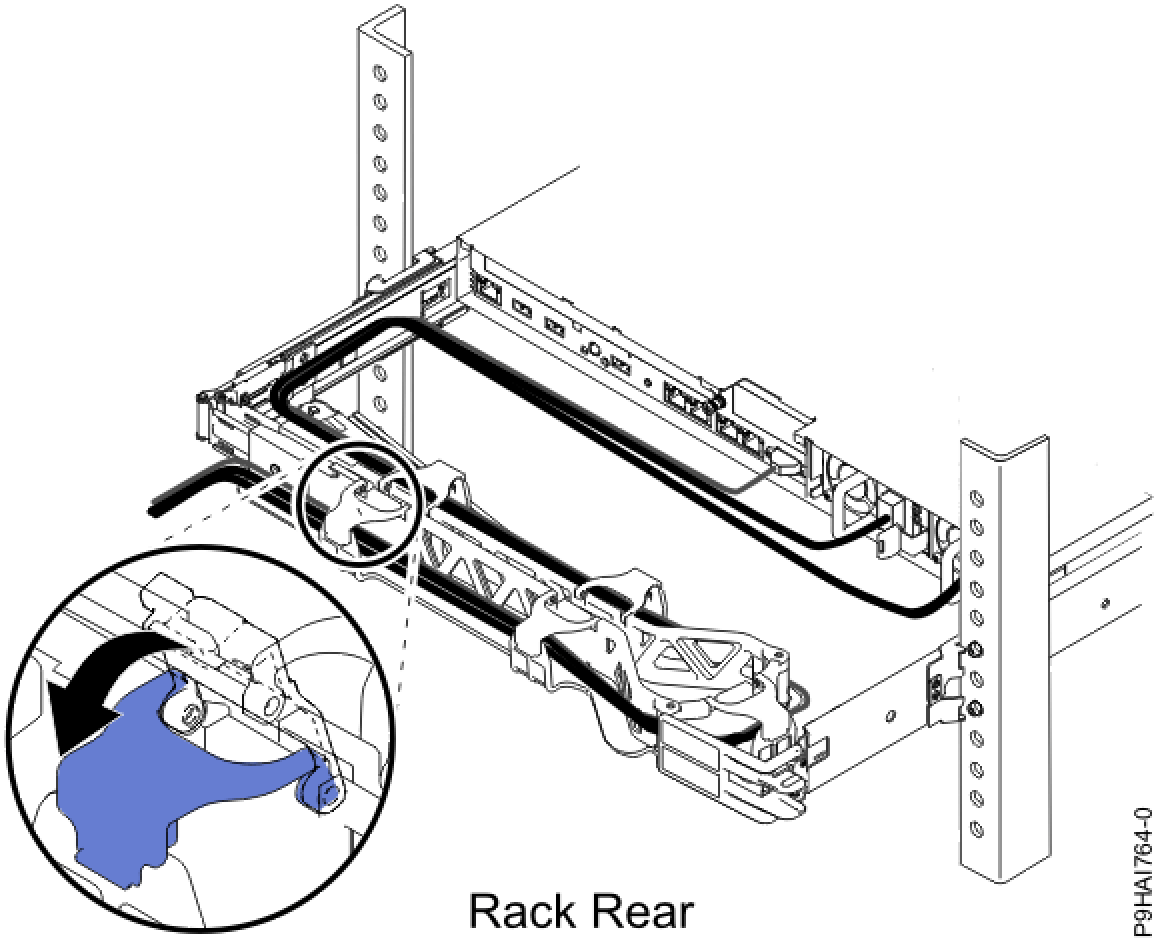

Figure 22. Attaching the Power cord and routing the cable

13. Cables must be bundled with the cable strap for proper movement of the cable management arm.

    Note: Ensure that the cables do not sag below the U space so they do not get caught on the lower systems. Allow slack in all cables to avoid tension in the cables as the cable-management arm moves.

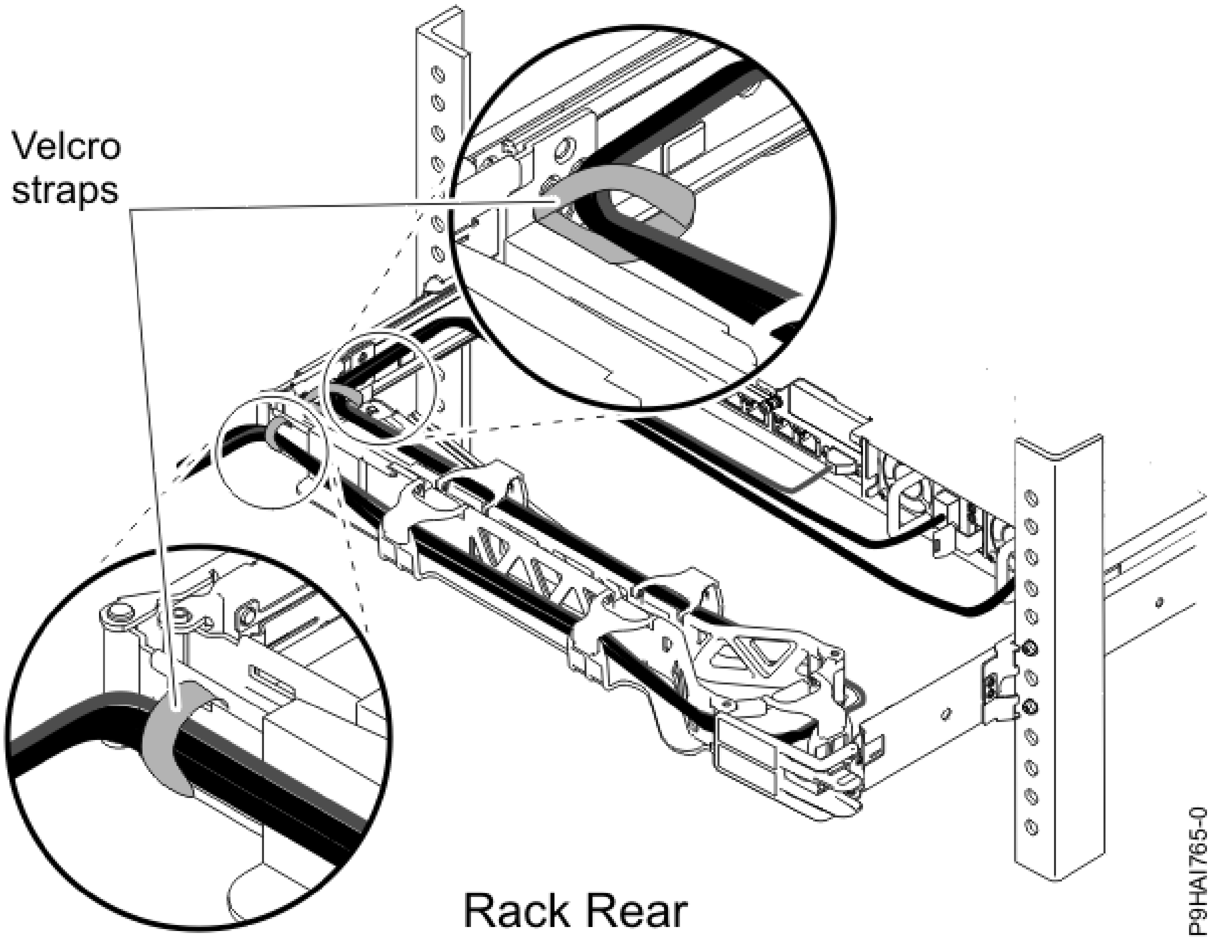

Figure 23. Hook-and-loop fastener

14. If you are shipping the rack with the system installed or if you are in a vibration-prone area, insert the M5 screws into the rear of the slides. Use a cable tie to secure the free end of the cable management arm to the rack if needed.

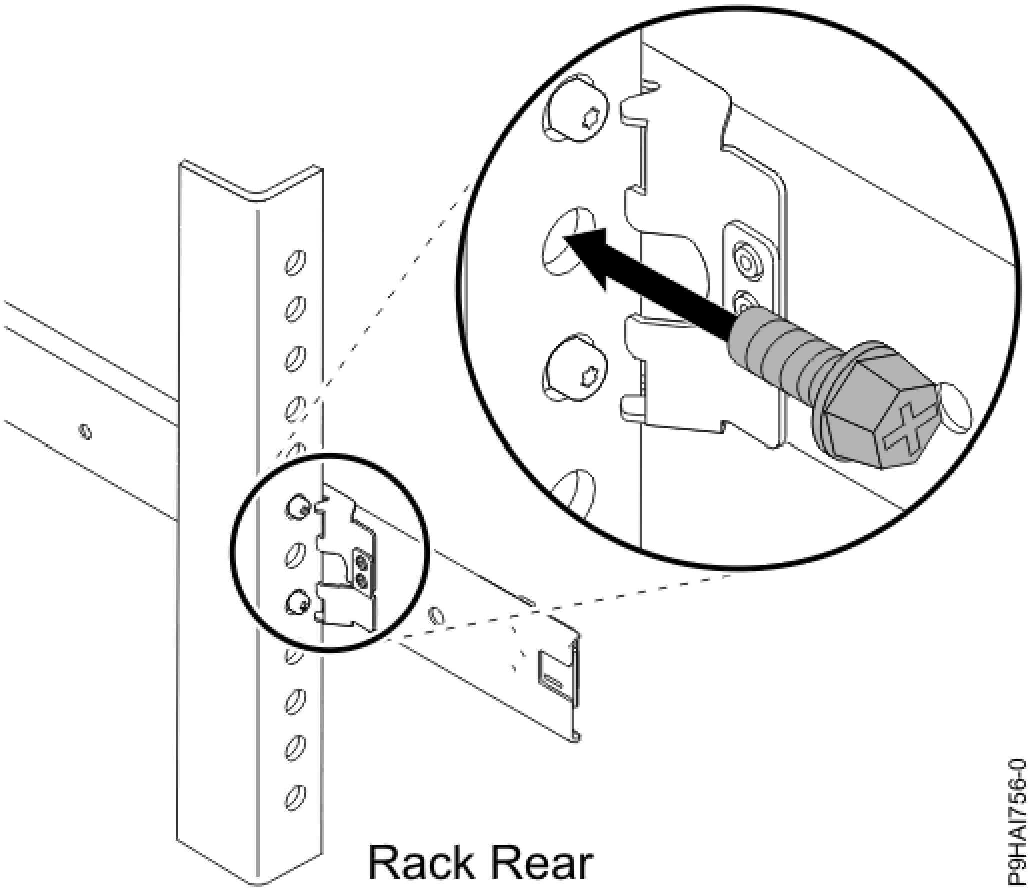

Figure 24. Securing the server for shipping

Installing the HMC virtual appliance

Learn how to install the Hardware Management Console (HMC) virtual appliance.

The HMC virtual appliance can be installed in your existing x86 or POWER® virtualized infrastructure. The HMC virtual appliance supports the following x86 virtualization hypervisors:

- Kernel-based virtual machine (KVM)
- Xen
- VMware

The HMC virtual appliance supports the following POWER virtualization hypervisors:

- PowerVM®

Minimum requirements for running the HMC virtual appliance:

- 16 GB of memory
- 4 virtual processors
- 2 network interfaces (maximum of 4 allowed)
- 1 disk drive that contains 500 GB of available disk space

  Note:

  PowerVM virtualization hypervisor requires 160 GB of disk space. 500 GB of memory is recommended.

  The minimum PowerVM processor requirement is 1.0 processing units and four shared virtual processors in capped sharing mode. Using dedicated processor is not recommended. 16 GB of memory is recommended.

Notes:

1. The processor on the systems that host the HMC virtual appliance must be either an Intel VT-x or an AMD-V hardware virtualization-enabled processor.
2. The HMC virtual appliance DVDs that you receive are not bootable. You must mount the media first and then copy the `.tgz` file from the media. The method to mount the DVD can vary depending on the operating system that you use.
3. The command syntax that are used in the following examples can vary depending on the operating system that you use.

Performance and scale requirements:

- When the HMC is at V9.2.950.0, or later, a single HMC can manage up to 48 systems and 2000 partitions across the systems that are managed by the HMC with the following requirements:
  - 16 GB memory for 1 - 500 partitions
  - 32 GB memory for 500 - 2000 partitions
- You can refer to the corresponding product documentation to find the maximum number of systems and partitions that an HMC can manage, when the HMC is used in combination with Cloud Management Console (CMC), PowerVC, VM High Availability/Disaster Recovery (HA/DR).

HMC V8 network installation images and installation instructions

Installing the HMC virtual appliance on x86

Learn how to install the Hardware Management Console (HMC) virtual appliance on a x86 environment.

Installing the HMC virtual appliance by using the KVM hypervisor

Learn how to install the Hardware Management Console (HMC) virtual appliance by using the kernel-based virtual machine (KVM) hypervisor.

To install the HMC virtual appliance on KVM, complete the following steps:

Note: The following use the command line interface and require root user authority. The command syntax might vary depending on the operating system.

1. Verify that virtualization packages are installed on systems with Red Hat Enterprise Linux (RHEL) version 7.0 or later.
2. Download the `<KVM vHMC installation filename>.tar.gz` file to the host system.
3. Run the following command: `mkdir -p /var/lib/libvirt/images/vHMC`.
4. Run the following command: `cd /var/lib/libvirt/images/vHMC`.
5. To extract the virtual disk images, run the following command: `tar -zxvf <KVM vHMC installation filename>.tgz`

   Note: In this command, specify the full path of your HMC virtual appliance .tar file.
6. A **domain.xml** file is provided in the `<KVM vHMC installation filename>.tar.gz` file. Complete the following steps:
   a. Edit the **domain.xml** file and verify that the path to your disks is correct. This file contains the string **DISK_PATH**.
   b. Make sure `virtio` is used in the bus value for your disk device.
   c. You can choose to have a different name for your VM. The default name in the **domain.xml** file is **vHMC**.
   d. Verify that the media access control (MAC) address is set in the **domain.xml** file. This file contains the string **MAC_ADDRESS**.

      Note: Remove this line if you want a MAC address to be generated automatically for you.

   e. Verify that your bridges match your Ethernet devices. The default **domain.xml** file specifies one Ethernet.

   f. If you are using the Activation Engine, replace **AEDISK** with the name of Activation Engine virtual disk image. Otherwise, remove the disk element.

7. To define the VM, run the following command: `virsh define <domain>.xml`.
8. To verify that Virtual HMC was added to the list of defined VMs, run the following command: `virsh list --all`.
9. To start the VM, run the following command: `virsh start vHMC`.
10. To determine the Virtual Network Computing (VNC) display number of your console, run the following command: `virsh vncdisplay vHMC`.
11. To connect to your console with a VNC viewer, run the following command: `vncviewer HOSTNAME:ID`(Where ID is the display number, for example `0`).

    Note: If you require remote access, you must drop or configure your firewall to allow access to port 5900.

Installing the HMC virtual appliance by using the Xen hypervisor

Learn how to install the Hardware Management Console (HMC) virtual appliance by using the Xen hypervisor.

The HMC virtual appliance supports Xen version 4.2 or later.

To install the HMC virtual appliance by using the Xen hypervisor, complete the following steps:

Note: The following steps use the command line interface and require root user authority. The command syntax might vary depending on the operating system.

1. Verify that virtualization packages are installed on systems with Red Hat Enterprise Linux (RHEL) version 6.4 or later.
2. Download the `<XEN vHMC installation filename>.tar.gz` file to the host system.
3. Run the following command: `mkdir -p /var/lib/libvirt/images/vHMC`.
4. Run the following command: `cd /var/lib/libvirt/images/vHMC`.
5. To extract the virtual disk images, run the following command: `tar -zxvf <XEN vHMC installation filename>.tgz`

   Note: In this command, specify the full path of your HMC virtual appliance .tar file.
6. A **vhmc.cfg** file is provided in the `<XEN vHMC installation filename>.tar.gz` file. Open the **vhmc.cfg** file in a text editor and edit the following values:

   a. Change the name of the virtual HMC (optional): Edit the **vhmc.cfg** file and verify that the path to your disks is correct. This file contains the string **DISK_PATH**.

   b. Replace **DISK_PATH** with the path for `disk1.img`:

   ```
   disk = [ 'file:DISKPATH,hda,w' ]
   ```

   c. Replace **ethernet adapter** and add MAC address (optional):

   ```
   vif = [ 'type=virtio, model=e1000, bridge=eth0' ]
   ```

   Optional MAC Address:

   ```
   vif = [ 'type=virtio, mac=MACADDRESS, model=e1000, bridge=eth0' ]
   ```

   Note: When the Virtual HMC is rebooted, the Xen hypervisor automatically regenerates a MAC address. Adding the optional MAC Address solves this issue.

   d. Replace **FLOPPYPATH** (if you are using the Activation Engine):

   ```
   device_model_args = [ "-fda", "FLOPPYPATH" ]
   ```

7. To create and start the VM, run the following command: `xl create vHMC.cfg`.
8. To check that the VM was added to the list of defined virtual machines, run the following command: `xl list`.
9. To access the VM local console, run the following command: `vncviewer localhost 0`.

Installing the HMC virtual appliance by using VMware ESXi

Learn how to install the Hardware Management Console (HMC) virtual appliance by using VMware ESXi.

You can install the HMC virtual appliance on VMware ESXi by using the graphical user interface on the vSphere client to deploy the Open Virtualization Format (OVF) template.

Note: You can install the HMC virtual appliance on VMware ESXi version 6.0 or later.

To install the HMC virtual appliance on VMware ESXi by using the vSphere client, complete the following steps:

Note: The command syntax might vary depending on the operating system.

1. Obtain the Tar archive file: `<VMware vHMC installation file name>.tgz`.
2. Use the `tar` command to extract the OVA file from the Tar archive file.
3. Start the vSphere client and log in to the ESXi host.
4. From the **File** menu, select **Deploy OVF template**.
5. Click **Browse** and select the OVA file.
6. Click **Next**.
7. After the deployment is completed, click **Close** and select the HMC virtual appliance icon to power the HMC virtual appliance on.

Installing the HMC virtual appliance on POWER

Learn how to install the Hardware Management Console (HMC) virtual appliance on a virtualized POWER environment.

Installing the HMC virtual appliance on PowerVM (logical partition)

Learn how to install the Hardware Management Console (HMC) virtual appliance on a PowerVM environment.

The HMC virtual appliance supports POWER9 servers on firmware level FW910 or later. For more information, see Supported Linux distributions for POWER8® and POWER9 Linux on Power systems (https://www.ibm.com/support/knowledgecenter/en/linuxonibm/liaam/liaamdistros.htm).

Notes:

1. You cannot manage the server that hosts the HMC virtual appliance.
2. You cannot manage the server that hosts another HMC virtual appliance which is managing the server that hosts this HMC virtual appliance.

   For example, HMC virtual appliance A is running on server A and HMC virtual appliance B is running on server B. HMC virtual appliance A cannot manage server B and HMC virtual appliance B cannot manage server A at the same time. One of the HMC virtual appliance can manage the other server, but both HMC virtual appliance cannot manage each other at the same time.

.

Create automated HMC installation image (optional)

You can create an automated HMC installation image that automatically installs the HMC virtual appliance without prompting for the **HMC Installallation** wizard.

Note: The HMC virtual appliance on PowerVM does not provide graphics adapter support for adapters that are assigned to the partition. You can use a supported web browser to connect to the HMC for user interface support.

To create an automated HMC installation image, complete the following steps:

1. Create two directories by running the following commands: `mkdir -p oldiso` and `mkdir -p newiso`.
2. Mount the HMC installation image to the **oldiso** directory by running the following command: `sudo mount -o loop <image_path> oldiso`.
3. Copy the contents of the **oldiso** directory to the **newiso** directory by running the following command: `cp -r oldiso/* newiso`.
4. If the Grub configuration file (**newiso/boot/grub/grub.cfg**) has 2 lines that start with **menuentry**, then remove the first **menuentry** section by running the following command: `sed -i '/\"Install Hardware Management Console\"/,+4d' newiso/boot/grub/grub.cfg`.
5. Edit the Grub file for the automated install by running the following command: `sed -i 's/biosdevname=0/biosdevname=0 mode=auto optype=Install/' newiso/boot/grub/grub.cfg`.
6. Make the Grub file read-only by running the following command: `sudo chown 0444 newiso/boot/grub/grub.cfg`.
7. Create a new HMC installation ISO by running the following command: `mkisofs -o <new_iso_name> -V <ISO label> -f -r -T -udf --allow-limited-size --netatalk -chrp-boot -iso-level 4 -part -no-desktop -quiet newiso` (where **ISO label** must be `HMC-<hmc version release number>`, for example `HMC-8.0.870.0`).

Note: For more information about setting up the Activation Engine and the configuration file, see "Using the Activation Engine for the HMC virtual appliance" on page 45.

Logical volume setup

To set up the logical volume, complete the following steps:

1. Select a managed system.
2. From the menu pod, select **System Actions** > **Power VM** > **Virtual Storage**.
3. Select **Manage System VIOS** > **Action** > **Manage Virtual Storage**.
4. Select the **Virtual Disks** tab.
5. Click **Create virtual disk** and enter the following information:
   - **Virtual disk name**: The name of the virtual disk.
   - **Storage pool name**: The name of the storage pool.
   - **Virtual disk size**: The size of the virtual disk.
   - **Assigned partition**: The name of the logical partition.

   Note: A minimum of 160 GB disk space is required (500 GB disk space is recommended).

Installation media setup - create media library

To create a media library, complete the following steps:

1. Select a managed system.
2. From the menu pod, select **System Actions** > **Power VM** > **Virtual Storage**.
3. Select **Manage System VIOS** > **Action** > **Manage Virtual Storage**.
4. Select the **Optical Devices** tab.
5. Click **Create Library** and enter the following information:
   - **Storage pool**: The name of the storage pool.

- **Media library size**: The size of the media library.

6. Click **OK**.

Installation media setup - upload media to VIOS

To upload media to Virtual I/O Server (VIOS), complete the following steps:

1. Log in to VIOS.
2. In VIOS root mode, run the following command: `oem_setup_env`.
3. To allow NFS connection, run the following command: `nfso -o nfs_use_reserved_ports=1`.
4. To mount the NFS into the local VIOS folder, run the following command: `mount <server_ip>:/Mountpoint <local_folder>`.
5. To verify that the NFS mount includes your HMC installation ISO and Activation Engine configuration image (optional), run the following command: `ls`.

Installation media setup - link media to media library

To link media to the media library, complete the following steps:

1. Navigate back to **Manage System VIOS** > **Action** > **Manage Virtual Storage** and select the **Optical Devices** tab.
2. From the **Virtual Optical Media** section, select **Add Media** from the **Actions** menu.
3. From the **Add Virtual Media** window, select **Add existing file from VIOS filesystem** and enter the following information:
   - **Media name**: The name of the media (for example, `HMCInstall` or `AEDrive`).
   - **Optical media file name**: The file name of the installation ISO file (for example, `01234567-ppc64ie.iso`).
4. Click **OK**.
5. If you created an Activation Engine configuration image, repeat steps 3 - 4 to add the Activation Engine configuration image. Otherwise, continue to step 6.
6. Verify that the optical media is uploaded to the media library by verifying that the media name is shown in available **Virtual Optical Media** list.

Logical partition setup

To set up the logical partition, complete the following steps:

1. Select a managed system.
2. From the menu pod, select **System Actions** > **Partitions** > **Partitions**.
3. Click **Create Partition** and enter the following information:
   - **Parititon Name**: The name of the partition.
   - **Partition ID**: The ID of the partition.
   - **Partition Type**: Select the operating system (**AIX/Linux** or **IBM i**).
4. Click **OK**.
5. Allocate the number of processors and the amount of memory for the partition.

   Note: A minimum of four virtual processors and 8 GB of memory is required.
6. From the menu pod, select **Partition Actions** > **Virtual I/O** > **Virtual Networks**.
7. Click **Attach Virtual Network** and select the **Show and attach new virtual ethernet adapters** check box. From the table, select the virtual network adapters that you want to attach to the logical partition.

   Note: A maximum of four virtual network adapters is allowed.

8. From the menu pod, select **Partition Actions** > **Virtual I/O** > **Virtual Storage**.
9. From the **Virtual Optical Device** tab, click **Add Virtual Optical Device**.
10. Enter the **Device Name** (for example, `HMCInstall` or `AEDrive`) and select the wanted Virtual I/O Server from the table.

    Note: Installing the `AEDrive` is optional.
11. Click **OK**.
12. Verify that the virtual optical devices that you added from step 10 is now listed in the table.
13. From the **Action** menu, click **Load**.
14. Select the media file to assign to the logical partition and click **OK**.
15. Verify that the virtual optical devices that you loaded from step 13 is now listed in the table.

Starting the HMC virtual appliance

Note: When you install the HMC virtual appliance on a partition by using the HMC ISO image file, you will not have local graphical console access to the web user interface.

To start the HMC virtual appliance on PowerVM, complete the following steps:

1. Select the managed partition.
2. Open an active connection to the logical partition by selecting **Actions** > **Console** > **Open Terminal Window**.
3. Activate the logical partition by selecting **Actions** > **Activate**.
4. Select **Activate (Normal)** and **Current Configuration**.
5. Click **Finish**.
6. Switch to the terminal window.
7. From the **Boot** menu, select **1 = SMS Menu**.
8. From the **Main** menu, select **5 = Select Boot Options**.
9. From the **Multiboot** menu, select **1 = Select Install/Boot Device**.
10. From the **Select Device Type** menu, select **5 = List all devices**.
11. Select the `HMCInstall` device based on the device location.
12. Select **2. Normal Mode Boot**.
13. Select **1. Yes** to confirm.
14. Follow the onscreen instructions from the **HMC Install** wizard.

    Note: Skip this step if you used an automated HMC installation image.
15. After the installation completes and the system starts, you must select a language from the **language selection** dialog box.
16. Accept the license agreement.

    Note: Ensure that the command controller is ready to accept commands before you run any commands. For example, running the **`lshmc -V`** command until it succeeds.
17. Log in as `hscroot` and use the **chhmc** command to configure the network.

    The following example shows the sequence of **chhmc** commands that can be used to configure the network and enable Secure Shell (SSH) and remote web access on the HMC.

    ```
    chhmc -c network -s modify -i ethX -a <hmc ip address> -nm <hmc network mask> --lparcomm on
    chhmc -c network -s modify -h <hmc hostname> -d <hmc domain name> -g <gateway ip>
    chhmc -c network -s add -ns <name server> -ds <domain search>
    chhmc -c ssh -s enable
    chhmc -c ssh.name -s add -a <ip address>
    chhmc -c SecureRemoteAccess.name -s add -a <ip address>
    chhmc -c remotewebui -s enable -i ethX
    hmcshutdown -r -t now
    ```

- **ethX** is the network interface name to configure.
- **hmc ip address** is the IP address of your HMC.
- **hmc network mask** is the network mask of your HMC.
- **hmc hostname** is the host name of your HMC.
- **hmc domain name** is the domain name of your HMC.
- **gateway ip** is the IP address of the gateway on your network.
- **name server** is the name server address of your network.
- **domain search** is the names of the domains that you want the HMC to search on.
- To allow access on all IP addresses, use **-a 0.0.0.0 -nm 0** in place of **ip address**.

Note: When you use multiple virtual Ethernet adapters, run the command **`cat /etc/sysconfig/network-scripts/ifcfg-ethX`** on the HMC virtual appliance on each interface. Compare the media access control (MAC) address against what the HMC shows in the adapter view of the virtual network of the partition. You can click **View Virtual Ethernet Adapter Settings** for more information on the virtual Ethernet adapters. This step helps you determine the correct interface to use.

18. Restart the system.

Using the Activation Engine for the HMC virtual appliance

Learn how to use the Activation Engine for the Hardware Management Console (HMC) virtual appliance.

Activation Engine is a framework that allows various components within a virtual machine to be configured during system startup. To use the Activation Engine, you need to set up an XML configuration profile to allow the HMC virtual appliance to be in a ready-to-manage state on first start. For more information about configuring the XML configuration profile, see "Setting up the configuration profile for the Activation Engine" on page 46. The configuration file can be used to configure the following options:

- Set Default Keyboard (US)
- Default Locale (US)
- Disable Keyboard Setup
- Disable Display Setup
- License Agreement and Machine Code Agreement
- Disable Setup Wizard
- Disable Call Home Wizard
- Configure up to four Network Interface Cards
- Configure Firewall Settings for each Interface
- Configure Network interface as IPv4 DHCP Server
- Configure Private and Open Interface
- Configure Default Gateway Interface Device

Note: The number of Ethernet adapters that is defined in the **vHMC-Conf.xml** configuration file must correlate with the defined Network adapters in the **domain.xml**, **vHMC.cfg**, or **VMWare** configuration file.

The Activation Engine requires a virtual disk that holds an XML configuration. You can edit the **user_data** file with a text editor and use the XML configuration guide that is shown in the following example.

To create a virtual ISO disk image with Activation Engine configuration in a Linux environment, complete the following steps:

1. Create a directory:

```
mkdir -p config-drive/openstack/latest
```

2. Copy the edited **user_data** file into the directory:

   ```
   cp user_data config-drive/openstack/latest
   ```

3. Create a virtual disk image with the Activation Engine configuration:

   ```
   mkisofs -R -V config-2 -o AEdrive.iso config-drive
   ```

Setting up the configuration profile for the Activation Engine

Learn how to set up the Activation Engine configuration file by using XML tags.

Configuration file

Use the following example of the configuration file to learn about the XML tags.

```
<vHMC-Configuration>
   <ConfigurationVersion>2.0</ConfigurationVersion>
   <LicenseAgreement></LicenseAgreement>
   <AcceptLicense>Yes</AcceptLicense>
   <Locale>en_US.UTF-8</Locale>

XML tags for the configuration file

XML tags are used in the Activation Engine configuration file to set specific values for various attributes. You can manually set these values in the Activation Engine configuration file. Use the following table to see a description of each tag and its allowed values:

Table 9. XML tags

Tags	Description	Acceptable values	Notes
ConfigurationVersion	Required element that defines the configuration version to use.	**2.0**	
LicenseAgreement	Required element that displays the HMC virtual appliance license agreement.		
AcceptLicense	Required element to accept the HMC virtual appliance license agreement.	• **Yes**: Accepts the HMC license agreement. • **No**: Prompts User to Accept HMC License Agreement	If an invalid value is entered, the Activation Engine uses the default setting of **No**.
Locale	Required element to define locale settings.	**en_US.UTF-8**	If an invalid value is entered, the Activation Engine uses the default setting of **US**.
SetupWizard	Required element to enable or disable the **HMC Setup** wizard.	• **Yes**: Displays the **HMC Setup** wizard. • **No**: Disables the **HMC Setup** wizard display.	If an invalid value is entered, the Activation Engine uses the default setting of **Yes**.
SetupCallHomeWizard	Required element to enable or disable the **HMC Call Home** wizard.	• **Yes**: Displays the **HMC Call Home** wizard. • **No**: Disables the **HMC Call Home** wizard display.	If an invalid value is entered, the Activation Engine uses the default setting of **Yes**.
SetupKeyboard	Required element to define the keyboard configuration.	• **Yes**: Prompts the user for keyboard configuration. • **No**: Accepts default keyboard configuration (US).	If an invalid value is entered, the Activation Engine uses the default setting of **Yes**.
SetupDisplay	Required element to enable or disable the display configuration.	• **Yes**: Prompts the user for display configuration. • **No**: Accepts default display configuration.	If an invalid value is entered, the Activation Engine uses the default setting of **Yes**.

Table 9. XML tags (continued)

Tags	Description	Acceptable values	Notes
Ethernet	Required element that holds values for Ethernet adapter configurations. A maximum of four Ethernet adapters can be configured.	**Enable**: • **Yes**: Configure this adapter. • **No**: Do not configure this adapter. **DefaultGatewayDevice**: • **Yes**: Configure this adapter as the main network adapter. • **No**: Do not configure this adapter as the main network adapter. **PrivateInterface**: • **Yes**: Configure this adapter as a private interface. **Yes** is required to configure interface as an IPv4 DHCP Server. • **No**: Do not configure this adapter as a private interface. **No** is required to configure interface as IPv4 static type.	The Activation Engine runs the default configuration if any invalid values are entered within the Ethernet adapter section or if multiple **Default Gateway Devices** are defined. Optional elements can be omitted from the configuration. At least one IPV4 or IPV6 configuration is required. If you do not specify an IP configuration, the Activation Engine uses the default configuration.
HostName	Optional element to define the network host name.	Any valid host name string.	If the element is not defined, the Activation Engine uses the default local host **HostName** value.
Domain	Optional element to define the network domain.	Any valid domain value (for example, **example.us.com**).	If the element is not defined, the Activation Engine uses the default empty **Domain** value.
DNSServers	Optional element to define the network DNS servers.	It is acceptable to have one DNS Server value or up to three valid IPv4 or IPv6 addresses that are separated by a comma. • Example 1: IPv4: 8.3.2.1 IPv6: 2001:4860:4860::8888 • Example 2: IPv4: 8.3.2.1,8.5.4.1 IPv6: 2001:4860:4860::8888,2001:4860:4860::8844 • Example 3: IPv4: 8.3.2.1,8.5.4.1,8.4.3.2 IPv6: 2001:4860:4860::8888,2001:4860:4860::8844, ::ffff:903:201	If the element is not defined, the Activation Engine uses the default empty **DNSServers** value.

Table 9. XML tags (continued)

Tags	Description	Acceptable values	Notes
IP4Config	Optional element to define IPv4 configuration settings.	**IPType**: Required element to define IPv4 configuration type. • **Static**: Configure this adapter by using static configuration. • **DHCP**: Configure this adapter by using DHCP configuration. • **DHCPServer**: Configure this adapter to be IPv4 DHCP server (requires **PrivateInterface** to be set to **Yes**). **IPAddress**: Optional element that is required only if **Static** or **DHCPServer** configuration is selected. • **Static Configuration**: Any valid IPv4 address value. • **DHCPServer Configuration**: Any DHCP server IP within the IP range. **Netmask**: Optional element that is required only if **Static** configuration is selected. • Any valid IPv4 netmask value. **Gateway**: Optional element that is required only if **Static** configuration is selected. • Any valid IPv4 netmask value.	
IP6Config	Optional element to define IPv6 configuration settings.	**IPType**: Required element to define IPv6 configuration type. • **Static**: Configure this adapter by using static configuration. • **DHCP**: Configure this adapter by using DHCP configuration. **IPAddress**: It is acceptable to have long or short form IPv6 format and long or short form IPv6 prefix. • Example 1: IPv6: 2001:4860:4860:0000:0000:0000:0000:8888 • Example 2: IPv6: 2001:4860:4860::8888 • Example 3: IPv6: 2001:4860:4860::8888/128 If no prefix is specified, the Activation Engine uses the default setting of /64 prefix. **Gateway**: • Any valid IPv6 address value.	

Table 9. XML tags (continued)

Tags	Description	Acceptable values	Notes
Firewall	Optional element to define firewall settings.	**PEGASUS**: • **Enabled**: Allows the PEGASUS ports to be open. • **Disabled**: Disables PEGASUS ports. **RPD**: • **Enabled**: Allows the RMC ports to be open. • **Disabled**: Disables RMC ports. **FCS**: • **Enabled**: Allows the FCS ports to be open. • **Disabled**: Disables FCS ports. **I5250**: • **Enabled**: Allows the 5250 ports to be open. • **Disabled**: Disables 5250 ports. **PING**: • **Enabled**: Allows the Ping port to be open. • **Disabled**: Disables Ping port. **L2TP**: • **Enabled**: Allows the L2TP ports to be open. • **Disabled**: Disables L2TP ports. **SLP**: • **Enabled**: Allows the SLP ports to be open. • **Disabled**: Disables SLP ports. **RSCT**: • **Enabled**: Allows the RSCT ports to be open. • **Disabled**: Disables RSCT ports. **SECUREREMOTEACCESS**: • **Enabled**: Allows the secure remote access ports to be open. • **Disabled**: Disables secure remote access ports. **SSH**: • **Enabled**: Allows the SSH port to be open. • **Disabled**: Disables SSH port.	

Table 9. XML tags (continued)

Tags	Description	Acceptable values	Notes
Firewall	Optional element to define firewall settings.	**NTP**: • **Enabled**: Allows the NTP ports to be open. • **Disabled**: Disables NTP ports. **SMNPTraps**: • **Enabled**: Allows the SMNP traps ports to be open. • **Disabled**: Disables SMNP traps ports. **SMNPAgents**: • **Enabled**: Allows the SMNP agents ports to be open. • **Disabled**: Disables SMNP agents ports.	

NTPServers	The **NTPServers** tag is needed if you want to configure up to five NTP servers within a HMC virtual appliance.	**NTPServers**: Accepts `<ntpparam ntpserver="server" ntpversion="version"/>`
		ntpparam:
		• **ntpserver**: Accepts any valid IPv4 or IPv6 values and valid host names.
		• **ntpversion**: Accepts 1-4 numeric value
		Example:
		`<NTPServers>`
		`  <ntpparam ntpserver=`
		`   "test.austin.ibm.com"`
		`   ntpversion="2"/>`
		`  <ntpparam`
		`ntpserver="192.168.34.1"`
		`   ntpversion="4"/>`
		`  <ntpparam`
		`ntpserver="::ffff:903:201"`
		`` ntpversion="3"/>` ``
		`</NTPServers>`	

Configuring the HMC

Learn how to set up your network connections, configure your HMC, complete postconfiguration steps, and upgrade and update your HMC.

Choosing network settings on the HMC

Learn about the network settings that you can use on the Hardware Management Console (HMC).

HMC network connections

Learn how the Hardware Management Console HMC can be used in a network.

You can use different types of network connections to connect your HMC to managed systems. For more information about how to configure the HMC to connect to a network, see "Configuring the HMC" on page 67. For more information about using the HMC on a network, see the following information:

Types of HMC network connections

Learn how to use the HMC remote management and service functions by using your network.

The HMC supports the following types of logical communications:

HMC to managed system

Used to perform most of the hardware management functions, in which HMC issues control function requests through the service processor of the managed system. The connection between the HMC and the service processor is sometimes referred to as the *service network*. This connection is required for managed system management.

HMC to logical partition

Used to collect platform-related information (hardware error events, hardware inventory) from the operating systems that are running on logical partitions, and to coordinate certain platform activities (dynamic LPAR, concurrent repair) with those operating systems. If you want to use service and error notification features, you must create this connection.

HMC to BMC

Note: The baseboard management controller (BMC) connection is applicable only to HMC model 7063-CR1.

Used to perform service and maintenance tasks. The BMC connection is used to load and maintain the HMC firmware on the system. This connection is required for access to the BMC on the HMC.

HMC to remote users

Provides remote users with access to HMC functions. Remote users can access the HMC in the following ways:

- By using the web browser to access all the HMC GUI functions remotely.
- By using Secure Socket Shell (SSH) to access the HMC command line functions remotely.
- By using a virtual terminal server for remote access to virtual logical partition consoles.

HMC to service and support

Used to transmit data, such as hardware error reports, inventory data, and microcode updates, to and from your service provider. You can use this communications path to make automatic service calls.

Your HMC can support up to four separate physical Ethernet interfaces, depending on the model. The stand-alone version of the HMC supports only three HMC interfaces, by using one integrated Ethernet adapter and up to two plug-in adapters. Use each of these interfaces in the following ways:

- One network interface can be used exclusively for HMC-to-managed system communications, which means that only the HMC and service processors of the managed systems would be on that network. One or more network interfaces can be used exclusively for HMC-to-managed system communications, which means that only the HMC and service processors of the managed systems are on that network. Even though the network interfaces into the service processors are encrypted for the Secure Sockets Layer (SSL) Protocol and password-protected, having a separate dedicated network can provide a higher level of security for these interfaces.
- An open network interface would typically be used for the network connection between the HMC and the logical partitions on the managed systems, for the HMC-to-logical partition communications. You can also use this open network interface to manage the HMC remotely.
- Optionally, you can use a third interface to connect to logical partitions and manage the HMC remotely. This interface can also be used as a separate HMC connection to different groups of logical partitions. For example, you might want to have an administrative LAN that is separate from the LAN on which all the usual business transactions are running. Remote administrators can access the HMC and other managed units by using this method. Sometimes the logical partitions are in different Network security domains, perhaps behind a firewall, and you might want to have different HMC network connections into each of those two domains.

Web browser requirements for HMC

The Hardware Management Console (HMC) version 9.1.0 is supported by Google Chrome version 57, Microsoft Internet Explorer (IE) version 11.0, Mozilla Firefox versions 45 and 52 Extended Support Release (ESR), and Safari version 10.1.

If your browser is configured to use an Internet proxy, a local IP addresses should be included in the exception list. Consult your network administrator for more information on the exception list. If you still need to use the proxy to get to the HMC, enable Use HTTP 1.1 through proxy connections under the Advanced tab in your Internet Options window.

Session cookies need to be enabled in order for ASMI to work when connected to HMC remotely. The asm proxy code saves session information and uses it. Follow the steps to enable the session cookies.

Enabling session cookies in Internet Explorer.

1. Select Tools and Click Internet Options
2. Select Privacy and Click Advanced
3. Ensure that the Always allow session cookies is checked. If not, select the Override automatic cookie handling and select Always allow session cookies.
4. Select Prompt under First-party Cookies and Third-party Cookies
5. Click OK.

Enabling session cookies in Firefox.

1. Select Tools and click Options
2. Click Cookies
3. Select Allow sites to set cookies.
4. Select Exceptions and add HMC.
5. Click OK.

Private and open networks in the HMC environment
The Hardware Management Console (HMC) can be configured to use open and private networks. Private networks allow the use of a selected range of nonroutable IP addresses. A *public*, or "open" network describes a network connection between the HMC to any logical partitions and to other systems on your regular network.

Private networks

The only devices on the HMC private network are the HMC itself and each of the managed systems to which that HMC is connected. The HMC is connected to each managed system's Flexible Service Processor (FSP).

On most systems, the FSP provides two Ethernet ports that are labeled **HMC1** and **HMC2**. You to connect up to two HMCs.

Some systems have a dual-FSP option. In this situation, the second FSP acts as a redundant backup. The basic setup requirements for a system with two FSPs are essentially the same as a system without a second FSP. The HMC must be connected to each FSP, so more network hardware is required (for example, a LAN switch or hub) when there is more than one FSP or multiple managed systems.

Note: Each FSP port on the managed system must be connected to only one HMC.

Public networks

The open network can be connected to a firewall or router for connecting to the internet. Connecting to the internet allows the HMC to call home when any hardware errors need to be reported.

The HMC itself provides its own firewall on each of its network interfaces. A basic firewall is automatically configured when you run the HMC Guided Setup wizard, but you customize your firewall settings after the initial HMC installation and configuration.

HMC as a DHCP server
You can use the Hardware Management Console (HMC) as a Dynamic Host Configuration Protocol (DHCP) server.

If you want to configure the first network interface as a private network, you can select from a range of IP addresses for the DHCP server to assign to its clients. The selectable address ranges include segments from the standard nonroutable IP address ranges.

In addition to these standard ranges, a special range of IP addresses is reserved for IP addresses. This special range can be used to avoid conflicts in cases where the HMC attached open networks are using one of the nonroutable address ranges. Based on the range that is selected, the HMC network interface on the private network is automatically assigned the first IP address of that range, and the service processors are then assigned addresses from the rest of the range.

The DHCP server in the HMC uses automatic allocation, which means that each unique service processor Ethernet interface is reassigned the same IP address each time it is started. Each Ethernet interface has a unique identifier that is based on a built-in Media Access Control (MAC) address, which allows the DHCP server to reassign the same IP parameters. You can configure both **eth0** and **eth1** HMC ports to serve DHCP addresses.You can configure both **eth0** and **eth1** HMC ports to serve DHCP addresses.

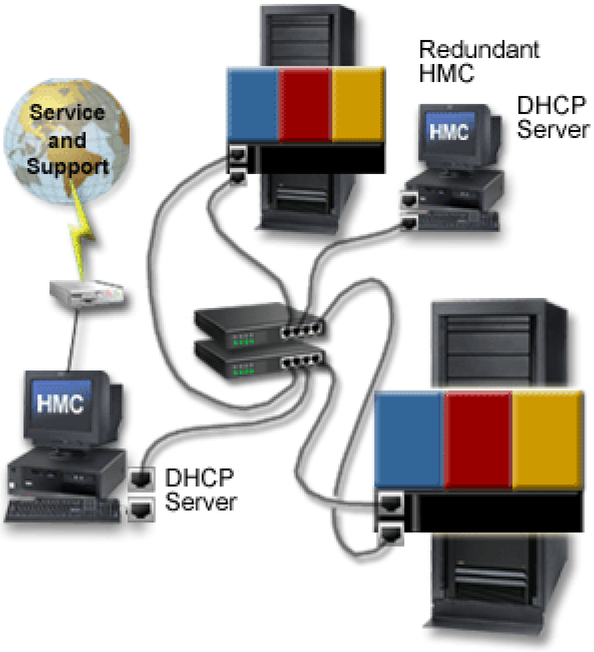

Figure 25. Private network with one HMC as a DHCP server

Note: If you are using IPv6, the discovery process must be done manually. For IPv6, automatic discovery is not available.

For more information about how to configure the HMC as a DHCP server, see "Configuring the HMC as a DHCP server" on page 75.

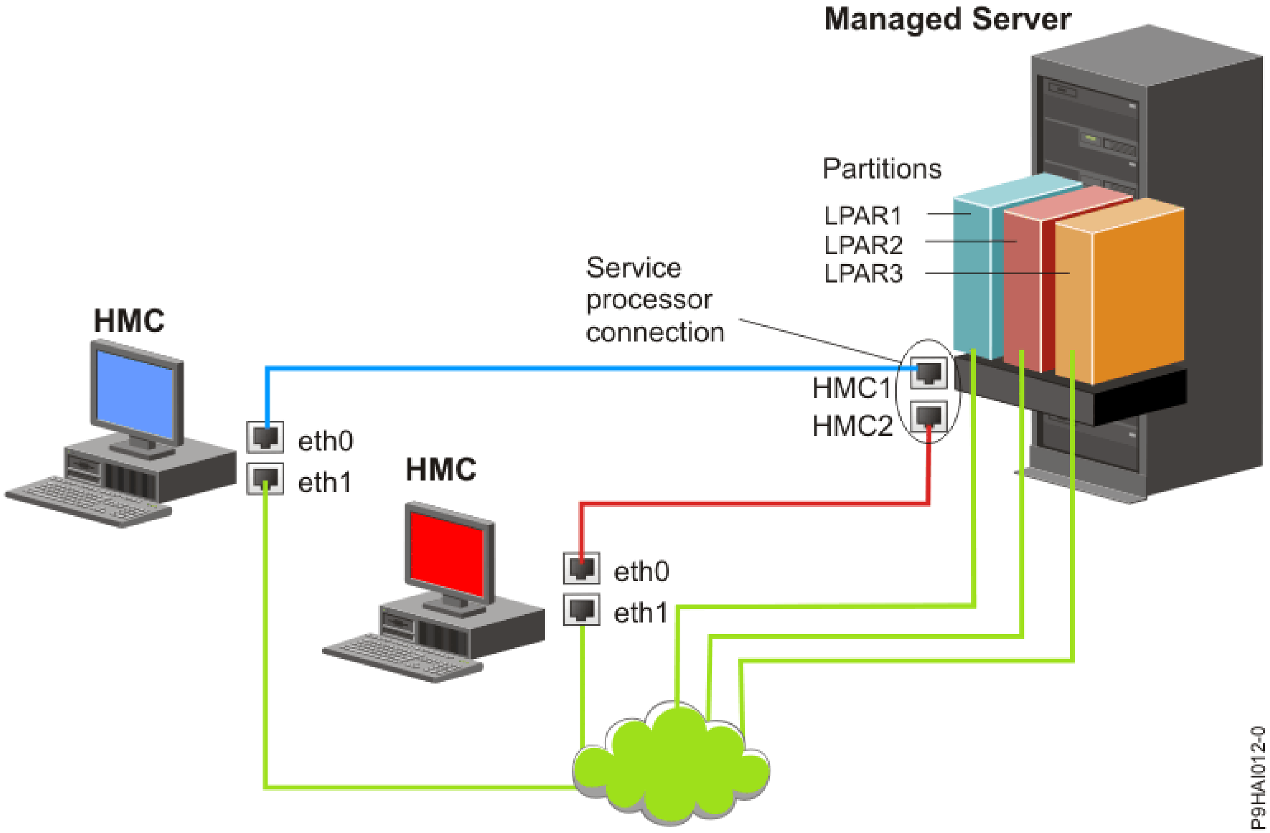
P9HAI011-0

This figure shows a redundant HMC environment with two managed systems. The first HMC is connected to the first port on each FSP, and the redundant HMC is connected to the second port on each HMC. Each HMC is configured as a DHCP server, by using a different range of IP addresses. The connections are on separate private networks. As such, it is important to ensure that no FSP port is connected to more than one HMC.

Each managed system's FSP port that is connected to an HMC requires a unique IP address. To ensure that each FSP has a unique IP address, use the HMC's built-in DHCP server capability. When the FSP detects the active network link, it issues a broadcast request to locate a DHCP server. When correctly configured, the HMC responds to that request by allocating one of a selected range of addresses.

If you have multiple FSPs, you must have your own LAN switch or hub for the HMC to FSP private network. Alternately, this private segment can exist as several ports in a private *virtual LAN* (VLAN) on a larger managed switch. If you have multiple private VLANs, you must ensure that they are isolated and without any crossover traffic.

If you have more than one HMC, you must also connect each HMC to the logical partitions, and to each other, on the same open network.



This figure shows two HMCs connected to a single managed server on the private network and to three logical partitions on the public network. You can have an extra Ethernet adapter for the HMC to have three network interfaces. You can use this third network as a management network or connect it to the CSM (Cluster Systems Manager) Management Server.

Deciding which connectivity method to use for the call-home server

Learn more about the connectivity options you have when you use the call-home server.

You can configure the Hardware Management Console (HMC) to send hardware service-related information to IBM by using a LAN-based internet connection, or a dial-up connection over a modem.

You have two communication choices when you configure the LAN-based internet connection. The first choice is to use standard Secure Sockets Layer (SSL). The SSL communication can be enabled to connect to the internet through your proxy server. SSL connectivity is more likely to be compliant with corporate security guidelines.

Note: If your open network interface connection uses only Internet Protocol Version 6 (IPv6), you cannot use internet VPN to connect to support. For more information about the protocols that are used, see "Choosing an Internet Protocol" on page 58.

The advantages to using an internet connection can include:

- Faster transmission speed
- Reduced customer expense (for example, the cost of a dedicated analog telephone line)
- Greater reliability

The following security characteristics are in effect, regardless of the connectivity method chosen:

- Remote Support Facility requests are always initiated from the HMC to IBM. An inbound connection is never initiated from the IBM Service Support System.
- All data that is transferred between the HMC and the IBM Service Support System are encrypted by using a high-grade encryption. Depending upon the connectivity method that is chosen, it is encrypted by using either SSL or IPSec Encapsulating Security Payload (ESP).

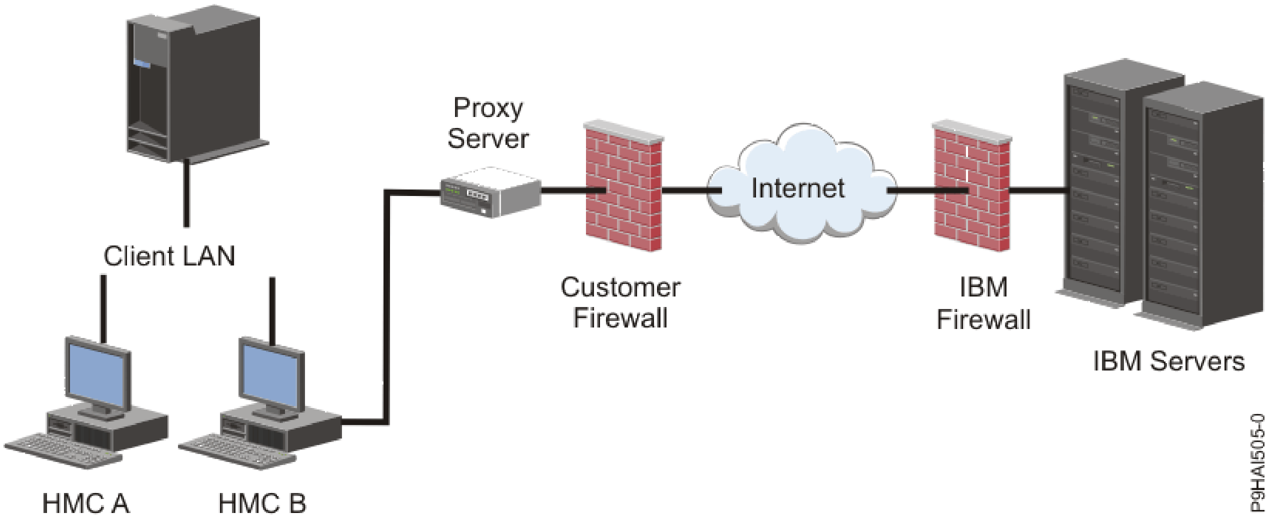
- When you initialize the encrypted connection, the HMC authenticates the target destination as the IBM Service Support System.

Data sent to the IBM Service Support System consists solely of information about hardware problems and configuration. No application or customer data is transmitted to IBM.

Using an indirect internet connection with a proxy server

If your installation requires the HMC to be on a private network, you might be able to connect indirectly to the internet by using an SSL proxy, which can forward requests to the internet. One of the other potential advantages of using an SSL proxy is that the proxy can support logging and audit facilities.

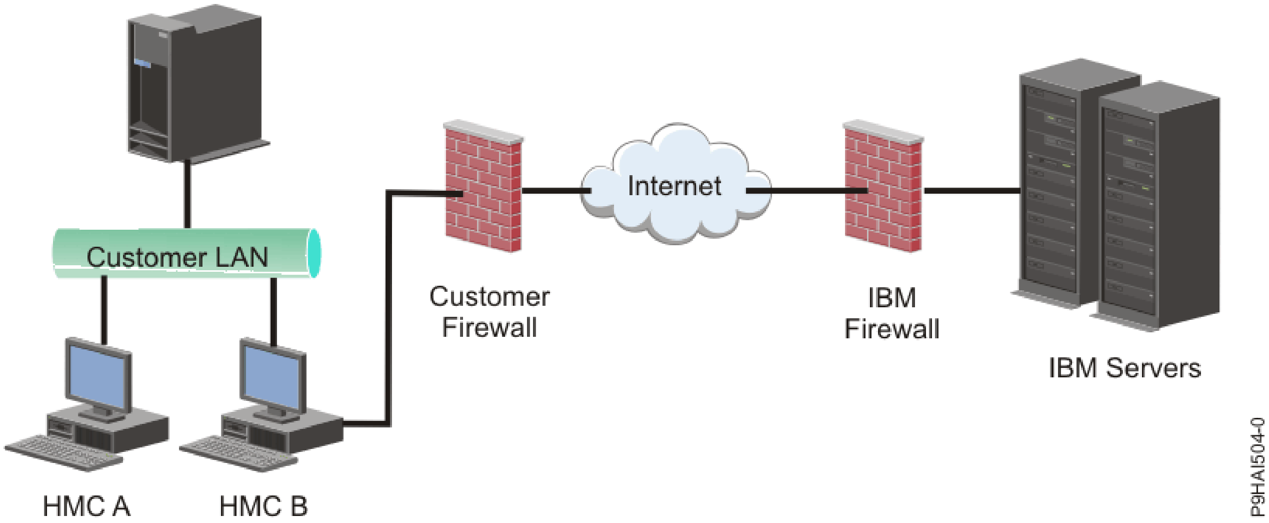
To forward SSL sockets, the proxy server must support the basic proxy header functions (as described in RFC 2616) and the CONNECT method. Optionally, basic proxy authentication (RFC 2617) can be configured so that the HMC authenticates before you attempt to forward sockets through the proxy server.



For the HMC to communicate successfully, the client's proxy server must allow connections to port 443. You can configure your proxy server to limit the specific IP addresses to which the HMC can connect. See "Internet SSL address lists" on page 58 for a list of IP addresses.

Using a direct internet SSL connection

If your HMC can be connected to the internet, and the external firewall can be set up to allow established TCP packets to flow outbound to the destinations described in "Internet SSL address lists" on page 58, you can use a direct internet connection.



Using internet SSL to connect to remote support

All the communications are handled through TCP sockets that are initiated by the Hardware Management Console (HMC) and use a high-grade SSL to encrypt the data that is transmitted. The destination TCP/IP addresses are published (see "Internet SSL address lists" on page 58) so that external firewalls can be configured to allow these connections.

Note: The standard HTTPS port 443 is used for all communications.

The HMC can be enabled to connect directly to the internet or to connect indirectly from a proxy server that is provided by the customer. The decision about which approach is best for your installation depends on the security and networking requirements of your enterprise. The HMC (directly or through the SSL proxy) uses the following addresses when it is configured to use internet SSL connectivity.

Choosing an Internet Protocol

Determine the IP address version that is used when the Hardware Management Console (HMC) connects to your service provider.

Most users use Internet Protocol Version 4 (IPv4) to connect to a service provider. IPv4 addresses appear in the format that represents the 4 bytes of the IPv4 address, which is separated by periods (for example, 9.60.12.123) to access the internet. You can also use Internet Protocol Version 6 (IPv6) to connect to a service provider. IPv6 is often used by network administrators to ensure unique address space. If you are unsure of the Internet Protocol used by your installation, contact your network administrator. For more information about using each version, see "Setting the IPv4 address" on page 101 and "Setting the IPv6 address" on page 101.

Internet SSL address lists

Learn about the addresses that the Hardware Management Console (HMC) uses when the HMC is using internet SSL connectivity.

The HMC uses the following IPv4 addresses to contact IBM service and support when it is configured to use internet SSL connectivity.

The following IPv4 addresses are for all locations:

- 129.42.26.224
- 129.42.42.224
- 129.42.50.224
- 129.42.56.216
- 129.42.58.216
- 129.42.60.216
- 170.225.15.41

The following IPv4 addresses are for the Americas:

- 129.42.160.48
- 129.42.160.49
- 207.25.252.197
- 207.25.252.200
- 207.25.252.204

The following IPv4 addresses are for all locations other than the Americas:

- 129.42.160.48
- 129.42.160.50
- 207.25.252.197
- 207.25.252.200
- 207.25.252.205

Note: When you configure a firewall to allow an HMC to connect to these servers, only the IP addresses specific to the geographic region are required.

The HMC uses the following IPv6 addresses to contact IBM service and support when it is configured to use internet SSL connectivity:

- 2620:0:6C0:1::1000
- 2620:0:6C2:1::1000
- 2620:0:6C4:1::1000

Using multiple call-home servers

Learn about what you need to know when you decide to use more than one call-home server.

To avoid a single point of failure, configure the Hardware Management Console (HMC) to use multiple call-home servers. The first available call-home server attempts to handle each service event. If the connection or transmission fails with this call-home server, the service request is retried by using the other available call-home servers until one is successful or all servers are tried.

The connected HMC that is identified by the problem analysis to be the primary analyzing console for a given managed system that reports the problem. This primary console also replicates the problem report to any secondary HMC. This secondary HMC must be recognized on the network by the primary HMC. A secondary HMC is recognized by the primary HMC as an extra call-home server when:

- The primary HMC is configured to use "discovered" call-home servers and the call-home server is either on the same subnet as the primary HMC or it manages the same system.
- The call-home server is manually added to the list of call-home server consoles available for outbound connectivity.

Preparing for HMC configuration

Learn about the required configuration settings that you need to know before you begin the configuration steps.

To configure the HMC, you must understand the related concepts, make decisions, and prepare information.

Learn about the information that you need to connect your HMC to the following locations:

- Service processors in your managed systems
- Logical partitions on those managed systems
- Remote workstations
- IBM Service to implement “call-home” functions

To prepare for HMC configuration, complete the following steps:

1. Obtain and install the latest level of the HMC code version you want to install.
2. Determine the physical location of the HMC in relation to the servers it manages. If the HMC is more than 25 feet from its managed system, you must provide web browser access to the HMC from the managed system's location so that service personnel can access the HMC.
3. Identify the servers that the HMC manages.
4. Determine whether you use a private or an open network to manage servers. If you decide to use a private network, use DHCP, unless you are using a Cluster Systems Management (CSM) configuration. CSM does not support IPv6. To access CSM, you must have two networks. For more information about CSM, see the documentation that was provided with that feature. For more information about private and open networks, see “Selecting a private or open network” on page 74.
5. If you use an open network to manage an FSP, you must set the FSP's address manually through the Advanced System Management Interface menus. A private, non-routable network is recommended.
6. If you have two HMCs, designate a primary and secondary HMC. The primary HMC needs be physically closer to the system, and must be the HMC that is configured to call home.

7. Determine the network settings that you need to connect the HMC to remote workstations, logical partitions, and network devices.
8. Define how the HMC calls home. Call home options include either over an outbound-only Secure Socket Layer (SSL) internet connection, a modem, or a Virtual Private Network (VPN) connection.
9. Determine the HMC users that you create and their passwords, as well which roles they are given. You must assign the **hscroot** and **hscpe** users a password.
10. Document the following company contact information that is needed when you configure call home:
    - Company name
    - Administrator contact
    - Email address
    - Telephone numbers
    - Fax numbers
    - The street address of the HMC's physical location
11. If you plan to use email to notify operators or systems administrators when information is sent to IBM Service through call-home, identify the Simple Mail Transfer Protocol (SMTP) server and the email addresses you use.
12. You must define the following passwords:
    - The access password that is used to authenticate the HMC to the FSP.
    - The ASMI password that is used for the **admin** user.
    - The ASMI password that is used for the **general** user.

    Create the passwords when you connect from the HMC to a new server for the first time. If the HMC is a redundant or second HMC, obtain the HMC User password and be prepared to enter it when you connect the first time to the managed server's FSP.

When you complete these preparation steps, complete the "Preinstallation configuration worksheet for the HMC" on page 60.

Preinstallation configuration worksheet for the HMC

Use this worksheet to have the installation information you need ready for the installation.

Improved password policy for HMC

You must set a new password on the first use for newly manufactured systems with HMC version 9.940.0, or later, and after a factory reset of the system. This policy change helps to enforce that the HMC is not left in a state with a well-known password.

With HMC Version 9.940.0, and later, the `hscroot` password is expired and must be changed before you can access the functions of the HMC. For more information on how to change the password, see https://www.ibm.com/support/knowledgecenter/POWER9/p9eh6/p9eh6_useridsandpassword.htm. However, if you are upgrading from a previous HMC level or an operational installation, you do not have to change the password.

Network Settings

LAN Interface: Choose the available adapters (such as eth0, eth1) that is used by this HMC to connect to managed systems, logical partitions, service and support, and remote users. For more information, see "HMC network connections" on page 51. Connectivity from the HMC can either be on a private or open network.

Ethernet Adapter Speed and Duplex

Enter the wanted Ethernet adapter speed and duplex mode. The autodetection option determines which option is optimal if you are not sure which speed and duplex would produce optimum results for your hardware. Default = Autodetection Media speed specifies the speed in duplex mode of an

Ethernet adapter. Select Autodetection unless you need to specify a fixed media speed. Any device that is connected to the FSP (switches/HMC), must be set to Auto (Speed) / Auto (Duplex) mode, as it is the default FSP setting and cannot be changed.

Table 10. Ethernet Adapter Speed and Duplex

Characteristic	**eth0**	**eth1**	**eth2**	**eth3**
Select speed and duplex mode				
Media speed (Autodetection, 10/100/1000 Full/ Half Duplex)				

For more information about private and open networks, see "Private and open networks in the HMC environment" on page 53.

Table 11. Private or Open network

Characteristic	**eth0**	**eth1**	**eth2**	**eth3**
Specify **Private** or **Open** network for each adapter.				

Dynamic Host Configuration Protocol (DHCP) provides an automated method for dynamic client configuration. You can specify this HMC as a DHCP server. If this is the first or only HMC on the private network, enable the HMC as a DHCP server. When you enable the HMC as a DHCP server, the managed systems on the network are automatically configured and discovered by the HMC.

For Ethernet adapters specified as Private networks, complete the following table:

Table 12. DHCP server

Characteristics	**eth0**	**eth1**
Do you want to specify this HMC as a DHCP server? (yes/no)		
If yes, record the IP address range you want to use.		

If you are using the 7063-CR2 HMC, you must connect the Ethernet **IPMI** port to a network to access the baseboard management controller (BMC) on the HMC. For more information, see "Configure BMC connectivity (7063-CR2)" on page 100. Complete the following table for your BMC connection.

Table 13. BMC connection

Characteristics	**IPMI**
Do you want to configure this connection through DHCP mode? (yes/no)	
If no, list the specified static addresses below:	
IP address:	
Subnet mask:	
Gateway:	

If you are using the 7063-CR1 HMC, you must connect the Ethernet **IPMI** port to a network to access the baseboard management controller (BMC) on the HMC. For more information, see "Configure BMC connectivity (7063-CR1)" on page 100. Complete the following table for your BMC connection.

Table 14. BMC connection

Characteristics	IPMI
Do you want to configure this connection through DHCP mode? (yes/no)	
If no, list the specified static addresses below:	
IP address:	
Subnet mask:	
Gateway:	

For Ethernet adapters specified as *open* networks, complete the following tables. For more information about the different Internet Protocol versions, see "Configuring the HMC network types" on page 70.

Using IPv6

If you are using IPv6, talk to your network administrator and decide how you want to obtain IP addresses. Then, complete the following tables:

Table 15. IPv6 (static)

Characteristic	eth0	eth1	eth2	eth3
Are you using a statically assigned IP address? If yes, record that address here.				

Table 16. IPv6 (DHCP server)

Characteristic	eth0	eth1	eth2	eth3
Are you getting IP addresses from a DHCP server? (Yes/No)				

Table 17. IPv6 (IPv6 router)

Characteristic	eth0	eth1	eth2	eth3
Are you getting IP addresses from an IPv6 router?				

For more information about setting IPv6 addresses, see "Setting the IPv6 address" on page 101. For more information about using only IPv6 addresses, see "Using only IPv6 addresses" on page 101.

Using IPv4

Complete the following tables for Ethernet adapters that are specified as open networks by using IPv4.

Table 18. IPv4

Characteristics	eth0	eth1	eth2	eth3
Do you want to obtain an IP address automatically? (yes/no)				
If no, list the specified address below:				
TCP/IP Interface Address:				
TCP/IP Interface Network Mask:				
Firewall Settings:				
Would you like to configure HMC firewall settings? (yes/no)				
If yes, list the applications and IP addresses that must be allowed through the firewall:				

TCP/IP information
A unique TCP/IP address is required for each node, both for Support Element (SE) and Hardware Management Console (HMC). The assigned network mask is used to generate a unique address, by default, for the local private LAN. If the nodes are connected into a larger network with an administered TCP/IP address, you can specify the TCP/IP address to be used. The default is generated by the system.

Firewall settings
HMC firewall settings create a security barrier that allows or denies access to specific network applications on the HMC. You can specify these control settings individually for each physical network interface, enabling you control over which HMC network applications can be accessed on each network.

If you configure at least one adapter as an Open network adapter, you must provide the following additional information to enable your HMC to access the LAN:

Table 19. Open network adapter

Local host information	
HMC host name:	
Domain name:	
Description of HMC:	
Gateway information	
Gateway Address: (nnn.nnn.nnn.nnn)	
Gateway device:	
DNS enablement	

Table 19. Open network adapter (continued)

Local host information	
Do you want to use DNS? (yes/no)	
If “yes”, specify DNS Server Search Order below:	
1.	
2.	
Domain suffix search order:	
1.	
2.	

Local Host information
To identify your Hardware Management Console (HMC) to the network, enter the HMC's host name and domain name. Unless you are using only short host names on your network, enter a fully qualified host name. Domain name example: name.yourcompany.com

Gateway information
To define a default gateway, complete the TCP/IP address to be used for routing IP packets. The gateway address informs each computer or network device when to send data if the target station is not on the same subnet as the source.

DNS Enablement
The Domain Name System (DNS) is used to provide a standard naming convention for locating IP-based computers. By defining DNS servers, you can use host names to identify servers and Hardware Management Consoles (HMCs) rather than IP addresses.

DNS Server Search Order
Enter the IP addresses of DNS servers to be searched for mapping the host names and IP addresses. This search order is available only when DNS is enabled.

Domain Suffix Search Order
Enter the domain suffixes you are using. The HMC uses domain suffixes to append to unqualified names for DNS searches. Suffixes are searched in the order in which they are listed. This search order is available only when DNS is enabled.

Email notification

List email contact information if you want to be notified by email when hardware problem events occur on your system.

Table 20. Email notification

Characteristics	**Entry field**
Email Addresses:	
SMTP server:	
Port:	
Errors to be notified:	
Only call-home problem events	
All problem events	

SMTP server
Type the simple mail transfer Protocol (SMTP) address of the server to be notified of a system event. An example of an SMTP server name is `relay.us.ibm.com`.

SMTP is the Protocol that is used to send email. When you use SMTP, a client sends a message and communicates with the SMTP server by using the SMTP Protocol.

If you do not know the SMTP address of your server or are not sure, contact your network administrator.

Port
Type the port number of the server to be notified of a system event, or use the default port.

Email addresses to be notified
Enter configured email addresses to be notified when a system event occurs.

- Select **Only call-home problem events** to receive notification only when events occur that create a call-home function.
- Select **All problem events** to receive notification when any events occur.

Service contact information

Table 21. Service contact information

Characteristics	Entry field
Company name	
Administrator name	
Email address	
Phone number	
Alternative phone number	
Fax number	
Alternative phone number	
Street address	
Street address 2	
City or locality	
State	
Postal code	
Country or region	
Location of HMC (if same as above administrator address, specify "same"):	
Street address	
Street address 2	
City or locality	
State	
Postal code	
Country or region	

Service authorization and connectivity

Select the type of connection to contact your service provider. For a description of these methods that include security characteristics and configuration requirements, see "Choosing existing call-home servers to connect to service and support for this HMC" on page 107.

Table 22. Service authorization and connectivity

Characteristics	Entry field
Secure Sockets Layer (SSL) through the internet	_____
Virtual private network (VPN) through the internet	_____

Secure Sockets Layer (SSL) through the internet:

If you have an existing internet connection from your HMC, you can use it to call your service provider. You can connect directly to your service provider by using encrypted Secure Sockets Layer (SSL) by using the existing internet connection. Select **Use SSL Proxy** if you want to configure the use of encrypted SSL by using an indirect connection that uses an SSL Proxy.

Table 23. SSL

Characteristics	Entry field
Use SSL proxy? (yes/no)	
If yes, list information below:	
Address:	
Port:	
Authenticate with the SSL Proxy?	
If yes, list information below:	
User:	
Password:	

Internet connection Protocol used

For more information about the different internet Protocols, see "Configuring the HMC network types" on page 70.

___ IPv4

___ IPv6

___ IPv4 and IPv6

Virtual Private Network (VPN)

If you have an existing internet connection from your HMC, you can use it to call your service provider. You can connect directly to your service provider by virtual private network (VPN) by using the existing internet connection.

Note: If you select Virtual Private Network (VPN) through the internet, you cannot select any other options.

Call-home servers

Determine which HMCs you want to configure to connect to service and support as call-home servers. For more information about using multiple call-home servers, see "Using multiple call-home servers" on page 59.

___ This HMC

___ Another HMC

If you checked **Another HMC**, list the other HMCs that are configured as call-home servers here:

Table 24. Other HMCs that are configured as call-home servers

List of HMC host names or IP addresses that are configured as call-home servers

Extra Support Benefits

My Systems and Premium Search

Table 25. My Systems and Premium Search

Characteristics	**Entry field**
List your IBM ID	__________________________
List any additional IBM IDs	__________________________

To access valuable, customized support information in the My Systems and Premium Search sections of the Electronic Services website, Customers must register their IBM ID with this system. If you do not already have one, you can register for an IBM ID at: www.ibm.com/account/profile.

Note: IBM provides personalized web functions that use information that is collected by the IBM Electronic Service Agent application. To use these functions, you must first register on the IBM Registration website at http://www.ibm.com/account/profile.

To authorize users to use the Electronic Service Agent information to personalize the web functions, enter your IBM ID that you registered on the IBM Registration website. Go to http://www.ibm.com/support/electronic to see the valuable support information available to customers that register an IBM ID with their systems.

Configuring the HMC

Learn how to configure network connections, security, service applications, and some user preferences.

Depending on the level of customization you intend to apply to your HMC configuration, you have several options for setting up your HMC to suit your needs. The Guided Setup wizard is a tool on the HMC designed to ease the setup of the HMC. You can choose a fast path through the wizard to quickly create the recommended HMC environment, or you can choose to fully explore the available settings that the wizard guides you through. You can also perform the configuration steps without the aid of the wizard by Configuring the HMC by using the HMC menus.

Before you start, gather the required configuration information that you need to complete the steps successfully. See "Preparing for HMC configuration" on page 59 for a list of the required information. When you are finished preparing, ensure that you complete the "Preinstallation configuration worksheet for the HMC" on page 60 and then return to this section.

Configuring the HMC by using the menus

This section provides a complete list of all HMC configuration tasks, guiding you through the process of configuring your HMC. Choose this option if you prefer not to use the Guided Setup wizard.

You must restart your HMC for the configuration settings to take effect, so you might want to print this checklist and keep it with you as you configure your HMC.

This information contains references to tasks that are not included in this document. You can access the IBM Power Systems hardware information on the HMC or on the Web. On the HMC, IBM Knowledge Center can be accessed from the upper-right corner of the task bar. On the web, IBM Knowledge Center can be accessed at https://www.ibm.com/support/knowledgecenter.

This information contains references to tasks that are not included in this PDF. You can access additional support materials by referring to the **Additional Resources** section on the HMC Welcome page.

Prerequisites

Before you begin configuring the HMC using the HMC menus, be sure to complete the configuration preparation activity described in "Preparing for HMC configuration" on page 59.

Table 26. Manual HMC configuration tasks and where to find related information

Task	Where to find related information
1. Start the HMC.	"Starting the HMC" on page 69
2. Set the date and time.	
3. Change predefined passwords.	
4. Create additional users and return to this checklist when you have completed this step.	
5. Configure network connections.	"Configuring the HMC network types" on page 70
6. For HMC model 7063-CR1, you must configure the baseboard management controller (BMC) IP address.	"Configure BMC connectivity (7063-CR1)" on page 100
7. If you are using an open network and a fixed IP address, set identification information.	
8. If you are using an open network and a fixed IP address, configure a routing entry as the default gateway.	"Configuring a routing entry as the default gateway" on page 103
9. If you are using an open network and a fixed IP address, configure domain name services.	"Configuring domain name services" on page 103
10. If you are using a fixed IP address and have DNS enabled, configure domain suffixes.	"Configuring domain suffixes" on page 104
11. Configure your server to connect to IBM service and support and return to this checklist when you have completed this step.	"Configuring the local console to report errors to service and support" on page 106
12. Configure the Events Manager for Call Home.	"Configuring the Events Manager for Call Home" on page 109
13. Connect the managed system to a power source.	
14. Set passwords for the managed system, and each of the ASMI passwords (general and admin)	"Setting passwords for the managed system" on page 110
15. Access ASMI to set the date and time on the managed system.	
16. Start the managed system and return to this checklist when you have completed this step.	
17. Ensure that you have one logical partition on the managed system.	
18. Optional: add another managed system and return to this checklist when you have completed this step.	

Table 26. Manual HMC configuration tasks and where to find related information (continued)

Task	Where to find related information
19. Optional: If you are installing a new server with your HMC, configure the logical partitions and install the operating system.	
20. If you are not installing a new server at this time, perform optional postconfiguration tasks to further customize your configuration.	"Postconfiguration steps" on page 111

Starting the HMC

You can long in to the HMC and choose which language you want to be displayed in the interface. Use the default User ID `hscroot` and password `abc123` to log on to the HMC for the first time.

About this task

To start the HMC, do the following procedure:

Procedure

1. Turn on the HMC by pressing the power button.
2. If English is your language preference, continue with step 4.

   If your language preference is a language other than English, type the number **2** when you are prompted to change the locale.

   Note: This prompt times out in 30 seconds if you do not act.
3. Select the locale that you want to display from the list in the **Locale Selection** window, and click **OK**. The locale identifies the language that the HMC interface uses.
4. Click **Log on and launch the Hardware Management Console web application**.
5. Log in to the HMC with the following default user ID and password:

   ID: `hscroot`
   Password: `abc123`

   HMC Enhanced
   Displays the newer enhanced GUI with the enhanced PowerVM features.

   HMC Classic
   Displays the standard GUI without the enhanced PowerVM features.

   Note: When the HMC is working as a DHCP server, the HMC uses the default password when it connects to the service processor for the first time.
6. Press Enter.

Changing the date and time

The battery-operated clock keeps the date and time for the Hardware Management Console (HMC). You might need to reset the console date and time if the battery is replaced, or if you physically move your system to a different time zone. Learn how to change the date and time for the HMC.

About this task

If you change the date and time information, the change does not affect the systems and logical partitions that the HMC manages.

To change the date and time for the HMC, complete the following steps:

Procedure

1. Ensure that you are a member of one of the following roles:
   - Super administrator
   - Service representative
   - Operator
   - Viewer
2. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
3. In the content pane, click **Change Date and Time**.
4. If you select **UTC** in the **Clock** field, the time setting adjusts automatically for Daylight Saving Time in the time zone you select. Enter the date, time, and time zone, and click **OK**.

Results

Configuring the HMC network types

Configure your HMC so that it can communicate to the managed system, logical partitions, remote users, and service and support.

Configuring HMC settings to use an open network to connect to the managed system

Configure the HMC so that it can connect to and manage a managed system using an open network.

Before you begin

To configure the HMC network settings so that it can connect to the managed system using an open network, do the following:

Table 27. Configuring HMC settings to use an open network to connect to the managed system

Task	**Where to find related information**
1. Decide which interface you want to use for your managed system. **eth0** is preferred.	“Preinstallation configuration worksheet for the HMC” on page 60
2. Identify the Ethernet ports for your HMC.	“Identifying the Ethernet port that is defined as eth0” on page 73
3. Configure the Ethernet adapter by performing the following tasks:	
a. Set the media speed.	“Setting the media speed” on page 74
b. Select the open network type.	“Selecting a private or open network” on page 74
c. Set static addresses.	“Setting the IPv6 address” on page 101
d. Set the firewall.	“Changing HMC firewall settings” on page 102
e. Configure the default gateway.	“Configuring a routing entry as the default gateway” on page 103
f. Configure DNS.	“Configuring domain name services” on page 103
4. Configure additional adapters, if you have them.	
5. Test the connection between the managed server and the HMC.	“Testing the connection between the HMC and the managed system” on page 111

Configuring HMC settings to use a private network to connect to the managed system
Configure the HMC so that it can connect to and manage a managed system using a private network.

Before you begin

To configure the HMC network settings so that it can connect to the managed system using a private network, do the following:

Table 28. Configuring HMC settings to use a private network to connect to the managed system

Task	Where to find related information
1. Decide which interface you want to use for your managed system.	"Preinstallation configuration worksheet for the HMC" on page 60
2. Identify the Ethernet ports for your HMC.	"Identifying the Ethernet port that is defined as eth0" on page 73
3. Configure the HMC as a DHCP server.	"Configuring the HMC as a DHCP server" on page 75
4. Test the connection between the managed server and the HMC.	"Testing the connection between the HMC and the managed system" on page 111

Configuring HMC settings to use an open network to connect to logical partitions

Before you begin

To configure the HMC network settings so that it can connect to logical partitions using an open network, do the following:

Table 29. Configuring HMC settings to use an open network to connect to logical partitions

Task	Where to find related information
1. Decide which interface you want to use for your managed system.	"Preinstallation configuration worksheet for the HMC" on page 60
2. Identify the Ethernet ports for your HMC.	"Identifying the Ethernet port that is defined as eth0" on page 73
3. Configure the Ethernet adapter by performing the following tasks:	
a. Set the media speed.	"Setting the media speed" on page 74
b. Select the open network type.	"Selecting a private or open network" on page 74
c. Set static addresses.	"Setting the IPv6 address" on page 101
d. Set the firewall.	"Changing HMC firewall settings" on page 102
e. Configure the default gateway.	"Configuring a routing entry as the default gateway" on page 103
f. Configure DNS.	"Configuring domain name services" on page 103
4. Configure additional adapters, if you have them.	
5. Test the connection between the managed server and the HMC.	"Testing the connection between the HMC and the managed system" on page 111

Configuring HMC settings to use an open network to connect to remote users

Before you begin

To configure the HMC network settings so that it can connect to remote users using an open network, do the following:

Table 30. Configuring HMC settings to use an open network to connect to remote users

Task	Where to find related information
1. Decide which interface you want to use for your managed system.	"Preinstallation configuration worksheet for the HMC" on page 60
2. Identify the Ethernet ports for your HMC.	"Identifying the Ethernet port that is defined as eth0" on page 73
3. Configure the Ethernet adapter by performing the following tasks:	
a. Set the media speed.	"Setting the media speed" on page 74
b. Select the open network type.	"Selecting a private or open network" on page 74
c. Set static addresses.	"Setting the IPv6 address" on page 101
d. Set the firewall.	"Changing HMC firewall settings" on page 102
e. Configure the default gateway.	"Configuring a routing entry as the default gateway" on page 103
f. Configure DNS.	"Configuring domain name services" on page 103
g. Configure suffixes.	"Configuring domain suffixes" on page 104
4. Configure additional adapters, if you have them.	

Configuring HMC call-home server settings

Before you begin

To configure the HMC call-home server settings so that problems can be reported, do the following:

Table 31. Configuring HMC call-home server settings

Task	Where to find related information
1. Be sure you have all the required customer information	"Preinstallation configuration worksheet for the HMC" on page 60
2. Configure this HMC to report errors or choose an existing call-home server to report errors	"Configuring the local console to report errors to service and support" on page 106 "Choosing existing call-home servers to connect to service and support for this HMC" on page 107
3. Verify that your call-home configuration is working	"Verifying that your connection to service and support is working" on page 108
4. Authorize users to view collected system data	"Authorizing users to view collected system data" on page 108
5. Schedule transmission of system data	"Transmitting service information" on page 109

Identifying the Ethernet port that is defined as eth0
Your Ethernet connection to the managed server must be made by using the Ethernet port that is defined as `eth0` on your HMC.

If you did not install any additional Ethernet adapters in the PCI slots on your HMC, then the primary-integrated Ethernet port is always defined as `eth0` or `eth1` on your HMC, if you intend to use the HMC as a DHCP server for your managed systems.

If you install extra Ethernet adapters in the PCI slots, then the port that is defined as `eth0` depends on the location and type of Ethernet adapters that are installed.

Note: The following general rules might not apply for all configurations.

The following table describes the rules for Ethernet placement by HMC type.

Table 32. HMC types and associated rules for Ethernet placement

HMC type	**Rules for Ethernet placement**
Rack-mounted HMCs with two integrated Ethernet ports.	The HMC supports only one extra Ethernet adapter. • If an extra Ethernet adapter is installed, then that port is defined as `eth0`. In this case, the primary-integrated Ethernet port is then defined as `eth1`, and the secondary integrated Ethernet port is defined as `eth2`. • If the Ethernet adapter is a dual port Ethernet adapter, then the port that is labeled Act/Link A is `eth0`. The port that is labeled `Act/link B` is `eth1`. In this case, the primary-integrated Ethernet port is then defined as `eth2`, and the secondary integrated Ethernet port is defined as `eth3`. • If no adapters are installed, then the primary-integrated Ethernet port is defined as `eth0`.
Stand-alone models with a single integrated Ethernet port.	The definitions depend upon the type of Ethernet adapter that is installed: • If only one Ethernet adapter is installed, then that adapter is defined as `eth0`. • If the Ethernet adapter is a dual port Ethernet adapter, then the port that is labeled `Act/link A` is `eth0`. The port that is labeled `Act/link B` would be `eth1`. In this case, the primary-integrated Ethernet port is then defined as `eth2`. • If no adapters are installed, then the integrated Ethernet port is defined as `eth0`. • If multiple Ethernet adapters are installed, see "Determining the interface name for an Ethernet adapter" on page 73.

Determining the interface name for an Ethernet adapter
If you configure the HMC as a DHCP server, that server can operate only on the network interface card (NIC) connectors that the HMC identifies as `eth0` and `eth1`. You might also need to determine which NIC

connector you need to plug the Ethernet cable into. Learn more about determining which NIC connectors the HMC identifies as `eth0` and `eth1`.

About this task

To determine the name the HMC has assigned to an Ethernet adapter, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon, and then select **Console Settings**.
2. In the content pane, click **Change Network Settings**.
3. From the **Change Network Settings** window, click the **LAN adapters** tab. The following example entry shows that this Ethernet port is identified as `eth0`: `Ethernet eth0 52:54:00:fa:b6:8e (<IP address of HMC>)`.
4. Record your results. If you need to view or change the LAN adapter settings, click **Details**.
5. Click **OK**.

Setting the media speed
Learn how to specify the media speed that includes the speed and duplex mode of the Ethernet adapter.

Before you begin

The default for the HMC adapter settings is **Autodetection**. If this adapter is connected to a LAN switch, you must match the switch port settings. To set the media speed and duplex, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon, and then select **Console Settings**.
2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. In the local area network (LAN) information section, select **Autodetection** or the appropriate media speed and duplex combination.
6. Click **OK**.

Selecting a private or open network
A *private service network* consists of the Hardware Management Console (HMC) and the managed systems. A private service network is restricted to consoles and the systems they manage, and is separate from your company network. An *open network* consists of your private service network and your company network. An open network might contain network endpoints in addition to consoles and managed systems, and might span across multiple subnets and network devices.

About this task

To select a private or public network, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon, and then select **Console Settings**.

2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. Click the **LAN Adapter** tab.
6. In the local area network information page, select **Private** or **Open**.
7. Click **OK**.

Configuring the HMC as a DHCP server
Dynamic Host Configuration Protocol (DHCP) provides an automated method for dynamic client configuration.

To configure the Hardware Management Console (HMC) as a DHCP server, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change network settings**. The Customize Network Settings window opens.
3. Select the LAN adapter that you want to work with and click **Details**.
4. Select **Private** and then select the network type.
5. In the DHCP Server section, select **Enable DHCP Server** to enable the HMC as a DHCP server.

   Note: You can configure the HMC to be a DHCP server only on a private network. If you use an open network, the option to select the **Enable DHCP** is not available.
6. Enter the address range of the DHCP server.
7. Click **OK**.

If you configured your HMC to be a DHCP server on a private network, you must verify that your HMC DHCP private network is configured correctly. For information about connecting your HMC to a private network, see “Selecting a private or open network” on page 74.

For more information, see “ HMC as a DHCP server” on page 54.

Managing the system by using OpenBMC-based HMC (7063-CR2)
IBM Power Systems servers use a baseboard management controller (BMC) for system service management, monitoring, maintenance, and control. The BMC also provides access to the system event log files (SEL). The BMC is a specialized service processor that monitors the physical state of the system by using sensors. A system administrator or service representative can communicate with the BMC through an independent connection. The OpenBMC tool provides a communication method to the BMC, by using a command-line interface. The OpenBMC tool can be used either from a remote Linux system, or from the host operating system console window. The OpenBMC tool can be connected remotely to the BMC by using a configured Ethernet port. You can connect your server to a monitor by using the VGA port at the rear of the server.

Managing the system by using the OpenBMC tool
Learn how to configure and manage your system by using the OpenBMC tool.

Downloading and installing the OpenBMC tool
Learn how to download and install the OpenBMC tool.

About this task

To download and install the OpenBMC tool, complete the following steps:

Procedure

1. Go to the IBM Support Portal.
2. In the search field, type: `Scale-out LC System Event Log Collection Tool`.

3. Click the **Scale-out LC System Event Log Collection Tool** entry and follow the instructions to install and run the OpenBMC tool.

Basic commands and functionality of the OpenBMC tool
The OpenBMC tool provides support for working with system event logs, updating system firmware, identifying the system, powering off the system, and other service-related functions.

OpenBMC tool top-level options
Learn more about the top-level options for the OpenBMC tool commands.

About this task

- `-H`: Host name or IP address of the BMC.
- `-U`: User name to log in with.
- `-A`: Provides a prompt to ask for the password.
- `-P`: Password for the user name.
- `-j`: Change output format to JSON.
- `-t`: Location of the policy table to use.
- `-T`: Provides time statistics for logging in, running the command, and logging out.
- `-V`: Displays current version of the OpenBMC tool.

System event log commands
Learn more about system event log commands for the OpenBMC tool.

Procedure

- To print a list of the system event logs in a readable format, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  sel print
  ```
- To list the system event logs in raw data, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  sel list
  ```
- To change the status of a system event log to resolved, use the following command:

  `openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> sel resolve -n x`, where *x* is the system event log number.
- To collect all service data including system event logs, use the following command:

  `openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> collect_service_data`.
- To clear gard records for disable hardware, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  gardclear
  ```
- To clear the alert logs of entries, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  sel clear
  ```

System firmware update command
Learn more about the system firmware update command.

Procedure

- To update the system firmware, use the following command:

`openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> firmware flash <bmc or pnor> -f xxx.tar`, where *bmc* or *pnor* is the type of image you wish to flash to the system.

Note: If you are not in the same folder as the TAR file, you must include the full path to the folder where the file resides.

- To activate a firmware image that is available in the BMC, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
firmware activate <firmware image ID>
```

System identify commands
Learn more about the system identify commands.

Procedure

- To activate the blue system identify LED, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
chassis identify on
```

- To turn off the blue system identify LED, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
chassis identify off
```

- To check the status of the blue system identify LED, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
chassis identify status
```

System power on and power off commands
Learn more about the system power on and power off commands.

Procedure

- To check the power status of the system, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
chassis power status
```

- To power on the system, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
chassis power on
```

- To power off the system normally, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
chassis power softoff
```

- To power off the system immediately, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
chassis power hardoff
```

System sensor commands
Learn more about the system sensor commands.

Procedure

- To display a list of all monitoring sensors, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
sensors print
```

or

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
sensors list
```

System FRU commands
Learn more about the system FRU commands.

Procedure

- To display a list of all inventory items, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  fru print
  ```

  or

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  fru list
  ```
- To display the known status of all FRU items, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  fru status
  ```

  Note: The FRU item must be designated as a replaceable FRU by the BMC.
- To automate the review of FRU status commands and to determine if there is a performance impact on the system, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  health_check
  ```

  Note: This command does not guarantee a healthy system as there can be system event logs entries that are not associated with the inventory items.

System BMC reset commands
Learn more about the system BMC reset commands.

Procedure

- To do a warm reset of the BMC remotely and without an AC cycle, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  bmc reset warm
  ```
- To do a cold reset of the BMC remotely and without an AC cycle, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  bmc reset cold
  ```

System dump commands
Learn more about the system dump commands.

Procedure

- To create a new dump file, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  dump create
  ```
- To list all dump files in the system, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  dump list
  ```
- To delete a specific dump file from the system, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
dump delete -n <dump file entry>
```

- To delete all dump files from the system, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  dump delete all
  ```

- To retrieve a specific dump file, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  dump retrieve -n <dump file entry>
  ```

- To retrieve a dump file and save it to specific directory, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  dump retrieve -s <location to save dump file>
  ```

  Note: If you do not specify a location, the file is saved in the OS where the command is run in the temp directory.

Enabling and disabling local BMC user accounts
Learn more about the **local_users**commands.

About this task

The local user accounts on the BMC, such as root, can be disabled, queried, and re-enabled with the **local_users** sub-command.

Note: After disabling local users, the LDAP user needs to be available for further interaction with the BMC, including enabling local users by using OpenBMC tool.

Procedure

- To view current local user account status, use the following command:

  ```
  openbmctool <connection options> local_users queryenabled
  ```

- To disable all local user accounts, use the following command:

  ```
  openbmctool <connection options> local_users disableall
  ```

- To enable all local user accounts, use the following command:

  ```
  openbmctool <connection options> local_users enableall
  ```

Remote logging by using rsyslog
Learn more about the remote logging commands.

About this task

The BMC can stream out local logs (that go to the systemd journal) by using RSYSLOG. The BMC sends everything in the logs. Any kind of filtering and appropriate storage has to be managed on the rsyslog server.

Procedure

- To configure the rsyslog server for remote logging, use the following command:

  ```
  openbmctool <connection options> logging remote_logging_config -a <IP
  address> -p <port>
  ```

  Note: The IP address and port are for the remote rsyslog server. After the command is run, the remote rsyslog server starts to receive logs from the BMC.

- To disable remote logging, use the following command:

  ```
  openbmctool <connection options> logging remote_logging disable
  ```

Note: Disable remote logging before you switch remote logging from an existing remote server to a new one.

- To view the remote logging configuration, use the following command:

  ```
  openbmctool <connection options> logging remote_logging view
  ```

  Note: This command prints out the IP address and port of the remote rsyslog server in JavaScript Object Notation (JSON) format.
- To turn REST API logging on, use the following command:

  ```
  openbmctool <connection options> logging rest_api on
  ```
- To turn REST API logging off, use the following command:

  ```
  openbmctool <connection options> logging rest_api off
  ```

  Note: REST API logging is turned off by default.

Certificate management
Learn more about the certificate management commands.

About this task

You can replace the existing certificate and private key file with another (possibly CA signed) certificate and private key file. You can install server, client, and root certificates.

Procedure

- To update the HTTPS server certificate, use the following command:

  ```
  openbmctool <connection options> certificate update server https -f <File>
  ```

  Note: The `<File>` is the privacy-enhanced mail (PEM) file that contains both the certificate and the private key.
- To update the LDAP client certificate, use the following command:

  ```
  openbmctool <connection options> certificate update client ldap -f <File>
  ```

  Note: The `<File>` is the PEM file that contains both the certificate and the private key.
- To update the LDAP root certificate, use the following command:

  ```
  openbmctool <connection options> certificate update authority ldap -f <File>
  ```

  Note: The `<File>` is the PEM file that contains only the certificate.
- To delete the HTTPS server certificate, use the following command:

  ```
  openbmctool <connection options> certificate delete server https
  ```

  Note: Deleting a certificate creates and installs a new self-signed certificate.
- To delete the LDAP client certificate, use the following command:

  ```
  openbmctool <connection options> certificate delete client ldap
  ```
- To delete the LDAP root certificate, use the following command:

  ```
  openbmctool <connection options> certificate delete authority ldap
  ```

  Note: Deleting the root certificate can cause an LDAP service outage.

LDAP configuration
Learn more about the LDAP configuration commands.

About this task

In the BMC, LDAP is used for remote authentication. The BMC does not support remote user-management functionality. The BMC supports both secure and non-secure LDAP configuration.

Procedure

- To create the LDAP configuration (non-secure), use the following command:

  ```
  openbmctool.py <connection options> ldap enable --uri="ldap://
  <ldap server IP/hostname>" --bindDN=<bindDN> --baseDN=<basDN> --
  bindPassword=<bindPassword> --scope="sub/one/base" --serverType="OpenLDAP/
  ActiveDirectory"
  ```

  Note: Configuring a fully qualified domain name or hostname in the `uri` parameter requires the domain name system (DNS) server to be configured on the BMC.

- To create the LDAP configuration (secure), use the following command:

  ```
  openbmctool.py <connection options> ldap enable --uri="ldaps://
  <ldap server IP/hostname>" --bindDN=<bindDN> --baseDN=<basDN> --
  bindPassword=<bindPassword> --scope="sub/one/base" --serverType="OpenLDAP/
  ActiveDirectory"
  ```

  Notes:

  1. It is common to encounter the following error when you run the above `openbmctool.py` command string:

     xyz.openbmc_project.Common.Error.NoCACertificate

     This error means that the BMC client needs to verify that the LDAP server certificate is signed by a known certification authority (CA). An administrator needs to upload the CA certificate to the BMC to resolve this error.

  2. The OpenBMC tool does not support individual LDAP configuration property updates. To update a single property, the administrator must recreate the LDAP configuration with the changed values.

- To delete the LDAP configuration, use the following command:

  ```
  openbmctool.py <connection options> ldap disable
  ```

  Note: The root user must be enabled before you run the command, otherwise the BMC is not accessible. To enable all local user accounts, see Enabling and disabling local user accounts.

- To add privilege mapping use the following command:

  ```
  openbmctool.py <connection options> ldap privilege-mapper create --
  groupName=<groupName> --privilege="priv-admin/priv-user"
  ```

- To delete privilege mapping, use the following command:

  ```
  openbmctool.py <connection options> ldap privilege-mapper delete --
  groupName=<groupName>
  ```

- To list privilege mapping, use the following command:

  ```
  openbmctool.py <connection options> ldap privilege-mapper list
  ```

  The normal workflow for LDAP configuration is in the following order:

  1. Configure the DNS server.
  2. Configure LDAP.
     a. Configure the CA certificate for secure LDAP configuration.

   b. Create LDAP configuration with local user.

3. Configure user privilege.

Notes:

1. If you login with LDAP credentials and have not added privilege mapping for the LDAP credentials, then you will get the following error message:

   403, 'LDAP group privilege mapping does not exist'.

   You can avoid this error by adding privilege mapping.

2. The following error message might mean that user lacks sufficient privileges on the BMC:

   Insufficient privileges

   You can avoid this error by adding privilege mapping.

3. After you setup the LDAP, the OpenBMC tool connection options work with both LDAP and local users.

Network configuration
Learn more about the network configuration commands.

Procedure

- To enable DHCP, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network enableDHCP -I
  <Interface name>
  ```

- To disable DHCP, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network disableDHCP -I
  <Interface name>
  ```

- To get the host name, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getHostName
  ```

- To set the host name, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setHostName -H
  <host name>
  ```

- To get the domain name, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getDomainName
  -I <Interface name>
  ```

- To set the domain name, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setDomainName
  -I <Interface name> -D DomainName1,DomainName2,..
  ```

- To get the media access control (MAC) address, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getMACAddress
  -I <Interface name>
  ```

- To set the MAC address, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setMACAddress
  -I <Interface name> -MA xx:xx:xx:xx:xx
  ```

- To get the default gateway, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getDefaultGW
  ```

- To set the default gateway, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setDefaultGW
  -GW <default gw>
  ```

- To view the current network configuration, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network view-config
  ```

- To get the network time protocol (NTP), use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getNTP -I
  <Interface name>
  ```

- To set the NTP, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setNTP -I
  <Interface name> -N NTP1,NTP2,...
  ```

- To get the domain name system (DNS), use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getDNS -I
  <Interface name>
  ```

- To set the DNS, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setDNS -I
  <Interface name> -d DNS1,DNS2,...
  ```

- To get the IP address, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getIP -I
  <Interface name>
  ```

- To set the IP address, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network addIP -a
  <ADDRESS> \-gw <GATEWAY> -l <PREFIXLENGTH> -p <protocol type> -I <Interface
  name>
  ```

- To delete the IP address, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network rmIP -I
  <Interface name> -a <ADDRESS>
  ```

- To enable a virtual local area network (VLAN), use the following command:

  ```
  openbmctool.py <connection options> network addVLAN -I <Interface name> -n
  <IDENTIFIER>
  ```

- To disable a virtual local area network (VLAN), use the following command:

  ```
  openbmctool.py <connection options> network deleteVLAN -I <Interface name>
  ```

- To view the DHCP configuration properties, use the following command:

  ```
  openbmctool.py <connection options> network viewDHCPConfig
  ```

- To configure the DHCP properties, use the following command:

  ```
  openbmctool.py <connection options> network configureDHCP -d <DNSENABLED> -n
  <HOSTNAMEENABLED> -t <NTPENABLED> -s <SENDHOSTNAMEENABLED>
  ```

  Note: DNSENABLED, HOSTNAMEENABLED, NTPENABLED, and SENDHOSTNAMEENABLED are boolean values (true or false).

- To reset the network settings to the factory defaults, use the following command:

  ```
  openbmctool.py <connection options> network nwReset
  ```

  Note: Reset settings are applied after the rebooting of the BMC.

Managing the system by using the IPMI
Learn how to configure and manage your system by using the Intelligent Platform Management Interface (IPMI).

Common IPMI commands
You can use **IPMI** commands to perform various managing tasks for your system.

Table 33. Common IPMI commands

Command option	**Description**
`ipmitool -I lanplus -H` *myserver.example.com* `-P` *mypass* `chassis power on`	Powers on the server.
`ipmitool -I lanplus -H` *myserver.example.com* `-P` *mypass* `chassis power off`	Powers off the server.
`ipmitool -I lanplus -H` *myserver.example.com* `-P` *mypass* `chassis status`	Checks the server status.
`ipmitool -I lanplus -H` *myserver.example.com* `-P` *mypass* `chassis power cycle`	Power cycle the server.
`ipmitool -I lanplus -H` *myserver.example.com* `-P` *mypass* `sol activate`	Activates SOL system console.
`ipmitool -I lanplus -H` *myserver.example.com* `-P` *mypass* `sol deactivate`	Deactivates SOL system console.
`ipmitool -I lanplus -H` *myserver.example.com* `-P` *mypass* `sel list`	Returns an error log.
`ipmitool -I lanplus -H` *myserver.example.com* `-P` *mypass* `sdr list`	Lists status of all sensors.
`ipmitool -I lanplus -H` *myserver.example.com* `-P` *mypass* `sol set retry-interval` *value*	Sets the default retry-interval value in milliseconds.
`ipmitool -I lanplus -H` *myserver.example.com* `-P` *mypass* `fru print`	Prints the FRU information.
`ipmitool -I lanplus -H` *myserver.example.com* `-P` *mypass* `user list`	Lists the IPMI users.

Configuring the BMC IP address
Dynamic Host Configuration Protocol (DHCP) is the default network setup for the BMC in the 7063-CR2 HMC. To enable your network connection, you can connect to your system and use the Petitboot bootloader interface to configure the IP address of the BMC. If you do not plan to use DHCP, you can also set up a static IP address. Alternatively, you can use the HMC GUI to enable your network connection by navigating to **HMC Management** > **Console Settings** > **Change BMC/IPMI Network Settings**.

Before you begin

You must connect the network cable and a VGA monitor before you access the Petitboot bootloader interface.

If you encounter any problems in accessing the Petitboot bootloader interface, see Resolving a BMC access problem.

About this task

To use the Petitboot bootloader interface to set up or enable the network interface of the BMC, complete the following steps:

Procedure

1. Power on the server by pressing the power button on the front of the system. The system powers on to the Petitboot bootloader menu.

   Note: The boot process takes about 1 to 2 minutes to complete.

   When Petitboot loads, the monitor activates. Press any key to interrupt the boot process.
2. At the Petitboot bootloader main menu, select **Exit to Shell**.
3. Run the following command: `ipmitool lan print 2`. If this command returns an IP address, verify that is correct. To set a static IP address, follow these steps:

   Notes:

   - The following two LAN interfaces are available to BMC:
     - Shared interface is LAN1
     - Dedicated interface is LAN2
   - The `ipmitool lan print 2` command cannot display more than one IP address. To avoid this situation, you can set the static IP address to a different subnet from the default zero configuration networking IP address.

   a. Set the mode to static by running the following command: `ipmitool lan set 2 ipsrc static`.

   b. Set your IP address by running the following command: `ipmitool lan set 2 ipaddr ip_address`, where *ip_address* is the static IP address that you want to assign to this system.

   c. Set your netmask by running the following command: `ipmitool lan set 2 netmask netmask_address`, where *netmask_address* is the netmask for the system.

   d. Set your gateway server by running the following command: `ipmitool lan set 2 defgw ipaddr gateway_server`, where *gateway_server* is the gateway for this system.

   e. Confirm the IP address by running the following command: `ipmitool lan print 2`.

Performing a factory reset
Learn how to perform a factory reset on the system.

The factory reset function can take up to 15 minutes to complete. When the LED on the power button starts flashing, the system is ready to start again. Perform the factory reset with the host powered off. If you perform the factory reset while the host is running, the system shuts down immediately and restarts the BMC. If the BMC is on a static network, you must manually power on the system with the physical power button.

To perform a factory reset, run the following command:

```
ipmitool -I lanplus -U <username> -P <password> -H <BMC_IP or Hostname> raw 0x3A 0x11
```

Note: The system does not send a validation response. The following system output is normal:

```
Unable to send RAW command (channel=0x0 netfn=0x3a lun=0x0 cmd=0x11)
```

If you forgot the password of the BMC, you can run the following command while the host is running to perform a factory reset and to restore the default password:

```
ipmitool raw 0x3A 0x11
```

You must set up and configure the BMC IP address after performing the factory reset. For more information, see "Configuring the BMC IP address" on page 84.

Risks of using IPMI on IBM Power Systems and OpenPower Systems
Various risks that are associated with the Intelligent Platform Management Interface (IPMI) have been identified and documented in the information technology (IT) security community.

IBM Power Systems and OpenPower Systems provide IPMI access by default. A subset of these identified risks is applicable to IBM servers.

Note: Model 9080-M9S does not provide IPMI access by default.

Vulnerability Details

The IPMI service can become unresponsive after it receives and rejects multiple authentication attempts. You might receive a `insufficient resources for session` message if you use the IPMI immediately after the failed authentication attempts. This situation lasts for a few seconds and normal service is restored afterward.

Important: Repeated authentication failures can cause denial of service.

A list of common vulnerabilities and exposures (CVE) is listed in Table 34 on page 86.

Table 34. Common vulnerabilities and exposures

CVE ID	Description
CVE-2013-4037	The Remote Authenticated Key-Exchange Protocol (RAKP), which is specified by the IPMI standard for authentication, has flaws. Although the system does not allow the use of null passwords, a hacker might reverse engineer the RAKP transactions to determine a password. The authentication process for IPMI requires the management controller to send a hash of the requested password of the user to the client before the client authenticates. This process is a key part of the IPMI specification. The password hash can be broken by using an offline brute force or dictionary attack.
CVE-2013-4031	IBM Power Systems and OpenPower Systems are preconfigured with one IPMI user account, which has the same default login name and password on all affected systems. If a malicious user gains access to the IPMI interface by using this preconfigured account, the user can power off or on, or restart the host server, and create or change user accounts possibly preventing legitimate users from accessing the system. On OpenPower Systems, the default IPMI user name is `root`. Additionally, if a user fails to change the default user name and password on each of the systems that is deployed, the user has the same login information for each of those systems.
CVE-2013-4786	The IPMI 2.0 specification supports RMCP+ Authenticated Key-Exchange Protocol (RAKP) authentication, which allows remote attackers to obtain password hashes and conduct offline password guessing attacks by obtaining the hash-based message authentication code (HMAC) from a RAKP message 2 response from a BMC.

Configuration options and best practices

- Change the preconfigured user name and password when the server is deployed. This action prevents unauthorized users from gaining access to the system through the preconfigured user account.
- Do not disable the IPMI access for the user whose access credentials have been shared with the HMC via the **Console Inband Communication Credentials** task.

  Note: To launch the **Console Inband Communications Credentials** task, complete the following steps:

  1. In the navigation area, click the **HMC Management** icon, and then select **Console Settings**.
  2. In the content pane, click **Console Inband Communications Credentials**.

3. From the **Console Inband Communications Credentials** window, you can set the inland BMC credentials or modify an expired password for previously set inband BMC credentials for the HMC.

- If a user is not managing a server by using the IPMI, you can configure the system to disallow IPMI network access from the user accounts. This task can be accomplished by using the IPMItool utility or a similar utility for managing and configuring the IPMI management controllers. You can use the following IPMItool command to disable the network access for an IPMI user:

  ```
  ipmitool channel setaccess 1 #user_slot# privilege=15
  ```

  Note: Replace #user_slot# in the command with the actual slot number (1 - 12) and repeat for each configured user.

  This example shows the command when it is run directly on the server. If the IPMItool command is run remotely over the network, or if a different utility is used, the command might be different. See the documentation for the utility that you are using to determine the correct command syntax. Disallowing IPMI network access removes the ability to use the weakness that is present in the IPMI RAKP protocol to discover user account credentials.
- Use strong passwords that are at least 16 characters long with a mixture of upper and lowercase letters, numbers, and special characters. By using more complex passwords, it makes it more difficult for malicious users to discover valid user credentials.
- Keep the management network separate from the public network. Keeping the management network separate lessens security exposures by reducing the number of individuals who can access the systems.

Managing the system by using the OpenBMC GUI
Learn how to manage and configure your system by using the OpenBMC GUI.

Logging on to the OpenBMC GUI
Learn how to log on to the OpenBMC GUI.

To log on to the OpenBMC GUI, complete the following steps:

1. Open a supported web browser. In the address bar, enter the IP address of the BMC that you want to connect to. For example, you can use the format `https://<BMC IP>` in the address bar of the web browser.
2. From the **OpenBMC logon** window, enter the **Host** address of the BMC and the **Username** and **Password** that is assigned to you.

   Note: The default user ID is `root` and the default password is `0penBmc`.

   If you are using firmware level OP940.01, or later, the root password is expired by default. You must change the default password before you can access the BMC. For more information about changing the expired default password, see "Setting the password" on page 87.

   If you forgot your password, you can perform a factory reset of the system to restore the default password. To reset the system, see "Performing a factory reset" on page 85.
3. Click **Log in**.

Setting the password
Learn how to change and set the password for your **root** account and to help secure the system.

Improved BMC password policy

The baseboard management controller (BMC) **root** password must be set on first use for newly manufactured systems or after performing a factory reset of the system. This policy change helps to enforce that the BMC is not left in a state with a well-known password.

In firmware level OP940.01, and later, the root password is expired and must be changed before you can access the functions of the BMC. However, if you are upgrading the firmware level from a previous OpenBMC firmware level or if you are performing an operational installation, you do not have to change the password.

The default user ID is `root` and the default password is `0penBmc`. You can use the web application, the Redfish REST APIs, the OpenBMC tool command to change the password. You can also use the **Console Inband Communications Credentials** task in the HMC GUI to change the expired password.

Note: To launch the **Console Inband Communications Credentials** task, complete the following steps:

1. In the navigation area, click the **HMC Management** icon, and then select **Console Settings**.
2. In the content pane, click **Console Inband Communications Credentials**.
3. From the **Console Inband Communications Credentials** window, you can set the inland BMC credentials or modify an expired password for previously set inband BMC credentials for the HMC.

After changing the password, you can access the BMC with your usual interface. To change the password, you must first access the account with the correct credentials, and then use the password change function. If you attempt to access the BMC with an expired password, you must change the password before accessing other functions.

- To change your expired password by using the web interface, enter `https://<BMC_IP>` into a web browser and then enter the access credentials of the BMC. The web interface prompts you to enter a new password.
- To change your expired password through a network interface, you can use Redfish APIs. For instructions, see "Managing the system by using DMTF Redfish APIs" on page 96.
- To change your expired password by using the OpenBMC tool, run the `openbmctool set_password` subcommand. For example,

```
openbmctool.py -H <BMC IP address or BMC host name> -U <username> -P <password> set_password
-p <new password>
Attempting login...
200
User root has been logged out
```

  Where `200` is the response status that indicates success.

Note: The system might take up to 5 minutes to update the new password on the BMC. If you have trouble accessing your account, wait for 5 minutes and try again.

Also, with firmware level OP940.01, the BMC factory reset function resets the BMC password back to its default value and causes the default password to expire. This function means that after you perform the factory reset, you must change the password before you can access the BMC (even if you upgraded from an older firmware level).

To increase account security of the system, the administrator must complete the following steps:

1. Set a strong password for the root account. Strong passwords have at least 15 characters and include non-alphabetic characters. Initially, the password must not exceed 20 characters. Passwords can be changed later to a length greater than 20 characters, but IPMI access will be removed. Avoid using the **root** account, as the **root** account has more access to the BMC than an **Administrator** account. The root account can present a security risk if it is used incorrectly or maliciously. Use the root account only when it is required.
2. Create a separate account for each entity to manage the system. For example, you can create an **Administrator** account for yourself and for xCat, and create an **Operator** account for your staff. You can use the web interface or Redfish APIs to create a new account. When you create a new account, carefully consider which privilege role to assign to the user. Always use the least privilege role that is required.

   - To create a new account by using the web interface, see "Local users" on page 94.
   - To create a new account by using the Redfish APIs, see "Managing the system by using DMTF Redfish APIs" on page 96.

   If your BMC is using Lightweight Directory Access Protocol (LDAP), you can add users to the LDAP server.

3. Log off from the root account and switch to your personal **Administrator** account.

To increase the security of the system, the administrator can optionally configure access to the LDAP server. For more information, see “Basic commands and functionality of the OpenBMC tool ” on page 76.

Dashboard
The dashboard displays the overall information about the server and the BMC.

The following options are available on the title bar (located in the top portion of the dashboard):

- **Server information**: Displays the server name and BMC IP address.
- **Server health**: Displays the status of the server.
- **Server power**: Displays whether the server is powered on, powered off, or in an error state.
- **Date last refreshed**: Displays the date and time that the information was last refreshed. The time zone of the user is determined by the web browser.
- **Refresh**: Click **Refresh** to refresh the information.

The following menus are available from the menu pod (located in the left portion of the dashboard):

- **Server overview**
- **Server health**
- **Server control**
- **Server configuration**
- **Users**

Server overview
Learn about the options that are available from the **Server overview** task.

From the **Server overview** window, you can choose from any of the following available options:

- **Server information**: Displays the model, manufacturer, firmware version, and serial number of the server.
- **BMC information**: Displays the host name, BMC IP address, firmware version, and MAC address of the BMC.
- **Power information**: Displays the power consumption and power cap.
- **High priority events**: View any high priority events. Click **Refresh** to reload the information that is displayed here.
- **BMC time**: Displays the BMC time in the time zone of the user, which is determined by the web browser.
- **Turn on server LED**: Turn on or turn off the server LED.
- **Launch serial over LAN console**: Launches the Serial over LAN (SoL) console.
- **Edit network settings**: Edit the network settings.

Server health
Learn about the tasks that are available from the **Server health** menu.

From this menu, you can choose from any of the following available tasks:

Event log
View all events from the BMC.

Note: For descriptions and service actions for FQPSPxxxxxxx event codes, see Managing BMC-based systems by using the HMC (http://www.ibm.com/support/knowledgecenter/POWER9/p9ia7/p9ia7_kickoff.htm).

You can view and filter event log files from the BMC. From the **Event log** window, you can perform the following actions:

- Search through event logs by entering keywords and clicking **Search**.

- Filter the event logs by severity (**All**, **High**, **Medium**, or **Low**). You can select multiple severity levels.
- Filter the event logs by date range.
- Filter the event logs by event status (**All events**, **Resolved events**, and **Unresolved events**).
- Click any of the events that are listed to expand the event log file for more information. You can click **Copy** to copy the information to the clipboard.
- Select multiple event logs by clicking the checkbox next to event log. After you select the event logs, you can delete the logs by clicking **Delete** and then clicking **Yes** in the confirmation message. You can also mark event logs as read by clicking **Mark as resolved**.

Hardware status
View the hardware status and associated events of all hardware in the server.

You can view the hardware status of various hardware components in your server. Click any of the hardware components to expand the view for more information. You can search for specific hardware components by using the **Filter Hardware Components** search feature and then clicking **Filter**. You can also export the data by clicking **Export**.

Sensors
View all sensors that are present in the system.

You can view and filter sensors from the BMC. From the **Sensors** window, you can perform the following actions:

- Search and filter for specific sensors by using the **Search** feature and then clicking **Filter**.
- Filter sensors by severity (**All**, **Critical**, **Warning**, or **Normal**).
- Export the sensor data by clicking **Export**.

Server control
Learn about the tasks that are available from the **Server control** menu.

From this menu, you can choose from any of the following available tasks:

Server power operations
Learn how to view current server status and select power operations.

To update the **Host OS boot settings**, complete the following steps:

Note: It is not recommended to modify the **Host OS boot settings** for 7063-CR2 HMC, unless instructed by IBM Support.

1. Select the boot setting override type from the **Boot setting override** menu.
2. You can optionally select **Enable one time boot**.
3. Select whether to enable or disable the TPM policy by selecting **On** or **Off**.
4. Click **Save**.

To restart the server, complete the following steps:

1. Select the type of reboot from **Operations** > **Reboot server**:
   - Orderly: Operating system shuts down first and then the server reboots.
   - Immediate: Server reboots without the operating system shutting down. This might cause data corruption.
2. Click **Reboot**.

To shutdown the server, complete the following steps:

1. Select the type of shutdown from **Operations** > **Shutdown server**:
   - Orderly: Operating system shuts down first and then the server reboots.
   - Immediate: Server reboots without the operating system shutting down. This might cause data corruption.

2. Click **Shutdown**.

Manage power usage
Learn how to view the power consumption of the server and set a power cap.

Note: It is recommended to set the **power cap** to **Off** for 7063-CR2 HMC. By default, the **power cap** is set to **Off**.

To set a power cap, complete the following steps:

1. From the **Server power cap setting** section, set the **power cap** to **On**.
2. Specify the number of watts to keep the server power consumption at or below the specified value.
3. Click **Save settings**.

You can turn off the power cap by setting the **power cap** to **Off** and clicking **Save settings**.

Server LED
Learn how to turn on and turn off the server light-emitting diode (LED).

You can turn on or turn off the server LED by clicking the toggle switch to either **On** or **Off**.

Note: If the server has a liquid crystal display (LCD), you can use this control to display text (**On**) or not to display text (**Off**) on the LCD.

Reboot BMC
Learn how to restart the BMC and view the current BMC boot status.

Click **Reboot BMC** to restart the BMC.

Note: When you restart the BMC, your web browser looses connection with the BMC for several minutes. When the BMC is back online, you must log in again. If the **Log in** button is not available after you restart the BMC, close your web browser. Then, reopen the web browser and enter your BMC IP address.

Serial over LAN console
Learn how to view information over the serial port of the server.

You can launch the Serial over LAN (SoL) console that displays the output of the serial port of the server.

KVM
Learn how to launch the remote keyboard, video, and mouse (KVM) console.

You can launch the KVM console from this task and interact with the remote system.

Virtual media
Learn how to start a session by using a virtual media device.

To start a session, complete the following steps:

1. Under **Virtual media device**, click **Choose file**.
2. Select the file and click **Open**.
3. Click **Start** to start the session.

Server configuration
Learn about the tasks that are available from the **Server configuration** menu.

From this menu, you can choose from any of the following available tasks:

Network settings
Learn how to view and set common network, IPv4, and DNS settings.

To view network settings, select the **Network Interface** that you want to view. The **Hostname**, **MAC Address**, and **Default Gateway** are displayed under **Common settings**. The **DHCP setting**, **IPv4 IP addresses**, **Gateways**, and **Netmasks** are displayed under **IPv4 Settings**. Under **DNS settings**, all DNS servers are displayed.

To set network settings, complete the following steps:

1. Select the **Network Interface** that you want to set.
2. Edit the **Hostname**, **MAC Address**, or **Default Gateway** fields under **Common settings**.
3. Edit the **DHCP setting**, **IPv4 IP address**, **Gateway**, and **Netmask Prefix Length** under **IPv4 Settings**.
4. Click **Save Settings**.

Note: You can edit network settings only on firmware level OP920.01 or later.

To add an IPv4 address, complete the following steps:

1. Click **Add IPV4 address**.
2. Complete the **IPv4 IP address**, **Gateway**, and **Netmask Prefix Length** fields.
3. Click **Save Settings**.

To add a DNS address, complete the following steps:

1. Click **Add DNS Server**.
2. Enter the Internet Protocol (IP) address of the **DNS Server**.
3. Click **Save Settings**.

SNMP settings
Learn how to view and set the simple network management protocol (SNMP) with a hostname or Internet Protocol (IP) address and a port.

To set the SNMP, complete the following steps:

Note: Only SNMPv2 is supported.

1. Click **Add Manager**.
2. Enter the hostname or IP address and the port number.
3. Click **Save Settings**.

You can remove a manager by clicking the trash bin icon next to the manager that you want to remove.

Firmware
Learn how to manage the BMC and server firmware.

You can use the **BMC images** and **Server images** tables to manage firmware image files. The image file that is listed at the top, the image with the highest boot priority, is used the next time that the device is booted. You can change the boot order for the image file by clicking the arrow icons.

Learn about the different image states that are available:

- **Functional**: The running image on the device.
- **Active**: The image is available to boot from, but is not currently the running image. If the image is the top image in the relevant table, it becomes the functional image the next time the device is rebooted.
- **Activating**: The image is in the process of being activated and becomes either **Active** or **Failed**.
- **Failed**: The image failed to activate.
- **Ready**: The image is ready to be activated.
- **Invalid**: This image is an invalid image and cannot be activated.

The system firmware is a combination of the BMC firmware and the PNOR firmware. You must update both the BMC firmware and the PNOR firmware for the system to operate properly. If you update only one type of firmware, but do not update the other type of firmware, system errors might occur.

You can upload an image file from the workstation or from the Trivial File Transfer Protocol (TFTP) server. If you choose **Upload image file from workstation**, click **Choose a file** and specify the location of the image on the workstation storage device. Click **Upload** to upload the image file to the BMC server. If you choose **Download image file from TFTP server**, enter the TFTP server IP address in the **TFTP Server IP**

Address field and the file name in the **File Name** field. Click **Download** to download the image file to the BMC server.

After you load the new image file to the BMC server, you can activate the image file to make it available for use. Locate the image in the correct image table, and then click **Activate** > **Continue**. For a BMC image, an option of **Activate Firmware File Without Rebooting BMC** or **Activate Firmware File and Automatically Reboot BMC** is available. If you select **Activate Firmware File Without Rebooting BMC**, the BMC must be rebooted by using the **Reboot BMC** option to make the image become the **Functional** image. If you select **Activate Firmware File and Automatically Reboot BMC**, the BMC automatically reboots after the image is activated and the new image becomes the **Functional** image.

For a server image, after the image is activated, the server must be rebooted (or powered on if the server is off) for the image to become active. The **Reboot** (or **Power on**) option can be accessed from the **Server power operations** menu.

Date and time settings
Learn how to set the date and time.

To automatically set the date and time, complete the following steps:

1. Select **Obtain automatically from a network time protocol (NTP) server**.
2. Click **Add new NTP server**.
3. Enter the NTP server address.
4. Click **Save setttings**.

To manually add the date and time, complete the following steps:

1. Select **Manually set date and time**.
2. Enter the date and time.
3. Change the **Time owner** to the following values:
   - **BMC**: the BMC owns the time and can set the time.
   - **Host**: the host owns the time and can set the time.
   - **Split**: the BMC and the host own separate time.

     Note: Split is the recommended value for **Time owner** for 7063-CR2.
   - **Both**: both the BMC and the host can set the time.

Access control
Learn about the tasks that are available from the **Access control** menu.

From this menu, you can choose from any of the following available tasks:

LDAP
Learn how to configure lightweight directory access protocol (LDAP) settings and manage role groups.

LDAP authentication

To enable LDAP authentication, complete the following steps:

1. Select the **Enable LDAP authentication** checkbox.

   Note: If you want to secure LDAP by using Secure Sockets Layer (SSL), select the **Secure LDAP using SSL** checkbox. You must have a certificate authority (CA) and LDAP certificate for this function.
2. Select the service type as **Open LDAP** or **Active directory**.
3. Complete the required fields.
4. Click **Save**.

Role groups

To add a new role group, complete the following steps:

1. Click **Add role group**.
2. Enter a name for the role group.
3. Set the privilege of the role group to **Administrator**, **Operator**, **User**, or **Callback**.
4. Click **Save**.

To remove a new role group, complete the following steps:

1. Select the checkbox next to the role group or groups that you want to remove from the table.
2. Click **Remove role groups**.
3. Click **Remove** in the pop-up window.

To modify the privilege of a role group, complete the following steps:

Note: LDAP authentication must be enabled to modify group roles.

1. Select the checkbox next to the role group or groups that you want to modify from the table.
2. Click the **Edit** icon.
3. Change the privilege of the role group to **Administrator**, **Operator**, **User**, or **Callback**.
4. Click **Save**.

Local users
Learn how to add or remove new users, modify user settings, manage user account policy settings, and view privilege role descriptions.

To add a new user, complete the following steps:

1. Click **Add user**.
2. Set the account status to either **Enabled** or **Disabled**.
3. Enter a new username.

   Note: The username cannot start with a number. No special characters are allowed except for an underscore.
4. Set the privilege of the user to **Administrator**, **Operator**, **ReadOnly**, or **NoAccess (Callback)**.
5. Enter the password of the user.

   Note: Initially, the password must be in the range of 8 - 20 characters in length. Passwords can be changed later to a length greater than 20 characters, but IPMI access is removed. The system might take up to 5 minutes for the new password to update on the BMC. If you have trouble accessing your account, wait for 5 minutes and try again.
6. Reenter the password for confirmation.
7. Click **Add user**.

To remove a user, complete the following steps:

1. Click the checkbox next to the user or users that you want to remove from the table.
2. Click **Remove**.
3. Click **Remove** again in the pop-up window.

You can modify user settings by selecting the user from the table and clicking the edit icon. From the **Modify user** window, you can update the following properties:

- Account status: set to **Enabled** or **Disabled**.
- Username: change the name of the user.
- Privilege: change the account privileges of the user to **Administrator**, **Operator**, **ReadOnly**, or **NoAccess (Callback)**.

- User password: update the password of the user.

You can modify user account policy settings by clicking **Account policy settings**. From the **Account policy settings** window, you can update the following properties:

- Maximum failed login attempts: change the number of allowed failed login attempts.
- User unlock method: set to **Automatic after timeout** or **manual**.
- Only non-root accounts can be locked out.

You can view privilege role descriptions by clicking **View privilege role descriptions**.

Table 35. Privilege role descriptions

Role	Privileges	Guidance
Administrator	Can configure the BMC and manage users and sessions. Operational control over BMC functions.	Use this role for the most trusted users.
Operator	Operational control over BMC functions.	Use this role for users who manage routine operations.
ReadOnly	Read-only access to BMC functions.	Use this role for users who need to monitor the BMC, but do not need to operate it.
NoAccess (Callback)	No access to BMC functions.	Use this role for users who do not need access to the web interface or REST APIs.

SSL certificates
Learn how to generate a certificate signing request (CSR), add new certificates, and replace existing certificates.

Generating a CSR

To generate a new CSR, complete the following steps:

1. Click **Generate CSR**.
2. Complete the required fields under the **General** section.
3. Under **Private key** > **Key Pair Algorithm**, select the algorithm as **EC** or **RSA**.
4. Click **Generate CSR**.

Certificates

To add a new certificate, complete the following steps:

1. Click **Add new certificate**.
2. Select the certificate type as **HTTPS Certificate**, **LDAP Certificate**, or **CA Certificate**.
3. Click **Choose file** to select the certificate.
4. Click **Open**.
5. Click **Save**.

To replace certificates, complete the following steps:

1. Select the certificate that you want to replace from the table.
2. Click the refresh icon.
3. Click **Choose file** to select the new certificate.

4. Click **Open**.
5. Click **Replace**.

Managing the system by using DMTF Redfish APIs
OpenBMC-based systems can be managed by using the DMTF Redfish APIs.

Overview

Redfish is a REST API used for platform management and is standardized by the Distributed Management Task Force, Inc. (http://www.dmtf.org/standards/redfish).

Redfish enables platform management tasks to be controlled by client scripts that are developed by using secure and modern programming paradigms.

The Redfish API enables provisioning of tunable parameters for better utilization of power.

IBM OpenBMC-based systems support DMTF Redfish API (DSP0266, version 1.7.0, published on 20 May 2019) for systems management.

A copy of the Redfish schema files that are in JSON format are published by DMTF (http://redfish.dmtf.org/schemas/v1/) and are packaged in the firmware image.

The schema files that are distributed in the chip enable proper functioning of the APIs in deployments that have no wide area network (WAN) connectivity.

Note: The Redfish API is enabled by default and the Redfish service cannot be enabled or disabled by the user.

Firmware levels

Redfish APIs are supported on OpenPOWER (OP) firmware level OP940, or later.

Communication prerequisites for Redfish on OpenBMC-based servers

Depending on the current firmware level and network deployment, complete the following prerequisite tasks:

- Upgrade the server firmware level to OP940, or later.
- Identify the IP address of the BMC.
- Install and run cURL (https://curl.haxx.se/) with the method, Uniform Resource Indicator (URI), and the request body as parameters to communicate with the Redfish service.
- Install Python on the client system (typically a Linux host).
- Optionally, install and run DMTF Redfishtool (https://github.com/DMTF/Redfishtool).

Interacting with the Redfish service

To interact with the Redfish service, complete the following steps.

1. Create an authenticated login session (POST method on the `/redfish/v1/SessionService/Sessions` resource).
2. Extract and save the following details:
   - Authentication token (found in the **X-Auth-Token** header of the response)
   - Session URI (found in the **Location** header of the response)
3. To read the properties of a resource, send a **GET** request with the **X-Auth-Token** header for the URI of the resource.
4. To set a property of a resource, send a **PATCH** request with the **X-Auth-Token** header for the URI of the resource, the property name, type, and value encoded as a JSON body.
5. Extract and parse the response from the Redfish service that contains the JSON body.

Redfish service home page URI

The Redfish service home page URI (also known as the service ROOT) can be accessed by retrieving the URI: `https://<ip:port>/redfish/v1`. The response to this URI is a high-level site map that enables a traversal of the Redfish service by using a hypermedia API paradigm.

Interpreting the data returned by the Redfish service

The format and structure of the data is defined in the schema files. Schema files are JSON files that describe the data that is sent by the Redfish service. You can use the schema files to understand the data that is sent by the Redfish service and to validate the response that is sent by the Redfish service.

Location of the schema files

DMTF publishes the schema files for the standard data that is used in Redfish.

The Redfish schema files in JSON format are hosted in the DMTF schema repository at http://redfish.dmtf.org/schemas/v1/

Supported schema files

The following schema files are supported for OpenBMC-based systems:

- Account
- AccountCollection
- AccountService
- Certificate
- CertificateCollection
- CertificateLocations
- CertificateService
- Chassis
- ChassisCollection
- ComputerSystem
- ComputerSystemCollection
- EthernetInterface
- EthernetInterfaceCollection
- LogEntry
- LogService
- LogServiceCollection
- Manager
- ManagerCollection
- ManagerNetworkProtocol
- Memory
- MemoryCollection
- Processor
- ProcessorCollection
- Role
- RoleCollection
- ServiceRoot
- Session

- SessionCollection
- SessionService
- SoftwareInventory
- SoftwareInventoryCollection
- ThermalPower
- UpdateService

Accessing the common system management functions on the Redfish service by using cURL command

The following examples show the client URL (cURL) commands that can be used to access the common functions that are supported by the OpenBMC Redfish APIs:

Note: In all cURL commands, *${BMC}* is the IP address of the BMC.

- To view major collections, run the following commands:
  - Chassis collection:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Chassis
    ```

  - Manager collection:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Managers
    ```

  - System collection:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Systems
    ```

- To view the chassis, manager, and system resources, run the following commands:
  - Chassis resource:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Chassis/chassis
    ```

  - Manager resource:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Managers/bmc
    ```

  - System resource:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Systems/system
    ```

- To perform host power control operations, run the following commands:
  - Host power on:

    ```
    -X POST https://${BMC}/redfish/v1/Systems/system/Actions/ComputerSystem.Reset -d
    '{"ResetType": "On"}'
    ```

  - Host soft power off:

    ```
    -X POST https://${BMC}/redfish/v1/Systems/system/Actions/ComputerSystem.Reset -d
    '{"ResetType": "GracefulShutdown"}'
    ```

  - Host hard power off:

    ```
    -X POST https://${BMC}/redfish/v1/Systems/system/Actions/ComputerSystem.Reset -d
    '{"ResetType": "ForceOff"}'
    ```

  - Restart host:

```
-X POST https://${BMC}/redfish/v1/Systems/system/Actions/ComputerSystem.Reset -d
'{"ResetType": "GracefulRestart"}'
```

- To view the host power control resource, run the following command:

  ```
  curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Systems/system/Actions/
  ```

- To view the log resource, run the following command:

  ```
  curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Systems/system/LogServices/EventLog/
  Entries
  ```

- To view sensor resources, run the following commands:
  - Power resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/chassis/Power
    ```

  - Thermal resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/chassis/Thermal
    ```

  - Sensor resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/chassis/Sensors
    ```

- To view inventory resources, run the following commands:
  - Memory resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Systems/system/Memory
    ```

  - Processor resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Systems/system/Processors
    ```

  - Power supply 0 resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/powersupply0
    ```

  - Power supply 1 resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/powersupply1
    ```

  - Motherboard resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/motherboard
    ```

- To update the firmware, run the following commands:
  - By using an image file from your system:

    ```
    curl -u root:0penBmc -curl k -s  -H "Content-Type: application/octet-stream" -X POST -T
    <image file path> https://${BMC}/redfish/v1/UpdateService
    ```

  - By using a Trivial File Transfer Protocol (TFTP) server:

    ```
    curl -u root:0penBmc -k -s -d '{"ImageURI":"<TFTP IP Address>/<File name on
    TFTP server>","TransferProtocol":"TFTP"}' -X POST https://${BMC}/redfish/v1/UpdateService/
    Actions/UpdateService.SimpleUpdate
    ```

- To create a new local account, run the following command:

  -
    ```
    curl -X POST https://${BMC}/redfish/v1/AccountService/Accounts/ -d '{"UserName": "admin",
    "Password": "NEWPASSWORD", "RoleId": "Administrator"}'
    ```

Where `admin` is the name of the user that you want to create, `NEWPASSWORD` is the new password, and `RoleId` maps to the privilege role.

- To change the account password, run the following command:

  -
    ```
    curl -X POST https://${BMC}/redfish/v1/AccountService/Accounts/root -d '{"Password":
    "NEWPASSWORD"}'
    ```

  Where `root` is the account name or user ID and `NEWPASSWORD` is the new password.

For more information about selecting a username, password, or role, see "Local users" on page 94.

Configure BMC connectivity (7063-CR2)
You can configure or view the network settings on the BMC for the management console.

Notes:

- This task applies only to the 7063-CR2. This connection is required to access the baseboard management controller (BMC) on the HMC.
- The settings in this task are applicable only to the dedicated IPMI or BMC network port.

To configure the BMC connection, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change BMC/IPMI network settings**.
3. Select the connection mode (**DHCP** or **Static**).

   If you select **Static** mode, complete the following addresses:

   - **IP address**
   - **Subnet mask**
   - **Gateway**
4. Click **OK**.

You can also configure the BMC network connection by using the Petitboot bootloader interface. For more information, see Configuring the firmware IP address.

Configure BMC connectivity (7063-CR1)
You can configure or view the network settings on the BMC for the management console.

Note: This task applies only to the 7063-CR1. This connection is required to access the baseboard management controller (BMC) on the HMC.

To configure the BMC connection, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change BMC/IPMI network settings**.
3. Select the connection mode (**DHCP** or **Static**).

   If you select **Static** mode, complete the following addresses:

   - **IP address**
   - **Subnet mask**
   - **Gateway**
4. Click **OK**.

You can also configure the BMC network connection by using the Petitboot bootloader interface. For more information, see Configuring the firmware IP address.

Setting the IPv4 address
Learn how to set your IPv4 address on the HMC.

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. Click the **Basic Settings** tab.
6. Select an IPv4 address.
7. If you selected to specify an IP address, enter the TCP/IP interface address and the TCP/IP interface network mask.
8. Click **OK**.

Setting the IPv6 address
Learn how to set your IPv6 address on the HMC.

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. Click the **IPv6 Settings** tab.
6. Select an **Autoconfig** option or add a static IP address.
7. If you added an IP address, enter the IPv6 address and the prefix length and click **OK**.
8. Click **OK**.

Using only IPv6 addresses
Learn how to configure the HMC so that it uses only IPv6 addresses.

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. Select **No IPv4 address**.
6. Click the **IPv6 Settings** tab.
7. Select **Use DHCPv6 to configure IP settings** or add static IP addresses, then click **OK**.

What to do next

After you click **OK**, you must restart your HMC for these changes to take effect.

Changing HMC firewall settings

In an open network, a firewall is used to control outside access to your company network. The HMC also has a firewall on each of its Ethernet adapters. To control the HMC remotely or give remote access to others, modify the firewall settings of the Ethernet adapter on the HMC that is connected to your open network.

About this task

To configure a firewall, use the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. Click the **Firewall** tab.
6. Using one of the following methods, you can allow any IP address by using a particular application through the firewall, or you can specify one or more IP addresses:
   - Allow any IP address by using a particular application through the firewall:
     a. From the top box, highlight the application.
     b. Click **Allow Incoming**. The application displays in the bottom box to signify that it is selected.
   - Specify which IP addresses to allow through the firewall:
     a. From the top box, highlight an application.
     b. Click **Allow Incoming by IP Address**.
     c. On the Hosts Allowed window, enter the IP address and the network mask.
     d. Click **Add** and click **OK**.
7. Click **OK**.

   Notes:

   - For more information about enabling remote restricted shell access, see "Enabling remote restricted shell access" on page 102.
   - For more information about enabling remote web access, see "Enabling remote web access" on page 103.

Enabling remote restricted shell access

You can enable remote restricted shell access when you configure a firewall.

About this task

To enable remote restricted shell access, complete the following steps:

Procedure

1. In the navigation area, click **Users and Security** > **Systems and Console Security**.
2. Click **Enable Remote Command Execution**.
3. Select **Enable remote command execution using the ssh facility** and then click **OK**.

What to do next

Now remote restricted shell access is enabled.

Enabling remote web access

You can enable remote web access to your Hardware Management Console (HMC).

About this task

To enable remote web access, complete the following steps:

Procedure

1. In the navigation area, click **Users and Security** > **Systems and Console Security**.
2. Click **Enable Remote Command Execution**.
3. Select **Enable** and then click **OK**.

What to do next

Now remote web access is enabled.

Configuring a routing entry as the default gateway

Learn how to configure a routing entry as the default gateway. This task is available when you are using an open network.

Before you begin

To configure a routing entry as the default gateway, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change network settings**. The Customize Network Settings window opens.
3. Click the **Routing** tab.
4. In the Default gateway information section, enter the gateway address and gateway device of the routing entry you want to set as the default gateway.
5. Click **OK**.

Configuring domain name services

If you plan to set up an open network, configure domain name services.

About this task

If you plan to set up an open network, configure domain name services. Domain Name System (DNS) is a distributed database system for managing host names and their associated Internet Protocol (IP) addresses. Configuring domain name services includes enabling DNS and specifying the domain suffix search order.

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change network settings**. The Change Network Settings window opens.
3. Click the **Name Services** tab.
4. Select **DNS enabled** to enable DNS.
5. Specify the DNS server and domain suffix search order and click **Add**.
6. Click **OK**.

Configuring domain suffixes

The list of domain suffixes is used to resolve an IP address that starts with the first entry in the list.

About this task

The domain suffix is a string that is appended to a host name that is used to help resolve its IP address. For example, a host name of `myname` might not be resolved. However, if the string `myloc.mycompany.com` is an element in the domain suffix table, then an attempt is made to resolve `myname.mloc.mycompany.com`.

To configure a domain suffix entry, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change network settings**. The Customize Network Settings window opens.
3. Click the **Name Services** tab.
4. Enter a string to be used as a domain suffix entry.
5. Click **Add** to add it to the list.

Configuring the HMC so that it uses LDAP remote authentication

You can configure your Hardware Management Console (HMC) so that it uses LDAP (Lightweight Directory Access Protocol) remote authentication.

Before you begin

When a user logs in to the HMC, authentication is first performed against a local password file. If a local password file is not found, the HMC can contact a remote LDAP server for authentication. You must configure your HMC so that it uses LDAP remote authentication.

Note: Before you configure the HMC so that it uses LDAP authentication, you must ensure that a working network connection exists between the HMC and the LDAP servers. For more information about configuring HMC network connections, see "Configuring the HMC network types" on page 70.

About this task

To configure your HMC so that it uses LDAP authentication, complete the following steps:

Procedure

1. In the navigation area, click the **Users and Security** icon , and then select **Systems and Console Security**.
2. In the content pane, select **Manage LDAP**. The LDAP Server Definition window opens.
3. Select **Enable LDAP**.
4. Define an LDAP server to use for authentication.
5. Define the LDAP attribute that is used to identify the user that is being authenticated. The default is **uid**, but you can use your own attributes.
6. Define the distinguished name tree, also known as the search base, for the LDAP server.
7. Click **OK**.
8. If a user wants to use LDAP authentication, the user must configure their profile so that it uses LDAP remote authentication instead of local authentication.

Configuring the HMC so that it uses Key Distribution Center servers for Kerberos remote authentication

You can configure the HMC so that it uses Key Distribution Center (KDC) servers for Kerberos remote authentication.

Before you begin

When a user logs in to the HMC, authentication is first verifies against a local password file. If a local password file is not found, the HMC can contact a remote Kerberos server for authentication. You must configure your HMC so that it uses Kerberos remote authentication.

Note: Before you configure the HMC so that it uses KDC servers for Kerberos remote authentication, you must ensure that a working network connection exists between the HMC and the KDC servers. For more information about configuring HMC network connections, see "Configuring the HMC network types" on page 70.

About this task

To configure the HMC so that it uses KDC servers for Kerberos remote authentication, complete the following steps:

Procedure

1. Enable the Network Time Protocol (NTP) service on the HMC and set the HMC and the KDC servers to synchronize time with the same NTP server. To enable the NTP service on the HMC, complete the following steps:
   a) In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
   b) In the content pane, select **Change Date and Time**.
   c) Select the **NTP Configuration** tab.
   d) Select **Enable NTP service on this HMC**.
   e) Click **OK**.
2. Configure each remote HMC user's profile so that it uses Kerberos remote authentication instead of local authentication.
3. Optionally, you can import a service-key file into this HMC. The service-key file contains the host principal that identifies the HMC to the KDC server. Service-key files are also known as *keytabs*. To import a service-key file into this HMC, complete the following steps:
   a) In the navigation area, click the **Users and Security** icon , and then select **Systems and Console Security**.
   b) In the content pane, select **Manage KDC**.
   c) Select **Actions > Import Service Key**. The Import Service Key window opens.
   d) Type the location of the service key file.
   e) Click **OK**.
4. Add a new KDC server to this HMC. To add a new KDC server to this HMC, complete the following steps:
   a) In the navigation area, click the **Users and Security** icon , and then select **Systems and Console Security**.
   b) In the content pane, select **Manage KDC**.

c) Select **Actions > Add KDC Server**. The Import Service Key window opens.

d) Type the realm and the host name or IP address of the KDC server.

e) Click **OK**.

Configuring the local console to report errors to service and support

Configure this HMC so that it can call-home errors by using LAN connectivity.

Configuring the HMC so that it can connect to service and support by using the call-home setup wizard
Configure the HMC so that it is a call-home server by using the call-home wizard.

Before you begin

This procedure describes how to configure the HMC as a call-home server by using direct (LAN-based) and indirect (SSL) connections to the internet.

Before you begin this task, ensure that:

- The network administrator verifies that connectivity is allowed. For more information, see "Preparing for HMC configuration" on page 59.
- If you are configuring internet support through a proxy server, you must also have the following information:
  - The IP address and port of the proxy server
  - The proxy authentication information
- The adapter that is designated as **eth1** (the one that is designated as an open network) is used. For more information, see "Choosing network settings on the HMC" on page 51.
- An Ethernet cable physically connects the HMC to the LAN.

To configure the HMC so that it is a call-home server by using the call-home wizard, complete the following steps:

Procedure

1. In the navigation area, click the **Serviceability** icon, and then select **Service Management**.
2. In the content pane, click **Call-Home Setup Wizard**. The Connectivity and Call-Home Servers wizard opens. Follow the instructions in the wizard to configure call-home.

Configuring the local console to report errors to service and support
Configure this HMC so that it can call-home errors by using LAN connectivity.

Configuring an HMC to contact service and support by using LAN-based internet and SSL
Describes how to configure the HMC as a call-home server by using direct (LAN-based) and indirect (SSL) connections to the internet.

Before you begin

Before you begin this task, ensure that:

- The network administrator verifies that connectivity is allowed. For more information, see "Preparing for HMC configuration" on page 59.
- Customer contact information is configured. Verify the contact information by going to the HMC interface and clicking **Serviceability>Service Management > Manage Customer Information**.
- If you are configuring internet support through a proxy server, you must also have the following information:
  - The IP address and port of the proxy server

  - The proxy authentication information
- You need at least one open network interface configured. For more information, see “Private and open networks in the HMC environment” on page 53.
- An Ethernet cable physically connects the HMC to the LAN.

About this task

To configure the HMC as a Call Home server by using LAN-based internet and SSL, complete the following steps:

Procedure

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the Connectivity section, click **Manage Outbound Connectivity**. The Call-home Server Consoles window opens.
3. Click **Configure.**
4. In the Outbound Connectivity Settings window, check **Enable local system as call-home server**.
5. Accept the agreement.
6. In the Outbound Connectivity Settings window, select the **Internet** page.
7. Check the **Allow an existing internet connections for service** box.
8. If you are using an SSL proxy, check the **Use SSL proxy** box.
9. If you are using an SSL proxy, complete the proxy's address and port. Obtain this information from the network administrator.
10. If you checked **Use SSL proxy** and the proxy requires user ID and password authentication, check the **Authenticate with the SSL proxy** box. Type the user ID and password. Obtain the user ID and password from the network administrator.
11. Select the **Protocol to Internet** you want to use.
12. On the **Internet** page, click **Test**.
13. In the Test internet window, click **Start**.
14. Verify that the test completes successfully.
15. In the Test internet window, click **Cancel**.
16. In the Outbound Connectivity Settings window, click **OK**.

Choosing existing call-home servers to connect to service and support for this HMC
Choose existing Hardware Management Console (HMC) call-home servers that are recognized or discovered by the HMC to report errors.

Before you begin

Discovered HMCs are HMCs that are enabled as call-home servers and are either on the same subnet or manage the same managed system as this HMC.

To choose a discovered HMC to call home when the HMC reports errors, complete the following steps:

Procedure

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Manage Outbound Connectivity**. The Call-Home Server Consoles window opens.

3. Click **Use discovered call-home server consoles**. The HMC displays the IP address or host name of the HMCs configured for call-home.
4. Click **OK**.

Results

You can also manually add existing HMC call-home servers that are on a different subnet. Select the IP address or host name of the HMC that is configured for call home and click **Add** and then click **OK**.

Verifying that your connection to service and support is working
Test problem reporting to ensure that connection to service and support is working.

About this task

To verify that your call-home configuration is working, complete the following steps:

Procedure

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Create Event**.
3. Select **Test Automatic problem Reporting** and type a comment.
4. Click **Request Service**. Wait a few minutes for the request to be sent.
5. In the Service Management window, select **Manage Events**.
6. Select **All open problems**.
7. Verify that a PMH event and number is assigned to the problem number you opened.
8. Select that event and click **Close**.
9. On the **Close** window, type your name and a brief comment.

Authorizing users to view collected system data
You must authorize users to view data about your systems.

Before you begin

Before you authorize users to view collected system data, you must obtain an IBM ID. For more information about obtaining an IBM ID, see "Preinstallation configuration worksheet for the HMC" on page 60.

About this task

To authorize users to view collected system data, complete the following steps:

Procedure

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, select **Authorize User**.
3. Enter your IBM ID.
4. Click **OK**.

Transmitting service information
You can transmit information to your service provider immediately, or you can schedule the information to be sent regularly.

Before you begin

IBM provides personalized web functions that use information that is collected by IBM Electronic Service Agent. To use these functions, you must first register on the IBM Registration website at http://www.ibm.com/account/profile. To authorize users to use the Electronic Service Agent information to personalize the web functions, see "Authorizing users to view collected system data" on page 108. For more information about the benefits of registering an IBM ID with your systems, see http://www.ibm.com/support/electronic.

Note: You must transmit service provider information as soon as the HMC is installed and configured for use.

About this task

To transmit service information, complete the following steps:

Procedure

1. In the navigation area, click the **Serviceability** icon, and then select **Service Management**.
2. In the content pane, click **Transmit Service Information.**
3. Complete the tasks in the **Transmit Service Information** window, and click **OK**.

Configuring the Events Manager for Call Home

Learn how to configure the Events Manager for Call Home task. You can monitor and approve any data that is being transmitted from an HMC to IBM through this task.

The Events Manager for Call Home mode (enabled or disabled) is set by using the HMC command line interface. Enabling the Events Manager for Call Home task blocks the HMC from automatically calling home events as they occur. To prevent events that are called home without approval, all HMCs running in this environment must have the Events Manager for Call Home enabled.

To enable or disable the Events Manager for Call Home task, run the following command:

```
chhmc -c emch

-s {enable | disable}

[--callhome {enable | disable}]

[--help]
```

Note: Enabling the Events Manager for Call Home task holds call home events until they are approved for the call home task. If you disable the Events Manager for Call Home task, it does not automatically enable the call home feature. This setup prevents any unintended call home of data back to IBM. Choose from the following command options to set up the required configuration:

- To enable the Events Manager for Call Home task: **`chhmc -c emch -s enable`**
- To disable the Events Manager for Call Home task and to re-enable automatic call home: **`chhmc -c emch -s disable --callhome enable`**
- To disable the Events Manager for Call Home task and not re-enable automatic call home: **`chhmc -c emch -s disable --callhome disable`**

Ensure that the HMC can communicate with other HMCs deployed in this environment. The Events Manager for Call Home has a test connection function when an HMC is registered.

You can register the HMC with the Events Manager for Call Home. After you register the HMC, the events manager queries the registered HMC for any events that are waiting to be called home to IBM. The Events

Manager shows what data is being sent back to IBM and approves these events. After approval, the Event Manager notifies the registered HMC that it can proceed with the call home operation.

The Events Manager for Call Home task can be run from any HMC or from multiple HMCs. To register a management console with the Events Manager for Call Home task, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Events Manager for Call Home**.
2. From the **Events Manager for Call Home** pane, click **Manage Consoles**.
3. From the **Manage Registered Consoles** window, click **Add Console** to enter information to register a management console with the Events Manager for Call Home task.
4. Click **OK** to commit the changes to the list of registered management console.

Note: The Events Manager for Call Home can be used with the event manager mode disabled. You can still register the HMC and view events in the events manager, but Events Manager does not control when the events are called home.

Setting passwords for the managed system

You must set passwords for both your server and Advanced System Management (ASM). Read more about how to use the HMC interface to set these passwords.

Before you begin

If you received the message `Authentication Pending`, the HMC prompts you to set the passwords for the managed system.

About this task

If you did not receive the message Authentication Pending, complete the following steps to set the passwords for the managed system.

Updating your server password

Before you begin

To update your server password, complete the following steps:

Procedure

1. In the navigation area, select the managed system and click the **Users and Security** icon , and then select **Users and Roles**.
2. Click **Change Password**. The Update Password window opens.
3. Type the required information and click **OK**.

Updating your Advanced System Management (ASM) general password

Before you begin

Note: The default password for the general user ID is `general`, and the default password for the administrator ID is `admin`.

To update your ASM general password, complete the following steps:

Procedure

1. In the navigation area of the HMC, select the managed system.

2. In the Tasks area, click **Operations**.
3. Click **Advanced System Management (ASM)**. The Launch ASM Interface window opens.
4. Select a Service Processor IP Address and click **OK**. The ASM interface opens.
5. On the ASMI Welcome pane, specify your user ID and password, and click **Log In**.
6. In the navigation area, expand **Login Profile**.
7. Select **Change Password**.
8. Specify the required information, and click **Continue**.

Resetting the Advanced System Management (ASM) administrator password

Before you begin

To reset the administrator password, contact an authorized service provider.

Testing the connection between the HMC and the managed system

Learn how to verify that you are properly connected to the network.

About this task

To test the network connectivity, you must be a member of one of the following roles:

- Super administrator
- Service representative

To test the connection between the HMC and the managed system, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Test Network Connectivity**.
3. In the Ping tab, type the host name or IP address of any system to which you want to connect. To test an open network, type the gateway. Click **Ping**.

Results

If you have not created any logical partitions, you cannot ping the addresses. You can use the HMC to create logical partitions on your server. For more information, see Logical partitioning.

To understand how the HMC can be used in a network, see "HMC network connections" on page 51.

For more information about configuring the HMC to connect to a network, see "Configuring the HMC by using the menus " on page 67.

Postconfiguration steps

After you install and configure the HMC, back up HMC data as necessary.

Backing up management console data

This task backs up (or archives) the data that is stored on your HMC hard disk that is critical to support HMC operations.

Before you begin

Your remote system must have Network File System (NFS) or Secure Shell (ssh) configured, and this network must be accessible from the HMC. To complete this task, you must shut down and reboot the HMC. Use only the HMC to perform these tasks.

About this task

To back up the HMC hard disk drive to a remote system, you must be a member of one of the following roles:

- Super administrator
- Operator
- Service representative

Back up the HMC data after changes have been made to the HMC or information associated with logical partitions.

The HMC data stored on the HMC hard drive can be saved to a DVD-RAM on a local system, a remote system mounted to the HMC file system (such as NFS), or sent to a remote site using File Transfer Protocol (FTP).

Note: For HMC model 7063-CR1, you can connect an external USB DVD drive.

Using the HMC, you can back up all important data, such as the following:

- User-preference files
- User information
- HMC platform-configuration files
- HMC log files
- HMC updates through Install Corrective Service.

To back up the HMC hard drive to a remote system, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Managment**.
2. In the content pane, click **Backup Management Console Data**.
3. From the **Backup Management Console Data** window, select the archive option you want to perform.
4. Click **Next**, then follow the appropriate instructions depending on the option you chose.
5. Click **OK** to continue with the backup process.

Updating, upgrading, and migrating your HMC machine code

Updates and upgrades are periodically released for the HMC to add new functionality and to improve existing features. Learn more about the differences between updating, upgrading, and migrating your HMC machine code. Also learn how to perform an HMC machine code update, upgrade, or migration.

When you are finished with each of these tasks, the HMC reboots but the partitions do not.

Updating HMC code

Applies maintenance to an existing HMC level

Does not require that you perform the **Save upgrade data** task

Upgrading HMC code

Replaces HMC software with a new release or fix level of the same program

Requires that you boot from recovery media

Migrating HMC code

Moves HMC data from one HMC version to another

A migration is a type of upgrade.

Note: For HMC model 7063-CR1, you can connect an external USB DVD drive.

Determining your HMC machine code version and release

Find out how to view the HMC machine code version and release.

About this task

The level of machine code on the HMC determines the available features, including concurrent server firmware maintenance and enhancements to upgrading to a new release.

To view the HMC machine code version and release, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon, and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the **Current HMC Driver Information** heading, including: the HMC version, release, maintenance level, build level, and base versions.

Obtaining and applying machine code updates for the HMC with an Internet connection

Learn how to obtain machine code updates for the HMC when the HMC has an Internet connection.

About this task

To obtain machine code updates for the HMC, complete all steps.

Step 1. Ensure that you have an Internet connection

About this task

To download updates from the service and support system or website to your HMC or server, you must have one of the following connections:

- SSL connectivity with or without a SSL proxy
- Internet VPN

To ensure that you have an Internet connection, do the following:

Procedure

1. In the navigation area, click the **Serviceability** icon, and then select **Service Management**.
2. In the content pane, **Manage Outbound Connectivity**.
3. Select the tab for the type of outbound connectivity that you chose for your HMC (Internet VPN or SSL connectivity).

   Note: If a connection to service and support does not exist, set up the service connection before proceeding with this procedure. For instructions on how to set up a connection to service and support, see Setting up your server to connect to IBM service and support.
4. Click **Test**.
5. Verify that the test completes successfully.

   If the test is not successful, troubleshoot your connectivity and correct the problem before proceeding with this procedure. Alternatively, you can obtain the update on DVD.

   Note: For HMC model 7063-CR1, you can connect an external USB DVD drive.

6. Continue with “Step 2. View the existing HMC machine code level” on page 114.

Step 2. View the existing HMC machine code level

About this task

To view the existing HMC machine code level, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver Information heading, including: the HMC version, release, maintenance level, build level, and base versions.
4. Continue with “Step 3. View the available HMC machine code levels” on page 114.

Step 3. View the available HMC machine code levels

About this task

To view the available HMC machine code levels, complete the following steps:

Procedure

1. From a computer or server with an Internet connection, go to http://www.ibm.com/eserver/support/fixes.
2. Select the appropriate family in the Product family list.
3. Select **Hardware Management Console** in the Product or fix type list.
4. Click **Continue**.

   The Hardware Management Console site is displayed.
5. Scroll down to your HMC Version level to view available HMC levels.

   Note: If you prefer, you can contact service and support.
6. Continue with “Step 4. Apply the HMC machine code update” on page 114.

Step 4. Apply the HMC machine code update

About this task

To apply the HMC machine code update, complete the following steps:

Procedure

1. Before you install updates to the HMC machine code, back up critical console information on your HMC.

   For instructions, see “Backing up management console data” on page 111. Then continue with the next step.

2. In the navigation area, click the **HMC Management** icon , and then select **Console Management**.
3. In the content pane, click **Update the Hardware Management Console**. The Install Corrective Service Wizard opens.
4. Follow the instructions in the Wizard to install the update.
5. Shut down and then restart the HMC for the update to take effect.
6. Click **Log on and launch the Hardware Management Console web application**.
7. Log in to the HMC interface.

Step 5. Verify that the HMC machine code update installed successfully

About this task

To verify that the HMC machine code update installed correctly, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver Information heading, including: the HMC version, release, maintenance level, build level, and base versions.
4. Verify that the version and release match the update that you installed.
5. If the level of code displayed is not the level that you installed, perform the following steps:

   a. Select the network connection on the HMC.

   b. Retry the firmware update using a different repository.

   c. If the problem persists, contact your next level of support.

Obtaining and applying machine code updates for the HMC using DVD or an FTP server

Learn how to obtain machine code updates for the Hardware Management Console (HMC) by using DVD or an FTP server.

About this task

To obtain HMC machine code updates, complete all steps.

Note: For HMC model 7063-CR1, you can connect an external USB DVD drive.

Step 1. View the existing HMC machine code level

Before you begin

To view the existing HMC machine code level, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver Information heading, including: the HMC version, release, maintenance level, build level, and base versions.
4. Continue with "Step 2. View the available HMC machine code levels" on page 116.

Step 2. View the available HMC machine code levels

Before you begin

To view the available HMC machine code levels, complete the following steps:

About this task

Procedure

1. From a computer or server with an internet connection, go to the Fix Central website.
2. Scroll down to your HMC Version level to view available HMC levels.

   Note: If you prefer, you can contact IBM service and support.
3. Continue with "Step 3. Obtain the HMC machine code update" on page 116.

Step 3. Obtain the HMC machine code update

Before you begin

To obtain the HMC machine code update, complete the following steps:

About this task

You can order the HMC machine code update through the Fix Central website, contact service and support, or download it to an FTP server.

Ordering the HMC machine code update through the Fix Central website

1. From a computer or server with an Internet connection, go to the Fix Central website.
2. Under Supported HMC products, select the latest HMC level.
3. Scroll down to the File names / Package area and locate the update that you want to order.
4. In the Order column, select **Go**.
5. Click **Continue** to sign in with your IBM ID.
6. Follow the on-screen prompts to submit your order.

Downloading the HMC machine code update to removable media

1. From a computer or server with an Internet connection, go to Fix Central website.
2. Under Supported HMC products, select the latest HMC level.
3. Scroll down to the File names / Package area and locate the update that you want to download.
4. Click the update that you want to download.
5. Accept the license agreement, and save the update to your removable media.

What to do next

When you are finished, continue with “Step 4. Apply the HMC machine code update” on page 117.

Step 4. Apply the HMC machine code update

Before you begin

To apply the HMC machine code update, complete the following steps:

Procedure

1. Before you install updates to the HMC machine code, back up HMC data. For more information, see “Backing up management console data” on page 111.
2. If you obtained or created the update on DVD-RAM, insert it into the DVD drive on the HMC. If you obtained or created the update on a USB memory device, insert the memory device.
3. Before you install updates to the HMC machine code, back up critical console information on your HMC.

   For instructions, see “Backing up management console data” on page 111. Then continue with the next step.
4. In the navigation area, click the **HMC Management** icon, and then select **Console Management**.
5. In the content pane, click **Update the Hardware Management Console**. The Install Corrective Service Wizard opens.
6. Follow the instructions in the Wizard to install the update.
7. Shut down, restart, and log back in to the HMC for the update to take effect.
8. Continue with “Step 5. Verify that the HMC machine code update installed successfully” on page 117.

Step 5. Verify that the HMC machine code update installed successfully

Before you begin

To verify that the HMC machine code update installed successfully, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon, and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver Information heading, including: the HMC version, release, maintenance level, build level, and base versions.
4. Verify that the version and release match the update that you installed.
5. If the level of code that is displayed is not the level that you installed, perform the following steps:

   a. Retry the machine code update. If you created a DVD for this procedure, use a new media.

   b. If the problem persists, contact your next level of support.

Upgrading your HMC software

Learn how to upgrade the software on an HMC from one release to the next while you maintain your HMC configuration data.

About this task

To upgrade the machine code on an HMC, complete all steps.

Note: For HMC models 7063-CR1 and 7063-CR2, you can connect an external USB DVD drive.

Step 1. Obtain the upgrade

About this task

You can order the HMC machine code upgrade through the Fix Central website.

To obtain the upgrade through the Fix Central website, complete the following steps:

Procedure

1. From a computer or server with an internet connection, go to the Hardware Management Console website at http://www-933.ibm.com/support/fixcentral/.
2. Click **Continue**.

   The Hardware Management Console site is displayed.
3. Navigate to the HMC version you want to upgrade to.
4. Locate the download and ordering section.

   Note: If you do not have access to the internet, contact IBM service and support to order the upgrade on DVD.
5. Follow the on-screen prompts to submit your order.
6. After you have the upgrade, continue with “Step 2. View the existing HMC machine code level” on page 118.

Step 2. View the existing HMC machine code level

About this task

To determine the existing level of machine code on an HMC, follow these steps:

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Console Management**. In the navigation area, click **Updates**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver information heading, including the HMC version, release, maintenance level, build level, and base versions.
4. Continue with “Step 3. Back up the managed system's profile data” on page 118.

Step 3. Back up the managed system's profile data

About this task

To back up the managed system's profile data, complete the following steps:

Procedure

1. Select the system that you want to save the profile data.
2. Click **Actions** > **View All Actions** > **Legacy** > **Manage Partition Data** > **Backup**.
3. Type a backup file name and record this information.
4. Click **OK**.
5. Repeat these steps for each system.
6. Continue with "Step 4. Back up HMC data" on page 119.

Step 4. Back up HMC data

About this task

Back up HMC data before you install a new version of HMC software so that previous levels can be restored in the event of a problem while you upgrade the software. Do not use this critical console data after a successful upgrade to a new version of the HMC software.

Note: To back up to removable media, you need to have that media available.

To back up HMC data, complete the following steps:

Procedure

1. If you plan to back up to media, perform the following steps to format the media:
   a. Insert the media into the drive.
   b. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
   c. In the content pane, click **Format Media**.
   d. Select the media type.
   e. Select the format type.
   f. Click **OK**.
2. In the navigation area, click the **HMC Management** icon , and then select **Console Management**.
3. In the content pane, click **Backup Management Console Data**.

   The **Backup Management Console Data** window opens.
4. Select an archive option.

   You can back up to media on a local system, a remote system that is mounted to the HMC file system (for example, NFS), or send the backup to a remote site by using File Transfer Protocol (FTP).

   - To back up to a local system, choose **Back up to media on local system** and follow the instructions.
   - To back up to a mounted remote system, choose **Back up to mounted remote system** and follow the instructions.
   - To back up to a remote FTP site, choose **Send back up critical data to remote site** and follow the instructions.
5. Continue with "Step 5. Record the current HMC configuration information" on page 119.

Step 5. Record the current HMC configuration information

About this task

Before you upgrade to a new version of HMC software, as a precautionary measure, record HMC configuration information.

To record the current HMC configuration, complete the following steps:

Procedure

1. Select a managed system or any partitions that you want to record HMC configuration information.
2. From the menu pod, select **Actions** > **Schedule Operations**.
   All scheduled operations for the target that you selected are displayed.
3. Select **Sort** > **By Object**.
4. Select each object and record the following details:
   - Object Name
   - Schedule date
   - Operation Time (displayed in 24-hour format)
   - Repetitive (if Yes, complete the following steps):
     a. Select **View** > **Schedule Details**.
     b. Record the interval information.
     c. Close the scheduled operations window.
     d. Repeat for each scheduled operation.
5. Close the **Customize Scheduled Operations** window.
6. Continue with "Step 6. Record remote command status" on page 120.

Step 6. Record remote command status

About this task

To record remote command status, complete the following steps:

Procedure

1. In the navigation area, click the **Users and Security** icon 🔓, and then select **Systems and Console Security**.
2. In the content pane, click **Enable Remote Command Execution**.
3. Record whether the **Enable remote command execution using the ssh facility** check box is selected.
4. Click **Cancel**.
5. Continue with "Step 7. Save upgrade data" on page 120.

Step 7. Save upgrade data

About this task

You can save the current HMC configuration in a designated disk partition on the HMC or to local media. Save upgrade data only immediately before you upgrade your HMC software to a new release. You can restore the HMC configuration settings after you upgrade.

Note: Only one level of backup data is allowed. Each time that you save upgrade data, the previous level is overwritten.

To save upgrade data, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon, and then select **Console Management**.
2. In the content pane, click **Save Upgrade Data**. The **Save Upgrade Data** wizard opens.
3. Select the media on which you want to save the upgrade data. If you choose to save to removable media, insert the media now. Click **Next**.
4. Click **Finish**.
5. Wait for the task to complete.

   If the Save Upgrade Data task fails, contact your next level of support before proceeding.

   Note: If the save upgrade data task fails, do not continue the upgrade process.
6. Click **OK**.
7. Continue with "Step 8. Upgrade the HMC software" on page 121.

Step 8. Upgrade the HMC software

About this task

To upgrade the HMC software, restart the system with the removable media in the DVD drive.

Procedure

1. Insert the HMC Product Installation media into the DVD drive.
2. In the navigation area, click the **HMC Management** icon, and then select **Console Management**.
3. In the content pane, select **Shutdown or Restart the Managment Console**.
4. Ensure **Restart the HMC** is selected.
5. Click **OK**.

   The HMC restarts and system information scrolls on the window.
6. Select **Upgrade** and click **Next**.
7. Choose from the following options:
   - If you saved the upgrade data during the previous task, continue with the next step.
   - If you did not save the upgrade data previously in this procedure, you must save the upgrade data now before you continue.
8. Select **Upgrade from media** and click **Next**.
9. Confirm the settings and click **Finish**.
10. Follow the prompts.

    Note:

    - If the screen goes blank, press the space bar to view the information.
    - The first DVD can take approximately 20 minutes to install.
11. At the login prompt, log in using your user ID and password.

    The HMC code installation is complete.
12. Continue with "Step 9. Verify that the HMC machine code upgrade installed successfully" on page 122.

Step 9. Verify that the HMC machine code upgrade installed successfully

About this task

To verify that the HMC upgrade is installed successfully, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon, and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver information heading, including the HMC version, release, maintenance level, build level, and base versions.
4. Verify that the version and release match the update that you installed.
5. If the level of code that is displayed is not the level that you installed, retry the upgrade task by using a new DVD. If the problem persists, contact your next level of support.

Upgrading HMC from remote location by using network upgrade images

Learn how to upgrade the software on an HMC from a remote location by using network upgrade images.

About this task

Learn how to upgrade the software on an HMC from a remote location by using network upgrade images.

Procedure

1. From a computer or server with an internet connection, go to the Hardware Management Console Support and downloads website (http://www14.software.ibm.com/webapp/set2/sas/f/hmcl/home.html).
2. Download the appropriate HMC V9 network images and save them on an FTP server.

   You cannot download these files directly to the HMC. You must download the image files to a server that accepts FTP requests.
3. Ensure that you download the following files:
   - img2a
   - img3a
   - base.img
   - disk1.img
   - hmcnetworkfiles.sum
4. Save the upgrade data on the HMC. Run the following commands to save the upgrade data:
   - To save data on both DVD and HDD, run the following commands:

     ```
     mount /media/cdrom
     ```

     ```
     saveupgdata -r diskdvd
     ```
   - To save data on the HDD, run the following command:

     ```
     saveupgdata -r disk
     ```
5. Copy the upgrade files to the bootable disk partition on the HMC. Run the **`getupgfiles`** command to copy the files.

   Example: **`getupgfiles -h <ftp server> -u <user id> -d <remote directory>`**

Where,

- **`ftp server`** is the host name or IP address of the FTP server where you download the HMC network images.
- **`user id`** is a valid user ID on the FTP server. If you do not specify the password with the `--passwd` argument, you are prompted for a password.
- **`remote directory`** is the directory on your FTP server where the HMC network images are saved.

6. Restart the HMC to upgrade the code that is copied to the bootable disk partition. Run the **`chhmc -c altdiskboot -s enable --mode upgrade`** to restart the HMC.
7. Restart the HMC and start the upgrade. Run the **`hmcshutdown -r -t now`** command to start the upgrade.

Securing the HMC

Learn how to enhance the security of your Hardware Management Console (HMC) that is based on your corporate security standards.

The default configuration of the HMC provides ample security for most enterprise users. With the Hardware Management Console (HMC) Version 8.4.0, or later, you can further enhance the security of the HMC that is based on your corporate security standards. To enhance the security for the HMC, you must set the HMC to a minimum of Level 1 security. You may choose Level 2 and Level 3 security depending on your environment and the corporate security requirements.

Note: Before changing the security level, check with your corporate security compliance team.

Level 1 security

To secure the HMC (level 1 security), complete the following steps:

1. Change the predefined password for the default `hscroot` user. For more information about password policy, see "Enhanced password policy" on page 125.
2. If the HMC does not belong to a physically secure environment, set the `grub` password by running the following command: `chhmc -c grubpasswd -s enable --passwd <new grub password>`
3. If you have configured the Integrated Management Module (IMM) on the HMC, set a strong IMM password.
4. Set a strong password for the *admin* user and general users on all servers.
5. Update the HMC with the latest released security fixes. For more information about the security fixes, see IBM Fix Central.

Level 2 security

If you have multiple users, complete the following steps to enhance the security for the HMC:

1. Create an account for each user on the HMC and assign the required roles and resources to users. For more information about the various roles in the HMC, see HMC tasks, user roles, IDs, and associated commands.

   Note: Ensure that you assign only the required resources and roles for users that are created on HMC. If necessary, you can also create custom roles.
2. Enable user data replication between different Hardware Management Consoles. The user data replication can be performed in Master-slave mode or Peer-Peer mode. For more information about user data replication, see Manage Data Replication.
3. Import a certificate that is signed by the Certificate Authority.

Level 3 security

If you have multiple Hardware Management Consoles and system administrators, complete the following steps to enhance the security for the HMC:

1. Use centralized authentication such as Lightweight Directory Access Protocol (LDAP) or Kerberos. For more information about configuring LDAP, see How to Configure LDAP on HMC.
2. Enable user data replication between different Hardware Management Consoles.
3. Ensure that the HMC is in NIST SP 800-131A mode so that the HMC uses only strong ciphers.
4. Block ports that are not required in the firewall. For information about the HMC ports that can be used, see the following table:

Table 36. Port used by the user for interaction with HMC

Port	Description	Type	Protocol version (Default mode)	Protocol Version (NIST mode)
22	Open SSH	TCP	SSH v3	SSH v3
123	NTP	UDP	NTP	NTP
161	SNMP Agent	UDP	SNMP v3	SNMP v3
162	SNMP Trap	UDP	SNMP v3	SNMP v3
427	SLP	UDP	N/A	N/A
443	HMC GUI and REST API	TCP	HTTPS (TLS 1.2)	HTTPS (TLS 1.2)
657	RMC	TCP/UDP	RSCT (Plain text + hash and sign)	RSCT (Plain text + hash and sign)
2300	5250 Terminal for IBM i	TCP	Plain text	Plain text
2301	5250 Secure terminal for IBM i	TCP	TLS 1.2	TLS 1.2
5989	CIM (legacy port, non-functional)	TCP	Non-functional	Non-functional
9900	FCS: HMC-HMC discovery	UDP	FCS	FCS
9920	FCS: HMC-HMC communication	TCP	HTTPS (TLS 1.2)	HTTPS (TLS 1.2)
9960	VTerm applet in GUI	TCP	HTTPS (TLS 1.2)	HTTPS (TLS 1.2)
12443	HMC REST API (legacy port)	TCP	HTTPS (TLS 1.2)	HTTPS (TLS 1.2)
12347	RSCT Peer Domain	UDP	RSCT (Plain text + hash and sign)	RSCT (Plain text + hash and sign)
12348	RSCT Peer Domain	UDP	RSCT (Plain text + hash and sign)	RSCT (Plain text + hash and sign)

Notes:

- You must use only SSH (port 22), HTTPS (port 443 and port 12443), 5250 secure terminal for IBM i (port 2301), and VTerm (port 9960) that are exposed to an intranet. All other ports must be used in a private or isolated network. You can use a separate Ethernet port and VLAN for the Resource

Monitoring and Control (RMC) (port 657), FCS (port 9900 and port 9920), and RSCT Peer Domain (port 12347 and port 12348).

- Ports listed in the **`netstat`** command are used for internal processes only.

Enhanced password policy

You can enforce password requirements for locally authenticated users by using the Hardware Management Console (HMC). The enhanced password policy function allows the system administrator to set password restrictions. The enhanced password policy applies to the systems in which an HMC is installed.

System administrators can use the enhanced password policy to define a single password policy for all users. The HMC provides a medium security password policy, which can be activated by the system administrators to set password restrictions. The system administrator can also choose to activate the medium security policy or a new user-defined policy. The HMC medium security password policy cannot be removed from the system. The following table lists the attributes of the medium security policy and the default values.

Table 37. Password attributes for the HMC medium security password policy

Attribute	Description	Default value
`min_pwage`	The minimum number of days for which a password must remain active.	1
`pwage`	The maximum number of days for which a password might remain active.	180
`min_length`	The minimum length of a password.	8
`hist_size`	The number of previously saved passwords that cannot be reused.	10
`warn_pwage`	When the password is about to expire, the number of days before which a user is warned that the password is about to expire.	7
`min_digits`	The minimum number of digits that are required to be used in the password.	None
`min_uppercase`	The minimum number of upper case characters.	1
`min_lowercase`	The minimum number of lower case characters.	6
`min_special_chars`	The minimum number of special characters that must be used in the password.	None

Consider the following items about the HMC medium security password policy:

- The policy features for password age and login disablement are not applicable to the **hscroot**, **hscpe**, and **root** user IDs. The policy feature for password character validation is applicable for these user IDs.
- The policy affects only the locally authenticated users that are managed by the HMC and the policy cannot be enforced on LDAP or Kerberos users.
- The HMC medium security password policy or the user-defined policy allows the system administrators to set password reuse restrictions.
- The HMC medium security password is read-only and the attributes of HMC medium security password cannot be changed. You can create a new user-defined password to set password restriction.

You can use the following commands to configure the HMC medium security password policy:

mkpwdpolicy
Imports the password policy from a file, which contains all the parameters, or creates a password policy.

lspwdpolicy
Lists all the available password policy profiles and searches for specific parameters. You can also view the password policy that is currently active.

rmpwdpolicy
Removes an existing inactive password policy.

Note: You cannot remove an active medium security policy and the default read-only password policy.

chpwdpolicy
Changes parameters of an inactive password policy.

Solving common problems while securing the HMC

Learn how to solve some problems that you might encounter when you secure the HMC.

How to secure the connection between the Hardware Management Console (HMC) and the system?

The HMC connects to the system through the Flexible Service Processor (FSP). A proprietary binary protocol called Network Client protocol (NETC) is used for managing both FSP and Power hypervisor. The following table lists ports that are used by the HMC:

Table 38. Ports on FSP that are used to interact with the HMC

Port on FSP	Description	Protocol version (Default mode)	Protocol Version (NIST mode)
443	Advanced System Management Interface	HTTPS (TLS 1.2)	HTTPS (TLS 1.2)
30000	NETC	NETC (TLS 1.2). Falls back to SSLv3 for support of older firmware.	NETC (TLS 1.2)
30001	VTerm	NETC (TLS 1.2). Falls back to SSLv3 for support of older firmware.	NETC (TLS 1.2)

How to lock the HMC?

If you want to enhance the security for your infrastructure, you can use an Intrusion Prevention System (IPS) device or add all Hardware Management Consoles and IBM Power Systems servers behind a firewall. Also, you can disable network services on the HMC if you do not use it remotely or if you want to lock the HMC down. To disable network services on the HMC, complete the following steps:

1. Disable remote command execution by using the SSH port.
2. Disable remote virtual terminal (VTerm port).
3. Disable remote web access (HMC graphical user interface and REST API).
4. Block ports in firewall by using HMC network settings for each configured Ethernet port.

How to set the HMC in NIST SP 800-131A compliance mode?

With HMC Version 8.1.0, or later, when you set the HMC in the compliance mode, only strong ciphers listed by NIST SP 800-131A are supported. You might not be able to connect to older Power Systems servers such as, POWER5 servers that do not support Transport Layer Security (TLS 1.2). For more information about changing the security mode, see HMC V8R8 NIST mode.

How to view and change ciphers that are used by the HMC?

With HMC Version 8.1.0, or later, the HMC supports more secure cipher sets that are defined in NIST 800-131A. Ciphers that are used in the default mode are strong. For more information about encryption ciphers that are used by the HMC, run the **lshmcencr** command. If your corporate standards requires the use of a different set of ciphers, run the **chhmcencr** command to modify the encryption ciphers.

To list the encryption ciphers that are used by the HMC to encrypt user password, run the following command:

```
lshmcencr -c passwd -t c
```

To list the encryption ciphers that can currently be used by the HMC web user interface and REST API, run the following command:

```
lshmcencr -c webui -t c
```

To list the encryption ciphers and MAC algorithm that can currently be used by the HMC SSH interface, run the following command:

```
lshmcencr -c ssh -t c
```

```
lshmcencr -c sshmac -t c
```

How to check the strength of the certificate on the HMC?

The self-signed certificates on the HMC use SHA256 with 2048-bit RSA encryption, which is strong. If you are using CA signed certificates, ensure that you are not using the 1024-bit encryption, which is weak. The following certificates can be used for the HMC:

- The CA signed certificate can be used for the HMC graphical user interface and REST API (ports 443 and 12443).
- The port 9920 is used for HMC to HMC communication. You cannot replace this certificate with your own certificate.

How to choose between a self-signed certificate (default) or a CA signed certificate?

The HMC auto-generates a certificate during installation. However, you can generate a Certificate Signing Request (CSR) from the HMC and get a new certificate that is issued by a Certificate Authority. You can import this certificate into HMC. Ensure that you also obtain a domain name for the HMC. For more details about managing the certificates in HMC, see Manage Certificates.

How to audit the HMC?

The audit on the Hardware Management Consoles focuses on configured ciphers and the usage activity of the various HMC users. Use the following commands to view the usage activity of various HMC users:

Table 39. Ciphers that are used by the HMC

Purpose	Command
Password encryption (global setting)	`lshmcencr -c passwd -t c`
Password encryption for each user	`lshmcusr -Fname:password_encryption`
SSH ciphers	`lshmcencr -c ssh -t c`
SSH MAC	`lshmcencr -c sshmac -t c`
Cipher that are used for the HMC graphical user interface and REST API	`lshmcencr -c webui -t c`

Use the following commands to monitor various console and serviceable events information for uses in the HMC:

Table 40. Commands to view the logged on users and console or serviceable events information in the HMC

Information	Command
GUI users	`lslogon –r webui –u`
GUI tasks	`lslogon –r webui –t`
CLI users	`lslogon –r ssh –u`
CLI tasks	`lslogon –r ssh –t`
Operations on HMC	`lssvcevents -t console -d <number of days>`
Operations on System	`lssvcevents –t hardware –m <managed system> -d <number of days>`

Centralized monitoring events for the HMC: If you have many Hardware Management Consoles, set the `rsyslog` file to collect all the usage data.

How does IBM fix the HMC security vulnerabilities?

IBM has a security incidence response process named IBM Product Security Incident Response Team (PSIRT). The IBM Product Security Incident Response Team (PSIRT) is a global team that manages the receipt, investigation and internal coordination of security vulnerability information related to IBM offerings. Open Source and IBM components that are shipped with the HMC are actively monitored and analyzed. Interim fixes and security fixes are provided by IBM for all supported releases of the HMC.

How to track new interim fixes on the HMC?

The security bulletin contains information about the vulnerability and interim fixes for supported HMC versions. To track interim fixes on the HMC, you can:

- Search the latest security bulletins at IBM Security Bulletin.
- Follow @IBMPowereSupp on Twitter for notifications.
- Subscribe to email notifications at IBM Support.

Security profiles: Global Data Protection Regulation (GDPR) and Payment Card Industry Data Security Standard (PCI-DSS)

Learn about how the Hardware Management Console (HMC) handles the privacy information of the users.

The Hardware Management Console (HMC) is a closed appliance that does not store any cardholder data. Hence, only a subset of requirements and security assessment procedures of IT security that are defined by PCI-DSS are applicable for the HMC. Only trusted code that is distributed by IBM can be installed on the HMC. When any vulnerability is known through the IBM PSIRT process, interim fixes are published. The requirements and recommendations include the following items:

GDPR queries

Table 41. GDPR queries . The table provides information about the questions related to GDPR.

Questions	Answers
What kind of data is stored in the HMC?	HMC stores configuration information of Power hardware, PowerVM virtualization, and the performance metrics information.
Does the HMC process any personal data?	You can provide contact information for the call home function. Providing contact information for the call home function is optional.
Which predefined accounts are used for system administration of the HMC?	The system administrator user uses the *hscroot* username.
Do any of the accounts in the HMC relate to a specific person?	No.
Is it mandatory to provide personal data in the HMC?	No. You do not need to provide personal data information. However, providing this information is optional.
Does the HMC log file have any personal data information?	No.
Is it possible to delete personal data completely and permanently?	Yes. Unconfigure the call home function.

PCI-DSS queries

Table 42. PCI-DSS queries . The table provides information about the questions related to PCI-DSS

Questions	Answers
How to install and maintain a firewall configuration to protect the data of the cardholder?	The HMC does not store or access any cardholder data. However, the HMC has a firewall configuration and the user can control and enable specific ports.
Can I use vendor-supplied default value for system passwords and other security parameters?	Before you install a system on the network, change all the predefined passwords of the *hscroot* user.
How does the HMC protect the stored data of the cardholder?	The HMC does not store or access any cardholder data.
How does the HMC encrypt the data of the cardholder when the data is transmitted across open public networks?	The HMC does not store or access any cardholder data.
How to use and regularly update anti-virus software programs?	The HMC is a closed appliance. Therefore, malware cannot infect the HMC.
How to develop and maintain secure systems and applications?	You must install the required patches to your system manually from the IBM Fix Central website. Only trusted code that are distributed by IBM can be installed on the HMC.
Does the HMC restrict access to the cardholder data?	The HMC does not store or access any cardholder data.

Table 42. *PCI-DSS queries* . The table provides information about the questions related to PCI-DSS *(continued)*

Questions	Answers
How to assign a unique ID to each person who has access to the computer?	You can implement this requirement by ensuring that there are no shared IDs and by following the password policies.
How to restrict the physical access to the data of the cardholder?	The HMC does not store or access any cardholder data
How to track and monitor the access to network resources and to the cardholder data?	The HMC does not store or access any cardholder data.
How does the HMC test the security of the system and processes?	Scan tools are used to run security scans on all the released versions of the HMC. The scan tools include: *Qualys*, *Nessus*, *testssl*, *sslscan* and *ASoC*.
How to maintain a security policy that includes information security for employees and contractors?	System administrator disables the remote user login, activates the user login on a need basis, and deactivates the user login when the access is no longer required.

HMC port locations

You can find port locations by using location codes. Use the HMC port location illustrations to map a location code to the HMC port position on the server.

Model 5105-22E, 9008-22L, 9009-22A, 9009-22G, 9223-22H, and 9223-22S HMC port locations

Use this diagram and table to map the HMC ports on the 5105-22E, 9008-22L, 9009-22A, 9009-22G, 9223-22H, and 9223-22S.

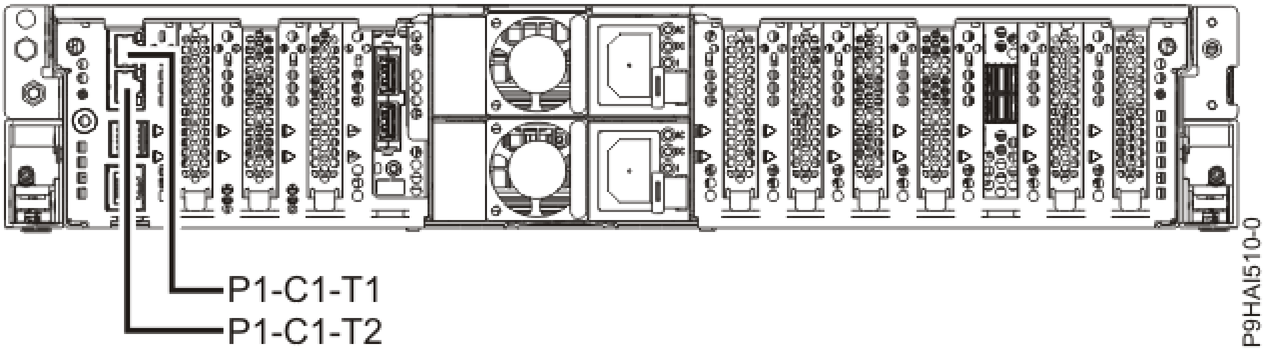

Figure 26. 5105-22E, 9008-22L, 9009-22A, 9009-22G, 9223-22H, and 9223-22S HMC port locations

Table 43. 5105-22E, 9008-22L, 9009-22A, 9009-22G, 9223-22H, and 9223-22S HMC port locations

Port	Physical location code	Identify LED
HMC port 1	Un-P1-C1-T1	No
HMC port 2	Un-P1-C1-T2	No
For more information about HMC port locations on the 5105-22E, 9008-22L, 9009-22A, 9009-22G, 9223-22H, or 9223-22S, see Part location and location codes for 9008-22L, 9009-22A, 9009-22G, 9223-22H, or 9223-22S.		

Model 9009-41A, 9009-41G, 9009-42A, 9009-42G, 9223-42H, and 9223-42S HMC port locations

Use this diagram and table to map the HMC ports on the 9009-41A, 9009-41G, 9009-42A, 9009-42G, 9223-42H, and 9223-42S.

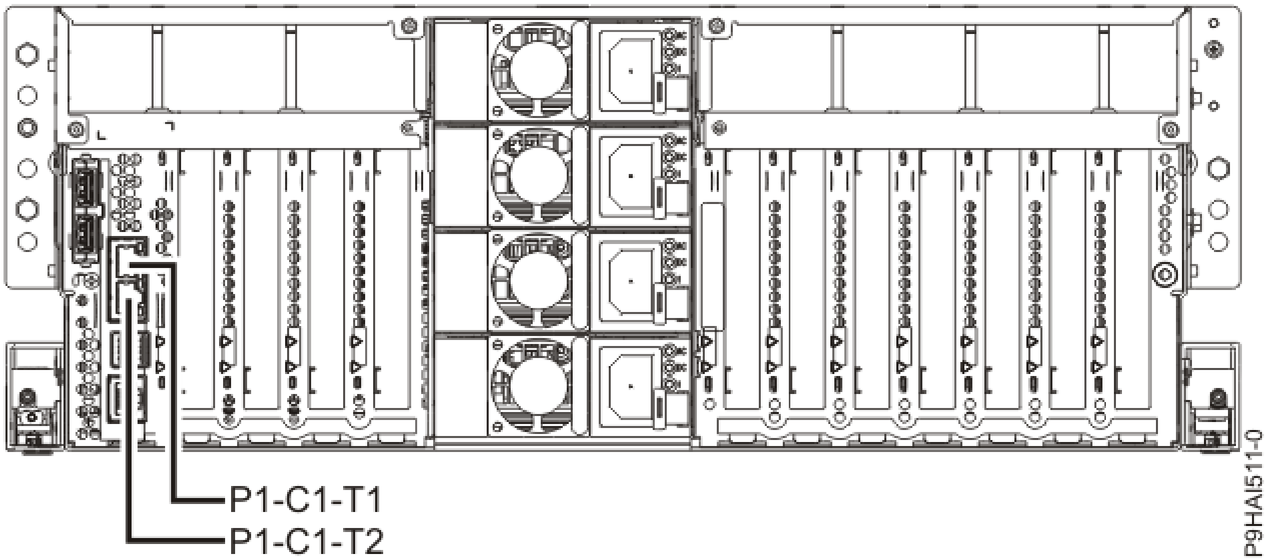

Figure 27. 9009-41A, 9009-41G, 9009-42A, 9009-42G, 9223-42H, and 9223-42S HMC port locations

Table 44. 9009-41A, 9009-41G, 9009-42A, 9009-42G, 9223-42H, and 9223-42S HMC port locations

Port	Physical location code	Identify LED
HMC port 1	Un-P1-C1-T1	No
HMC port 2	Un-P1-C1-T2	No
For more information about HMC port locations on the 9009-41A, 9009-41G, 9009-42A, 9009-42G, 9223-42H, or 9223-42S, see Part location and location codes for 9009-41A, 9009-41G, 9009-42A, 9009-42G, 9223-42H, or 9223-42S.		

Model 9040-MR9 HMC port locations

Use this diagram and table to map the HMC ports on the 9040-MR9.

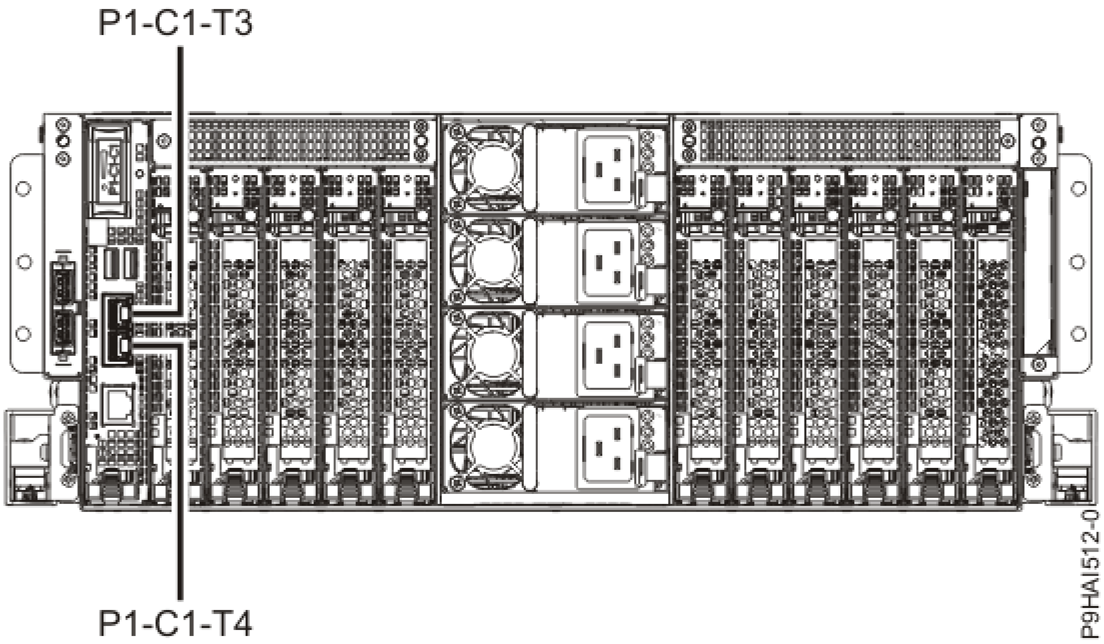

Figure 28. 9040-MR9 HMC port locations

Table 45. 9040-MR9 HMC port locations		
Port	**Physical location code**	**Identify LED**
HMC port 1	Un-P1-C1-T3	No
HMC port 2	Un-P1-C1-T4	No
For more information about HMC port locations on the 9040-MR9, see Part location and location codes.		

Model 9080-M9S HMC port locations

Use this diagram and table to map the HMC ports on the 9080-M9S.

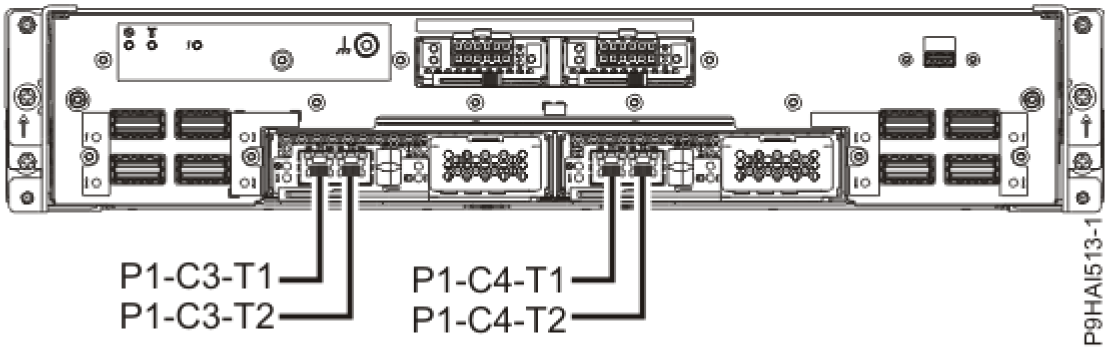

Figure 29. 9080-M9S HMC port locations

Table 46. 9080-M9S HMC port locations		
Port	**Physical port location**	**Identify LED**
Service processor card 1 - HMC port 1	Un-P1-C3-T1	No
Service processor card 1 - HMC port 2	Un-P1-C3-T2	No

Table 46. 9080-M9S HMC port locations (continued)

Port	Physical port location	Identify LED
Service processor card 2 - HMC port 1	Un-P1-C4-T1	No
Service processor card 2 - HMC port 2	Un-P1-C4-T2	No
For more information about HMC port locations on the 9080-M9S, see Part location and location codes.		

Notices

This information was developed for products and services offered in the US.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive, MD-NC119
Armonk, NY 10504-1785
US

INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some jurisdictions do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM websites are provided for convenience only and do not in any manner serve as an endorsement of those websites. The materials at those websites are not part of the materials for this IBM product and use of those websites is at your own risk.

IBM may use or distribute any of the information you provide in any way it believes appropriate without incurring any obligation to you.

The performance data and client examples cited are presented for illustrative purposes only. Actual performance results may vary depending on specific configurations and operating conditions.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

All IBM prices shown are IBM's suggested retail prices, are current and are subject to change without notice. Dealer prices may vary.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to actual people or business enterprises is entirely coincidental.

If you are viewing this information in softcopy, the photographs and color illustrations may not appear.

The drawings and specifications contained herein shall not be reproduced in whole or in part without the written permission of IBM.

IBM has prepared this information for use with the specific machines indicated. IBM makes no representations that it is suitable for any other purpose.

IBM's computer systems contain mechanisms designed to reduce the possibility of undetected data corruption or loss. This risk, however, cannot be eliminated. Users who experience unplanned outages, system failures, power fluctuations or outages, or component failures must verify the accuracy of operations performed and data saved or transmitted by the system at or near the time of the outage or failure. In addition, users must establish procedures to ensure that there is independent data verification before relying on such data in sensitive or critical operations. Users should periodically check IBM's support websites for updated information and fixes applicable to the system and related software.

Homologation statement

This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Contact an IBM representative or reseller for any questions.

Accessibility features for IBM Power Systems servers

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Power Systems servers include the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Power Systems servers use the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with US Section 508 (www.access-board.gov/guidelines-and-standards/communications-and-it/about-the-section-508-standards/section-508-standards) and Web Content Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the IBM Power Systems servers.

The IBM Power Systems servers online product documentation in IBM Knowledge Center is enabled for accessibility. The accessibility features of IBM Knowledge Center are described in the Accessibility section of the IBM Knowledge Center help (www.ibm.com/support/knowledgecenter/doc/kc_help.html#accessibility).

Keyboard navigation

This product uses standard navigation keys.

Interface information

The IBM Power Systems servers user interfaces do not have content that flashes 2 - 55 times per second.

The IBM Power Systems servers web user interface relies on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

The IBM Power Systems servers web user interface includes WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Power Systems servers include certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Privacy policy considerations

IBM Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

Depending upon the configurations deployed, this Software Offering may use session cookies that collect each user’s user name and IP address for purposes of session management. These cookies can be disabled, but disabling them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM’s Privacy Policy at http://www.ibm.com/privacy and IBM’s Online Privacy Statement at http://www.ibm.com/privacy/details/us/en/ in the section entitled “Cookies, Web Beacons and Other Technologies”.

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information.

The registered trademark Linux is used pursuant to a sublicense from the Linux Foundation, the exclusive licensee of Linus Torvalds, owner of the mark on a worldwide basis.

Red Hat, JBoss, OpenShift, Fedora, Hibernate, Ansible, CloudForms, RHCA, RHCE, RHCSA, Ceph, and Gluster are trademarks or registered trademarks of Red Hat, Inc. or its subsidiaries in the United States and other countries.

Microsoft and Windows are trademarks of Microsoft Corporation in the United States, other countries, or both.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Electronic emission notices

Class A Notices

The following Class A statements apply to the IBM servers that contain the POWER9 processor and its features unless designated as electromagnetic compatibility (EMC) Class B in the feature information.

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

Canada Notice

CAN ICES-3 (A)/NMB-3(A)

European Community and Morocco Notice

This product is in conformity with the protection requirements of Directive 2014/30/EU of the European Parliament and of the Council on the harmonization of the laws of the Member States relating to electromagnetic compatibility. IBM cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-IBM option cards.

This product may cause interference if used in residential areas. Such use must be avoided unless the user takes special measures to reduce electromagnetic emissions to prevent interference to the reception of radio and television broadcasts.

Warning: This equipment is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

Germany Notice

Deutschsprachiger EU Hinweis: Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit

Dieses Produkt entspricht den Schutzanforderungen der EU-Richtlinie 2014/30/EU zur Angleichung der Rechtsvorschriften über die elektromagnetische Verträglichkeit in den EU-Mitgliedsstaatenund hält die Grenzwerte der EN 55022 / EN 55032 Klasse A ein.

Um dieses sicherzustellen, sind die Geräte wie in den Handbüchern beschrieben zu installieren und zu betreiben. Des Weiteren dürfen auch nur von der IBM empfohlene Kabel angeschlossen werden. IBM übernimmt keine Verantwortung für die Einhaltung der Schutzanforderungen, wenn das Produkt ohne Zustimmung von IBM verändert bzw. wenn Erweiterungskomponenten von Fremdherstellern ohne Empfehlung von IBM gesteckt/eingebaut werden.

EN 55032 Klasse A Geräte müssen mit folgendem Warnhinweis versehen werden:

"Warnung: Dieses ist eine Einrichtung der Klasse A. Diese Einrichtung kann im Wohnbereich Funk-Störungen verursachen; in diesem Fall kann vom Betreiber verlangt werden, angemessene Maßnahmen zu ergreifen und dafür aufzukommen."

Deutschland: Einhaltung des Gesetzes über die elektromagnetische Verträglichkeit von Geräten

Dieses Produkt entspricht dem “Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG)“. Dies ist die Umsetzung der EU-Richtlinie 2014/30/EU in der Bundesrepublik Deutschland.

Zulassungsbescheinigung laut dem Deutschen Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) (bzw. der EMC Richtlinie 2014/30/EU) für Geräte der Klasse A

Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen.

Verantwortlich für die Einhaltung der EMV Vorschriften ist der Hersteller:
International Business Machines Corp.

New Orchard Road
Armonk, New York 10504
Tel: 914-499-1900

Der verantwortliche Ansprechpartner des Herstellers in der EU ist:

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Responsible Party:
International Business Machines Corporation

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult an IBM-authorized dealer or service representative for help.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions:

(1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Managing the Hardware Management Console

Note

Before using this information and the product it supports, read the information in "Notices" on page 117.

This edition applies to IBM Hardware Management Console Version 9 Release 2 Maintenance Level 950 and to all subsequent releases and modifications until otherwise indicated in new editions.

Contents

Managing the HMC

Learn how to use the Hardware Management Console (HMC).

About this task

Learn about the tasks that you can use on the console and how to navigate by using the web-based user interface with graphical views of managed systems and simplified navigation.

Note: Many of the HMC tasks that are listed here can also be performed by using PowerVC. For more information about the tasks that you can perform by using PowerVC, see HMC and PowerVC.

What's new in Managing the HMC

Read about new or significantly changed information in Managing the HMC since the previous update of this topic collection.

November 2020

- Added the following topics:
  - “Validate Maintenance Readiness” on page 61
  - “Manage Virtual I/O Server Backups” on page 84
- Updated the following topics:
  - “Create Partition” on page 42
  - “Serviceable Events Manager” on page 47
  - “Add FRU” on page 50
  - “Exchange FRU” on page 51
  - “Remove FRU” on page 51
  - “Partition content pane” on page 56
  - “Partition Properties” on page 57
  - “Serviceable Events Manager” on page 63

May 2020

- Updated the following topics:
  - “HMC tasks, user roles, IDs, and associated commands” on page 9
  - “Partition Templates” on page 83
  - “Hardware Virtualized I/O” on page 66

February 2020

Updated the following topic:

- “VIOS Images” on page 83

November 2019

- Added the following topic:
  - “Logging on to the Hardware Management Console (HMC) when PowerSC MFA is configured on the HMC” on page 3

- Updated the following topics:
  - “Introduction to the HMC” on page 2
  - “Predefined user IDs and passwords” on page 4
  - “Partition Properties” on page 57
  - “Hardware Virtualized I/O” on page 66
  - “Console Default Settings” on page 77
  - “Backup Management Console Data” on page 80
  - “Partition Templates” on page 83
  - “Manage Task and Resource Roles” on page 89
  - “Manage Event Notification” on page 104

May 2019

- Added the following topics:
  - “Netboot” on page 58
  - “Manage Groups” on page 72
- Updated the following topics:
  - “System content pane” on page 30
  - “Create Partition” on page 42
  - “Processor, Memory, I/O” on page 43
  - “Partition content pane” on page 56
  - “Change User Password” on page 86

August 2018

- Added the following topics:
  - “Manage MFA” on page 96
  - “Console Default Settings” on page 77
  - “Managing OpenBMC-based and BMC-based systems by using the HMC” on page 110
- Updated the “Change Network Settings” on page 75 topic.

December 2017

- Added information for HMC Version 9, Release 1, or later on IBM Power Systems servers that contain the POWER9™ processor.

Introduction to the HMC

Learn about some of the concepts and functions of the Hardware Management Console (HMC) and the user interface that is used for accessing those functions.

You can configure and manage servers on the HMC. One HMC can manage multiple servers, and dual HMCs can provide redundant support by managing the same system. To ensure consistent function, each HMC is shipped preinstalled with the HMC Licensed Machine Code Version 9, Release 1.

To provide flexibility and availability, you can implement HMCs in several configurations.

HMC as the DHCP server

An HMC that is connected by either a private network to the systems it manages might be a DHCP server for the service processors of the systems. An HMC might also manage a system over an open network, where the managed system's service processor IP address is assigned by a customer-supplied DHCP server or manually assigned by using the Advanced System Management Interface (ASMI).

Physical proximity

Before HMC Version 7, at least one local HMC was required to be physically located near the managed systems. As an alternative to the local HMC, you can use a supported device, such as a personal computer that has connectivity and authority to operate through a remotely attached HMC. The local device must be in the same room as your server and at a distance of 8 m (26 ft) from your server. The local device must have the functional capability that is equivalent to the HMC that it replaces and that is needed by the service representative to service the system. For a virtual HMC, the functional capabilities also include the method of transferring service data, such as firmware updates or diagnostic data, and transferring the log information to and from the HMC.

Redundant or Dual HMCs

A server might be managed by either 1 or 2 Hardware Management Consoles. When two Hardware Management Consoles manage one system, they are peers, and each HMC can be used to control the managed system. The best practice is to attach one HMC to the supported networks or HMC ports of the managed systems. The networks are intended to be independent. Each HMC might be the DCHP server for a service network. Because the networks are independent, the DHCP servers must be set up to provide IP addresses on two unique and nonroutable IP ranges.

Redundant or Dual HMCs that manage the same server must not be at different version and release levels. For example, an HMC at Version 7 Release 7.1.0 and an HMC at Version 7 Release 3.5.0 cannot manage the same server. The HMCs must be at the same version and release level.

When the server is connected to the higher version of the management console, the partition configuration is upgraded to the latest version. After the partition configuration upgrade, lower levels of the management consoles will not be able to interpret the data correctly. After the server is managed by the higher version of the management console, you must first initialize the server before you can go back to the lower version of the management console. You can restore a backup that is taken at the older level or re-create the partitions. If the server is not initialized, one of the following outcomes can occur depending on the version of the lower-level HMC:

- HMC Version 7 Release 7.8.0 and later reports a connection error of **Version mismatch** with reference code **Save Area Version Mismatch**.
- HMC Version 7 Release 7.7.0 and earlier might report a server state of **Incomplete** or **Recovery**. In addition, partition configuration corruption can also occur.

Logging on to the Hardware Management Console (HMC) when PowerSC MFA is configured on the HMC

Learn how to log in to the HMC when IBM PowerSC Multi-factor Authentication (MFA) is configured on the HMC.

If IBM PowerSCMFA is enabled on the HMC and the user is configured on the PowerSC MFA server, you can choose to log in to the HMC by first entering the user ID and a policy name that is provided by your security administrator. You are then prompted to provide additional credentials.

In the HMC login page, if you click **Policy Name**, the authentication mechanism is set to the in-band authentication type. For example, if the policy that you want to use is associated with the Rivest-Shamir-Adleman (RSA) authentication method, you can enter the secure ID passcode that you received from the RSA secure ID device or the application. Then, click **Next or Sign In** to log in to the HMC.

Notes:

- If MFA is not enabled on the HMC, you can log in to the HMC with the user ID and password.
- If you obtain a cache token credential (CTC) code from the PowerSC MFA server that is configured by your security administrator, enter the CTC code in the **Password** field.

Predefined user IDs and passwords

Predefined user IDs and passwords are included with the Hardware Management Console (HMC). It is imperative to the security of your system that you change the `hscroot` predefined password immediately.

If the password expires when you try to log in to the HMC, complete the following steps:

1. Enter the **Current Password** and the **New Password**.
2. Re-enter the new password in the **Confirmation new password** field.
3. Click **OK**. If the new password complies with the current password policy, the password for the HMC is changed.

The following predefined user IDs and passwords are included with the HMC:

Table 1. Predefined HMC user IDs and passwords

User ID	Password	Purpose
`hscroot`	`abc123`	The `hscroot` user ID and password are used to log in to the HMC for the first time. They are case-sensitive and can be used only by a member of the super administrator role.

Using the web-based user interface

You can use the web-based user interface to perform tasks on the Hardware Management Console (HMC) or on your managed resources.

This user interface comprises several major components: the title bar, the navigation area, the content pane, the menu pod, and the dock pod.

The *title bar*, across the top of the workplace window, identifies the product, any user that is logged in, and help options.

The *navigation area*, in the left portion of the window, contains the primary navigation links for selecting your system and starting tasks for your HMC.

The *content pane*, in the middle portion of the window, displays information that is based on the current selection from the navigation area. For example, when **All Systems** is selected in the navigation area, all the available systems are shown in the content pane.

The *menu pod*, in the left portion of the window, is displayed after you select a system and provides quick access to commonly used HMC tasks and views of resources and properties.

The *dock pod*, in the right portion of the window, displays the *Pins* function that can be used to pin any user-selected HMC task. This function allows for quick access to these tasks.

You can resize the panes of the HMC workplace by moving the mouse pointer over the border that separates the navigation pane from the work pane until the mouse pointer changes to a double-pointed arrow. When the pointer changes shape, press and hold the left mouse button while you drag the mouse pointer to the left or right. Release the button and your navigation pane or work pane is now larger or smaller in size. You can also do this task within the work pane border that separates the resources table from the taskpad.

You can change the layout of the *content pane* according to your preference by clicking **Display Gallery View**, **Display Table View**, or **Display Relationship View**.

You can reposition columns in tables by selecting and dragging a column to a new position. You can also select which columns to display by clicking the drop-down menu that is located next to the last column of each table. You can save your preferences by clicking the **Save User Preferences** icon.

You can change how many rows are displayed in tables on each page by clicking one of the **Items per page** (**10**, **20**, **30**, or **50**) icons that are located below each table.

Note: Pop-up windows must be enabled for full functionality of the HMC.

Overview of menu options

Learn about the menu options and associated tasks that are available in the Hardware Management Console (HMC).

The menu options and tasks that are described in this section are available in the HMC interface.

Table 2. HMC menu options

Menu	Submenu	Options/Tasks
Resources	All Systems	View All Systems
	All Partitions	View All Partitions
	All Virtual I/O Servers	View All Virtual I/O Servers
	All Frames	View All Frames
	All Power Enterprise Pools	View All Power Enterprise Pools
	All Shared Storage Pool Clusters	View All Shared Storage Pool Clusters
	All Groups	View All Groups

Table 2. HMC menu options (continued)

Menu	Submenu	Options/Tasks
HMC Management	Console Settings	Launch Guided Setup Wizard
		View Network Topology
		Test Network Connectivity
		Change Network Settings
		Change Performance Management Settings
		Change Date and Time
		Change Language and Locale
	Console Management	Shut Down or Restart the Management Console
		Schedule Operations
		View Licences
		Update the Hardware Management Console
		Manage Install Resources
		Manage Virtual I/O Server Image Repository
		Format Media
		Backup Management Console Data
		Restore Management Console Data
		Save Upgrade Data
		Manage Data Replication
	Template Library	System and Partition Library
	Updates	Not available (use the Update the Hardware Management Console option instead)

Table 2. HMC menu options (continued)

Menu	Submenu	Options/Tasks
Users and Security	Users and Roles	Change User Password
		Manage User Profiles and Access
		Manage Users and Tasks
		Manage Task and Resource Roles
	Systems and Console Security	Manage Certificates
		Manage LDAP
		Manage KDC
		Enable Remote Command Execution
		Enable Remote Operation
		Enable Remote Virtual Terminal

Table 2. HMC menu options (continued)

Menu	Submenu	Options/Tasks
Serviceability	Console Events Logs	View Console Events window
	Serviceable Events Manager	Serviceable Events Manager window
	Events Manager for Call Home	Events Manager for Call Home window
	Service Management	Create Serviceable Event
		Manage Remote Connections
		Manage Remote Support Requests
		Manage Dumps
		Transmit Service Information
		Schedule Service Information

		Perform Management Console Trace
		View Management Console Logs
		View Component Logs
		Electronic Service Agent Setup Wizard
		Authorize User
		Enable Electronic Service Agent
		Manage Outbound Connectivity
		Manage Inbound Connectivity
		Manage Customer Information
		Manage Serviceable Event Notification
		Manage Connection Monitoring

Tasks and roles

Each HMC user can be a member of a different role. Each of these roles allows the user to access different parts of the HMC and complete different tasks on the managed system. HMC roles are either predefined or customized.

The roles that are discussed refer to HMC users; operating systems that are running on logical partitions have their own set of users and roles. When you create an HMC user, you must assign that user a task role. Each task role allows the user different levels of access to tasks available on the HMC interface. For more information about the tasks each HMC user role can perform, see "HMC tasks, user roles, IDs, and associated commands" on page 9.

You can assign managed systems and logical partitions to individual HMC users. This action allows you to create a user that has access to managed system A but not to managed system B. Each grouping of managed resource access is called a managed resource role.

The **predefined** HMC roles, which are the default on the HMC, are as follows:

Table 3. Predefined HMC Roles

Role	Description	HMC User ID
Operator	The operator is responsible for daily system operation.	**hmcoperator**
Super administrator	The super administrator acts as the root user, or manager, of the HMC system. The super administrator has unrestricted authority to access and modify most of the HMC system.	**hmcsuperadmin**
Product engineer	A product engineer helps support situations, but cannot access HMC user management functions. To provide support access for your system, you must create and administer user IDs with the product engineer role.	
Service representative	A service representative is an employee who is at your location to install, configure, or repair the system.	**hmcservicerep**
Viewer	A viewer can view HMC information, but cannot change any configuration information.	**hmcviewer**
Client live update	The client live update role is intended for use when you are using the AIX Live Update capability on a partition of a managed system. A client live update user has authority that is limited to what is necessary to complete a live update on AIX.	**hmcclientliveupdate**

You can create **customized** HMC roles by modifying predefined HMC roles. Creating customized HMC roles is useful for restricting or granting specific task privileges to a certain user.

HMC tasks, user roles, IDs, and associated commands

The roles discussed in this section refer to HMC users; operating systems running on logical partitions has its own set of users and roles.

Each HMC user has an associated task role and a resource role. The task role defines the operations the user can perform. The resource role defines the systems and partitions for performing the tasks. The users may share task or resource roles. The HMC is installed with five predefined task roles. The single predefined resource role allows access to all resources. The operator can add customized task roles, customized resource roles, and customized user IDs.

Some tasks have an associated command. For more information about accessing the HMC command line, see “Using the HMC remote command line” on page 108.

Some tasks can only be performed using the command line. For a listing of those tasks, see Table 9 on page 26.

For more information about where to find task information, see the following table:

Table 4. HMC task groupings

Session handling

Learn about session limitations in the Hardware Management Console (HMC).

Session limitations

The HMC does not support disconnected sessions. A session logoff and a session disconnect are both considered as a session logoff. This means that you cannot reconnect to the same session to resume your task or tasks that were initiated from a previous session. Every login through the HMC creates a new session.

1. If you initiate long running tasks from the HMC interface and then log off from the session, the long running tasks continue to run in the background. However, when you log in again, a new session is created and the task progress panels (which helps track the progress of the previous tasks) are no longer available. In this scenario, if you need to check the progress of the tasks that were initiated from a previous session, you can run the respective command line interface (CLI) commands, check the state of the managed resource, or check the console event logs.

   Note: Some examples of long running tasks include the following tasks:

   System management for servers:

   - Deploy system plan
   - Code update
   - Hardware - Prepare for hot repair or upgrade

   System management for partitions:

- DLPAR memory in large units in the order of Terabytes
- Live Partition Mobility (LPM)
- Suspend or resume

HMC management:

- Backup management console data
- Restore management console data
- Save upgrade data

2. If you fail to reauthenticate within the time that is specified in the verify timeout settings, you are automatically logged off from the current session.
3. The idle timeout user property task is not functional. The HMC interface uses the default value of **0** for the idle timeout setting. If you set a different value for this setting, it is ignored.

   Note: Session, idle, and verify timeout properties are set for a user and it can be different for different users on the same HMC.

Version mismatch state for a managed system

The **Version mismatch** state can occur when the redundant or dual Hardware Management Consoles (HMCs) that manage the same server are at different version and release levels.

The **Version mismatch** state can occur for any of the following reasons:

- FSP firmware and HMC versions are incompatible.
- An HMC Version 7.7.8 or later is connected to a server that was managed by a newer version of the HMC.
- An HMC Version 7.7.8 or later is connected to a server that was managed by a lower version of the HMC and does not have enough space present to upgrade the data to HMC Version 7.7.8 or later.
- The hypervisor or server brand or model is not supported by this version of the HMC.

To recover from the **Version mismatch** state, select the appropriate action, depending on the reference code that is displayed:

- **Save Area Version Mismatch**

  HMC Version 7.7.8 and later blocks attempts to manage a server with a configuration at a newer level by posting a new **Connection error** state and reference code. If an HMC Version 7.7.8 or later is connected to a server that was managed by a newer version of the HMC that updated the configuration format, then the HMC reports a connection error of **Version mismatch** with the reference code **Save Area Version Mismatch**. This error prevents accidental corruption of the configuration.

  If you want to continue on a lower HMC version, then you must first initialize the server in the lower version of the HMC before you proceed to run any operation.

- **Profile Data Save Area is full**

  The HMC uses a storage area on each managed server to store the server configuration, primarily PowerVM partition profiles. HMC Version 7.8.0 and later increases the usage of the storage area by adding another (mostly hidden) profile for each partition. Servers that already contain many profiles might not have sufficient space to allow the HMC Version 7.8.0 and later to run properly.

  HMC Version 7.8.0 and later checks for sufficient space in this storage area and stops the connection process with a connection state of **Version mismatch** and a reference code of **Profile Data Save Area is full** if sufficient space does not exist.

- **Connecting 0000-0000-00000000 (Unsupported Hypervisor)**

  A connection state of **Version mismatch** and a reference code of **Connecting 0000-0000-00000000 (Unsupported Hypervisor)** is returned when the server is configured for a hypervisor other than PowerVM.

To recover from this state, first start the ASM by selecting the server with the **Version mismatch** and selecting **Operations** and then **Launch Advanced System Manager (ASM)**.

On models that support multiple hypervisors, the hypervisor mode setting can be found in the ASM by selecting **System Configuration** and then **Hypervisor Configuration**. The hypervisor mode shows a setting of either PowerVM or OPAL.

If OPAL is the wanted configuration, then you must remove this connection from the HMC by selecting **Connections** and then **Reset or Remove Connections**. Next, select **Remove Connections** and click **OK**.

Note: The OPAL hypervisor is not supported on the HMC.

If PowerVM is the wanted configuration, select **PowerVM** from the hypervisor mode menu and click **Continue**.

Note: The setting can be changed only when the server is powered off. To power off the server select **Power/Restart Control** and then **Power On/Off System**. Click **Save Settings and Power off** .

- **Connection not allowed**

  A connection state of **Version mismatch** and a reference code of **Connection not allowed 0009-0008-00000000** is returned when the FSP firmware and HMC versions are incompatible.

  To recover from this state, install an HMC version that supports the managed server model.

For more information about correction a **Version mismatch** state, see Version mismatch errors.

Systems Management for Servers

Systems Management displays tasks to manage servers, logical partitions, and frames. Use these tasks to set up, configure, view current status, troubleshoot, and apply solutions for servers.

These tasks are listed when a managed system is selected. The tasks listed in the menu pod change as selections are made in the work area.

System content pane

View and monitor the state, health, and capacity information of all the systems that are connected to the management console.

The content pane, in the middle portion of the window, displays all the available systems and the associated information for each server. You can choose to display the information in a table view or a gallery view.

Each system displays the current state of the system, the number of central processing units (CPUs) that are in use, CPUs that are available, the amount of random access memory (RAM) that is in use, and the RAM that is available. Additionally, if you choose a tabular format view, you can filter the information to be displayed by selecting the drop-down arrow in the upper-right corner of the table. Select the check box corresponding to the field that you want to display on the table. If you are using HMC Version 9.1.930, in the **All Systems** table, you can also view information about the activated and deferred firmware levels.

You can click the **properties** icon to display the following information:

- Current state
- Reference code
- Machine type
- Serial number
- System location
- Firmware level
- Group tags
- Attention LED

You can click the **capacity** icon to display the following information:

- Date of collection.
- Processor usage (installed, activated, available, average, and peak). The bar graph and the numerical value show the average usage (average divided by activated) in a percentage. The threshold line on the bar graph shows the peak threshold (peak divided by activated). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Memory allocation (installed, activated, available, average, and peak). The bar graph and the numerical value show the average usage (average divided by activated) in a percentage. The threshold line on the bar graph shows the peak threshold (peak divided by activated). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Network I/O usage (sent and received in kilobytes per second and in packets per second). The bar graph and the numerical value show the average usage ((average transferred bytes divided by the number of adapters) divided by the maximum transferred bytes) in a percentage. The threshold line on the bar graph shows the high threshold (maximum transferred bytes). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Storage I/O usage (written and read information in kilobytes per second). The bar graph and the numerical value show the average usage ((average transferred bytes divided by the number of adapters) divided by the maximum transferred bytes) in a percentage. The threshold line on the bar graph shows the high threshold (maximum transferred bytes). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Data collection.

You can hover over the systems in the **All systems** window to view the system model description.

Operations

Operations contains the tasks for operating managed systems.

Power Off

Shut down the managed system. Powering off the managed system will make all partitions unavailable until the system is again powered on.

Before you power off the managed system, ensure that all logical partitions have been shut down and that their states have changed from `Running` to `Not Activated`. For more information on shutting down a logical partition, see “Shut Down” on page 59

If you do not shut down all logical partitions on the managed system before you power off the managed system, the managed system shuts down each logical partition before the managed system itself powers off. This can cause a substantial delay in powering off the managed system, particularly if the logical partitions are not responsive. Further, the logical partitions might shut down abnormally, which could result in data loss and further delays when you activate the logical partitions once more.

Choose from the following options:

Normal power off
The Normal power off mode shuts down the system's operations in a controlled manner. During the shutdown, programs running active jobs are allowed to perform cleanup (end-of-job processing).

Fast power off
The Fast power off mode shuts down the system by stopping all active jobs immediately. The programs running those jobs are not allowed to perform any cleanup. Use this option when you need to shut down the system because of an urgent or critical situation.

Power On

Use the **Power On** task to start a managed system.

Choose from the following options to power on your managed system:

Normal: Select this option to specify that the HMC uses the current setting for the partition start policy to determine how to power on the managed system. The current setting can be one of the following values:

- **Auto-Start Always**: This option specifies that the HMC power on logical partitions automatically after the managed system powers on. If powering on the managed system is the result of a user action, the HMC starts all partitions that are configured for automatic startup. If powering on the managed system is the result of an automatic recovery process, the HMC starts only those logical partitions that were running at the time the system is powered off. This option is always available for selection.
- **Stop at Partition Standby**: This option specifies that logical partition startup is in standby mode after the managed system powers on and the HMC does not start any logical partitions when the managed system powers on. If powering on the managed system is the result of an automatic recovery process and the HMC is used to start a logical partition, the HMC starts all logical partitions that were running at the time the system is powered off. This option is available for selection only when the firmware for the managed system does not support advanced IPL capabilities.
- **Auto-Start for Auto-Recovery**: This option specifies that the HMC power on logical partitions automatically only after the managed system powers on as the result of an automatic recovery process. This option is available for selection only when the firmware for the managed system supports this advanced IPL capability.
- **User-Initiated**: This option specifies that the HMC does not start any logical partitions when the managed system powers on. You must start logical partitions manually on the managed system by using the HMC. This option is available for selection only when the firmware for the managed system supports this advanced IPL capability.

You can set the partition start policy from the **Power On Parameters** page of the **Properties** task for the managed system.

System profile: Selecting this power-on option specifies that the HMC power on the system and its logical partitions based on a predefined system profile. When you select this power-on option, you must select the partition profile that you want the HMC to use to activate logical partitions on the managed system.

Hardware Discovery: Selecting this power-on option specifies that the HMC run the hardware discovery process when the managed system powers on. The hardware discovery process captures information about all I/O devices, in particular those devices that are not currently assigned to partitions. When you select the hardware discovery **power on** option for a managed system, the managed system is powered on into a special mode that performs the hardware discovery. After the Hardware Discovery process is complete, the system will be in Operating state with any partitions in the power-off state. The hardware discovery process records the hardware inventory in a cache on the managed system. The collected information is then available for use when you display data for I/O devices or when you create a system plan based on the managed system. This option is available only if the system is capable of using the hardware discovery process to capture I/O hardware inventory for the managed system.

Power Management

You can reduce the processor power consumption of the managed system by enabling power saver mode.

About this task

To enable power saver mode, complete the following steps:

Procedure

1. In the navigation area, click the **Resources** icon, and then select **All Systems**.
2. Select the server for which you want to enable the power saver mode and click **Actions** > **View All Actions**.
3. Select **Power Management** under **Operations**.
4. Choose from any of the following Power Saver mode options:
   - **Disable All modes**: Disables the Power Saver mode. The processor clock frequency is set to a nominal value and the power that is used by the system remains at a nominal level.

- **Enable Static mode**: Reduces the power consumption by reducing the processor clock frequency and the voltage to fixed values. This option also reduces the power consumption of the system while still delivering predictable performance.
- **Enable Dynamic Performance mode**: Causes the processor frequency to vary based on processor use. During periods of moderate or high use, the processor frequency is set to the maximum value allowed, which might be higher than the nominal frequency. Additionally, the frequency is set to a value that is less than the nominal frequency during periods of low processor use.
- **Enable Maximum Performance mode**: Causes the processor frequency to be set at a fixed value that you can specify. You can set the maximum limit of the processor frequency and power consumption of the system.

Note: Enabling any of the power saver modes causes changes in the processor frequencies, changes in processor use, changes in power consumption, and varying performance.

Schedule Operations

Create a schedule for certain operations to be performed on the managed system without operator assistance.

Scheduled operations are helpful for situations where automatic, delayed, or repetitious processing of system operations is necessary. A scheduled operation is started at a specified time, without operator assistance to perform the operation. A schedule can be set for one operation or repeated many times.

For example, you might schedule power on or off operations for a managed system.

The Scheduled Operations task displays the following information for each operation:

- The processor that is the object of the operation.
- The scheduled date
- The scheduled time
- The operation
- The number of remaining repetitions

From the **Scheduled Operations** window, you can perform the following tasks:

- Schedule an operation to run later.
- Define operations to repeat at regular intervals.
- Delete a previously scheduled operation.
- View details for a currently scheduled operation.
- View scheduled operations within a specified time range.
- Sort scheduled operations by date, operation, or managed system.

You can schedule an operation to occur once or you can schedule it to repeat. You must provide the time and date that you want the operation to occur. If you want the operation to repeat, you are asked to select the following options:

- The day or days of the week that you want the operation to occur. (optional)
- The interval, or time between each occurrence. (required)
- The total number of repetitions. (required)

The operations that you can schedule for the managed system include the following operations:

Activate on a System Profile
Schedules an operation on a selected system for scheduling activation of a selected system profile.

Backup Profile Data
Schedules an operation to back up profile data for a managed system.

Power Off Managed System
Schedules an operation for a system power off at regular intervals for a managed system.

Power On Managed System
Schedules an operation for a system power-on at regular intervals for a managed system.

Manage Utility CoD processors
Schedules an operation for managing how your Utility CoD processors are used.

Manage Utility CoD processor minute usage limit
Creates a limit for Utility CoD processor usage.

Modify a Shared Processor Pool
Schedules an operation for modifying a shared processor pool.

Move a partition to a different pool
Schedules an operation for moving a partition to a different processor pool.

Change power saver mode on a managed system
Schedules an operation for changing a managed system's power saver mode.

Monitor/Perform Dynamic Platform Optimize
Schedules an operation for performing dynamic platform optimization and for sending an email notification alert to a user.

To schedule operations on the managed system, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select one or more managed systems and click **Actions** > **Schedule Operations**.
3. From the **Scheduled Operations** window, click **Options** from the menu bar to display the next level of options:
   - To add a scheduled operation, click **Options** and then click **New**.
   - To delete a scheduled operation, select the operation that you want to delete, point to **Options** and then click **Delete**.
   - To update the list of scheduled operations with the current schedules for the selected objects, point to **Options** and then click **Refresh**.
   - To view a scheduled operation, select the operation that you want to view, point to **View** and then click **Schedule Details**.
   - To change the time of a scheduled operation, select the operation that you want to view, point to **View** and then click **New Time Range...**.
   - To sort the scheduled operations, point to **Sort** and then click one of the sort categories that appears.
4. To close the window, click **Options** and then click **Exit**.

Launch ASM Interface

The Hardware Management Console (HMC) can connect directly to the Advanced System Management Interface (ASMI) for a selected system.

The ASMI is an interface to the service processor that allows you to manage the operation of the server, such as auto power restart, and to view information about the server, such as the error log and vital product data.

To connect to the Advanced System Management Interface, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. In the content area, select one or more managed systems and click **Actions** > **View All Actions** > **Launch Advanced System Management (ASM)**.

Rebuild

You can extract the configuration information from the managed system and rebuild the information on the Hardware Management Console (HMC).

This task does not disrupt the operation of the running server.

Rebuilding the managed system updates the information on the HMC about the managed system. Rebuilding the managed system is useful when the state of the managed system is `Incomplete`. The Incomplete state means that the HMC cannot gather complete information from the managed system about logical partitions, profiles, or resources.

Rebuilding the managed system is different from refreshing the **HMC** window. When the managed system is rebuilt, the HMC extracts the information from the managed system. You cannot start other tasks while the HMC rebuilds the managed system. This process can take several minutes.

Change Password

Change the Hardware Management Console (HMC) access password on the selected managed system.

After the password is changed, you must update the HMC access password for all other HMCs from which you want to access this managed system.

Enter the current password and then, enter a new password and verify it by entering it again.

Attention LED

View system attention LED information, light specific LEDs to identify a system component, and test all LEDs on a managed system.

The system provides several LEDs that help identify various components, such as enclosures or field replaceable units (FRUs), in the system. For this reason, they are called **Identify** LEDs. Individual LEDs are on or near the components. The LEDs are located either on the component itself or on the carrier of the component (for example, memory card, fan, memory module, or processor). LEDs are either green or amber. Green LEDs indicate either of the following states:

- Electrical power is present.
- Activity is occurring on a link. (The system might be sending or receiving information).

Amber LEDs indicate a fault or identify condition. If your system or one of the components on your system has an amber LED turned on or flashing, identify the problem and take the appropriate action to restore the system back to normal.

You can activate or deactivate the following types of identify LEDs:

Identify LED for an enclosure

If you want to add an adapter to a specific drawer (enclosure), you need to know the machine type, model, and serial number (MTMS) of the drawer. To determine whether you have the correct MTMS for the drawer that needs the new adapter, you can activate the LED for a drawer and verify that the MTMS corresponds to the drawer that requires the new adapter.

Identify LED for a FRU associated with a specified enclosure

If you want to attach a cable to a specific I/O adapter, you can activate the LED for the adapter that is a field replaceable unit (FRU), and then physically verify where to attach the cable. This step can be especially useful when you have several adapters with open ports.

You can deactivate a system attention LED or a logical partition LED. For example, you might determine that a problem is not a high priority and decide to repair the problem later. However, you want to be alerted if another problem occurs, so you must deactivate the system attention LED so that it can be activated again if another problem occurs.

Choose from the following options:

Turn Attention LED Off

From this task, you can deactivate the system attention LED.

Identify Attention LED

Displays the current Identify LED states for all the location codes that are contained in the selected enclosure. From this task, you can select a single location code or multiple location codes to operate against and activate or deactivate one or more LEDs by selecting the corresponding button.

Test Attention LED

Initiates an LED Lamp Test against the selected system. All LEDs activate for several minutes.

Connections

You can view the Hardware Management Console (HMC) connection status to service processors or frames, reset those connections, connect another HMC to the selected managed system, or disconnect another HMC.

If you select a managed system in the work area, the following tasks pertain to that managed system. If you select a frame, the tasks pertain to that frame.

Service Processor Status

View information about the status of the Hardware Management Console (HMC) connection to the service processors on the managed system.

About this task

To show the service processor connection status to the service processors on the managed system, complete the following steps:

Procedure

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to view the service processor connection status and click **Actions** > **View All Actions** > **Service Processor Status**.

Reset or Remove Connections

Reset or remove a managed system from the Hardware Management Console (HMC) interface.

About this task

To reset or remove connections, complete the following steps:

Procedure

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server that you want to reset or remove and click **Actions** > **Reset or Remove System Connection**.
3. Select one of the options from **Reset Connection** or **Remove Connection** and click **OK**.

Disconnect Another HMC

You can disconnect a connection between a selected Hardware Management Console (HMC) and the managed server.

About this task

To disconnect another HMC, complete the following steps:

Procedure

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to disconnect another Management Console and click **Actions** > **View All Actions** > **Disconnect Another HMC**.
3. Select an HMC from the list and click **OK**.

System Templates

System templates contain configuration details for resources such as system properties, shared processor pools, reserved storage pool, shared memory pool, Host Ethernet adapters, and SR-IOV adapters. Many of the system settings that you previously configured by using separate tasks are available in the **Deploy System from Template** wizard. For example, you can configure the Virtual I/O Servers, virtual network bridges, and virtual storage settings when you use the wizard to deploy a system from a system template.

The template library includes predefined system templates, which contain configuration settings based on common usage scenarios. Predefined system templates are available for your immediate use.

You can also create custom system templates that contain configuration settings that are specific to your environment. You can create a custom template by copying a predefined template and changing it to fit your needs. Or, you can capture the configuration of an existing system and save the details in a template. Then, you can deploy that template to other systems that require the same configuration.

Deploy System from Template

You can deploy systems by using system templates that are available in the template library of the Hardware Management Console (HMC). The Deploy System from Template wizard guides you to provide target system-specific information that is required to complete the deployment of the selected system.

Create Partition from Template

You can create a partition by using partition templates that are available in the template library of the Hardware Management Console (HMC). The Create a Partition from Template wizard guides you through the deployment process and configuration steps.

Capture Configuration as Template

You can capture the configuration details of a running server and save the information as a custom system template by using the Hardware Management Console (HMC). This function is useful if you want to deploy multiple servers with the same configuration. If you want to use a predefined template, you do not need to complete this task.

To capture configuration as a template, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to view the system information and click **Actions** > **View All Actions**
3. Click **Capture Configuration as Template with Physical I/O** or **Capture Configuration as Template without Physical I/O**.
4. Enter a template name and description, and then click **OK**.

Use the online Help if you need additional information about capturing the configuration as a template.

Updates

Display tasks to view system information, manage updates on your Hardware Management Console (HMC), or check system readiness.

View System Information

Display information on a selected system from the Hardware Management Console (HMC).

To view the network topology, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to view the system information and click **Actions** > **Updates** > **View System Information**.
3. Select a LIC repository from the list and click **OK**.
4. When you have completed this task, click **Close**.

Use the online Help if you need additional information for viewing system information of the HMC.

Change Licensed Internal Code

Change the Licensed Internal Code of a managed system by using your Hardware Management Console (HMC).

You can change the Licensed Internal Code for the current release or to a new release.

To change the Licensed Internal Code, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to view the system information and click **Actions** > **Updates**.
3. Select **Change Licensed Internal Code** > **for the Current Release** or **Change Licensed Internal Code** > **to a New Release**.

   Note: Click **Start Change Licensed Internal Code** wizard to start a guided update of managed system, power, and I/O Licensed Internal Code (LIC). Click **View System Information** to examine current LIC levels, including retrievable levels. Click **Select Advanced Features** to update the managed system and power the LIC with more options and more targeting choices.
4. Select an action from the list and click **OK**.
5. When you complete this task, click **Close**.

Use the online Help if you need additional information for changing the Licensed Internal Code of the HMC.

Check System Readiness

Check the readiness of the Licensed Internal Code of a selected system from the Hardware Management Console (HMC).

To check system readiness, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to view the system information and click **Actions** > **Updates** > **Check System Readiness**.
3. When you have completed this task, click **OK**.

Use the online Help if you need additional information for checking system readiness of the HMC.

SR-IOV Firmware Update

Update the driver firmware for SR-IOV adapters on your Hardware Management Console (HMC).

Note: The adapter must be in shared mode.

To update the firmware for SR-IOV adapters, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to view the system information and click **Actions** > **Updates** > **SR-IOV Firmware Update**.
3. Select and right-click an adapter or adapters to get the context menu.
4. Select the type of firmware update to start.

   Note: Either the adapter driver firmware can be updated or both the adapter driver and adapter firmware can be updated. During the update operation of the adapter or adapter driver firmware, configured logical ports on the adapter might experience a temporary disruption of network traffic. Each adapter can take between 2 - 5 minutes to update. Updates are performed serially.
5. When you have completed this task, click **Close**.

Use the online Help if you need additional information for updating the driver or firmware for SR-IOV adapters.

Legacy

You can view **legacy** tasks that are available on the Hardware Management Console (HMC).

If you select a managed system in the work area, the following **legacy** tasks pertain to that managed system.

Partition Availability Priority

Use this task to specify the partition-availability priority of each logical partition on this managed system.

The managed system uses partition-availability priorities when a processor fails. If a processor fails on a logical partition and unassigned processors are not available on the managed system, then the logical partition can acquire a replacement processor from logical partitions with a lower partition-availability priority. This task allows the logical partition with the higher partition-availability priority to continue running after a processor failure.

You can change the partition availability priority for a partition by selecting a partition and by choosing an availability priority from the list.

Use the online Help if you need additional information about prioritizing partitions.

View Workload Management Groups

Display a detailed view of the workload management groups that you specify for the managed system.

Each group displays the total number of processors, processing units for partitions that use shared mode processing, and the total amount of memory that is allocated to the partitions in the group.

Manage System Profiles

A system profile is an ordered list of partition profiles that is used by the Hardware Management Console (HMC) to start the logical partitions on a managed system in a specific configuration.

When you activate the system profile, the managed system attempts to activate each partition profile in the system profile in the order specified. A system profile helps you to activate or change the managed system from one set of logical partition configurations to another.

You can create a system profile that has a partition profile with overcommitted resources. You can use the HMC to validate the system profile against the currently available system resources and against the total system resources. Validating your system profile ensures that your I/O devices and processing resources are not overcommitted, and it increases the likelihood that the system profile can be activated. The validation process estimates the amount of memory that is needed to activate all of the partition profiles in the system profile. A system profile can pass validation and yet not have enough memory to be activated.

Use this task to complete the following tasks:

- Create new system profiles.
- Create a copy of a system profile.
- Validate the resources that are specified in the system profile against the resources available on the managed system. The validation process indicates whether any of the logical partitions in the system profile are already active and whether the uncommitted resources on the managed system can meet the minimum resources that are specified in the partition profile.
- View the properties of a system profile. From this task, you can view or change an existing system profile.
- Delete a system profile.
- Activate a system profile. When you activate a system profile, the managed system attempts to activate the partition profiles in the order that is specified in the system profile.

Use the online Help if you need additional information about managing system profiles.

Manage Partition Data

A partition profile is a record on the HMC that specifies a possible configuration for a logical partition. When you activate a partition profile, the managed system attempts to start the logical partition by using the configuration information in the partition profile.

A partition profile specifies the wanted system resources for the logical partition and the minimum and maximum amounts of system resources that the logical partition can have. The system resources that are specified within a partition profile includes processors, memory, and I/O resources. The partition profile can also specify certain operating settings for the logical partition. For example, you can set a partition profile such that, when the partition profile is activated, the logical partition is set to start automatically the next time that you power on the managed system.

Each logical partition on a managed system that is managed by an HMC has at least one partition profile. You can create more partition profiles with different resource specifications for your logical partition. If you create multiple partition profiles, you can designate any partition profile on the logical partition to be the default partition profile. The HMC activates the default profile if you do not select a specific partition profile to be activated. Only one partition profile can be active at one time. To activate another partition profile for a logical partition, you must shut down the logical partition before you activate the other partition profile.

A partition profile is identified by partition ID and profile name. Partition IDs are whole numbers that are used to identify each logical partition that you create on a managed system, and profile names identify the partition profiles that you create for each logical partition. Each partition profile on a logical partition must have a unique profile name, but you can use a profile name for different logical partitions on a single managed system. For example, logical partition 1 cannot have more than one partition profile with a profile name of normal, but you can create a profile named normal for each logical partition on the managed system.

When you create a partition profile, the HMC shows you all of the resources available on your system. The HMC does not verify whether another partition profile is using a portion of these resources. Therefore, it is possible for you to overcommit resources. When you activate a profile, the system attempts to allocate the resources that you assigned to the profile. If you overcommit resources, the partition profile is not activated.

For example, you have four processors on your managed system. Partition 1 profile A has three processors, and partition 2 profile B has two processors. If you attempt to activate both of these partition profiles at the same time, partition 2 profile B fails to activate because you overcommitted processor resources.

When you shut down a logical partition and reactivate the logical partition by using a partition profile, the partition profile overlays the resource specifications of the logical partition with the resource specifications in the partition profile. Any resource changes that you made to the logical partition by using dynamic logical partitioning are lost when you reactivate the logical partition that uses a partition profile. This action is required when you want to undo dynamic logical partitioning changes for the logical partition. However, this action is not required if you want to reactivate the logical partition that uses the resource specifications that the logical partition had when you shut down the managed system. Therefore, keep your partition profiles up to date with the latest resource specifications. You can save the current configuration of the logical partition as a partition profile. This task avoids having to change partition profiles manually.

If you shut down a logical partition whose partition profiles are not up to date, and if the logical partition is set to start automatically when the managed system starts, you can preserve the resource specifications on that logical partition by restarting the entire managed system by using the partition autostart power-on mode. When the logical partitions start automatically, the logical partitions have the resource specifications that the logical partitions had when you shut down the managed system.

Use the Manage Partition Data tasks to complete the following tasks:

- Restore partition data. If you lose partition profile data, use the restore task in one of the following ways:
  - Restore partition data from a backup file. Profile modifications that are completed after the selected backup file was created are lost.
  - Restore merged data from your backup file and recent profile activity. The data in the backup file takes priority over recent profile activity if the information conflicts.
  - Restore merged data from recent profile activity and your backup file. The data from recent profile activity takes priority over your backup file if the information conflicts.
- Initialize partition data. Initializing the partition data for a managed system deletes all of the currently defined system profiles, partitions, and partition profiles.
- Back up a partition profile to a file.
- Back up partition data to a file.

Use the online Help if you need additional information about managing partition data.

Utilization Data

You can set the Hardware Management Console (HMC) to collect resource utilization data for a specific managed system or for all systems the HMC manages.

The HMC collects utilization data for memory and processor resources. You can use this data to analyze trends and make resource adjustments. The data is collected into records that are called events. Events are created at the following times:

- At periodic intervals (30 seconds, 1 minute, 5 minutes, 30 minutes, hourly, daily, and monthly).
- When you make system-level and partition-level state and configuration changes that affect resource utilization.

- When you start, shut down, and change the local time on the HMC.

You must set the HMC to collect utilization data for a managed system before utilization data can display for the managed system.

Use the **Change Sampling Rate** task to enable, set and change the sampling rate, or to disable sampling collection.

Create Partition

You can quickly create partitions with minimum resources.

To create a partition, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to create a partition and click **Actions** > **View System Partitions**.
3. Click **Create Partition**.
4. Complete the required information in the **Basic Partition Configuration**, **Processor Configuration**, and **Memory Configuration** tabs. If you want to assign all the system resources to the partition, select the **Assign all system resources** check box.
5. To create multiple partitions, move the slider to the right and select the **Multiple Partitions View**.
6. To add a new partition definition, click the **(+)** sign located on the top of the partition table.
7. Select the added partition and complete the required information in the **Basic Partition Configuration**, **Processor Configuration**, and **Memory Configuration** tabs. In the **Basic Partition Configuration** tab, you can provide details about the number of partition instances that you want to create. You can create a maximum of 20 partition instances.
8. To remove an existing partition, select the partition that you want to remove and click the **(-)** sign.
9. Click **OK**.

Use the online Help if you need additional information about this task.

Note: If the managed system supports virtual serial number and if the managed system is not in an Enterprise Pool 2.0, the **Virtual Serial Number** can be specified in the **Basic Partition Configuration** tab.

When the firmware level is at FW950 and the managed system has logical partitions that are assigned with virtual serial numbers, the managed system cannot be added to an Enterprise Pool 2.0. Also, if the managed system is in an Enterprise Pool 2.0, virtual serial number cannot be assigned to the logical partitions.

Properties

Displays the properties of the selected managed system. This information is useful in system and partition planning and resource allocation.

To open the properties tasks that are available for your system, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Properties** and then select the properties task that you want to perform from the list.

General Settings

View or change the general and advanced settings for the managed system.

These properties include the following tabs:

General Properties
The **General Properties** tab displays the system's name, serial number, model and type, state, attention led state, service processor version, maximum number of partitions, assigned service partition (if designated), and power off policy information.

Migration
View the partition mobility properties and change the migration policy for inactive partitions on the managed system.

Power-On Parameters
From the **Power-On Parameters** tab, you can change the power-on parameters for the next restart by changing the values in the **Next Value** fields. These changes are only valid for the next managed system restart.

Advanced
The **Advanced** tab displays huge page memory capabilities on the managed system, including available huge page memory, configurable huge page memory, current page size, and current maximum huge page memory. To change memory allocation on systems with huge page table support, set the Requested huge page memory (in pages) field to the wanted memory. To change the requested value for huge page memory, the system must be powered off.

The **Barrier Synchronization Register (BSR)** option displays array information.

The **Processor Performance** option displays the TurboCore mode and the System Partition Processor Limit (SPPL). You can set the next TurboCore mode and the next SPPL value. The SPPL applies to both dedicated processor partitions and shared processor partitions.

The **Memory Mirroring** option displays the current mirroring mode and the current system firmware mirroring status. You can set the next mirroring mode. You can also start the memory optimization tool.

You can view the VTPM settings.

Processor, Memory, I/O

View or change the memory, processor, and physical I/O resource settings for the managed system.

These properties include the following tabs:

Processor
The **Processor** tab displays information about the processors of the managed system, which includes:

- installed processing units
- unconfigured processing units
- available processor units
- available with stealable processor units
- configurable processing units
- minimum number of processing units per virtual processor
- maximum number of shared processor pools

The **Available with stealable** field displays the information about the available processing units, which is the sum of the available processing units in the managed system and the number of stealable processing units.

The stealable processor units value is the sum of the processor resources that are assigned to all the powered off or hibernated partitions on the managed system.

Notes:

- The information about stealable processor units is available only when the managed system is in the standby state or in the operating state.
- If the managed system is licensed with Power® IFL processor and if the firmware level is at FW910, or later, the **Available (with stealable)** field is displayed.
- When a POWER9 system is licensed with some IFL processors, the tab also displays the information about the remaining processors that are available for running the AIX or IBM i partitions.

Memory

The **Memory** tab displays information about the memory of the managed system, which includes:

- installed memory
- unconfigured memory
- available memory
- available with stealable memory
- configurable memory
- memory region size
- current memory available for partition usage
- system firmware current memory

The **Available with stealable** field displays the information about the available memory, which is the sum of available memory in the managed system and the amount of stealable memory resources. The tab also displays the maximum number of memory pools that are available.

Note: The information about stealable memory resources is available only when the managed system is in the standby state or in the operating state.

Physical I/O adapters

The **Physical I/O Adapters** tab displays the physical I/O resources for the managed system. The assignment of I/O slots and partition, the adaptor-type, and the slot LP limit information are displayed. The physical I/O resources information is grouped by units.

- The **Adapter Description** column displays the physical description of each resource.
- The **Physical Location Code** column displays the physical location code of each resource.
- The **Owner** column displays who currently own the physical I/O. The value of this column can be any of the following values:
  - When a single root I/O virtualization (SR-IOV) adapter is in the shared mode, **Hypervisor** is displayed in this column.
  - When an SR-IOV adapter is in the dedicated mode, **Unassigned** is displayed when the adapter is not assigned to any partition as a dedicated physical I/O.
  - When an SR-IOV adapter is in the dedicated mode, the logical partition name is displayed when the adapter is assigned to any logical partition as a dedicated physical I/O.
- The **Bus Number** column displays the bus number of the resource.
- The **I/O Pools** button displays all of the I/O pools found in the system and the partitions that are participating in the pools.

PowerVM

You can use the PowerVM function on the Hardware Management Console (HMC) to manage the system-level virtualization capabilities of your IBM Power Systems servers.

You can use the PowerVM task to manage virtual resources that are associated with a system, such as configuring a Virtual I/O Server (VIOS), virtual networks, and virtual storage. You can manage the PowerVM functions at the managed system level in response to changes in workloads or to enhance performance.

The PowerVM functions include the following tasks:

- Managing Virtual I/O Servers
- Managing virtual networks
- Managing virtual storage
- Managing hardware virtualized I/O (SR-IOV adapters, host Ethernet adapters (HEAs), and host channel adapters (HCAs))
- Managing a reserved processor pool
- Managing shared processor pools
- Managing a shared memory pool

Use the online Help if you need additional information about managing PowerVM.

Capacity on Demand

Activate disabled processors or memory that is installed on your managed server.

You can use Capacity on Demand (CoD) to nondisruptively activate (no startup needed) processors and memory. Capacity on Demand also gives you the option to temporarily activate capacity to meet intermittent performance needs, to activate extra capacity on a trial basis, and to access capacity to support operations in times of need.

Capacity on Demand Functions

Learn about the different Capacity on Demand functions that are available for your system.

You can use Capacity on Demand (CoD) to nondisruptively activate (no startup needed) processors and memory. Capacity on Demand also gives you the option to temporarily activate capacity to meet intermittent performance needs, to activate extra capacity on a trial basis, and to access capacity to support operations in times of need.

The **Capacity on Demand Processor** functions include the following tasks:

- View processor settings
- CUoD (permanent) processor
  - View CUoD code information
- On/Off processor
  - Manage
  - View billing information
  - View capacity settings
  - View code information
- Utility processor
  - Manage
  - View capacity settings
  - View code information
  - View shared processor utilization
- Trial processor
  - Stop trial
  - View capacity settings
  - View code information

The **Capacity on Demand Memory** functions include the following tasks:

- View memory settings
- CUoD (permanent) memory

  - View CUoD code information
- On/Off memory
  - Manage
  - View billing information
  - View capacity settings
  - View code information
- Trial memory
  - Stop trial
  - View capacity settings
  - View code information

Use the online Help if you need additional information about Capacity on Demand functions.

Licensed Capabilities

View and edit the runtime capabilities that are supported by the managed system.

You can view which licensed capabilities are active on your managed system. To activate a new licensed capability, click **Enter Activation Code** and enter the activation code.

The licensed functions that are available on the managed system include the following capabilities:

- Active Memory Sharing Capable
- Live Partition Mobility Capable
- Micro-Partitioning® Capable
- PowerVM Partition Simplified Remote Restart Capable
- SR-IOV Capable (Logical Port Limit)
- Virtual I/O Server Capable
- Active Memory Expansion Capable
- Active Memory Mirroring for Hypervisor Capable
- Coherent Accelerator Processor Interface (CAPI)
- AIX Enablement for 256-Core Partition Capable
- Dynamic Platform Optimization Capable
- IBM i 5250 Application Capable

Use the online Help if you need additional information about licensed capabilities.

Serviceability

Problem Analysis on the HMC automatically detects error conditions and reports to you any problem that requires service to repair it.

These problems are reported to you as serviceable events. Use the **Serviceable Events Manager** task to view specific events for selected systems. However, if you notice a problem occurred or you suspect a problem is affecting the system but Problem Analysis has not reported it to you, use the **Create Serviceable Event** task to report the problem to your service provider.

To open the serviceability tasks that are available for your system, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.

3. In the menu pod, expand **Serviceability** and then click **Serviceability**.
4. Select the serviceability task that you want to perform from the list.

Tasks Log

View all the tasks that are currently running or completed on the Hardware Management Console (HMC).

To view the tasks log, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Tasks Log**.
2. You can view the following tabs in the tasks log:
   - **Task name**: Displays the name of task.
   - **Status**: Displays the current state of the task (running or completed).
   - **Resource**: Displays the name of the resource.
   - **Resource type**: Displays the type of resource.
   - **Initiator**: Displays the name of the user that initiated the task.
   - **Start time**: Displays the time that the task was initiated.
   - **Duration**: Displays the amount of time that the task took to complete.

Use the online Help for additional information about viewing the tasks log.

Serviceability

Problem Analysis on the Hardware Management Console (HMC) automatically detects error conditions and reports to you any problem that requires service to repair it.

These problems are reported to you as serviceable events. Use the **Serviceable Events Manager** task to view specific events for selected systems. However, if you notice a problem occurred or you suspect a problem is affecting the system but Problem Analysis has not reported it to you, use the **Create Serviceable Event** task to report the problem to your service provider.

To open the serviceability tasks that are available for your system, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Serviceability** and then click **Serviceability**.
4. Select the serviceability task that you want to perform from the list.

Serviceable Events Manager

Problems on your managed system are reported to the Hardware Management Console (HMC) as serviceable events. You can view the problem, manage problem data, call home the event to your service provider, or repair the problem.

To set the criteria for the serviceable events you to view, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to manage serviceable events.
3. In the menu pod, expand **Serviceability** and then click **Serviceability**.
4. Click **Serviceable Events Manager**.

5. Provide event criteria, error criteria, and FRU criteria. If you do not want the results to be filtered, select **ALL**. Click **Refresh** to refresh the list of serviceable events based on the criteria filter values.

The **Serviceable Events Overview** window displays all of the events that match your criteria. The information that is displayed in the compact table view includes the following information:

- Problem Number
- PMH Number
- Reference Code - Click the Reference code to display a description of the problem reported and actions that can be taken to fix the problem.
- Status of the problem
- Last reported time of the problem
- Failing MTMS of the problem
- Originating HMC

The full table view includes more detailed information, including reporting partition ID, primary data event timestamp, duplicate count, notification type, first reported time, reporting name, reporting MTMS, firmware fix, and serviceable event text.

Select a serviceable event and use the **Action** menu to:

- **View Details**: Field-replaceable units (FRUs) associated with this event and their descriptions.
- **View Files**: View the files associated with the selected serviceable event.
- **View Reference Code Description**: View the description of the reference code associated with the selected serviceable event. The option will not be available if additional description is not available.
- **Call Home**: Report the event to your service provider.
- **Repair**: Start a guided repair procedure, if available.
- **Close Event**: After the problem is solved, add comments and close the event.
- **Add PMH Comment**: Add a comment to a PMH for a selected serviceable event. If a PMH number does not exist for a given problem, the Add PMH Comment option is not available.

Use the online Help if you need additional information on managing serviceable events.

Create Serviceable Event

This task reports problems that occurred on your Hardware Management Console (HMC) to the service provider (for example, the mouse does not work) or lets you test problem reporting.

Submitting a problem is dependent upon whether you have customized this Hardware Management Console to use the Remote Support Facility (RSF) and if it is authorized to automatically call for service. If so, the problem information and service request is sent to the service provider automatically with a modem transmission.

To report a problem on your Hardware Management Console, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Create Serviceable Event**.
3. From the **Create Serviceable Event** window, select a problem type from the list displayed.
4. Enter a brief description of your problem in the **Problem Description** input field and then click **Request Service**.

To test problem reporting from the **Report a Problem** window:

1. Select **Test automatic problem reporting** and enter *This is just a test* in the **Problem Description** input field.

2. Click **Request Service**. The problems are reported to the service provider for the Hardware Management Console. Reporting a problem sends to the service provider the information you provide on **Report a Problem** window, and machine information that identifies the console.

Use the online Help if you need additional information for reporting a problem or testing if problem reporting works.

Manage Dumps

Manage system, service processor, and power subsystem dumps for systems that are managed by the Hardware Management Console (HMC).

system dump
A collection of data from server hardware and firmware, either after a system failure or a manual request. Perform a system dump only under the direction of your next level of support or your service provider.

service processor dump
A collection of data from a service processor either after a failure, external reset, or manual request.

power subsystem dump
A collection of data from Bulk Power Control service processor. This process is only applicable to certain models of managed systems.

Use the **Manage Dump** task to complete the following tasks:

- Initiate a system dump, a service processor dump, or a power subsystem dump.
- Modify the dump capability parameters for a dump type before you initiate a dump.
- Delete a dump.
- Copy a dump to media.
- Copy a dump to another system by using file transfer protocol (FTP).
- Call home a dump by using the Call Home feature to transmit the dump back to your service provider, for example IBM Remote Support, for further analysis.
- View the offload status of a dump as it progresses.

Use the online Help if you need additional information for managing dumps.

Collect VPD

Copy Vital Product Data (VPD) to removable media.

The managed system has VPD that is stored internally. The VPD consists of information such as how much memory is installed, and how many processors are installed. These records can provide valuable information that can be used by remote service and service representatives so that they can help you keep the firmware and software on your managed system up to date.

Note: To collect VPD, you must have at least one operational partition. For more information, see Logical Partitioning.

The information in the VPD file can be used to complete the following types of orders for your managed system:

- Install or remove a sales feature.
- Upgrade or rollback a model.
- Upgrade or rollback a feature.

Using this task, this information can be sent to removable media (diskette or memory key) for use by you or your service provider.

Use the online Help if you need additional information for collecting VPD.

Type, Model, Feature

Edit or display the model, type, machine type model serial (MTMS), or configuration ID of an enclosure.

The MTMS value or configuration ID for an expansion unit might need to be edited during a replacement procedure.

Use the online Help if you need additional information for editing MTMS.

Hardware Operations

Add, exchange, or remove hardware from the managed system. Display a list of installed FRUs or enclosures and their locations. Select a FRU or an enclosure and launch a step-by-step procedure to add, exchange, or remove the unit.

To open the hardware tasks that are available for your system, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to manage hardware tasks.
3. In the menu pod, expand **Serviceability** and then click **Serviceability**.
4. Select the hardware operations task that you want to perform from the list.

Prepare for Hot Repair or Upgrade

Provides a summary of required actions to be performed to isolate a particular hardware component as part of a service procedure.

From the **Component List** table, you can select the component to be repaired using the location code on the system to be repaired as directed by an Authorized Service Representative.

Power On/Off Unit

Use the **Power On/Off Unit** task to power on or off an I/O unit.

Only units or slots that reside in a power domain can be powered on or off. The corresponding power on/off buttons are disabled for location codes that are not controllable by the HMC.

Add FRU

Locate and add a Field Replaceable Unit (FRU).

To add a FRU to a POWER9 system, complete the following steps:

1. Select an enclosure type from the **Enclosure** menu.
2. Select a FRU type from the displayed list of FRU types for this enclosure, and click **Next**.
3. Select a FRU location, then click **Next** to start the Add FRU procedure for the selected location.
4. Follow the **Procedure** details listed in the window. The **Operation** list displays the correct operations for the procedure that you want to execute. The procedures direct when to perform each operation. Wait until advised to perform the operation before selecting the operation in the **Operation** list. Click **Next** to continue to the next service procedure.

   Note: Select the FRU location image on the header to display the location of the part to be serviced. To see a larger version of the FRU location image in a separate window, click **Display FRU Location**.
5. Click **Finish** to end the service when you have completed the last service procedure.

When the managed system is a POWER8® or earlier, to add a FRU, complete the following steps:

1. Select an enclosure type from the **Add FRU** menu.
2. Select a FRU type from the menu.
3. Click **Next**.
4. Select a location code from the displayed menu.
5. Click **Add**.

6. Click **Launch Procedure**.
7. When you complete the FRU installation process, click **Finish**.

Exchange FRU
Use the **Exchange FRU** task to exchange one field replaceable unit (FRU) with another FRU.

When the managed system is a POWER9 or later, to exchange a FRU, complete the following steps:

1. Select an installed enclosure type from the **Enclosure** menu.
2. Select a FRU type to be replaced, from the displayed list of FRU types for this enclosure and click **Next**.
3. Select a installed FRU location, then click **Next** to start the Exchange / Replace FRU procedure for the selected FRU.
4. Follow the **Procedure** details listed in the window. The **Operation** list displays the correct operations for the procedure that you want to execute. The procedures direct when to perform each operation. Wait until advised to perform the operation before selecting the operation in the **Operation** list. Click **Next** to continue to the next service procedure.

   Note: Select the FRU location image on the header to display the location of the part to be serviced. To see a larger version of the FRU location image in a separate window, click **Display FRU Location**.
5. Click **Finish** when you complete the exchange procedure.

When the managed system is a POWER8 or earlier, to exchange a FRU, complete the following steps:

1. Select an installed enclosure type from the **Exchange FRU** menu.
2. From the displayed list of FRU types for this enclosure, select a FRU type.
3. Click **Next** to display a list of locations for the FRU type.
4. Select a location code for a specific FRU.
5. Click **Add** to add the FRU location to **Pending Actions**.
6. Select **Launch Procedure** to begin replacing the FRUs that are listed in **Pending Actions**.
7. Click **Finish** when you complete the installation.

Remove FRU
Use the **Remove FRU** task to remove a FRU from your managed system.

When the managed system is a POWER9 or later, to remove a FRU, complete the following steps:

1. Select an enclosure from the menu to display a list of FRU types that are currently installed in the selected enclosure.
2. Select a FRU type from the displayed list of FRU types available for removal from the selected system and click **Next**.
3. Select a FRU location, then click **Next** to start the Remove FRU procedure for the selected FRU .
4. Follow the **Procedure** details listed in the window. The **Operation** list displays the correct operations for the procedure you want to execute. The procedures direct when to perform each operation. Wait until advised to perform the operation before selecting the operation in the **Operation** list. Click **Next** to continue to the next service procedure.

   Note: Select the FRU location image on the header to display the location of the part to be serviced. To see a larger version of the FRU location image in a separate window, click **Display FRU Location**.
5. Click **Finish** when you complete the removal procedure.

When the managed system is a POWER8 or earlier, to remove a FRU, complete the following steps:

1. Select an enclosure from the menu to display a list FRU types that are currently installed in the selected enclosure.
2. From the displayed list of FRU types for this enclosure, select a FRU type.
3. Click **Next** to display a list of locations for the FRU type.
4. Select a location code for a specific FRU.

5. Click **Add** to add the FRU location to **Pending Actions**.
6. Select **Launch Procedure** to begin removing the FRUs listed in **Pending Actions**.
7. Click **Finish** when you complete the removal procedure.

Add Enclosure
Learn how to locate and add an enclosure.

To add an enclosure, complete the following steps:

1. Select an enclosure type, then click **Add**.
2. Click **Launch Procedure**.
3. When you complete the enclosure installation process, click **Finish**.

Remove Enclosure
Use the **Remove Enclosure** task to remove an enclosure.

To remove an enclosure, complete the following steps:

1. Select an enclosure type, then click **Add** to add the selected enclosure type's location code to **Pending Actions**.
2. Click **Launch Procedure** to begin removing the enclosures that are identified in **Pending Actions** from the selected system.
3. Click **Finish** when you complete the enclosure removal process.

Open MES
View MES order numbers and their states, for any MES operations active or inactive for the Hardware Management Console (HMC).

Use **Add MES Order Number** to add a new order number to the list. To add an order number, complete the following steps:

1. Click **Add MES Order Number**.
2. Enter new MES order number.
3. Click **OK**.

Close MES
Close MES order numbers.

Use **Close MES** to close a MES. To close a MES, complete the following steps:

1. Select an open MES order number from the table.
2. Click **OK**.

Setup FSP Failover
Set up a secondary service processor if your managed system's primary service processor fails.

FSP Failover is designed to reduce customer outages due to service processor hardware failures. If a redundant service processor is supported for the current system configuration, select **Setup** to set up FSP Failover for the selected managed system.

To set up the FSP failover, complete the following steps:

1. In the content pane under **FSP failover**, click **Setup**.
2. Click **OK** to enable automatic failover for the selected system.

Initiate FSP Failover
Initiate a secondary service processor if your managed system's primary service processor fails.

FSP Failover is designed to reduce customer outages due to service processor hardware failures. Select **Initiate** to start the FSP Failover for the selected managed system.

To start the FSP failover, complete the following steps:

1. In the content pane under **FSP failover**, click **Initiate**.
2. Click **OK** to start the automatic failover for the selected system.

Reference Code Log

Reference codes provide general diagnostic, troubleshooting, and debugging information.

View reference codes that are generated for the selected managed system. Reference codes are diagnostic aids that help you determine the source of a hardware or operating system problem.

To view the reference code history, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Serviceability** and then click **Reference Code Log**.
4. Select a specific reference code to view the details.

Use the online Help if you need additional information about this task.

RIO Configuration

View the current hardware topology and the last valid hardware topology.

Displays the current hardware and last valid hardware topology. Any discrepancies between the current topology and the last valid topology are identified as errors.

To view the hardware topology, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Serviceability** and then click **RIO Configuration**.
4. View the hardware topology information.

Use the online Help if you need additional information about this task.

PCI Configuration

View information about the Peripheral Component Interconnect Express (PCIe) hardware topology.

The PCIe hardware topology utility provides information about the PCIe links that exist for each system.

To view the PCIe hardware topology, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Serviceability** and then click **PCI Configuration**.
4. View the PCIe hardware topology.

Use the online Help if you need additional information about this task.

Topology diagrams

Learn how to view the topology diagrams of a partition.

You can use the Hardware Management Console (HMC) to view the topology diagrams of a partition.

Viewing virtual networking diagrams

You can view the end-to-end network configuration for the selected system, by using the Hardware Management Console (HMC). The view of the virtual networks begins with the physical adapter cards and the physical ports that are connected to them. As you scroll down, you can see the defined virtual bridges, link aggregation devices, virtual switches, virtual networks, and partitions in the VIOS.

You can click a resource and drag to pan across the diagram. You can also double-click a resource to highlight that resource and the relationship between its various virtual and physical components in the network. To remove the highlighting, double-click in an empty area of the network diagram. To view more detailed information about a resource, you can right-click a resource and additional information is displayed in a click card. Alternatively, you can hover over the label of a resource area to display the name of the resource as a tooltip.

To view the end-to-end network configuration for the selected system by using the HMC, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Topology** and then click **Virtual Networking Diagram**.
4. Right-click a resource for the selected system to view more detailed information in a click card. You can also hover over the label of a resource area to display the name of the resource as a tooltip.
5. In the upper-right corner of the work pane, click the **zoom in** and **zoom out** icons to achieve the required level of magnification.

   Note: You can also zoom in and zoom out by using the scroll wheel on the mouse from within the diagram.
6. In the upper-right corner of the work pane, click the **Legend** icon to view an explanation of the symbols that are used in the virtual networking diagram.

Use the online Help if you need additional information about this task.

Viewing virtual storage diagrams

Two types of virtual storage diagrams are available; systems storage and partition storage. You can view the virtual storage configuration for the selected system, including the physical and virtual components of system storage, by using the HMC. You can also view the virtual storage configuration for a single partition in a particular system, including the physical and virtual components of storage assigned to that particular partition, by using the Hardware Management Console (HMC).

This diagram displays a high-level overview of the contents of the system or a single partition, and not specific component relationships. You can click a resource and drag to pan across the diagram. You can also double-click a resource to highlight that resource and the relationship between its various virtual and physical components in the network. To remove the highlighting, double-click in an empty area of the storage diagram. To view more detailed information about a resource, you can right-click a resource and additional information is displayed in a click card. Alternatively, you can hover over the label of a resource area to display the name of the resource as a tooltip.

To view the virtual storage configuration for the selected system or a single partition by using the HMC, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Topology** and then click **Virtual Storage Diagram**.

   Note: To view the virtual storage diagrams of a single partition in a particular system, select the partition of your choice and then expand **Topology** and click **Partition Virtual Storage Diagram**
4. Right-click a resource for the selected system to view more detailed information in a click card. You can also hover over the label of a resource area to display the name of the resource as a tooltip.
5. In the upper-right corner of the work pane, click the **zoom in** and **zoom out** icons to achieve the required level of magnification.

   Note: You can also zoom in and zoom out by using the scroll wheel on the mouse from within the diagram.
6. In the upper-right corner of the work pane, click the **Legend** icon to view an explanation of the symbols that are used in the virtual storage diagram.

Use the online Help if you need additional information about this task.

Viewing SR-IOV and vNIC diagrams

You can view the SR-IOV and virtual Network Interface Controllers (vNIC) configuration for the selected system, including the physical and virtual components, by using the Hardware Management Console (HMC).

This diagram displays the relationships between SR-IOV adapters and other virtual components, such as vNIC. You can click a resource and drag to pan across the diagram. You can also double-click a resource to highlight that resource and the relationship between its various virtual and physical components in the network. To remove the highlighting, double-click in an empty area of the SR-IOV and vNIC diagram. To view more detailed information about a resource, you can right-click a resource and additional information is displayed in a click card. Alternatively, you can hover over the label of a resource area to display the name of the resource as a tooltip.

To view the end-to-end network configuration for the selected system by using the HMC, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Topology** and then click **SR-IOV vNIC Diagram**.
4. Right-click a resource for the selected system to view more detailed information in a click card. You can also hover over the label of a resource area to display the name of the resource as a tooltip.
5. In the upper-right corner of the work pane, click the **zoom in** and **zoom out** icons to achieve the required level of magnification.

   Note: You can also zoom in and zoom out by using the scroll wheel on the mouse from within the diagram.
6. In the upper-right corner of the work pane, click the **Legend** icon to view an explanation of the symbols that are used in the SR-IOV and vNIC diagram.

Use the online Help if you need additional information about this task.

Systems Management for Partitions

Systems Management displays tasks that you can perform to manage servers, logical partitions, and frames. Use these tasks to set up, configure, view current status, troubleshoot, and apply solutions for partitions.

The following sets of tasks are represented when a partition is selected and is shown in the menu pod or content pane. The tasks that are listed in the menu pod change as selections are made in the work area.

Partition content pane

View and monitor the state, health, and capacity information of all the partitions that are connected to the management console.

The content pane, in the middle portion of the window, displays all the available partition and the associated information for each partition.

Each partition displays the current state of the partition, the reference code, the number of virtual processors that are allocated, and the amount of random access memory (RAM) that is allocated. Additionally, if you choose a tabular format view, you can filter the information to be displayed by selecting the drop-down arrow in the upper-right corner of the table. Select the check box corresponding to the field that you want to display on the table. If you are using HMC Version 9.1.930, or later, in the **All partition** table, you can also view the memory mode of all partitions that are associated with the managed system.

You can click the **properties** icon to display the following information:

- Current state
- System name
- Reference code
- Partition ID
- IP address
- Environment
- OS version
- RMC connection
- Last activated profile
- Contains physical I/O
- Group tags
- Attention LED

You can click the **capacity** icon to display the following information:

- Date of collection.
- Processor usage (type (dedicated, uncapped, or capped), entitled capacity, and virtual processors). When the processor type is dedicated, the bar graph and the numerical value show the used processor usage (used divided by assigned) in a percentage. The threshold line on the bar graph shows the peak threshold (peak divided by assigned). When the processor type is uncapped, the bar graph and the numerical value show the used processor usage (used divided by the number of virtual processors) in a percentage. The threshold line on the bar graph shows the peak threshold (peak divided by the number of virtual processors). When the processor type is capped, then the bar graph and the numerical value show the used processor usage (used divided by entitled) in a percentage. The threshold line on the bar graph shows the peak threshold (peak divided by entitled). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Memory allocation (allocated).
- Network I/O usage (sent and received in terabytes per second and in packets per second). The bar graph and the numerical value show the average usage ((average transferred bytes divided by the

number of adapters) divided by the maximum transferred bytes) in a percentage. The threshold line on the bar graph shows the high threshold (maximum transferred bytes). When the value exceeds the threshold, the bar graph changes to a dashed line format.

- Storage I/O usage (written and read information in kilobytes per second). The bar graph and the numerical value show the average usage ((average transferred bytes divided by the number of adapters) divided by the maximum transferred bytes) in a percentage. The threshold line on the bar graph shows the high threshold (maximum transferred bytes). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Data collection.

Partition Properties

The **View Partition Properties** task displays the selected partition's properties. This information is useful in resource allocation and partition management. These properties include:

General

The **General** tab displays the partition's name, ID, environment, state, resource configuration, operating system, boot mode to start the operating system, and the system on which the partition is located.

Note: If the managed system supports virtual serial number and if the managed system is not in an Enterprise Pool 2.0, the Virtual Serial Number property is displayed in the **General** tab.

Click **Advanced settings** to also view the list of supported hardware accelerators for a logical partition and Quality of Service (QoS) credits for a specific hardware accelerator. This section is not displayed if the managed system does not support hardware accelerators.

Note: When the HMC is at V9.2.950.0, or later, and when the firmware is at level FW950, or later, the **KeyStore Size** value can be chosen in the range 4 KB - 64 KB as the keystore size of the logical partition. The value of 0 KB indicates that the keystore function is disabled for the logical partition.

Processor

The **Processor** tab displays the current usage of processors.

Note: When the operating system and the hypervisor support a minimum entitlement of 0.05 processor per virtual processor, the minimum, maximum, and desired processing units can be set to the lowest supported value of 0.05.

Memory

The **Memory** tab displays properties of the running logical partition that is using the dedicated or the shared memory.

Physical I/O adapter

The **Physical I/O Adapter** tab displays the properties of all the physical I/O adapters that are available for the managed system and that can be assigned to a partition. You can also add and remove an adapter in a partition.

Change Default Profile

Change the default profile for the partition.

Select a profile from the drop down list to be the new default profile.

Operations

Operations contains the tasks for operating partitions.

About this task

To open the operations tasks that are available for your partitions, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Partitions**.
2. Select the partition for which you want to manage operations tasks. Click **Actions** > **View Partition Properties**
3. In the menu pod, expand **Partition Actions** and then expand **Operations**.
4. Select the operations task that you want to perform from the list.

Activate

Use the **Activate** task to activate a partition on your managed system that is in the **Not Activated** state.

Select the partition profile from the list of profiles and click **OK** to activate the partition. On the **Advanced** tab, select the **No VSI Profile** check box to ignore the failure while configuring the Virtual Station Interface (VSI) profile.

Note: As of HMC Version 7.7, or later, you can install a Virtual I/O Server (VIOS) on a logical partition from an HMC by using a DVD, a saved image, or a Network Installation Management (NIM) server.

Netboot

Use the **netboot** task to network boot an AIX, Linux, or an IBM i partition on your managed system that is in the **Not Activated** state.

The **Network boot** wizard guides you through the steps of installing the operating system on the partition and then activating the partition. Select a partition profile to install the operating system on the partition. Click **Next** to configure the network settings for the logical partition.

Note: For Virtual I/O Server, you must choose the **Install** option from the **Actions** menu to install the VIOS on your managed system that is in the **Not Activated** state.

Restart

Restart the selected logical partition or partitions.

For IBM i logical partitions, use this window only if you cannot restart the IBM i logical partition from the command line of the operating system. Using this window to restart an IBM i logical partition results in an abnormal IPL.

If you choose to restart VIOS partitions that are acting as the Paging Service Partition (PSP) for a number of client partitions, a warning displays, indicating that you must shut down the client partitions before you shut down the VIOS partition.

Choose one of the following options. The Operating System option and the Operating System Immediate option are enabled only if Resource Monitoring and Control (RMC) is up and configured.

Dump

The HMC shuts down the logical partition and initiates a main storage or system memory dump. For AIX and Linux logical partitions, the HMC also notifies the logical partition to shut down. For IBM i logical partitions, the processors are stopped immediately. After the shutdown is complete, the logical partition is immediately restarted. (IBM i logical partitions are restarted multiple times so that the logical partition can store the dump information.) Use this option if a portion of the operation system appears hung and you want a dump of the logical partition for analysis.

Operating System

The HMC shuts down the logical partition normally by issuing a shutdown -r command to the logical partition. During this operation, the logical partition performs any necessary shutdown activities. After the shutdown is complete, the logical partition is immediately restarted. This option is only available for AIX logical partitions. Immediate: The HMC shuts down the logical partition immediately. The HMC ends all active jobs immediately. The programs that are running in those jobs are not allowed to perform any job cleanup. This option might cause undesirable results if data is partially updated. Use this option only after a controlled end is unsuccessfully attempted.

Operating System Immediate

The HMC shuts down the logical partition immediately by issuing a shutdown -Fr command to the logical partition. During this operation, the logical partition bypasses messages to other users and other shutdown activities. After the shutdown is complete, the logical partition is immediately restarted. This option is only available for AIX logical partitions.

Dump Retry

The HMC retries a main storage or system memory dump on the logical partition. After this operation is complete, the logical partition is shut down and restarted. Use this option only if you previously tried the **Dump** option without success. This option is only available for IBM i logical partitions.

Shut Down

Shut down the selected logical partition or partitions.

For IBM i logical partitions, use this window only if you cannot shut down the IBM i logical partition from the command line of the operating system. Using this window to shut down an IBM i logical partition will result in an abnormal IPL.

If you choose to shut down VIOS partitions that are acting as the Paging Service Partition (PSP) for a number of client partitions, a warning displays, indicating that you should shut down the client partitions before shutting down the VIOS partition.

Choose from the following options:

Delayed

The HMC shuts down the logical partition using the delayed power-off sequence. This allows the logical partition time to end jobs and write data to disks. If the logical partition is unable to shut down within the predetermined amount of time, it will end abnormally and the next restart may be longer than normal.

Immediate

The HMC shuts down the logical partition immediately. The HMC ends all active jobs immediately. The programs running in those jobs are not allowed to perform any job cleanup. This option might cause undesirable results if data has been partially updated. Use this option only after a controlled shutdown has been unsuccessfully attempted.

Operating System

The HMC shuts down the logical partition normally by issuing a shutdown command to the logical partition. During this operation, the logical partition performs any necessary shutdown activities. This option is only available for AIX logical partitions.

Operating System Immediate

The HMC shuts down the logical partition immediately by issuing a shutdown -F command to the logical partition. During this operation, the logical partition bypasses messages to other users and other shutdown activities. This option is only available for AIX logical partitions.

Delete

Use the **Delete** task to delete the selected partition.

The Delete task deletes the selected partition and all of the partition profiles associated with the partition from the managed system. When you delete a partition, all hardware resources currently assigned to that partition become available to other partitions.

Schedule Operations

Create a schedule for certain operations to be performed on the logical partition.

Scheduled operations are helpful for situations where automatic, delayed, or repetitious processing of system operations is necessary. A scheduled operation is started at a specified time, without operator assistance to perform the operation. A schedule can be set for one operation or repeated many times.

For example, you might schedule an operation to remove resources from a logical partition or move resources from one logical partition to another.

The Scheduled Operations task displays the following information for each operation:

- The processor that is the object of the operation
- The scheduled date
- The scheduled time
- The operation
- The number of remaining repetitions

From the **Scheduled Operations** window you can perform the following operations:

- Schedule an operation to run later.
- Define operations to repeat at regular intervals.
- Delete a previously scheduled operation.
- View details for a currently scheduled operation.
- View scheduled operations within a specified time range.
- Sort scheduled operations by date, operation, or managed system.

You can schedule an operation to occur once or you can schedule it to repeat. You must provide the time and date that you want the operation to occur. If you want the operation to repeat, you are asked to select the following time intervals:

- The day or days of the week that you want the operation to occur. (optional)
- The interval, or time between each occurrence. (required)
- The total number of repetitions. (required)

The operations that you can schedule for a logical partition include the following operations:

Activate on an LPAR
Schedules an operation on a selected profile for activation of the selected logical partition.

Dynamic Reconfiguration
Schedules an operation for adding, removing, or moving a resource (processors or megabytes of memory).

Operating System Shutdown (on a partition)
Schedules a shutdown of the selected logical partition.

To schedule operations on the HMC, complete the following steps:

1. In the Navigation area, click **Systems Management**.
2. In the work pane, select one or more partitions.
3. In the taskpad, select the **Operations** task category, then click **Schedule Operations**. The **Customize Scheduled Operations** window opens.
4. From the **Customize Scheduled Operations** window, click **Options** from the menu bar to display the next level of options:
   - To add a scheduled operation, click **Options** and then click **New**.
   - To delete a scheduled operation, select the operation that you want to delete, point to **Options** and then click **Delete**.
   - To update the list of scheduled operations with the current schedules for the selected objects, point to **Options** and then click **Refresh**.
   - To view a scheduled operation, select the operation that you want to view, point to **View** and then click **Schedule Details**.
   - To change the time of a scheduled operation, select the operation that you want to view, point to **View** and then click **New Time Range**.
   - To sort the scheduled operations, point to **Sort** and then click one of the sort categories that appears.

5. To return to the HMC workplace, point to **Operations** and then click **Exit**.

Validate Maintenance Readiness

Use the **Validate Maintenance Readiness** task to validate the readiness of the Virtual I/O Server (VIOS) for maintenance. The VIOS must be in **Running** state with an active Resource Monitoring Control (RMC) connection to perform the validation operation on the VIOS. To complete the validation operation, you must have access to all the partitions of the managed system.

The Hardware Management Console (HMC) validates the readiness of the VIOS for the maintenance. When you execute the maintenance readiness operation, the HMC validates all the client logical partition that use Virtual I/O Servers for Multi-path I/O operation or redundancy setup for the network and storage that is attached to a logical partition. To check the redundancy setup of the network or storage, the HMC gets the inventory information of other Virtual I/O Servers that are associated with the managed system. However, if other VIOS partitions in the system do not have a proper RMC connection, the validation process continues, and results are shown based on the current states of the Virtual I/O Servers.

The page also displays information about all the impacted client partitions that do not have a redundant Virtual SCSI Storage, Virtual Fibre Channel, Virtual networks, and Virtual NIC that is provided by the VIOS.

Mobility

Use the Mobility task to migrate your partition to another server, ensure that the requirements for the migration are met, and recover if the partition is in an invalid state.

Migrate

Migrate a partition to another managed system.

About this task

To migrate a partition to another system, complete the following steps:

Procedure

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. In the content pane, select the server. Click **Actions** > **View System Partitions**.
3. In the content pane, select the partition that you want to migrate to another system.
4. Click **Actions** > **Mobility** > **Migrate**. The Partition Migration wizard opens.
5. Complete the steps in the Partition Migration wizard and click **Finish**.

Validate

Validate the settings for moving the partition from the source system to the destination system.

About this task

To validate the settings, complete the following steps:

Procedure

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. In the content pane, select the server. Click **Actions** > **View System Partitions**.
3. In the content pane, select the partition for which you want to validate the settings.
4. Click **Actions** > **Mobility** > **Validate**. The Partition Migration Validation window opens.
5. Fill in the information in the fields, and click **Validate**.

Recover

Recover this partition from a migration that did not complete.

About this task

To recover this partition from a migration that did not complete, complete the following steps:

Procedure

1. In the navigation area, click the **Resources** icon , and then select **All Systems**.
2. In the content pane, select the server. Click **Actions** > **View System Partitions**.
3. In the content pane, select the partition that you want to recover.
4. Click **Actions** > **Mobility** > **Recover**. The Migration Recovery window opens.
5. Complete the information as necessary and click **Recover**.

Partition Templates

Partition templates contain details for partition resources, such as physical adapters, virtual networks, and storage configuration. You can create client partitions from the quick-start templates that are available in the template library or from your own user-defined templates on the Hardware Management Console (HMC).

Capture Partition as a Template

You can capture the configuration details of a running partition and save the information as a partition template by using the Hardware Management Console (HMC).

To capture the configuration as a template, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Partitions**.
2. Select the partition for which you want to capture as a template.
3. Click **Actions** > **Templates** > **Capture Partition as a Template**.
4. Enter a template name and description.
5. Click **OK**.

Use the online Help if you need additional information about this task.

Profiles

Learn about the tasks that are available in the **Profiles** menu.

Manage Profiles

Use the **Manage Profiles** task to create, edit, copy, delete, or activate a profile for the selected partition.

A partition profile contains the resource configuration for the partition. You can modify the processor, memory, and adapter assignments for a profile by editing the profile.

The default partition profile for a logical partition is the partition profile that is used to activate the logical partition if no other partition profile is selected. You cannot delete the default partition profile unless you first designate another partition profile as the default partition profile. The default profile is defined in the status column.

Choose **Copy** to create an exact copy of the selected partition profile. This allows you to create multiple partition profiles that are nearly identical to one another by copying a partition profile and changing the copies as needed.

Manage Custom Groups

Groups are comprised of logical collections of objects. You can report status on a group basis, allowing you to monitor your system in a way that you prefer. You can also nest groups (a group contained within a group) to provide hierarchical or topology views.

One or more user-defined groups might already be defined on your Hardware Management Console (HMC). Default groups are listed under **Custom Groups** node under **Configuration**. The default groups are **All Partitions** and **All Objects**. You can create others, delete the ones that were created, add to created groups, create groups using the pattern match method, or delete from created groups by using the **Manage Custom Groups** task.

Use the online Help if you need additional information for managing custom groups.

Save Current Configuration

Save the current configuration of a logical partition to a new partition profile by entering a new profile name.

This procedure is useful if you change the configuration of a logical partition using dynamic logical partitioning and you do not want to lose the changes when you restart the logical partition. You can perform this procedure at any time after you initially activate a logical partition.

Delete Partition

You can delete a partition and the associated partition profile by using the Hardware Management Console (HMC).

To delete a partition, complete the following steps:

1. In the navigation area, click the **Resources** icon, and then select **All Partitions**.
2. Select the partition for which you want to delete.
3. Click **Actions** > **Delete Partition**.
4. Select any options that you want.
5. Click **OK**.

Use the online Help if you need additional information about this task.

Serviceability

Problem Analysis on the HMC automatically detects error conditions and reports to you any problem that requires service to repair it.

These problems are reported to you as serviceable events. Use the **Serviceable Events Manager** task to view specific events for selected systems. However, if you notice a problem occurred or you suspect a problem is affecting the system but Problem Analysis has not reported it to you, use the **Create Serviceable Event** task to report the problem to your service provider.

Serviceable Events Manager

Problems on your managed partitions are reported to the Hardware Management Console (HMC) as serviceable events. You can view the problem, manage problem data, call home the event to your service provider, or repair the problem.

To set the criteria for the serviceable events you to view, complete the following steps:

1. In the navigation area, click the **Resources** icon, and then select **All Systems**.
2. Select the server for which you want to manage serviceable events.

3. In the menu pod, expand **Serviceability** and then click **Serviceability**.
4. Click **Serviceable Events Manager**.
5. Provide event criteria, error criteria, and FRU criteria. If you do not want the results that are filtered, select **ALL**. Click **Refresh** to refresh the list of serviceable events based on the criteria filter values.

The **Serviceable Events Overview** window displays all of the events that match your criteria. The information that is displayed in the compact table view includes the following information:

- Problem Number
- PMH Number
- Reference Code - Click the Reference code to display a description of the problem reported and actions that can be taken to fix the problem.
- Status of the problem
- Last reported time of the problem
- Failing MTMS of the problem
- Originating HMC

The full table view includes more detailed information, including reporting partition ID, primary data event timestamp, duplicate count, notification type, first reported time, reporting name, reporting MTMS, firmware fix, and serviceable event text.

Select a serviceable event and use the **Action** drop-down menu to:

- **View Details**: Field-replaceable units (FRUs) associated with this event and their descriptions.
- **View Files**: View the files associated with the selected serviceable event.
- **View Reference Code Description**: View the description of the reference code associated with the selected serviceable event. The option will not be available if additional description is not available.
- **Call Home**: Report the event to your service provider.
- **Repair**: Start a guided repair procedure, if available.
- **Close Event**: After the problem is solved, add comments and close the event.
- **Add PMH Comment**: Add a comment to a PMH for a selected serviceable event. If a PMH number does not exist for a given problem, the Add PMH Comment option is not available.

Use the online Help if you need additional information on managing serviceable events.

Reference Code Log

Use the **Reference Code Log** task to view reference codes that have been generated for the selected logical partition. Reference codes are diagnostic aids that help you determine the source of a hardware or operating system problem.

By default, only the most recent reference codes that the logical partition has generated are displayed. To view more reference codes, enter the number of reference codes that you want to view into **View history** and click **Refresh**. The window displays that number of the latest reference codes, with the date and time at which each reference code was generated. The window can display up to the maximum number of reference codes stored for the logical partition.

Control Panel Functions

This task displays the available virtual control panel functions for the selected IBM i partition. The tasks are:

(21) Activate Dedicated Service Tools
Starts Dedicated Service Tools (DST) on the partition.

(65) Disable Remote Service
Deactivates remote service on the partition.

(66) Enable Remote Service
Activates remote service on the partition.

(68) Concurrent Maintenance Power Off Domain
Concurrent maintenance power domain Power Off.

(69) Concurrent Maintenance Power On Domain
Concurrent maintenance power domain Power On.

Virtual I/O

Learn how to view the virtual networks, virtual network interface controllers, and virtual storage of a partition.

You can use the Hardware Management Console (HMC) to view the virtual topology of a partition.

Virtual Networks

You can view and add virtual networks that are associated with the selected logical partition.

The **Virtual Networks** table lists the virtual network name, VLAN ID, virtual switch, virtual network bridge, and virtual Ethernet adapter ID that are associated with each virtual network. You can click **Attach Virtual Network** to view the available virtual networks and attach additional virtual networks to the logical partition.

To view the virtual networks for the selected partitions by using the HMC, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Partitions**.
2. Select the partition for which you want to manage serviceability tasks and click **Actions** > **View Partition Properties**.
3. In the menu pod, expand **Virtual I/O** and then click **Virtual Networks**.

Use the online Help if you need additional information about this task.

Virtual NIC

You can manage all aspects of the virtual Network Interface Controller (NIC) configuration that is associated with the partition.

A virtual NIC is a type of virtual adapter that can be configured on logical partitions to provide a network interface. Each virtual NIC client adapter is backed by an SR-IOV logical port that is owned by the hosting partition.

The **Virtual NIC** table lists all virtual NICs that are configured for the selected partition. A virtual NIC can have one or more backing devices. The maximum number of backing devices per virtual NIC depends on the system. If the virtual NIC has more than one backing device, you can expand the node to view all the backing devices. If the virtual NIC has only one backing device, that backing device is the active backing device. The active backing device is the one that is in use by the virtual NIC. If the managed system is not failover capable, the table displays virtual NICs that have a single backing device.

You can add a virtual NIC to the partition. To add a virtual NIC, click **Add Virtual NIC**. You can configure the virtual NIC only in dedicated mode. You can also modify and view virtual NIC properties. To modify properties of a virtual NIC, select the virtual NIC in the table and click **Action** > **Modify vNIC** . To view the properties of a virtual NIC, select the virtual NIC in the table and click **Action** > **View vNIC**.

To view the virtual NIC for the selected partition by using the HMC, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Partitions**.
2. Select the partition for which you want to manage serviceability tasks and click **Actions** > **View Partition Properties**.

3. In the menu pod, expand **Virtual I/O** and then click **Virtual NICs**.

Use the online Help if you need additional information about this task.

Virtual Storage

You can create, view, and manage the storage capability of the logical partition.

The **Virtual Storage** table displays the Virtual Small Computer Serial Interface (SCSI) devices that are configured to a logical partition. You can also view the information about the physical volume groups, shared storage pool volume, and the logical volume.

You can add the virtual storage resources to a partition. Click **Adapter View** to create, view the adapter configuration of the virtual storage devices that are allocated for the logical partition. Click **Storage View** to view and manage the storage capability of the logical partition.

Physical volumes can be exported to partitions as virtual SCSI disks. Click **Show assigned physical volumes** to view the assigned physical volumes that are assigned to the logical partition.

To add physical volumes to a partition, select the physical volumes from the list and specify the **User Defined Name** for each physical volume that you want to add to the partition and then click **OK**. If you want to change the server adapter ID that is assigned to each physical volume, click **Edit** for each of the physical volumes that you want to update. The **Edit connection** window is displayed. You can specify up to 3 Virtual I/O servers, and then enter the new server adapter ID that you want to assign for the adapter connection.

To add different types of virtual storage devices to a partition, click **Add Virtual SCSI Device**. Select the available virtual storage that you want to add. You can select the virtual storage types such as **Physical Volume**, **Shared Storage Pool Volume**, or **Logical Volume**.

To view the virtual storage for the selected partition by using the HMC, complete the following steps:

1. In the navigation area, click the **Resources** icon, and then select **All Partitions**.
2. Select the partition for which you want to manage serviceability tasks and click **Actions** > **View Partition Properties**.
3. In the menu pod, expand **Virtual I/O** and then click **Virtual Storage**.

Use the online Help if you need additional information about this task.

Hardware Virtualized I/O

You can view and change the settings of hardware virtualized I/O adapters, such as single root I/O virtualization (SR-IOV) port adapters and logical host Ethernet adapters (LHEA) for a partition by using the Hardware Management Console (HMC).

To view the hardware virtualized I/O adapters for the selected partition by using the HMC, complete the following steps:

1. In the navigation area, click the **Resources** icon, and then select **All Partitions**.
2. Select the partition for which you want to manage serviceability tasks and click **Actions** > **View Partition Properties**.
3. In the menu pod, expand **Virtual I/O** and then click **Hardware I/O**.
4. In the **SRIOV** tab, you can add an SR-IOV logical port to the partition or change the settings of the SR-IOV logical ports. In the **SR-IOV logical port** table, you can also view the information about the logical ports that can be migrated and the information about the backing device that is configured for the logical ports. In the **Logical host Ethernet adapters** (LHEA) tab, you can change the settings of an LHEA adapter. You can also add and remove an LHEA adapter.

Notes:

- With HMC Version 9.1.930, or later, the HMC also supports the RDMA over Converged Ethernet (RoCE) adapter.
- If you are using HMC Version 9.1.940, with firmware at level FW940, or later, you can create logical partitions that have an SR-IOV logical port that can be migrated. You can migrate a logical partition with SR-IOV logical ports when the Migratable option is used to create a backup virtual device when creating a logical port. The backup device can be either a virtual Ethernet or a virtual Network Interface Controller (NIC) adapter. When the HMC is at Version 9.1.940.x, and when the firmware is at level FW940, the Migratable option for the Hybrid Network Virtualization capability is available as a Technology Preview only and is not intended for production deployments. However, when the HMC is at Version 9.1.941.0, or later, and when the firmware is at level FW940.10, or later, the Migratable option for the Hybrid Network Virtualization capability is supported.

Use the online Help if you need additional information about this task.

Systems Management for Frames

Set up, configure, view status, troubleshoot, and apply solutions for frames.

Properties

Display the selected frame properties.

Frame properties include the following properties:

General
The **General** tab displays the frame name and number, state, type, model, and serial number.

Managed Systems
The **Managed Systems** tab displays all of the managed systems that are contained in the frame and their cage numbers. A cage is a division of the enclosure that holds the managed systems, the I/O units, and the bulk power assemblies (BPAs).

I/O Units
The **I/O Units** tab displays all of the I/O units that are contained in the frame, their cage numbers, and their assigned managed systems. A cage is a division of the enclosure that holds the managed systems, the I/O units, and the BPAs. If the System column displays **Not owned**, the corresponding I/O unit is not assigned to a managed system.

Operations

Perform tasks on managed frames.

Initialize Frames

Learn how to initialize managed frames.

This operation task is available when one or more frames are selected. It first powers on the unowned I/O units within the selected managed frames, then power on the managed systems within the selected managed frames. The complete initialization process might take several minutes to complete.

Note: Managed systems that are already powered on are not affected and are not powered off and back on again.

Initialize All Frames

Initialize all of your frames.

About this task

This operation task is available when no managed frame is selected and the **Frames** tab on the navigation area is highlighted. It first powers on unowned I/O units within each managed frame, then power on managed systems within each managed frame.

Note: Frames are already powered on when they are connected to HMC. Initializing frames does not power on the frames.

Rebuild

Update frame information on the Hardware Management Console (HMC) interface.

Updating, or rebuilding, the frame acts much like a refresh of the frame information. Rebuilding the frame is useful when the system's state indicator in the Work pane of the HMC is shown as **Incomplete**. The **Incomplete** indicator signifies that the HMC cannot gather complete resource information from the managed system within the frame.

No other tasks can be performed on the HMC during this process, which can take several minutes.

Change Password

Change the Hardware Management Console (HMC) access password on the selected managed frame.

After the password is changed, you must update the HMC access password for all other HMCs from which you want to access this managed frame.

Enter the current password and then, enter a new password and verify it by entering it again.

Power On/Off IO Unit

Power off an IO unit by using the Hardware Management Console (HMC) interface.

Only units or slots that reside in a power domain can be powered off. The corresponding power on/off buttons are disabled for location codes that are not controllable by the HMC.

Configuration

You can use the **Configuration** tasks to configure your frame. You can also manage custom groups by using the **Configuration** task.

Manage Custom Groups

You can report status on a group basis to monitor your system in a way that you prefer.

You can also nest groups (a group that is contained within a group) to provide hierarchical or topology views.

One or more user-defined groups might already be defined on your HMC. Default groups are listed under **Custom Groups** node under **Server Management**. The default groups are **All Partitions** and **All Objects**. You can create others, delete the ones that were created, add to created groups, create groups by using the pattern match method, or delete from created groups by using the **Manage Custom Groups** task.

Use the online Help if you need additional information for working with groups.

Connections

You can use the **Connections** tasks to view the Hardware Management Console (HMC) connection status to frames or reset those connections.

Bulk Power Assembly (BPA) Status

Use the **Bulk Power Assembly (BPA) Status** task to view the state of the connection from the Hardware Management Console (HMC) to side A and side B of the bulk power assembly. The HMC operates normally with a connection to either side A or side B. However, for code update operations and some concurrent maintenance operations, the HMC needs connections to both sides.

The HMC displays the following information:

- IP address
- BPA Role
- Connection Status
- Connection Error code

If the status is not Connected, the Connection status might be one of the following conditions:

Starting/Unknown
One of the Bulk Power Assemblies (BPAs) contained in the frame is in the process of starting. The state of the other BPA cannot be determined.

Standby/Standby
Both of the BPAs contained in the frame are in the standby state. A BPA in the standby state is operating normally.

Standby/Starting
One of the BPAs contained in the frame is operating normally (in standby state). The other BPA is in the process of starting.

Standby/Not Available
One of the BPAs contained in the frame is operating normally (in the standby state), but the other BPA is not operating normally.

Pending frame number
A change to the frame number is in progress. No operations can be completed when the frame is in this state.

Failed Authentication
The HMC access password for the frame is not valid. Enter a valid password for the frame.

Pending Authentication - Password Updates Required
The frame access passwords are not set. You must set the required passwords for the frame to enable secure authentication and access control from the HMC.

No Connection
The HMC cannot connect to the frame.

Incomplete
The HMC failed to get all of the necessary information from the managed frame. The frame is not responding to requests for information.

Reset

Reset the connection between the Hardware Management Console (HMC) and the selected managed frame.

When you reset the connection with a managed frame, the connection is broken and then reconnected. Reset the connection with the managed frame if the managed frame is in a **No Connection** state and you verify that the network settings are correct on both the HMC and the managed frame.

Serviceability

Problem analysis on the Hardware Management Console (HMC) automatically detects error conditions and reports to you any problem that requires service to repair it.

These problems are reported to you as serviceable events. You can view specific events for selected systems and add, remove, or exchange a Field Replaceable Unit (FRU). Use the **Serviceable Events Manager** task to view specific events for selected frames.

To open the serviceability tasks that are available for your frame, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Frames**.
2. Select the frame for which you want to manage serviceability tasks.
3. In the menu pod, expand **Serviceability** and then click **Serviceability**.
4. Select the serviceability task that you want to complete from the list.

Serviceable Events Manager

Problems on your managed frame are reported to the Hardware Management Console (HMC) as serviceable events. You can view the problem, manage problem data, call home the event to your service provider, or repair the problem.

To set the criteria for the serviceable events you want to view, complete the following steps:

1. From the menu pod, open **Serviceable Events Manager**.
2. Provide event criteria, error criteria, and FRU criteria.
3. Click **OK**.
4. If you do not want the results that are filtered, select **ALL**.

The **Serviceable Events Overview** window displays all of the events that match your criteria. The information that is displayed in the compact table view includes the following fields:

- Problem Number.
- PMH Number.
- Reference Code: Click **Reference** code to display a description of the problem reported and actions that can be taken to fix the problem.
- Status of the problem.
- Last reported time of the problem.
- Failing MTMS of the problem.

The full table view includes more detailed information, including reporting MTMS, first reported time, and serviceable event text.

Select a serviceable event and complete the following tasks:

- **View event details**: FRUs associated with this event and the descriptions.
- **Repair the event**: Start a guided repair procedure, if available.
- **Call home the event**: Report the event to your service provider.
- **Manage event problem data**: View, call home, or offload to media data and logs associated with this event.
- **Close the event**: After the problem is solved, add comments and close the event.

Use the online Help if you need additional information on managing serviceable events.

Hardware

These tasks are used to add, exchange, or remove hardware from the managed frame. From the hardware tasks, you can display a list of installed FRUs or enclosures and their locations. Select a FRU or an enclosure and start a step-by-step procedure to add, exchange, or remove the unit.

Add FRU

Use the **Add FRU** task to locate and add a FRU.

To add a FRU, complete the following steps:

1. From the **FRU** menu, select an enclosure type.
2. Select a FRU type.
3. Click **Next**.
4. Select a location code.
5. Add the selected enclosure location to Pending Actions by clicking **Add**.
6. Begin adding the selected FRU type to the enclosure locations identified in Pending Actions by clicking **Launch Procedure**.
7. When you complete the FRU installation process, click **Finish**.

Add Enclosure

Use the **Add Enclosure** task to locate and add an enclosure.

To add an enclosure, complete the following steps:

1. Select an enclosure type, then click **Add** to add the selected enclosure type's location code to **Pending Actions**.
2. To begin adding the enclosures that are identified in **Pending Actions** to the selected system, click **Launch Procedure**.
3. When you complete the enclosure installation process, click **Finish**.

Exchange FRU

Exchange one FRU with another FRU.

To exchange a FRU, complete the following steps:

1. Select an installed enclosure type.
2. Select a FRU type.
3. Click **Next**.
4. Select a location code for a specific FRU.
5. Click **Add**.
6. Select **Launch Procedure**.

   Note: This procedure identifies the resources that are impacted by the **Exchange FRU** task, including any resources that are in use by partitions. Workloads that are running on partitions might be impacted if redundancy is not configured. Follow the on-screen instructions to complete the exchange.
7. When you complete the installation, click **Finish**.

Exchange Enclosure

Exchange one enclosure for another enclosure.

To exchange an enclosure, complete the following steps:

1. Select an installed enclosure, then click **Add** to add the selected enclosure's location code to **Pending Actions**.
2. Begin replacing the enclosures that are identified in **Pending Actions** in the selected system by clicking **Launch Procedure**.

3. When you complete the enclosure replacement process, click **Finish**.

Remove FRU

Remove a FRU from your managed system.

To remove a FRU, complete the following steps:

1. Select an enclosure from the menu.
2. Select a FRU type from the displayed list of FRU types for this enclosure.
3. Click **Next**.
4. Select a location code for a specific FRU.
5. Click **Add**.
6. Select **Launch Procedure**.
7. When you complete the removal procedure, click **Finish**.

Remove Enclosure

Remove an enclosure that is identified by the Hardware Management Console (HMC).

To remove an enclosure, complete the following steps:

1. Select an enclosure type, then click **Add**.
2. Click **Launch Procedure**.
3. When you complete the enclosure removal process, click **Finish**.

Manage Groups

The **All groups** view provides a mechanism for you to group system resources together in a single view.

Groups may be nested to create customized system resources view.

You can view all the groups that are created by the users of the management console, including cumulative state information for system resources in a group. A custom group can consist of any systems, partitions, and Virtual I/O Servers that are managed by the management console.

To create a new group, complete the following steps:

1. Click **Create group** on the toolbar.
2. In the **Create group** window, specify a group name and description for the group. You can also tag a color to the group that you want to create.
3. Select one or more resources (for example: servers, partitions, or frames) that you want to include in the group that you want to work with.
4. Click **OK** to save the changes and to close the window.

You can edit an existing group to add or remove the resources from the group.

Note: When the last member (resources) of the group is removed, a message is displayed to confirm whether you want to delete the group. Click **Cancel** to retain the group in the **All groups** view.

Power Enterprise Pools

Systems Management for Power Enterprise Pool displays Power Enterprise Pool tasks that you can perform.

You can perform the following operations by using the Power Enterprise Pool offering:

- Add processors or memory to a server.
- Remove processors or memory from a server.
- Update the pool configuration.
- Add a server to the pool.

- Remove an existing server from the pool.
- Add processors or memory to the pool.
- View the following Power Enterprise Pool information:
  - Pool membership information
  - Pool resource information
  - Pool compliance information
  - Pool history log

HMC Management tasks

Learn about the tasks that are available on the Hardware Management Console (HMC) under **HMC Management**.

To open these tasks, see “HMC tasks, user roles, IDs, and associated commands” on page 9.

Note: Depending on the task roles that are assigned to your user ID, you might not have access to all the tasks. See Table 3 on page 9 for a listing of the tasks and the user roles that are allowed to access them.

Launch Guided Setup Wizard

This task uses a wizard to set up your system and HMC.

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Launch Guided Setup Wizard**.
3. From the **Launch Guided Setup Wizard - Welcome** window it is recommended that you have certain prerequisites on hand. Click **Prerequisites** in the **Launch Guided Setup Wizard - Welcome** window for the information. When you have completed that, this wizard takes you through the following tasks required to set up your system and HMC. As you complete each task, click **Next** to proceed.
   a. Change HMC Date and Time
   b. Change HMC passwords
   c. Create additional HMC users
   d. Configure HMC Network Settings (This task cannot be performed if you are accessing the **Launch Guided Setup Wizard** remotely.)
   e. Specify contact information
   f. Configure connectivity information
   g. Authorize users to use the Electronic Service Agent software tool and configure notification of problem events.
4. Click **Finish** when you have completed all the tasks in the wizard.

View Network Topology

This task allows you to view and ping the connectivity between various network nodes within the Hardware Management Console (HMC).

To view the network topology, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **View Network Topology**.
3. From the **View Network Topology** window, you can ping current and saved nodes.
4. Click **Close** when you have completed this task.

Use the online Help if you need additional information about viewing the network topology.

Test Network Connectivity

This task allows you to view network diagnostic information about the network protocols for the Hardware Management Console (HMC).

To test the network connectivity, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Test Network Connectivity**.
3. From the **Test Network Connectivity** window, you can work with the following tabs:

   Ping
   You can ping the TCP/IP address or name.

   Interfaces
   Displays the statistics for the network interfaces that are currently configured. To update the information that is currently displayed with the most recent information, click **Refresh**.

   Ethernet Settings
   Displays the settings for the Ethernet cards that are currently configured. To update the information that is currently displayed with the most recent information, click **Refresh**.

   Address
   Display the TCP/IP addresses for the configured network interfaces. To update the information that is currently displayed with the most recent information, click **Refresh**.

   Routes
   Displays the Kernel IP and IPv6 routing tables and corresponding network interfaces. To update the information that is currently displayed with the most recent information, click **Refresh**.

   ARP
   Displays the contents of the Address Resolution Protocol (ARP) connections. To update the information that is currently displayed with the most recent information, click **Refresh**.

   Sockets
   Displays information about TCP/IP sockets. To update the information that is currently displayed with the most recent information, click **Refresh**.

   TCP
   Displays information about Transmission Control Protocol (TCP) connections. To update the information that is currently displayed with the most recent information, click **Refresh**.

   IP Tables
   Displays information (in table format) about the Internet Protocol (IP) packet filter rules. To update the information that is currently displayed with the most recent information, click **Refresh**.

   UDP
   Displays information about User Datagram Protocol (UDP) statistics. To update the information that is currently displayed with the most recent information, click **Refresh**.
4. Click **Cancel** when you have completed this task.

Use the online Help if you need additional information about testing the network connectivity.

Change Network Settings

This task allows you to view the current network information for the HMC and to change network settings.

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change Network Settings**.
3. From the **Change Network Settings** window, you can work with the following tabs:

   Identification
   Contains the host name, domain name, and console description of the HMC.

   LAN Adapters
   A summarized list of all (visible) Local Area Network (LAN) adapters. You can select any of these and click **Details...** to open a window allowing you to change addressing, routing, other LAN adapter characteristics, and firewall settings.

   Bond LAN Adapters
   Create or delete a Bond LAN adapter. A Bond LAN adapter combines two Ethernet interfaces into a single logical link. To change the settings of the Bond LAN adapter, select a Bond LAN adapter and click **Edit**. You can change the IP address, IP network mask, gateway, and the firewall settings of the Bond LAN adapter.

   Name Services
   Specify the DNS and domain suffix values for configuring the console network settings.

   Routing
   Specify the routing information and default gateway information for configuring the console network settings.

   The **Gateway address** is the route to all networks. The default gateway address (if defined) informs this HMC where to send data if the target station does not reside on the same subnet as the source. If your machine can reach all stations on the same subnet (usually a building or a sector within a building), but cannot communicate outside the area, it is usually because of an incorrectly configured default gateway.

   You can assign a specific LAN to be the **Gateway device** or you can choose “any.”

   You can select **Enable ’routed’** to start the routed daemon, which allows it to run and allows any routing information to be exported from the HMC.
4. Click **OK** when you have completed this task.

Note: Depending on the type of change that you make, the network or console automatically restarts or the console automatically reboots.

Use the online Help to get additional information for customizing the network settings.

Change Performance Monitoring Settings

The Performance and Capacity Monitor tool collects allocation and usage data for virtualized server resources. It displays data in the form of graphs and tables, which are viewable from the Performance and Capacity Monitor home page.

The Performance and Capacity Monitor gathers data and provides capacity reporting and performance monitoring. This information can help you to determine the available capacity and whether your resources might be overextended or underused. In addition, your interpretation of the graphs and tables might be useful for capacity planning and troubleshooting. For more information about The Performance and Capacity Monitor tool, see Using the Performance and Capacity Monitor.

The Performance and Capacity Monitor captures data only from the servers for which you choose to enable data collection.

To enable data collection, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change Performance Monitoring Settings**.
3. Specify the number of days for which you want to store performance data by typing in a number 1 - 366. Alternatively, you can click the up or down arrows next to **Number of days to store performance data** under **Performance Data Storage**.

   Note: By default, the HMC stores data for 180 days. However, you can specify the maximum number of days that the HMC stores data to 366 days.
4. Click the toggle switch in the **Collection** column next to the name of the server for which you want to collect data. Alternatively, you can click **All On** to enable data collection for all of the servers in your environment that the HMC manages.

   Note: You might be prevented from collecting data from all of the servers in your environment because storage space is limited. The HMC prohibits you from enabling data collection from more servers when the HMC determines that it might run out of estimated storage space.
5. Click **OK** to apply the changes and close the window. You can now review the collected data when you access the Performance and Capacity Monitor home page.

Change Date and Time

Change the time and date of the battery-operated Hardware Management Console (HMC) clock and add or remove time servers for the Network Time Protocol (NTP) service.

Use this task in the following situations:

- If the battery is replaced in the HMC.
- If your system is physically moved to a different time zone.

Note: The time setting adjusts automatically for Daylight Saving Time in the time zone you select.

To change the date and time, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change Date and Time**.
3. Click the **Customize Console Date and Time** tab.
4. Enter the date and time information.
5. Click **OK**.

To change the time server information, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change Date and Time**.
3. Click the **NTP Configuration** tab.
4. Provide the appropriate information for the time server.
5. Click **OK**.

If you need additional information for changing the date and time of the HMC or for adding or removing time servers for the Network Time Protocol (NTP) service, use the online Help.

Change Language and Locale

This task sets the language and location for the HMC. After you select a language, you can select a locale associated with that language.

The language and locale settings determine the language, the character set, and other settings specific to the country or region (such as formats for date, time, numbers, and monetary units). Changes made in the **Change Language and Locale** window affect only the language and locale for the HMC itself. If you access the HMC remotely, the language and locale settings on your browser determine the settings that the browser uses to display the HMC interface.

To change the language and locale on the HMC:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Change Language and Locale**.
3. From the **Change Language and Locale** window, choose the applicable language and locale.
4. Click **OK** to apply the change.

Use the online Help if you need additional information for changing the language and locale of the HMC.

Create Welcome Text

Create and display a welcome message or display a warning message that appears before users log on to the Hardware Management Console (HMC).

The text that you enter in the message input area for this task appears on the **Welcome** window after you initially access the console. You can use this text to notify users about certain corporate policies or security restrictions that apply to the system.

To create a welcome text, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Create Welcome Text**.
3. Enter the welcome text that you want to display in the text box.

   Note: A maximum of 8192 characters is allowed.
4. Click **OK**.

For more information about this task, use the online Help.

Console Default Settings

You can modify the default console settings on the Hardware Management Console (HMC).

You can also modify the number of days for which a certificate is valid.

Note: The certificate can be valid for maximum of 3650 days.

To modify the console default settings, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.
2. In the content pane, click **Console Default Settings**.
3. In the **Console Default Settings** window, you can specify the number of days for which the certificate will be valid and you can also configure the time out settings for a HMC session. If you are using HMC

9.1.940, or later, you can specify the maximum number of log in attempts to the HMC graphical user interface (GUI). You can enter a value in the range 3 - 50.

4. When you complete the task, click **OK**.

Use the online Help if you need additional information about this task.

Shut Down or Restart

This task enables you to shut down (power off the console) or to restart the console.

1. In the navigation area, click the **HMC Management** icon , and then select **Console Managment**.
2. In the content pane, click **Shut Down or Restart**.
3. From the **Shut Down or Restart** window, you can:
   - Select **Restart the HMC** to automatically restart the HMC once the shut down has occurred.
   - Do not select **Restart the HMC** if you do not want to automatically restart the HMC.
4. Click **OK** to proceed with the shut down, otherwise click **Cancel** to exit the task.

Use the online Help if you need additional information about shutting down or restarting the HMC.

Schedule Operations

Create a schedule for certain operations to be performed on the Hardware Management Console (HMC) itself without operator assistance.

Scheduled operations are helpful for situations where automatic, delayed, or repetitious processing of system operations is necessary. A scheduled operation is started at a specified time, without operator assistance to perform the operation. A schedule can be set for one operation or repeated many times.

For example, you might schedule a backup of important HMC information to DVD to occur once, or set up a repeating schedule.

The **Scheduled Operations** task displays the following information for each operation:

- The processor that is the object of the operation.
- The scheduled date.
- The scheduled time.
- The operation.
- The number of remaining repetitions.

From the **Scheduled Operations** window you can:

- Schedule an operation to run later.
- Define operations to repeat at regular intervals.
- Delete a previously scheduled operation.
- View details for a currently scheduled operation.
- View scheduled operations within a specified time range.
- Sort scheduled operations by date, operation, or managed system.

An operation can be scheduled to occur one time or it can be scheduled to be repeated. You are required to provide the time and date that you want the operation to occur. If the operation is scheduled to be repeated, you are asked to select:

- The day or days of the week that you want the operation to occur. (optional)
- The interval, or time between each occurrence. (required)

- The total number of repetitions. (required)

The operation that can be scheduled for the HMC is:

Backup Critical Console Data
Schedules an operation to back up the critical console hard disk information for the HMC.

To schedule operations on the HMC, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Managment**.
2. In the content pane, click **Schedule Operations**.
3. From the **Schedule Operations** window, click **Options** from the menu bar to display the next level of options:
   - To add a scheduled operation, point to **Options** and then click **New**.
   - To delete a scheduled operation, select the operation that you want to delete, point to **Options** and then click **Delete**.
   - To update the list of scheduled operations with the current schedules for the selected objects, point to **Options** and then click **Refresh**.
   - To view a scheduled operation, select the operation that you want to view, point to **View** and then click **Schedule Details**.
   - To change the time of a scheduled operation, select the operation that you want to view, point to **View** and then click **New Time Range**.
   - To sort the scheduled operations, point to **Sort** and then click one of the sort categories that appears.
4. To return to the HMC workplace, point to **Options** and then click **Exit**.

Use the online Help to get additional information for scheduling an operation.

View Licenses

View the Licensed Internal Code that you agreed to for this Hardware Management Console (HMC).

You can view licenses at any time. To view licenses, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Managment**.
2. In the content pane, click **View Licenses**.
3. Click any of the license links to view more information.

   Note: This list does not include programs and code that is provided under separate license agreements.
4. Click **OK**.

Update the Hardware Management Console

Learn how to update the internal code of the Hardware Management Console (HMC) and view system information and system readiness.

To update the HMC, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Management**.

2. In the content pane, click **Update the Hardware Management Console**. The **Install HMC Corrective Service Wizard** opens.
3. Click **Next** to start the update process.
4. Follow the steps in the wizard to complete the update operation.
5. Click **Finish** when you have completed this task.

Use the online Help if you need additional information about updating the Hardware Management Console.

Format Media

This task formats a diskette or USB 2.0 Flash Drive Memory Key.

You can format a diskette by supplying a user-specified label.

To format a diskette or USB 2.0 Flash Drive Memory Key, complete the following steps:

1. In the navigation area, click the **HMC Management** icon, and then select **Console Managment**.
2. In the content pane, click **Format Media**.
3. From the **Format Media** window, select the type of media you want to format, then click **OK**.
4. Make sure that your media is correctly inserted, then click **Format**. The **Format Media** progress window is displayed. When the media is formatted, the **Format Media Completed** window is displayed.
5. Click **OK** and then click **Close** to end the task.

Use the online Help if you need additional information about this task.

Backup Management Console Data

This task backs up (or archives) the data that is stored on your Hardware Management Console (HMC) hard disk that is critical to support HMC operations.

Back up the HMC data after changes are made to the HMC or information that is associated with logical partitions.

The HMC data that is stored on the HMC hard disk drive can be saved to a DVD-RAM on a local system, a remote system that is mounted to the HMC file system (such as NFS), or sent to a remote site by using File Transfer Protocol (FTP).

By using the HMC, you can back up all important data, such as the following data:

- User-preference files
- User information
- HMC platform-configuration files
- HMC log files
- HMC updates through Install Corrective Service.

Note: Use the archived data only along with a reinstallation of the HMC from the product CDs.

To back up the HMC critical data, complete the following steps:

1. In the navigation area, click the **HMC Management** icon, and then select **Console Managment**.
2. In the content pane, click **Backup Management Console Data**.

3. From the **Backup Management Console Data** window, choose the archive option that you want to complete.
4. Click **Next**, then follow the appropriate instructions that are associated with the option you chose.
5. Click **OK** to continue with the backup process.

Use the online Help if you need additional information for backing up the HMC data.

Notes:

- For HMC model 7063-CR1, DVD media is not supported.
- If you are using HMC Version 9.1.940, or later, you can specify a name for the generated backup file. If the backup file exists on the server, select the **Replace file** to replace the contents of the existing file that has the same name.

Restore Management Console Data

This task is used to select a remote repository for restoring critical backup data for the HMC.

1. In the navigation area, click the **HMC Management** icon , and then select **Console Managment**.
2. In the content pane, click **Restore Management Console Data**.
3. From the **Restore Management Console Data** window, click **Restore from a remote Network File System (NFS) server**, **Restore from a remote File Transfer Protocol (FTP) server**, **Restore from a remote Secure Shell File Transfer Protocol (SFTP) server**, or **Restore from a remote removable media**.
4. Click **Next** to proceed or **Cancel** to exit the task without making any changes.

Use the online Help if you need additional information about restoring critical backup data for this HMC.

Save Upgrade Data

This task uses a wizard to save upgrade data to selected media. This data consists of files that were created or customized while running the current software level. Saving this data to selected media is performed prior to an HMC software upgrade.

1. In the navigation area, click the **HMC Management** icon , and then select **Console Managment**.
2. In the content pane, click **Save Upgrade Data**.
3. From the **Save Upgrade Data** window, this wizard takes you through the steps required for saving your data. Select the type of media you want to save your data to, then click **Next** to proceed through the task windows.
4. Click **Finish** when you have completed the task.

Use the online Help if you need additional information for saving upgrade data.

Manage Data Replication

This task enables or disables customized data replication. Customized data replication allows another HMC to obtain customized console data from or send data to this HMC.

The following types of data can be configured:

- Customer information data

- Administrator information (such as customer name, address, and telephone number)
  - System information (such as administrator name, address, and telephone of your system)
  - Account information (such as customer number, enterprise number, and sales branch office)
- Group data
  - All user-defined group definitions
- Modem configuration data
  - Configure modem for remote support
- Outbound connectivity data
  - Configure local modem to RSF
  - Enable an internet connection
  - Configure to an external time source

Note: Customizable console data is accepted from other HMCs only after specific HMCs and their associated allowable customizable data types have been configured.

To manage data replication, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Managment**.
2. In the content pane, click **Manage Data Replication**.
3. From the **Manage Data Replication** window, choose the appropriate option that you want to perform.

Use the online Help to get additional information for enabling or disabling customizable data replication.

Templates and OS Images

System templates contain configuration details for resources such as system properties, shared processor pools, reserved storage pool, shared memory pool, Host Ethernet adapters, and SR-IOV adapters. Many of the system settings that you previously configured by using separate tasks are available in the Deploy System from Template wizard. For example, you can configure the Virtual I/O Servers, virtual network bridges, and virtual storage settings when you use the wizard to deploy a system from a system template.

The template library includes predefined system templates, which contain configuration settings based on common usage scenarios. Predefined system templates are available for your immediate use. You can view, modify, deploy, copy, import, export, or delete templates that are available in the template library.

You can also create custom system templates that contain configuration settings that are specific to your environment. You can create a custom template by copying a predefined template and changing it to fit your needs. Or, you can capture the configuration of an existing system and save the details in a template. Then, you can deploy that template to other systems that require the same configuration.

To access the Template Library, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Templates and OS Images**.
2. From the **Templates and OS Images** window, you can access:
   - **System**
   - **Partition**
   - **OS and VIOS Images**
3. When you complete this task, click **Close**.

System Templates

System templates contain configuration information about resources such shared processor pools, reserved storage pool, shared memory pool, physical I/O adapters, Host Ethernet adapters, single root I/O virtualization (SRIOV) adapters, Virtual I/O Server (VIOS), virtual networks, and virtual storage.

You can create custom system templates that contain configuration settings that are specific to your environment. You can also create a custom template by copying a predefined template and changing it to fit your needs. Or, you can capture the configuration of an existing system and save the details in a template. Then, you can deploy that template to other systems that require the same configuration. Click the template name to see the details about the template. Select a system template from the list to view, edit, copy, delete, deploy, or export a template.

Use the online Help if you need additional information on system templates.

Partition Templates

Partition templates contain details about partition resources, such as physical adapters, virtual networks, and storage configuration.

You can create custom partition templates that contain configuration settings that are specific to your environment. You can also create a custom template by copying a predefined template and changing it to fit your needs. Or, you can capture the configuration of an existing system and save the details in a template. Then, you can deploy that template to other systems that require the same configuration. Click the template name to see the details about the template. Select a partition template from the list to view, edit, copy, delete, deploy, or export a template.

Notes:

- If you are using HMC Version 9.1.940, or later, and if you are using a non-captured template to create a logical partition, you can configure an SR-IOV logical port that can be migrated. Select **migratable** in the **Edit** menu of the partition template. You can migrate the logical partition by using the SR-IOV logical port by creating a backup device and associate the SR-IOV logical port to the logical partition. The backup device can either be a virtual Ethernet adapter or a virtual Network Interface Controller (NIC) adapter.
- When the HMC is at Version 9.1.940.x, and when the firmware is at level FW940, the Migratable option for the Hybrid Network Virtualization capability is available as a Technology Preview only and is not intended for production deployments. However, when the HMC is at Version 9.1.941.0, or later, and when the firmware is at level FW940.10, or later, the Migratable option for the Hybrid Network Virtualization capability is supported.

Use the online Help if you need additional information on partition templates.

VIOS Images

Define VIOS images and installation resources for the operating environment that the Hardware Management Console (HMC) can access and use.

You can access the following tasks:

Manage Virtual I/O Server Image Repository

As of HMC version 7.7, or later, you can store the Virtual I/O Server (VIOS) images from a DVD, a saved image, or a Network Installation Management (NIM) server on the HMC. The stored VIOS images can be used for VIOS installation. You must be an HMC super administrator (hmcsuperadmin) to install the VIOS image.

About this task

To manage or to import the VIOS image repository, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Templates and OS Images**.
2. From the **Templates and OS Images** window, select the **OS and VIOS Images** tab, and then click **Manage Virtual I/O Server Image Repository**.
3. In the Virtual I/O Server Image Repository window, click **Import New Virtual I/O Server Image**.
4. In the Import New Virtual I/O Server Image window, choose to import the VIOS images from a DVD or from a file system.

   - To import VIOS images from a DVD to the HMC, complete the following steps:

     a. In the Import Virtual I/O Server Image window, select **Management console DVD**.

     b. In the **Name** field, enter the VIOS image name that you want to import from the DVD.

     c. Click **OK**.

   - To import VIOS images from a Network File System (NFS), File Transfer Protocol (FTP), or Secure Shell File Transfer Protocol (SFTP), complete the following steps:

     a. In the Import Virtual I/O Server Image window, select **File System**.

     b. Select **Remote NFS Server**, **Remote FTP Server**, or **Remote SFTP Server**.

     c. Enter the required details and click **OK**.

Manage Virtual I/O Server Backups

With HMC version 9.2.950, or later, you can manage the I/O configuration of Virtual I/O Servers and manage the backup of the VIOS image on the management console.

About this task

To manage the backup or restore operation of the I/O configuration of the VIOS and to manage the VIOS image, complete the following steps:

Procedure

1. In the navigation area, click the **HMC Management** icon , and then select **Templates and OS Images**.
2. From the **Templates and OS Images** window, select the **VIOS Images** tab, and then click **Manage Virtual I/O Server Backups**.
3. In the Manage Virtual I/O Server Backups window, select the **Virtual I/O Server Configuration Backup** tab. A table is displayed that lists all the backup files of the VIOS configuration that is taken by the HMC. Additionally, you can view the time at which the configuration file was last edited.

   a) To take the backup of the input/output configuration of a VIOS, click **Backup I/O configuration**. In the Backup I/O configuration window, select the managed system and the VIOS for which the back up is created, and then specify a name for the backup file.

   The name you specify must consist of 1 - 40 characters including file extension **`.tar.gz`**. You can use the characters A - Z and a - z, the numbers of 0 - 9, the dot (.), the dash (-) and the underscore (_) characters.

   b) To rename an existing backup file that is stored in the HMC, select a configuration file from the table and click **Action** > **Rename**.

   c) To restore the VIOS input/output configuration, select a backup file which contains the I/O configuration of the VIOS that you want to restore, and click **Action** > **Restore**.

4. In the Manage Virtual I/O Server Backups window, click the **Virtual I/O Server Backup** tab. A table is displayed that list all the VIOS image backup that are taken in the HMC. Additionally, you can also view the name and size of the VIOS image, the time when the VIOS image file was last edited, the managed system and the VIOS from which the image was captured.
   a) To take the backup of the VIOS image, click **Create Backup**. In the Create Backup window, select the managed system and the VIOS for which the back up is created, and then specify a name for the backup file.

      The name you specify must consist of 1 - 40 characters including file extension **`.tar`**. You can use the characters A - Z and a - z, the numbers of 0 - 9, the dot (.), the dash (-) and the underscore (_) characters.
   b) To rename an existing VIOS image backup file that is stored in the HMC, select a backup file from the table and click **Action** > **Rename**.
   c) To remove a VIOS image backup file from the HMC, select a backup file which contains the VIOS configuration that you want to remove from the table, and click **Action** > **Remove**.
5. Click **OK**.

All System Plans

A system plan is a specification of the logical partition configuration of a single managed system.

The table lists all the system plans that can be used to configure a managed system. You can create your own system plan or import an existing system plan.

Create System Plan

You can create a new system plan for a system that this Hardware Management Console (HMC) manages. The new system plan contains specifications for the logical partitions and partition profiles of the managed system that you used to create the plan.

1. Click **Create**.
2. Select a managed system from the available list and complete the **System plan name** and **Plan description** fields.
3. Check any options that you want.
4. Click **Create**.

Import System Plan

You can import a system plan file to the Hardware Management Console (HMC). The new system plan contains specifications for the logical partitions and partition profiles of the managed system that you used to create the plan.

1. Click **Import**.
2. Select a source to import the system plan file to the HMC.
3. Click **Import**.

Export System Plan

You can export a system plan file from the Hardware Management Console (HMC).

1. Select the system plan from the list and click **Actions** > **Export**.
2. Select a source to export the system plan file to the HMC.
3. Click **Export**.

Deploy System Plan

You can deploy a system plan file to one or more systems that the HMC manages. The managed system that you deploy the system plan on must have hardware that is identical to the hardware in the system plan.

1. Select the system plan from the list and click **Actions** > **Deploy**.
2. Follow the instructions on the **Deploy System Plan** wizard.

Delete System Plan

You can delete a system plan file from the Hardware Management Console (HMC).

1. Select the system plan from the list and click **Actions** > **Delete**.

Refresh

You can refresh the table to see any recent changes to the available system plans.

1. Click **Refresh** to update the table with the latest data.

Use the online Help if you need additional information about this task.

Users and Security tasks

The tasks that are available on the HMC for the **Users and Security** tasks are described.

Note: Depending on the task roles assigned to your user ID you may not have access to all the tasks. See "HMC tasks, user roles, IDs, and associated commands" on page 9 for a listing of the tasks and the user roles allowed to access them.

Change User Password

This task allows you to change your existing password that is used for logging on to the Hardware Management Console (HMC). A password verifies your user ID and your authority to log in to the console.

To change your password, complete the following steps:

1. In the navigation area, select the managed system and click the **Users and Security** icon , and then select **Users and Roles**.
2. In the content pane, click **Change User Password**.
3. From the **Change User Password** window, specify your current password, specify a new password that you want to use, and re-specify the new password for confirmation in the fields provided.

   Note: The new password that you specify must have atleast eight characters.
4. Click **OK** to proceed with the changes.

Use the online Help if you need additional information for changing your password.

Manage User Profiles and Access

Manage your system users that log on to the HMC. A user profile is a combination of a user ID, server authentication method, permissions, and a text description. Permissions represent the authority levels assigned to the user profile for the objects the user has permission to access.

Users can be authenticated using local authentication on the HMC, by using Kerberos remote authentication, or by using LDAP authentication. For more information on setting up Kerberos authentication on the HMC, see “Manage KDC” on page 92. For more information about LDAP authentication, see “Manage LDAP” on page 92.

For security reasons, remotely authenticated Kerberos or LDAP users cannot lock the local console.

If you are using local authentication, the user ID and password are used to verify a user’s authorization to log on the HMC. The user ID must start with an alphabetic character and consist of 1 to 32 characters. The password has the following rules:

- Must begin with an alphanumeric character.
- Must contain at least 8 characters, however, this limit can be changed by your system administrator.
- The characters must be standard 7-bit ASCII characters.
- Valid characters to use for the password can be: A-Z, a-z, 0-9 and special characters (~ ! @ # $ % ^ & * ( ) _ + - = { } [ ] \ : " ; ’).

If you are using Kerberos authentication, specify a Kerberos remote user ID.

If you select LDAP authentication, no additional information is required.

The user profile includes managed resource roles and task roles that are assigned to the user. The *managed resource roles* assign permissions for a managed object or group of objects and the *task roles* define the access level for a user to perform on a managed object or group of objects. You can choose from a list of available default managed resource roles, task roles, or customized roles that are created by using the **Manage Task and Resource Roles** task.

See “HMC tasks, user roles, IDs, and associated commands” on page 9 for a listing of all the HMC tasks and the predefined default user IDs that can perform each task.

The default managed resource roles include:

- All System Resources

The default task roles include:

- hmcservicerep (Service Representative)
- hmcviewer (Viewer)
- hmcoperator (Operator)
- hmcpe (Product Engineer)
- hmcsuperadmin (Super Administrator).

To add or customize a user profile, complete the following steps:

1. In the navigation area, select the managed system and click the **Users and Security** icon , and then select **Users and Roles**.
2. In the content pane, click **Manage User Profiles and Access**.
3. Complete one of the following steps:
   - From the **User Profiles** window, if you are creating a new user ID, point to **User** on the menu bar and when its menu is displayed, click **Add**. The **Add User** window is displayed.
   - From the **User Profiles** window, if you are creating a user ID with the same attributes as an existing profile, point to **User** on the menu bar and when its menu is displayed, click **Copy**. The **Copy User** window is displayed.

     Note: Some user profiles are predefined, such as a default ID, and those permissions cannot be changed. However, you can copy a default user profile, such as operator, and then modify the resulting new user profile. The newly defined user cannot have greater permissions than the original copied user profile.
   - From the **User Profiles** window, if you are deleting a user ID, point to **User** on the menu bar and when its menu is displayed, click **Remove**. The **Remove User** window is displayed.

- From the **User Profiles** window, if the user ID exists in the window, select the user ID from the list, and then point to **User** on the menu bar and when its menu is displayed, click **Modify**. The **Modify User** window is displayed.
  - To specify timeout and inactivity values, click **User Properties** from the **Modify User** window.

4. Complete or change the fields in the window, click **OK** when you are done.

Use the online Help if you need additional information for creating, modifying, copying, or removing a user profile and modifying timeout and inactivity values.

Adding, Copying, or Modifying User Profiles

Learn how to add, copy, or modify user profiles.

Users who remotely authenticate through Kerberos or Lightweight Directory Access Protocol (LDAP) must have their profiles set appropriately. You must set the user profile of each remotely authenticated Kerberos or LDAP user to use that type of authentication instead of local authentication. A user that is set to use Kerberos or LDAP remote authentication always uses that type of authentication, even when the user logs into the HMC locally.

Note: The use of Kerberos authentication requires configuration of a key distribution center (KDC) server by using the **KDC Configuration** task. The use of LDAP authentication requires configuration of an LDAP server by using the **LDAP Configuration** task. You do not need to set all users to use Kerberos or LDAP remote authentication. You can set some user profiles so that the users can use local authentication only.

From the Adding, Copying, or Modifying User Profiles window, you can modify the following attributes:

- **User ID**: Enter the user ID for the user profile you are creating or managing. The user name must start with an alphabetic character and consist of 1 to 32 characters.
- **Description**: Enter a meaningful description for your own records.
- **Password**: Enter the password for the user ID.
- **Confirm password**: Enter the password again for verification.
- **Password expires in (days)**: Specify the number of days a password is valid before it expires. This input field is available when **Enforce strict password rules** check box is selected.
- **Manage resource roles**: Displays the managed resource roles that are currently available. Select one or more managed resource roles to define access permissions for this user ID.
- **Task roles**: Displays the task roles that are currently available. Select one task role for this user ID.

Use the online Help if you need additional information about creating, modifying, copying, or removing a user profile and modifying timeout and inactivity values.

User Properties

Learn how to specify timeout and inactivity values for the selected user.

You can specify the amount of time for the following timeout and inactivity tasks:

Timeout Values

- **Session timeout minutes**: Specifies the number of minutes during a logon session that a user is prompted for identity verification. If a value other than zero is specified, the user is prompted after the specified time is reached to reenter their password. If a password is not reentered within the specified amount of time in the **Verify timeout minutes** field, the session is disconnected.
- **Verify timeout minutes**: Specifies the amount of time that is required for the user to reenter their password when prompted, if a value was specified in the **Session timeout minutes** field. If the password is not reentered within the specified time, the session is disconnected.
- **Idle timeout minutes**: Specifies the number of minutes the user's session can be idle. If the user does not interact with the session in the specified amount of time, the session is locked and the screen saver starts. Clicking anywhere on the screen prompts the user for identity verification.

- **Minimum time in days between password changes**: Specifies the minimum amount of time in days that must elapse between changes for the user's password.

Note: A note of zero in any of these fields indicates that there is no expiration of time and it is the default value. You can specify up to a maximum value of 525600 minutes (equivalent to one year).

Inactivity Values

- **Disable for inactivity in days**: Specifies the amount of time in days a user is temporarily disabled after the maximum number of days of inactivity is reached.
- **Never disable for inactivity**: Option to never disable a user's session due to inactivity.
- **Allow remote access via the web**: Option to enable remote web server access for the user you are managing.

Manage Users and Tasks

Display the logged on users and the tasks they are running.

1. In the navigation area, select the managed system and click the **Users and Security** icon 🔓, and then select **Users and Roles**.
2. In the content pane, click **Manage Users and Tasks**.
3. In the Manage Users and Tasks window, the following information displays:
   - User you are logged in as
   - Time you logged in
   - Number of tasks running
   - Your access location
   - Information about tasks that are running:
     - Task ID
     - Task name
     - Targets (if any)
     - Session ID
4. Choose to log off or disconnect from a session that is currently running by selecting the session from the Users **Logged On** list, then click **Logoff** or **Disconnect**.

   Alternately, you can choose to switch to another task or end a task by selecting the task from the **Running Tasks** list, then click **Switch To** or **Terminate**.
5. When you have completed this task, click **Close**.

Manage Task and Resource Roles

Use this task to define and customize user roles.

Note: Predefined roles (default roles) cannot be modified.

A *user role* is a collection of authorizations. A user role can be created to define the set of tasks allowed for a given class of user (*task roles*) or it can be created to define the set of managed objects that are manageable for a user (*managed resource roles*). Once you have defined or customized the user roles you can use the **Manage User Profiles and Access** task to create new users with their own permissions.

If the automatic resource role update function is enabled on the Hardware Management Console (HMC) either through the command line interface or through the Rest API CLI runner job, the HMC user can automatically receive permission to the logical partition that is created. If the logical partition is deleted, the permission is automatically revoked.

The predefined managed resource roles include:

- All System Resources

The predefined task roles include:

- hmcservicerep (Service Representative)
- hmcviewer (Viewer)
- hmcoperator (Operator)
- hmcpe (Product Engineer)
- hmcsuperadmin (Super Administrator)

To customize managed resource roles or task roles:

1. In the navigation area, select the managed system and click the **Users and Security** icon 🔓, and then select **Users and Roles**.
2. In the content pane, click **Manage Task and Resource Roles**.
3. From the **Manage Task and Resource Roles** window, select either **Managed Resource Roles** or **Task Roles**.
4. To add a role, click **Edit** from the menu bar, then click **Add** to create a new role.

   or

   To copy, remove, or modify an existing role, select the object you want to customize, click **Edit** from the menu bar, then click **Copy**, **Remove**, or **Modify**.
5. Click **Exit** when you are have completed the task.

Use the online Help to get additional information for customizing managed resource roles and task roles.

Manage Certificates

Use this task to manage the certificates used on your HMC. It provides the capability of getting information on the certificates used on the console. This task allows you to create a new certificate for the console, change the property values of the certificate, and work with existing and archived certificates or signing certificates.

All remote browser access to the HMC must use Secure Sockets Layer (SSL) encryption. With SSL encryption required for all remote access to the HMC, a certificate is required to provide the keys for this encryption. The HMC provides a self-signed certificate that allows this encryption to occur.

To manage your certificates:

1. In the navigation area, select the managed system and click the **Users and Security** icon 🔓, and then select **Users and Roles**.
2. In the content pane, click **Manage Certificates**.
3. Use the menu bar from the **Manage Certificates** window for the actions you want to take with the certificates:
   - To create a new certificate for the console, click **Create**, then select **New Certificate**. Determine whether your certificate will be self-signed or signed by a Certificate Authority (CA), then click **OK**.
   - To modify the property values of the self-signed certificate, click **Selected**, then select **Modify**. Make the appropriate changes, then click **OK**.

  Note: If you have a certificate signed by a Certificate Authority (CA) that consists of a root certificate, intermediate certificate, and a client or leaf certificate, complete the following steps to upload the certificate to the HMC:

  - Open the CA signed certificate file by using a text-based editor and split the content of the file and save as three separate files. The first file is the client or leaf certificate, the second file is the intermediate certificate, and the third file is the root certificate.
  - Log in to the HMC to import the certificate. First upload the client certificate and click **Yes** for uploading more files. In the new window, upload the intermediate certificate and the root certificate.
  - Click **OK** to restart the console.

- To work with existing and archived certificates or signing certificates, click **Advanced**. Then you can choose the following options:
  - Delete existing certificates
  - Work with archived certificates
  - Import certificates
  - View issuer certificates

4. Click **Apply** for all changes to take effect.

Use the online Help if you need additional information for managing your certificates.

Manage Certificate Revocation List

Use this task to create, modify, delete, and import the certificate revocation list that is used on your Hardware Management Console (HMC).

All remote browsers that are accessing the HMC must use Secure Sockets Layer (SSL) encryption. A certificate is required to provide the keys for this encryption. The HMC provides a self-signed certificate that allows this encryption to occur.

To manage your certificate revocation list, complete the following steps:

1. In the navigation area, select the managed system and click the **Users and Security** icon 🔒, and then select **Users and Roles**.
2. In the content pane, click **Manage Certificate Revocation List**.
3. Use the menu bar from the **Manage Certificate Revocation List** window for the actions you want to take with the certificates:
   - To create a new certificate revocation list for the console, click **Import**, then select **New CRL**. Determine whether your certification revocation list is imported from removable media on the console or from the file system on the system that is running the web browser.

     Note: If the list is from removable media, then the certificate revocation list file must be in the top directory on the media.
   - To modify a certificate revocation list on the console, select the certification revocation list from the table, and make appropriate changes, then click **Apply**.
   - To delete a certificate revocation list from the console, click **Selected**, then select **Delete CRL**. Select the certification revocation list, then click **OK**.
   - To work with existing and archived certificates or signing certificates, click **Advanced**.

Use the online Help if you need additional information for managing your certificate revocation list.

Manage LDAP

Configure your HMC so that it uses LDAP (Lightweight Directory Access Protocol) authentication.

Before you begin

Note: Before you configure the HMC so that it uses LDAP authentication, you must ensure that a working network connection exists between the HMC and the LDAP servers.

About this task

To configure your HMC so that it uses LDAP authentication, complete the following steps:

Procedure

1. In the navigation area, select the managed system and click the **Users and Security** icon , and then select **Systems and Console Security**.
2. In the content pane, click **Manage LDAP**. The **LDAP Server Definition** window opens.
3. Select **Enable LDAP**.
4. Define an LDAP server to use for authentication (for example, Microsoft Active Directory, Tivoli®, and Open LDAP).
5. Define the LDAP attribute that is used to identify the authenticated user. The default is **uid**, but you can use your own attributes. For Microsoft Active Directory, use **sAMAccountName** as the attribute.
6. Define the distinguished name tree, also known as the search base, for the LDAP server.
7. Click **OK**.

What to do next

If you want to use LDAP authentication, you must configure each remote user's profile so that it uses LDAP remote authentication instead of local authentication.

Manage KDC

View the key distribution center (KDC) servers that are used by this Hardware Management Console (HMC) for Kerberos remote authentication.

From this task, you can complete the following tasks:

- View existing KDC servers.
- Modify existing KDC server parameters that include realm, ticket lifetime, and clock skew.
- Add and configure a KDC server on the HMC.
- Remove a KDC server.
- Import a service key.
- Remove a service key.

Kerberos is a network authentication protocol that is designed to provide strong authentication for client/server applications by using secret-key cryptography.

Under Kerberos, a client (generally either a user or a service) sends a request for a ticket to the KDC. The KDC creates a ticket-granting ticket (TGT) for the client, encrypts it using the client's password as the key, and sends the encrypted TGT back to the client. The client then attempts to decrypt the TGT, by using its password. If the client successfully decrypts the TGT (for example, if the client gave the correct password), it keeps the decrypted TGT, which indicates proof of the client's identity.

The tickets have a time availability period. Kerberos requires the clocks of the involved hosts to be synchronized. If the HMC clock is not synchronized with the clock of KDC server, authentication fails.

A Kerberos realm is an administrative domain, site, or logical network that uses Kerberos remote authentication. Each realm uses a master Kerberos database that is stored on a KDC server and that contains information about the users and services for that realm. A realm might also have one or more slave KDC servers, which store read-only copies of the master Kerberos database for that realm.

To prevent KDC spoofing, the HMC can be configured to use a service key to authenticate to the KDC. Service key files are also known as keytabs. Kerberos verifies that the TGT requested was issued by the same KDC that issued the service key file for the HMC. Before you can import a service key file into an HMC, you must generate a service key for the host principal of the HMC client.

Note: For MIT Kerberos V5 *nix distributions, create a service key file by running the `kadmin` utility on a KDC and by using the `ktadd` command. Other Kerberos implementations might require a different process to create a service key.

You can import a service key file from one of these sources:

- Removable media that is mounted to the HMC, such as optical discs or USB Mass Storage devices. You must use this option locally at the HMC (not remotely), and you must mount the removable media to the HMC before you use this option.
- A remote site that uses secure FTP. You can import a service-key file from any remote site with SSH installed and running.

To use Kerberos remote authentication for this HMC, complete the following tasks:

- You must enable the Network Time Protocol (NTP) service on the HMC and set the HMC and the KDC servers to synchronize time with the same NTP server. You can enable the NTP service on the HMC by accessing the “Change Date and Time” on page 76 task from the **HMC Management** icon , and then selecting **Console Settings**.
- You must set the user profile of each remote user to use Kerberos remote authentication instead of local authentication. A user that is set to use Kerberos remote authentication always uses Kerberos remote authentication, even when the user logs on to the HMC locally.

  Note: You do not need to set all users to use Kerberos remote authentication. You can set some user profiles so that the users can use local authentication only.
- Use of a service key file is optional. Before you use a service key file, you must import it into the HMC. If a service key is installed on the HMC, realm names must be equivalent to the network domain name. The following example shows how to create the service key file on a Kerberos server by using the **kadmin.local** command, assuming the HMC hostname is `hmc1`, the DNS domain is `example.com`, and the Kerberos realm name is `EXAMPLE.COM`:

  –
  ```
  # kadmin_local kadmin.local: ktadd -k /etc/krb5.keytab host/
  hmc1.example.com@EXAMPLE.COM
  ```

  Using the Kerberos ktutil on the Kerberos server, verify the service key file contents. The output looks like the following example:

  –
  ```
  # ktutil

  ktutil: rkt /etc/krb5.keytab

  ktutil: l

  slot KVNO Principal

  ---- ----
  --------------------------------------------------------------------

  1 9 host/hmc1.example.com@EXAMPLE.COM

  2 9 host/hmc1.example.com@EXAMPLE.COM
  ```
- The HMC Kerberos configuration can be modified for SSH (Secure Shell) login without a password by using GSSAPI. For remote login without a password through Kerberos to an HMC, configure the HMC to

use a service key. After the configuration is completed, use `kinit -f principal` to obtain forwardable credentials on a remote Kerberos client machine. You can then enter the following command to log in to the HMC without having to enter a password: `$ ssh -o PreferredAuthentications=gssapi-with-mic user@host`.

To manage the KDC, complete the following steps:

1. In the navigation area, select the managed system and click the **Users and Security** icon 🔓, and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. From the **Manage KDC** window, select the appropriate task from the available options under the **Actions** menu.
4. When you complete the task, click **OK**.

Use the online Help if you need additional information for Managing KDC.

View KDC Server

Display existing key distribution center (KDC) servers on the Hardware Management Console (HMC).

To view existing KDC Servers on your HMC, click the **Users and Security** icon 🔓, and then select **Users and Roles**. In the content pane, click **Configure KDC**. If no servers exist and NTP has not yet been enabled, a warning panel message displays. Enable the NTP service on the HMC and configure a new KDC server as desired.

Modify KDC Server

Learn how to modify the key distribution center (KDC) on your Hardware Management Console (HMC).

To modify existing key distribution center (KDC) server parameters, complete the following steps:

1. In the navigation area, select the managed system and click the **Users and Security** icon 🔓, and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. Select a KDC Server.
4. Select a value to modify:
   - **Realm**. A realm is an authentication administrative domain. Normally, realms always appear in upper case letters. It is good practice to create a realm name that is the same as your DNS domain (in upper case letters). A user belongs to a realm if and only if the user shares a key with the authentication server of that realm. Realm names must be equivalent to the network domain name if a service key file is installed on the HMC.
   - **Ticket Lifetime**. Ticket lifetime sets the lifetime for credentials. The format is an integer number followed by one of **s** seconds, **m** minutes, **h** hours, or **d** days. Enter a Kerberos lifetime string such as *2d4h10m*.
   - **Clock skew**. Clock skew sets the maximum allowable amount of clock skew between the HMC and the KDC server before Kerberos considers messages invalid. The format is an integer number that represents number of seconds.
5. Click **OK**.

Add KDC server

Add a Key Distribution Center (KDC) server to this Hardware Management Console (HMC).

To add a new KDC server, complete the following steps:

1. In the navigation area, select the managed system and click the **Users and Security** icon , and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. From the **Actions** drop down list, select **Add KDC Server**.
4. Enter the host name or IP address of the KDC server.
5. Enter the KDC server realm.
6. Click **OK**.

Remove KDC server

Kerberos authentication on the Hardware Management Console (HMC) remains enabled until all key distribution center (KDC) servers are removed.

To remove a KDC server:

1. In the navigation area, select the managed system and click the **Users and Security** icon , and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. Select the KDC server from the list.
4. From the **Actions** drop down list, select **Remove KDC Server**.
5. Click **OK**.

Import Service Key

Before you can import a service key file into an Hardware Management Console (HMC), a service key file must first be created on the Kerberos server for the HMC host. The service key file contains the host principal of the HMC client, for example, `host/example.com@EXAMPLE.COM`. In addition to KDC Authentication, the host service key file is used to enable password-less SSH (Secure Shell) login using GSSAPI.

Note: For MIT Kerberos V5 *nix distributions, create a service key file by running the `kadmin` utility on a KDC and using the `ktadd` command. Other Kerberos implementations may require a different process to create a service key.

To import a service key, complete the following steps:

1. In the navigation area, select the managed system and click the **Users and Security** icon , and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. From the **Actions** drop down list, select **Import Service Key**.
4. Select from one of the following:
   - **Local** - The service key must be located on removable media currently mounted on the HMC. You must use this option locally at the HMC (not remotely), and you must mount the removable media to the HMC before using this option. Specify the full path of the service key file on the media.

- **Remote** - The service key must be located on a remote site available to the HMC via secure FTP. You can import a service key file from any remote site that has SSH (Secure Shell) installed and running. Specify the hostname of the site, a user ID and password for the site, and the full path of the service key file on the remote site.

5. Click **OK**.

Implementation of the service key file will not take effect until the HMC is rebooted.

Remove Service Key

Learn how to remove a service key from your Hardware Management Console (HMC).

To remove the service key from the HMC, complete the following steps:

1. In the navigation area, select the managed system and click the **Users and Security** icon , and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. From the **Actions** drop down list, select **Remove Service Key**.
4. Click **OK**.

You must reboot the HMC after removing the service key. Failure to reboot may cause login errors.

Manage MFA

Learn how to enable Multi-Factor Authentication (MFA) on the Hardware Management Console (HMC).

Notes:

1. Multi-Factor Authentication is disabled on the HMC by default.
2. For HMC GUI login, when MFA is enabled and the user is configured on the PowerSC MFA server, enter the Cache Token Credential (CTC) code in the password field.
3. For Secure Shell (SSH) login:

   When MFA is enabled, all users that login through SSH are prompted for a CTC code. If the user is configured on the PowerSC MFA server, then you can enter the CTC code at the prompt. If the user is not configured on the PowerSC MFA server, press `Enter` when prompted for CTC code, and then enter the password of the user at the prompt.

To enable Multi-Factor Authentication, complete the following steps:

1. In the navigation area, click the **Users and Security** icon , and then select **Systems and Console Security**.
2. In the content pane, click **Manage MFA**.
3. From the **Manage MFA** window, select the **Enable multi factor authentication** check box.
4. Enter the following information:
   - **Host name or IP address of the authentication server**
   - **Port of the authentication server**
5. Click **OK**.

Use the online Help if you need additional information about this task.

Enable Remote Command Execution

This task is used to enable remote command execution using the ssh facility.

1. In the navigation area, select the managed system and click the **Users and Security** icon 🔓, and then select **Users and Roles**.
2. In the content pane, click **Enable Remote Command Execution**.
3. From the **Enable Remote Command Execution** window, select **Enable remote command execution using the ssh facility**.
4. Click **OK**.

Enable Remote Operation

This task is used to allow the HMC to be accessed at a remote workstation through a web browser.

To enable the HMC remote access:

1. In the navigation area, select the managed system and click the **Users and Security** icon 🔓, and then select **Users and Roles**.
2. In the content pane, click **Enable Remote Operation**.
3. Select **Enabled** from the Remote Operation drop-down list, then click **OK**. The HMC can be accessed from a remote workstation using a Web browser.

Use the online Help to get additional information for allowing remote access to the HMC.

Enable Remote Virtual Terminal

A Remote Virtual Terminal connection is a terminal connection to a logical partition from another remote HMC. Use this task to enable Remote Virtual Terminal access for remote clients.

1. In the navigation area, select the managed system and click the **Users and Security** icon 🔓, and then select **Users and Roles**.
2. In the content pane, click **Enable Remote Virtual Terminal**.
3. From the **Enable Remote Virtual Terminal** window, you can enable this task by selecting Enable remote virtual terminal connections.
4. Click **OK** to activate your changes.

Use the online Help to get additional information for enabling a remote terminal connection.

Serviceability tasks

The tasks that are available on the HMC for the **Serviceability** tasks are described.

Note: Depending on the task roles assigned to your user ID you may not have access to all the tasks. See "HMC tasks, user roles, IDs, and associated commands" on page 9 for a listing of the tasks and the user roles allowed to access them.

Tasks Log

View all the tasks that are currently running or completed on the Hardware Management Console (HMC).

To view the tasks log, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Tasks Log**.
2. You can view the following tabs in the tasks log:
   - **Task name**: Displays the name of task.
   - **Status**: Displays the current state of the task (running or completed).
   - **Resource**: Displays the name of the resource.
   - **Resource type**: Displays the type of resource.
   - **Initiator**: Displays the name of the user that initiated the task.
   - **Start time**: Displays the time that the task was initiated.
   - **Duration**: Displays the amount of time that the task took to complete.

Use the online Help for additional information about viewing the tasks log.

Console Events Logs

View a record of system events occurring on the Hardware Management Console (HMC). System events are individual activities that indicate when processes occur, begin and end, succeed or fail.

To view console events legs, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Console Events Logs**.
2. Use the menu bar to change to a different time range, or to change how the events display in the summary. You can also use the table icons or the **Select Action** menu on the table toolbar to display different variations of the table.
3. When you are done viewing the events, select **View** on the menu bar, then click **Exit**.

Use the online Help for additional information about viewing HMC events.

Serviceable Events Manager

This task allows you to select the criteria for the set of serviceable events you want to view. When you finish selecting the criteria, you can view the serviceable events that match your specified criteria.

To set the criteria for the serviceable events you want to view, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Serviceable Events Manager**.
2. From the **Serviceable Events Manager** window, provide event criteria, error criteria, and FRU criteria.
3. Click **OK** when you have specified the criteria you want for the serviceable events you want to view.

Use the online Help if you need additional information managing events.

Events Manager for Call Home

Learn how to monitor and approve any data that is being transmitted from an HMC to IBM.

1. In the navigation area, click the **Serviceability** icon , and then select **Events Manager for Call Home**.
2. From the **Events Manager for Call Home** window, select **Manage Consoles** to manage the list of registered management consoles. You can use the **Event Criteria** to specify the approval state, status, and originating HMC to filter the list of events that are available for all registered management consoles. You can use the criteria to filter the view and select events to view details, view files, and complete call home operations.
3. Click **OK** to exit Events Manager for Call Home and to save the filter values.

Use the online Help if you need additional information about this task.

Create Serviceable Event

This task reports problems that occurred on your Hardware Management Console (HMC) to the service provider (for example, the mouse does not work) or lets you test problem reporting.

Submitting a problem is dependent upon whether you have customized this Hardware Management Console to use the Remote Support Facility (RSF) and if it is authorized to automatically call for service. If so, the problem information and service request is sent to the service provider automatically with a modem transmission.

To report a problem on your Hardware Management Console, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Create Serviceable Event**.
3. From the **Create Serviceable Event** window, select a problem type from the list displayed.
4. Enter a brief description of your problem in the **Problem Description** input field and then click **Request Service**.

To test problem reporting from the **Report a Problem** window:

1. Select **Test automatic problem reporting** and enter *This is just a test* in the **Problem Description** input field.
2. Click **Request Service**. The problems are reported to the service provider for the Hardware Management Console. Reporting a problem sends to the service provider the information you provide on **Report a Problem** window, and machine information that identifies the console.

Use the online Help if you need additional information for reporting a problem or testing if problem reporting works.

Manage Dumps

Learn how to manage the procedures for dumps of selected systems on your Hardware Management Console (HMC).

To manage a dump, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.

2. In the content pane, click **Manage Dumps**.
3. From the **Manage Dumps** window, select a dump and perform one of the following dump-related tasks:

   From **Selected** on the menu bar:

   - Copy the dump to media.
   - Copy the dump to a remote system.
   - Use the call home feature to transmit the dump to your service provider.
   - Delete a dump.

   From **Actions** on the menu bar:

   - Initiate a dump of the hardware and server firmware for the managed system.
   - Initiate a dump of the service processor.
   - Initiate a dump of the Bulk Power Control service processor.
   - Modify the dump capability parameters for a dump type.

   From **Status** on the menu bar, you can view the offload progress of the dump.
4. Click **OK** when you complete this task.

Use the online Help to get additional information for managing dumps.

Transmit Service Information

Transmit service information to your service provider immediately or schedule when to transmit service information for use for problem determination.

To schedule or transmit service information, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Transmit Service Information**.
3. In the content pane, click the **Schedule and Send Data** tab to schedule the service information.

   Note: You can also click the following tabs to select the data that you want to send and to configure FTP connections:

   - **Schedule and Send Data**: Transmit information to your service provider immediately or schedule the transmission.
   - **Configure FTP Connection**: Provide configuration data to allow the use of FTP to offload service information.
   - **Send Problem Reports**: Select the data that you want and the destination for the data.
4. Select the types of service information that you want to enable regular transmissions or to send immediately.

   - **Operational Test (Heartbeat) Information -- always enabled**: Send the Problem Event log file.
   - **Hardware Service Information (VPD)**: Send the Vital Product Data (VPD) for all managed systems that are attached to this HMC.
   - **Software Service Information**: Send the VPD for all software that is running on the partitions.
   - **Performance Management Information**: Gather and send the performance management information.
   - **Update Access Key Information**: Verifies and updates Access Key information.
5. Select the interval (in days) and the time to schedule repeating transmissions. To transmit the information immediately, click **Send Now**.
6. Click **OK**.

Use the online Help for additional information about scheduling service information.

Format Media

This task formats a diskette or USB 2.0 Flash Drive Memory Key.

You can format a diskette by supplying a user-specified label.

To format a diskette or USB 2.0 Flash Drive Memory Key, complete the following steps:

1. In the navigation area, click the **HMC Management** icon , and then select **Console Managment**.
2. In the content pane, click **Format Media**.
3. From the **Format Media** window, select the type of media you want to format, then click **OK**.
4. Make sure that your media is correctly inserted, then click **Format**. The **Format Media** progress window is displayed. When the media is formatted, the **Format Media Completed** window is displayed.
5. Click **OK** and then click **Close** to end the task.

Use the online Help if you need additional information about this task.

Electronic Service Agent Setup Wizard

Learn how to open the Electronic Service Agent Setup wizard using the Hardware Management Console (HMC) interface.

About this task

To open the Electronic Service Agent Setup wizard, complete the following steps:

Procedure

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the contents pane, select **Electronic Service Agent Setup Wizard**. The Electronic Service Agent wizard opens. Follow the instructions in the wizard to configure call-home tasks.

Authorize User

Request authorization for Electronic Service Agent. Electronic Service Agent associates your system with a user ID and allows access to system information through the Electronic Service Agent facility. This registration is also used by your operating system to automate service processes for your AIX or IBM i operation system.

To register a user ID, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Authorize User**.
3. Provide a user ID that is registered with the Electronic Service Agent. If you need a user ID, you can register at the IBM Registration website.
4. Click **OK**.

Use the online Help if you need additional information for registering a customer user ID with the eService website.

Enable Electronic Service Agent

This task allows you enable or disable the call-home state for managed systems.

Note: If Customizable Data Replication is **Enabled** on this HMC (using the **Manage Data Replication** task), the data specified in this task may change depending on automatic replication from other HMCs configured on your network. For more information on data replication, see "Manage Data Replication" on page 81.

By enabling the call-home state for a managed system this causes the console to automatically contact a service center when a serviceable event occurs. When a managed system is disabled, your service representative is not informed of serviceable events.

To manage call-home for the system(s):

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Enable Electronic Service Agent**.
3. From the **Enable Electronic Service Agent** window, select a system or systems you want to enable or disable the call-home state.
4. Click **OK** when you have completed the task.

Use the online Help if you need additional information for enabling the Electronic Service Agent.

Manage Outbound Connectivity

Customize the means for outbound connectivity for the Hardware Management Console (HMC) to use to connect to remote service.

Note: If Customizable Data Replication is **Enabled** on this HMC (using the **Manage Data Replication** task), the data specified in this task may change depending on automatic replication from other HMCs configured on your network. For more information on data replication, see "Manage Data Replication" on page 81.

You can configure this HMC to attempt connections through the local modem, Internet, Internet Virtual Private Network (VPN), or through a remote pass-through system. Remote service is a two-way communication between the HMC and the IBM Service Support System for the purpose of conducting automated service operations. The connection can only be initiated by the HMC. IBM Service Support System cannot and never attempts to initiate a connection to the HMC.

To customize your connectivity information, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Manage Outbound Connectivity**.
3. From the **Manage Outbound Connectivity** window select **Enable local server as call-home server** (a check mark appears) before proceeding with the task.

   Note: You must first **Accept** the terms described about the information you provided in this task.

   This allows the local HMC to connect to your service provider's remote support facility for call-home requests.
4. The dial information window displays the following tabs for providing input:
   - Local Modem
   - Internet
   - Internet VPN

- Pass-Through Systems

5. If you want to allow connectivity over a modem, use the **Local Modem** tab, then select **Allow local modem dialing for service** .
   a. If your location requires a prefix to be dialed in order to reach an outside line, click **Modern Configuration** and enter the **Dial prefix** in the **Customize Modem Settings** window required by your location. Click **OK** to accept the setting.
   b. Click **Add** from the **Local Modem** tab page to add a telephone number. When local modem dialing is allowed, there must be at least one telephone number configured.
6. If you want to allow connectivity over the Internet, use the **Internet** tab, then select **Allow an existing internet connection for service**.
7. If you want to configure the use of a VPN over an existing Internet connection to connect from the local HMC to your service provider's remote support facility, use the **Internet VPN** tab.
8. If you want to allow the HMC to use the pass-through systems as configured by the TCP/IP address or host name, use the **Pass-Through Systems** tab.
9. When you complete all the necessary fields, click **OK** to save your changes.

Use the online Help if you need additional information for customizing outbound connectivity information.

Manage Inbound Connectivity

Learn how to allow your service provider to temporarily access your local console, such as the Hardware Management Console (HMC), or the partitions of a managed system.

To manage inbound connectivity, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Manage Inbound Connectivity**.
3. From the **Manage Inbound Connectivity** settings window, you can perform the following tasks:
   - Use the **Remote Service** tab to provide the information necessary to start an attended remote service session.
   - Use the **Call Answer** tab to provide the information necessary to accept incoming calls from your service provider to start an unattended remote service session.
4. Click **OK** to proceed with your selections.

Use the online Help if you need additional information about this task.

Manage Customer Information

This task enables you to customize the customer information for the Hardware Management Console (HMC).

Note: If Customizable Data Replication is *Enabled* on this HMC (using the **Manage Data Replication** task), the data specified in this task may change depending on automatic replication from other HMCs configured on your network. For more information on data replication, see “Manage Data Replication” on page 81.

The **Manage Customer Information** window displays the following tabs for providing input:

- Administrator
- System
- Account

To customize your customer information, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Manage Customer Information**.
3. From the **Manage Customer Information** window, provide the appropriate information on the **Administrator** page.

   Note: Information is required for fields with an asterisk (*).
4. Select the **System** and **Account** tabs from the **Manage Customer Information** window to provide additional information.
5. Click **OK** when you have completed the task.

Use the online Help to get additional information about customizing your account information.

Manage Event Notification

This task adds email addresses that notify you when problem events occur on your system and configures how you want to receive notification of system events from the Electronic Service Agent.

To set up notification, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Manage Event Notification**.
3. From the **Manage Event Notification** window, you can complete the following tasks:
   - Use the **Email** tab to add the email addresses that are notified when problem events occur on your system and when scheduled operations are planned for your system.
   - Use the **SNMP Trap Configuration** tab to specify locations for sending Simple Network Management Protocol (SNMP) trap messages for Hardware Management Console application programming interface events.
4. Click **OK** when you complete this task.

Use the online Help if you need additional information about this task.

Manage Connection Monitoring

Learn how to configure the timers that the connection monitoring uses to detect outages and enables or disables connection monitoring for selected machines.

You can view and, if authorized, change connection monitoring settings by machine. Connection monitoring generates serviceable events when communication problems are detected between the HMC and managed systems. If you disable connection monitoring, no serviceable events are generated for networking problems between the selected machine and this HMC.

To monitor the connections, complete the following steps:

1. In the navigation area, click the **Serviceability** icon , and then select **Service Management**.
2. In the content pane, click **Manage Connection Monitoring**.
3. From the **Manage Connection Monitoring** window, adjust the timer settings, if required, and enable or disable the server.

4. Click **OK** when you have completed the task.

Use the online Help if you need additional information about connection monitoring.

Remote operations

Connect to and use the Hardware Management Console (HMC) remotely.

Remote operations use the GUI used by a local HMC operator or the command line interface (CLI) on the HMC. You can perform operations remotely in the following ways:

- Use a remote HMC.
- Use a web browser to connect to a local HMC.
- Use an HMC remote command line.

The remote HMC is an HMC that is on a different subnet from the service processor, therefore the service processor cannot be auto discovered with IP multicast.

To determine whether to use a remote HMC or web browser that is connected to a local HMC, consider the scope of control that you need. A remote HMC defines a specific set of managed objects that are directly controlled by the remote HMC, while a web browser to a local HMC has control over the same set of managed objects as the local HMC. The communications connectivity and communications speed is an extra consideration. LAN connectivity provides acceptable communications for either a remote HMC or web browser control.

Using a remote HMC

A remote HMC gives the most complete set of functions because it is a complete HMC. Only the process of configuring the managed objects is different from a local HMC.

As a complete HMC, a remote HMC has the same setup and maintenance requirements as a local Hardware Management Console. A remote HMC needs LAN TCP/IP connectivity to each managed object (service processor) that is to be managed; therefore, any customer firewall that might exist between the remote HMC and its managed objects must allow the HMC to service processor communications to occur. A remote HMC might also need communication with another HMC for service and support. Table 10 on page 105 shows the ports that a remote HMC uses for communications.

Table 10. Ports used by a Remote HMC for Communications

Port	**Use**
udp 9900	HMC to HMC discovery
tcp 9920	HMC to HMC commands

A remote HMC needs connectivity to IBM (or another HMC that has connectivity to IBM) for service and support. The connectivity to IBM might be in the form of access to the internet (through a company firewall).

Performance and the availability of the status information and access to the control functions of the service processor depends on the reliability, availability, and responsiveness of the customer network that interconnects the remote HMC with the managed object. A remote HMC monitors the connection to each service processor and attempts to recover any lost connections and can report those connections that cannot be recovered.

Security for a remote HMC is provided by the HMC user-login procedures in the same way as a local HMC. As with a local HMC, all communication between a remote HMC and each service processor is encrypted. Certificates for secure communications are provided, and can be changed by the user if wanted.

TCP/IP access to the remote HMC is controlled through its internally managed firewall and is limited to HMC-related functions.

Using a web browser

If you need occasional monitoring and control of managed objects that are connected to a single local Hardware Management Console (HMC), use a web browser. An example of using the web browser might be an off-hours monitor from home by an operator or system programmer.

Each HMC contains a web server that can be configured to allow remote access for a specified set of users. If a customer firewall exists between the web browser and the local HMC, the ports must be accessible and the firewall setup to allow incoming requests on these ports. Table 11 on page 106 shows the ports that a web browser needs for communicating with an HMC.

Table 11. Ports that are used by a web browser for communications to the HMC

Port	Use
TCP 443	Secure (HTTPS) remote interface communication
TCP 8443	Secure browser access to web server communication
TCP 9960	Browser applet communication

[1]This port is opened in the HMC firewall when remote access is enabled in HMC Version 7.8.0 and later. This port must also be opened in any firewall that is between the remote client and the HMC.

After an HMC is configured to allow web browser access, a web browser gives an enabled user access to all the configured functions of a local HMC, except those functions that require physical access to the HMC, such as those that use the local diskette or DVD media. The user interface that is presented to the remote web browser user is the same as that of the local HMC and is subject to the same constraints as the local HMC.

The web browser can be connected to the local HMC by using a LAN TCP/IP connection and by using only encrypted (HTTPS) protocols. Logon security for a web browser is provided by the HMC user-login procedures. Certificates for secure communications are provided, and can be changed by the user.

Performance and the availability of the status information and access to the control functions of the managed objects depends on the reliability, availability, and responsiveness of the network that interconnects the web browser with the local HMC. Because there is no direct connection between the web browser and the individual managed objects, the web browser does not monitor the connection to each service processor, does not perform any recovery, and does not report any lost connections. These functions are handled by the local HMC

The web browser system does not require connectivity to IBM for service or support. Maintenance of the browser and system level is the responsibility of the customer.

If the URL of the HMC is specified by using the format https://*xxx.xxx.xxx.xxx* (where *xxx.xxx.xxx.xxx* is the IP address) and Microsoft Internet Explorer is used as the browser, a host name mismatch message is displayed. To avoid this message, a Firefox browser is used or a host name is configured for the HMC, by using the **Change Network Settings** task (see "Change Network Settings" on page 75), and this host name is specified in the URL instead of an IP address. For example, you can use the format https://*host name.domain_name* or https://*host name* (for example, by using https://hmc1.ibm.com or https://hmc1).

Preparing to use the web browser

Perform the necessary steps to prepare to use a web browser to access the Hardware Management Console (HMC).

Before you can use a web browser to access an HMC, you must complete the following tasks:

- Configure the HMC to allow remote control for specified users.
- For LAN-based connections, you must know the TCP/IP address of the HMC to be controlled, and correctly set up any firewall access between the HMC and the web browser.
- Have a valid user ID and password that is assigned by the access administrator for HMC web access.

Web browser requirements

Learn about the requirements your web browser must meet to monitor and control the Hardware Management Console (HMC).

HMC web browser support requires HTML 2.0, JavaScript 1.0, Java™ Virtual Machine (JVM), Java Runtime Environment (JRE) Version 7, and cookie support in browsers that connect to the HMC. Contact your support personnel to assist you in determining whether your browser is configured with a Java Virtual Machine. The web browser must use HTTP 1.1. If you are using a proxy server, HTTP 1.1 must be enabled for the proxy connections. Additionally, pop-up windows must be enabled for all HMCs addressed in the browser if the browser is running with pop-up windows disabled. The following browsers have been tested:

Google Chrome

HMC Version 8.1 supports Google Chrome Version 33.

Microsoft Internet Explorer

HMC Version 8.1 supports Internet Explorer 9.0, Internet Explorer 10.0, and Internet Explorer 11.0.

Note: The performance CEC task is not supported in Internet Explorer 9.0.

- If your browser is configured to use an Internet proxy, then local IP addresses are included in the exception list. For more information, see your network administrator. If you still need to use the proxy to get to the Hardware Management Console, enable Use **HTTP 1.1 through proxy connections** under the **Advanced** tab in your Internet Options window.

Mozilla Firefox

HMC Version 8.1 supports Mozilla Firefox Version 17 and Mozilla Firefox Version 24 Extended Support Release (ESR). Ensure that the JavaScript options to raise or lower windows and to move or resize existing windows are enabled. To enable these options, click the **Content** tab in the browser's Options dialog, click **Advanced** next to the Enable JavaScript option, and then select the Raise or lower windows option and the Move or resize existing windows options. Use these options to easily switch between HMC tasks. For more information about the latest Mozilla Firefox ESR levels, see Security Advisories for Firefox ESR.

Note: The following restrictions apply when you are using Mozilla Firefox while the HMC is in NIST SP 800-131a security mode:

- Mozilla Firefox cannot be used for the remote client.
- The local console cannot be used.

Other web browser considerations

Session cookies need to be enabled in order for ASMI to work when connected to HMC remotely. The ASM proxy code saves session information and uses it.

Internet Explorer

1. Click **Tools** > **Internet Options**.
2. Click the **Privacy** tab and select **Advanced**.
3. Determine whether **Always allow session cookies** is checked.
4. If not checked, select **Override automatic cookie handling** and **Always allow session cookies**.
5. For the First-party Cookies and Third-party Cookies, choose block, prompt, or accept. Prompt is preferred, in which case you are prompted every time that a site tries to write cookies. Some sites need to be allowed to write cookies.

Firefox

1. Click **Tools** > **Options**.
2. Click the **Cookies** Tab.
3. Select **Allow sites to set cookies**.
4. If you want to allow only specific sites, select **Exceptions**, and add this HMC to allow access.

Using the HMC remote command line

An alternative to performing tasks on the HMC graphical user interface is using the command line interface (CLI).

You can use the command line interface in the following situations:

- When consistent results are required. If you must administer several managed systems, you can achieve consistent results by using the command line interface. The command sequence can be stored in scripts and run remotely.
- When automated operations are required. After you develop a consistent way to manage the managed systems, you can automate the operations by starting the scripts from batch-processing applications, such as the **cron** daemon, from other systems.

On a local HMC, you can use the command line interface in the console window.

Setting up secure script execution between SSH clients and the HMC

You must ensure that your script executions between Secure Shell (SSH) clients and the Hardware Management Console (HMC) are secure.

HMCs typically are placed inside the server room where managed systems are located, so you might not have physical access to the HMC. In this case, you can remotely access it using either a remote web browser or the remote command line interface.

Note: To enable scripts to run unattended between an SSH client and an HMC, the SSH protocol must already be installed on the client's operating system.

To enable scripts to run unattended between an SSH client and an HMC, complete the following steps:

1. Enable remote command execution. For more information, see "Enable Remote Command Execution" on page 97.
2. On the client's operating system, run the SSH protocol key generator. To run the SSH protocol key generator, complete the following steps:
   a. To store the keys, create a directory that is named `$HOME/.ssh` (either RSA or DSA keys can be used).
   b. To generate public and private keys, run the following command:

      ```
      ssh-keygen -t rsa
      ```

      The following files are created in the $HOME/.ssh directory:

      ```
      private key: id_rsa
      public key: id_rsa.pub
      ```

      The write bits for both group and other are turned off. Ensure that the private key has a permission of 600."
3. On the client's operating system, use ssh and run the `mkauthkeys` command to update the HMC user's authorized_keys2 file on the HMC by using the following command:

   ```
   ssh hmcuser@hmchostname mkauthkeys -–add <the contents of $HOME/.ssh/
   id_rsa.pub>
   ```

   Note: Double quotes (") are used in commands to ensure that the remote shell can properly process the command. For example:

   ```
   ssh "mkauthkeys hscuser@somehmchost --add 'ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQDa+Zc8+hn1+
   TjEXu640LqnVNB+UsixIE3c649Cgj20gaVWnFKTjcpWVahK/duCLac/zteMtVAfCx7/ae2g5RTPu7FudF2xjs4r
   +NadVXhoIqmA53a
   NjE4GILpfe5vOF25xkBdG9wxigGtJyOKeJHzgnElP7RlEeOBijJDKo5gGE12NVfBxboChm6LtKnDxLi9ahhOYtLlFehJr
   6pV/lMAEu
   Lhd6ax1hWvwrhf/
   h5Ym6J8JbLVL3EeKbCsuG9E4iN1z4HrPkT5OQLqtvC1Ajch1ravsaQqYloMTWNFzM4Qo5O3fZbLc6RuJjtJv8C5t
   4/SZUGHZxSPnQmkuii1z9hxt hscpe@vhmccloudvm179'"
   ```

To delete the key from the HMC, you can use the following command:

```
ssh hmcuser@hmchostname mkauthkeys --remove joe@somehost
```

To enable passwords that prompts for all hosts that access the HMC through SSH, use the `scp` command to copy the key file from the HMC: `scp hmcuser@hmchostname:.ssh/authorized_keys2 authorized_keys2`

Edit the `authorized_keys2` file and remove all lines in this file and then, copy it back to the HMC: `scp authorized_keys2 hmcuser@hmchostname:.ssh/authorized_keys2`

Enabling and disabling HMC remote commands

You can enable or disable the remote command line interface access to the Hardware Management Console (HMC).

To enable or disable remote commands, complete the following steps:

1. In the navigation area, select the managed system and click the **Users and Security** icon 🔓, and then select **Users and Roles**.
2. In the content pane, click **Enable Remote Command Execution**.
3. From the **Enable Remote Command Execution** window, select from the following options:
   - To enable remote commands, select **Enable remote command execution using the ssh facility**.
   - To disable remote commands, make sure **Enable remote command execution using the ssh facility** is not selected.
4. Click **OK**.

Logging in to the HMC from a LAN-connected web browser

Log in to the Hardware Management Console (HMC) remotely from a LAN-connected web browser.

Use the following steps to log in to the HMC from a LAN-connected web browser:

1. Ensure that your web browser has LAN connectivity to the wanted HMC.
2. From your web browser, enter the URL of the wanted HMC in the format `https://hostname.domain_name` (for example: `https://hmc1.ibm.com`) or `https://xxx.xxx.xxx.xxx`.

   If this connection is the first access of the HMC for the current web browser session, you might receive a certificate error. This certificate error is displayed if any of the following conditions occur:

   - The web server that is contained in the HMC is configured to use a self-signed certificate and the browser is not configured to trust the HMC as an issuer of certificates.
   - The HMC is configured to use a certificate that is signed by a certificate authority (CA) and the browser is not configured to trust this CA.

   In either case, if you know that the certificate that is being displayed to the browser is the one used by the HMC, you can continue and all communications to the HMC is encrypted.

   If you do not want to receive notification of a certificate error for the first access of any browser session, you can configure the browser to trust the HMC or the CA. In general, to configure the browser, use one of the following methods:

   - You must indicate that the browser permanently trusts the issuer of the certificate.
   - By viewing the certificate and installing to the database of trusted CAs, the certificate of the CA that issues the certificate is used by the HMC.

   If the certificate is self-signed, the HMC itself is considered the CA that issues the certificate.
3. When prompted, enter the user name and password that is assigned by your administrator.

Managing OpenBMC-based and BMC-based systems by using the HMC

Learn how to manage OpenBMC-based and BMC-based systems by using the Hardware Management Console (HMC).

About this task

Learn about the tasks that you perform from the console and how to navigate the baseboard management controller (BMC) by using the web-based user interface with graphical views of managed systems and simplified navigation.

Note: You cannot manage OpenBMC-based and BMC-based systems while the HMC is running in NIST mode.

Add Managed Systems

Learn how to add a managed Baseboard Management Controller (BMC) system to the Hardware Management Console (HMC).

To add one or more managed BMC systems to the HMC, complete the following steps:

1. From the HMC dashboard, click **Connect Systems**
2. From the **Add Managed Systems** window, you can add a BMC system by completing the following fields:
   - **IP Address/Host name**
   - **Username (BMC system)**

     Notes:

     – For model 8335-GTH and 8335-GTX, the default user name is `admin`.

     – For model 9006-12P and 9006-22P, the default user name is `ADMIN`.
   - **Password**

   Alternatively, you can specify a range of IP addresses and click **OK** to view a list of systems that were discovered. You can select one or more discovered systems to add to the HMC.

   Note: The discovery process can take a long time to complete.
3. Click **OK** to add the managed system to the HMC.

Use the online Help if you need additional information about this task.

Systems Management for Servers

Systems Management displays tasks to manage servers. Use these tasks to set up, configure, view status, troubleshoot, and apply solutions for servers.

These tasks are listed when a managed system is selected. The tasks that are listed in the menu pod change as selections are made in the work area.

Operations

Operations contains the tasks for operating managed systems.

Power Off

Shut down the managed system.

Choose from the following options:

Normal power off

The Normal power off mode shuts down the system's operations in a controlled manner. During the shutdown, programs running active jobs are allowed to perform cleanup (end-of-job processing).

Power On

Use the **Power On** task to start a managed system.

Choose from the following options to power on your managed system:

Normal: Select this option to specify that the HMC uses the current setting for the partition start policy to determine how to power on the managed system. The default setting is set to the following value:

- **Auto-Start Always**: This option specifies that the HMC power on logical partitions automatically after the managed system powers on. If powering on the managed system is the result of a user action, the HMC starts all partitions that are configured for automatic startup. If powering on the managed system is the result of an automatic recovery process, the HMC starts only those logical partitions that were running at the time the system is powered off. This option is always available for selection.

Schedule Operations

Create a schedule for certain operations to be performed on the managed system without operator assistance.

Scheduled operations are helpful for situations where automatic, delayed, or repetitious processing of system operations is necessary. A scheduled operation is started at a specified time, without operator assistance to perform the operation. A schedule can be set for one operation or repeated many times.

For example, you might schedule power on or off operations for a managed system.

The Scheduled Operations task displays the following information for each operation:

- The processor that is the object of the operation.
- The scheduled date
- The scheduled time
- The operation
- The number of remaining repetitions

From the **Scheduled Operations** window, you can perform the following tasks:

- Schedule an operation to run later.
- Define operations to repeat at regular intervals.
- Delete a previously scheduled operation.
- View details for a currently scheduled operation.
- View scheduled operations within a specified time range.
- Sort scheduled operations by date, operation, or managed system.

You can schedule an operation to occur once or you can schedule it to repeat. You must provide the time and date that you want the operation to occur. If you want the operation to repeat, you are asked to select the following options:

- The day or days of the week that you want the operation to occur. (optional)
- The interval, or time between each occurrence. (required)
- The total number of repetitions. (required)

The operations that you can schedule for the managed system include the following operations:

Power Off Managed System

Schedules an operation for a system power off at regular intervals for a managed system.

Power On Managed System

Schedules an operation for a system power-on at regular intervals for a managed system.

To schedule operations on the managed system, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Servers**.
2. In the content pane, select one or more managed systems.
3. In the menu pod, select **Actions** > **View All Actions** > **Operations** > **Schedule Operations**.
4. From the **Scheduled Operations** window, click **Options** from the menu bar to display the next level of options:
   - To add a scheduled operation, click **Options** and then click **New**.
   - To delete a scheduled operation, select the operation that you want to delete, point to **Options** and then click **Delete**.
   - To update the list of scheduled operations with the current schedules for the selected objects, point to **Options** and then click **Refresh**.
   - To view a scheduled operation, select the operation that you want to view, point to **View** and then click **Schedule Details**.
   - To change the time of a scheduled operation, select the operation that you want to view, point to **View** and then click **New Time Range**.
   - To sort the scheduled operations, point to **Sort** and then click one of the sort categories that appears.
5. To return to the HMC workplace, point to **Operations** and then click **Exit**.

Launch BMC System Management

The Hardware Management Console (HMC) can connect directly to the Baseboard Management Controller (BMC) for a selected system.

The BMC system management is an interface to the service processor that allows you to manage the operation of the server, such as auto power restart, and to view information about the server, such as the error log and vital product data.

To connect to the BMC, complete the following steps:

Note: To access the BMC user interface, you must be at the console or have access to the BMC by using a supported web browser.

1. In the navigation area, click the **Resources** icon , and then select **All Servers**.
2. In the content pane, select one or more managed systems.
3. In the menu pod, select **Actions** > **View All actions** > **Operations** > **Launch BMC System Management**.
4. Click **Continue**.

Configuring Call Home

Problems on your BMC-based managed system are reported to the Hardware Management Console (HMC) as events. You can set up alerts to be automatically notified of any events.

Note: You must enable SNMP traps in the HMC to receive alerts. To enable SNMP traps, navigate to **Console Settings** > **Change Network Settings** > **LAN Adapters** > **Details** > **Firewall Settings**. Select **SNMP Traps** and **SNMP Agent** from the table and then click **Allow Incoming**.

To set up alerts for call home, complete the following steps:

Note: This procedure is applicable for model 9006-12P, 9006-22C, and 9006-22P.

1. From the **BMC System Management** window, click **Configuration** > **Alerts**.
2. Select any alert from the table and click **Modify**.

Note: You can set up multiple HMCs to receive traps. Duplicate reporting of events by multiple HMCs is possible as duplicate event verification is not performed.

3. Complete the following fields:
   - **Event Severity**
   - **Destination IP**
4. Click **Save**.
5. Verify the new alert in the table.

Use the online Help if you need additional information about this task.

Rebuild

You can extract the configuration information from the managed system and rebuild the information on the Hardware Management Console (HMC).

This task does not disrupt the operation of the running server.

Rebuilding the managed system updates the information on the HMC about the managed system. Rebuilding the managed system is useful when the state of the managed system is `Incomplete`. The Incomplete state means that the HMC cannot gather complete information from the managed system about logical partitions, profiles, or resources.

Rebuilding the managed system is different from refreshing the **HMC** window. When the managed system is rebuilt, the HMC extracts the information from the managed system. You cannot start other tasks while the HMC rebuilds the managed system. This process can take several minutes.

Updates

Display tasks to view system information, manage updates on your Hardware Management Console (HMC), or check system readiness.

Change Licensed Internal Code

Change the Licensed Internal Code of a managed BMC system by using your Hardware Management Console (HMC).

The system firmware is a combination of the BMC firmware and the PNOR firmware. You must update both the BMC firmware and the PNOR firmware for the system to operate properly. If you update only one type of firmware, but do not update the other type of firmware, system errors might occur.

To change the Licensed Internal Code, complete the following steps:

1. In the navigation area, click the **Resources** icon , and then select **All Servers**.
2. Select the server for which you want to view system information.
3. In the menu pod, expand **Actions** and then expand **Updates**.
4. Select **Change Licensed Internal Code** > **BMC Change Licensed Internal Code**.
5. Follow the onscreen instructions in the **BMC Change Licensed Internal Code** guided wizard.

   Note: The BMC system must be in the powered off state before you can proceed with the wizard.
6. When you complete this task, click **Close**.

Use the online Help if you need additional information about this task.

Attention LED

View system attention LED information, light specific LEDs to identify a system component, and test all LEDs on a managed system.

The system provides several LEDs that help identify various components, such as enclosures or field replaceable units (FRUs), in the system. For this reason, they are called **Identify** LEDs. Individual LEDs are on or near the components. The LEDs are located either on the component itself or on the carrier of the component (for example, memory card, fan, memory module, or processor). LEDs are either green or amber. Green LEDs indicate either of the following states:

- Electrical power is present.
- Activity is occurring on a link. (The system might be sending or receiving information).

Amber LEDs indicate a fault or identify condition. If your system or one of the components on your system has an amber LED turned on or flashing, identify the problem and take the appropriate action to restore the system back to normal.

You can activate or deactivate the following types of identify LEDs:

Identify LED for an enclosure

If you want to add an adapter to a specific drawer (enclosure), you need to know the machine type, model, and serial number (MTMS) of the drawer. To determine whether you have the correct MTMS for the drawer that needs the new adapter, you can activate the LED for a drawer and verify that the MTMS corresponds to the drawer that requires the new adapter.

You can deactivate a system attention LED. For example, you might determine that a problem is not a high priority and decide to repair the problem later. However, you want to be alerted if another problem occurs, so you must deactivate the system attention LED so that it can be activated again if another problem occurs.

Connections

You can view the Hardware Management Console (HMC) connection status to service processors, reset those connections, connect another HMC to the selected managed system, or disconnect another HMC.

If you select a managed system in the work area, the following tasks pertain to that managed system.

Service Processor Status

View information about the status of the Hardware Management Console (HMC) connection to the service processors on the managed system.

About this task

To show the service processor connection status to the service processors on the managed system, complete the following steps:

Procedure

1. In the navigation area, click the **Resources** icon , and then select **All Servers**.
2. Select the server for which you want to view service processor connection status.
3. In the menu pod, select **Actions** > **View All Actions** > **Connections** > **Service Processor Status**.

Reset or Remove Connections

Reset or remove a managed system from the Hardware Management Console (HMC) interface.

About this task

To reset or remove connections, complete the following steps:

Procedure

1. In the navigation area, click the **Resources** icon , and then select **All Servers**.
2. Select the server that you want to reset or remove.

3. In the menu pod, select **Actions** > **View All Actions** > **Connections** > **Reset or Remove Connections**.
4. Select **Reset Connection** or **Remove Connection**.
5. Click **OK**.

Notices

This information was developed for products and services offered in the US.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive, MD-NC119
Armonk, NY 10504-1785
US

For license inquiries regarding double-byte character set (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Some jurisdictions do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM websites are provided for convenience only and do not in any manner serve as an endorsement of those websites. The materials at those websites are not part of the materials for this IBM product and use of those websites is at your own risk.

IBM may use or distribute any of the information you provide in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM Director of Licensing
IBM Corporation
North Castle Drive, MD-NC119
Armonk, NY 10504-1785
US

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any equivalent agreement between us.

The performance data and client examples cited are presented for illustrative purposes only. Actual performance results may vary depending on specific configurations and operating conditions.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

All IBM prices shown are IBM's suggested retail prices, are current and are subject to change without notice. Dealer prices may vary.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to actual people or business enterprises is entirely coincidental.

COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

Each copy or any portion of these sample programs or any derivative work must include a copyright notice as follows:

© (your company name) (year).
Portions of this code are derived from IBM Corp. Sample Programs.
© Copyright IBM Corp. _enter the year or years_.

If you are viewing this information in softcopy, the photographs and color illustrations may not appear.

Accessibility features for IBM Power Systems servers

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Power Systems servers include the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Power Systems servers use the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with US Section 508 (www.access-board.gov/guidelines-and-standards/communications-and-it/about-the-section-508-standards/section-508-standards) and Web Content

Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the IBM Power Systems servers.

The IBM Power Systems servers online product documentation in IBM Knowledge Center is enabled for accessibility. The accessibility features of IBM Knowledge Center are described in the Accessibility section of the IBM Knowledge Center help (www.ibm.com/support/knowledgecenter/doc/kc_help.html#accessibility).

Keyboard navigation

This product uses standard navigation keys.

Interface information

The IBM Power Systems servers user interfaces do not have content that flashes 2 - 55 times per second.

The IBM Power Systems servers web user interface relies on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

The IBM Power Systems servers web user interface includes WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Power Systems servers include certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Privacy policy considerations

IBM Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

Depending upon the configurations deployed, this Software Offering may use session cookies that collect each user’s user name and IP address for purposes of session management. These cookies can be disabled, but disabling them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM’s Privacy Policy at http://www.ibm.com/privacy and IBM’s Online Privacy Statement at http://www.ibm.com/privacy/details/us/en/ in the section entitled “Cookies, Web Beacons and Other Technologies”.

Programming interface information

This Managing the Hardware Management Console publication documents intended Programming Interfaces that allow the customer to write programs to obtain the services of IBM Hardware Management Console Version 9 Release 2 Maintenance Level 950.

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information.

The registered trademark Linux is used pursuant to a sublicense from the Linux Foundation, the exclusive licensee of Linus Torvalds, owner of the mark on a worldwide basis.

Microsoft is a trademark of Microsoft Corporation in the United States, other countries, or both.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Terms and conditions

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Personal Use: You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative works of these publications, or any portion thereof, without the express consent of IBM.

Commercial Use: You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights: Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

Problem analysis, system parts, and locations for the IBM Power Systems HMC (7063-CR2)

IBM

Note

Before using this information and the product it supports, read the information in “Safety notices” on page v, “Notices” on page 25, the *IBM Systems Safety Notices* manual, G229-9054, and the *IBM Environmental Notices and User Guide*, Z125–5823.

This edition applies to IBM® Power Systems servers that contain the POWER9™ processor and to all associated models.

Contents

Safety notices

Safety notices may be printed throughout this guide:

- **DANGER** notices call attention to a situation that is potentially lethal or extremely hazardous to people.
- **CAUTION** notices call attention to a situation that is potentially hazardous to people because of some existing condition.
- **Attention** notices call attention to the possibility of damage to a program, device, system, or data.

World Trade safety information

Several countries require the safety information contained in product publications to be presented in their national languages. If this requirement applies to your country, safety information documentation is included in the publications package (such as in printed documentation, on DVD, or as part of the product) shipped with the product. The documentation contains the safety information in your national language with references to the U.S. English source. Before using a U.S. English publication to install, operate, or service this product, you must first become familiar with the related safety information documentation. You should also refer to the safety information documentation any time you do not clearly understand any safety information in the U.S. English publications.

Replacement or additional copies of safety information documentation can be obtained by calling the IBM Hotline at 1-800-300-8751.

German safety information

Das Produkt ist nicht für den Einsatz an Bildschirmarbeitsplätzen im Sinne § 2 der Bildschirmarbeitsverordnung geeignet.

Laser safety information

IBM servers can use I/O cards or features that are fiber-optic based and that utilize lasers or LEDs.

Laser compliance

IBM servers may be installed inside or outside of an IT equipment rack.

DANGER: When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard: If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product. Do not open or service any power supply assembly. Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.

- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords. For AC power, disconnect all power cords from their AC power source. For racks with a DC power distribution panel (PDP), disconnect the customer's DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected. For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate. For racks with a DC power distribution panel (PDP), connect the customer's DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.
- Connect any equipment that will be attached to this product to properly wired outlets.

- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- When performing a machine inspection: Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements. Do not attempt to switch power to the machine until all possible unsafe conditions are corrected. Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.
- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

  To Disconnect: 1) Turn off everything (unless instructed otherwise). 2) For AC power, remove the power cords from the outlets. 3) For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source. 4) Remove the signal cables from the connectors. 5) Remove all cables from the devices.

  To Connect: 1) Turn off everything (unless instructed otherwise). 2) Attach all cables to the devices. 3) Attach the signal cables to the connectors. 4) For AC power, attach the power cords to the outlets. 5) For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP. 6) Turn on the devices.
-  Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

(R001 part 1 of 2):

DANGER: Observe the following precautions when working on or around your IT rack system:

- Heavy equipment–personal injury or equipment damage might result if mishandled.
- Always lower the leveling pads on the rack cabinet.
- Always install stabilizer brackets on the rack cabinet if provided, unless the earthquake option is to be installed.
- To avoid hazardous conditions due to uneven mechanical loading, always install the heaviest devices in the bottom of the rack cabinet. Always install servers and optional devices starting from the bottom of the rack cabinet.
- Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack mounted devices and do not use them to stabilize your body position (for example, when working from a ladder).

- Stability hazard:
  - The rack may tip over causing serious personal injury.
  - Before extending the rack to the installation position, read the installation instructions.
  - Do not put any load on the slide-rail mounted equipment mounted in the installation position.
  - Do not leave the slide-rail mounted equipment in the installation position.
- Each rack cabinet might have more than one power cord.
  - For AC powered racks, be sure to disconnect all power cords in the rack cabinet when directed to disconnect power during servicing.

  - For racks with a DC power distribution panel (PDP), turn off the circuit breaker that controls the power to the system unit(s), or disconnect the customer’s DC power source, when directed to disconnect power during servicing.
- Connect all devices installed in a rack cabinet to power devices installed in the same rack cabinet. Do not plug a power cord from a device installed in one rack cabinet into a power device installed in a different rack cabinet.
- An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (R001 part 1 of 2)

(R001 part 2 of 2):

⚠ **CAUTION:**

- Do not install a unit in a rack where the internal rack ambient temperatures will exceed the manufacturer's recommended ambient temperature for all your rack-mounted devices.
- Do not install a unit in a rack where the air flow is compromised. Ensure that air flow is not blocked or reduced on any side, front, or back of a unit used for air flow through the unit.
- Consideration should be given to the connection of the equipment to the supply circuit so that overloading of the circuits does not compromise the supply wiring or overcurrent protection. To provide the correct power connection to a rack, refer to the rating labels located on the equipment in the rack to determine the total power requirement of the supply circuit.
- *(For sliding drawers.)* Do not pull out or install any drawer or feature if the rack stabilizer brackets are not attached to the rack or if the rack is not bolted to the floor. Do not pull out more than one drawer at a time. The rack might become unstable if you pull out more than one drawer at a time.

- *(For fixed drawers.)* This drawer is a fixed drawer and must not be moved for servicing unless specified by the manufacturer. Attempting to move the drawer partially or completely out of the rack might cause the rack to become unstable or cause the drawer to fall out of the rack. (R001 part 2 of 2)

⚠ **CAUTION:** Removing components from the upper positions in the rack cabinet improves rack stability during relocation. Follow these general guidelines whenever you relocate a populated rack cabinet within a room or building.

- Reduce the weight of the rack cabinet by removing equipment starting at the top of the rack cabinet. When possible, restore the rack cabinet to the configuration of the rack cabinet as you received it. If this configuration is not known, you must observe the following precautions:
  - Remove all devices in the 32U position and above.
  - Ensure that the heaviest devices are installed in the bottom of the rack cabinet.

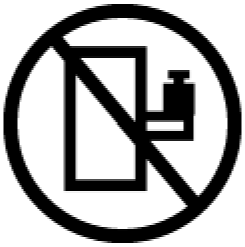
  - Ensure that there are little-to-no empty U-levels between devices installed in the rack cabinet below the 32U level, unless the received configuration specifically allowed it.
- If the rack cabinet you are relocating is part of a suite of rack cabinets, detach the rack cabinet from the suite.
- If the rack cabinet you are relocating was supplied with removable outriggers they must be reinstalled before the cabinet is relocated.
- Inspect the route that you plan to take to eliminate potential hazards.
- Verify that the route that you choose can support the weight of the loaded rack cabinet. Refer to the documentation that comes with your rack cabinet for the weight of a loaded rack cabinet.
- Verify that all door openings are at least 760 x 2083 mm (30 x 82 in.).
- Ensure that all devices, shelves, drawers, doors, and cables are secure.
- Ensure that the four leveling pads are raised to their highest position.
- Ensure that there is no stabilizer bracket installed on the rack cabinet during movement.
- Do not use a ramp inclined at more than 10 degrees.
- When the rack cabinet is in the new location, complete the following steps:
  - Lower the four leveling pads.
  - Install stabilizer brackets on the rack cabinet or in an earthquake environment bolt the rack to the floor.
  - If you removed any devices from the rack cabinet, repopulate the rack cabinet from the lowest position to the highest position.
- If a long-distance relocation is required, restore the rack cabinet to the configuration of the rack cabinet as you received it. Pack the rack cabinet in the original packaging material, or equivalent. Also lower the leveling pads to raise the casters off of the pallet and bolt the rack cabinet to the pallet.

(R002)

(L001)

⚠ **DANGER:** Hazardous voltage, current, or energy levels are present inside any component that has this label attached. Do not open any cover or barrier that contains this label. (L001)

(L002)



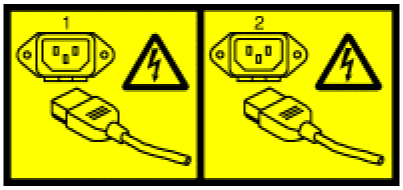
⚠ **DANGER:** Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack-mounted devices and do not use them to stabilize your body position (for example, when working from a ladder). Stability hazard:

- The rack may tip over causing serious personal injury.

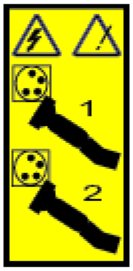
- Before extending the rack to the installation position, read the installation instructions.
- Do not put any load on the slide-rail mounted equipment mounted in the installation position.
- Do not leave the slide-rail mounted equipment in the installation position.

(L002)

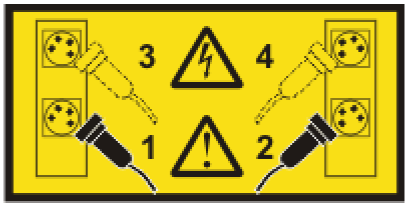
(L003)



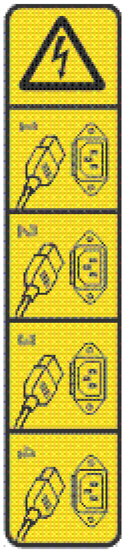
or



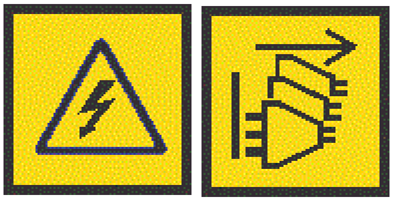
or

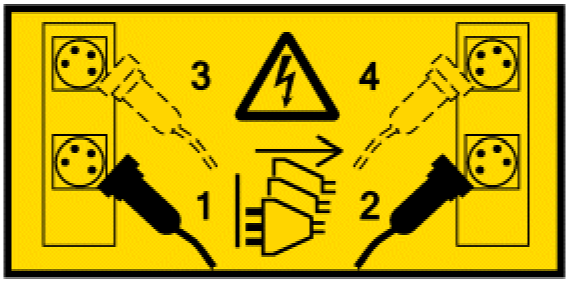


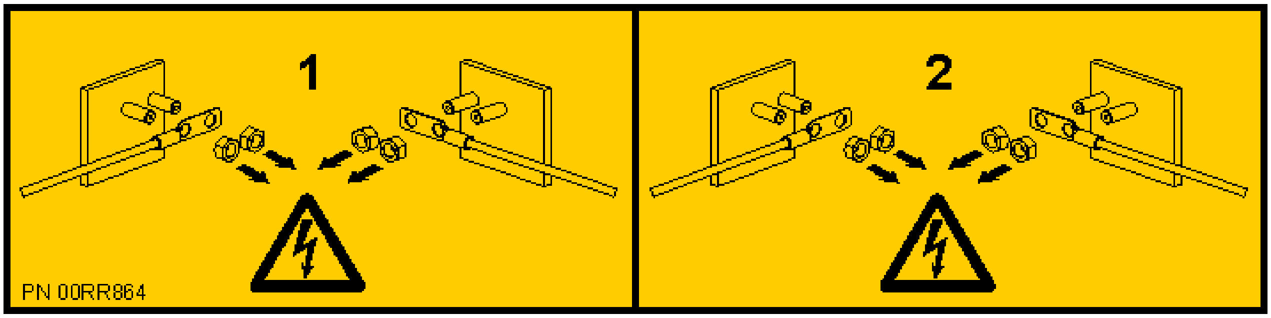
or



or





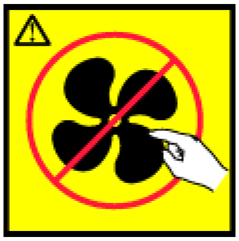


DANGER: Multiple power cords. The product might be equipped with multiple AC power cords or multiple DC power cables. To remove all hazardous voltages, disconnect all power cords and power cables. (L003)

(L007)

CAUTION: A hot surface nearby. (L007)

(L008)



CAUTION: Hazardous moving parts nearby. (L008)

All lasers are certified in the U.S. to conform to the requirements of DHHS 21 CFR Subchapter J for class 1 laser products. Outside the U.S., they are certified to be in compliance with IEC 60825 as a class 1 laser product. Consult the label on each part for laser certification numbers and approval information.

CAUTION: This product might contain one or more of the following devices: CD-ROM drive, DVD-ROM drive, DVD-RAM drive, or laser module, which are Class 1 laser products. Note the following information:

- Do not remove the covers. Removing the covers of the laser product could result in exposure to hazardous laser radiation. There are no serviceable parts inside the device.
- Use of the controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

(C026)

CAUTION: Data processing environments can contain equipment transmitting on system links with laser modules that operate at greater than Class 1 power levels. For this reason, never look into the end of an optical fiber cable or open receptacle. Although shining light into one end and looking into the other end of a disconnected optical fiber to verify the continuity of optic fibers may not injure the eye, this procedure is potentially dangerous. Therefore, verifying the continuity of optical fibers by shining light into one end and looking at the other end is not recommended. To verify continuity of a fiber optic cable, use an optical light source and power meter. (C027)

CAUTION: This product contains a Class 1M laser. Do not view directly with optical instruments. (C028)

CAUTION: Some laser products contain an embedded Class 3A or Class 3B laser diode. Note the following information:

- Laser radiation when open.
- Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam. (C030)

(C030)

CAUTION: The battery contains lithium. To avoid possible explosion, do not burn or charge the battery.

Do Not:

- Throw or immerse into water
- Heat to more than 100 degrees C (212 degrees F)
- Repair or disassemble

Exchange only with the IBM-approved part. Recycle or discard the battery as instructed by local regulations. In the United States, IBM has a process for the collection of this battery. For information, call 1-800-426-4333. Have the IBM part number for the battery unit available when you call. (C003)

CAUTION: Regarding IBM provided VENDOR LIFT TOOL:

- Operation of LIFT TOOL by authorized personnel only.
- LIFT TOOL intended for use to assist, lift, install, remove units (load) up into rack elevations. It is not to be used loaded transporting over major ramps nor as a replacement for such designated tools like pallet jacks, walkies, fork trucks and such related relocation practices. When this is not practicable, specially trained persons or services must be used (for instance, riggers or movers).
- Read and completely understand the contents of LIFT TOOL operator's manual before using. Failure to read, understand, obey safety rules, and follow instructions may result in property damage and/or personal injury. If there are questions, contact the vendor's service and support. Local paper manual must remain with machine in provided storage sleeve area. Latest revision manual available on vendor's web site.
- Test verify stabilizer brake function before each use. Do not over-force moving or rolling the LIFT TOOL with stabilizer brake engaged.
- Do not raise, lower or slide platform load shelf unless stabilizer (brake pedal jack) is fully engaged. Keep stabilizer brake engaged when not in use or motion.
- Do not move LIFT TOOL while platform is raised, except for minor positioning.
- Do not exceed rated load capacity. See LOAD CAPACITY CHART regarding maximum loads at center versus edge of extended platform.
- Only raise load if properly centered on platform. Do not place more than 200 lb (91 kg) on edge of sliding platform shelf also considering the load's center of mass/gravity (CoG).
- Do not corner load the platforms, tilt riser, angled unit install wedge or other such accessory options. Secure such platforms -- riser tilt, wedge, etc options to main lift shelf or forks in all four

(4x or all other provisioned mounting) locations with provided hardware only, prior to use. Load objects are designed to slide on/off smooth platforms without appreciable force, so take care not to push or lean. Keep riser tilt [adjustable angling platform] option flat at all times except for final minor angle adjustment when needed.

- Do not stand under overhanging load.
- Do not use on uneven surface, incline or decline (major ramps).
- Do not stack loads.
- Do not operate while under the influence of drugs or alcohol.
- Do not support ladder against LIFT TOOL (unless the specific allowance is provided for one following qualified procedures for working at elevations with this TOOL).
- Tipping hazard. Do not push or lean against load with raised platform.
- Do not use as a personnel lifting platform or step. No riders.
- Do not stand on any part of lift. Not a step.
- Do not climb on mast.
- Do not operate a damaged or malfunctioning LIFT TOOL machine.
- Crush and pinch point hazard below platform. Only lower load in areas clear of personnel and obstructions. Keep hands and feet clear during operation.
- No Forks. Never lift or move bare LIFT TOOL MACHINE with pallet truck, jack or fork lift.
- Mast extends higher than platform. Be aware of ceiling height, cable trays, sprinklers, lights, and other overhead objects.
- Do not leave LIFT TOOL machine unattended with an elevated load.
- Watch and keep hands, fingers, and clothing clear when equipment is in motion.
- Turn Winch with hand power only. If winch handle cannot be cranked easily with one hand, it is probably over-loaded. Do not continue to turn winch past top or bottom of platform travel. Excessive unwinding will detach handle and damage cable. Always hold handle when lowering, unwinding. Always assure self that winch is holding load before releasing winch handle.
- A winch accident could cause serious injury. Not for moving humans. Make certain clicking sound is heard as the equipment is being raised. Be sure winch is locked in position before releasing handle. Read instruction page before operating this winch. Never allow winch to unwind freely. Freewheeling will cause uneven cable wrapping around winch drum, damage cable, and may cause serious injury.
- This TOOL must be maintained correctly for IBM Service personnel to use it. IBM shall inspect condition and verify maintenance history before operation. Personnel reserve the right not to use TOOL if inadequate. (C048)

Power and cabling information for NEBS (Network Equipment-Building System) GR-1089-CORE

The following comments apply to the IBM servers that have been designated as conforming to NEBS (Network Equipment-Building System) GR-1089-CORE:

The equipment is suitable for installation in the following:

- Network telecommunications facilities
- Locations where the NEC (National Electrical Code) applies

The intrabuilding ports of this equipment are suitable for connection to intrabuilding or unexposed wiring or cabling only. The intrabuilding ports of this equipment *must not* be metallically connected to the interfaces that connect to the OSP (outside plant) or its wiring. These interfaces are designed for use as intrabuilding interfaces only (Type 2 or Type 4 ports as described in GR-1089-CORE) and require isolation from the exposed OSP cabling. The addition of primary protectors is not sufficient protection to connect these interfaces metallically to OSP wiring.

Note: All Ethernet cables must be shielded and grounded at both ends.

The ac-powered system does not require the use of an external surge protection device (SPD).

The dc-powered system employs an isolated DC return (DC-I) design. The DC battery return terminal *shall not* be connected to the chassis or frame ground.

The dc-powered system is intended to be installed in a common bonding network (CBN) as described in GR-1089-CORE.

Beginning troubleshooting and problem analysis

This information provides a starting point for analyzing problems.

This information is the starting point for diagnosing and repairing systems. From this point, you are guided to the appropriate information to help you diagnose problems, determine the appropriate repair action, and then complete the necessary steps to repair the system.

Notes:

- Update the system firmware to the latest level before you start problem analysis. If you update the system firmware, you have the latest available fixes and improvements for error handling, reporting, and isolation. For instructions about updating the system firmware, see Getting fixes.
- Some service procedures use OpenBMC tool commands. To download and install the OpenBMC tool, see Downloading and installing the OpenBMC tool.

What type of problem are you dealing with?	Problem analysis procedure
You do not know the type of problem.	Go to "Determining the problem analysis procedure to perform" on page 1.
You have an FQPSP*xxxxxxx* event code.	Go to FQPSP*xxxxxxx* Event Codes.
A baseboard management controller (BMC) access problem occurred.	Go to "Resolving a BMC access problem" on page 2.
The system does not power on (the power button or the BMC power on command does not power on the system).	Go to "Resolving a power problem" on page 4.
A system firmware boot failure occurred (the system started but was not able to boot to the Petitboot menu).	Go to "Resolving a system firmware boot failure" on page 5.
A video graphics array (VGA) monitor problem occurred (the system started but no video is displayed on the monitor).	Go to "Resolving a VGA monitor problem" on page 6.
An operating system boot failure occurred (the system booted to the Petitboot menu but the operating system did not start).	Go to "Resolving an operating system boot failure" on page 6.
A processor, memory, power, or cooling hardware failure occurred.	Go to "Resolving a hardware problem" on page 7.
Missing or faulty PCIe adapter or device.	Go to "Resolving a PCIe adapter or device problem" on page 7.

Determining the problem analysis procedure to perform

Learn how to identify the correct problem analysis procedure to perform.

About this task

To determine the correct problem analysis procedure to perform, complete the following steps:

Procedure

1. After you apply power to the system, are the power supply LEDs green?

If	Then
Yes:	Continue with the next step.
No:	Go to "Resolving a power problem" on page 4.

2. Can you access the baseboard management controller (BMC) across the network?

If	Then
Yes:	Continue with the next step.
No:	Go to "Resolving a BMC access problem" on page 2.

3. Can you boot the system to the Petitboot menu?

If	Then
Yes:	Continue with the next step.
No:	Go to "Resolving a system firmware boot failure" on page 5.

4. Is video displayed on the video graphics array (VGA) monitor?

If	Then
Yes:	Continue with the next step.
No:	Go to "Resolving a VGA monitor problem" on page 6.

5. Can you start the operating system?

If	Then
Yes:	Continue with the next step.
No:	Go to "Resolving an operating system boot failure" on page 6.

6. Go to "Resolving a hardware problem" on page 7. **This ends the procedure.**

Resolving a BMC access problem

Learn how to identify the service action that is needed to resolve a baseboard management controller (BMC) access problem.

Procedure

1. Ensure that the BMC password is not set to the default password. For information about changing the default password, see Logging on to the OpenBMC GUI. Does the problem persist?

If	Then
Yes:	Continue with the next step.
No:	**This ends the procedure.**

2. Are both ends of the network cable seated securely?

If	Then
Yes:	Continue with the next step.
No:	Seat both ends of the cable securely. If the problem persists, continue with the next step.

3. Is the operating system available?

If	Then
Yes:	Continue with the next step.
No:	Continue with step "5" on page 3.

4. Verify that the BMC network settings are correct.

   a) In the navigation area, click the **HMC Management** icon , and then select **Console Settings**.

   b) In the content pane, click **Change BMC/IPMI network settings**.

   c) Verify that the MAC address and the IP address settings are correct.

   Does the BMC access problem persist?

If	Then
Yes:	Continue with the next step.
No:	**This ends the procedure.**

5. Power off the system and disconnect all AC power cords for 30 seconds. Then, reconnect the AC power cords and power on the system. Does the BMC access problem persist?

If	Then
Yes:	Continue with the next step.
No:	**This ends the procedure.**

6. Verify that the BMC network settings are correct.

   Note: To verify the BMC network settings, you must have a cabled serial connection or a monitor and keyboard.

   a) Power on the system by using the power button on the front of the system. Wait 1 - 2 minutes for the system to display the Petitboot menu.

   b) When the Petitboot menu is displayed, press any key to interrupt the boot process. Then, select Exit to Shell.

   c) For a shared BMC Ethernet port, type the following command and press Enter:

```
ipmitool lan print 1
```

   For a dedicated BMC Ethernet port, type the following command and press Enter:

```
ipmitool lan print 2
```

   To determine the location of the shared and dedicated BMC Ethernet ports, see Table 1 on page 3.

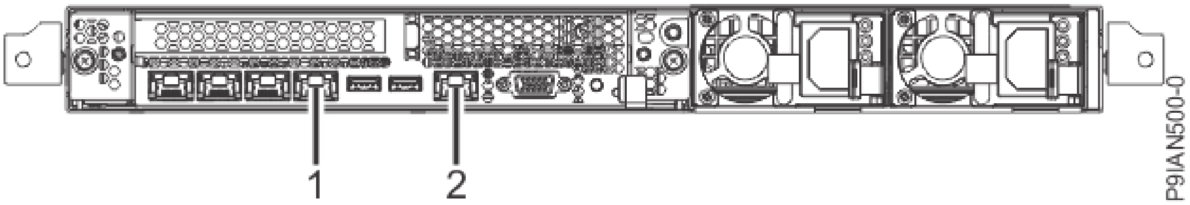


Figure 1. Rear BMC Ethernet ports

Table 1. BMC Ethernet ports

Identifier	Description
1	Shared BMC Ethernet
2	Dedicated BMC Ethernet

   d) Verify that the MAC address and the IP address settings are correct. Then, continue with the next step.

Note: If the IP address setting is incorrect, go to Configuring the BMC IP address. If the MAC address is 00:00:00:00:00:00, go to “Contacting IBM service and support” on page 12.

7. Complete the following actions:

   a. Power on to the Petitboot menu.

   b. Update the system firmware. For instructions, see Getting fixes.

   Are you able to access the BMC?

If	Then
Yes:	**This ends the procedure.**
No:	Continue with the next step.

8. Replace the system backplane. Go to “7063-CR2 locations” on page 15 to identify the physical location and the removal and replacement procedure. **This ends the procedure.**

Resolving a power problem

Learn how to identify the service action that is needed to resolve a power problem.

Procedure

1. Is the amber LED (bottom LED) of a power supply on solid and is the amber LED on the front of the system turned off?

If	Then
Yes:	Ensure that the power cords for both power supplies are fully seated and that the power distribution units (PDUs) and power outlets are supplying electricity. **This ends the procedure.**
No:	Continue with the next step.

2. Are the power supply LEDs turned off?

If	Then
Yes:	Continue with the next step.
No:	Continue with step “4” on page 4.

3. Perform the following actions, one at a time until the problem is resolved:

   a. Ensure that all of the power cords are fully seated in the power supplies.

   b. Ensure that all of the power cords are fully seated in the power distribution units (PDUs) or wall outlets.

   c. If the power cords are plugged into PDUs, ensure that the PDUs are turned on.

   d. Ensure that all of the power cords are plugged into PDUs or wall outlets that are supplying electricity.

   e. Replace the power cords.

   f. Replace the power supplies. Go to “7063-CR2 locations” on page 15 to identify the physical location and the removal and replacement procedure. **This ends the procedure**.

4. Is the amber LED of a power supply on solid and is the amber system attention LED on the front of the system on solid?

If	Then
Yes:	Continue with the next step.
No:	Go to “Contacting IBM service and support” on page 12. **This ends the procedure.**

5. Perform the following actions, one at a time until the problem is resolved:

a. Resolve any serviceable alerts that are in the event log. Go to “Resolving a hardware problem” on page 7.

b. Ensure that the power supply is fully seated in the system.

c. Ensure that the power supply fan is not blocked.

d. Replace the power supply. Go to “7063-CR2 locations” on page 15 to identify the physical location and the removal and replacement procedure. **This ends the procedure**.

Resolving a system firmware boot failure

Learn how to identify the service action that is needed to resolve a failure while booting your system firmware.

Procedure

1. After you press the power button, did the system turn on but fail to display the Petitboot menu?

If	**Then**
Yes:	Continue with the next step.
No:	Continue with step “6” on page 5.

2. Does the baseboard management controller (BMC) respond to commands?

   Note: To determine whether the BMC responds to commands, run the following OpenBMC tool command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> chassis power status
```

If	**Then**
Yes:	Continue with the next step.
No:	Continue with step “4” on page 5.

3. Complete the following actions:

   a. Update the system firmware. For instructions, see Getting fixes.

   b. Check the system event logs. For instructions, see “Identifying a service action by using system event logs” on page 10. Then, continue with step “6” on page 5.

4. Disconnect the power cords from the system for 30 seconds. Reconnect the power cords, wait 5 minutes, and then continue with the next step.

5. Does the baseboard management controller (BMC) respond to commands?

   Note: To determine whether the BMC responds to commands, run the following OpenBMC tool command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> chassis power status
```

If	**Then**
Yes:	Update the system firmware. For instructions, see Getting fixes. **This ends the procedure.**
No:	Replace the system backplane. Go to “7063-CR2 locations” on page 15 to identify the physical location and the removal and replacement procedure. **This ends the procedure.**

6. Power off the system and disconnect all AC power cords for 30 seconds. Then, reconnect the AC power cords and power on the system. Does the system boot successfully?

If	Then
Yes:	**This ends the procedure.**
No:	Go to "Resolving a hardware problem" on page 7. **This ends the procedure.**

Resolving a VGA monitor problem

Learn how to identify the service action that is needed to resolve a video graphics array (VGA) monitor problem.

Procedure

1. Is the system powered on and is the VGA monitor connected to the VGA display port, but no video is displayed?

If	Then
Yes:	Continue with the next step.
No:	Power on the system. **This ends the procedure.**

2. Complete the following steps, one at a time until the problem is resolved:
   a) Ensure that the network image that is specified is a valid boot image.
   b) Ensure that the VGA cable is properly seated to the server port and to the monitor port.
   c) Verify that your monitor and your VGA cable are working properly by testing them on a system that is known to be working properly. If the monitor or the VGA cable does not work properly, replace it.
   d) Verify that the system is powered on by activating a serial over LAN (SOL) session through the baseboard management controller (BMC). If the system is not active, go to "Resolving a system firmware boot failure" on page 5.
   e) Replace the system backplane. Go to "7063-CR2 locations" on page 15 to identify the physical location and the removal and replacement procedure. **This ends the procedure**.

Resolving an operating system boot failure

Learn how to identify the service action that is needed to resolve a failure while booting your operating system.

Procedure

1. Was the system recently installed, serviced, moved, or upgraded?

If	Then
Yes:	Ensure that all cables are properly seated in the connection path to the designated boot device. **This ends the procedure.**
No:	Continue with the next step.

2. Petitboot displays all recognized bootable images to use by default. Is the boot image recognized by Petitboot?

If	Then
Yes:	Continue with the next step.
No:	Select the Petitboot menu option to refresh the boot images. If the problem persists, go to "Resolving a storage device problem" on page 10. **This ends the procedure.**

3. Does an operating system error occur during the boot?

If	Then
Yes:	Recover the operating system with the tools provided for the operating system. If that does not resolve the problem, reinstall the operating system. **This ends the procedure.**
No:	Reinstall the operating system. **This ends the procedure.**

Resolving a hardware problem

Learn how to identify the service action that is needed to resolve a hardware problem.

Procedure

1. If you have not already done so, manually boot the system.
2. Go to "Identifying a service action by using system event logs" on page 10. Then, continue with the next step.
3. Was a service action identified?

If	Then
Yes:	Continue with the next step.
No:	Go to step "5" on page 7.

4. Did the service action fix the problem?

If	Then
Yes:	**This ends the procedure.**
No:	Go to step "5" on page 7.

5. Go to "Resolving a PCIe adapter or device problem" on page 7. Then, continue with the next step.
6. Was a service action identified?

If	Then
Yes:	Continue with the next step.
No:	Go to "Collecting diagnostic data" on page 11. Then, go to "Contacting IBM service and support" on page 12. **This ends the procedure.**

7. Did the service action fix the problem?

If	Then
Yes:	**This ends the procedure.**
No:	Go to "Collecting diagnostic data" on page 11. Then, go to "Contacting IBM service and support" on page 12. **This ends the procedure.**

Resolving a PCIe adapter or device problem

Learn how to access log files, information to identify types of events, and a list of potential problems and service actions.

Procedure

1. To identify the correct service procedure to perform by using operating system log information, complete the following steps:

   a) Log in as the **hscroot** user.

   b) To display the operating system logs, type `less /var/log/messages` and press **Enter**.

2. Scan the operating system logs that occurred around the time that the problem started for the first occurrence of keywords, such as fail, failure, or failed. When you find a keyword that accompanies one or more of the resource names in the following table, a service action is required. Use the following table to determine the service procedure to perform for your type of problem.

Table 2. Resource names, examples, and service procedures for different types of operating system logs.

Resource name	Example of a log requiring a service action	Type of problem	Service procedure
eth1, eth2, eth3, enP*xxxxx*, where *xxxxx* indicates the network port.	`Failed to re-initialize device`	Network	Go to "Resolving a network adapter problem" on page 9.

tg3	`PCI I/O error detected.`
	`Link is Down`
		Network	Go to "Resolving a network adapter problem" on page 9.

sda, sdb, sdc	`FAILED Result`	Storage	Go to "Resolving a storage device problem" on page 10.
EEH	`Detected error on PHB#`*xxx*, where *xxx* is the PHB number.	PCIe bus or adapter	Resolve any device driver errors that are related to I/O and that occurred near the time of this operating system log entry.
	xxx `has failed 6 times in the last hour and has been permanently disabled`, where *xxx* is the PCI bus number.	PCIe bus or adapter	Ensure that the correct device drivers are properly installed for the device. If the problem persists, replace the adapter in the PCIe slot that is specified in the operating system log entry.

Resolving a network adapter problem

Learn about the possible problems and service actions that you can perform to resolve a network adapter problem.

About this task

Table 3. Network adapter problems and service actions

Problem	Service action
System unable to find adapter	1. Verify that the most recent firmware is installed on the system. Otherwise, install the most recent firmware if it is not already installed. 2. Restart the system. 3. Replace the adapter. 4. Replace the system backplane. 5. Replace the central processing unit (CPU).
Adapter stops working suddenly	1. If the system was recently installed, moved, serviced, or upgraded, verify that the adapter is seated properly and all associated cables are correctly connected. 2. Inspect the PCIe socket and verify that there is no dirt or debris in the socket. 3. Inspect the card and verify that it is not physically damaged. 4. Verify that all cables are properly seated and are not physically damaged. 5. Replace the adapter. 6. Replace the system backplane. 7. Replace the CPU.
Link indicator light on the adapter is off	1. Verify that the cable functions properly by testing it with a known working connection. 2. Verify that the port or ports on the switch are enabled and functional. 3. Verify that the switch and adapter are compatible. 4. Replace the adapter.
Link light on the adapter is on, but there is no communication from the adapter	1. Verify that the most recent driver is installed, or install the most recent driver if it is not already installed. 2. Verify that the adapter and its link have compatible settings, such as speed and duplex configuration.

Resolving a storage device problem

Learn about the possible problems and service actions that you can perform to resolve a storage device problem.

About this task

Note: To determine the location of the storage device, see Removing and replacing a drive in the 7063-CR2.

Table 4. Storage device problems and service actions

Problem	**Service action**
System unable to find a storage device that is at the front of the system	1. If the system was recently installed, moved, serviced, or upgraded, verify that the device is seated and installed properly. 2. Verify that the device is compatible with your system. 3. Verify that all internal cables are properly seated and are not physically damaged. 4. Verify that the most recent firmware is installed on the system. Otherwise, install the most recent firmware if it is not already installed. 5. Replace the drive. 6. Replace the cable. 7. Replace the drive holder.
Drive stops working suddenly	1. Verify that all internal cables are properly seated and are not physically damaged. 2. Check the system logs to verify whether the system detected a problem. 3. Replace the drive. 4. Replace the cable.
Other problems	Check the messages and resolve any other problems that were detected. Then, test the drive again. If the drive continues not to function, refer to the documentation for the drive.

Identifying a service action by using system event logs

Use the OpenBMC tool to examine system event logs (SELs) to identify a service action.

Procedure

1. From a system that has the OpenBMC tool installed, type the following command and press Enter:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> sel print
```

2. Is there an **Active Alerts** section displayed in the output of the command?

If	**Then**
Yes:	Continue with the next step.
No	No service action is required. **This ends the procedure.**

If	Then
	Note: Alerts that are displayed in the **Historical Alerts** section do not require service.

3. Is there an entry in the **Active Alerts** section with a value of **Yes** in the **Serviceable** column?

If	Then
Yes:	Continue with the next step.
No	No service action is required. **This ends the procedure.** **Note:** Alerts with a value of **No** that are displayed in the **Serviceable** column do not require service.

4. Starting with the first entry in the **Active Alerts** section with a value of **Yes** in the **Serviceable** column, complete the following steps until all entries are resolved:
   a. Record the log number that is displayed in the **Entry** column.
   b. Record the FQPSP*xxxxxxx* value that is displayed in the **ID** column. Then, go to FQPSP*xxxxxxx* Event Codes and complete the service action that is indicated for the FQPSP*xxxxxxx* event code.
   c. After the service action is complete and the problem is resolved, type the following command and press Enter:

   `openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> sel resolve -n x`, where *x* is the log number that you recorded in step "4.a" on page 11.

This ends the procedure.

Verifying a repair

Learn how to verify hardware operation after you make repairs to the system.

Procedure

1. Power on the system.
2. Scan the system event logs (SELs) for serviceable events that occurred after system hardware was replaced. For information about SELs that require a service action, see "Identifying a service action by using system event logs" on page 10.
3. Did any serviceable SEL events occur after hardware was replaced?

If	Then
Yes:	The problem is not resolved. Go to "Identifying a service action by using system event logs" on page 10 and complete the service actions indicated. **This ends the procedure.**
No:	The problem is resolved. **This ends the procedure.**

Collecting diagnostic data

Learn how to collect diagnostic data to send to IBM service and support.

About this task

To collect diagnostic data, complete the following steps:

Procedure

1. Are you able to log on to the Hardware Management Console (HMC)?

If	Then
Yes:	Continue with the next step.
No:	Go to step "3" on page 12.

2. Collect diagnostic data from the 7063-CR2 by using the **PEDBG** command on the HMC. To collect diagnostic data, go to HMC Enhanced View: Collecting PEDBG from the HMC (http://www.ibm.com/support/pages/hmc-enhanced-view-collecting-pedbg-hmc) and complete the steps that are indicated. Send the data that you collected during this procedure to IBM service and support. **This ends the procedure.**
3. Can you boot the system to the Petitboot menu or is another system available that has the Linux® operating system?

If	Then
Yes:	Continue with the next step.
No:	Go to "Contacting IBM service and support" on page 12.

4. To collect system event logs, complete the following steps:
   a) Go to the IBM Support Portal (http://www.ibm.com/mysupport/s/).
   b) In the search field, type `Scale-out LC System Event Log Collection Tool`.
   c) Click the **Scale-out LC System Event Log Collection Tool** entry and follow the instructions to install and run the system event log collection tool. Then, continue with the next step.
5. Send the data that you collected during this procedure to IBM service and support. **This ends the procedure.**

Contacting IBM service and support

You can contact IBM service and support by telephone or through the IBM Support Portal.

Before you contact IBM service and support, go to "Beginning troubleshooting and problem analysis" on page 1 and complete all of the service actions indicated. If the service actions do not resolve the problem, or if you are directed to contact support, go to "Collecting diagnostic data" on page 11. Then, use the information below to contact IBM service and support.

Customers in the United States, United States territories, or Canada can place a hardware service request online. To place a hardware service request online, go to the IBM Support Portal (http://www.ibm.com/support/entry/portal/product/power/scale-out_lc).

For up-to-date telephone contact information, go to the Directory of worldwide contacts website (www.ibm.com/planetwide/).

Table 5. Service and support contacts

Type of problem	Call
• Advice • Migrating • "How to" • Operating • Configuring • Ordering • Performance • General information	• 1-800-IBM-CALL (1–800–426–2255) • 1-800-IBM-4YOU (1–800–426–4968)

Table 5. Service and support contacts (continued)

Type of problem	Call
Software: • Fix information • Operating system problem • IBM application program • Loop, hang, or message Hardware: • IBM system hardware broken • Hardware reference code • IBM input/output (I/O) problem • Upgrade	1-800-IBM-SERV (1–800–426–7378)

Finding parts and locations

Locate physical part locations and identify parts with system diagrams.

Locate the FRU

Use the graphics and tables to locate the field-replaceable unit (FRU) and identify the FRU part number.

7063-CR2 locations

Use this information to find the location of a field-replaceable unit (FRU) in the system unit.

Rack views

The following diagrams show FRU layouts in the system. Use these diagrams with the following tables.

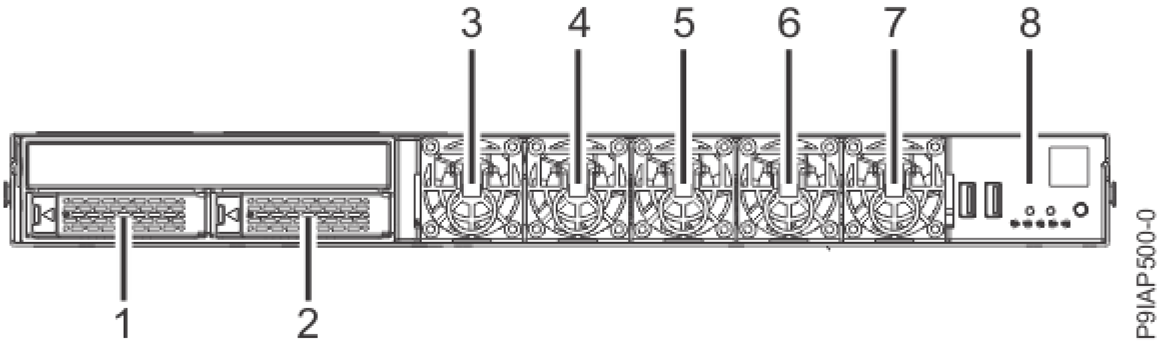

Figure 2. Front view

Table 6. Front view locations

Index number	FRU description	FRU removal and replacement procedures
1	Drive 0	See Removing and replacing a drive in the 7063-CR2.
2	Drive 1	
3	Fan 0	See Removing and replacing fans in the 7063-CR2.
4	Fan 1	
5	Fan 2	
6	Fan 3	
7	Fan 4	
8	Control panel	See Removing and replacing the control panel in the 7063-CR2.

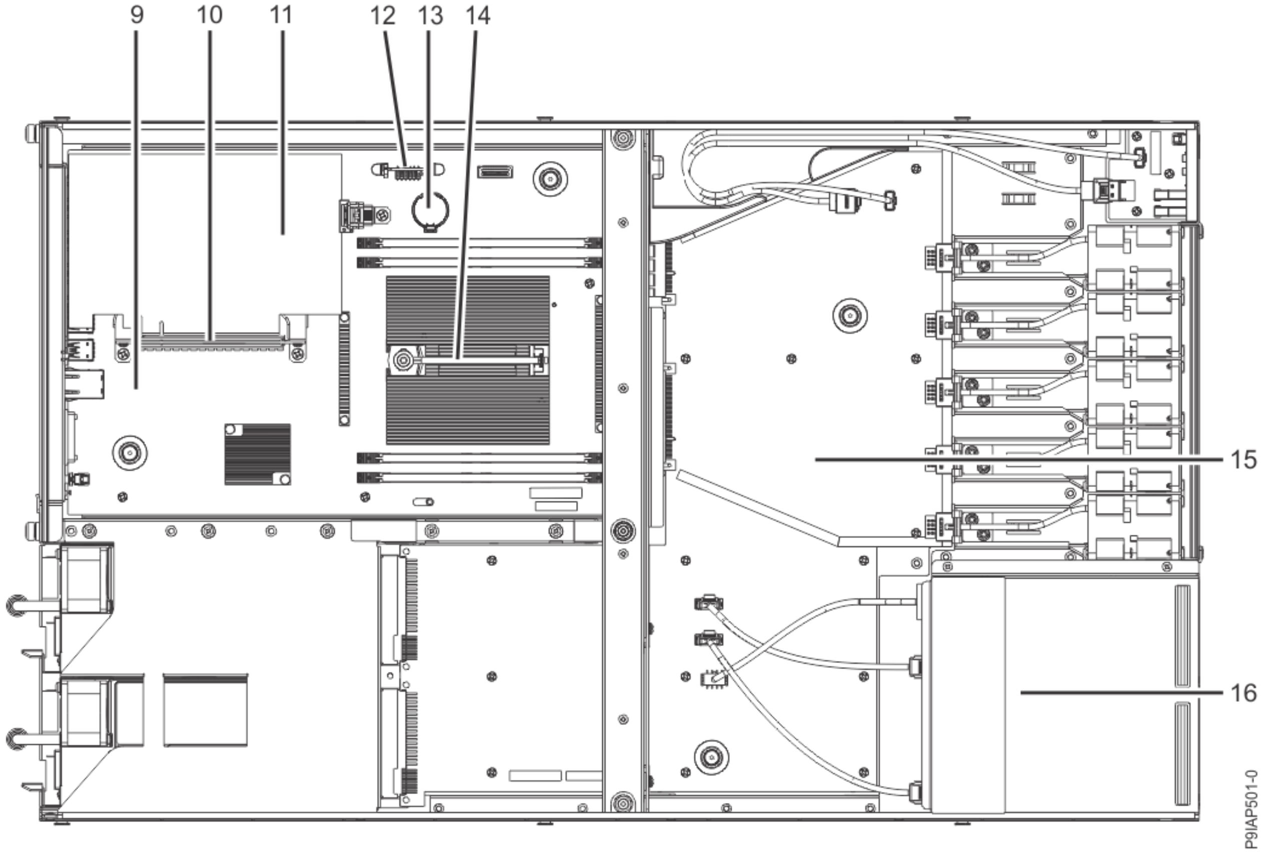

Figure 3. Top view

Table 7. Top view locations

Index number	FRU description	FRU removal and replacement procedures
9	System backplane	See Removing and replacing the system backplane in the 7063-CR2.
10	Riser	See Removing and replacing the PCIe riser in the 7063-CR2.
11	PCIe adapter	See Removing and replacing PCIe adapters in the 7063-CR2.
12	Trusted platform module	See Removing and replacing the trusted platform module in the 7063-CR2.
13	Time-of-day battery	See Removing and replacing the time-of-day battery in the 7063-CR2.
14	CPU 0	See Removing and replacing the system processor module in the 7063-CR2.
15	Power distribution board	See Removing and replacing the power distribution board in the 7063-CR2.

Table 7. Top view locations (continued)		
Index number	**FRU description**	**FRU removal and replacement procedures**
16	Drive holder	See Removing and replacing the drive holder in the 7063-CR2.

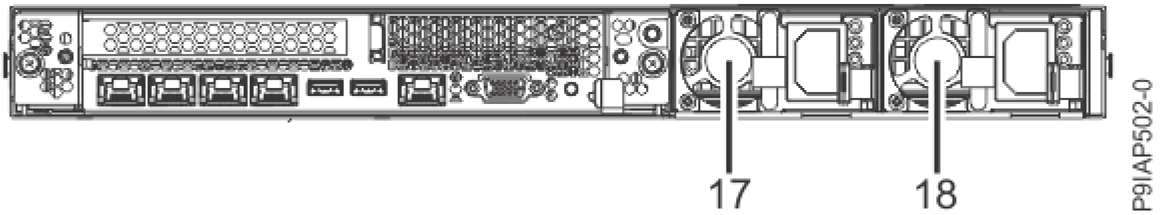

Figure 4. Rear view

Table 8. Rear view locations		
Index number	**FRU description**	**FRU removal and replacement procedures**
17	Power supply unit 1 (PSU 1)*	See Removing and replacing a power supply in the 7063-CR2.
18	Power supply unit 0 (PSU 0)*	

* The E*x* labels on the chassis do not match the power supply unit number.

Memory locations

The following diagram shows memory DIMMs and their corresponding field-replaceable unit (FRU) layouts in the system. Use this diagram with the following table.

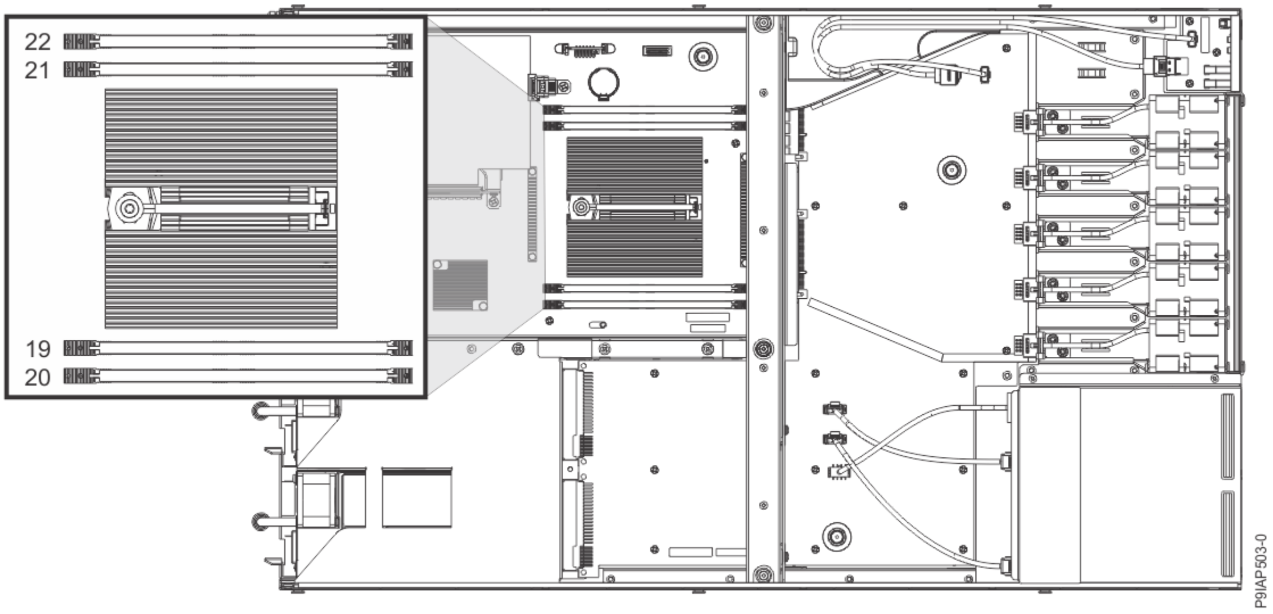

Figure 5. Memory locations

Table 9. Memory locations

Index number	FRU description	FRU removal and replacement procedures
19	DIMM 0	See Removing and replacing memory in the 7063-CR2.
20	DIMM 1	
21	DIMM 2	
22	DIMM 3	

7063-CR2 parts

Use this information to find the field-replaceable unit (FRU) part number.

After you identify the part number of the part that you want to order, go to Advanced Part Exchange Warranty Service. Registration is required. If you are not able to identify the part number, go to Contacting IBM service and support.

Rack final assembly

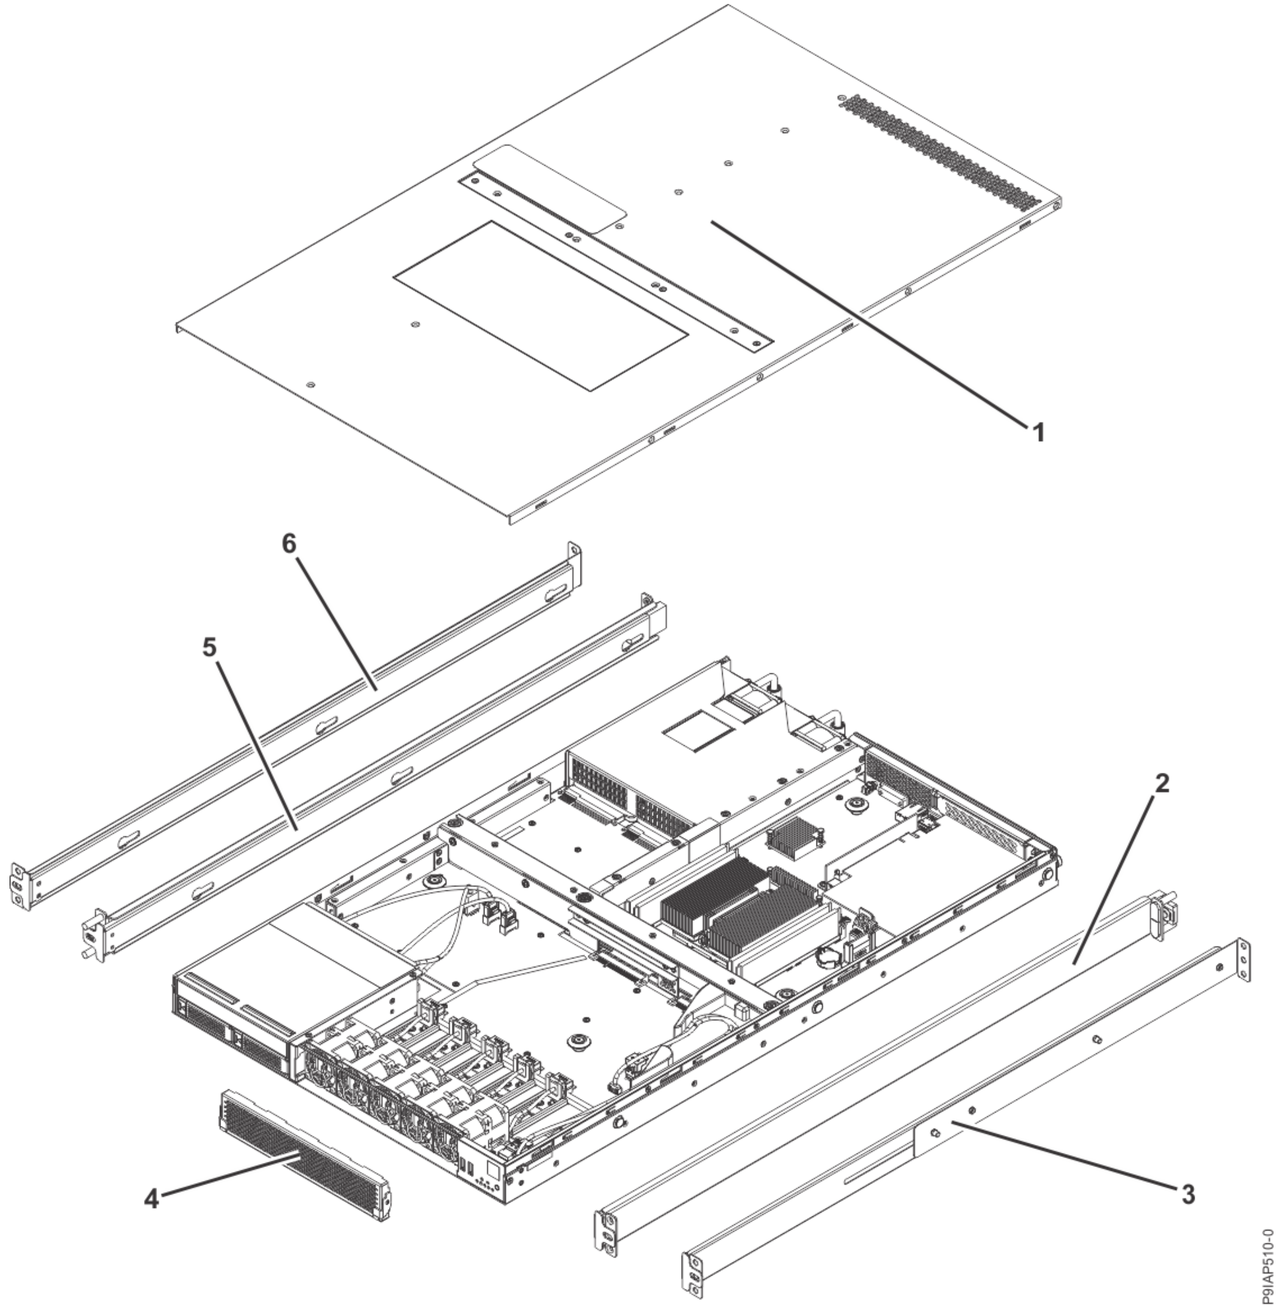

Figure 6. Rack final assembly

Table 10. Rack final assembly part numbers

Index number	Part number	Units per assembly	Description
1		1	Top cover assembly
2	03GM910	1	Fixed rail kit - contains left rail, right rail, attaching screws, and shipping brackets
3	03GM955	1	Fixed rail kit (adjustable in length) - contains left rail, right rail, and attaching screws
4	03GM764	1	Front bezel

Table 10. Rack final assembly part numbers (continued)			
Index number	**Part number**	**Units per assembly**	**Description**
5	03GM910	1	Fixed rail kit - contains left rail, right rail, attaching screws, and shipping brackets
6	03GM955	1	Fixed rail kit (adjustable in length) - contains left rail, right rail, and attaching screws

System parts

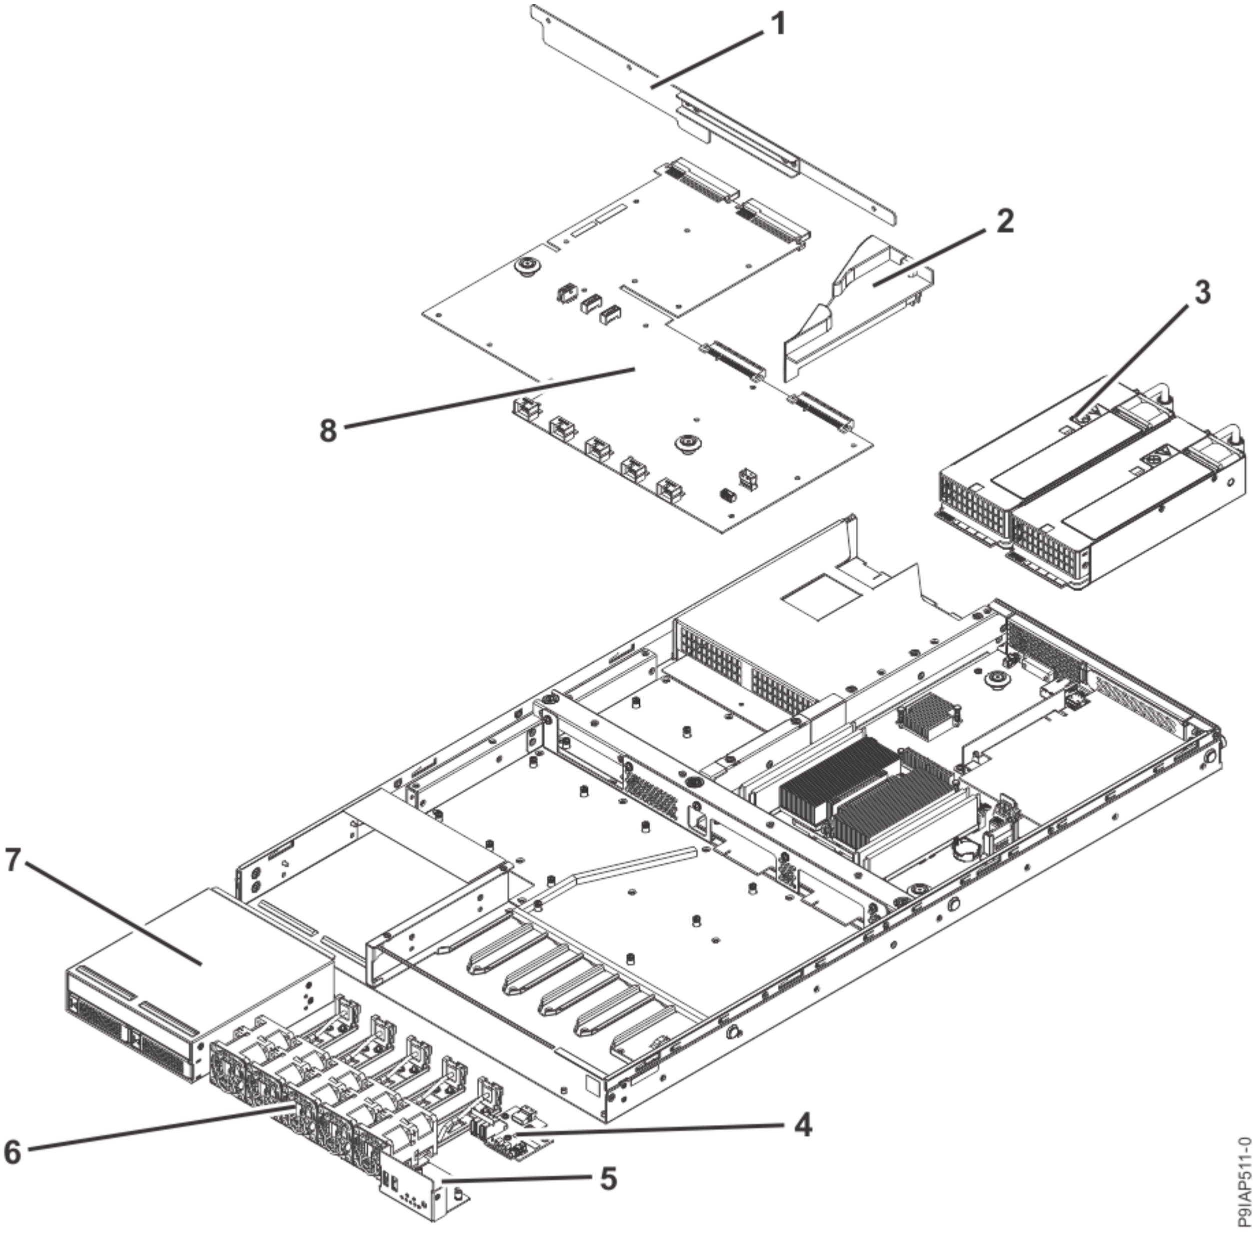

Figure 7. System parts

Table 11. System parts

Index numbe r	Part number	Units per assembly	Description
1	03GM757	1	Air baffle (left)
2	03GM759	1	Air baffle (right)
3	03FP372	2	Power supply
4	02WF445	1	Control panel card
5		1	Control panel cover
6	03GM774	5	Fan
7	03GM776	1	Drive holder
	03GM792	2	1.8 TB 2.5 inch SAS disk drive (includes drive and carrier)
	03GM803	2	Drive carrier
8	02WF441	1	Power distribution board

Additional system parts

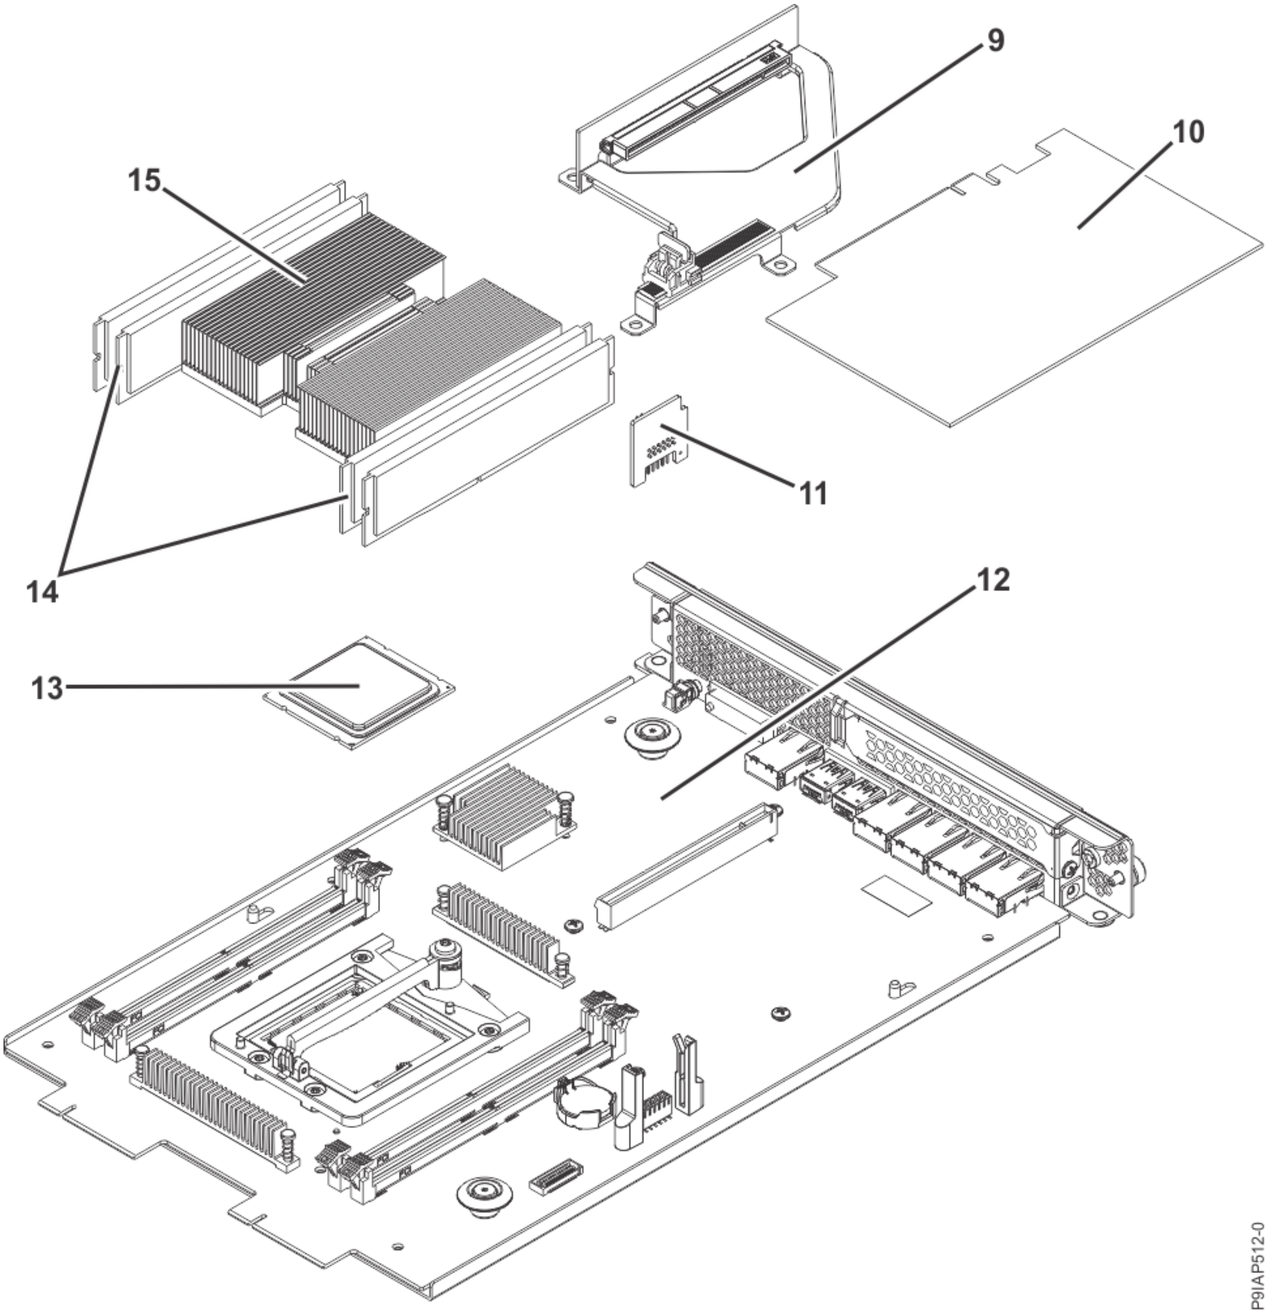

Figure 8. Additional system parts

Table 12. Additional system parts

Index numbe r	Part number	Units per assembly	Description
9	02WF443	1	PCIe riser
10	02JD569	1	PCIe2 2-port 10 GbE BaseT RJ45 adapter
11	00VK865	1	Trusted platform module

Table 12. Additional system parts (continued)			
Index number	**Part number**	**Units per assembly**	**Description**
12	02WF439	1	System backplane kit (includes time-of-day battery, PCIe riser, PCIe tailstock filler, system processor module removal tool, and thermal interface material)
13	03GM808	1	6 core 3.0 GHz system processor module kit (includes system processor module, thermal interface material, tweezers, and system processor module removal tool)
14	78P6722	4	16 GB 2RX4 DDR4 IS RDIMM (Micron Technology, Inc.)
	78P4197	4	16 GB 2RX4 DDR4 IS RDIMM (Samsung Electronics Co., Ltd. or SK hynix, Inc.)
	78P4198	4	32 GB 2RX4 DDR4 IS RDIMM (Micron Technology, Inc., Samsung Electronics Co., Ltd., or SK hynix, Inc.)
15	03GM989	1	Heat sink kit (includes heat sink and thermal interface material)

Table 13. Miscellaneous parts	
Description	**Part number**
USB cable	03GM778
Control panel cable	03GM780
Drive signal cable	03GM782
Drive power cable	03GM784
CR2032 Lithium time-of-day battery	00RY543
Chassis crossbar	03GM755

IBM may use or distribute any of the information you provide in any way it believes appropriate without incurring any obligation to you.

The performance data and client examples cited are presented for illustrative purposes only. Actual performance results may vary depending on specific configurations and operating conditions.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

All IBM prices shown are IBM's suggested retail prices, are current and are subject to change without notice. Dealer prices may vary.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to actual people or business enterprises is entirely coincidental.

If you are viewing this information in softcopy, the photographs and color illustrations may not appear.

The drawings and specifications contained herein shall not be reproduced in whole or in part without the written permission of IBM.

IBM has prepared this information for use with the specific machines indicated. IBM makes no representations that it is suitable for any other purpose.

IBM's computer systems contain mechanisms designed to reduce the possibility of undetected data corruption or loss. This risk, however, cannot be eliminated. Users who experience unplanned outages, system failures, power fluctuations or outages, or component failures must verify the accuracy of operations performed and data saved or transmitted by the system at or near the time of the outage or failure. In addition, users must establish procedures to ensure that there is independent data verification before relying on such data in sensitive or critical operations. Users should periodically check IBM's support websites for updated information and fixes applicable to the system and related software.

Homologation statement

This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Contact an IBM representative or reseller for any questions.

Accessibility features for IBM Power Systems servers

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Power Systems servers include the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Power Systems servers use the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with US Section 508 (www.access-board.gov/guidelines-and-standards/communications-and-it/about-the-section-508-standards/section-508-standards) and Web Content Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the IBM Power Systems servers.

The IBM Power Systems servers online product documentation in IBM Knowledge Center is enabled for accessibility. The accessibility features of IBM Knowledge Center are described in the Accessibility section of the IBM Knowledge Center help (www.ibm.com/support/knowledgecenter/doc/kc_help.html#accessibility).

Keyboard navigation

This product uses standard navigation keys.

Interface information

The IBM Power Systems servers user interfaces do not have content that flashes 2 - 55 times per second.

The IBM Power Systems servers web user interface relies on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

The IBM Power Systems servers web user interface includes WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Power Systems servers include certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as the customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at http://www.ibm.com/privacy and IBM's Online Privacy Statement at http://www.ibm.com/privacy/details/us/en/ in the section entitled "Cookies, Web Beacons and Other Technologies".

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information.

The registered trademark Linux is used pursuant to a sublicense from the Linux Foundation, the exclusive licensee of Linus Torvalds, owner of the mark on a worldwide basis.

Electronic emission notices

Class A Notices

The following Class A statements apply to the IBM servers that contain the POWER9 processor and its features unless designated as electromagnetic compatibility (EMC) Class B in the feature information.

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

Canada Notice

CAN ICES-3 (A)/NMB-3(A)

European Community and Morocco Notice

This product is in conformity with the protection requirements of Directive 2014/30/EU of the European Parliament and of the Council on the harmonization of the laws of the Member States relating to electromagnetic compatibility. IBM cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-IBM option cards.

This product may cause interference if used in residential areas. Such use must be avoided unless the user takes special measures to reduce electromagnetic emissions to prevent interference to the reception of radio and television broadcasts.

Warning: This equipment is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

Germany Notice

Deutschsprachiger EU Hinweis: Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit

Dieses Produkt entspricht den Schutzanforderungen der EU-Richtlinie 2014/30/EU zur Angleichung der Rechtsvorschriften über die elektromagnetische Verträglichkeit in den EU-Mitgliedsstaatenund hält die Grenzwerte der EN 55022 / EN 55032 Klasse A ein.

Um dieses sicherzustellen, sind die Geräte wie in den Handbüchern beschrieben zu installieren und zu betreiben. Des Weiteren dürfen auch nur von der IBM empfohlene Kabel angeschlossen werden. IBM übernimmt keine Verantwortung für die Einhaltung der Schutzanforderungen, wenn das Produkt ohne Zustimmung von IBM verändert bzw. wenn Erweiterungskomponenten von Fremdherstellern ohne Empfehlung von IBM gesteckt/eingebaut werden.

EN 55032 Klasse A Geräte müssen mit folgendem Warnhinweis versehen werden:

"Warnung: Dieses ist eine Einrichtung der Klasse A. Diese Einrichtung kann im Wohnbereich Funk-Störungen verursachen; in diesem Fall kann vom Betreiber verlangt werden, angemessene Maßnahmen zu ergreifen und dafür aufzukommen."

Deutschland: Einhaltung des Gesetzes über die elektromagnetische Verträglichkeit von Geräten

Dieses Produkt entspricht dem “Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG)“. Dies ist die Umsetzung der EU-Richtlinie 2014/30/EU in der Bundesrepublik Deutschland.

Zulassungsbescheinigung laut dem Deutschen Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) (bzw. der EMC Richtlinie 2014/30/EU) für Geräte der Klasse A

Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen.

Verantwortlich für die Einhaltung der EMV Vorschriften ist der Hersteller:
International Business Machines Corp.

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Responsible Party:
International Business Machines Corporation
New Orchard Road
Armonk, NY 10504

電話：0800-016-888

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult an IBM-authorized dealer or service representative for help.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions:

(1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Terms and conditions

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Personal Use: You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative works of these publications, or any portion thereof, without the express consent of IBM.

Commercial Use: You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights: Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

Power Systems

Beginning troubleshooting and problem analysis

Note

Before using this information and the product it supports, read the information in "Safety notices" on page v, "Notices" on page 73, the *IBM Systems Safety Notices* manual, G229-9054, and the *IBM Environmental Notices and User Guide*, Z125–5823.

This edition applies to IBM® Power® servers that contain the Power10 processor and to all associated models.

Contents

Safety notices

Safety notices may be printed throughout this guide:

- **DANGER** notices call attention to a situation that is potentially lethal or extremely hazardous to people.
- **CAUTION** notices call attention to a situation that is potentially hazardous to people because of some existing condition.
- **Attention** notices call attention to the possibility of damage to a program, device, system, or data.

World Trade safety information

Several countries require the safety information contained in product publications to be presented in their national languages. If this requirement applies to your country, safety information documentation is included in the publications package (such as in printed documentation, on DVD, or as part of the product) shipped with the product. The documentation contains the safety information in your national language with references to the U.S. English source. Before using a U.S. English publication to install, operate, or service this product, you must first become familiar with the related safety information documentation. You should also refer to the safety information documentation any time you do not clearly understand any safety information in the U.S. English publications.

Replacement or additional copies of safety information documentation can be obtained by calling the IBM Hotline at 1-800-300-8751.

German safety information

Das Produkt ist nicht für den Einsatz an Bildschirmarbeitsplätzen im Sinne § 2 der Bildschirmarbeitsverordnung geeignet.

Laser safety information

IBM servers can use I/O cards or features that are fiber-optic based and that utilize lasers or LEDs.

Laser compliance

IBM servers may be installed inside or outside of an IT equipment rack.

⚠ **DANGER:** When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard: If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product. Do not open or service any power supply assembly. Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.

- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords. For AC power, disconnect all power cords from their AC power source. For racks with a DC power distribution panel (PDP), disconnect the customer's DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected. For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate. For racks with a DC power distribution panel (PDP), connect the customer's DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.
- Connect any equipment that will be attached to this product to properly wired outlets.

- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- When performing a machine inspection: Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements. Do not attempt to switch power to the machine until all possible unsafe conditions are corrected. Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.
- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

  To Disconnect: 1) Turn off everything (unless instructed otherwise). 2) For AC power, remove the power cords from the outlets. 3) For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source. 4) Remove the signal cables from the connectors. 5) Remove all cables from the devices.

  To Connect: 1) Turn off everything (unless instructed otherwise). 2) Attach all cables to the devices. 3) Attach the signal cables to the connectors. 4) For AC power, attach the power cords to the outlets. 5) For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP. 6) Turn on the devices.
-  Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

(R001 part 1 of 2):

DANGER: Observe the following precautions when working on or around your IT rack system:

- Heavy equipment–personal injury or equipment damage might result if mishandled.
- Always lower the leveling pads on the rack cabinet.
- Always install stabilizer brackets on the rack cabinet if provided, unless the earthquake option is to be installed.
- To avoid hazardous conditions due to uneven mechanical loading, always install the heaviest devices in the bottom of the rack cabinet. Always install servers and optional devices starting from the bottom of the rack cabinet.
- Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack mounted devices and do not use them to stabilize your body position (for example, when working from a ladder).

- Stability hazard:
  - The rack may tip over causing serious personal injury.
  - Before extending the rack to the installation position, read the installation instructions.
  - Do not put any load on the slide-rail mounted equipment mounted in the installation position.
  - Do not leave the slide-rail mounted equipment in the installation position.
- Each rack cabinet might have more than one power cord.
  - For AC powered racks, be sure to disconnect all power cords in the rack cabinet when directed to disconnect power during servicing.

  - For racks with a DC power distribution panel (PDP), turn off the circuit breaker that controls the power to the system unit(s), or disconnect the customer's DC power source, when directed to disconnect power during servicing.
- Connect all devices installed in a rack cabinet to power devices installed in the same rack cabinet. Do not plug a power cord from a device installed in one rack cabinet into a power device installed in a different rack cabinet.
- An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (R001 part 1 of 2)

(R001 part 2 of 2):

⚠ **CAUTION:**

- Do not install a unit in a rack where the internal rack ambient temperatures will exceed the manufacturer's recommended ambient temperature for all your rack-mounted devices.
- Do not install a unit in a rack where the air flow is compromised. Ensure that air flow is not blocked or reduced on any side, front, or back of a unit used for air flow through the unit.
- Consideration should be given to the connection of the equipment to the supply circuit so that overloading of the circuits does not compromise the supply wiring or overcurrent protection. To provide the correct power connection to a rack, refer to the rating labels located on the equipment in the rack to determine the total power requirement of the supply circuit.
- *(For sliding drawers.)* Do not pull out or install any drawer or feature if the rack stabilizer brackets are not attached to the rack or if the rack is not bolted to the floor. Do not pull out more than one drawer at a time. The rack might become unstable if you pull out more than one drawer at a time.

- *(For fixed drawers.)* This drawer is a fixed drawer and must not be moved for servicing unless specified by the manufacturer. Attempting to move the drawer partially or completely out of the rack might cause the rack to become unstable or cause the drawer to fall out of the rack. (R001 part 2 of 2)

⚠ **CAUTION:** Removing components from the upper positions in the rack cabinet improves rack stability during relocation. Follow these general guidelines whenever you relocate a populated rack cabinet within a room or building.

- Reduce the weight of the rack cabinet by removing equipment starting at the top of the rack cabinet. When possible, restore the rack cabinet to the configuration of the rack cabinet as you received it. If this configuration is not known, you must observe the following precautions:
  - Remove all devices in the 32U position (compliance ID RACK-001 or 22U (compliance ID RR001) and above.
  - Ensure that the heaviest devices are installed in the bottom of the rack cabinet.

  - Ensure that there are little-to-no empty U-levels between devices installed in the rack cabinet below the 32U (compliance ID RACK-001 or 22U (compliance ID RR001) level, unless the received configuration specifically allowed it.
- If the rack cabinet you are relocating is part of a suite of rack cabinets, detach the rack cabinet from the suite.
- If the rack cabinet you are relocating was supplied with removable outriggers they must be reinstalled before the cabinet is relocated.
- Inspect the route that you plan to take to eliminate potential hazards.
- Verify that the route that you choose can support the weight of the loaded rack cabinet. Refer to the documentation that comes with your rack cabinet for the weight of a loaded rack cabinet.
- Verify that all door openings are at least 760 x 2083 mm (30 x 82 in.).
- Ensure that all devices, shelves, drawers, doors, and cables are secure.
- Ensure that the four leveling pads are raised to their highest position.
- Ensure that there is no stabilizer bracket installed on the rack cabinet during movement.
- Do not use a ramp inclined at more than 10 degrees.
- When the rack cabinet is in the new location, complete the following steps:
  - Lower the four leveling pads.
  - Install stabilizer brackets on the rack cabinet or in an earthquake environment bolt the rack to the floor.
  - If you removed any devices from the rack cabinet, repopulate the rack cabinet from the lowest position to the highest position.
- If a long-distance relocation is required, restore the rack cabinet to the configuration of the rack cabinet as you received it. Pack the rack cabinet in the original packaging material, or equivalent. Also lower the leveling pads to raise the casters off of the pallet and bolt the rack cabinet to the pallet.

All lasers are certified in the U.S. to conform to the requirements of DHHS 21 CFR Subchapter J for class 1 laser products. Outside the U.S., they are certified to be in compliance with IEC 60825 as a class 1 laser product. Consult the label on each part for laser certification numbers and approval information.

⚠ **CAUTION:** This product might contain one or more of the following devices: CD-ROM drive, DVD-ROM drive, DVD-RAM drive, or laser module, which are Class 1 laser products. Note the following information:

- Do not remove the covers. Removing the covers of the laser product could result in exposure to hazardous laser radiation. There are no serviceable parts inside the device.
- Use of the controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

(C026)

⚠ **CAUTION:** Data processing environments can contain equipment transmitting on system links with laser modules that operate at greater than Class 1 power levels. For this reason, never look into the end of an optical fiber cable or open receptacle. Although shining light into one end and looking into the other end of a disconnected optical fiber to verify the continuity of optic fibers may not injure the eye, this procedure is potentially dangerous. Therefore, verifying the continuity of optical fibers by shining light into one end and looking at the other end is not recommended. To verify continuity of a fiber optic cable, use an optical light source and power meter. (C027)

⚠ **CAUTION:** This product contains a Class 1M laser. Do not view directly with optical instruments. (C028)

⚠ **CAUTION:** Some laser products contain an embedded Class 3A or Class 3B laser diode. Note the following information:

- Laser radiation when open.
- Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam. (C030)

(C030)

⚠ **CAUTION:** The battery contains lithium. To avoid possible explosion, do not burn or charge the battery.

Do Not:

- Throw or immerse into water
- Heat to more than 100 degrees C (212 degrees F)
- Repair or disassemble

Exchange only with the IBM-approvedapproved part. Recycle or discard the battery as instructed by local regulations. In the United States, IBM has a process for the collection of this battery. For information, call 1-800-426-4333. Have the IBM part number for the battery unit available when you call. (C003)(C003a)

⚠ **CAUTION:** Regarding IBM providedprovided VENDOR LIFT TOOL:

- Operation of LIFT TOOL by authorized personnel only.
- LIFT TOOL intended for use to assist, lift, install, remove units (load) up into rack elevations. It is not to be used loaded transporting over major ramps nor as a replacement for such designated tools like pallet jacks, walkies, fork trucks and such related relocation practices. When this is not practicable, specially trained persons or services must be used (for instance, riggers or movers).
- Read and completely understand the contents of LIFT TOOL operator's manual before using. Failure to read, understand, obey safety rules, and follow instructions may result in property damage and/or personal injury. If there are questions, contact the vendor's service and support. Local paper manual must remain with machine in provided storage sleeve area. Latest revision manual available on vendor's web site.

- Test verify stabilizer brake function before each use. Do not over-force moving or rolling the LIFT TOOL with stabilizer brake engaged.
- Do not raise, lower or slide platform load shelf unless stabilizer (brake pedal jack) is fully engaged. Keep stabilizer brake engaged when not in use or motion.
- Do not move LIFT TOOL while platform is raised, except for minor positioning.
- Do not exceed rated load capacity. See LOAD CAPACITY CHART regarding maximum loads at center versus edge of extended platform.
- Only raise load if properly centered on platform. Do not place more than 200 lb (91 kg) on edge of sliding platform shelf also considering the load's center of mass/gravity (CoG).
- Do not corner load the platforms, tilt riser, angled unit install wedge or other such accessory options. Secure such platforms -- riser tilt, wedge, etc options to main lift shelf or forks in all four (4x or all other provisioned mounting) locations with provided hardware only, prior to use. Load objects are designed to slide on/off smooth platforms without appreciable force, so take care not to push or lean. Keep riser tilt [adjustable angling platform] option flat at all times except for final minor angle adjustment when needed.
- Do not stand under overhanging load.
- Do not use on uneven surface, incline or decline (major ramps).
- Do not stack loads.
- Do not operate while under the influence of drugs or alcohol.
- Do not support ladder against LIFT TOOL (unless the specific allowance is provided for one following qualified procedures for working at elevations with this TOOL).
- Tipping hazard. Do not push or lean against load with raised platform.
- Do not use as a personnel lifting platform or step. No riders.
- Do not stand on any part of lift. Not a step.
- Do not climb on mast.
- Do not operate a damaged or malfunctioning LIFT TOOL machine.
- Crush and pinch point hazard below platform. Only lower load in areas clear of personnel and obstructions. Keep hands and feet clear during operation.
- No Forks. Never lift or move bare LIFT TOOL MACHINE with pallet truck, jack or fork lift.
- Mast extends higher than platform. Be aware of ceiling height, cable trays, sprinklers, lights, and other overhead objects.
- Do not leave LIFT TOOL machine unattended with an elevated load.
- Watch and keep hands, fingers, and clothing clear when equipment is in motion.
- Turn Winch with hand power only. If winch handle cannot be cranked easily with one hand, it is probably over-loaded. Do not continue to turn winch past top or bottom of platform travel. Excessive unwinding will detach handle and damage cable. Always hold handle when lowering, unwinding. Always assure self that winch is holding load before releasing winch handle.
- A winch accident could cause serious injury. Not for moving humans. Make certain clicking sound is heard as the equipment is being raised. Be sure winch is locked in position before releasing handle. Read instruction page before operating this winch. Never allow winch to unwind freely. Freewheeling will cause uneven cable wrapping around winch drum, damage cable, and may cause serious injury.
- This TOOL must be maintained correctly for IBM Service personnel to use it. IBM shall inspect condition and verify maintenance history before operation. Personnel reserve the right not to use TOOL if inadequate. (C048)

Power and cabling information for NEBS (Network Equipment-Building System) GR-1089-CORE

The following comments apply to the IBM servers that have been designated as conforming to NEBS (Network Equipment-Building System) GR-1089-CORE:

The equipment is suitable for installation in the following:

- Network telecommunications facilities
- Locations where the NEC (National Electrical Code) applies

The intra-building ports of this equipment are suitable for connection to intra-building or unexposed wiring or cabling only. The intra-building ports of this equipment *must not* be metallically connected to the interfaces that connect to the OSP (outside plant) or its wiring. These interfaces are designed for use as intrabuilding interfaces only (Type 2 or Type 4 ports as described in GR-1089-CORE) and require isolation from the exposed OSP cabling. The addition of primary protectors is not sufficient protection to connect these interfaces metallically to OSP wiring.

Note: All Ethernet cables must be shielded and grounded at both ends.

The AC-powered system does not require the use of an external surge protection device (SPD).

The DC-powered system employs an isolated DC return (DC-I) design. The DC battery return terminal *shall not* be connected to the chassis or frame ground.

The DC-powered system is intended to be installed in a common bonding network (CBN) as described in GR-1089-CORE.

Beginning troubleshooting and problem analysis

This information provides a starting point for analyzing problems.

This information is the starting point for diagnosing and repairing servers. From this point, you are guided to the appropriate information to help you diagnose server problems, determine the appropriate repair action, and then perform the necessary steps to repair the server. A system attention light, an enclosure fault light, or a system information light indicates there is a serviceable event (an SRC in the control panel or in one of the serviceable event views) on the system. This information guides you through finding the serviceable event.

Beginning problem analysis

You can use problem analysis to gather information that helps you determine the nature of a problem encountered on your system. This information is used to determine if you can resolve the problem yourself or to gather sufficient information to communicate with a service provider and quickly determine the service action that needs to be taken.

If you are using this information because of a problem with your Hardware Management Console (HMC), see Managing the HMC.

To begin analyzing the problem, complete the following steps:

1. Do you have a direct indication of a hardware error (such as an automated email that notified you of a hardware error or a fault indicator on a system unit or expansion unit)?

   - **Yes:** Continue with the next step.
   - **No:** Go to "Detecting problems" on page 54.

2. How do you manage the system that is failing? If you do not know how the failing system is managed, ask the system administrator.

System management	Problem analysis
Hardware Management Console (HMC)	Go to the section "Hardware Management Console (HMC) problem analysis" on page 1.
Operating system (AIX®, Linux®, or IBM i)	Go to the problem analysis topic for your operating system. • If you are having a problem with an AIX or Linux system unit, go to "AIX and Linux problem analysis" on page 3. • If you are having a problem with an IBM i system unit, go to " IBM i problem analysis" on page 6.

Hardware Management Console (HMC) problem analysis

To perform beginning problem analysis on a system that is managed by Hardware Management Console (HMC), complete the following steps:

1. Is the management console functional and connected to the hardware?

   - **Yes:** Continue with the next step.
   - **No:** Start the management console and attach it to the system unit. Then return here and continue with the next step.

2. On the management console that is used to manage the system unit, complete the following steps:

   Note: If you are unable to locate the reported problem, and there is more than one open problem near the time of the reported failure, use the earliest problem in the log.

   a. In the navigation area, click **Serviceability**, and then click **Serviceable Events Manager**. The Manage Serviceable Events window is displayed.
   b. In the Event Criteria area, for **Serviceable Event Status**, select **Open**. For all other criteria, select **ALL**, then click **OK**.

   Scroll through the log and verify that there is a problem with the status of Open to correspond with the failure.

   Do you find a serviceable event, or an open problem near the time of the failure?

   - **Yes:** Continue with the next step.
   - **No:** Contact your hardware service provider. **This ends the procedure.**

3. The reference code description might provide information or an action that you can take to correct the failure.

   Use the search function of IBM Knowledge Center to find the reference code details. The search function is located in the upper-left corner of IBM Knowledge Center. Read the reference code description and return here. Do not take any other action at this time.

   For more information about reference codes, see Reference codes.

   Was there a reference code description that enabled you to resolve the problem?

   - **Yes: This ends the procedure.**
   - **No:** Continue with the next step.

4. Service is required to resolve the error. Collect as much error data as possible and record it. You and your service provider will develop a corrective action to resolve the problem based on the following guidelines:

   - If a FRU location code is provided in the serviceable event view or control panel, use that location to determine which FRU to replace.
   - If an isolation procedure is listed for the reference code in the reference code lookup information, include the isolation procedure as a corrective action even if it is not listed in the serviceable event view or control panel.
   - If any FRUs are marked for block replacement, replace all FRUs in the block replacement group at the same time.

   From the Repair Serviceable Event window, complete the following steps:

   a. Record the problem management record (PMR) number for the problem if one is listed.
   b. Select the serviceable event from the list.
   c. Click **Selected and View Details**.
   d. In the Serviceable Event Details page, locate details such as the reference code and FRU list and record this information.
   e. If a Problem Management Hardware (PMH) number was found for the problem on the Serviceable Event Overview panel, the problem has already been reported. If there was no PMH number for the problem, contact your service provider.

   This ends the procedure.

AIX and Linux problem analysis

You can use this procedure to find information about a problem with your server hardware when service is managed by the AIX or Linux operating system.

Remember the following points while troubleshooting problems:

- Has an external power outage or momentary power loss occurred?
- Has the hardware configuration changed?
- Has system software been added?
- Have any new programs or program updates (including PTFs) been installed recently?

Before you use this procedure, ensure that you completed the steps in "Beginning problem analysis" on page 1.

After you review these considerations, complete the following steps:

1. Is the operating system operational?

   - **Yes:** Continue with the next step.
   - **No:** Go to step "11" on page 5.

2. Are any messages (for example, a device is not available or reporting errors) related to this problem displayed on the system console or sent to you in email that provides a reference code?

   Note: A reference code can be an 8 character system reference code (SRC) or a service request number (SRN) of 5, 6, or 7 characters, with or without a hyphen.

   - **Yes:** Continue with the next step.
   - **No:** Go to step "4" on page 3.

3. The reference code description might provide information or an action that you can take to correct the failure.

   Use the search function of IBM Knowledge Center to find the reference code details. The search function is located in the upper-left corner of IBM Knowledge Center. Read the reference code description and return here. Do not take any other action now.

   For more information about reference codes, see Reference codes.

   If the reference code description provides information to resolve the problem without replacing FRUs in the failing item list, complete the steps.

   Were you able to resolve the problem?

   - **Yes: This ends the procedure.**
   - **No:** Continue with the next step.

4. Are you running the Linux operating system?

   - **Yes:** Continue with the next step.
   - **No:** Go to step "6" on page 4.

5. To locate the error information in a system or logical partition that is running the Linux operating system, complete the following steps:

   Note: Before you proceed with this step, ensure that the diagnostics package is installed on the system.

a. Log in as root user.
b. At the command line, type `grep RTAS /var/log/platform` and press **Enter**.
c. Look for the most recent entry that contains a reference code.

Continue with step “8” on page 4.

6. To locate the error information in a system or logical partition that is running the AIX operating system, complete the following steps:

   a. Log in to the AIX operating system as root user, or use CE login. If you need help, contact the system administrator.
   b. Type `diag` to load the diagnostic controller, and display the online diagnostic menus.
   c. From the Function selection menu, select **Task selection**.
   d. From the Task selection list menu, select **Display previous diagnostic results**.
   e. From the Previous diagnostic results menu, select **Display diagnostic log summary**.

   Continue with the next step.

7. A display diagnostic log is shown with a time ordered table of events from the error log.

   Look in the T column for the most recent entry that has an S entry. Press **Enter** to select the row in the table and then select **Commit**.

   The details of this entry from the table are shown. Look for the SRN entry near the end of the entry and record the information that is shown.

   Continue with the next step.

8. Do you find a serviceable event or an open problem near the time of the failure?

   - **Yes:** Continue with the next step.
   - **No:** Contact your hardware service provider. **This ends the procedure.**

9. The reference code description might provide information or an action that you can take to correct the failure.

   Use the search function of IBM Knowledge Center to find the reference code details. The search function is located in the upper-left corner of IBM Knowledge Center. Read the reference code description and return here. Do not take any other action now.

   For more information about reference codes, see Reference codes.

   Was there a reference code description that helped you to resolve the problem?

   - **Yes: This ends the procedure.**
   - **No:** Continue with the next step.

10. Service is required to resolve the error. Collect as much error data as possible and record it. You and your service provider will develop a corrective action to resolve the problem based on the following guidelines:

- If a field-replaceable unit (FRU) location code is provided in the serviceable event view or control panel, use that location to determine which FRU to replace.
- If an isolation procedure is listed for the reference code in the reference code lookup information, include it as a corrective action even if it is not listed in the serviceable event view or control panel.
- If any FRUs are marked for block replacement, replace all FRUs in the block replacement group at the same time.

From the Error Event Log view, complete the following steps:

a. Record the reference code.
b. Record the error details.
c. Contact your service provider.

This ends the procedure.

---

11. Details about errors that occur when the operating system is not running or when the operating system is now not accessible can be found in the control panel or in the Advanced System Management Interface (ASMI).

    Do you choose to look for error details by using ASMI?

    - **Yes:** Go to step "13" on page 5.
    - **No:** Continue with the next step.

---

12. At the control panel, complete the following steps.

    a. Press the increment or decrement button until the number 11 is displayed in the upper-left corner of the display.
    b. Press **Enter** to display the contents of function 11.
    c. Look for a reference code in the upper-right corner.

    Is a reference code displayed on the control panel in function 11?

    - **Yes:** Go to step "14" on page 5.
    - **No:** Contact your hardware service provider. **This ends the procedure.**

---

13. On the console that is connected to the ASMI, complete the following steps.

    Note: If you are unable to locate the reported problem, and there is more than one open problem near the time of the reported failure, use the earliest problem in the log.

    a. Log in with a user ID that has an authority level as general, administrator, or authorized service provider.
    b. In the navigation area, expand **System Service Aids** and click **Error/Event Logs**. If log entries exist, a list of error and event log entries is displayed in a summary view.
    c. Scroll through the log under **Serviceable Customer Attention Events** and verify that there is a problem to correspond with the failure.

    For information about the ASMI, see Managing the Advanced System Management Interface.

    Do you find a serviceable event, or an open problem near the time of the failure?

    - **Yes:** Continue with the next step.
    - **No:** Contact your hardware service provider. **This ends the procedure.**

---

14. The reference code description might provide information or an action that you can take to correct the failure.

Use the search function of IBM Knowledge Center to find the reference code details. The search function is located in the upper-left corner of IBM Knowledge Center. Read the reference code description and return here. Do not take any other action now.

For more information about reference codes, see Reference codes.

Was there a reference code description that helped you to resolve the problem?

- **Yes: This ends the procedure.**
- **No:** Continue with the next step.

15. Service is required to resolve the error. Collect as much error data as possible and record it. You and your service provider will develop a corrective action to resolve the problem based on the following guidelines:

    - If a field-replaceable unit (FRU) location code is provided in the serviceable event view or control panel, use that location to determine which FRU to replace.
    - If an isolation procedure is listed for the reference code in the reference code lookup information, include the isolation procedure as a corrective action even if it is not listed in the serviceable event view or control panel.
    - If any FRUs are marked for block replacement, replace all FRUs in the block replacement group at the same time.

    To find error details on the control panel, complete the following steps:

    a. Press **Enter** to display the contents of function 14. If data is available in function 14, the reference code has a FRU list.
    b. Record the information in functions 11 through 20 on the control panel.
    c. Contact your service provider and report the reference code and other information.

    To find error details on the ASMI, complete the following steps from the Error Event Log view:

    a. Record the reference code.
    b. Select the corresponding check box on the log and click Show details.
    c. Record the error details.
    d. Contact your service provider.

    This ends the procedure.

IBM i problem analysis

You can use this procedure to find information about a problem with your server hardware when service is managed by the IBM i operating system.

If you experience a problem with your system or logical partition, try to gather more information about the problem to either solve it, or to help your next level of support or your hardware service provider to solve it more quickly and accurately.

This procedure refers to the IBM i control language (CL) commands that provide a flexible means of entering commands on the IBM i logical partition or system. You can use CL commands to control most of the IBM i functions by entering them from either the character-based interface or the IBM Navigator for i Web console. While the CL commands might be unfamiliar at first, the commands follow a consistent syntax, and IBM i includes many features to help you use them easily. The Programming navigation category in IBM i Documentation includes a complete CL reference and a CL Finder to look up specific CL commands.

Remember the following points while troubleshooting problems:

- Has an external power outage or momentary power loss occurred?

- Has the hardware configuration changed?
- Has system software been added?
- Have any new programs or program updates (including PTFs) been installed recently?

To make sure that your IBM software was correctly installed, use the Check Product Option (CHKPRDOPT) command.

- Have any system values changed?
- Has any system tuning been done?

Before you use this procedure, ensure that you completed the steps in "Beginning problem analysis" on page 1.

After you review these considerations, follow these steps:

1. Is the IBM i operating system up and running?

   - **Yes:** Continue with the next step.
   - **No:** Go to step "19" on page 9.

2. Are you experiencing problems with the Operations Console?

   - **Yes:** See Troubleshooting Operations Console.
   - **No:** Continue with the next step.

3. Does the console show a Main Storage Dump Manager display?

   - **Yes:** Go to Copying a dump.
   - **No:** Continue with the next step.

4. Is the console that was in use when the problem occurred (or any console) operational?

   Note: The console is operational if a sign-on display or a command line is present. If another console is operational, use it to resolve the problem.

   - **Yes:** Continue with the next step.
   - **No:** See the Troubleshooting navigation category in IBM i Documentation.

5. Is a message related to this problem shown on the console?

   - **Yes:** Continue with the next step.
   - **No:** Go to step "10" on page 8.

6. Is this a system operator message?

   Note: It is a system operator message if the display indicates that the message is in the QSYSOPR message queue. Critical messages can be found in the QSYSMSG message queue. For more information, see the *Create message queue QSYSMSG for severe messages* topic in the Troubleshooting navigation category of IBM i Documentation.

   - **Yes:** Continue with the next step.
   - **No:** Go to step "8" on page 8.

7. Is the system operator message highlighted, or does it have an asterisk (*) next to it?

   - **Yes:** Go to step "17" on page 9.
   - **No:** Go to step "12" on page 8.

8. Move the cursor to the message line and press F1 (Help). Does the Additional Message Information display appear?

   - **Yes:** Continue with the next step.
   - **No:** Go to step "10" on page 8.

---

9. Record the additional message information on the appropriate problem reporting form. For details, see "Problem reporting form" on page 14.

   Follow the recovery instructions on the Additional Message Information display.

   Did this solve the problem?

   - **Yes: This ends the procedure**.
   - **No:** Continue with the next step.

---

10. To display system operator messages, type `dspmsg qsysopr` on any command line and then press **Enter**.

    Did you find a message that is highlighted or has an asterisk (*) next to it?

    - **Yes:** Go to step "17" on page 9.
    - **No:** Continue with the next step.

    Note: The message monitor in the IBM Navigator for i Web console can also inform you when a problem has developed. For details, see the *Scenario: Message monitor topic in the Systems Management navigation category* of IBM i Documentation.

---

11. Did you find a message with a date or time that is at or near the time the problem occurred?

    Note: Move the cursor to the message line and press F1 (Help) to determine the time that a message occurred. If the problem is shown to affect only one console, you might be able to use information from the JOB menu to diagnose and solve the problem. To find this menu, type **GO JOB** and press **Enter** on any command line.

    - **Yes:** Continue with the next step.
    - **No:** Go to step "14" on page 9.

---

12. Complete the following steps:

    a. Move the cursor to the message line and press F1 (Help) to display additional information about the message.
    b. Record the additional message information on the appropriate problem reporting form. For details, see "Problem reporting form" on page 14.
    c. Follow any recovery instructions that are shown.

    Did this solve the problem?

    - **Yes: This ends the procedure**.
    - **No:** Continue with the next step.

---

13. Did the message information indicate to look for additional messages in the system operator message queue (QSYSOPR)?

    - **Yes:** Press F12 (Cancel) to return to the list of messages and look for other related messages. Then, return to step "10" on page 8.
    - **No:** Continue with the next step.

---

14. Do you know which input/output device is causing the problem?

    - **Yes:** Continue with step "16" on page 9.
    - **No:** Continue with the next step.

15. If you do not know which input/output device is causing the problem, describe the problems that you observed by completing the following steps:

    a. Type `GO USERHELP` on any command line and then press **Enter**.
    b. Select option 10 (Save information to help resolve a problem).
    c. Type a brief description of the problem and then press **Enter**. If you specify the default **Y** in the **Enter notes about problem** field, you can enter more text to describe your problem.
    d. Report the problem to your hardware service provider.

16. Complete the following steps:

    a. Type ANZPRB on the command line and then press **Enter**. For details, see *Using the Analyze Problem (ANZPRB) command* in the Troubleshooting navigation category in IBM i Documentation.
    b. Contact your next level of support. **This ends the procedure**.

    Note: To describe your problem in greater detail, see *Using the Analyze Problem (ANZPRB) command* in the Troubleshooting navigation category in IBM i Documentation. This command can also run a test to further isolate the problem.

17. Complete the following steps:

    a. Move the cursor to the message line and press F1 (Help) to display additional information about the message.
    b. Press F14, or use the Work with Problem (WRKPRB) command. For details, see *Work with Problem (WRKPRB)* in the Troubleshooting navigation category in IBM i Documentation.
    c. If this does not solve the problem, see the IBM i server or IBM i partition symptoms.

18. Choose from the following options:

    - If reference codes appear on the control panel or the management console, record them. Then, go to Reference codes to see if additional details are available for the code you received.
    - If no reference codes appear on the control panel or the management console, a serviceable event is indicated by a message in the problem log. Use the WRKPRB command. For details, see *Work with Problem (WRKPRB)* in the Troubleshooting navigation category in IBM i Documentation.

19. Details about errors that occur when IBM i is not running or when IBM i is now not accessible can be found in the control panel or in the Advanced System Management Interface (ASMI).

    Do you choose to look for error details by using ASMI?

    - **Yes:** Go to step "21" on page 10.
    - **No:** Continue with the next step.

20. At the control panel, complete the following steps.

a. Press the increment or decrement button until the number 11 is displayed in the upper-left corner of the display.
b. Press **Enter** to display the contents of function 11.
c. Look for a reference code in the upper-right corner.

Is there a reference code displayed on the control panel in function 11?

- **Yes:** Go to step "22" on page 10.
- **No:** Contact your hardware service provider. **This ends the procedure.**

---

21. On the console that is connected to the ASMI, complete the following steps.

Note: If you are unable to locate the reported problem, and there is more than one open problem near the time of the reported failure, use the earliest problem in the log.

a. Log in with a user ID that has an authority level as general, administrator, or authorized service provider.
b. In the navigation area, expand **System Service Aids** and click **Error/Event Logs**. If log entries exist, a list of error and event log entries is displayed in a summary view.
c. Scroll through the log under **Serviceable Customer Attention Events** and verify that there is a problem to correspond with the failure.

For more detailed information on the ASMI, see Managing the Advanced System Management Interface.

Do you find a serviceable event, or an open problem near the time of the failure?

- **Yes:** Continue with the next step.
- **No:** Contact your hardware service provider. **This ends the procedure.**

---

22. The reference code description might provide information or an action that you can take to correct the failure.

Use the search function of IBM Knowledge Center to find the reference code details. The search function is located in the upper-left corner of IBM Knowledge Center. Read the reference code description and return here. Do not take any other action now.

For more information about reference codes, see Reference codes.

Was there a reference code description that helped you to resolve the problem?

- **Yes: This ends the procedure.**
- **No:** Continue with the next step.

---

23. Service is required to resolve the error. Collect as much error data as possible and record it. You and your service provider will develop a corrective action to resolve the problem based on the following guidelines:

- If a field-replaceable unit (FRU) location code is provided in the serviceable event view or control panel, use that location to determine which FRU to replace.
- If an isolation procedure is listed for the reference code in the reference code lookup information, include the isolation procedure as a corrective action even if it is not listed in the serviceable event view or control panel.
- If any FRUs are marked for block replacement, replace all FRUs in the block replacement group at the same time.

To find error details on the control panel, complete the following steps:

a. Press **Enter** to display the contents of function 14. If data is available in function 14, the reference code has a FRU list.
b. Record the information in functions 11 through 20 on the control panel.
c. Contact your service provider and report the reference code and other information.

To find error details on the ASMI, complete the following steps from the Error Event Log view:

a. Record the reference code.
b. Select the corresponding check box on the log and click Show details.
c. Record the error details.
d. Contact your service provider.

This ends the procedure.

Light path diagnostics

Light path diagnostics is a simplified approach for repair actions that provides fault indicators to identify parts that need to be replaced.

Light path diagnostics is a system of light-emitting diodes (LEDs) on the control panel and on various internal components. When an error occurs, LEDs are lit throughout the system to help identify the source of the error.

With light path diagnostics, the fault LED for the FRUs to be replaced will be active when the unit is powered on. The failing FRUs can be attached to another FRU, which must be first removed to access the failing FRUs. For those cases, light path diagnostics provides a blue switch on the FRU that has to be removed first. When the first FRU is removed, you can press and hold the light path diagnostics switch to light the LEDs and locate the failing part. In most of the situations, the switch will have enough power stored to activate the LEDs for two hours after the unit has been powered off. However, this can vary significantly and therefore the switch should be used as soon as possible. The amber LEDs can normally be kept active for 30 seconds, however, this can also vary. Associated with the light path diagnostics switch is a green LED that will be activated when the switch is used and there is enough power stored to activate the amber LEDs. If the green LED does not activate when the switch is pressed then there is not enough power remaining to activate any amber LEDs on that FRU. If that happens then light path diagnostics and FRU identify function cannot be used for replacing the failing FRUs. Perform the repair action using the location codes in the error log or if determined by problem analysis as if the unit did not have light path diagnostics and did not have functioning identify LEDs.

At the core of light path diagnostics is a set of fault indicators that are implemented as amber LEDs. These LEDs provide a way for the diagnostics to identify which field-replaceable unit (FRU) needs to be replaced. Service labels, color-coded touch points for the FRUs, and a no tools required design for FRU removal and installation are all elements of light path diagnostics.

With light path diagnostics, at the same time that the diagnostics create an error log for the problem, it also activates the fault indicator when a FRU has a failed or failing component. This includes predictive failure analysis (PFA). The FRU fault LED is turned on solid (not flashing). Whenever a fault indicator is activated the enclosure's external Fault indicator on the operator panel is also turned on solid. The enclosure fault indicator on the panel means that inside the unit one or more FRU fault indicators is on.

The error log shows the part number and location code of the FRU that must be replaced along with other FRUs or procedures to follow if replacing the first FRU does not resolve the problem.

If the diagnostics determine that the problem is firmware related, configuration related, or not isolated to a specific FRU then no fault indicator is activated. For these kinds of problems the amber System Info indicator on the operator panel is activated. The error log shows the procedures to follow and the possible FRUs that could be causing the problem.

During the repair action, the service label on the service access cover shows the FRUs and the steps required to remove or install the FRUs. Therefore, the basic flow of the repair is that the LEDs show which part to replace, the color-coded touch points indicate if the unit must be powered off to remove or install the part, and the service label shows the steps needed on the touch points. The FRU fault LED is not an indication that the FRU is ready to be replaced. To replace the FRU, some preparation steps might be necessary, such as removing the resource from use or powering off the unit. The service label and the touch point colors give the initial guidance for FRU removal.

When a FRU has been replaced, the fault indicator automatically turns off either when the new FRU is installed, or when the power is restored to the new FRU. This automatic shut off might take several seconds to a minute as the new FRU is powered on, brought online and tested by the system. When there are no more FRU fault indicators on in an enclosure then the enclosure's Fault indicator on the operator panel turns off automatically.

In addition to the fault indicators, there are also amber identify indicators for each FRU. The identify indicators flash when activated. Identify indicators are used to help a servicer identify where a location is. The location may be occupied or empty. The servicer can turn them on and off from a user interface either during a repair action or during the installation of new parts or when removing parts. The identify indicator visually confirms where a location code is. Whenever an identify indicator is activated, the enclosure's blue *locate* or *beacon* LED on the operator panel is also activated (flashing).

The same amber LED on a FRU can be used for both fault and identify indications. Whenever the LED is on solid for a fault, the LED switches to flashing when the FRU identify function is turned on. When identify function is turned off, the LED returns to fault (solid on) if that was the previous state of the LED.

Replacing FRUs by using enclosure fault indicators

After you obtain a replacement part, use this procedure to identify the location of the part that needs to be replaced.

About this task

To identify and locate the part that requires replacement, complete the following steps.

Procedure

1. Before you move the unit into the service position, refer to the service label. It might be necessary to identify and remove cables that are attached to the FRU you are about to exchange. Use the FRU location code and the service label to determine whether there are any actions before you move the unit into the service position. Complete those actions and return to the next step in this procedure.
2. Identify the unit with the active enclosure fault indicator. Use the service label that is affixed to the service access cover and the amber light-emitting diode (LED) on the FRU to find the failing FRU. Move the unit into the service position, but do not remove the service access cover.
   - If the unit is rack-mounted, the service label is visible on the service access cover. Continue with the next step.
   - If the unit is a stand-alone system, the exterior cover must be removed to view the service label.
3. Using the service label, determine whether the FRU you are replacing can be exchanged without removing the service access cover. Is the FRU fault LED visible externally and active (on solid, not flashing) and does the service label show that the service access cover does not need to be removed to exchange the FRU? (Choose No if you are unsure.)

Note: If you used the identify function in a user interface to help locate the FRU, then the amber LED is flashing. Otherwise, the amber LED is solid (not flashing).

- **Yes:** Go to step 6.
- **No:** To identify which FRU to exchange, you must remove the service access cover and locate the FRU that has an active FRU fault indicator (amber LED on). Continue with the next step.

4. Remove the service access cover and locate the FRU that has an active fault indicator (amber LED on, not flashing). Use the following table to determine whether you must power off the unit before you remove the cover.

   Note: You can remove the service access cover while the unit is powered on.
5. Search for the FRU to be replaced by locating the active amber LED.

   Notes:

   - If you used the identify function in a user interface to help locate the FRU, then the amber LED is flashing. Otherwise, the amber LED is solid (not flashing).
   - Some FRUs might be an integral part of another FRU. This might make it difficult to see the FRU that you need to exchange or the amber LED that designates the FRU that needs to be exchanged. If so, remove all FRUs that are associated with the failing FRU.

   Do you need to remove another FRU to replace the FRU designated by the amber LED?

   - **Yes:** Go to step 9.
   - **No:** Continue with the next step.
6. For the FRU you located with its fault LED active, was it replaced for this problem or service action?

   - **Yes:** The FRU replaced for the original problem did not resolve the problem. Go back to the serviceable event for the original problem and address the remaining FRUs that are listed.

     Note: If the fault indicator for the replaced FRU is turned on, use the Advanced System Management Interface (ASMI) to turn off the fault indicator.

     This ends the procedure.
   - **No:** Continue with the next step.
7. For the FRU you located with the active fault LED, compare the location code that you recorded for the replacement FRU of the problem you are working on with the location code of the active fault indicator. If they do not match, you are working a problem from the log that is different from the problem that activated the fault indicators. Do the location codes match?

   - **Yes:** You are working the same problem that activated the fault indicators. Continue with the next step.
   - **No:** If you have the correct replacement FRU for where the fault indicator is active, you can continue with this repair action. When you replace the FRU, record the location codes of the active fault indicators for use later to identify which problem to close when the repair is complete, then continue with the next step. Otherwise, contact your service provider to obtain the replacement part for the FRU with an active fault indicator and begin problem analysis again. **This ends the procedure.**
8. If you have not already done so, record the location of the FRU you are about to exchange either by where the service label shows the FRU or where it is in the unit by the location labeling. For information on part locations and location codes, see Part locations and location codes. In the locations and addresses information for your system, locate the FRU and the corresponding FRU exchange procedure. The exchange procedure provides the steps necessary to exchange the FRU. If the FRU can be replaced while the unit is powered on, the exchange procedure provides that option and the necessary instructions. If the enclosure fault indicator turns on again within a few minutes of completing the replacement and returning to normal use of the unit, then begin problem analysis again. Otherwise, close the problem. **This ends the procedure.**

9. If you have not already done so, record the location of the FRU that you plan to remove either by where the service label shows the FRU or by the location labeling where it is in the unit. For information on part locations and location codes, see Part locations and location codes.

   In the locations and addresses information, locate the FRU and the corresponding FRU exchange procedure. The exchange procedure provides the steps necessary to remove this FRU. If the FRU can be removed while the unit is powered on, the exchange procedure provides that option and the necessary instructions. When you remove this FRU, the fault indicator for the associated FRU you are exchanging turns off. This FRU has an LED activation button that you can press that powers the amber indicator of the FRU you are exchanging. Use the button to locate the FRU you are exchanging. Go to step 8.

   Note: If the button's green LED does not activate, there is not enough charge in the switch to activate the amber fault LED. To identify the failing FRU, use the FRU location code either from the error log or as determined by problem analysis.

10. For the FRU you located that has its fault LED active, were any of them replaced for this problem or service action?

    - **Yes:** The FRU replaced for the original problem did not resolve the problem. Go back to the serviceable event for the original problem and work the remaining FRUs listed. Use ASMI to turn off the fault indicator for the FRU. **This ends the procedure.**
    - **No:** Use the information on the service label to exchange the FRU. When the FRU is exchanged, use the service label to guide you in reassembling the unit. Power on the unit. The FRU fault indicator is turned off during the power-on process if it was not already turned off. If the enclosure fault indicator turns on again within a few minutes of powering on the unit, then begin problem analysis again. Otherwise, close this problem. **This ends the procedure.**

Problem reporting form

Use the problem reporting form to record information about your server that will assist you in problem analysis.

Collect as much information as possible in the tables below, using either the control panel or the management console to gather the information.

Table 1. Customer, system, and problem information

Customer information and problem description	
Your name	
Telephone number	
IBM customer number, if available	
Date and time that the problem occurred	
Describe the problem	
System Information	
Machine type	
Model	
Serial number	
IPL type	
IPL mode	
Message information	

Table 1. Customer, system, and problem information (continued)

Customer information and problem description	
Message ID	
Message text	
Service request number (SRN)	
In which mode were IBM hardware diagnostics run?	___ Online or ___ stand-alone ? ___ Service mode or ___ concurrent mode?

Go to the management console or the control panel and indicate whether the following lights are on.

Table 2. Control panel lights

Control panel light	Place a check if light is on
Power On	
System Attention	

Go to the management console or control panel to find and record the values for functions 11 through 20. Use the following grid to record the characters shown on the management console or Function/Data display.

Table 3. Function values

Function	Value
11	__ __
12	__ __
13	__ __
14	__ __
15	__ __
16	__ __
17	__ __
18	__ __
19	__ __
20 (for control panel users)	__ __

Table 3. Function values (continued)

Function	Value
20 (for management console users)	Machine type: Model: Processor feature code: IPL type:

Reference information for problem determination

The problem determination reference information is provided as an additional resource for problem detection and analysis when you are directed here by your service representative.

All repair actions should start with "Beginning problem analysis" on page 1 before you use these tools and techniques for problem determination.

Symptom index

Use this symptom index only when you are guided here by your service representative.

Note: If you were not guided here by your service representative, go to "Beginning problem analysis" on page 1.

Review the symptoms in the left column. Look for the symptom that most closely matches the symptoms on the server that you are troubleshooting. When you find the matching symptom, perform the appropriate action as described in the right column.

Table 4. Determining symptom types

Symptom	What you should do:
You do not have a symptom.	Go to the "Beginning problem analysis" on page 1.
The symptom or problem is on a server or a partition running IBM ian operating system other than AIX or Linux.	Go to "IBM i server or IBM i partition symptoms" on page 16.
The symptom or problem is on a server or a partition running AIX.	Go to "AIX server or AIX partition symptoms" on page 21.
The symptom or problem is on a server or a partition running Linux.	Go to "Linux server or Linux partition symptoms" on page 35.

IBM i server or IBM i partition symptoms

Use the following tables to find the symptom you are experiencing. If you cannot find your symptom, contact your next level of support.

- General symptoms
- Symptoms occurring when the system is not operational
- Symptoms related to a logical partition on a server that has multiple logical partitions
- Obvious physical symptoms
- Time-of-day symptoms

Table 5. General IBM i server or IBM i partition symptoms

Symptom	**Service action**
You have an intermittent problem or you suspect that the problem is intermittent.	Go to "Intermittent problems" on page 61.
DST/SST functions are available on the logical partition console and: • The customer reports reduced system function. • There is a server performance problem. • There are failing, missing, or inoperable server resources.	On most servers with logical partitions, it is common to have one or more missing or non-reporting system bus resource's under Hardware Service Manager (see Hardware Service Manager for more information).
Operations Console, or the remote control panel is not working properly.	Contact Software Support.
The system has a processor or memory problem.	Use the Service action log to check for a reference code or any failing items. See Service action log for instructions, replacing any hardware FRUs if necessary.
The system has detected a bus problem. An SRC of the form B600 69*xx* or B700 69*xx* will be displayed on the control panel or management console.	Go to Service action log.

Table 6. Symptoms occurring when the system is not operational

Symptom	**Service action**
A bouncing or scrolling ball (moving row of dots) remains on the operator panel display, or the operator panel display is filled with dashes or blocks.	Verify that the operator panel connections to the system backplane are connected and properly seated. Also, reseat the Service Processor card. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Operator panel assembly. 2. Service processor.

Table 6. Symptoms occurring when the system is not operational (continued)

Symptom	Service action
You have a blank display on the operator panel. Other LEDs on the operator panel appear to behave normally.	Verify that the operator panel connections to the system backplane are connected and properly seated. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Control (operator) panel assembly. 2. Service processor.
There is an IPL problem, the system attention light is on, and blocks of data appear for 5 seconds at a time before moving to the next block of data for 5 seconds, and so on until 5 seconds of a blank control panel is displayed at which time the cycle repeats.	These blocks of data are functions 11 through 20. The first data block after the blank screen is function 11, the second block is function 12, and so on. Use this information to fill out the Problem reporting forms. Then go to Reference codes.
You have a power problem, the system or an attached unit will not power on or will not power off, or there is a 1*xxx*-*xxxx* reference code.	Go to Power problems.
There is an SRC in function 11.	Look up the reference code (see Reference codes).
There is an IPL problem.	Go to "IPL problems" on page 67.
There is a `Device Not Found` message during an installation from an alternate installation device.	Go to TUPIP06.

Table 7. Symptoms related to a logical partition on a server that has multiple logical partitions

Symptom	Service action
The console is not working for a logical partition.	See the Troubleshooting navigation category in IBM i Documentation.

Table 7. Symptoms related to a logical partition on a server that has multiple logical partitions (continued)

Symptom	Service action
• There is an SRC on the panel of an I/O expansion unit owned by a logical partition. • You suspect a power problem with resources owned by a logical partition. • There is an IPL problem with a logical partition and there is an SRC on the management console. • The logical partition's operations have stopped or the partition is in a loop and there is an SRC on the management console.	• Search Service Focal Point for a serviceable event. • If you do not find a serviceable event in Service Focal Point, then record the partition's SRC from the Operator Panel Values field in the management console. 1. In the navigation area, click **Resources**, and then select **All Systems**. 2. In the content pane, select the required system or click on the server name and then select the required partition. 3. Use that SRC and look up the reference code. For more information, see Reference codes.
The logical partition's console is functioning, but the state of the partition in the management console is "Failed" or "Unit Attn" and there is an SRC.	Use the logical partition's SRC. From the partition's console search for that SRC in the partition's Service Action Log. See Service action log.
There is an IPL problem with a logical partition and there is no SRC displayed in the management console.	Perform the following to look for the panel value for the partition in the management console. 1. In the navigation area, click **Resources**, and then select **All Systems**. 2. In the content pane, select the required system or click on the server name and then select the required partition. 3. In the navigation area, click **Serviceability** > **Reference Code Log** and view the codes. 4. When finished, click **Cancel**. Go to Reference codes. If no reference code can be found, contact your next level of support.
The partition's operations have stopped or the partition is in a loop and there is no SRC displayed on the management console.	Perform function 21 from the management console. If this fails to resolve the problem, contact your next level of support.
One or more of the following was reported: • There is a system reference code or message on the logical partition's console. • The customer reports reduced function in the partition. • There is a logical partition performance problem. • There are failing, missing, or inoperable resources.	From the partition's console search the partition's Service Action Log. Go to Service action log. **Note:** On most systems with logical partitions, it is common to have one or more "Missing or Non-reporting" system bus resource's under Hardware Service Manager. See Hardware Service Manager for details.
There is a `Device Not Found` message during an installation from an alternate installation device.	Go to TUPIP06.

Table 7. Symptoms related to a logical partition on a server that has multiple logical partitions (continued)

Symptom	**Service action**
There is a problem with a guest partition. **Note:** These are problems reported from the operating system (other than IBM i) running in a guest partition or reported from the hosting partition of a guest partition.	If there are serviceable events in the logical partition or hosting partition, work on these problems first. If there are no SAL entries in the logical partition and no SAL entries in the hosting partition, contact your next level of support.

Table 8. Obvious physical symptoms

Symptom	**Service action**
One or more of the following was reported: • Noise • Smoke • Odor	Go to the system safety inspection procedures for your specific system.
A part is broken or damaged.	Go to the System parts to get the part number. Then go to the remove and replace procedures for your specific system to exchange the part.

Table 9. Time-of-day problems

Symptom	**Service action**
System clock loses or gains more than 1 second per day when the system is connected to utility power.	Replace the service processor. See symbolic FRU SVCPROC.
System clock loses or gains more than 1 second per day when the system is disconnected from utility power.	Replace the time-of-day battery on the service processor. Go to symbolic FRU TOD_BAT.

AIX server or AIX partition symptoms

Use the following tables to find the symptom you are experiencing. If you cannot find your symptom, contact your next level of support.

Choose the description that best describes your situation:

- You have a service action to complete
- An LED is not operating as expected
- Control (operator) panel problems
- Reference codes
- Management consoles
- There is a display or monitor problem (for example, distortion or blurring)
- Power and cooling problems
- Other symptoms or problems

You have a service action to complete

Symptom	What you should do:
You have an open service event in the service action event log.	Go to "Beginning problem analysis" on page 1.
You have parts to exchange or a corrective action to complete.	1. Go to the remove and replace procedures for your specific server. 2. Go to Close of call procedure.
You need to verify that a part exchange or corrective action corrected the problem.	1. Go to Verifying the repair. 2. Go to the Close of call procedure.
You need to verify correct system operation.	1. Go to Verifying the repair. 2. Go to Close of call procedure.

An LED is not operating as expected

Symptom	What you should do:
The system attention LED on the control panel is on.	Go to "Beginning problem analysis" on page 1.
The rack indicator LED does not turn on, but a drawer identify LED is on.	1. Make sure that the rack indicator LED is properly mounted to the rack. 2. Make sure that the rack identify LED is properly cabled to the bus bar on the rack and to the drawer identify LED connector. 3. Replace the following parts one at a time: • Rack LED to bus bar cable • LED bus bar to drawer cable • LED bus bar 4. Contact your next level of support.

Control (operator) panel problems

Symptom	What you should do:
01 does not appear in the upper-left corner of the operator panel display after the power is connected and before you press the power-on button. Other symptoms appear in the operator panel display or LEDs before the power on button is pressed.	Go to Power problems.

Symptom	What you should do:
A bouncing or scrolling ball (moving row of dots) remains on the operator panel display, or the operator panel display is filled with dashes or blocks.	Verify that the operator panel connections to the system backplane are connected and properly seated. Also, reseat the service processor card. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. See Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. See Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Operator panel assembly. 2. Service processor.

Symptom	What you should do:
You have a blank display on the operator panel. Other LEDs on the operator panel appear to behave normally.	Verify that the operator panel connections to the system backplane are connected and properly seated. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. See Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. See Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Control (operator) panel assembly. 2. Service processor.
You have a blank display on the operator panel. Other LEDs on the operator panel are off.	Go to Power problems.

Reference codes

Symptom	What you should do:
An 8-digit error code is displayed.	Look up the reference code in the Reference codes section of IBM Knowledge Center. **Note:** If the repair for this code does not involve replacing a FRU (for instance, running an AIX command that fixes the problem or changing a hot-pluggable FRU), then update the AIX error log after the problem is resolved by completing the following steps: 1. In the online diagnostics, select **Task Selection** > **Log Repair Action**. 2. Select resource **sysplanar0**. On systems with a fault indicator LED, this changes the fault indicator LED from the fault state to the normal state.
The system stops with an 8-digit error code displayed when you boot.	Look up the reference code in the Reference codes section of IBM Knowledge Center.
The system stops and a 4-digit code displays on the control panel that does **not** begin with 0 or 2.	Look up the reference code in the Reference codes section of IBM Knowledge Center.
The system stops and a 4-digit code displays on the control panel that begins with 0 or 2.	Record SRN 101-*xxxx*, where *xxxx* is the 4-digit code that is displayed in the control panel. Then, look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN.
The system stops and a 3-digit number is displayed on the control panel.	Add 101– to the left of the three digits to create an SRN, then look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN. If a location code is displayed under the 3-digit error code, look at the location to see whether it matches the failing component that the SRN pointed to. If they do not match, complete the action that is given in the error code table. If the problem still exists, replace the failing component from the location code. If a location code is displayed under the 3-digit error code, record the location code. Record SRN 101-*xxx*, where *xxx* is the 3-digit number that is displayed in the operator panel display, then look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN.

Management consoles

Symptom	What you should do:
The management console cannot be used to manage a managed system, or the connection to the managed system is failing.	If the managed system is operating normally (that is, there are no error codes or other symptoms) the management console might have a problem, or the connection to the managed system might be damaged or incorrectly cabled. Complete the following steps: 1. Check the connections between the management console and the managed system. Correct any cabling errors, if found. If another cable is available, connect it in place of the existing cable and refresh the management console interface. You might have to wait up to 30 seconds for the managed system to reconnect. 2. Verify that any connected management console is connected to the managed system. **Note:** The managed system must have power that is connected, and either be waiting for a power-on instruction (that is, `01` is in the upper-left corner of the operator panel) or be running. If the managed system does not appear in the navigation area of the management console management environment, the management console or the connection to the managed system might be failing. 3. Go to the entry MAP: - Go to: Managing the HMC section. 4. If there is a problem with the service processor card or the system backplane, complete the following steps. - If you cannot fix the problem by using the HMC tests in the Managing the HMC section: a. Replace the service processor card. See the remove and replace procedures for your specific system. b. Replace the system backplane if not already replaced in substep a. See the remove and replace procedures for your specific system.

Symptom	What you should do:
The management console (HMC only) cannot call out by using the attached modem and the customer's telephone line.	If the managed system is operating normally (that is, there are no error codes or other symptoms), the management console might have a problem, or the connection to the modem and telephone line might have a problem. Complete the following steps: 1. Check the connections between the management console, the modem, and the telephone line. Correct any cabling errors, if found. 2. Go to the entry MAP in the Managing your server using the Hardware Management Console section.

There is a display problem (for example, distortion or blurring)

Symptom	What you should do:
All display problems.	1. If you are using the HMC: Go to the Managing the HMC section. 2. If you are using a graphics display, complete the following steps: a. Go to the problem determination procedures for the display. b. If you do not find a problem, complete the following steps, one at a time, until the problem is resolved: i) Replace the graphics display adapter. See the remove and replace procedures for your specific system. ii) Replace the backplane into which the card is plugged. See the remove and replace procedures for your specific system. 3. If you are using an ASCII terminal, complete the following steps: a. Make sure that the ASCII terminal is connected to S1. b. If problems persist, go to the problem determination procedures for the terminal. c. If you do not find a problem, replace the service processor. See the remove and replace procedures for your specific system.
There appears to be a display problem (distortion, blurring, and so on).	Go to the problem determination procedures for the display.

Power and cooling problems

Symptom	What you should do:
The system does not power on and no error codes are available.	Go to Power problems.
The power LEDs on the operator panel and the power supply do not come on or stay on.	1. Check the service processor error log. 2. Go to Power problems.
The power LEDs on the operator panel and the power supply come on and stay on, but the system does not power on.	1. Check the service processor error log. 2. Go to Power problems.
A rack or a rack-mounted unit will not power on.	1. Check the service processor error log. 2. Go to Power problems.
The cooling fans do not come on, or come on but do not stay on.	1. Check the service processor error log. 2. Go to Power problems.
The system attention LED on the operator panel is on and there is no error code displayed.	1. Check the service processor error log. 2. Go to Power problems.

Other symptoms or problems

Symptom	What you should do:
The system stopped and a code is displayed on the operator panel.	Go to “Beginning problem analysis” on page 1.
`01` is displayed in the upper-left corner of the operator panel and the fans are off.	The service processor is ready. The system is waiting for power-on. Boot the system. If the boot is unsuccessful, and the system returns to the default display (indicated by `01` in the upper-left corner of the operator panel), go to MAP 0200: Problem determination procedure.
The operator panel displays STBY.	The service processor is ready. The server was shut down by the operating system and is still powered on. This condition can be requested by a privileged system user with no faults. Go to “Beginning problem analysis” on page 1. **Note:** See the service processor error log for possible operating system fault indications.
All of the system power-on self-test (POST) indicators are displayed on the firmware console, the system pauses and then restarts. The term *POST indicators* refers to the device mnemonics (the words `memory`, `keyboard`, `network`, `scsi`, and `speaker`) that appear on the firmware console during the POST.	Go to Problems with loading and starting the operating system.

Symptom	**What you should do:**
The system stops and all of the POST indicators are displayed on the firmware console. The term *POST indicators* refers to the device mnemonics (the words `memory`, `keyboard`, `network`, `scsi`, and `speaker`) that appear on the firmware console during the power-on self-test (POST).	Go to Problems with loading and starting the operating system.
The system stops and the message `starting software please wait...`is displayed on the firmware console.	Go to Problems with loading and starting the operating system.
The system does not respond to the password that you entered or the system login prompt is displayed when you boot in service mode.	1. If the password is being entered from HMC: Go to the Managing the HMC. 2. If the password is being entered from a keyboard that is attached to the system, the keyboard or its controller might be faulty. In this case, replace these parts in the following order: a. Keyboard b. Service processor 3. If the password is being entered from an ASCII terminal, use the problem determination procedures for the ASCII terminal. Make sure that the ASCII terminal is connected to S1. If the problem persists, replace the service processor. If the problem is fixed, go to “MAP 0410: Repair checkout” on page 32.
The system stops with a prompt to enter a password.	Enter the password. You cannot continue until a correct password is entered. After you enter a valid password, go to the beginning of this table and wait for one of the other conditions to occur.
The system does not respond when the password is entered.	Go to Step 1020-2.
No codes are displayed on the operator panel within a few seconds of turning on the system. The operator panel is blank before the system is powered on.	Reseat the operator panel cable. If the problem is not resolved, replace in the following order: 1. Operator panel assembly. See the remove and replace procedures for your specific system. 2. Service processor. See the remove and replace procedures for your specific system. If the problem is fixed, go to “MAP 0410: Repair checkout” on page 32. If the problem is still not corrected, go to MAP 0200: Problem determination procedure.

Symptom	**What you should do:**
The SMS configuration list or boot sequence selection menu shows more SCSI devices that are attached to a controller or an adapter than are actually attached.	A device might be set to use the same SCSI bus ID as the control adapter. Note the ID being used by the controller or adapter (this can be checked or changed through an SMS utility), and verify that no device that is attached to the controller is set to use that ID. If settings do not appear to be in conflict, complete the following steps: 1. Go to MAP 0200: Problem determination procedure. 2. Replace the SCSI cable. 3. Replace the device. 4. Replace the SCSI adapter **Note:** In a **twin-tailed** configuration where there is more than one initiator device (normally another system) attached to the SCSI bus, it might be necessary to use SMS utilities to change the ID of the SCSI controller or adapter.
You have a problem that does not prevent the system from booting. The operator panel is functional and the rack indicator LED operates as expected.	Go to MAP 0200: Problem determination procedure.
All other symptoms.	Go to MAP 0200: Problem determination procedure.
All other problems.	Go to MAP 0200: Problem determination procedure.
You do not have a symptom.	Go to MAP 0200: Problem determination procedure.
You have parts to exchange or a corrective action to complete.	1. Go to “Beginning problem analysis” on page 1. 2. Go to Close of call procedure.
You need to verify that a part exchange or corrective action corrected the problem.	Go to “MAP 0410: Repair checkout” on page 32.
You need to verify correct system operation.	Go to “MAP 0410: Repair checkout” on page 32.

Symptom	**What you should do:**
The system stopped. A POST indicator is displayed on the system console and an eight-digit error code is not displayed.	If the POST indicator represents: 1. Memory, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 2. Keyboard a. Replace the keyboard. b. Replace the service processor, location: model dependent. c. Go to PFW 1548: Memory and processor subsystem problem isolation procedure. 3. Network, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 4. SCSI, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 5. Speaker a. Replace the control panel. The location depends on the model. b. Replace the service processor. The location depends on the model. c. Go to PFW 1548: Memory and processor subsystem problem isolation procedure.
The diagnostic operating instructions are displayed.	Go to MAP 0200: Problem determination procedure.
The system login prompt is displayed.	If you are loading the diagnostics from a CD-ROM, you might not have pressed the correct key or you might not have pressed the key soon enough when you were trying to indicate a service mode IPL of the diagnostic programs. If so, try to boot the CD-ROM again and press the correct key. **Note:** Complete the system shutdown procedure before you turn off the system. If you are sure that you pressed the correct key in a timely manner, go to Step 1020-2. If you are loading diagnostics from a Network Installation Management (NIM) server, check for the following items: • The bootlist on the client might be incorrect. • Cstate on the NIM server might be incorrect. • Network problems might be preventing you from connecting to the NIM server. Verify the settings and the status of the network. If you continue to have problems see Problems with loading and starting the operating system and follow the steps for network boot problems.

Symptom	What you should do:
The System Management Services (SMS) menu is displayed when you were trying to boot stand-alone AIX diagnostics.	If you are loading diagnostics from the CD-ROM, you might not have pressed the correct key when you were trying to indicate a service mode IPL of the diagnostic programs. If so, try to boot the CD-ROM again and press the correct key. If you are sure that you pressed the correct key, the device or media you are attempting to boot from might be faulty. 1. Try to boot from an alternate boot device that is connected to the same controller as the original boot device. If the boot succeeds, replace the original boot device (for removable media devices, try the media first). If the boot fails, go to Problems with loading and starting the operating system. 2. Go to PFW 1548: Memory and processor subsystem problem isolation procedure.
The SMS boot sequence selection menu or remote IPL menu does not show all of the bootable devices in the partition or system.	If an AIX or Linux partition is being booted, verify that the devices that you expect to see in the list are assigned to this partition. If they are not, use the management console to reassign the required resources. If they are assigned to this partition, go to Problems with loading and starting the operating system to resolve the problem.

MAP 0410: Repair checkout

Use this MAP to check out the server after a repair is completed.

Purpose of this MAP

Use this MAP to check out the server after a repair is completed.

Note: Only use standalone diagnostics for repair verification when no other diagnostics are available on the system. Standalone diagnostics do not log repair actions.

If you are servicing an SP system, go to the End-of-call MAP in the *SP System Service Guide*.

If you are servicing a clustered system, go to the End of Call MAP in the *Clustered eServer Installation and Service Guide*.

If you are servicing a cluster, go to the End-of-call procedure in the *Clustered Installation and Service Guide*.

- **Step 0410-1**

  Did you use an AIX diagnostics service aid hot-swap operation to change the FRU?

  No

  Go to Step 0410-2.

  Yes

  Go to Step 0410-4.

- **Step 0410-2**

  Note: If the system backplane or battery has been replaced and you are loading diagnostics from a server over a network, it may be necessary for the customer to set the network boot information for this system before diagnostics can be loaded. The system time and date information should also be set when the repair is completed.

Do you have any FRUs (for example cards, adapters, cables, or devices) that were removed during problem analysis that you want to put back into the system?

No
Go to Step 0410-3.

Yes
Reinstall all of the FRUs that were removed during problem analysis. Go to Step 0410-3.

- **Step 0410-3**

  Is the system or logical partition that you are performing a repair action on running the AIX operating system?

  No
  Go to Step 0410-5.

  Yes
  Go to Step 0410-4.

- **Step 0410-4**

  Does the system or logical partition you are performing a repair action on have AIX installed?

  Note: Answer **No** to this question if you have just replaced a hard disk in the root volume group.

  No
  Go to Step 0410-5.

  Yes
  Go to Step 0410-6.

- **Step 0410-5**

  Run standalone diagnostics from either a CD ROM or from a NIM server.

  Did you encounter any problems?

  No
  Go to Step 0410-14.

  Yes
  Go to MAP 0020: Problem determination procedure.

- **Step 0410-6**

  1. Power on the system.
  2. Wait until the AIX operating system login prompt displays or until system activity on the operator panel or display apparently has stopped.

  Did the AIX Login Prompt display?

  No
  Go to MAP 0020: Problem determination procedure.

  Yes
  Go to Step 0410-7.

- **Step 0410-7**

  If the **Resource Repair Action** menu is already displayed, go to Step 0410-10; otherwise, complete the following steps:

  1. Log into the operating system either with root authority (if needed, ask the customer to enter the password) or use the CE login.
  2. Enter the `diag -a` command and check for missing resources. Follow any instructions that display. If an SRN displays, suspect a loose card or connection. If no instructions display, no resources were detected as missing. Continue on to Step 0410-8

- **Step 0410-8**

  1. Enter `diag` at the command prompt.
  2. Press Enter.
  3. Select the **Diagnostics Routines** option.
  4. When the DIAGNOSTIC MODE SELECTION menu displays, select **Problem determination**.
  5. When the ADVANCED DIAGNOSTIC SELECTION menu displays, select the **All Resources** option or test the FRUs you exchanged, and any devices that are attached to the FRUs you exchanged, by selecting the diagnostics for the individual FRU.

  Did the RESOURCE REPAIR ACTION menu (801015) display?

  No
  Go to Step 0410-9.

  Yes
  Go to Step 0410-10.

- **Step 0410-9**

  Did the TESTING COMPLETE, no trouble was found menu (801010) display?

  No
  There is still a problem. Go to MAP 0020: Problem determination procedure.

  Yes
  Use the **Log Repair Action** option, if not previously logged, in the TASK SELECTION menu to update the AIX error log. If the repair action was reseating a cable or adapter, select the resource associated with that repair action.

  If the resource associated with your action is not displayed on the resource list, select **sysplanar0**.

  Note: If the check log indicator is on, this will set it back to the normal state.

  Go to Step 0410-12.

- **Step 0410-10**

  When a test is run on a resource in system verification mode, and that resource has an entry in the AIX error log, if the test on the resource was successful, the RESOURCE REPAIR ACTION menu displays.

  After replacing a FRU, you must select the resource for that FRU from the RESOURCE REPAIR ACTION menu. This updates the AIX error log to indicate that a system-detectable FRU has been replaced.

  Note: If the check log indicator is on, this action will set it back to the normal state.

  Complete the following steps:

  1. Select the resource that has been replaced from the RESOURCE REPAIR ACTION menu. If the repair action was reseating a cable or adapter, select the resource associated with that repair action. If the resource associated with your action is not displayed on the resource list, select **sysplanar0**.
  2. Press **Commit** after you make your selections.

  Did another Resource Repair Action (801015) display?

  No
  If the No Trouble Found menu displays, go to Step 0410-12.

  Yes
  Go to Step 0410-11.

- **Step 0410-11**

  The parent or child of the resource you just replaced may also require that you run the RESOURCE REPAIR ACTION service aid on it.

  When a test is run on a resource in system verification mode, and that resource has an entry in the AIX error log, if the test on the resource was successful, the RESOURCE REPAIR ACTION menu displays.

After replacing that FRU, you must select the resource for that FRU from the RESOURCE REPAIR ACTION menu. This updates the AIX error log to indicate that a system-detectable FRU has been replaced.

Note: If the check log indicator is on, this action will set it back to the normal state.

Complete the following steps:

1. From the RESOURCE REPAIR ACTION menu, select the parent or child of the resource that has been replaced . If the repair action was reseating a cable or adapter, select the resource associated with that repair action. If the resource associated with your action is not displayed on the resource list, select **sysplanar0**.
2. Press COMMIT after you make your selections.
3. If the No Trouble Found menu displays, go to Step 0410-12.

- **Step 0410-12**

  If you changed the service processor or network settings, as instructed in previous MAPs, restore the settings to the value they had prior to servicing the system. If you ran standalone diagnostics from CD-ROM, remove the standalone diagnostics CD-ROM from the system.

  Did you perform service on a RAID subsystem involving changing of the PCI RAID adapter cache card or changing the configuration?

  No
  Go to Step 0410-14.

  Yes
  Go to Step 0410-13.

- **Step 0410-13**

  Use the **Recover Options** selection to resolve the RAID configuration. To do this, complete the following steps:

  1. On the PCI SCSI Disk Array Manager screen, select **Recovery options**.
  2. If a previous configuration exists on the replacement adapter, this must be cleared. Select **Clear PCI SCSI Adapter Configuration**. Press F3.
  3. On the Recovery Options screen, select **Resolve PCI SCSI RAID Adapter Configuration**.
  4. On the Resolve PCI SCSI RAID Adapter Configuration screen, select **Accept Configuration on Drives**.
  5. On the PCI SCSI RAID Adapter selections menu, select the adapter that you changed.
  6. On the next screen, press Enter.
  7. When you get the Are You Sure selection menu, press Enter to continue.
  8. You should get an OK status message when the recover is complete. If you get a `Failed` status message, verify that you selected the correct adapter, then repeat this procedure. When recover is complete, exit the operating system.
  9. Go to Step 0410-14.

- **Step 0410-14**

  If the system you are servicing has a management console, go to the end-of-call procedure for systems with Service Focal Point.

This completes the repair; return the server to the customer.

Linux server or Linux partition symptoms

Use the following tables to find the symptom you are experiencing. If you cannot find your symptom, contact your next level of support.

Choose the description that best describes your situation:

- You have a service action to complete
- An LED is not operating as expected
- Control (operator) panel problems
- Reference codes
- Management consoles
- There is a display or monitor problem (for example, distortion or blurring)
- Power and cooling problems
- Other symptoms or problems

You have a service action to complete

Symptom	What you should do:
You have an open service event in the service action event log.	Go to "Beginning problem analysis" on page 1.
You have parts to exchange or a corrective action to complete.	1. Go to the remove and replace procedures for your specific system. 2. Go to Close of call procedure.
You need to verify that a part exchange or corrective action corrected the problem.	1. Go to Verifying the repair. 2. Go to the Close of call procedure.
You need to verify correct system operation.	1. Go to Verifying the repair. 2. Go to the Close of call procedure.

An LED is not operating as expected

Symptom	What you should do:
The system attention LED on the control panel is on.	Go to "Linux fast-path problem isolation" on page 46.
The rack identify LED does not operate properly.	Go to the "Linux fast-path problem isolation" on page 46.
The rack indicator LED does not turn on, but a drawer identify LED is on.	1. Make sure that the rack indicator LED is properly mounted to the rack. 2. Make sure that the rack identify LED is properly cabled to the bus bar on the rack and to the drawer identify LED connector. 3. Replace the following parts one at a time: • Rack LED to bus bar cable • LED bus bar to drawer cable • LED bus bar 4. Contact your next level of support.

Control (operator) panel problems

Symptom	What you should do:
01 does not appear in the upper-left corner of the operator panel display after the power is connected and before you press the power-on button. Other symptoms appear in the operator panel display or LEDs before the power on button is pressed.	Go to Power problems.
A bouncing or scrolling ball (moving row of dots) remains on the operator panel display, or the operator panel display is filled with dashes or blocks.	Verify that the operator panel connections to the system backplane are connected and properly seated. Also, reseat the service processor card. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Operator panel assembly. 2. Service processor.

Symptom	**What you should do:**
You have a blank display on the operator panel. Other LEDs on the operator panel appear to behave normally.	Verify that the operator panel connections to the system backplane are connected and properly seated. If a client computer (such as a PC with Ethernet capability and a Web browser) is available, connect it to the service processor in the server that is displaying the symptom. To connect a personal computer with Ethernet capability and a Web browser, or an ASCII terminal, to access the Advanced System Management Interface (ASMI), go to Managing your server using the Advanced System Management Interface. • If you can successfully access the ASMI, replace the operator panel assembly. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. • If you cannot successfully access the ASMI, replace the service processor. Refer to Finding parts, locations, and addresses to determine the part number and correct exchange procedure. If you do not have a PC or ASCII terminal, replace the following one at a time (go to Finding parts, locations, and addresses to determine the part number and correct exchange procedure): 1. Control (operator) panel assembly. 2. Service processor.
You have a blank display on the operator panel. Other LEDs on the operator panel are off.	Go to Power problems.

Reference codes

Symptom	What you should do:
An 8-digit error code is displayed.	Look up the reference code in the Reference codes section of IBM Knowledge Center. **Note:** If the repair for this code does not involve replacing a FRU (for instance, running an AIX command that fixes the problem or changing a hot-pluggable FRU), then update the AIX error log after the problem is resolved by completing the following steps: 1. In the online diagnostics, select **Task SelectionLog Repair Action**. 2. Select resource **sysplanar0**. On systems with a fault indicator LED, this changes the "fault indicator" LED from the "fault" state to the "normal" state.
The system stops with an 8-digit error code displayed when you boot.	Look up the reference code in the Reference codes section of IBM Knowledge Center.
The system stops and a 4-digit code displays on the control panel that does **not** begin with 0 or 2.	Look up the reference code in the Reference codes section of IBM Knowledge Center.
The system stops and a 4-digit code displays on the control panel that begins with 0 or 2 is displayed in the operator panel display.	Record SRN 101-*xxxx*, where *xxxx* is the 4-digit code that is displayed in the control panel, then look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN.
The system stops and a 3-digit number is displayed on the control panel.	Add 101– to the left of the three digits to create an SRN, then look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN. If a location code is displayed under the 3-digit error code, look at the location to see whether it matches the failing component that the SRN pointed to. If they do not match, complete the action that is given in the error code table. If the problem still exists, then replace the failing component from the location code. If a location code is displayed under the 3-digit error code, record the location code. Record SRN 101-*xxx*, where *xxx* is the 3-digit number that is displayed in the operator panel display, then look up this reference code in the Reference codes section of IBM Knowledge Center. Follow the instructions that are given in the Description and Action column for your SRN.

Management consoles

Symptom	**What you should do:**
The management console cannot be used to manage a managed system, or the connection to the managed system is failing.	If the managed system is operating normally (no error codes or other symptoms), the management console might have a problem, or the connection to the managed system might be damaged or incorrectly cabled. Complete the following steps: 1. Check the connections between the management console and the managed system. Correct any cabling errors if found. If another cable is available, connect it in place of the existing cables and refresh the management console interface. You might need to wait up to 30 seconds for the managed system to reconnect. 2. Verify that any connected management console is connected to the managed system by checking the Management Environment of the management console. **Note:** The managed system must have power that is connected and the system running, or waiting for a power-on instruction (`01` is in the upper-left corner of the operator panel). If the managed system does not appear in the Navigation area of the management console Management Environment, the management console or the connection to the managed system might be failing. 3. Go to the Managing the HMC section. 4. There might be a problem with the service processor card or the system backplane. If you cannot fix the problem by using the HMC tests in the Managing the HMC section, complete the following steps, one at a time, until the problem is resolved: a. Replace the service processor card. Refer to the remove and replace procedures for your specific system. b. Replace the management console system backplane. Refer to the remove and replace procedures for your specific system.

Symptom	What you should do:
The management console (HMC only) cannot call out using the attached modem and the customer's telephone line.	If the managed system is operating normally (no error codes or other symptoms), the management console might have a problem, or the connection to the modem and telephone line might have a problem. Complete the following steps: 1. Check the connections between the management console, the modem, and the telephone line. Correct any cabling errors, if found. 2. Go to the Managing your server using the Hardware Management Console section.

There is a display problem (for example, distortion or blurring)

Symptom	What you should do:
All display problems.	1. Go to the Managing the HMC section. 2. If you are using a graphics display, complete the following steps: a. Go to the problem determination procedures for the display. b. If you do not find a problem, complete the following steps, one at a time, until the problem is resolved: i) Replace the graphics display adapter. Refer to the remove and replace procedures for your specific system. ii) Replace the backplane into which the graphics display adapter is plugged. Refer to the remove and replace procedures for your specific system.
There appears to be a display problem (distortion, blurring, and so on).	Go to the problem determination procedures for the display.

Power and cooling problems

Symptom	What you should do:
The system does not power on and no error codes are available.	Go to Power problems.
The power LEDs on the operator panel and the power supply do not come on or stay on.	1. Check the service processor error log. 2. Go to Power problems.
The power LEDs on the operator panel and the power supply come on and stay on, but the system does not power on.	1. Check the service processor error log. 2. Go to Power problems.
A rack or a rack-mounted unit will not power on.	1. Check the service processor error log. 2. Go to Power problems.

Symptom	What you should do:
The cooling fans do not come on, or come on but do not stay on.	1. Check the service processor error log. 2. Go to Power problems.
The system attention LED on the operator panel is on and no error code is displayed.	1. Check the service processor error log. 2. Go to Power problems.

Other symptoms or problems

Symptom	What you should do:
The system stopped and a code is displayed on the operator panel.	Go to "Beginning problem analysis" on page 1.
`01` is displayed in the upper-left corner of the operator panel and the fans are off.	The service processor is ready. The system is waiting for power-on. Boot the system. If the boot is unsuccessful, and the system returns to the default display (indicated by `01` in the upper-left corner of the operator panel), go to MAP 0020: Problem determination procedure.
The operator panel displays STBY.	The service processor is ready. The server was shut down by the operating system and is still powered on. This condition can be requested by a privileged system user with no faults. Go to "Beginning problem analysis" on page 1. **Note:** See the service processor error log for possible operating system fault indications.
All of the system POST indicators are displayed on the firmware console, the system pauses and then restarts. The term *POST indicators* refers to the device mnemonics (the words `memory`, `keyboard`, `network`, `scsi`, and `speaker`) that appear on the firmware console during the power-on self-test (POST).	Go to Problems with loading and starting the operating system.
The system stops and all of the POST indicators are displayed on the firmware console. The term *POST indicators* refers to the device mnemonics (the words `memory`, `keyboard`, `network`, `scsi`, and `speaker`) that appear on the firmware console during the power-on self-test (POST).	Go to Problems with loading and starting the operating system.
The system stops and the message `starting software please wait...`is displayed on the firmware console.	Go to Problems with loading and starting the operating system.

Symptom	What you should do:
The system does not respond to the password that was entered or the system login prompt is displayed when you boot the system in service mode.	1. Go to the Managing the HMC. 2. If the password is being entered from a keyboard that is attached to the system, the keyboard or its controller might be faulty. In this case, replace these parts in the following order: a. Keyboard b. Service processor If the problem is fixed, go to “MAP 0410: Repair checkout” on page 32.
The system stops with a prompt to enter a password.	Enter the password. You cannot continue until a correct password is entered. After you enter a valid password, go to the beginning of this table and wait for one of the other conditions to occur.
The system does not respond when the password is entered.	Go to Step 1020-2.
No codes are displayed on the operator panel within a few seconds of turning on the system. The operator panel is blank before the system is powered on.	Reseat the operator panel cable. If the problem is not resolved, replace in the following order: 1. Operator panel assembly. Refer to the remove and replace procedures for your specific system. 2. Service processor. Refer to the remove and replace procedures for your specific system. If the problem is fixed, go to “MAP 0410: Repair checkout” on page 32. If the problem is still not corrected, go to MAP 0020: Problem determination procedure.
The SMS configuration list or boot sequence selection menu shows more SCSI devices that are attached to a controller/adapter than are actually attached.	A device might be set to use the same SCSI bus ID as the control adapter. Note the ID being used by the controller/adapter (this can be checked or changed through an SMS utility), and verify that no device that is attached to the controller is set to use that ID. If settings do not appear to be in conflict, complete the following steps: 1. Go to MAP 0020: Problem determination procedure. 2. Replace the SCSI cable. 3. Replace the device. 4. Replace the SCSI adapter. **Note:** In a "twin-tailed" configuration where there is more than one initiator device (normally another system) attached to the SCSI bus, it might be necessary to use SMS utilities to change the ID of the SCSI controller or adapter.

Symptom	What you should do:
You suspect a cable problem.	Go to Adapters, Devices and Cables for Multiple Bus Systems.
You have a problem that does not prevent the system from booting. The operator panel is functional and the rack indicator LED operates as expected.	Go to MAP 0020: Problem determination procedure.
All other symptoms.	Go to MAP 0020: Problem determination procedure.
All other problems.	Go to MAP 0020: Problem determination procedure.
You do not have a symptom.	Go to MAP 0020: Problem determination procedure.
You have parts to exchange or a corrective action to complete.	1. Go to "Beginning problem analysis" on page 1. 2. Go to Close of call procedure.
You need to verify that a part exchange or corrective action corrected the problem.	Go to "MAP 0410: Repair checkout" on page 32.
You need to verify correct system operation.	Go to "MAP 0410: Repair checkout" on page 32.
The system stopped. A POST indicator is displayed on the system console and an eight-digit error code is not displayed.	If the POST indicator represents: 1. Memory, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 2. Keyboard a. Replace the keyboard. b. Replace the service processor. The location depends on the model. c. Go to PFW 1548: Memory and processor subsystem problem isolation procedure. 3. Network, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 4. SCSI, go to PFW 1548: Memory and processor subsystem problem isolation procedure. 5. Speaker a. Replace the control panel. The location depends on the model. b. Replace the service processor. The location depends on the model. c. Go to PFW 1548: Memory and processor subsystem problem isolation procedure.
The diagnostic operating instructions are displayed.	Go to MAP 0020: Problem determination procedure.

Symptom	What you should do:
The system login prompt is displayed.	If you are loading the diagnostics from a CD-ROM, you might not have pressed the correct key or you might not have pressed the key soon enough when you were trying to indicate a service mode IPL of the diagnostic programs. If so, start again at the beginning of this step. **Note:** Complete the system shutdown procedure before you turn off the system. If you are sure that you pressed the correct key in a timely manner, go to Step 1020-2. If you are loading diagnostics from a Network Installation Management (NIM) server, check for the following items: • The bootlist on the client might be incorrect. • Cstate on the NIM server might be incorrect. • There might be network problems that are preventing you from connecting to the NIM server. Verify the settings and the status of the network. If you continue to have problems refer to Problems with loading and starting the operating system and follow the steps for network boot problems.
The System Management Services (SMS) menu is displayed when you were trying to boot stand-alone diagnostics.	If you are loading diagnostics from the CD-ROM, you might not have pressed the correct key when you were trying to indicate a service mode IPL of the diagnostic programs. If so, try to boot the CD-ROM again and press the correct key. If you are sure that you pressed the correct key, the device or media you are attempting to boot from might be faulty. 1. Try to boot from an alternate boot device that is connected to the same controller as the original boot device. If the boot succeeds, replace the original boot device (for removable media devices, try the media first). If the boot fails, go to problems with loading and starting the operating system. 2. Go to PFW 1548: Memory and processor subsystem problem isolation procedure.
The SMS boot sequence selection menu or remote IPL menu does not show all of the bootable devices in the partition or system.	If an AIX or Linux partition is being booted, verify that the devices that you expect to see in the list are assigned to this partition. If they are not, use the management console to reassign the required resources. If they are assigned to this partition, go to Problems with loading and starting the operating system to resolve the problem.

Linux fast-path problem isolation

Use this information to help you isolate a hardware problem when you use the Linux operating system.

Linux fast path table

Locate the problem in the following table and then go to the action indicated for the problem.

Symptoms	Action
You have an eight-digit reference code.	Go to Reference codes, and do the listed action for the eight-digit reference code.
You are trying to isolate a problem on a Linux server or a partition that is running Linux operating system.	**Note:** This procedure is used to help display an eight-digit reference code by using system log information. Before you use this procedure, if you are having a problem with a media device such as a tape or DVD-ROM drive, continue through this table and follow the actions for the appropriate device. Go to "Linux problem isolation procedure" on page 49.
You suspect a problem with your server but you do not have any specific symptom.	Go to MAP 0020: Problem determination procedure for problem determination procedures.
You need to run the eServer™ stand-alone diagnostics.	Go to AIX and Linux diagnostics and service aids
SRNs	
You have an SRN.	Look up the SRN in the Service request numbers and do the listed action.
An SRN is displayed when you run the eServer stand-alone diagnostics.	1. Record the SRN and location code. 2. Look up the SRN in the Service request numbers and do the listed action.
Tape Drive Problems	
You suspect a tape drive problem.	1. Refer to the tape drive documentation and clean the tape drive. 2. Refer to the tape drive documentation and do any listed problem determination procedures. 3. Go to MAP 0020: Problem determination procedure for problem determination procedures. **Note:** Information on tape cleaning and tape-problem determination is normally either in the tape drive operator guide or the system operator guide.
Optical Drive Problems	
You suspect an optical drive problem.	1. Refer to the optical documentation and do any listed problem determination procedures. 2. Before you service an optical drive, ensure that it is not in use and that the power connector is correctly attached to the drive. If the load or unload operation does not function, replace the optical drive. 3. Go to MAP 0020: Problem determination procedure for problem determination procedures. **Note:** If the optical drive has its own user documentation, follow any problem determination for the optical drive.

Symptoms	Action
SCSI Disk Drive Problems	
You suspect a disk drive problem. Disk problems are logged in the error log and are analyzed when the stand-alone disk diagnostics are run in problem determination mode. Problems are reported if the number of errors is above defined thresholds.	Go to MAP 0020: Problem determination procedure for problem determination procedures.
Token-Ring Problems	
You suspect a token-ring adapter or network problem.	1. Check with the network administrator for known problems. 2. Go to MAP 0020: Problem determination procedure for problem determination procedures.
Ethernet Problems	
You suspect an Ethernet adapter or network problem.	1. Check with the network administrator for known problems. 2. Go to MAP 0020: Problem determination procedure for problem determination procedures.
Display Problems	
You suspect a display problem.	1. If your display is connected to a KVM switch, go to Troubleshooting the keyboard, video, and mouse (KVM) switch for the 1x8 and 2x8 console manager. If you are still having display problems after you complete the KVM switch procedures, come back here and continue with step 2. 2. Go to the Managing your server using the Hardware Management Console section. 3. If you are using a graphics display, complete the following steps: a. Go to the problem determination procedures for the display. b. If you do not find a problem, complete the following steps, one at a time, until the problem is resolved: i) Replace the graphics display adapter. Refer to the remove and replace procedures for your specific system. ii) Replace the backplane into which the graphics display adapter is plugged. Refer to the remove and replace procedures for your specific system.
Keyboard or Mouse	

Symptoms	Action
You suspect a keyboard or mouse problem.	If your keyboard is connected to a KVM switch, go to Troubleshooting the keyboard, video, and mouse (KVM) switch for the 1x8 and 2x8 console manager. If you are still having keyboard problems after you complete the KVM switch procedures, come back here and continue to the next paragraph. Go to MAP 0020: Problem determination procedure for problem determination procedures. If you are unable to run diagnostics because the system does not respond to the keyboard, replace the keyboard or system backplane. **Note:** If the problem is with the keyboard, it might be caused by the mouse device. To check, unplug the mouse and then recheck the keyboard. If the keyboard works, replace the mouse.
System Messages	
A System Message is displayed.	1. If the message describes the cause of the problem, attempt to correct it. 2. Look for another symptom to use.
System Hangs or Loops when you run the OS or Diagnostics	
The system hangs in the same application.	Suspect the application. To check the system, complete the following steps: 1. Power off the system. 2. Go to MAP 0020: Problem determination procedure for problem determination procedures. 3. If an SRN is displayed at anytime, record the SRN and location code. 4. Look up the SRN in the Service request numbers and do the listed action.
The system hangs in various applications.	1. Power off the system. 2. Go to MAP 0020: Problem determination procedure for problem determination procedures. 3. If an SRN is displayed at anytime, record the SRN and location code. 4. Look up the SRN in the Service request numbers and do the listed action.
The system hangs when you run diagnostics.	Replace the resource that is being tested.
Exchanged FRUs Did Not Fix the Problem	
A FRU or FRUs you exchanged did not fix the problem.	Go to MAP 0020: Problem determination procedure for problem determination procedures.
You Cannot Find the Symptom in This Table	
All other problems.	Go to MAP 0020: Problem determination procedure for problem determination procedures.

Linux problem isolation procedure
Use this procedure when servicing a Linux partition or a server that has Linux as its only operating system.

About this task

DANGER: When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard: If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product. Do not open or service any power supply assembly. Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.

- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords. For AC power, disconnect all power cords from their AC power source. For racks with a DC power distribution panel (PDP), disconnect the customer's DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected. For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate. For racks with a DC power distribution panel (PDP), connect the customer's DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.
- Connect any equipment that will be attached to this product to properly wired outlets.
- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- When performing a machine inspection: Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements. Do not attempt to switch power to the machine until all possible unsafe conditions are corrected. Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.
- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

  To Disconnect: 1) Turn off everything (unless instructed otherwise). 2) For AC power, remove the power cords from the outlets. 3) For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source. 4) Remove the signal cables from the connectors. 5) Remove all cables from the devices.

  To Connect: 1) Turn off everything (unless instructed otherwise). 2) Attach all cables to the devices. 3) Attach the signal cables to the connectors. 4) For AC power, attach the power cords to the outlets. 5) For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP. 6) Turn on the devices.
- Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

These procedures define the steps to take when servicing a Linux partition or a server that has Linux as its only operating system.

Before continuing with this procedure it is recommended that you review the additional software available to enhance your Linux solutions. See Service and productivity tools for PowerLinux servers (http://www14.software.ibm.com/webapp/set2/sas/f/lopdiags).

Note: If the server is attached to a management console, the various codes that might display on the management console are all listed as reference codes by Service Focal Point (SFP). Use the following table to help you identify the type of error information that might be displayed when you are using this procedure.

Number of digits in reference code	Reference code	Name or code type
Any	Contains # (number sign)	Menu goal
Any	Contains - (hyphen)	Service request number (SRN)
5	Does not contain # or -	SRN
8	Does not contain # or -	system reference code (SRC)

Procedure

1. Is the server managed by a management console that is running Service Focal Point (SFP)?

   No
   Go to step "3" on page 50.

   Yes
   Go to step "2" on page 50.
2. Servers with Service Focal Point

   Look at the service action event log in SFP for errors. Focus on those errors with a timestamp near the time at which the error occurred. Follow the steps indicated in the error log entry to resolve the problem. If the problem is not resolved, continue with step "3" on page 50.
3. Look for and record all reference code information or software messages on the operator panel and in the service processor error log (which is accessible by viewing the ASMI menus).
4. Choose a Linux partition that is running correctly (preferably the partition with the problem).

   Is Linux usable in any partition with Linux installed?

   No
   Go to step "10" on page 51.

   Yes
   Go to step "5" on page 50.
5. Diagnose the RTAS events. For instructions, see Diagnosing RTAS events.
6. Record any RTAS events found in the Linux system log

   If the system is configured with more than one logical partition with Linux installed, repeat step "5" on page 50 and step "6" on page 50 for all logical partitions that have Linux installed.
7. Examine the Linux boot (IPL) log by logging in to the system as the root user and entering the following command:

   ```
   cat /var/log/boot.msg |grep RTAS |more
   ```

   Linux boot (IPL) error messages are logged into the **boot.msg** file under **/var/log**. An example of the Linux boot error log:

   ```
   RTAS daemon started
   RTAS: -------- event-scan begin --------
   RTAS: Location Code: U0.1-F3
   RTAS: WARNING: (FULLY RECOVERED) type: SENSOR
   RTAS: initiator: UNKNOWN target: UNKNOWN
   RTAS: Status: bypassed new
   RTAS: Date/Time: 20020830 14404000
   RTAS: Environment and Power Warning
   RTAS: EPOW Sensor Value: 0x00000001
   RTAS: EPOW caused by fan failure
   RTAS: -------- event-scan end ----------
   ```

8. Record any RTAS events found in the Linux boot (IPL) log in step “7” on page 50.

   Ignore all other events in the Linux boot (IPL) log. If the system is configured with more than one logical partition with Linux installed, repeat step “7” on page 50 and step “8” on page 51 for all logical partitions that have Linux installed.
9. Record any extended data found in the Linux system log in Step “5” on page 50 or the Linux boot (IPL) log in step “7” on page 50.

   Note: The lines in the Linux extended data that begin with `<4>RTAS: Log Debug: 04` contain the reference code listed in the next 8 hexadecimal characters. In the previous example, `4b27 26fb` is a reference code. The reference code is also known as word 11. Each 4 bytes after the reference code in the Linux extended data is another word (for example, `04a0 0011` is word 12, and `702c 0014` is word 13, and so on).

   If the system is configured with more than one logical partition with Linux installed, repeat step “9” on page 51 for all logical partitions that have Linux installed.
10. Were any reference codes or checkpoints recorded in steps “3” on page 50, “6” on page 50, “8” on page 51, or “9” on page 51?

    No

    Go to step “11” on page 51.

    Yes

    Go to the Linux fast-path problem isolation with each reference code that was recorded. Perform the indicated actions one at a time for each reference code until the problem has been corrected. If all recorded reference codes have been processed and the problem has not been corrected, go to step “11” on page 51.
11. If no additional error information is available and the problem has not been corrected, complete the following steps:

    a) Shut down the system.

    b) If a management console is not attached, see Managing your server using the Advanced System Management Interface for instructions to access the ASMI.

    Note: The ASMI functions can also be accessed by using a personal computer connected to system port 1.

    You need a personal computer capable of connecting to system port 1 on the system unit. (The Linux login prompt cannot be seen on a personal computer connected to system port 1.) If the ASMI functions are not otherwise available, use the following procedure:

    i) Attach the personal computer and cable to system port 1 on the system unit.

    ii) With 01 displayed in the operator panel, press a key on the virtual terminal on the personal computer. The service ASMI menus are available on the attached personal computer.

    iii) If the service processor menus are not available on the personal computer, perform the following steps:

    a) Examine and correct all connections to the service processor.

    b) Replace the service processor.

    Note: The service processor might be contained on a separate card or board; in some systems, the service processor is built into the system backplane. Contact your next level of support for help before replacing a system backplane.

    c) Examine the service processor error log.

    Record all reference codes and messages written to the service processor error log. Go to step “12” on page 51.
12. Were any reference codes recorded in step “11” on page 51?

    No

    Go to step “20” on page 53.

Yes

Go to the Linux fast-path problem isolation with each reference code or symptom you have recorded. Perform the indicated actions, one at a time, until the problem has been corrected. If all recorded reference codes have been processed and the problem has not been corrected, go to "20" on page 53.

13. Reboot the system and bring all partitions to the login prompt.

    If Linux is not usable in all partitions, go to step "17" on page 53.

14. Use the `lscfg` command to list all resources assigned to all partitions.

    Record the adapter and the partition for each resource.

15. To determine whether any devices or adapters are missing, compare the list of partition assignments, and resources found, to the customer's known configuration. Record the location of any missing devices.

    Also record any differences in the descriptions or the locations of devices.

    You may also compare this list of resources that were found to an earlier version of the device tree as follows:

    Note: At the Linux command prompt, type `vpdupdate`, and press Enter. The device tree is stored in the `/var/lib/lsvpd/` directory in a file with the file name device-tree-YYYY-MM-DD-HH:MM:SS, where YYYY is the year, MM is the month, DD is the day, and HH, MM, and SS are the hour, minute and second, respectively, of the date of creation.

    - At the command line, type the following:

      ```
      cd /var/lib/lsvpd/
      ```

    - At the command line, type the following:

      ```
      lscfg -vpz /var/lib/lsvpd/<file_name>
      ```

      Where, *<file_name>* is the .gz file name that contains the database archive.

    The **diff** command offers a way to compare the output from a current **lscfg** command to the output from an older **lscfg** command. If the files names for the current and old device trees are **current.out** and **old.out**, respectively, type: `diff old.out current.out`. Any lines that exist in the old, but not in the current will be listed and preceded by a less-than symbol (<). Any lines that exist in the current, but not in the old will be listed and preceded by a greater-than symbol (>). Lines that are the same in both files are not listed; for example, files that are identical will produce no output from the diff command. If the location or description changes, lines preceded by both < and > will be output.

    If the system is configured with more than one logical partition with Linux installed, repeat "14" on page 52 and "15" on page 52 for all logical partitions that have Linux installed.

16. Was the location of one and only one device recorded in "15" on page 52?

    No

    If you previously answered Yes to step "16" on page 52, return the system to its original configuration. **This ends the procedure**.

    Go to MAP 0410: Repair checkout.

    If you did not previously answer Yes to step "16" on page 52, go to step "17" on page 53.

    Yes

    Complete the following steps one at a time. Power off the system before each step. After each step, power on the system and go to step "13" on page 52.

    a. Check all connections from the system to the device.

    b. Replace the device (for example, tape or DASD).

    c. If applicable, replace the device backplane.

    d. Replace the device cable.

e. Replace the adapter.

   - If the adapter resides in an I/O drawer, replace the I/O backplane.
   - If the device adapter resides in the CEC, replace the I/O riser card, or the CEC backplane in which the adapter is plugged.

f. Call service support. Do not go to step “13” on page 52.

17. Does the system appear to stop or hang before reaching the login prompt or did you record any problems with resources in step “15” on page 52?

    Note: If the system console or VTERM window is always blank, choose NO. If you are sure the console or VTERM is operational and connected correctly, answer the question for this step.

    No
    Go to step “18” on page 53.

    Yes
    There may be a problem with an I/O device. Go to PFW1542: I/O problem isolation procedure. When instructed to boot the system, boot a full system partition.

18. Boot the eServer standalone diagnostics, refer to Running the online and stand-alone diagnostics.

    Run diagnostics in problem determination mode on all resources. Be sure to boot a full system partition. Ensure that diagnostics were run on all known resources. You may need to select each resource individually and run diagnostics on each resource one at a time.

    Did standalone diagnostics find a problem?

    No
    Go to step “22” on page 53.

    Yes
    Go to the Reference codes and perform the actions for each reference code you have recorded. For each reference code not already processed in step “16” on page 52, repeat this action until the problem has been corrected. Perform the indicated actions, one at a time. If all recorded reference codes have been processed and the problem has not been corrected, go to step “22” on page 53.

19. Does the system have Linux installed on one or more partitions?

    No
    Return to the “Beginning problem analysis” on page 1.

    Yes
    Go to step “3” on page 50.

20. Were any location codes recorded in steps “3” on page 50, “6” on page 50, “8” on page 51, “9” on page 51, “10” on page 51, or “11” on page 51?

    No
    Go to step “13” on page 52.

    Yes
    Replace, one at a time, all parts whose location code was recorded in steps “3” on page 50, “6” on page 50, “8” on page 51, “9” on page 51, “10” on page 51, or “11” on page 51 that have not been replaced. Power off the system before replacing a part. After replacing the part, power on the system to check if the problem has been corrected. Go to step “21” on page 53 when the problem has been corrected, or all parts in the location codes list have been replaced.

21. Was the problem corrected in step “20” on page 53?

    No
    Go to step “13” on page 52.

    Yes
    Return the system to its original configuration. **This ends the procedure**.

    Go to MAP 0410: Repair checkout.

22. Were any other symptoms recorded in step “3” on page 50?

No

Call support.

Yes

Go to the "Beginning problem analysis" on page 1 with each symptom you have recorded. Perform the indicated actions for all recorded symptoms, one at a time, until the problem has been corrected. If all recorded symptoms have been processed and the problem has not been corrected, call your next level of support.

Detecting problems

Provides information on using various tools and techniques to detect and identify problems.

IBM i problem determination procedures

There are several tools you can use to determine a problem with an IBM i system or partition.

For information about these tools, see the following topics:

- Searching the service action log
- Using the product activity log
-

Using the problem log

Use this procedure to find and analyze a problem log entry that relates to the problem reported.

About this task

Note: For on-line problem analysis (WRKPRB), ensure that you are logged on with QSRV authority. During problem isolation, this will allow access to test procedures that are not available under any other log-on.

Procedure

1. On the command line, enter the Work with Problems command:

   ```
   WRKPRB
   ```

   Note: Use F4 to change the WRKPRB parameters to select and sort on specific problem log entries that match the problem. Also, F11 displays the dates and times the problems were logged by the system.

   Was an entry that relates to the problem found?

   Note: If the WRKPRB function was not available answer NO.

   Yes: Continue with the next step.
   No: Go to Problems with noncritical resources. **This ends the procedure**.
2. Select the problem entry by moving the cursor to the problem entry option field and entering option 8 to work with the problem.

   Is Analyze Problem (option 1) available on the Work with Problem display?

   No: Perform the following:

   a. Return to the initial problem log display (F12).
   b. Select the problem entry by moving the cursor to the problem entry option field and selecting the option to display details.
   c. Select the function key to display possible causes.

      Note: If this function key is not available, use the customer reported symptom string for customer perceived information about this problem. Then, go to Using the product activity log.
   d. Use the list of possible causes as the FRU list and go to step "5" on page 55.

Yes: Run Analyze Problem (option 1) from the Work with Problem display.

Notes:

a. For SRCs starting with 6112 or 9337, use the SRC and go to the Reference codes topic.
b. If the message on the display directs you to use SST (System Service Tools), go to COMIP01.

Was the problem corrected by the analysis procedure?

No: Continue with the next step.
Yes: **This ends the procedure**.

3. Did problem analysis send you to another entry point in the service information?

   No: Continue with the next step.
   Yes: Go to the entry point indicated by problem analysis. **This ends the procedure**.

4. Was the problem isolated to a list of failing items?

   Yes: Continue with the next step.
   No: Go to Problems with noncritical resources. **This ends the procedure**.

5. Exchange the failing items one at a time until the problem is repaired.

   Notes:

   a. For Symbolic FRUs, see Symbolic FRUs.
   b. When exchanging FRUs, go to the remove and replace procedures for your specific system.

   Has the problem been resolved?

   No: Contact your next level of support. **This ends the procedure**.
   Yes: **This ends the procedure**.

Problem determination procedure for AIX or Linux servers or partitions

This procedure helps to produce or retrieve a service request number (SRN) if the customer or a previous procedure did not provide one.

If your server is running AIX or Linux, use one of the following procedures to test the server or partition resources to help you determine where a problem might exist.

If you are servicing a server running the AIX operating system, go to MAP 0020: Problem determination procedure.

If you are servicing a server running the Linux operating system, go to the Linux problem isolation procedure.

System unit problem determination

Use this procedure to obtain a reference code if the customer did not provide you with one, or you are unable to load server diagnostics.

If you are able to load the diagnostics, go to Problem determination procedure for AIX or Linux servers or partitions.

The service processor may have recorded one or more symptoms in its error log. Examine this error log before proceeding (For more information, see Managing your server using the Advanced System Management Interface). The server may have been set up by using the management console. Check the Service Action Event (SAE) log in the Service Focal Point. The SAE log may have recorded one or more symptoms in the Service Focal Point. To avoid unnecessary replacement of the same FRU for the same problem, it is necessary to check the SAE log for evidence of prior service activity on the same subsystem.

The service processor may have been set by the user to monitor system operations and to attempt recoveries. You can disable these actions while you diagnose and service the system. If the system maintenance policies were saved by using the save/restore hardware maintenance policies, all the settings of the service processor (except language) were saved and you can use the same service aid to restore the settings at the conclusion of your service action.

If you disable the service processor settings, note their current settings so that you can restore when you are done.

If the system is set to power on using one of the parameters in the following table, disconnect the modem to prevent incoming signals that could cause the system to power on.

Following are the service processor settings. For more information about the service processor settings, see Managing your server using the Advanced System Management Interface.

Table 10. Service processor settings

Setting	Description
Monitoring (also called surveillance)	From the ASMI menu, expand the **System Configuration**, then click on **Monitoring**. Disable both types of surveillance.
Auto power restart (also called unattended start mode)	From the ASMI menu, expand **Power/Restart Control**, then click on **Auto Power Restart**, and set it to disabled.
Wake on LAN	From the ASMI menu, expand **Wake on LAN**, and set it to disabled
Call out	From the ASMI menu, expand the **Service Aids**, then click on **Call-Home/Call-In Setup**. Set the call-home system port and the call-in system port to disabled.

Step 1020-1

Be prepared to record code numbers to help analyze a problem.

Analyze a failure to load the diagnostic programs

Follow these steps to analyze a failure to load the diagnostic programs.

Note: Be prepared to answer questions regarding the control panel and to perform certain actions based on displayed POST indicators. Observer these conditions.

1. Run diagnostics on any partition. Find your symptom in the following table, then follow the instructions given in the Action column. If no fault is identified, continue to the next step.
2. Run diagnostics on the failing partition. Find your symptom in the following table, then follow the instructions given in the Action column. If no fault is identified, continue to the next step.
3. Power off the system.
4. Load the standalone diagnostics in service mode to test the full system partition. For more information, see Running the online and stand-alone diagnostics.
5. Wait until the diagnostics are loaded or the system appears to stop. If you receive an error code or if the system stops before diagnostics are loaded, find your symptom in the following table, then follow the instructions given in the Action column. If no fault is identified, continue to the next step.
6. Run the standalone diagnostics on the entire system. Find your symptom in the following table, then follow the instructions given in the Action column. If no fault is identified, call service support for assistance.

Symptom	Action
One or more logical partitions does not boot.	a. Check service processor error log. If an error is indicated, go to "Beginning problem analysis" on page 1. b. Check the Serviceable action event log, go to "Beginning problem analysis" on page 1. c. Go to Problems with loading and starting the operating system.
The rack identify LED does not operate properly.	Go to "Beginning problem analysis" on page 1.
The system stopped and a system reference code is displayed on the operator panel.	Go to "Beginning problem analysis" on page 1.
The system stops with a prompt to enter a password.	Enter the password. You cannot continue until a correct password has been entered. When you have entered a valid password, go to the beginning of this table and wait for one of the other conditions to occur.
The diagnostic operating instructions are displayed.	Go to MAP 0020: AIX or Linux problem determination procedure.
The power good LED does not come on or does not stay on, or you have a power problem.	Go to Power problems.
The system login prompt is displayed.	You may not have pressed the correct key or you may not have pressed the key soon enough when you were to trying to indicate a service mode IPL of the diagnostic programs. If this is the case, start again at the beginning of this step. **Note:** Perform the system shutdown procedure before turning off the system. If you are sure you pressed the correct key in a timely manner, go to Step 1020-2.
The system does not respond when the password is entered.	Go to Step 1020-2.

Symptom	Action
The system stopped. A POST indicator is displayed on the system console and an eight-digit error code is not displayed.	If the POST indicator represents: a. Memory, go to PFW 1548: Memory and processor subsystem problem isolation procedure. b. Keyboard i) Replace the keyboard cable. ii) Replace the keyboard. iii) Replace the service processor. Location is model dependent. iv) Go to PFW1542: I/O problem isolation procedure. c. Network, go to PFW1542: I/O problem isolation procedure. d. SCSI, go to PFW1542: I/O problem isolation procedure. e. Speaker i) Replace the operator panel. Location is model dependent. ii) Replace the service processor. Location is model dependent. iii) Go to PFW1542: I/O problem isolation procedure.
The System Management Services menu is displayed.	Go to PFW1542: I/O problem isolation procedure.
All other symptoms.	If you were directed here from the Entry MAP, go to PFW1542: I/O problem isolation procedure. Otherwise, find the symptom in the "Beginning problem analysis" on page 1.

Step 1020-2

Use this procedure to analyze a keyboard problem.

Find the type of keyboard you are using in the following table; then follow the instructions given in the Action column.

Keyboard Type	Action
Type 101 keyboard (U.S.). Identified by the size of the Enter key. The Enter key is in only one horizontal row of keys.	Record error code M0KB D001; then go to Step 1020-3.
Type 102 keyboard (W.T.). Identified by the size of the Enter key. The Enter key extends into two horizontal rows.	Record error code M0KB D002; then go to Step 1020-3.
Type 106 keyboard. (Identified by the Japanese characters.)	Record error code M0KB D003; then go to Step 1020-3.
ASCII terminal keyboard	Go to the documentation for this type of ASCII terminal and continue with problem determination.

Step 1020-3

Perform the following steps:

1. Find the 8-digit error code in Reference codes.

   Note: If you do not locate the 8-digit code, look for it in one of the following places:

- Any supplemental service manuals for attached devices
- The diagnostic problem report screen for additional information
- The Service Hints service aid
- The CEREADME file

2. Perform the action listed.

Management console machine code problems

The support organization uses the *pesh* command to look at the management console internal machine code to determine how to fix a machine code problem. Only a service representative or support representative can access this feature.

Launching an xterm shell

About this task

You may need to launch an xterm shell to perform directed support from the support center. This may be required if the support center needs to analyze a system dump in order to better understand machine code operations at the time of a failure. To launch an xterm shell, perform the following:

Procedure

1. Open a terminal by right-clicking the background and selecting **Terminals** > **rshterm**.
2. Type the *pesh* command followed by the serial number of the management console and press Enter.
3. You will be prompted for a password, which you must obtain from your next level of support.

Results

Additional information: "Viewing the management console logs" on page 59.

Viewing the management console logs

The console logs display error and information messages that the console has logged while running commands.

About this task

The service representative can use this information to learn more about what caused an error and how to resolve it. The management console classifies log entries as either an informational message or an error message. Log entries are identified with an *I* or *E*, respectively. The management console lists these log entries chronologically, with the most recent shown at the top of the list.

Use the management console Log to view a record of management console system events. System events are activities that indicate when processes begin and end. These events also indicate whether the attempted action was successful.

To view the HMC log, perform the following:

1. Launch an xterm shell (see "Launching an xterm shell" on page 59).
2. When you have entered the password, use the *showLog* command to launch the HMC log window.

The log includes the following information:

- The event's unique ID code
- The date the event occurred
- The time the event occurred
- The log's type
- The name of the attempted action

- The log's reference code
- The status of the log

View a particular event

About this task

To view a particular event, perform the following steps:

Procedure

1. Select an event by clicking once on it.
2. Press Enter to get to a summary of the log you selected. From here, you must select a Block ID to display. The blocks are listed next to the buttons and include the following options:
   - Standard Data Block
   - Secondary Data Block
   - Microcode Reason / ID Error Information
3. Select the data block you want to view.
4. Press Enter. The extended information shown for the data blocks you selected includes the following items:
   - Program name
   - Current process ID
   - Parent process ID
   - Current thread priority
   - Current thread ID
   - Screen group
   - Subscreen group
   - Current foreground screen process group
   - Current background screen process group

Problem determination procedures

Problem determination procedures are provided by power-on self-tests (POSTs), service request numbers, and maintenance analysis procedures (MAPs). Some of these procedures use the service aids that are described in the user or maintenance information for your system SCSI attachment.

Disk drive module power-on self-tests

The disk drive module Power-on Self-Tests (POSTs) start each time that the module is switched on, or when a Send Diagnostic command is received. They check whether the disk drive module is working correctly. The POSTs also help verify a repair after a Field Replaceable Unit (FRU) has been exchanged.

The tests are POST-1 and POST-2.

POST-1 runs immediately after the power-on reset line goes inactive, and before the disk drive module motor starts. POST-1 includes the following tests:

- Microprocessor
- ROM
- Checking circuits

If POST-1 completes successfully, POST-2 is enabled.

If POST-1 fails, the disk drive module is not configured into the system.

POST-2 runs after the disk drive module motor has started. POST-2 includes the following tests:

- Motor control
- Servo control
- Read and write on the diagnostic cylinder (repeated for all heads)
- Error checking and correction (ECC).

If POST-2 completes successfully, the disk drive module is ready for use with the system.

If POST-2 fails, the disk drive module is not configured into the system.

SCSI card power-on self-tests

The SCSI card Power-On Self Tests (POSTs) start each time power is switched on, or when a Reset command is sent from the using system SCSI attachment. They check only the internal components of the SCSI card; they do not check any interfaces to other FRUs.

If the POSTs complete successfully, control passes to the functional microcode of the SCSI card. This microcode checks all the internal interfaces of the I/O enclosure, and reports failures to the host system.

If the POSTs fail, one of the following events occur:

- The SCSI card check LED and the enclosure check LED come on.
- If the SCSI was configured for high availability using a dual initiator card the error will be reported. However, the functional operation of the enclosure is not affected. For example, the customer still has access to all the disk drive modules.

The failure is reported when:

- the failure occurs at system bring-up time, the host system might detect that the enclosure is missing, and reports an error.
- the failure occurs at any time other than system bring-up time, the hourly health check reports the failure.

Analyzing problems

Use these instructions and procedures to help you determine the cause of the problem.

Intermittent problems

An intermittent problem is a problem that occurs for a short time, and then goes away.

About this task

The problem may not occur again until some time in the future, if at all. Intermittent problems cannot be made to appear again easily.

Some examples of intermittent problems are:

- A reference code appears on the control panel (the system attention light is on) but disappears when you power off, then power on the system. An entry does not appear in the Product Activity Log.
- An entry appears in the problem log when you use the Work with Problems (`WRKPRB`) command. For example, an expansion unit becomes powered off, but starts working again when you power it on.
- The workstation adapter is in a hang condition but starts working normally when it gets reset.

Note: You can get equipment for the following conditions from your branch office or installation planning representative:

- If you suspect that the air at the system site is too hot or too cold, you need a thermometer to check the temperature.
- If you suspect the moisture content of the air at the system site is too low or too high, use a wet/dry bulb to check the humidity. See "General intermittent problem checklist" on page 63 for more information.

- If you need to check AC receptacles for correct wiring, you need an ECOS tester, Model 1023-100, or equivalent tester. The tester lets you quickly check the receptacles. If you cannot find a tester, use an analog multimeter instead. Do not use a digital multimeter.

Follow the steps below to correct an intermittent problem:

Procedure

1. Read the information in "About intermittent problems" on page 62 before you attempt to correct an intermittent problem.

   Then, continue with the next step of this procedure.
2. Perform *all* steps in the "General intermittent problem checklist" on page 63.

   Then, continue with the next step of this procedure.
3. Did you correct the intermittent problem?

   Yes: This ends the procedure.

   No: Go to "Analyzing intermittent problems" on page 65. **This ends the procedure.**

About intermittent problems

An intermittent problem can show many different symptoms, so it might be difficult for you to determine the real cause without completely analyzing the failure.

To help with this analysis, you should determine as many symptoms as possible.

- The complete reference code is necessary to determine the exact failing area and the probable cause.
- Product activity log (PAL) information can provide time and device relationships.
- Information about environmental conditions when the failure occurred can be helpful (for example, an electrical storm occurring when the failure happened).

Note: If you suspect that an intermittent problem is occurring, increase the log sizes to the largest sizes possible. Select the PAL option on the Start a Service Tool display (see Using the product activity log for details).

Types of intermittent problems

Following are the major types of intermittent problems:

- Code (PTFs):
  - Licensed Internal Code
  - IBM i
  - Licensed program products
  - Other application software
- Configuration:
  - Non-supported hardware that is used on the system
  - Non-supported system configurations
  - Non-supported communication networks
  - Model and feature upgrades that are not performed correctly
  - Incorrectly configured or incorrectly cabled devices
- Environment:
  - Power line disturbance (for example, reduced voltage, a pulse, a surge, or total loss of voltage on the incoming AC voltage line)
  - Power line transient (for example, lightning strike)
  - Electrical noise (constant or intermittent)

  - Defective grounding or a ground potential difference
  - Mechanical vibration
- Intermittent hardware failure

General intermittent problem checklist

Use the following procedure to correct intermittent problems.

About this task

Performing these steps removes the known causes of most intermittent problems.

Procedure

1. Discuss the problem with the customer.

   Look for the following symptoms:

   - A reference code that goes away when you power off and then power on the system.
   - Repeated failure patterns that you cannot explain. For example, the problem occurs at the same time of day or on the same day of the week.
   - Failures that started after system relocation.
   - Failures that occurred during the time specific jobs or software were running.
   - Failures that started after recent service or customer actions, system upgrade, addition of I/O devices, new software, or program temporary fix (PTF) installation.
   - Failures occurring only during high system usage.
   - Failures occur when people are close to the system or machines are attached to the system.
2. Recommend that the customer install the latest cumulative PTF package, since code PTFs have corrected many problems that seem to be hardware failures.

   The customer can order the latest cumulative PTF package electronically through Electronic Customer Support or by calling the Software Support Center.
3. If you have not already done so, use the maintenance package to see the indicated actions for the symptom described by the customer.

   Attempt to perform the on-line problem analysis procedure first. If this is not possible, such as when the system is down, go to the “Beginning problem analysis” on page 1.

   Use additional diagnostic tools, if necessary, and attempt to recreate the problem.

   Note: Ensure that the service information you are using is at the same level as the operating system.
4. Check the site for the following environmental conditions:

   a) Any electrical noise that matches the start of the intermittent problems. Ask the customer such questions as:

   - Have any external changes or additions, such as building wiring, air conditioning, or elevators been made to the site?
   - Has any arc welding occurred in the area?
   - Has any heavy industrial equipment, such as cranes, been operating in the area?
   - Have there been any thunderstorms in the area?
   - Have the building lights become dim?
   - Has any equipment been relocated, especially computer equipment?

   If there was any electrical noise, find its source and prevent the noise from getting into the system.

   b) Site temperature and humidity conditions that are within the system specifications.

   See temperature and humidity design criteria in the Planning for the system topic relevant for your system.

   c) Poor air quality in the computer room:

      - Look for dust on top of objects. Dust particles in the air cause poor electrical connections and may cause disk unit failures.
      - Smell for unusual odors in the air. Some gases can corrode electrical connections.

   d) Any large vibration (caused by thunder, an earthquake, an explosion, or road construction) that occurred in the area at the time of the failure.

      Note: A failure that is caused by vibration is more probable if the server is on a raised floor.

5. Ensure that all ground connections are tight.

   These items reduce the effects of electrical noise. Check the ground connections by measuring the resistance between a conductive place on the frame to building ground or to earth ground. The resistance must be 1.0 ohm or less.

6. Ensure proper cable retention is used, as provided.

   If no retention is provided, the cable should be strapped to the frame to release tension on cable connections.

   Ensure that you pull the cable ties tight enough to fasten the cable to the frame bar tightly. A loose cable can be accidentally pulled with enough force to unseat the logic card in the frame to which the cable is attached. If the system is powered on, the logic card could be destroyed.

7. Ensure that all workstation and communications cables meet hardware specifications:

   - All connections are tight.
   - Any twinaxial cables that are not attached to devices must be removed.
   - The lengths and numbers of connections in the cables must be correct.
   - Ensure that lightning protection is installed on any twinaxial cables that enter or leave the building.

8. Perform the following:

   a) Review recent repair actions.

      Contact your next level of support for assistance.

   b) Review entries in the problem log (WRKPRB).

      Look for problems that were reported to the user.

   c) Review entries in the PAL, SAL, and service processor log. Look for a pattern:

      - SRCs on multiple adapters occurring at the same time
      - SRCs that have a common time-of-day or day-of-week pattern
      - Log is wrapping (hundreds of recent entries and no older entries)

      Check the PAL sizes and increase them if they are smaller than recommended.

   d) Review entries in the history log (`Display Log (DSPLOG)`).

      Look for a change that matches the start of the intermittent problems.

   e) Ensure that the latest engineering changes are installed on the system and on all system I/O devices.

9. Ensure that the hardware configuration is correct and that the model configuration rules have been followed.

   Use the **Display hardware configuration** service function (under SST or DST) to check for any missing or failed hardware.

10. Was a system upgrade, feature, or any other field bill of material or feature field bill of material installed just before the intermittent problems started occurring?

    No: Continue with the next step.

    Yes: Review the installation instructions to ensure that each step was performed correctly. Then, continue with the next step of this procedure.

11. Is the problem associated with a removable media storage device?

No: Continue with the next step.

Yes: Ensure that the customer is using the correct removable media storage device cleaning procedures and good storage media. Then, continue with the next step of this procedure.

12. Perform the following to help prevent intermittent thermal checks:

    - Ensure that the AMDs are working.
    - Exchange all air filters as recommended.

13. If necessary, review the intermittent problems with your next level of support and installation planning representative.

    Ensure that all installation planning checks were made on the system. Because external conditions are constantly changing, the site may need to be checked again. **This ends the procedure.**

Analyzing intermittent problems

This procedure enables you to begin analyzing an intermittent problem.

About this task

Use this procedure only after you have first reviewed the information in "About intermittent problems" on page 62 and gone through the "General intermittent problem checklist" on page 63.

Procedure

1. Is a reference code associated with the intermittent problem?

   No: Continue with the next step.

   Yes: Go to Reference codes. If the actions in the reference code tables do not correct the intermittent problem, return here and continue with the next step.

2. Is a symptom associated with the intermittent problem?

   No: Continue with the next step.

   Yes: Go to "Intermittent symptoms" on page 65. If the information there does not help to correct the intermittent problem, return here and continue with the next step.

3. Go to "Failing area intermittent isolation procedures" on page 66.

   If the information there does not help to correct the intermittent problem, return here and then, continue with the next step.

4. Send the data you have collected to your next level of support so that an Authorized Program Analysis Report (APAR) can be written.

   This ends the procedure.

Intermittent symptoms

Use the table below to find the symptom and description of the intermittent problem. Then perform the corresponding intermittent isolation procedures.

Although an isolation procedure may correct the intermittent problem, use your best judgment to determine if you should perform the remainder of the procedure shown for the symptom.

Note: If the symptom for the intermittent problem you have is not listed, go to "Failing area intermittent isolation procedures" on page 66.

Table 11. Intermittent symptoms

Symptom	Description	Isolation procedure
System powered off.	The system was operating correctly, then the system powered off. A 1xxx SRC may occur when this happens, and this SRC info should be logged in the service processor log.	INTIP09

Table 11. Intermittent symptoms (continued)

Symptom	Description	Isolation procedure
System stops.	The system is powered on but is not operating correctly. No SRC is displayed. The system attention light is off and the processor activity lights may be on or off. Noise on the power-on reset line can cause the processor to stop.	INTIP18
System or subsystem runs slow.	The system or the subsystem is not processing at its normal speed.	INTIP20

Failing area intermittent isolation procedures

This procedure helps you determine how to resolve intermittent problems when you do not have a system reference code (SRC) or cannot determine the symptom.

About this task

Use this table only if you do not have a system reference code (SRC), or cannot find your symptom in "Intermittent symptoms" on page 65.

Procedure

1. Perform all of the steps in "General intermittent problem checklist" on page 63 for all failing areas.

   Then, continue with the next step.
2. Refer to the table below, and perform the following:
   a) Find the specific area of failure under **Failing area**.
   b) Look down the column of the area of failure until you find an X.
   c) Look across to the **Isolation procedure** column and perform the procedure indicated.
   d) If the isolation procedure does not correct the intermittent problem, continue down the column of the area of failure until you have performed all of the procedures shown for the failing area.
3. Although an isolation procedure may correct the intermittent problem, use your best judgment to determine if you should perform the remainder of the procedures shown for the failing area.

Results

Table 12. Failing area intermittent isolation procedures

Failing area						Isolation procedure to perform:
Power	**Work station I/O processor**	**Disk unit adapter**	**Comm-unication**	**Processor bus**	**Tape optical**	**Perform all steps in:**

		X				INTIP16
X	X	X	X	X	X	INTIP18
	X	X	X	X	X	INTIP20

IPL problems

Use these scenarios to help you diagnose your IPL problem.

Cannot perform IPL from the control panel (no SRC)

Use this procedure when you cannot perform an IBM i IPL from the control panel (no SRC).

About this task

DANGER: An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (D004)

Procedure

1. Perform the following:
   a) Verify that the power cable is plugged into the power outlet.
   b) Verify that power is available at the customer's power outlet.
2. Start an IPL by doing the following:
   a) Select Manual mode and IPL type A or B on the control panel. See Control panel functions for details.
   b) Power on the system. See Starting a system.

   Does the IPL complete successfully?

   No: Continue with the next step.
   Yes: **This ends the procedure.**
3. Have all the units in the system become powered on that you expected to become powered on?

   Yes: Continue with the next step.
   No: Go to Power problems and find the symptom that matches the problem. **This ends the procedure.**
4. Is an SRC displayed on the control panel?
   - **Yes**: Go to Power problems and use the displayed SRC to correct the problem. **This ends the procedure.**
   - **No**: For all models, exchange the following FRUs, one at a time. Refer to the remove and replace procedures for your specific system for additional information.

   a) SPCN card unit. See symbolic FRU TWRCARD.
   b) Power Supply. See symbolic FRU PWRSPLY. **This ends the procedure.**

Cannot perform IPL at a specified time (no SRC)

Use this procedure when you cannot perform an IBM i IPL at a specified time (no SRC). To correct the IPL problem, perform this procedure until you determine the problem and can perform an IPL at a specified time.

About this task

DANGER: An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (D004)

Procedure

1. Verify the following:
   a) The power cable is plugged into the power outlet.
   b) That power is available at the customer's power outlet.
2. Power on the system in normal mode. See Starting a system.

   Does the IPL complete successfully?

   Yes: Continue with the next step.
   No: Go to the “Beginning problem analysis” on page 1 procedure. **This ends the procedure.**
3. Have all the units in the system become powered on that you expected to become powered on?

   Yes: Continue with the next step.
   No: Go to “Beginning problem analysis” on page 1 and find the symptom that matches the problem. **This ends the procedure.**
4. Verify the requested system IPL date and time by doing the following:
   a) On the command line, enter the Display System Value command:

   ```
   DSPSYSVAL QIPLDATTIM
   ```

   Observe the system value parameters.

   Note: The system value parameters are the date and time the system operator requested a timed IPL.

   ```
   +------------------------------------------------------------------------------+
   |Display System Value                                                          |
   |System:  S0000000                                                             |
   |System value . . . . . . . . . :  QIPLDATTIM                                  |
   |                                                                              |
   |Description  . . . . . . . . . :  Date and time to automatically IPL          |
   |                                                                              |
   |                                                                              |
   |IPL date     . . . . . . . . . :  MM/DD/YY                                    |
   |IPL time     . . . . . . . . . :  HH:MM:SS                                    |
   +------------------------------------------------------------------------------+
   ```

   Figure 1. Display for QIPLDATTIM

   b) Verify the system date. On the command line, enter the Display System Value command:

   ```
   DSPSYSVAL QDATE
   ```

   Check the system values for the date.

```
+------------------------------------------------------------------------------+
|Display System Value                                                          |
|System:  S0000000                                                             |
|System value . . . . . . . . . . :  QDATE                                     |
|                                                                              |
|Description  . . . . . . . . . . :  System date                               |
|                                                                              |
|Date          . . . . . . . . . . :  MM/DD/YY                                 |
+------------------------------------------------------------------------------+
```

Figure 2. Display for QDATE

Does the operating system have the correct date?

- **Yes**: Continue with this step.
- **No**: Set the correct date by doing the following:

  i) On the command line, enter the Change System Value command (`CHGSYSVAL QDATE VALUE('mmddyy')`).

  ii) Set the date by entering

      mm=month
      dd=day
      yy=year

  iii) Press **Enter**.

c) Verify the system time. On the command line, enter the Display System Value command: `DSPSYSVAL QTIME`

Check the system values for the time.

```
+------------------------------------------------------------------------------+
|Display System Value                                                          |
|System:  S0000000                                                             |
|System value . . . . . . . . . . :  QTIME                                     |
|                                                                              |
|Description  . . . . . . . . . . :  Time of day                               |
|                                                                              |
|Time          . . . . . . . . . . :  HH:MM:SS                                 |
+------------------------------------------------------------------------------+
```

Figure 3. Display for QTIME

Does the operating system have the correct time?

- **Yes**: Continue with this step.
- **No**: Set the correct time by doing the following:

  i) On the command line, enter the Change System Value command (`CHGSYSVAL QTIME VALUE('hhmmss')`).

  ii) Set the time by entering

      hh=24 hour time clock
      mm=minutes
      ss=seconds

  iii) Press **Enter** and then, continue with the next step.

5. Verify that the system can perform an IPL at a specified time by doing the following:

   a) Set the IPL time to 5 minutes past the present time by entering the Change System Value command (`CHGSYSVAL SYSVAL(QIPLDATTIM) VALUE('mmddyy hhmmss')`) on the command line.

      mm = month to power on
      dd = day to power on
      yy = year to power on
      hh = hour to power on

mm = minute to power on
ss = second to power on

b) Power off the system by entering the Power Down System Immediate command (`PWRDWNSYS *IMMED`) on the command line.

c) Wait 5 minutes.

Does the IPL start at the time you specified?

No: Continue with the next step.
Yes: **This ends the procedure.**

6. Power on the system in normal mode. See Starting a system.

   Does the IPL complete successfully?

   Yes: Continue with the next step.
   No: Go to “Beginning problem analysis” on page 1. **This ends the procedure.**

7. Find an entry in the Service Action Log that matches the time, SRC, and/or resource that compares to the reported problem.

   a) On the command line, enter the Start System Service Tools command:

   ```
   STRSST
   ```

   If you cannot get to SST, select DST. See Dedicated service tools (DST) for details.

   Note: Do not IPL the system or partition to get to DST.

   b) On the Start Service Tools Sign On display, type in a user ID with service authority and password.

   c) Select **Start a Service Tool** > **Hardware Service Manager** > **Work with service action log**.

   d) On the Select Timeframe display, change the From: Date and Time to a date and time prior to when the customer reported having the problem.

   e) Find an entry that matches one or more conditions of the problem:

   - SRC
   - Resource
   - Time
   - FRU list (choose **Display the failing item information** to display the FRU list).

   Notes:

   a. All entries in the service action log represent problems that require a service action. It may be necessary to handle any problem in the log even if it does not match the original problem symptom.

   b. The information displayed in the date and time fields are the time and date for the first occurrence of the specific system reference code (SRC) for the resource displayed during the time range selected.

   Did you find an entry in the Service Action Log?

   No: Continue with the next step.
   Yes: Go to step “9” on page 71.

8. Exchange the following parts one at a time.

   See the remove and replace procedures for your specific system. After exchanging each part, return to step “5” on page 69 to verify that the system can perform an IPL at a specified time.

   Note: If you exchange the control panel or the system backplane, you must set the correct date and time by performing step “4” on page 68.

   ⚠ **Attention:** Before exchanging any part, power off the system. See Stopping a system.

   - System unit backplane (see symbolic FRU SYSBKPL)

- System control panel
- System control panel cable

Did the IPL complete successfully after you exchanged all of the parts listed above?

No: Contact your next level of support. **This ends the procedure.**
Yes: Continue with the next step.

9. Was the entry isolated (is there a Y in the Isolated column)?

   - **No**: Go to Reference codes and use the SRC indicated in the log. **This ends the procedure.**
   - **Yes**: Display the failing item information for the Service Action Log entry. Items at the top of the failing item list are more likely to fix the problem than items at the bottom of the list.

     Exchange the failing items one at a time until the problem is repaired. After exchanging each one of the items, verify that the item exchanged repaired the problem.

     Notes:

     a. For symbolic FRUs see Symbolic FRUs.
     b. When exchanging FRUs, refer to the remove and replace procedures for your specific system.
     c. After exchanging an item, go to Verifying the repair.

     After the problem has been resolved, close the log entry by selecting **Close a NEW entry** on the Service Actions Log Report display. **This ends the procedure.**

Cannot automatically perform an IPL after a power failure

Use this procedure when you cannot automatically perform an IBM i IPL after a power failure.

Procedure

1. Normal or Auto mode on the control panel must be selected when power is returned to the system.

   Is Normal or Auto mode on the control panel selected?

   Yes: Continue with the next step.
   No: Select **Normal** or **Auto** mode on the control panel. **This ends the procedure.**

2. Use the Display System Value command (`DSPSYSVAL`) to verify that the system value under QPWRRSTIPL on the Display System Value display is equal to 1.

   Is QPWRRSTIPL equal to 1?

   Yes: Contact your next level of support.
   No: Use the Change System Value command (`CHGSYSVAL`) to set QPWRRSTIPL equal to 1. **This ends the procedure.**

Notices

This information was developed for products and services offered in the US.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some jurisdictions do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM websites are provided for convenience only and do not in any manner serve as an endorsement of those websites. The materials at those websites are not part of the materials for this IBM product and use of those websites is at your own risk.

IBM may use or distribute any of the information you provide in any way it believes appropriate without incurring any obligation to you.

The performance data and client examples cited are presented for illustrative purposes only. Actual performance results may vary depending on specific configurations and operating conditions.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

All IBM prices shown are IBM's suggested retail prices, are current and are subject to change without notice. Dealer prices may vary.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to actual people or business enterprises is entirely coincidental.

If you are viewing this information in softcopy, the photographs and color illustrations may not appear.

The drawings and specifications contained herein shall not be reproduced in whole or in part without the written permission of IBM.

IBM has prepared this information for use with the specific machines indicated. IBM makes no representations that it is suitable for any other purpose.

IBM's computer systems contain mechanisms designed to reduce the possibility of undetected data corruption or loss. This risk, however, cannot be eliminated. Users who experience unplanned outages, system failures, power fluctuations or outages, or component failures must verify the accuracy of operations performed and data saved or transmitted by the system at or near the time of the outage or failure. In addition, users must establish procedures to ensure that there is independent data verification before relying on such data in sensitive or critical operations. Users should periodically check IBM's support websites for updated information and fixes applicable to the system and related software.

Homologation statement

This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Contact an IBM representative or reseller for any questions.

Accessibility features for IBM Power servers

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Power servers include the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Power servers use the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with ICT Accessibility 508 Standards and 255 Guidelines (https://www.access-board.gov/ict/) and Web Content Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the IBM Power servers.

The IBM Power servers online product documentation in IBM Documentation is enabled for accessibility. For more information about IBM's commitment to accessibility, see the IBM accessibility website at IBM Accessibility (https://www.ibm.com/able/).

Keyboard navigation

This product uses standard navigation keys.

Interface information

The IBM Power servers user interfaces do not have content that flashes 2 - 55 times per second.

The IBM Power servers web user interface relies on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

The IBM Power servers web user interface includes WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Power servers include certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Privacy policy considerations

IBM Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as the customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM’s Privacy Policy at http://www.ibm.com/privacy and IBM’s Online Privacy Statement at http://www.ibm.com/privacy/details the section entitled “Cookies, Web Beacons and Other Technologies” and the “IBM Software Products and Software-as-a-Service Privacy Statement” at http://www.ibm.com/software/info/product-privacy.

Trademarks

IBM, the IBM logo, and ibm.com are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information.

The registered trademark Linux is used pursuant to a sublicense from the Linux Foundation, the exclusive licensee of Linus Torvalds, owner of the mark on a worldwide basis.

Electronic emission notices

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

Class A Notices

The following Class A statements apply to the IBM servers that contain the Power10 processor and its features unless designated as electromagnetic compatibility (EMC) Class B in the feature information.

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

The following Class A statements apply to the servers.

Canada Notice

CAN ICES-3 (A)/NMB-3(A)

European Community and Morocco Notice

This product is in conformity with the protection requirements of Directive 2014/30/EU of the European Parliament and of the Council on the harmonization of the laws of the Member States relating to electromagnetic compatibility. IBM cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-IBM option cards.

This product may cause interference if used in residential areas. Such use must be avoided unless the user takes special measures to reduce electromagnetic emissions to prevent interference to the reception of radio and television broadcasts.

Warning: This equipment is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

Germany Notice

Deutschsprachiger EU Hinweis: Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit

Dieses Produkt entspricht den Schutzanforderungen der EU-Richtlinie 2014/30/EU zur Angleichung der Rechtsvorschriften über die elektromagnetische Verträglichkeit in den EU-Mitgliedsstaatenund hält die Grenzwerte der EN 55022 / EN 55032 Klasse A ein.

Um dieses sicherzustellen, sind die Geräte wie in den Handbüchern beschrieben zu installieren und zu betreiben. Des Weiteren dürfen auch nur von der IBM empfohlene Kabel angeschlossen werden. IBM übernimmt keine Verantwortung für die Einhaltung der Schutzanforderungen, wenn das Produkt ohne Zustimmung von IBM verändert bzw. wenn Erweiterungskomponenten von Fremdherstellern ohne Empfehlung von IBM gesteckt/eingebaut werden.

EN 55032 Klasse A Geräte müssen mit folgendem Warnhinweis versehen werden:

"Warnung: Dieses ist eine Einrichtung der Klasse A. Diese Einrichtung kann im Wohnbereich Funk-Störungen verursachen; in diesem Fall kann vom Betreiber verlangt werden, angemessene Maßnahmen zu ergreifen und dafür aufzukommen."

Deutschland: Einhaltung des Gesetzes über die elektromagnetische Verträglichkeit von Geräten

Dieses Produkt entspricht dem "Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) ". Dies ist die Umsetzung der EU-Richtlinie 2014/30/EU in der Bundesrepublik Deutschland.

Zulassungsbescheinigung laut dem Deutschen Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) (bzw. der EMC Richtlinie 2014/30/EU) für Geräte der Klasse A

Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen.

Verantwortlich für die Einhaltung der EMV Vorschriften ist der Hersteller:
International Business Machines Corp.

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Responsible Party:
International Business Machines Corporation
New Orchard Road
Armonk, NY 10504

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult an IBM-authorized dealer or service representative for help.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions:

(1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Terms and conditions

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Power Systems

Installing and configuring the Hardware Management Console

Note

Before using this information and the product it supports, read the information in "Safety notices" on page v, "Notices" on page 93, the *IBM Systems Safety Notices* manual, G229-9054, and the *IBM Environmental Notices and User Guide*, Z125–5823.

This edition applies to IBM® Hardware Management Console Version 10 Release 1 Maintenance Level 1010 and to all subsequent releases and modifications until otherwise indicated in new editions.

Contents

Safety notices

Safety notices may be printed throughout this guide:

- **DANGER** notices call attention to a situation that is potentially lethal or extremely hazardous to people.
- **CAUTION** notices call attention to a situation that is potentially hazardous to people because of some existing condition.
- **Attention** notices call attention to the possibility of damage to a program, device, system, or data.

World Trade safety information

Several countries require the safety information contained in product publications to be presented in their national languages. If this requirement applies to your country, safety information documentation is included in the publications package (such as in printed documentation, on DVD, or as part of the product) shipped with the product. The documentation contains the safety information in your national language with references to the U.S. English source. Before using a U.S. English publication to install, operate, or service this product, you must first become familiar with the related safety information documentation. You should also refer to the safety information documentation any time you do not clearly understand any safety information in the U.S. English publications.

Replacement or additional copies of safety information documentation can be obtained by calling the IBM Hotline at 1-800-300-8751.

German safety information

Das Produkt ist nicht für den Einsatz an Bildschirmarbeitsplätzen im Sinne § 2 der Bildschirmarbeitsverordnung geeignet.

Laser safety information

IBM servers can use I/O cards or features that are fiber-optic based and that utilize lasers or LEDs.

Laser compliance

IBM servers may be installed inside or outside of an IT equipment rack.

DANGER: When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard: If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product. Do not open or service any power supply assembly. Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.

- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords. For AC power, disconnect all power cords from their AC power source. For racks with a DC power distribution panel (PDP), disconnect the customer's DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected. For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate. For racks with a DC power distribution panel (PDP), connect the customer's DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.
- Connect any equipment that will be attached to this product to properly wired outlets.

- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- When performing a machine inspection: Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements. Do not attempt to switch power to the machine until all possible unsafe conditions are corrected. Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.
- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

  To Disconnect: 1) Turn off everything (unless instructed otherwise). 2) For AC power, remove the power cords from the outlets. 3) For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source. 4) Remove the signal cables from the connectors. 5) Remove all cables from the devices.

  To Connect: 1) Turn off everything (unless instructed otherwise). 2) Attach all cables to the devices. 3) Attach the signal cables to the connectors. 4) For AC power, attach the power cords to the outlets. 5) For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP. 6) Turn on the devices.
-  Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

(R001 part 1 of 2):

DANGER: Observe the following precautions when working on or around your IT rack system:

- Heavy equipment–personal injury or equipment damage might result if mishandled.
- Always lower the leveling pads on the rack cabinet.
- Always install stabilizer brackets on the rack cabinet if provided, unless the earthquake option is to be installed.
- To avoid hazardous conditions due to uneven mechanical loading, always install the heaviest devices in the bottom of the rack cabinet. Always install servers and optional devices starting from the bottom of the rack cabinet.
- Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack mounted devices and do not use them to stabilize your body position (for example, when working from a ladder).

- Stability hazard:
  - The rack may tip over causing serious personal injury.
  - Before extending the rack to the installation position, read the installation instructions.
  - Do not put any load on the slide-rail mounted equipment mounted in the installation position.
  - Do not leave the slide-rail mounted equipment in the installation position.
- Each rack cabinet might have more than one power cord.
  - For AC powered racks, be sure to disconnect all power cords in the rack cabinet when directed to disconnect power during servicing.

  - For racks with a DC power distribution panel (PDP), turn off the circuit breaker that controls the power to the system unit(s), or disconnect the customer’s DC power source, when directed to disconnect power during servicing.
- Connect all devices installed in a rack cabinet to power devices installed in the same rack cabinet. Do not plug a power cord from a device installed in one rack cabinet into a power device installed in a different rack cabinet.
- An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (R001 part 1 of 2)

(R001 part 2 of 2):

⚠ **CAUTION:**

- Do not install a unit in a rack where the internal rack ambient temperatures will exceed the manufacturer's recommended ambient temperature for all your rack-mounted devices.
- Do not install a unit in a rack where the air flow is compromised. Ensure that air flow is not blocked or reduced on any side, front, or back of a unit used for air flow through the unit.
- Consideration should be given to the connection of the equipment to the supply circuit so that overloading of the circuits does not compromise the supply wiring or overcurrent protection. To provide the correct power connection to a rack, refer to the rating labels located on the equipment in the rack to determine the total power requirement of the supply circuit.
- *(For sliding drawers.)* Do not pull out or install any drawer or feature if the rack stabilizer brackets are not attached to the rack or if the rack is not bolted to the floor. Do not pull out more than one drawer at a time. The rack might become unstable if you pull out more than one drawer at a time.

- *(For fixed drawers.)* This drawer is a fixed drawer and must not be moved for servicing unless specified by the manufacturer. Attempting to move the drawer partially or completely out of the rack might cause the rack to become unstable or cause the drawer to fall out of the rack. (R001 part 2 of 2)

⚠ **CAUTION:** Removing components from the upper positions in the rack cabinet improves rack stability during relocation. Follow these general guidelines whenever you relocate a populated rack cabinet within a room or building.

- Reduce the weight of the rack cabinet by removing equipment starting at the top of the rack cabinet. When possible, restore the rack cabinet to the configuration of the rack cabinet as you received it. If this configuration is not known, you must observe the following precautions:
  - Remove all devices in the 32U position (compliance ID RACK-001 or 22U (compliance ID RR001) and above.
  - Ensure that the heaviest devices are installed in the bottom of the rack cabinet.

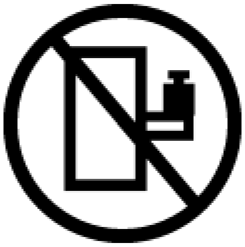
  - Ensure that there are little-to-no empty U-levels between devices installed in the rack cabinet below the 32U (compliance ID RACK-001 or 22U (compliance ID RR001) level, unless the received configuration specifically allowed it.
- If the rack cabinet you are relocating is part of a suite of rack cabinets, detach the rack cabinet from the suite.
- If the rack cabinet you are relocating was supplied with removable outriggers they must be reinstalled before the cabinet is relocated.
- Inspect the route that you plan to take to eliminate potential hazards.
- Verify that the route that you choose can support the weight of the loaded rack cabinet. Refer to the documentation that comes with your rack cabinet for the weight of a loaded rack cabinet.
- Verify that all door openings are at least 760 x 2083 mm (30 x 82 in.).
- Ensure that all devices, shelves, drawers, doors, and cables are secure.
- Ensure that the four leveling pads are raised to their highest position.
- Ensure that there is no stabilizer bracket installed on the rack cabinet during movement.
- Do not use a ramp inclined at more than 10 degrees.
- When the rack cabinet is in the new location, complete the following steps:
  - Lower the four leveling pads.
  - Install stabilizer brackets on the rack cabinet or in an earthquake environment bolt the rack to the floor.
  - If you removed any devices from the rack cabinet, repopulate the rack cabinet from the lowest position to the highest position.
- If a long-distance relocation is required, restore the rack cabinet to the configuration of the rack cabinet as you received it. Pack the rack cabinet in the original packaging material, or equivalent. Also lower the leveling pads to raise the casters off of the pallet and bolt the rack cabinet to the pallet.

(R002)

(L001)

⚠ **DANGER:** Hazardous voltage, current, or energy levels are present inside any component that has this label attached. Do not open any cover or barrier that contains this label. (L001)

(L002)



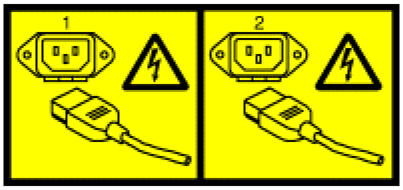
⚠ **DANGER:** Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack-mounted devices and do not use them to stabilize your body position (for example, when working from a ladder). Stability hazard:

- The rack may tip over causing serious personal injury.

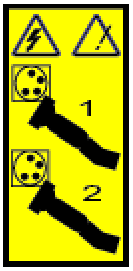
- Before extending the rack to the installation position, read the installation instructions.
- Do not put any load on the slide-rail mounted equipment mounted in the installation position.
- Do not leave the slide-rail mounted equipment in the installation position.

(L002)

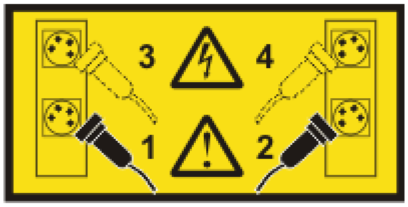
(L003)



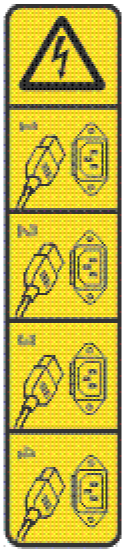
or



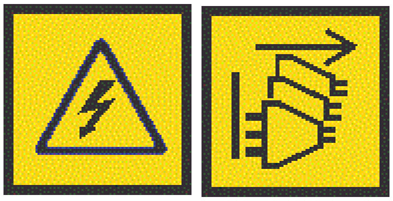
or

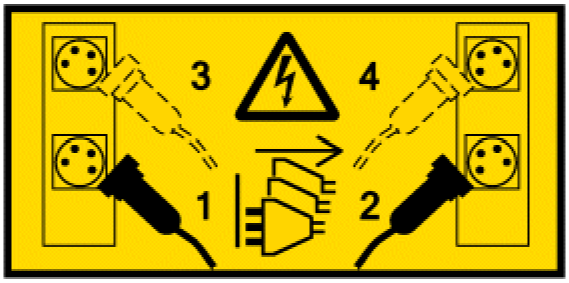


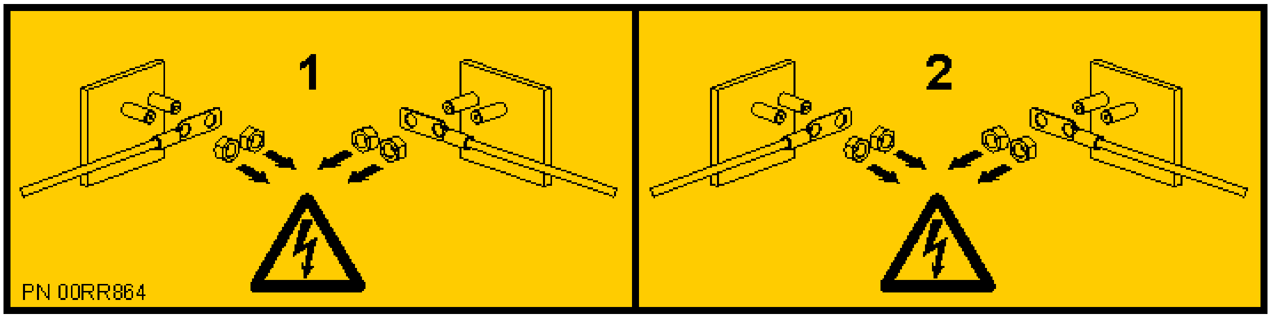
or



or





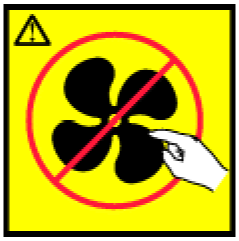


DANGER: Multiple power cords. The product might be equipped with multiple AC power cords or multiple DC power cables. To remove all hazardous voltages, disconnect all power cords and power cables. (L003)

(L007)

CAUTION: A hot surface nearby. (L007)

(L008)



CAUTION: Hazardous moving parts nearby. (L008)

(L018)

or

CAUTION: High levels of acoustical noise are (or could be under certain circumstances) present. Use approved hearing protection and/ or provide mitigation or limit exposure. (L018)

All lasers are certified in the U.S. to conform to the requirements of DHHS 21 CFR Subchapter J for class 1 laser products. Outside the U.S., they are certified to be in compliance with IEC 60825 as a class 1 laser product. Consult the label on each part for laser certification numbers and approval information.

⚠ **CAUTION:** This product might contain one or more of the following devices: CD-ROM drive, DVD-ROM drive, DVD-RAM drive, or laser module, which are Class 1 laser products. Note the following information:

- Do not remove the covers. Removing the covers of the laser product could result in exposure to hazardous laser radiation. There are no serviceable parts inside the device.
- Use of the controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

(C026)

⚠ **CAUTION:** Data processing environments can contain equipment transmitting on system links with laser modules that operate at greater than Class 1 power levels. For this reason, never look into the end of an optical fiber cable or open receptacle. Although shining light into one end and looking into the other end of a disconnected optical fiber to verify the continuity of optic fibers may not injure the eye, this procedure is potentially dangerous. Therefore, verifying the continuity of optical fibers by shining light into one end and looking at the other end is not recommended. To verify continuity of a fiber optic cable, use an optical light source and power meter. (C027)

⚠ **CAUTION:** This product contains a Class 1M laser. Do not view directly with optical instruments. (C028)

⚠ **CAUTION:** Some laser products contain an embedded Class 3A or Class 3B laser diode. Note the following information:

- Laser radiation when open.
- Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam. (C030)

(C030)

⚠ **CAUTION:** The battery contains lithium. To avoid possible explosion, do not burn or charge the battery.

Do Not:

- Throw or immerse into water
- Heat to more than 100 degrees C (212 degrees F)
- Repair or disassemble

Exchange only with the IBM-approvedapproved part. Recycle or discard the battery as instructed by local regulations. In the United States, IBM has a process for the collection of this battery. For information, call 1-800-426-4333. Have the IBM part number for the battery unit available when you call. (C003)(C003a)

⚠ **CAUTION:** Regarding IBM providedprovided VENDOR LIFT TOOL:

- Operation of LIFT TOOL by authorized personnel only.
- LIFT TOOL intended for use to assist, lift, install, remove units (load) up into rack elevations. It is not to be used loaded transporting over major ramps nor as a replacement for such designated tools like pallet jacks, walkies, fork trucks and such related relocation practices. When this is not practicable, specially trained persons or services must be used (for instance, riggers or movers).
- Read and completely understand the contents of LIFT TOOL operator's manual before using. Failure to read, understand, obey safety rules, and follow instructions may result in property damage and/or personal injury. If there are questions, contact the vendor's service and support. Local paper manual must remain with machine in provided storage sleeve area. Latest revision manual available on vendor's web site.

- Test verify stabilizer brake function before each use. Do not over-force moving or rolling the LIFT TOOL with stabilizer brake engaged.
- Do not raise, lower or slide platform load shelf unless stabilizer (brake pedal jack) is fully engaged. Keep stabilizer brake engaged when not in use or motion.
- Do not move LIFT TOOL while platform is raised, except for minor positioning.
- Do not exceed rated load capacity. See LOAD CAPACITY CHART regarding maximum loads at center versus edge of extended platform.
- Only raise load if properly centered on platform. Do not place more than 200 lb (91 kg) on edge of sliding platform shelf also considering the load's center of mass/gravity (CoG).
- Do not corner load the platforms, tilt riser, angled unit install wedge or other such accessory options. Secure such platforms -- riser tilt, wedge, etc options to main lift shelf or forks in all four (4x or all other provisioned mounting) locations with provided hardware only, prior to use. Load objects are designed to slide on/off smooth platforms without appreciable force, so take care not to push or lean. Keep riser tilt [adjustable angling platform] option flat at all times except for final minor angle adjustment when needed.
- Do not stand under overhanging load.
- Do not use on uneven surface, incline or decline (major ramps).
- Do not stack loads.
- Do not operate while under the influence of drugs or alcohol.
- Do not support ladder against LIFT TOOL (unless the specific allowance is provided for one following qualified procedures for working at elevations with this TOOL).
- Tipping hazard. Do not push or lean against load with raised platform.
- Do not use as a personnel lifting platform or step. No riders.
- Do not stand on any part of lift. Not a step.
- Do not climb on mast.
- Do not operate a damaged or malfunctioning LIFT TOOL machine.
- Crush and pinch point hazard below platform. Only lower load in areas clear of personnel and obstructions. Keep hands and feet clear during operation.
- No Forks. Never lift or move bare LIFT TOOL MACHINE with pallet truck, jack or fork lift.
- Mast extends higher than platform. Be aware of ceiling height, cable trays, sprinklers, lights, and other overhead objects.
- Do not leave LIFT TOOL machine unattended with an elevated load.
- Watch and keep hands, fingers, and clothing clear when equipment is in motion.
- Turn Winch with hand power only. If winch handle cannot be cranked easily with one hand, it is probably over-loaded. Do not continue to turn winch past top or bottom of platform travel. Excessive unwinding will detach handle and damage cable. Always hold handle when lowering, unwinding. Always assure self that winch is holding load before releasing winch handle.
- A winch accident could cause serious injury. Not for moving humans. Make certain clicking sound is heard as the equipment is being raised. Be sure winch is locked in position before releasing handle. Read instruction page before operating this winch. Never allow winch to unwind freely. Freewheeling will cause uneven cable wrapping around winch drum, damage cable, and may cause serious injury.
- This TOOL must be maintained correctly for IBM Service personnel to use it. IBM shall inspect condition and verify maintenance history before operation. Personnel reserve the right not to use TOOL if inadequate. (C048)

Power and cabling information for NEBS (Network Equipment-Building System) GR-1089-CORE

The following comments apply to the IBM servers that have been designated as conforming to NEBS (Network Equipment-Building System) GR-1089-CORE:

The equipment is suitable for installation in the following:

- Network telecommunications facilities
- Locations where the NEC (National Electrical Code) applies

The intra-building ports of this equipment are suitable for connection to intra-building or unexposed wiring or cabling only. The intra-building ports of this equipment *must not* be metallically connected to the interfaces that connect to the OSP (outside plant) or its wiring. These interfaces are designed for use as intrabuilding interfaces only (Type 2 or Type 4 ports as described in GR-1089-CORE) and require isolation from the exposed OSP cabling. The addition of primary protectors is not sufficient protection to connect these interfaces metallically to OSP wiring.

Note: All Ethernet cables must be shielded and grounded at both ends.

The AC-powered system does not require the use of an external surge protection device (SPD).

The DC-powered system employs an isolated DC return (DC-I) design. The DC battery return terminal *shall not* be connected to the chassis or frame ground.

The DC-powered system is intended to be installed in a common bonding network (CBN) as described in GR-1089-CORE.

Installing and configuring the Hardware Management Console

Learn how to install the Hardware Management Console (HMC) hardware, connect it to your managed system, and configure it for use. You can perform these tasks yourself, or contact a service provider to perform these tasks for you. You might be charged a fee by the service provider for this service.

What's new in Installing and configuring the HMC

Read about new or significantly changed information in the Installing and configuring the HMC topic since the previous update of the topic collection.

September 2021

- Removed the menu icons in the HMC topics.
- Updated the following topics:
  - "Installation and configuration tasks" on page 1
  - "Securing the HMC" on page 84
  - "Enhanced password policy" on page 86
  - "HMC port locations" on page 92

Installation and configuration tasks

Learn about the tasks that are associated with different HMC installation and configuration tasks.

Learn about, at a high level, the tasks you must complete when you install and configure your HMC. You can install and configure your HMC in different ways. Find the situation that best matches the task that you want to complete.

Notes:

- If you are managing Power10 processor-based systems, the HMC must be at Version 10.1.1010, or later. For more information, see "Determining your HMC machine code version and release" on page 75.
- Hardware Management Console Version 10.1.1010, or later is not supported on the HMC 7042 Machine Type. For more information about the HMC versions for your 7042 HMC, see the HMC release notes that is available in the Fix Central website.

Installing and configuring a new HMC with a new server

Learn more about the high-level tasks you must complete when you install and configure a new HMC with a new server.

Table 1. Tasks that you need to complete when you install and configure a new HMC with a new server

Task	Where to find related information
1. Gather information and complete the Preinstallation Configuration worksheet.	"Preinstallation configuration worksheet for the HMC" on page 24 "Preparing for HMC configuration" on page 23
2. Unpack the hardware.	

Table 1. Tasks that you need to complete when you install and configure a new HMC with a new server (continued)

Task	**Where to find related information**
3. Cable the HMC hardware.	"Cabling the rack-mounted 7063-CR2 HMC" on page 9
4. Power on the HMC by pressing the power button.	
5. Log in and start the HMC web application.	
6. Access the Guided setup wizard or use the HMC menus to configure the HMC.	"Configuring the HMC by using the menus " on page 31
7. Attach the server to the HMC.	

Updating and upgrading your HMC code

Learn more about the high-level tasks you must complete when you update and upgrade your HMC code.

If you have an existing HMC and want to update or upgrade your HMC code, you must complete the following high-level tasks:

Table 2. Tasks that you need to complete when you update or upgrade HMC code

Task	**Where to find related information**
1. Obtain the upgrade.	"Upgrading your HMC software" on page 80
2. View the existing HMC machine code level.	
3. Back up the managed system's profile data.	
4. Back up HMC data.	
5. Record the current HMC configuration information.	
6. Record remote command status.	
7. Save upgrade data.	
8. Upgrade the HMC software.	
9. Verify that the HMC machine code upgrade installed successfully	

Adding a second HMC to an existing installation

Learn more about the high-level tasks you must complete when you add a second HMC to your managed system.

If you have an existing HMC and managed system and want to add a second HMC to this configuration, complete the following steps:

Table 3. Tasks that you need to complete when you add a second HMC to an existing installation

Task	**Where to find related information**
1. Ensure that your HMC hardware supports HMC Version 7 code.	
2. Gather information and complete the Preinstallation Configuration worksheet.	"Preinstallation configuration worksheet for the HMC" on page 24

Table 3. Tasks that you need to complete when you add a second HMC to an existing installation (continued)

Task	Where to find related information
3. Unpack the hardware.	
4. Cable the HMC hardware.	"Cabling the rack-mounted 7063-CR2 HMC" on page 9
5. Power on the HMC by pressing the power button.	
6. Log in to the HMC.	
7. The HMC code levels must match. Change the code on one of the HMCs to match the code on the other.	"Determining your HMC machine code version and release" on page 75 "Upgrading your HMC software" on page 80
8. Access the Guided setup wizard or use the HMC menus to configure the HMC.	"Configuring the HMC by using the menus " on page 31
9. Configure this HMC for service by using the Call-Home Setup wizard.	"Configuring the HMC so that it can connect to service and support by using the call-home setup wizard" on page 69
10. Attach the server to the HMC.	

Setting up the HMC

You must set up the HMC hardware before you configure the HMC software. Learn more about setting up a desk-side HMC or a rack-mounted HMC.

Installing the IBM Power Systems HMC (7063-CR2) into a rack

Learn how to install the IBM Power® systems HMC (7063-CR2) into a rack.

You can view the online installation documentation, or you can print the PDF version of the same information. To view or print the PDF version, see Installing and configuring the Hardware Management Console.

Prerequisites for installing the rack-mounted 7063-CR2 system

Use the information to understand the prerequisites that are required for installing the system.

About this task

⚠ **CAUTION:** This part or unit is heavy but has a weight smaller than 18 kg (39.7 lb). Use care when lifting, removing, or installing this part or unit. (C008)

You might need to read the following documents before you begin to install the server:

- The latest version of this document is maintained online, see Installing the 7063-CR2 into a rack (http://www.ibm.com/support/knowledgecenter/POWER9/p10hai/p10hai_install7063cr2_kickoff.htm).
- To plan your server installation, see Site and hardware planning.

Procedure

1. Ensure that you have the following items before starting your installation:
   - Size 2 Phillips screwdriver
   - Flat-head screwdriver

- T25 screwdriver
- Box cutter
- Electrostatic discharge (ESD) wrist strap
- Rack with one Electronic Industries Association (EIA) unit (1U) of space.

Notes:

- If you do not have a rack that is installed, install the rack. For instructions, see Racks and rack features (http://www.ibm.com/support/knowledgecenter/POWER10/p10hbf/p10hbf_10xx_kickoff.htm).
- The power supply ratings are 100 to 127 V ac, 9 A (x2), 200 to 240 V ac, 4.5 A (x2); 50 or 60 Hz.

2. Remove the shipping brackets on the system.
3. Continue with "Completing inventory for your system" on page 4.

Completing inventory for your system

Use this information to complete inventory for your system.

Procedure

1. Verify that you received all the boxes you ordered.
2. Unpack the server components as needed.
3. Complete a parts inventory and verify that you have received all the parts that you ordered before you install each server component.

   Note:

   Your order information is included with your product. You can also obtain order information from your marketing representative or the IBM Business Partner.

   If you have incorrect, missing, or damaged parts, consult any of the following resources:

   - Your IBM reseller.
   - IBM Rochester manufacturing automated information line at 1-800-300-8751 (United States only).
   - The Directory of worldwide contacts website (http://www.ibm.com/planetwide). Select your location to view the service and support contact information.
4. Continue with "Determining and marking the location in the rack for the 7063-CR2 system" on page 4.

Determining and marking the location in the rack for the 7063-CR2 system

You need to determine where to install the system unit into the rack.

Procedure

1. Read the Rack safety notices (http://www.ibm.com/support/knowledgecenter/POWER10/p10hbf/p10hbf_racksafety.htm).
2. Determine where to place the system unit in the rack. As you plan for installing the system unit in a rack, consider the following information:
   - Organize larger and heavier units into the lower part of the rack.
   - Plan to install system units into the lower part of the rack first.
   - Record the Electronic Industries Alliance (EIA) locations in your plan.
3. If necessary, remove the filler panels to allow access to the inside of the rack enclosure where you plan to place the unit, as shown in Figure 1 on page 5.

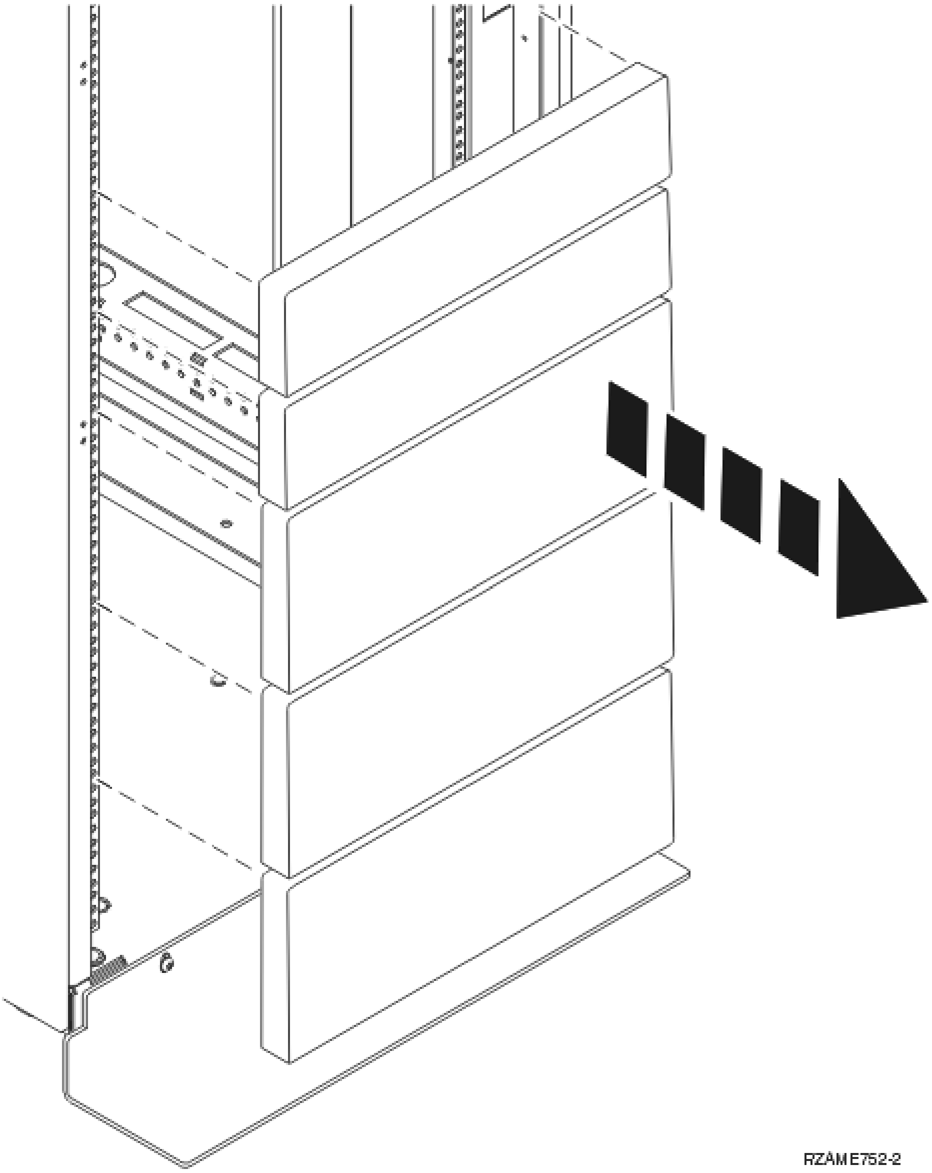


Figure 1. Removing the filler panels

4. Determine where to place the system in the rack. Record the EIA location.
5. Facing the front of the rack and working from the right side, use tape, a marker, or pencil to mark the lower hole of each EIA unit.
6. Repeat step "5" on page 5 for the corresponding holes located on the left side of the rack.
7. Go to the rear of the rack.
8. On the right side, find the EIA unit that corresponds to the bottom EIA unit marked on the front of the rack.
9. Mark the bottom EIA unit.
10. Mark the corresponding holes on the left side of the rack.
11. Continue with "Attaching the adjustable rails to the system chassis and to the rack" on page 6 to attach the adjustable rails or continue with "Attaching the fixed rails to the system chassis and to the rack" on page 7 to attach the fixed rails.

Attaching the adjustable rails to the system chassis and to the rack

You must install the rails onto the chassis and into the rack. Use this procedure to perform this task.

About this task

Attention: To avoid rail failure and potential danger to yourself and to the unit, ensure that you have the correct rails and fittings for your rack. If your rack has square support flange holes or screw-thread support flange holes, ensure that the rails and fittings match the support flange holes that are used on your rack. Do not install mismatched hardware by using washers or spacers. If you do not have the correct rails and fittings for your rack, contact your IBM reseller.If you don’t have the correct rails and fittings for your rack, contact your reseller.

Note: The 1 EIA units in racks are measured in vertical increments of 44.45 mm (1.75 in.) each. Each 44.45 mm (1.75 in.) increment is called an “EIA.” In some countries, the same increment can be referred to as a “U.”

Note: The system requires 1 EIA rack unit (1U) of space.

Ensure that you have the necessary parts to install the rails. The following parts are included with the rail kit:

- 4 - Philips 6.35 mm (0.25 in.) screws
- 2 - rack and slide bracket rail assemblies
- 2 - HMC slide brackets
- 10 - nut clips for square EIA mounting holes
- 10 - nut clips for round EIA mounting holes
- 10 - M5 hex flange screws

Procedure

1. Remove the rail pieces from the packaging and put them on a work surface.
2. Identify 1U space in the rack of the HMC.
3. To attach the slide brackets to the HMC, perform the following tasks:
   a. Identify the right slide bracket.
   b. Align the holes on the right slide bracket with the slide bracket pins located on the right side of the HMC. Ensure that all the pins are aligned with the bracket holes.
   c. Push the HMC slide bracket toward the rear side of the HMC until it is fully locked into position.
   d. Secure the right slide bracket to the right side of the HMC workstation by installing two Philips 6.35 mm (0.25 in.) screws into the screw holes.
   e. Repeat the steps “3.a” on page 6 - “3.d” on page 6 to install the left slide bracket to the left side of the HMC workstation.
4. Move to the front of the rack.
   a. On the left side, install three nut clips into the three holes on the front edge of the rack in the 1U slot that is designated for the HMC.

      Note: The rail kit includes nut clips for both square and round rack holes. Ensure that you use appropriate nut clips that match the holes in the rack.
   b. Repeat step “4.a” on page 6 on the right side of the rack.
5. Move to the rear of the rack.
   a. On the left side, install two nut clips into the upper and lower holes on the front edge of the rack in the 1U slot that is designated for the HMC.

      Note: The middle hole must remain empty.
   b. Repeat step “5.a” on page 6 on the right side of the rack.

6. To install the HMC slide rails into the rack, perform the following steps:
    a. Measure the depth of the rack. The depth must be between 558.8 mm (22 in.) and 863.6 mm (34 in.).
    b. Place the HMC slide rails on a flat surface and locate the preinstalled screws.

       Note: The slide rails have four screw holes.
    c. Loosen the preinstalled screws on the slide rails enough that the rails can be moved in and out easily.
    d. Based on the depth of the rack measured in step "6.a" on page 7, you must adjust the screws on the rails.
        i) If the depth of the rack is between 558.8 mm (22 in.) and 698.5 mm (27.5 in.), attach the screws to the first and the third holes.
        ii) If the depth of the rack is between 698.5 mm (27.5 in.) and 863.6 mm (34 in.), attach the screws to the second and the fourth holes.

        Notes:

        - The first hole is always the hole closest to the end of the slide rail. The third and fourth holes are located close together.
        - Ensure that the screws are loose enough so that the length of the slide rail can be slightly adjusted while it is being installed in the rack.
7. At the front of the rack, install the HMC slide rails into the rack by performing the following steps:
    a. Locate the left slide rail assembly.
    b. Orient the rail assembly so that the end with the closest screw hole (the first hole) goes into the rack first. Ensure that the screw heads face the inside of the rack. The open slot of the rail assembly is closest to the front of the rack.
    c. On the left side of the rack, connect the flange on the end of the slide rail to the front edge of the rack by using two M5 screws, leaving the middle hole open. Ensure that the rail assembly is left slightly loose on the front of the rack to allow for the HMC to be inserted.
8. At the rear of the rack, on the right side, pull the free end of the slide rail toward the rear and secure the flange of the slide rail to the rack by using two M5 screws, leaving the middle screw hole open.
9. Repeat the step "7" on page 7 and step "8" on page 7 to install the right slide rail assembly on the right side of the rack.
10. In front of the rack, install the HMC workstation into the rack by performing the following steps:
    a. Holding the HMC workstation level, insert the slide brackets into the HMC slide rails that you installed in the previous step. Push the HMC forward until the flanges on the front of the HMC are flush with the open screw holes on the front of the rack.
    b. Connect the HMC to the left side of the frame using one M5 screw. Repeat this step on the right side of the rack.
11. Continue with "Installing the system into the rack and connecting and routing power cables" on page 9.

Attaching the fixed rails to the system chassis and to the rack

You must install the rails onto the chassis and into the rack. Use this procedure to perform this task.

About this task

Attention: To avoid rail failure and potential danger to yourself and to the unit, ensure that you have the correct rails and fittings for your rack. If your rack has square support flange holes or screw-thread support flange holes, ensure that the rails and fittings match the support flange holes that are used on your rack. Do not install mismatched hardware by using washers or spacers.

If you do not have the correct rails and fittings for your rack, contact your IBM reseller.If you don’t have the correct rails and fittings for your rack, contact your reseller.

Note: The 1 EIA unit in racks are measured in vertical increments of 44.45 mm (1.75 in.) each. Each 44.45 mm (1.75 in.) increment is called an “EIA.” In some countries, the same increment can be referred to as a “U.”

Note: The system requires 1 EIA rack unit (1U) of space.

Ensure that you have the necessary parts to install the rails. The following parts are included with the rail kit:

- 4 - Philips 6.35 mm (0.25 in.) screws
- 2 - Inner rails
- 2 - HMC support rails
- 2 - Nut clips for square EIA mounting holes
- 2 - Nut clips for round EIA mounting holes
- 8 - M5 hex flange screws

Procedure

1. Remove the rail pieces from the packaging and put them on a work surface.
2. Identify 1U space in the rack of the HMC.
3. To attach the inner rails to the HMC, perform the following tasks:
   a. Identify the right inner rail.
   b. Align the holes on the right inner rail with the inner rail pins located on the right side of the HMC. Ensure that all the pins are aligned with the inner rail holes.
   c. Push the HMC inner rail toward the front side of the HMC until it is fully locked into position.
   d. Secure the right inner rail to the right side of the HMC workstation by installing two Philips 6.35 mm (0.25 in.) screws into the screw holes.
   e. Repeat the steps 3.a - “3.d” on page 8 to install the left inner rail to the left side of the HMC workstation.
4. Move to the front of the rack. On the left side, install one nut clips into the hole on the front edge of the rack in the 1U slot that is designated for the HMC.

   Note: The rail kit includes nut clips for both square and round rack holes. Ensure that you use appropriate nut clips that match the holes in the rack.
5. Move to the rear of the rack. On the left side, install one nut clips into the middle hole on the front edge of the rack in the 1U slot that is designated for the HMC.
6. At the front of the rack, install the HMC support rails into the rack by performing the following steps:
   a. Align the pins of the support rails above and below the nut clip you installed in the previous step..
   b. On the right side of the rack, connect the flange on the end of the support rail to the front edge of the rack by using two M5 screws into the upper and lower screw holes, leaving the middle screw hole open. Ensure that the rail assembly is left slightly loose on the front of the rack to allow for the HMC to be inserted.
7. At the rear of the rack, on the right side, pull the free end of the support rail toward the rear and secure the flange of the support rail to the rack by using two M5 screws, leaving the middle screw hole open.
8. Repeat the step “6” on page 8 and step “7” on page 8 to install the right support rail assembly on the right side of the rack.
9. In front of the rack, install the HMC workstation into the rack by performing the following steps:

a. Holding the HMC workstation level, insert the inner rails into the HMC support rails that you installed in the previous step. Push the HMC forward until the flanges on the front of the HMC are flush with the open screw holes on the front of the rack.

b. Connect the HMC to the left side of the frame using one M5 screw. Repeat this step on the right side of the rack.

Note: If present, remove the orange shipping brackets that are attached to the rear of the system and reinstall the screw back in.

10. Continue with "Installing the system into the rack and connecting and routing power cables" on page 9.

Installing the system into the rack and connecting and routing power cables

Install the system onto the rails and connect and route power cables.

About this task

⚠ **CAUTION:** This part or unit is heavy but has a weight smaller than 18 kg (39.7 lb). Use care when lifting, removing, or installing this part or unit. (C008)

Procedure

1. Plug the power cords into the power supplies.

   Note: Do not connect the other end of the power cord to the power source now.

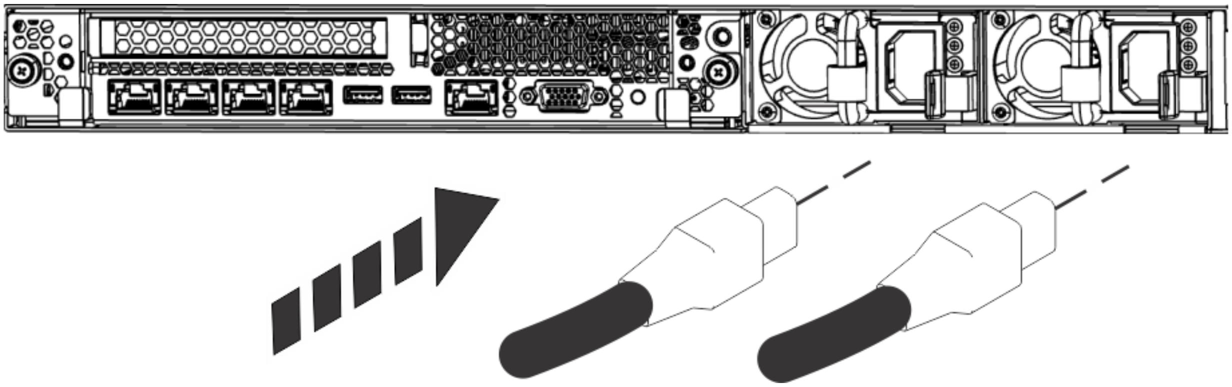

Figure 2. Plugging the power cords into the power supplies

2. Fasten the hook-and-loop fasteners to secure the power cords.
3. Continue with "Cabling the rack-mounted 7063-CR2 HMC" on page 9.

Cabling the rack-mounted 7063-CR2 HMC

Learn how to physically install your rack-mounted Hardware Management Console (HMC).

Procedure

1. Ensure that the HMC is installed into a rack and the power cords are plugged into the power supplies. For more information, see "Installing the system into the rack and connecting and routing power cables" on page 9. After you install the HMC into a rack, continue with the next step.
2. Connect the keyboard, monitor, and mouse.

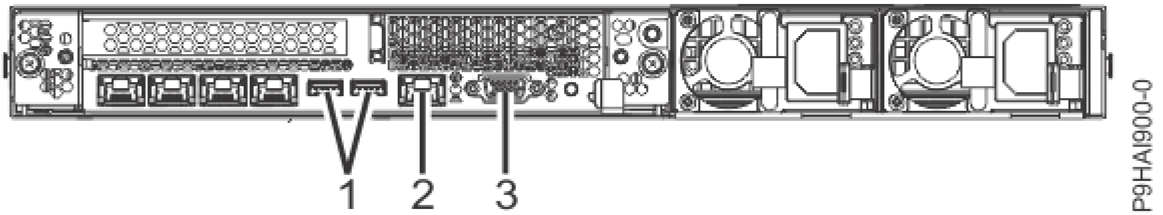

Figure 3. Rear ports

Table 4. Input and output ports	
Identifier	**Description**
1	USB 2.0 used for keyboard and mouse
2	Ethernet Intelligent Platform Management Interface (IPMI)
3	Video Graphics Array (VGA) that is used for the monitor. Only the 1024 x 768 at 60 Hz VGA setting is supported. Only up to a 3-meter cable is supported.

Note: The system has two front USB ports that you can use.

3. Connect the Ethernet Intelligent Platform Management Interface (IPMI) port to a network.

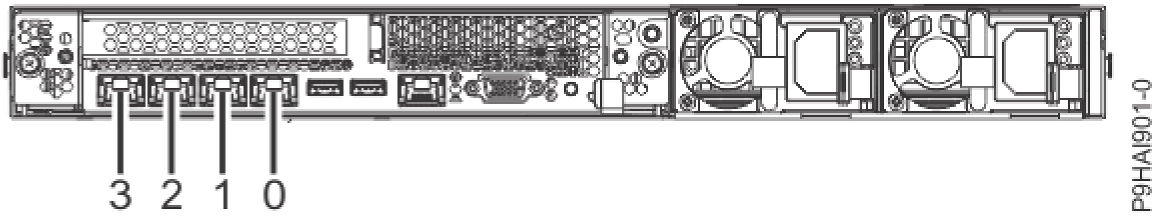

Figure 4. Ethernet ports

Table 5. Ethernet ports	
Identifier	**Description**
0	Shared Ethernet Intelligent Platform Management Interface (IPMI) and HMC Network Connection
1, 2, and 3	HMC network connection

Notes:

- When the HMC is equipped with an optional 10 Gb PCI Express (PCIe) adapter, two additional ethernet ports are available.
- This connection is required to access the baseboard management controller (BMC) on the HMC. Access to the BMC is required for service tasks and to maintain the HMC firmware. For more information, see “Types of HMC network connections” on page 15.

Warning: This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Please contact IBM for more information.

4. Connect the Ethernet cable that is intended for the connection to the managed system or systems.

Notes:

- If you are using a shared connection for IPMI and HMC, a single cable to port 0 in Figure 2 can satisfy both requirements for IPMI and HMC.
- To learn more about the HMC network connections, see "HMC network connections" on page 15.

5. If your managed system is already installed, you can verify that the Ethernet cable connection is active by observing the green status lights at both the HMC and managed system Ethernet ports as your installation progresses.
6. Plug the system power cords and the power cords for any other attached devices into the alternating current (AC) power source.
7. Verify the power status by using the power supply LEDs as indicators. For more information, see LEDs on the 7063-CR2 systemLEDs on the 7063-CR2 system.
8. Press the power button to start the system. The power-on light stops flashing and remains on, indicating that the system power is on.

Results

Next, you need to install and configure your HMC software. Continue with "Configuring the 7063-CR2 HMC" on page 11.

Configuring the 7063-CR2 HMC

Learn how to install and configure the Hardware Management Console (HMC).

Check the HMC version that is shipped with your HMC. To find out how to view the HMC machine code version and release, see Check the HMC version that is shipped with your HMC. You can download the latest HMC version that is available from the Fix Central website. Use removable media (such as a DVD or USB) to create a bootable ISO file from the HMC package (ISO image).

Note: The following table describes the predefined (default) login information for the HMC and BMC interfaces.

Table 6.

Console or Interface	Default ID	Default Password	Description
BMC (OpenBMC)	`root`	`0penBmc`	The root user ID and password are used to log in to the BMC for the first time.
HMC	`hscroot`	`abc123`	The hscroot user ID and password are used to log in to the HMC for the first time. They are case-sensitive and can only be used by a member of the super administrator role.
HMC	`root`	`passw0rd`	The root user ID and password are used by the service provider to perform maintenance procedures. They cannot be used to log in to the HMC.

Note: The following installations are shown as examples.

Installing the HMC by using USB flash drive

To install the HMC by using USB flash drive, complete the following steps for Linux® systems:

Note: For examples in different operating systems, see:

- Windows: USB flash installation media (Windows)
- Mac: USB flash installation media (macOS)

1. Download the HMC version that you want from the Fix Central website.
2. Run the following command to identify the device name of the USB drive when it is plugged in: **`lsblk`**.

   For example: **`/dev/sdb`** (where **sdb** is the name of the USB drive)
3. Run the following command to wipe the USB drive: **`wipefs --all /dev/sdX`**.

   For example: **`wipefs --all /dev/sdb`**
4. Run the following command to verify the size of the disk under the SIZE column: **`lsblk`**.

   For example: When a 16 GB USB drive shows as 14.3 GB, round it down to 14 GB for the next step "5" on page 12.
5. Run the following command to format the disk and create a partition: **`parted /dev/sdX`**

   From the parted utility, run the following three commands:

   ```
   mklabel gpt
   mkpart primary ext3 1MiB <size>GiB
   quit
   ```

   Note: size is the size of the USB drive obtained in the step "4" on page 12.

   For example:

   ```
   parted /dev/sdb
   mklabel gpt
   mkpart primary ext3 1MiB 14GiB
   quit
   ```
6. Run the following command to copy the ISO onto the partition: **`cat HMC-Recovery-ppc64le.iso > /dev/sdX1`**.

   For example: **`cat HMC-9.2.950.0-2103300827-ppc64le.iso > /dev/sdb1`**
7. Insert the USB drive, and power on the system.

   Note: The USB drive must be at least 8 GB. Certain USB drives might be too wide to fit properly into the USB port at the rear of the system. Test the fit of your USB drive before you proceed.
8. If viewing the HMC console via the BMC UI (under **Server control**) instead of the local console, the **KVM** console loads with Petitboot. The pre-Petitboot output can only be seen in the **Serial over LAN console**.
9. When the Petitboot menu is displayed, select the **Install Hardware Management Console** option that is located under **USB**.

Installing the HMC by using virtual media from the BMC

To install the HMC by using virtual media from the BMC, complete the following steps:

1. Open a supported web browser. In the address bar, enter the IP address of the BMC that you want to connect to. For example, you can use the format `https://<BMC IP>` in the address bar of the web browser.
2. From the **OpenBMC logon** window, enter the **Host** address of the BMC and the **Username** and **Password** that is assigned to you.

Note: The default user ID is `root` and the default password is `0penBmc`.

If you are using firmware level OP940.01, or later, the root password is expired by default. You must change the default password before you can access the BMC. For more information about changing the expired default password, see .

If you forgot your password, you can perform a factory reset of the system to restore the default password. To reset the system, see .

3. Click **Log in**.
4. Select **Server control**.
5. Select **Virtual Media**.
6. Click **Choose file**.
7. Locate the HMC Recovery media ISO and click **Open**.
8. Click **Start**.
9. Power on the system.
10. If viewing the HMC console via the BMC UI (under **Server control**) instead of the local console, the **KVM** console loads with Petitboot. The pre-Petitboot output can only be seen in the **Serial over LAN console**.
11. When the Petitboot menu is displayed, select the **Install Hardware Management Console** option that is located under **USB**.

Installing the HMC by using an external USB attached DVD drive

To install the HMC by using an external USB attached DVD drive, complete the following steps:

1. Download the HMC recovery version that you want from the Fix Central website.
2. Burn the HMC recovery DVD image to a DVD-R DL media as an image.
3. Power off the HMC.
4. Connect the external USB DVD drive to the HMC and insert the HMC recovery DVD.

   Note: You might need to connect the USB DVD drive to an external power source or use a USB Y cable to connect to an extra USB port to provide sufficient power to the DVD drive.
5. Power on the HMC.

   Note: The display monitor might show no signal during startup. The process might take 2 or 3 minutes before the display monitor shows any status.
6. When the Petitboot bootloader starts, navigate to stop the automatic boot.

   Note: A 10-second timeout is enforced. If no action is taken within 10 seconds, the system attempts to boot from the hard disk drive.
7. Wait until the **CD/DVD** device appears in the Petitboot menu.

   Note: This process can take up to a minute.
8. If viewing the HMC console via the BMC UI (under **Server control**) instead of the local console, the **KVM** console loads with Petitboot. The pre-Petitboot output can only be seen in the **Serial over LAN console**.
9. Select the **Install Hardware Management Console** option that is located under **CD/DVD**.

Enabling secure boot on 7063-CR2 HMC

Use the information to understand the prerequisites and steps to enable secure boot on 7063-CR2 HMC.

About this task

- To enable secure boot on the HMC, the firmware verification should be enabled and the operating system should be **enforcing** verification.

- The secure boot jumper is set to the **enabled** position on all 7063-CR2 HMC systems by default.
- Secure boot is enabled on firmware on all 7063-CR2 HMC systems that are shipped with HMC version 10.1.1010.
- OS secure boot can be enabled manually on 7063-CR2 HMC systems starting from HMC version 10.1.1010.

Note: It is required to re-enable the secure boot after the following replacement procedures:

- Removing and replacing the system backplane in the 7063-CR2.
- Removing and replacing the trusted platform module in the 7063-CR2.

To enable secure boot on 7063-CR2 HMC, complete the following steps:

Procedure

1. Update the firmware on the HMC to the following minimum levels, or later:
   - PNOR: IBM-mowgli-ibm-OP9_v2.5_4.123
   - OpenBMC: op940.hmc-11.1
2. Upgrade the HMC to version 10.1.1010.
3. Access Petitboot through **Petitboot** > **System Information** to verify whether **FW verification** is enabled by scrolling down to the section **Petitboot System Information**.

```
Petitboot System Information

  Secure & trusted boot
  FW verification : enabled
  FW measurement  : enabled
  OS verification : disabled
```

4. If **FW verification** is disabled, complete the following steps:
   - Shut down the HMC.
   - Remove the system backplane. For more information, see Removing the system backplane from the 7063-CR2 system.
   - Flip the secure boot jumper from debug or insecure pins to secure pins.
5. If **OS verification** is disabled, complete the following steps:
   - Boot the HMC.
   - Copy the **PK.auth** and **db.auth** files from the HMC file system to a remote system by using the **sendfile** command as shown in the :

   ```
   sendfile-f /opt/hsc/data/secureboot/PK.auth-h <ip> -d <dir> -u <username> -n PK.auth -s
   sendfile-f /opt/hsc/data/secureboot/db.auth-h <ip> -d <dir> -u <username> -n db.auth–s
   ```

   Note: **`<ip>`** is the IP address of the remote system and **`<dir>`** is the directory in the remote system where the files are stored.
6. On the remote system, copy the **PK.auth** and **db.auth** files to a USB drive.

   Note: Alternatively, you can create an ISO file that contains both the files. This ISO file can then be mounted remotely via the Virtual Media feature of the BMC. Another method to create an ISO file from a directory is to use the **`mkisofs`** command in Linux as follows:

   ```
   mkisofs -o secureboot.iso <dir with auth files>
   ```
7. Boot the HMC to **Petitboot**, and then select **Exit to Shell**.
   - If the files were copied to a USB drive, insert the USB drive.
   - If the files were combined into an ISO file to be remotely mounted via virtual media, start the Virtual Media session.
8. Run the **`mount`** command to verify the automatic mount point.

- An example of automatic mount location for USB drive is:

  ```
  /var/petitboot/mnt/dev/sda1
  ```

  Note: Adjust the mount location as necessary for your drive.

- An example of automatic mount location for ISO file over Virtual Media is:

  ```
  /var/petitboot/mnt/dev/sdb
  ```

9. Change directory to the location of the keys in the media.

   For example, when the mount location is **`/var/petitboot/mnt/dev/sda1`**, you can run the command as following:

   ```
   cd /var/petitboot/mnt/dev/sda1
   ```

10. Write the contents of the **PK** key and **db** files to the system firmware by running the following commands:

    ```
    cat PK.auth > /sys/firmware/secvar/vars/PK/update
    cat db.auth > /sys/firmware/secvar/vars/db/update
    ```

11. Reboot the system by running the **`reboot`** command.
12. Stop the system at **Petitboot** again, and then select **System Information** to confirm that the **Secure & trusted boot** section reflects the following information:

    ```
    Secure & trusted boot
      FW verification : enabled
      FW measurement  : enabled
      OS verification : enforcing
    ```

13. Exit the shell. On the main **Petitboot** menu, select **Hardware Management Console**.
14. Verify that the HMC reports secure boot as enabled by running the command **`lshmc --boot`**. If secure boot is enabled, the following message is displayed:

    ```
    secure_boot=1
    ```

Configuring the HMC

Learn how to set up your network connections, configure your HMC, complete postconfiguration steps, and upgrade and update your HMC.

Choosing network settings on the HMC

Learn about the network settings that you can use on the Hardware Management Console (HMC).

HMC network connections

Learn how the Hardware Management Console HMC can be used in a network.

You can use different types of network connections to connect your HMC to managed systems. For more information about using the HMC on a network, see the following information:

Types of HMC network connections

Learn how to use the HMC remote management and service functions by using your network.

The HMC supports the following types of logical communications:

HMC to managed system

Used to perform most of the hardware management functions, in which HMC issues control function requests through the service processor of the managed system. The connection between the HMC and the service processor is sometimes referred to as the *service network*. This connection is required for managed system management.

HMC to logical partition
Used to collect platform-related information (hardware error events, hardware inventory) from the operating systems that are running on logical partitions, and to coordinate certain platform activities (dynamic LPAR, concurrent repair) with those operating systems. If you want to use service and error notification features, you must create this connection.

HMC to BMC

Note: The baseboard management controller (BMC) connection is applicable only to HMC model 7063-CR1.

Used to perform service and maintenance tasks. The BMC connection is used to load and maintain the HMC firmware on the system. This connection is required for access to the BMC on the HMC.

HMC to remote users
Provides remote users with access to HMC functions. Remote users can access the HMC in the following ways:

- By using the web browser to access all the HMC GUI functions remotely.
- By using Secure Socket Shell (SSH) to access the HMC command line functions remotely.
- By using a virtual terminal server for remote access to virtual logical partition consoles.

HMC to service and support
Used to transmit data, such as hardware error reports, inventory data, and microcode updates, to and from your service provider. You can use this communications path to make automatic service calls.

Your HMC can support up to four separate physical Ethernet interfaces, depending on the model. The stand-alone version of the HMC supports only three HMC interfaces, by using one integrated Ethernet adapter and up to two plug-in adapters. Use each of these interfaces in the following ways:

- One network interface can be used exclusively for HMC-to-managed system communications, which means that only the HMC and service processors of the managed systems would be on that network. One or more network interfaces can be used exclusively for HMC-to-managed system communications, which means that only the HMC and service processors of the managed systems are on that network. Even though the network interfaces into the service processors are encrypted for the Secure Sockets Layer (SSL) Protocol and password-protected, having a separate dedicated network can provide a higher level of security for these interfaces.
- An open network interface would typically be used for the network connection between the HMC and the logical partitions on the managed systems, for the HMC-to-logical partition communications. You can also use this open network interface to manage the HMC remotely.
- Optionally, you can use a third interface to connect to logical partitions and manage the HMC remotely. This interface can also be used as a separate HMC connection to different groups of logical partitions. For example, you might want to have an administrative LAN that is separate from the LAN on which all the usual business transactions are running. Remote administrators can access the HMC and other managed units by using this method. Sometimes the logical partitions are in different Network security domains, perhaps behind a firewall, and you might want to have different HMC network connections into each of those two domains.

Web browser requirements for HMC

The Hardware Management Console (HMC) version 9.1.0 is supported by Google Chrome version 57, Microsoft Internet Explorer (IE) version 11.0, Mozilla Firefox versions 45 and 52 Extended Support Release (ESR), and Safari version 10.1.

If your browser is configured to use an Internet proxy, a local IP addresses should be included in the exception list. Consult your network administrator for more information on the exception list. If you still need to use the proxy to get to the HMC, enable Use HTTP 1.1 through proxy connections under the Advanced tab in your Internet Options window.

Session cookies need to be enabled in order for ASMI to work when connected to HMC remotely. The asm proxy code saves session information and uses it. Follow the steps to enable the session cookies.

Enabling session cookies in Internet Explorer.

1. Select Tools and Click Internet Options
2. Select Privacy and Click Advanced
3. Ensure that the Always allow session cookies is checked. If not, select the Override automatic cookie handling and select Always allow session cookies.
4. Select Prompt under First-party Cookies and Third-party Cookies
5. Click OK.

Enabling session cookies in Firefox.

1. Select Tools and click Options
2. Click Cookies
3. Select Allow sites to set cookies.
4. Select Exceptions and add HMC.
5. Click OK.

Private and open networks in the HMC environment
The Hardware Management Console (HMC) can be configured to use open and private networks. Private networks allow the use of a selected range of nonroutable IP addresses. A *public*, or "open" network describes a network connection between the HMC to any logical partitions and to other systems on your regular network.

Private networks

The only devices on the HMC private network are the HMC itself and each of the managed systems to which that HMC is connected. The HMC is connected to each managed system's Flexible Service Processor (FSP).

On most systems, the FSP provides two Ethernet ports that are labeled **HMC1** and **HMC2**. You to connect up to two HMCs.

Some systems have a dual-FSP option. In this situation, the second FSP acts as a redundant backup. The basic setup requirements for a system with two FSPs are essentially the same as a system without a second FSP. The HMC must be connected to each FSP, so more network hardware is required (for example, a LAN switch or hub) when there is more than one FSP or multiple managed systems.

Note: Each FSP port on the managed system must be connected to only one HMC.

Public networks

The open network can be connected to a firewall or router for connecting to the internet. Connecting to the internet allows the HMC to call home when any hardware errors need to be reported.

The HMC itself provides its own firewall on each of its network interfaces. A basic firewall is automatically configured when you run the HMC Guided Setup wizard, but you customize your firewall settings after the initial HMC installation and configuration.

HMC as a DHCP server
You can use the Hardware Management Console (HMC) as a Dynamic Host Configuration Protocol (DHCP) server.

If you want to configure the first network interface as a private network, you can select from a range of IP addresses for the DHCP server to assign to its clients. The selectable address ranges include segments from the standard nonroutable IP address ranges.

In addition to these standard ranges, a special range of IP addresses is reserved for IP addresses. This special range can be used to avoid conflicts in cases where the HMC attached open networks are using one of the nonroutable address ranges. Based on the range that is selected, the HMC network interface on the private network is automatically assigned the first IP address of that range, and the service processors are then assigned addresses from the rest of the range.

The DHCP server in the HMC uses automatic allocation, which means that each unique service processor Ethernet interface is reassigned the same IP address each time it is started. Each Ethernet interface has a unique identifier that is based on a built-in Media Access Control (MAC) address, which allows the DHCP server to reassign the same IP parameters. You can configure both **eth0** and **eth1** HMC ports to serve DHCP addresses.You can configure both **eth0** and **eth1** HMC ports to serve DHCP addresses.

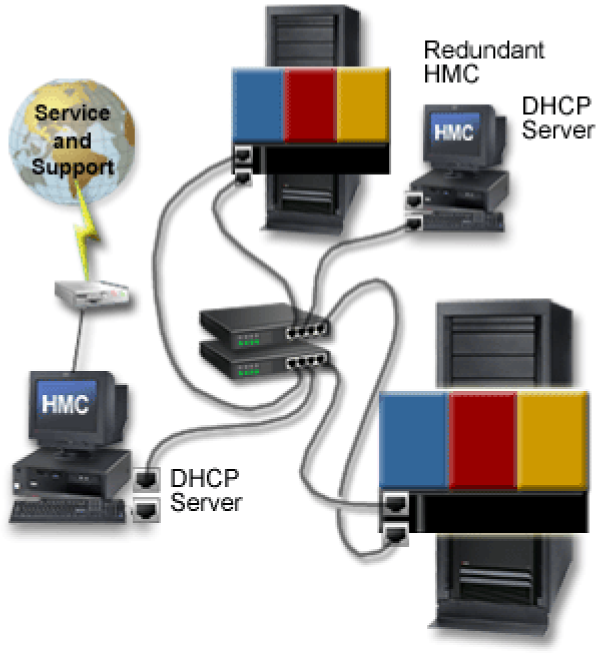

Figure 5. Private network with one HMC as a DHCP server

Note: If you are using IPv6, the discovery process must be done manually. For IPv6, automatic discovery is not available.

For more information about how to configure the HMC as a DHCP server, see "Configuring the HMC as a DHCP server" on page 38.

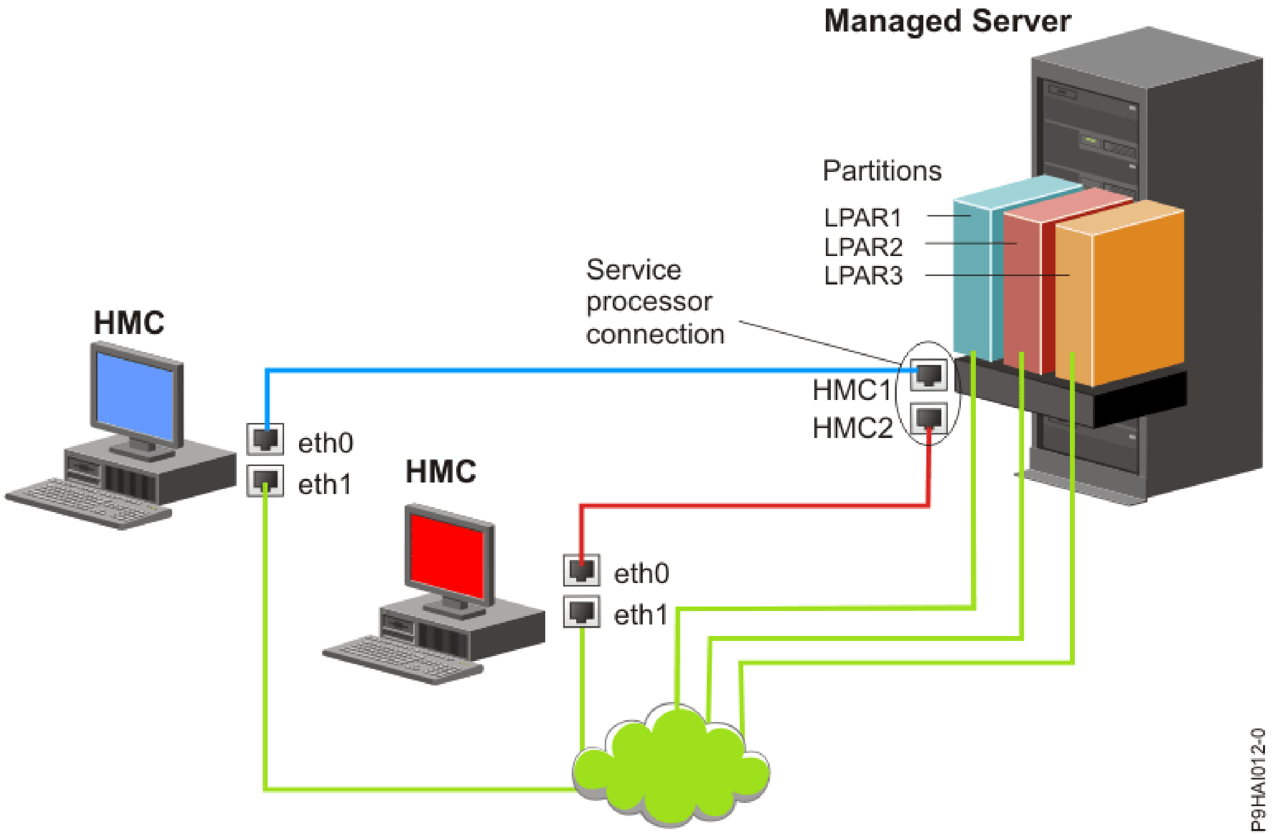
HMC DHCP Server
P9HAI011-0

This figure shows a redundant HMC environment with two managed systems. The first HMC is connected to the first port on each FSP, and the redundant HMC is connected to the second port on each HMC. Each HMC is configured as a DHCP server, by using a different range of IP addresses. The connections are on separate private networks. As such, it is important to ensure that no FSP port is connected to more than one HMC.

Each managed system's FSP port that is connected to an HMC requires a unique IP address. To ensure that each FSP has a unique IP address, use the HMC's built-in DHCP server capability. When the FSP detects the active network link, it issues a broadcast request to locate a DHCP server. When correctly configured, the HMC responds to that request by allocating one of a selected range of addresses.

If you have multiple FSPs, you must have your own LAN switch or hub for the HMC to FSP private network. Alternately, this private segment can exist as several ports in a private *virtual LAN* (VLAN) on a larger managed switch. If you have multiple private VLANs, you must ensure that they are isolated and without any crossover traffic.

If you have more than one HMC, you must also connect each HMC to the logical partitions, and to each other, on the same open network.



This figure shows two HMCs connected to a single managed server on the private network and to three logical partitions on the public network. You can have an extra Ethernet adapter for the HMC to have three network interfaces. You can use this third network as a management network or connect it to the CSM (Cluster Systems Manager) Management Server.

Deciding which connectivity method to use for the call-home server

Learn more about the connectivity options you have when you use the call-home server.

You can configure the Hardware Management Console (HMC) to send hardware service-related information to IBM by using a LAN-based internet connection, or a dial-up connection over a modem.

You have two communication choices when you configure the LAN-based internet connection. The first choice is to use standard Secure Sockets Layer (SSL). The SSL communication can be enabled to connect to the internet through your proxy server. SSL connectivity is more likely to be compliant with corporate security guidelines.

Note: If your open network interface connection uses only Internet Protocol Version 6 (IPv6), you cannot use internet VPN to connect to support. For more information about the protocols that are used, see "Choosing an Internet Protocol" on page 22.

The advantages to using an internet connection can include:

- Faster transmission speed
- Reduced customer expense (for example, the cost of a dedicated analog telephone line)
- Greater reliability

The following security characteristics are in effect, regardless of the connectivity method chosen:

- Remote Support Facility requests are always initiated from the HMC to IBM. An inbound connection is never initiated from the IBM Service Support System.
- All data that is transferred between the HMC and the IBM Service Support System are encrypted by using a high-grade encryption. Depending upon the connectivity method that is chosen, it is encrypted by using either SSL or IPSec Encapsulating Security Payload (ESP).

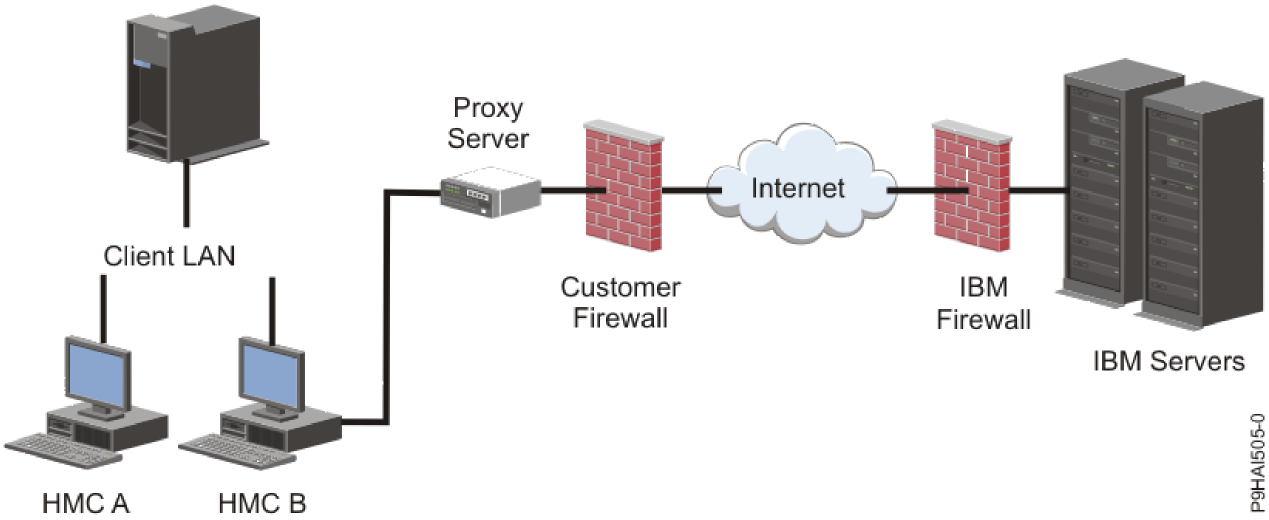
- When you initialize the encrypted connection, the HMC authenticates the target destination as the IBM Service Support System.

Data sent to the IBM Service Support System consists solely of information about hardware problems and configuration. No application or customer data is transmitted to IBM.

Using an indirect internet connection with a proxy server

If your installation requires the HMC to be on a private network, you might be able to connect indirectly to the internet by using an SSL proxy, which can forward requests to the internet. One of the other potential advantages of using an SSL proxy is that the proxy can support logging and audit facilities.

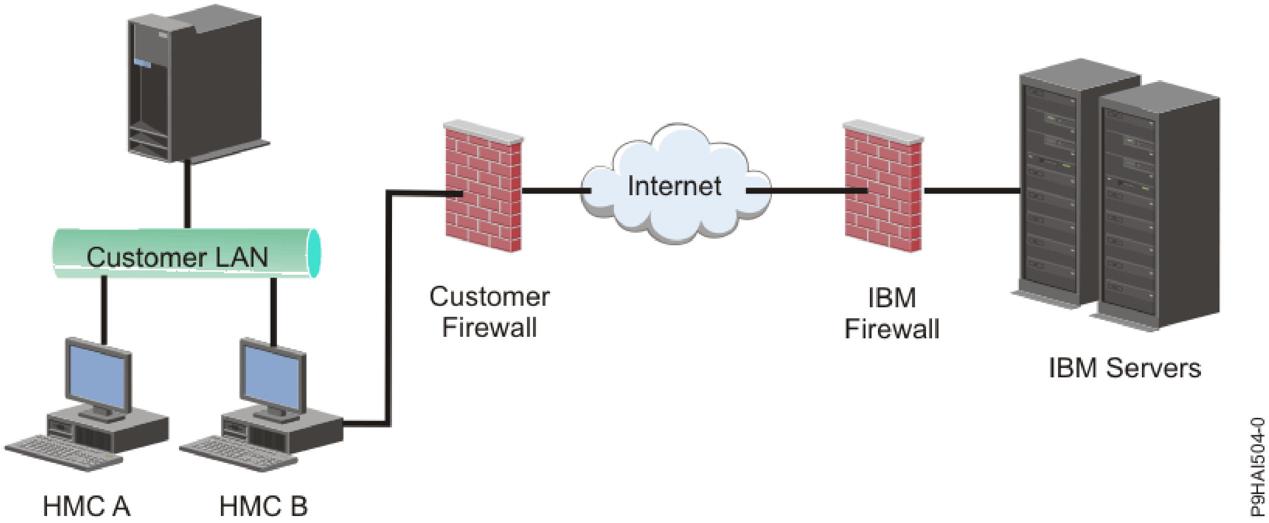
To forward SSL sockets, the proxy server must support the basic proxy header functions (as described in RFC 2616) and the CONNECT method. Optionally, basic proxy authentication (RFC 2617) can be configured so that the HMC authenticates before you attempt to forward sockets through the proxy server.



For the HMC to communicate successfully, the client's proxy server must allow connections to port 443. You can configure your proxy server to limit the specific IP addresses to which the HMC can connect. See "Internet SSL address lists" on page 22 for a list of IP addresses.

Using a direct internet SSL connection

If your HMC can be connected to the internet, and the external firewall can be set up to allow established TCP packets to flow outbound to the destinations described in "Internet SSL address lists" on page 22, you can use a direct internet connection.



Using internet SSL to connect to remote support

All the communications are handled through TCP sockets that are initiated by the Hardware Management Console (HMC) and use a high-grade SSL to encrypt the data that is transmitted. The destination TCP/IP addresses are published (see "Internet SSL address lists" on page 22) so that external firewalls can be configured to allow these connections.

Note: The standard HTTPS port 443 is used for all communications.

The HMC can be enabled to connect directly to the internet or to connect indirectly from a proxy server that is provided by the customer. The decision about which approach is best for your installation depends on the security and networking requirements of your enterprise. The HMC (directly or through the SSL proxy) uses the following addresses when it is configured to use internet SSL connectivity.

Choosing an Internet Protocol

Determine the IP address version that is used when the Hardware Management Console (HMC) connects to your service provider.

Most users use Internet Protocol Version 4 (IPv4) to connect to a service provider. IPv4 addresses appear in the format that represents the 4 bytes of the IPv4 address, which is separated by periods (for example, 9.60.12.123) to access the internet. You can also use Internet Protocol Version 6 (IPv6) to connect to a service provider. IPv6 is often used by network administrators to ensure unique address space. If you are unsure of the Internet Protocol used by your installation, contact your network administrator. For more information about using each version, see "Setting the IPv4 address" on page 64 and "Setting the IPv6 address" on page 64.

Internet SSL address lists

Learn about the addresses that the Hardware Management Console (HMC) uses when the HMC is using internet SSL connectivity.

The HMC uses the following IPv4 addresses to contact IBM service and support when it is configured to use internet SSL connectivity.

The following IPv4 addresses are for all locations:

- 129.42.26.224
- 129.42.42.224
- 129.42.50.224
- 129.42.56.216
- 129.42.58.216
- 129.42.60.216
- 170.225.15.41

The following IPv4 addresses are for the Americas:

- 129.42.160.48
- 129.42.160.49
- 207.25.252.197
- 207.25.252.200
- 207.25.252.204

The following IPv4 addresses are for all locations other than the Americas:

- 129.42.160.48
- 129.42.160.50
- 207.25.252.197
- 207.25.252.200
- 207.25.252.205

Note: When you configure a firewall to allow an HMC to connect to these servers, only the IP addresses specific to the geographic region are required.

The HMC uses the following IPv6 addresses to contact IBM service and support when it is configured to use internet SSL connectivity:

- 2620:0:6C0:1::1000
- 2620:0:6C2:1::1000
- 2620:0:6C4:1::1000

Using multiple call-home servers

Learn about what you need to know when you decide to use more than one call-home server.

To avoid a single point of failure, configure the Hardware Management Console (HMC) to use multiple call-home servers. The first available call-home server attempts to handle each service event. If the connection or transmission fails with this call-home server, the service request is retried by using the other available call-home servers until one is successful or all servers are tried.

The connected HMC that is identified by the problem analysis to be the primary analyzing console for a given managed system that reports the problem. This primary console also replicates the problem report to any secondary HMC. This secondary HMC must be recognized on the network by the primary HMC. A secondary HMC is recognized by the primary HMC as an extra call-home server when:

- The primary HMC is configured to use "discovered" call-home servers and the call-home server is either on the same subnet as the primary HMC or it manages the same system.
- The call-home server is manually added to the list of call-home server consoles available for outbound connectivity.

Preparing for HMC configuration

Learn about the required configuration settings that you need to know before you begin the configuration steps.

To configure the HMC, you must understand the related concepts, make decisions, and prepare information.

Learn about the information that you need to connect your HMC to the following locations:

- Service processors in your managed systems
- Logical partitions on those managed systems
- Remote workstations
- IBM Service to implement “call-home” functions

To prepare for HMC configuration, complete the following steps:

1. Obtain and install the latest level of the HMC code version you want to install.
2. Determine the physical location of the HMC in relation to the servers it manages. If the HMC is more than 25 feet from its managed system, you must provide web browser access to the HMC from the managed system's location so that service personnel can access the HMC.
3. Identify the servers that the HMC manages.
4. Determine whether you use a private or an open network to manage servers. If you decide to use a private network, use DHCP, unless you are using a Cluster Systems Management (CSM) configuration. CSM does not support IPv6. To access CSM, you must have two networks. For more information about CSM, see the documentation that was provided with that feature. For more information about private and open networks, see “Selecting a private or open network” on page 38.
5. If you use an open network to manage an FSP, you must set the FSP's address manually through the Advanced System Management Interface menus. A private, non-routable network is recommended.
6. If you have two HMCs, designate a primary and secondary HMC. The primary HMC needs be physically closer to the system, and must be the HMC that is configured to call home.

7. Determine the network settings that you need to connect the HMC to remote workstations, logical partitions, and network devices.
8. Define how the HMC calls home. Call home options include either over an outbound-only Secure Socket Layer (SSL) internet connection, a modem, or a Virtual Private Network (VPN) connection.
9. Determine the HMC users that you create and their passwords, as well which roles they are given. You must assign the **hscroot** and **hscpe** users a password.
10. Document the following company contact information that is needed when you configure call home:
    - Company name
    - Administrator contact
    - Email address
    - Telephone numbers
    - Fax numbers
    - The street address of the HMC's physical location
11. If you plan to use email to notify operators or systems administrators when information is sent to IBM Service through call-home, identify the Simple Mail Transfer Protocol (SMTP) server and the email addresses you use.
12. You must define the following passwords:
    - The access password that is used to authenticate the HMC to the FSP.
    - The ASMI password that is used for the **admin** user.
    - The ASMI password that is used for the **general** user.

    Create the passwords when you connect from the HMC to a new server for the first time. If the HMC is a redundant or second HMC, obtain the HMC User password and be prepared to enter it when you connect the first time to the managed server's FSP.

When you complete these preparation steps, complete the "Preinstallation configuration worksheet for the HMC" on page 24.

Preinstallation configuration worksheet for the HMC

Use this worksheet to have the installation information you need ready for the installation.

Improved password policy for HMC

You must set a new password on the first use for newly manufactured systems with HMC version 9.940.0, or later, and after a factory reset of the system. This policy change helps to enforce that the HMC is not left in a state with a well-known password.

With HMC Version 9.940.0, and later, the `hscroot` password is expired and must be changed before you can access the functions of the HMC. For more information on how to change the password, see https://www.ibm.com/support/knowledgecenter/POWER10/p10eh6/p10eh6_useridsandpassword.htm. However, if you are upgrading from a previous HMC level or an operational installation, you do not have to change the password.

Network Settings

LAN Interface: Choose the available adapters (such as eth0, eth1) that is used by this HMC to connect to managed systems, logical partitions, service and support, and remote users. For more information, see "HMC network connections" on page 15. Connectivity from the HMC can either be on a private or open network.

Ethernet Adapter Speed and Duplex

Enter the wanted Ethernet adapter speed and duplex mode. The autodetection option determines which option is optimal if you are not sure which speed and duplex would produce optimum results for your hardware. Default = Autodetection Media speed specifies the speed in duplex mode of an

Ethernet adapter. Select Autodetection unless you need to specify a fixed media speed. Any device that is connected to the FSP (switches/HMC), must be set to Auto (Speed) / Auto (Duplex) mode, as it is the default FSP setting and cannot be changed.

Table 7. Ethernet Adapter Speed and Duplex

Characteristic	**eth0**	**eth1**	**eth2**	**eth3**
Select speed and duplex mode				
Media speed (Autodetection, 10/100/1000 Full/ Half Duplex)				

For more information about private and open networks, see "Private and open networks in the HMC environment" on page 17.

Table 8. Private or Open network

Characteristic	**eth0**	**eth1**	**eth2**	**eth3**
Specify **Private** or **Open** network for each adapter.				

Dynamic Host Configuration Protocol (DHCP) provides an automated method for dynamic client configuration. You can specify this HMC as a DHCP server. If this is the first or only HMC on the private network, enable the HMC as a DHCP server. When you enable the HMC as a DHCP server, the managed systems on the network are automatically configured and discovered by the HMC.

For Ethernet adapters specified as Private networks, complete the following table:

Table 9. DHCP server

Characteristics	**eth0**	**eth1**
Do you want to specify this HMC as a DHCP server? (yes/no)		
If yes, record the IP address range you want to use.		

If you are using the 7063-CR2 HMC, you must connect the Ethernet **IPMI** port to a network to access the baseboard management controller (BMC) on the HMC. For more information, see "Configure BMC connectivity (7063-CR2)" on page 63. Complete the following table for your BMC connection.

Table 10. BMC connection

Characteristics	**IPMI**
Do you want to configure this connection through DHCP mode? (yes/no)	
If no, list the specified static addresses below:	
IP address:	
Subnet mask:	
Gateway:	

For Ethernet adapters specified as *open* networks, complete the following tables. For more information about the different Internet Protocol versions, see "Configuring the HMC network types" on page 34.

Using IPv6

If you are using IPv6, talk to your network administrator and decide how you want to obtain IP addresses. Then, complete the following tables:

Table 11. IPv6 (static)

Characteristic	eth0	eth1	eth2	eth3
Are you using a statically assigned IP address? If yes, record that address here.				

Table 12. IPv6 (DHCP server)

Characteristic	eth0	eth1	eth2	eth3
Are you getting IP addresses from a DHCP server? (Yes/No)				

Table 13. IPv6 (IPv6 router)

Characteristic	eth0	eth1	eth2	eth3
Are you getting IP addresses from an IPv6 router?				

For more information about setting IPv6 addresses, see "Setting the IPv6 address" on page 64. For more information about using only IPv6 addresses, see "Using only IPv6 addresses" on page 64.

Using IPv4

Complete the following tables for Ethernet adapters that are specified as open networks by using IPv4.

Table 14. IPv4

Characteristics	eth0	eth1	eth2	eth3
Do you want to obtain an IP address automatically? (yes/no)				
If no, list the specified address below:				
TCP/IP Interface Address:				
TCP/IP Interface Network Mask:				
Firewall Settings:				
Would you like to configure HMC firewall settings? (yes/no)				

Table 14. IPv4 (continued)

Characteristics	**eth0**	**eth1**	**eth2**	**eth3**
If yes, list the applications and IP addresses that must be allowed through the firewall:				

TCP/IP information

A unique TCP/IP address is required for each node, both for Support Element (SE) and Hardware Management Console (HMC). The assigned network mask is used to generate a unique address, by default, for the local private LAN. If the nodes are connected into a larger network with an administered TCP/IP address, you can specify the TCP/IP address to be used. The default is generated by the system.

Firewall settings

HMC firewall settings create a security barrier that allows or denies access to specific network applications on the HMC. You can specify these control settings individually for each physical network interface, enabling you control over which HMC network applications can be accessed on each network.

If you configure at least one adapter as an Open network adapter, you must provide the following additional information to enable your HMC to access the LAN:

Table 15. Open network adapter

Local host information	
HMC host name:	
Domain name:	
Description of HMC:	
Gateway information	
Gateway Address: (nnn.nnn.nnn.nnn)	
Gateway device:	
DNS enablement	
Do you want to use DNS? (yes/no)	
If "yes", specify DNS Server Search Order below:	
1.	
2.	
Domain suffix search order:	
1.	
2.	

Local Host information

To identify your Hardware Management Console (HMC) to the network, enter the HMC's host name and domain name. Unless you are using only short host names on your network, enter a fully qualified host name. Domain name example: name.yourcompany.com

Gateway information

To define a default gateway, complete the TCP/IP address to be used for routing IP packets. The gateway address informs each computer or network device when to send data if the target station is not on the same subnet as the source.

DNS Enablement

The Domain Name System (DNS) is used to provide a standard naming convention for locating IP-based computers. By defining DNS servers, you can use host names to identify servers and Hardware Management Consoles (HMCs) rather than IP addresses.

DNS Server Search Order

Enter the IP addresses of DNS servers to be searched for mapping the host names and IP addresses. This search order is available only when DNS is enabled.

Domain Suffix Search Order

Enter the domain suffixes you are using. The HMC uses domain suffixes to append to unqualified names for DNS searches. Suffixes are searched in the order in which they are listed. This search order is available only when DNS is enabled.

Email notification

List email contact information if you want to be notified by email when hardware problem events occur on your system.

Table 16. Email notification

Characteristics	**Entry field**
Email Addresses:	
SMTP server:	
Port:	
Errors to be notified:	
Only call-home problem events	
All problem events	

SMTP server

Type the simple mail transfer Protocol (SMTP) address of the server to be notified of a system event. An example of an SMTP server name is `relay.us.ibm.com`.

SMTP is the Protocol that is used to send email. When you use SMTP, a client sends a message and communicates with the SMTP server by using the SMTP Protocol.

If you do not know the SMTP address of your server or are not sure, contact your network administrator.

Port

Type the port number of the server to be notified of a system event, or use the default port.

Email addresses to be notified

Enter configured email addresses to be notified when a system event occurs.

- Select **Only call-home problem events** to receive notification only when events occur that create a call-home function.
- Select **All problem events** to receive notification when any events occur.

Service contact information

Table 17. Service contact information

Characteristics	Entry field
Company name	
Administrator name	
Email address	
Phone number	
Alternative phone number	
Fax number	
Alternative phone number	
Street address	
Street address 2	
City or locality	
State	
Postal code	
Country or region	
Location of HMC (if same as above administrator address, specify “same”):	
Street address	
Street address 2	
City or locality	
State	
Postal code	
Country or region	

Service authorization and connectivity

Select the type of connection to contact your service provider. For a description of these methods that include security characteristics and configuration requirements, see “Choosing existing call-home servers to connect to service and support for this HMC” on page 70.

Table 18. Service authorization and connectivity

Characteristics	Entry field
Secure Sockets Layer (SSL) through the internet	_____
Virtual private network (VPN) through the internet	_____

Secure Sockets Layer (SSL) through the internet:

If you have an existing internet connection from your HMC, you can use it to call your service provider. You can connect directly to your service provider by using encrypted Secure Sockets Layer (SSL) by using the existing internet connection. Select **Use SSL Proxy** if you want to configure the use of encrypted SSL by using an indirect connection that uses an SSL Proxy.

Table 19. SSL

Characteristics	**Entry field**
Use SSL proxy? (yes/no)	
If yes, list information below:	
Address:	
Port:	
Authenticate with the SSL Proxy?	
If yes, list information below:	
User:	
Password:	

Internet connection Protocol used

For more information about the different internet Protocols, see "Configuring the HMC network types" on page 34.

___ IPv4

___ IPv6

___ IPv4 and IPv6

Virtual Private Network (VPN)

If you have an existing internet connection from your HMC, you can use it to call your service provider. You can connect directly to your service provider by virtual private network (VPN) by using the existing internet connection.

Note: If you select Virtual Private Network (VPN) through the internet, you cannot select any other options.

Call-home servers

Determine which HMCs you want to configure to connect to service and support as call-home servers. For more information about using multiple call-home servers, see "Using multiple call-home servers" on page 23.

___ This HMC

___ Another HMC

If you checked **Another HMC**, list the other HMCs that are configured as call-home servers here:

Table 20. Other HMCs that are configured as call-home servers

List of HMC host names or IP addresses that are configured as call-home servers

Extra Support Benefits

My Systems and Premium Search

Table 21. My Systems and Premium Search

Characteristics	Entry field
List your IBM ID	__________________________
List any additional IBM IDs	__________________________

To access valuable, customized support information in the My Systems and Premium Search sections of the Electronic Services website, Customers must register their IBM ID with this system. If you do not already have one, you can register for an IBM ID at: www.ibm.com/account/profile.

Note: IBM provides personalized web functions that use information that is collected by the IBM Electronic Service Agent application. To use these functions, you must first register on the IBM Registration website at http://www.ibm.com/account/profile.

To authorize users to use the Electronic Service Agent information to personalize the web functions, enter your IBM ID that you registered on the IBM Registration website. Go to http://www.ibm.com/support/electronic to see the valuable support information available to customers that register an IBM ID with their systems.

Configuring the HMC

Learn how to configure network connections, security, service applications, and some user preferences.

Depending on the level of customization you intend to apply to your HMC configuration, you have several options for setting up your HMC to suit your needs. The Guided Setup wizard is a tool on the HMC designed to ease the setup of the HMC. You can choose a fast path through the wizard to quickly create the recommended HMC environment, or you can choose to fully explore the available settings that the wizard guides you through. You can also perform the configuration steps without the aid of the wizard by Configuring the HMC by using the HMC menus.

Before you start, gather the required configuration information that you need to complete the steps successfully. See “Preparing for HMC configuration” on page 23 for a list of the required information. When you are finished preparing, ensure that you complete the “Preinstallation configuration worksheet for the HMC” on page 24 and then return to this section.

Configuring the HMC by using the menus

This section provides a complete list of all HMC configuration tasks, guiding you through the process of configuring your HMC. Choose this option if you prefer not to use the Guided Setup wizard.

You must restart your HMC for the configuration settings to take effect, so you might want to print this checklist and keep it with you as you configure your HMC.

This information contains references to tasks that are not included in this document. You can access the information centerIBM Power systems hardware information on the HMC or on the Web. On the HMC, IBM Knowledge Center can be accessed from the upper-right corner of the task bar. On the web, IBM Knowledge Center can be accessed at https://www.ibm.com/support/knowledgecenter.

This information contains references to tasks that are not included in this PDF. You can access additional support materials by referring to the **Additional Resources** section on the HMC Welcome page.

Prerequisites

Before you begin configuring the HMC using the HMC menus, be sure to complete the configuration preparation activity described in “Preparing for HMC configuration” on page 23.

Table 22. Manual HMC configuration tasks and where to find related information

Task	**Where to find related information**
1. Start the HMC.	"Starting the HMC" on page 33
2. Set the date and time.	
3. Change predefined passwords.	
4. Create additional users and return to this checklist when you have completed this step.	
5. Configure network connections.	"Configuring the HMC network types" on page 34
6. For HMC model 7063-CR2, you must configure the baseboard management controller (BMC) IP address.	"Configure BMC connectivity (7063-CR2)" on page 63
7. If you are using an open network and a fixed IP address, set identification information.	
8. If you are using an open network and a fixed IP address, configure a routing entry as the default gateway.	"Configuring a routing entry as the default gateway" on page 66
9. If you are using an open network and a fixed IP address, configure domain name services.	"Configuring domain name services" on page 66
10. If you are using a fixed IP address and have DNS enabled, configure domain suffixes.	"Configuring domain suffixes" on page 67
11. Configure your server to connect to IBM service and support and return to this checklist when you have completed this step.	"Configuring the local console to report errors to service and support" on page 68
12. Configure the Events Manager for Call Home.	"Configuring the Events Manager for Call Home" on page 72
13. Connect the managed system to a power source.	
14. Set passwords for the managed system, and each of the ASMI passwords (general and admin)	"Setting passwords for the managed system" on page 72
15. Access ASMI to set the date and time on the managed system.	
16. Start the managed system and return to this checklist when you have completed this step.	
17. Ensure that you have one logical partition on the managed system.	
18. Optional: add another managed system and return to this checklist when you have completed this step.	
19. Optional: If you are installing a new server with your HMC, configure the logical partitions and install the operating system.	
20. If you are not installing a new server at this time, perform optional postconfiguration tasks to further customize your configuration.	"Postconfiguration steps" on page 74

Starting the HMC

You can long in to the HMC and choose which language you want to be displayed in the interface. Use the default User ID `hscroot` and password `abc123` to log on to the HMC for the first time.

About this task

To start the HMC, do the following procedure:

Procedure

1. Turn on the HMC by pressing the power button.
2. If English is your language preference, continue with step 4.

   If your language preference is a language other than English, type the number **2** when you are prompted to change the locale.

   Note: This prompt times out in 30 seconds if you do not act.
3. Select the locale that you want to display from the list in the **Locale Selection** window, and click **OK**. The locale identifies the language that the HMC interface uses.
4. Click **Log on and launch the Hardware Management Console web application**.
5. Log in to the HMC with the following default user ID and password:

   ID: `hscroot`
   Password: `abc123`

   HMC Enhanced
   Displays the newer enhanced GUI with the enhanced PowerVM® features.

   HMC Classic
   Displays the standard GUI without the enhanced PowerVM features.

   Note: When the HMC is working as a DHCP server, the HMC uses the default password when it connects to the service processor for the first time.
6. Press Enter.

Changing the date and time

The battery-operated clock keeps the date and time for the Hardware Management Console (HMC). You might need to reset the console date and time if the battery is replaced, or if you physically move your system to a different time zone. Learn how to change the date and time for the HMC.

About this task

If you change the date and time information, the change does not affect the systems and logical partitions that the HMC manages.

To change the date and time for the HMC, complete the following steps:

Procedure

1. Ensure that you are a member of one of the following roles:
   - Super administrator
   - Service representative
   - Operator
   - Viewer
2. In the navigation area, click **Console Management**, and then select **Console Settings**.
3. In the content pane, click **Change Date and Time**.
4. If you select **UTC** in the **Clock** field, the time setting adjusts automatically for Daylight Saving Time in the time zone you select. Enter the date, time, and time zone, and click **OK**.

Results

Configuring the HMC network types

Configure your HMC so that it can communicate to the managed system, logical partitions, remote users, and service and support.

Configuring HMC settings to use an open network to connect to the managed system
Configure the HMC so that it can connect to and manage a managed system using an open network.

Before you begin

To configure the HMC network settings so that it can connect to the managed system using an open network, do the following:

Table 23. Configuring HMC settings to use an open network to connect to the managed system

Task	Where to find related information
1. Decide which interface you want to use for your managed system. **eth0** is preferred.	"Preinstallation configuration worksheet for the HMC" on page 24
2. Identify the Ethernet ports for your HMC.	"Identifying the Ethernet port that is defined as eth0" on page 36
3. Configure the Ethernet adapter by performing the following tasks:	
a. Set the media speed.	"Setting the media speed" on page 38
b. Select the open network type.	"Selecting a private or open network" on page 38
c. Set static addresses.	"Setting the IPv6 address" on page 64
d. Set the firewall.	"Changing HMC firewall settings" on page 64
e. Configure the default gateway.	"Configuring a routing entry as the default gateway" on page 66
f. Configure DNS.	"Configuring domain name services" on page 66
4. Configure additional adapters, if you have them.	
5. Test the connection between the managed server and the HMC.	"Testing the connection between the HMC and the managed system" on page 73

Configuring HMC settings to use a private network to connect to the managed system
Configure the HMC so that it can connect to and manage a managed system using a private network.

Before you begin

To configure the HMC network settings so that it can connect to the managed system using a private network, do the following:

Table 24. Configuring HMC settings to use a private network to connect to the managed system

Task	Where to find related information
1. Decide which interface you want to use for your managed system.	"Preinstallation configuration worksheet for the HMC" on page 24
2. Identify the Ethernet ports for your HMC.	"Identifying the Ethernet port that is defined as eth0" on page 36

Table 24. Configuring HMC settings to use a private network to connect to the managed system (continued)

Task	Where to find related information
3. Configure the HMC as a DHCP server.	"Configuring the HMC as a DHCP server" on page 38
4. Test the connection between the managed server and the HMC.	"Testing the connection between the HMC and the managed system" on page 73

Configuring HMC settings to use an open network to connect to logical partitions

Before you begin

To configure the HMC network settings so that it can connect to logical partitions using an open network, do the following:

Table 25. Configuring HMC settings to use an open network to connect to logical partitions

Task	Where to find related information
1. Decide which interface you want to use for your managed system.	"Preinstallation configuration worksheet for the HMC" on page 24
2. Identify the Ethernet ports for your HMC.	"Identifying the Ethernet port that is defined as eth0" on page 36
3. Configure the Ethernet adapter by performing the following tasks:	
a. Set the media speed.	"Setting the media speed" on page 38
b. Select the open network type.	"Selecting a private or open network" on page 38
c. Set static addresses.	"Setting the IPv6 address" on page 64
d. Set the firewall.	"Changing HMC firewall settings" on page 64
e. Configure the default gateway.	"Configuring a routing entry as the default gateway" on page 66
f. Configure DNS.	"Configuring domain name services" on page 66
4. Configure additional adapters, if you have them.	
5. Test the connection between the managed server and the HMC.	"Testing the connection between the HMC and the managed system" on page 73

Configuring HMC settings to use an open network to connect to remote users

Before you begin

To configure the HMC network settings so that it can connect to remote users using an open network, do the following:

Table 26. Configuring HMC settings to use an open network to connect to remote users

Task	Where to find related information
1. Decide which interface you want to use for your managed system.	"Preinstallation configuration worksheet for the HMC" on page 24
2. Identify the Ethernet ports for your HMC.	"Identifying the Ethernet port that is defined as eth0" on page 36

Table 26. Configuring HMC settings to use an open network to connect to remote users (continued)

Task	Where to find related information
3. Configure the Ethernet adapter by performing the following tasks:	
a. Set the media speed.	“Setting the media speed” on page 38
b. Select the open network type.	“Selecting a private or open network” on page 38
c. Set static addresses.	“Setting the IPv6 address” on page 64
d. Set the firewall.	“Changing HMC firewall settings” on page 64
e. Configure the default gateway.	“Configuring a routing entry as the default gateway” on page 66
f. Configure DNS.	“Configuring domain name services” on page 66
g. Configure suffixes.	“Configuring domain suffixes” on page 67
4. Configure additional adapters, if you have them.	

Configuring HMC call-home server settings

Before you begin

To configure the HMC call-home server settings so that problems can be reported, do the following:

Table 27. Configuring HMC call-home server settings

Task	Where to find related information
1. Be sure you have all the required customer information	“Preinstallation configuration worksheet for the HMC” on page 24
2. Configure this HMC to report errors or choose an existing call-home server to report errors	“Configuring the local console to report errors to service and support” on page 68 “Choosing existing call-home servers to connect to service and support for this HMC” on page 70
3. Verify that your call-home configuration is working	“Verifying that your connection to service and support is working” on page 70
4. Authorize users to view collected system data	“Authorizing users to view collected system data” on page 71
5. Schedule transmission of system data	“Transmitting service information” on page 71

Identifying the Ethernet port that is defined as eth0
Your Ethernet connection to the managed server must be made by using the Ethernet port that is defined as `eth0` on your HMC.

If you did not install any additional Ethernet adapters in the PCI slots on your HMC, then the primary-integrated Ethernet port is always defined as `eth0` or `eth1` on your HMC, if you intend to use the HMC as a DHCP server for your managed systems.

If you install extra Ethernet adapters in the PCI slots, then the port that is defined as `eth0` depends on the location and type of Ethernet adapters that are installed.

Note: The following general rules might not apply for all configurations.

The following table describes the rules for Ethernet placement by HMC type.

Table 28. HMC types and associated rules for Ethernet placement

HMC type	Rules for Ethernet placement
Rack-mounted HMCs with two integrated Ethernet ports.	The HMC supports only one extra Ethernet adapter. • If an extra Ethernet adapter is installed, then that port is defined as `eth0`. In this case, the primary-integrated Ethernet port is then defined as `eth1`, and the secondary integrated Ethernet port is defined as `eth2`. • If the Ethernet adapter is a dual port Ethernet adapter, then the port that is labeled Act/Link A is `eth0`. The port that is labeled `Act/link` B is `eth1`. In this case, the primary-integrated Ethernet port is then defined as `eth2`, and the secondary integrated Ethernet port is defined as `eth3`. • If no adapters are installed, then the primary-integrated Ethernet port is defined as `eth0`.
Stand-alone models with a single integrated Ethernet port.	The definitions depend upon the type of Ethernet adapter that is installed: • If only one Ethernet adapter is installed, then that adapter is defined as `eth0`. • If the Ethernet adapter is a dual port Ethernet adapter, then the port that is labeled `Act/link` A is `eth0`. The port that is labeled `Act/link` B would be `eth1`. In this case, the primary-integrated Ethernet port is then defined as `eth2`. • If no adapters are installed, then the integrated Ethernet port is defined as `eth0`. • If multiple Ethernet adapters are installed, see "Determining the interface name for an Ethernet adapter" on page 37.

Determining the interface name for an Ethernet adapter
If you configure the HMC as a DHCP server, that server can operate only on the network interface card (NIC) connectors that the HMC identifies as `eth0` and `eth1`. You might also need to determine which NIC connector you need to plug the Ethernet cable into. Learn more about determining which NIC connectors the HMC identifies as `eth0` and `eth1`.

About this task

To determine the name the HMC has assigned to an Ethernet adapter, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change Network Settings**.
3. From the **Change Network Settings** window, click the **LAN adapters** tab. The following example entry shows that this Ethernet port is identified as `eth0`: `Ethernet eth0 52:54:00:fa:b6:8e (<IP address of HMC>)`.
4. Record your results. If you need to view or change the LAN adapter settings, click **Details**.
5. Click **OK**.

Setting the media speed
Learn how to specify the media speed that includes the speed and duplex mode of the Ethernet adapter.

Before you begin

The default for the HMC adapter settings is **Autodetection**. If this adapter is connected to a LAN switch, you must match the switch port settings. To set the media speed and duplex, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. In the local area network (LAN) information section, select **Autodetection** or the appropriate media speed and duplex combination.
6. Click **OK**.

Selecting a private or open network
A *private service network* consists of the Hardware Management Console (HMC) and the managed systems. A private service network is restricted to consoles and the systems they manage, and is separate from your company network. An *open network* consists of your private service network and your company network. An open network might contain network endpoints in addition to consoles and managed systems, and might span across multiple subnets and network devices.

About this task

To select a private or public network, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. Click the **LAN Adapter** tab.
6. In the local area network information page, select **Private** or **Open**.
7. Click **OK**.

Configuring the HMC as a DHCP server
Dynamic Host Configuration Protocol (DHCP) provides an automated method for dynamic client configuration.

To configure the Hardware Management Console (HMC) as a DHCP server, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change network settings**. The Customize Network Settings window opens.
3. Select the LAN adapter that you want to work with and click **Details**.
4. Select **Private** and then select the network type.
5. In the DHCP Server section, select **Enable DHCP Server** to enable the HMC as a DHCP server.

   Note: You can configure the HMC to be a DHCP server only on a private network. If you use an open network, the option to select the **Enable DHCP** is not available.
6. Enter the address range of the DHCP server.

7. Click **OK**.

If you configured your HMC to be a DHCP server on a private network, you must verify that your HMC DHCP private network is configured correctly. For information about connecting your HMC to a private network, see "Selecting a private or open network" on page 38.

For more information, see " HMC as a DHCP server" on page 17.

Managing the system by using OpenBMC-based HMC (7063-CR2)
IBM Power Systems servers use a baseboard management controller (BMC) for system service management, monitoring, maintenance, and control. The BMC also provides access to the system event log files (SEL). The BMC is a specialized service processor that monitors the physical state of the system by using sensors. A system administrator or service representative can communicate with the BMC through an independent connection. The OpenBMC tool provides a communication method to the BMC, by using a command-line interface. The OpenBMC tool can be used either from a remote Linux system, or from the host operating system console window. The OpenBMC tool can be connected remotely to the BMC by using a configured Ethernet port. You can connect your server to a monitor by using the VGA port at the rear of the server.

Managing the system by using the OpenBMC tool
Learn how to configure and manage your system by using the OpenBMC tool.

Downloading and installing the OpenBMC tool
Learn how to download and install the OpenBMC tool.

About this task

To download and install the OpenBMC tool, complete the following steps:

Procedure

1. Go to the IBM Support Portal.
2. In the search field, type: `Scale-out LC System Event Log Collection Tool`.
3. Click the **Scale-out LC System Event Log Collection Tool** entry and follow the instructions to install and run the OpenBMC tool.

Basic commands and functionality of the OpenBMC tool
The OpenBMC tool provides support for working with system event logs, updating system firmware, identifying the system, powering off the system, and other service-related functions.

OpenBMC tool top-level options
Learn more about the top-level options for the OpenBMC tool commands.

About this task

- `-H`: Host name or IP address of the BMC.
- `-U`: User name to log in with.
- `-A`: Provides a prompt to ask for the password.
- `-P`: Password for the user name.
- `-j`: Change output format to JSON.
- `-t`: Location of the policy table to use.
- `-T`: Provides time statistics for logging in, running the command, and logging out.
- `-V`: Displays current version of the OpenBMC tool.

System event log commands
Learn more about system event log commands for the OpenBMC tool.

Procedure

- To print a list of the system event logs in a readable format, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> sel print
  ```

- To list the system event logs in raw data, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> sel list
  ```

- To change the status of a system event log to resolved, use the following command:

  `openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> sel resolve -n x`, where *x* is the system event log number.

- To collect all service data including system event logs, use the following command:

  `openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> collect_service_data`.

- To clear gard records for disable hardware, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> gardclear
  ```

- To clear the alert logs of entries, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> sel clear
  ```

System firmware update command
Learn more about the system firmware update command.

Procedure

- To update the system firmware, use the following command:

  `openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> firmware flash <bmc or pnor> -f xxx.tar`, where *bmc* or *pnor* is the type of image you wish to flash to the system.

  Note: If you are not in the same folder as the TAR file, you must include the full path to the folder where the file resides.

- To activate a firmware image that is available in the BMC, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> firmware activate <firmware image ID>
  ```

System identify commands
Learn more about the system identify commands.

Procedure

- To activate the blue system identify LED, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> chassis identify on
  ```

- To turn off the blue system identify LED, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> chassis identify off
  ```

- To check the status of the blue system identify LED, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
chassis identify status
```

System power on and power off commands
Learn more about the system power on and power off commands.

Procedure

- To check the power status of the system, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  chassis power status
  ```
- To power on the system, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  chassis power on
  ```
- To power off the system normally, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  chassis power softoff
  ```
- To power off the system immediately, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  chassis power hardoff
  ```

System sensor commands
Learn more about the system sensor commands.

Procedure

- To display a list of all monitoring sensors, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  sensors print
  ```

  or

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  sensors list
  ```

System FRU commands
Learn more about the system FRU commands.

Procedure

- To display a list of all inventory items, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  fru print
  ```

  or

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  fru list
  ```
- To display the known status of all FRU items, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  fru status
  ```

  Note: The FRU item must be designated as a replaceable FRU by the BMC.
- To automate the review of FRU status commands and to determine if there is a performance impact on the system, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
health_check
```

Note: This command does not guarantee a healthy system as there can be system event logs entries that are not associated with the inventory items.

System BMC reset commands
Learn more about the system BMC reset commands.

Procedure

- To do a warm reset of the BMC remotely and without an AC cycle, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  bmc reset warm
  ```
- To do a cold reset of the BMC remotely and without an AC cycle, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  bmc reset cold
  ```

System dump commands
Learn more about the system dump commands.

Procedure

- To create a new dump file, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  dump create
  ```
- To list all dump files in the system, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  dump list
  ```
- To delete a specific dump file from the system, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  dump delete -n <dump file entry>
  ```
- To delete all dump files from the system, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  dump delete all
  ```
- To retrieve a specific dump file, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  dump retrieve -n <dump file entry>
  ```
- To retrieve a dump file and save it to specific directory, use the following command:

  ```
  openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name>
  dump retrieve -s <location to save dump file>
  ```

  Note: If you do not specify a location, the file is saved in the OS where the command is run in the temp directory.

Enabling and disabling local BMC user accounts
Learn more about the **local_users**commands.

About this task

The local user accounts on the BMC, such as root, can be disabled, queried, and re-enabled with the **local_users** sub-command.

Note: After disabling local users, the LDAP user needs to be available for further interaction with the BMC, including enabling local users by using OpenBMC tool.

Procedure

- To view current local user account status, use the following command:

  ```
  openbmctool <connection options> local_users queryenabled
  ```
- To disable all local user accounts, use the following command:

  ```
  openbmctool <connection options> local_users disableall
  ```
- To enable all local user accounts, use the following command:

  ```
  openbmctool <connection options> local_users enableall
  ```

Remote logging by using rsyslog
Learn more about the remote logging commands.

About this task

The BMC can stream out local logs (that go to the systemd journal) by using RSYSLOG. The BMC sends everything in the logs. Any kind of filtering and appropriate storage has to be managed on the rsyslog server.

Procedure

- To configure the rsyslog server for remote logging, use the following command:

  ```
  openbmctool <connection options> logging remote_logging_config -a <IP
  address> -p <port>
  ```

  Note: The IP address and port are for the remote rsyslog server. After the command is run, the remote rsyslog server starts to receive logs from the BMC.
- To disable remote logging, use the following command:

  ```
  openbmctool <connection options> logging remote_logging disable
  ```

  Note: Disable remote logging before you switch remote logging from an existing remote server to a new one.
- To view the remote logging configuration, use the following command:

  ```
  openbmctool <connection options> logging remote_logging view
  ```

  Note: This command prints out the IP address and port of the remote rsyslog server in JavaScript Object Notation (JSON) format.
- To turn REST API logging on, use the following command:

  ```
  openbmctool <connection options> logging rest_api on
  ```
- To turn REST API logging off, use the following command:

  ```
  openbmctool <connection options> logging rest_api off
  ```

  Note: REST API logging is turned off by default.

Certificate management
Learn more about the certificate management commands.

About this task

You can replace the existing certificate and private key file with another (possibly CA signed) certificate and private key file. You can install server, client, and root certificates.

Procedure

- To update the HTTPS server certificate, use the following command:

  ```
  openbmctool <connection options> certificate update server https -f <File>
  ```

  Note: The <File> is the privacy-enhanced mail (PEM) file that contains both the certificate and the private key.
- To update the LDAP client certificate, use the following command:

  ```
  openbmctool <connection options> certificate update client ldap -f <File>
  ```

  Note: The <File> is the PEM file that contains both the certificate and the private key.
- To update the LDAP root certificate, use the following command:

  ```
  openbmctool <connection options> certificate update authority ldap -f <File>
  ```

  Note: The <File> is the PEM file that contains only the certificate.
- To delete the HTTPS server certificate, use the following command:

  ```
  openbmctool <connection options> certificate delete server https
  ```

  Note: Deleting a certificate creates and installs a new self-signed certificate.
- To delete the LDAP client certificate, use the following command:

  ```
  openbmctool <connection options> certificate delete client ldap
  ```
- To delete the LDAP root certificate, use the following command:

  ```
  openbmctool <connection options> certificate delete authority ldap
  ```

  Note: Deleting the root certificate can cause an LDAP service outage.

LDAP configuration
Learn more about the LDAP configuration commands.

About this task

In the BMC, LDAP is used for remote authentication. The BMC does not support remote user-management functionality. The BMC supports both secure and non-secure LDAP configuration.

Procedure

- To create the LDAP configuration (non-secure), use the following command:

  ```
  openbmctool.py <connection options> ldap enable --uri="ldap://
  <ldap server IP/hostname>" --bindDN=<bindDN> --baseDN=<basDN> --
  bindPassword=<bindPassword> --scope="sub/one/base" --serverType="OpenLDAP/
  ActiveDirectory"
  ```

  Note: Configuring a fully qualified domain name or hostname in the `uri` parameter requires the domain name system (DNS) server to be configured on the BMC.
- To create the LDAP configuration (secure), use the following command:

  ```
  openbmctool.py <connection options> ldap enable --uri="ldaps://
  <ldap server IP/hostname>" --bindDN=<bindDN> --baseDN=<basDN> --
  bindPassword=<bindPassword> --scope="sub/one/base" --serverType="OpenLDAP/
  ActiveDirectory"
  ```

  Notes:

  1. It is common to encounter the following error when you run the above `openbmctool.py` command string:

     xyz.openbmc_project.Common.Error.NoCACertificate

This error means that the BMC client needs to verify that the LDAP server certificate is signed by a known certification authority (CA). An administrator needs to upload the CA certificate to the BMC to resolve this error.

2. The OpenBMC tool does not support individual LDAP configuration property updates. To update a single property, the administrator must recreate the LDAP configuration with the changed values.

- To delete the LDAP configuration, use the following command:

  ```
  openbmctool.py <connection options> ldap disable
  ```

  Note: The root user must be enabled before you run the command, otherwise the BMC is not accessible. To enable all local user accounts, see Enabling and disabling local user accounts.

- To add privilege mapping use the following command:

  ```
  openbmctool.py <connection options> ldap privilege-mapper create --
  groupName=<groupName> --privilege="priv-admin/priv-user"
  ```

- To delete privilege mapping, use the following command:

  ```
  openbmctool.py <connection options> ldap privilege-mapper delete --
  groupName=<groupName>
  ```

- To list privilege mapping, use the following command:

  ```
  openbmctool.py <connection options> ldap privilege-mapper list
  ```

  The normal workflow for LDAP configuration is in the following order:

  1. Configure the DNS server.
  2. Configure LDAP.
     a. Configure the CA certificate for secure LDAP configuration.
     b. Create LDAP configuration with local user.
  3. Configure user privilege.

  Notes:

  1. If you login with LDAP credentials and have not added privilege mapping for the LDAP credentials, then you will get the following error message:

     403, 'LDAP group privilege mapping does not exist'.

     You can avoid this error by adding privilege mapping.

  2. The following error message might mean that user lacks sufficient privileges on the BMC:

     Insufficient privileges

     You can avoid this error by adding privilege mapping.

  3. After you setup the LDAP, the OpenBMC tool connection options work with both LDAP and local users.

Network configuration
Learn more about the network configuration commands.

Procedure

- To enable DHCP, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network enableDHCP -I
  <Interface name>
  ```

- To disable DHCP, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network disableDHCP -I
  <Interface name>
  ```

- To get the host name, use the following command:

```
openbmctool.py -H <BMC_IP> -U root -P <root password> network getHostName
```

- To set the host name, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setHostName -H
  <host name>
  ```

- To get the domain name, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getDomainName
  -I <Interface name>
  ```

- To set the domain name, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setDomainName
  -I <Interface name> -D DomainName1,DomainName2,..
  ```

- To get the media access control (MAC) address, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getMACAddress
  -I <Interface name>
  ```

- To set the MAC address, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setMACAddress
  -I <Interface name> -MA xx:xx:xx:xx:xx
  ```

- To get the default gateway, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getDefaultGW
  ```

- To set the default gateway, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setDefaultGW
  -GW <default gw>
  ```

- To view the current network configuration, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network view-config
  ```

- To get the network time protocol (NTP), use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getNTP -I
  <Interface name>
  ```

- To set the NTP, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setNTP -I
  <Interface name> -N NTP1,NTP2,...
  ```

- To get the domain name system (DNS), use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getDNS -I
  <Interface name>
  ```

- To set the DNS, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network setDNS -I
  <Interface name> -d DNS1,DNS2,...
  ```

- To get the IP address, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network getIP -I
  <Interface name>
  ```

- To set the IP address, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network addIP -a
  <ADDRESS> \-gw <GATEWAY> -l <PREFIXLENGTH> -p <protocol type> -I <Interface
  name>
  ```

- To delete the IP address, use the following command:

  ```
  openbmctool.py -H <BMC_IP> -U root -P <root password> network rmIP -I
  <Interface name> -a <ADDRESS>
  ```

- To enable a virtual local area network (VLAN), use the following command:

  ```
  openbmctool.py <connection options> network addVLAN -I <Interface name> -n
  <IDENTIFIER>
  ```

- To disable a virtual local area network (VLAN), use the following command:

  ```
  openbmctool.py <connection options> network deleteVLAN -I <Interface name>
  ```

- To view the DHCP configuration properties, use the following command:

  ```
  openbmctool.py <connection options> network viewDHCPConfig
  ```

- To configure the DHCP properties, use the following command:

  ```
  openbmctool.py <connection options> network configureDHCP -d <DNSENABLED> -n
  <HOSTNAMEENABLED> -t <NTPENABLED> -s <SENDHOSTNAMEENABLED>
  ```

  Note: `DNSENABLED`, `HOSTNAMEENABLED`, `NTPENABLED`, and `SENDHOSTNAMEENABLED` are boolean values (true or false).

- To reset the network settings to the factory defaults, use the following command:

  ```
  openbmctool.py <connection options> network nwReset
  ```

  Note: Reset settings are applied after the rebooting of the BMC.

Managing the system by using the IPMI
Learn how to configure and manage your system by using the Intelligent Platform Management Interface (IPMI).

Common IPMI commands
You can use **`IPMI`** commands to perform various managing tasks for your system.

Table 29. Common IPMI commands

Command option	Description
`ipmitool -I lanplus -H` *`myserver.example.com`* `-P` *`mypass`* `chassis power on`	Powers on the server.
`ipmitool -I lanplus -H` *`myserver.example.com`* `-P` *`mypass`* `chassis power off`	Powers off the server.
`ipmitool -I lanplus -H` *`myserver.example.com`* `-P` *`mypass`* `chassis status`	Checks the server status.
`ipmitool -I lanplus -H` *`myserver.example.com`* `-P` *`mypass`* `chassis power cycle`	Power cycle the server.
`ipmitool -I lanplus -H` *`myserver.example.com`* `-P` *`mypass`* `sol activate`	Activates SOL system console.
`ipmitool -I lanplus -H` *`myserver.example.com`* `-P` *`mypass`* `sol deactivate`	Deactivates SOL system console.
`ipmitool -I lanplus -H` *`myserver.example.com`* `-P` *`mypass`* `sel list`	Returns an error log.
`ipmitool -I lanplus -H` *`myserver.example.com`* `-P` *`mypass`* `sdr list`	Lists status of all sensors.
`ipmitool -I lanplus -H` *`myserver.example.com`* `-P` *`mypass`* `sol set retry-interval` *`value`*	Sets the default retry-interval value in milliseconds.
`ipmitool -I lanplus -H` *`myserver.example.com`* `-P` *`mypass`* `fru print`	Prints the FRU information.

Table 29. Common IPMI commands (continued)

Command option	Description
`ipmitool -I lanplus -H` *`myserver.example.com`* `-P` *`mypass`* `user list`	Lists the IPMI users.

Configuring the BMC IP address
Dynamic Host Configuration Protocol (DHCP) is the default network setup for the BMC in the 7063-CR2 HMC. To enable your network connection, you can connect to your system and use the Petitboot bootloader interface to configure the IP address of the BMC. If you do not plan to use DHCP, you can also set up a static IP address. Alternatively, you can use the HMC GUI to enable your network connection by navigating to **HMC Management** > **Console Settings** > **Change BMC/IPMI Network Settings**.

Before you begin

You must connect the network cable and a VGA monitor before you access the Petitboot bootloader interface.

If you encounter any problems in accessing the Petitboot bootloader interface, see Resolving a BMC access problem.

About this task

To use the Petitboot bootloader interface to set up or enable the network interface of the BMC, complete the following steps:

Procedure

1. Power on the server by pressing the power button on the front of the system. The system powers on to the Petitboot bootloader menu.

   Note: The boot process takes about 1 to 2 minutes to complete.

   When Petitboot loads, the monitor activates. Press any key to interrupt the boot process.
2. At the Petitboot bootloader main menu, select **Exit to Shell**.
3. Run the following command: `ipmitool lan print 2`. If this command returns an IP address, verify that is correct. To set a static IP address, follow these steps:

   Notes:

   - The following two LAN interfaces are available to BMC:
     - Shared interface is LAN1
     - Dedicated interface is LAN2
   - The `ipmitool lan print 2` command cannot display more than one IP address. To avoid this situation, you can set the static IP address to a different subnet from the default zero configuration networking IP address.

   a. Set the mode to static by running the following command: `ipmitool lan set 2 ipsrc static`.

   b. Set your IP address by running the following command: `ipmitool lan set 2 ipaddr ip_address`, where *ip_address* is the static IP address that you want to assign to this system.

   c. Set your netmask by running the following command: `ipmitool lan set 2 netmask netmask_address`, where *netmask_address* is the netmask for the system.

   d. Set your gateway server by running the following command: `ipmitool lan set 2 defgw ipaddr gateway_server`, where *gateway_server* is the gateway for this system.

   e. Confirm the IP address by running the following command: `ipmitool lan print 2`.

Performing a factory reset
Learn how to perform a factory reset on the system.

The factory reset function can take up to 15 minutes to complete. When the LED on the power button starts flashing, the system is ready to start again. Perform the factory reset with the host powered off. If you perform the factory reset while the host is running, the system shuts down immediately and restarts the BMC. If the BMC is on a static network, you must manually power on the system with the physical power button.

To perform a factory reset, run the following command:

```
ipmitool -I lanplus -U <username> -P <password> -H <BMC_IP or Hostname> raw 0x3A 0x11
```

Note: The system does not send a validation response. The following system output is normal:

```
Unable to send RAW command (channel=0x0 netfn=0x3a lun=0x0 cmd=0x11)
```

If you forgot the password of the BMC, you can run the following command while the host is running to perform a factory reset and to restore the default password:

```
ipmitool raw 0x3A 0x11
```

You must set up and configure the BMC IP address after performing the factory reset. For more information, see "Configuring the BMC IP address" on page 48.

Risks of using IPMI on IBM Power systems and OpenPower Systems
Various risks that are associated with the Intelligent Platform Management Interface (IPMI) have been identified and documented in the information technology (IT) security community.

IBM Power systems and OpenPower Systems provide IPMI access by default. A subset of these identified risks is applicable to IBM servers.

Vulnerability Details

The IPMI service can become unresponsive after it receives and rejects multiple authentication attempts. You might receive a `insufficient resources for session` message if you use the IPMI immediately after the failed authentication attempts. This situation lasts for a few seconds and normal service is restored afterward.

Important: Repeated authentication failures can cause denial of service.

A list of common vulnerabilities and exposures (CVE) is listed in Table 30 on page 49.

Table 30. Common vulnerabilities and exposures

CVE ID	Description
CVE-2013-4037	The Remote Authenticated Key-Exchange Protocol (RAKP), which is specified by the IPMI standard for authentication, has flaws. Although the system does not allow the use of null passwords, a hacker might reverse engineer the RAKP transactions to determine a password. The authentication process for IPMI requires the management controller to send a hash of the requested password of the user to the client before the client authenticates. This process is a key part of the IPMI specification. The password hash can be broken by using an offline brute force or dictionary attack.

Table 30. Common vulnerabilities and exposures (continued)

CVE ID	Description
CVE-2013-4031	IBM Power systems and OpenPower Systems are preconfigured with one IPMI user account, which has the same default login name and password on all affected systems. If a malicious user gains access to the IPMI interface by using this preconfigured account, the user can power off or on, or restart the host server, and create or change user accounts possibly preventing legitimate users from accessing the system. On OpenPower Systems, the default IPMI user name is `root`. Additionally, if a user fails to change the default user name and password on each of the systems that is deployed, the user has the same login information for each of those systems.
CVE-2013-4786	The IPMI 2.0 specification supports RMCP+ Authenticated Key-Exchange Protocol (RAKP) authentication, which allows remote attackers to obtain password hashes and conduct offline password guessing attacks by obtaining the hash-based message authentication code (HMAC) from a RAKP message 2 response from a BMC.

Configuration options and best practices

- Change the preconfigured user name and password when the server is deployed. This action prevents unauthorized users from gaining access to the system through the preconfigured user account.
- Do not disable the IPMI access for the user whose access credentials have been shared with the HMC via the **Console Inband Communication Credentials** task.

  Note: To launch the **Console Inband Communications Credentials** task, complete the following steps:

  1. In the navigation area, click **Console Management**, and then select **Console Settings**.
  2. In the content pane, click **Console Inband Communications Credentials**.
  3. From the **Console Inband Communications Credentials** window, you can set the inband BMC credentials or modify an expired password for previously set inband BMC credentials for the HMC.
- If a user is not managing a server by using the IPMI, you can configure the system to disallow IPMI network access from the user accounts. This task can be accomplished by using the IPMItool utility or a similar utility for managing and configuring the IPMI management controllers. You can use the following IPMItool command to disable the network access for an IPMI user:

  ```
  ipmitool channel setaccess 1 #user_slot# privilege=15
  ```

  Note: Replace #user_slot# in the command with the actual slot number (1 - 12) and repeat for each configured user.

  This example shows the command when it is run directly on the server. If the IPMItool command is run remotely over the network, or if a different utility is used, the command might be different. See the documentation for the utility that you are using to determine the correct command syntax. Disallowing IPMI network access removes the ability to use the weakness that is present in the IPMI RAKP protocol to discover user account credentials.
- Use strong passwords that are at least 16 characters long with a mixture of upper and lowercase letters, numbers, and special characters. By using more complex passwords, it makes it more difficult for malicious users to discover valid user credentials.
- Keep the management network separate from the public network. Keeping the management network separate lessens security exposures by reducing the number of individuals who can access the systems.

Managing the system by using the OpenBMC GUI
Learn how to manage and configure your system by using the OpenBMC GUI.

Logging on to the OpenBMC GUI
Learn how to log on to the OpenBMC GUI.

To log on to the OpenBMC GUI, complete the following steps:

1. Open a supported web browser. In the address bar, enter the IP address of the BMC that you want to connect to. For example, you can use the format `https://<BMC IP>` in the address bar of the web browser.
2. From the **OpenBMC logon** window, enter the **Host** address of the BMC and the **Username** and **Password** that is assigned to you.

   Note: The default user ID is `root` and the default password is `0penBmc`.

   If you are using firmware level OP940.01, or later, the root password is expired by default. You must change the default password before you can access the BMC. For more information about changing the expired default password, see "Setting the password" on page 51.

   If you forgot your password, you can perform a factory reset of the system to restore the default password. To reset the system, see "Performing a factory reset" on page 49.
3. Click **Log in**.

Setting the password
Learn how to change and set the password for your **root** account and to help secure the system.

Improved BMC password policy

The baseboard management controller (BMC) **root** password must be set on first use for newly manufactured systems or after performing a factory reset of the system. This policy change helps to enforce that the BMC is not left in a state with a well-known password.

In firmware level OP940.01, and later, the root password is expired and must be changed before you can access the functions of the BMC. However, if you are upgrading the firmware level from a previous OpenBMC firmware level or if you are performing an operational installation, you do not have to change the password.

The default user ID is `root` and the default password is `0penBmc`. You can use the web application, the Redfish REST APIs, the OpenBMC tool command to change the password. You can also use the **Console Inband Communications Credentials** task in the HMC GUI to change the expired password.

Note: To launch the **Console Inband Communications Credentials** task, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Console Inband Communications Credentials**.
3. From the **Console Inband Communications Credentials** window, you can set the inband BMC credentials or modify an expired password for previously set inband BMC credentials for the HMC.

After changing the password, you can access the BMC with your usual interface. To change the password, you must first access the account with the correct credentials, and then use the password change function. If you attempt to access the BMC with an expired password, you must change the password before accessing other functions.

- To change your expired password by using the web interface, enter `https://<BMC_IP>` into a web browser and then enter the access credentials of the BMC. The web interface prompts you to enter a new password.
- To change your expired password through a network interface, you can use Redfish APIs. For instructions, see "Managing the system by using DMTF Redfish APIs" on page 59.

- To change your expired password by using the OpenBMC tool, run the `openbmctool set_password` subcommand. For example,

  ```
  openbmctool.py -H <BMC IP address or BMC host name> -U <username> -P <password> set_password
  -p <new password>
  Attempting login...
  200
  User root has been logged out
  ```

  Where `200` is the response status that indicates success.

Note: The system might take up to 5 minutes to update the new password on the BMC. If you have trouble accessing your account, wait for 5 minutes and try again.

Also, with firmware level OP940.01, the BMC factory reset function resets the BMC password back to its default value and causes the default password to expire. This function means that after you perform the factory reset, you must change the password before you can access the BMC (even if you upgraded from an older firmware level).

To increase account security of the system, the administrator must complete the following steps:

1. Set a strong password for the root account. Strong passwords have at least 15 characters and include non-alphabetic characters. Initially, the password must not exceed 20 characters. Passwords can be changed later to a length greater than 20 characters, but IPMI access will be removed. Avoid using the **root** account, as the **root** account has more access to the BMC than an **Administrator** account. The root account can present a security risk if it is used incorrectly or maliciously. Use the root account only when it is required.
2. Create a separate account for each entity to manage the system. For example, you can create an **Administrator** account for yourself and for xCat, and create an **Operator** account for your staff. You can use the web interface or Redfish APIs to create a new account. When you create a new account, carefully consider which privilege role to assign to the user. Always use the least privilege role that is required.

   - To create a new account by using the web interface, see "Local users" on page 57.
   - To create a new account by using the Redfish APIs, see "Managing the system by using DMTF Redfish APIs" on page 59.

   If your BMC is using Lightweight Directory Access Protocol (LDAP), you can add users to the LDAP server.
3. Log off from the root account and switch to your personal **Administrator** account.

To increase the security of the system, the administrator can optionally configure access to the LDAP server. For more information, see "Basic commands and functionality of the OpenBMC tool " on page 39.

Dashboard

The dashboard displays the overall information about the server and the BMC.

The following options are available on the title bar (located in the top portion of the dashboard):

- **Server information**: Displays the server name and BMC IP address.
- **Server health**: Displays the status of the server.
- **Server power**: Displays whether the server is powered on, powered off, or in an error state.
- **Date last refreshed**: Displays the date and time that the information was last refreshed. The time zone of the user is determined by the web browser.
- **Refresh**: Click **Refresh** to refresh the information.

The following menus are available from the menu pod (located in the left portion of the dashboard):

- **Server overview**
- **Server health**
- **Server control**
- **Server configuration**

- **Users**

Server overview
Learn about the options that are available from the **Server overview** task.

From the **Server overview** window, you can choose from any of the following available options:

- **Server information**: Displays the model, manufacturer, firmware version, and serial number of the server.
- **BMC information**: Displays the host name, BMC IP address, firmware version, and MAC address of the BMC.
- **Power information**: Displays the power consumption and power cap.
- **High priority events**: View any high priority events. Click **Refresh** to reload the information that is displayed here.
- **BMC time**: Displays the BMC time in the time zone of the user, which is determined by the web browser.
- **Turn on server LED**: Turn on or turn off the server LED.
- **Launch serial over LAN console**: Launches the Serial over LAN (SoL) console.
- **Edit network settings**: Edit the network settings.

Server health
Learn about the tasks that are available from the **Server health** menu.

From this menu, you can choose from any of the following available tasks:

Event log
View all events from the BMC.

You can view and filter event log files from the BMC. From the **Event log** window, you can perform the following actions:

- Search through event logs by entering keywords and clicking **Search**.
- Filter the event logs by severity (**All**, **High**, **Medium**, or **Low**). You can select multiple severity levels.
- Filter the event logs by date range.
- Filter the event logs by event status (**All events**, **Resolved events**, and **Unresolved events**).
- Click any of the events that are listed to expand the event log file for more information. You can click **Copy** to copy the information to the clipboard.
- Select multiple event logs by clicking the checkbox next to event log. After you select the event logs, you can delete the logs by clicking **Delete** and then clicking **Yes** in the confirmation message. You can also mark event logs as read by clicking **Mark as resolved**.

Hardware status
View the hardware status and associated events of all hardware in the server.

You can view the hardware status of various hardware components in your server. Click any of the hardware components to expand the view for more information. You can search for specific hardware components by using the **Filter Hardware Components** search feature and then clicking **Filter**. You can also export the data by clicking **Export**.

Sensors
View all sensors that are present in the system.

You can view and filter sensors from the BMC. From the **Sensors** window, you can perform the following actions:

- Search and filter for specific sensors by using the **Search** feature and then clicking **Filter**.
- Filter sensors by severity (**All**, **Critical**, **Warning**, or **Normal**).
- Export the sensor data by clicking **Export**.

Server control
Learn about the tasks that are available from the **Server control** menu.

From this menu, you can choose from any of the following available tasks:

Server power operations
Learn how to view current server status and select power operations.

To update the **Host OS boot settings**, complete the following steps:

Note: It is not recommended to modify the **Host OS boot settings** for 7063-CR2 HMC, unless instructed by IBM Support.

1. Select the boot setting override type from the **Boot setting override** menu.
2. You can optionally select **Enable one time boot**.
3. Select whether to enable or disable the TPM policy by selecting **On** or **Off**.
4. Click **Save**.

To restart the server, complete the following steps:

1. Select the type of reboot from **Operations** > **Reboot server**:
   - Orderly: Operating system shuts down first and then the server reboots.
   - Immediate: Server reboots without the operating system shutting down. This might cause data corruption.
2. Click **Reboot**.

To shutdown the server, complete the following steps:

1. Select the type of shutdown from **Operations** > **Shutdown server**:
   - Orderly: Operating system shuts down first and then the server reboots.
   - Immediate: Server reboots without the operating system shutting down. This might cause data corruption.
2. Click **Shutdown**.

Manage power usage
Learn how to view the power consumption of the server and set a power cap.

Note: It is recommended to set the **power cap** to **Off** for 7063-CR2 HMC. By default, the **power cap** is set to **Off**.

To set a power cap, complete the following steps:

1. From the **Server power cap setting** section, set the **power cap** to **On**.
2. Specify the number of watts to keep the server power consumption at or below the specified value.
3. Click **Save settings**.

You can turn off the power cap by setting the **power cap** to **Off** and clicking **Save settings**.

Server LED
Learn how to turn on and turn off the server light-emitting diode (LED).

You can turn on or turn off the server LED by clicking the toggle switch to either **On** or **Off**.

Note: If the server has a liquid crystal display (LCD), you can use this control to display text (**On**) or not to display text (**Off**) on the LCD.

Reboot BMC
Learn how to restart the BMC and view the current BMC boot status.

Click **Reboot BMC** to restart the BMC.

Note: When you restart the BMC, your web browser looses connection with the BMC for several minutes. When the BMC is back online, you must log in again. If the **Log in** button is not available after you restart the BMC, close your web browser. Then, reopen the web browser and enter your BMC IP address.

Serial over LAN console
Learn how to view information over the serial port of the server.

You can launch the Serial over LAN (SoL) console that displays the output of the serial port of the server.

KVM
Learn how to launch the remote keyboard, video, and mouse (KVM) console.

You can launch the KVM console from this task and interact with the remote system.

Virtual media
Learn how to start a session by using a virtual media device.

To start a session, complete the following steps:

1. Under **Virtual media device**, click **Choose file**.
2. Select the file and click **Open**.
3. Click **Start** to start the session.

Server configuration
Learn about the tasks that are available from the **Server configuration** menu.

From this menu, you can choose from any of the following available tasks:

Network settings
Learn how to view and set common network, IPv4, and DNS settings.

To view network settings, select the **Network Interface** that you want to view. The **Hostname**, **MAC Address**, and **Default Gateway** are displayed under **Common settings**. The **DHCP setting**, **IPv4 IP addresses**, **Gateways**, and **Netmasks** are displayed under **IPv4 Settings**. Under **DNS settings**, all DNS servers are displayed.

To set network settings, complete the following steps:

1. Select the **Network Interface** that you want to set.
2. Edit the **Hostname**, **MAC Address**, or **Default Gateway** fields under **Common settings**.
3. Edit the **DHCP setting**, **IPv4 IP address**, **Gateway**, and **Netmask Prefix Length** under **IPv4 Settings**.
4. Click **Save Settings**.

Note: You can edit network settings only on firmware level OP920.01 or later.

To add an IPv4 address, complete the following steps:

1. Click **Add IPV4 address**.
2. Complete the **IPv4 IP address**, **Gateway**, and **Netmask Prefix Length** fields.
3. Click **Save Settings**.

To add a DNS address, complete the following steps:

1. Click **Add DNS Server**.
2. Enter the Internet Protocol (IP) address of the **DNS Server**.
3. Click **Save Settings**.

SNMP settings
Learn how to view and set the simple network management protocol (SNMP) with a hostname or Internet Protocol (IP) address and a port.

To set the SNMP, complete the following steps:

Note: Only SNMPv2 is supported.

1. Click **Add Manager**.
2. Enter the hostname or IP address and the port number.
3. Click **Save Settings**.

You can remove a manager by clicking the trash bin icon next to the manager that you want to remove.

Firmware
Learn how to manage the BMC and server firmware.

You can use the **BMC images** and **Server images** tables to manage firmware image files. The image file that is listed at the top, the image with the highest boot priority, is used the next time that the device is booted. You can change the boot order for the image file by clicking the arrow icons.

Learn about the different image states that are available:

- **Functional**: The running image on the device.
- **Active**: The image is available to boot from, but is not currently the running image. If the image is the top image in the relevant table, it becomes the functional image the next time the device is rebooted.
- **Activating**: The image is in the process of being activated and becomes either **Active** or **Failed**.
- **Failed**: The image failed to activate.
- **Ready**: The image is ready to be activated.
- **Invalid**: This image is an invalid image and cannot be activated.

The system firmware is a combination of the BMC firmware and the PNOR firmware. You must update both the BMC firmware and the PNOR firmware for the system to operate properly. If you update only one type of firmware, but do not update the other type of firmware, system errors might occur.

You can upload an image file from the workstation or from the Trivial File Transfer Protocol (TFTP) server. If you choose **Upload image file from workstation**, click **Choose a file** and specify the location of the image on the workstation storage device. Click **Upload** to upload the image file to the BMC server. If you choose **Download image file from TFTP server**, enter the TFTP server IP address in the **TFTP Server IP Address** field and the file name in the **File Name** field. Click **Download** to download the image file to the BMC server.

After you load the new image file to the BMC server, you can activate the image file to make it available for use. Locate the image in the correct image table, and then click **Activate** > **Continue**. For a BMC image, an option of **Activate Firmware File Without Rebooting BMC** or **Activate Firmware File and Automatically Reboot BMC** is available. If you select **Activate Firmware File Without Rebooting BMC**, the BMC must be rebooted by using the **Reboot BMC** option to make the image become the **Functional** image. If you select **Activate Firmware File and Automatically Reboot BMC**, the BMC automatically reboots after the image is activated and the new image becomes the **Functional** image.

For a server image, after the image is activated, the server must be rebooted (or powered on if the server is off) for the image to become active. The **Reboot** (or **Power on**) option can be accessed from the **Server power operations** menu.

Date and time settings
Learn how to set the date and time.

To automatically set the date and time, complete the following steps:

1. Select **Obtain automatically from a network time protocol (NTP) server**.
2. Click **Add new NTP server**.
3. Enter the NTP server address.
4. Click **Save setttings**.

To manually add the date and time, complete the following steps:

1. Select **Manually set date and time**.

2. Enter the date and time.
3. Change the **Time owner** to the following values:
   - **BMC**: the BMC owns the time and can set the time.
   - **Host**: the host owns the time and can set the time.
   - **Split**: the BMC and the host own separate time.

     Note: Split is the recommended value for **Time owner** for 7063-CR2.
   - **Both**: both the BMC and the host can set the time.

Access control
Learn about the tasks that are available from the **Access control** menu.

From this menu, you can choose from any of the following available tasks:

LDAP
Learn how to configure lightweight directory access protocol (LDAP) settings and manage role groups.

LDAP authentication

To enable LDAP authentication, complete the following steps:

1. Select the **Enable LDAP authentication** checkbox.

   Note: If you want to secure LDAP by using Secure Sockets Layer (SSL), select the **Secure LDAP using SSL** checkbox. You must have a certificate authority (CA) and LDAP certificate for this function.
2. Select the service type as **Open LDAP** or **Active directory**.
3. Complete the required fields.
4. Click **Save**.

Role groups

To add a new role group, complete the following steps:

1. Click **Add role group**.
2. Enter a name for the role group.
3. Set the privilege of the role group to **Administrator**, **Operator**, **User**, or **Callback**.
4. Click **Save**.

To remove a new role group, complete the following steps:

1. Select the checkbox next to the role group or groups that you want to remove from the table.
2. Click **Remove role groups**.
3. Click **Remove** in the pop-up window.

To modify the privilege of a role group, complete the following steps:

Note: LDAP authentication must be enabled to modify group roles.

1. Select the checkbox next to the role group or groups that you want to modify from the table.
2. Click the **Edit** icon.
3. Change the privilege of the role group to **Administrator**, **Operator**, **User**, or **Callback**.
4. Click **Save**.

Local users
Learn how to add or remove new users, modify user settings, manage user account policy settings, and view privilege role descriptions.

To add a new user, complete the following steps:

1. Click **Add user**.
2. Set the account status to either **Enabled** or **Disabled**.
3. Enter a new username.

   Note: The username cannot start with a number. No special characters are allowed except for an underscore.
4. Set the privilege of the user to **Administrator**, **Operator**, **ReadOnly**, or **NoAccess (Callback)**.
5. Enter the password of the user.

   Note: Initially, the password must be in the range of 8 - 20 characters in length. Passwords can be changed later to a length greater than 20 characters, but IPMI access is removed. The system might take up to 5 minutes for the new password to update on the BMC. If you have trouble accessing your account, wait for 5 minutes and try again.
6. Reenter the password for confirmation.
7. Click **Add user**.

To remove a user, complete the following steps:

1. Click the checkbox next to the user or users that you want to remove from the table.
2. Click **Remove**.
3. Click **Remove** again in the pop-up window.

You can modify user settings by selecting the user from the table and clicking the edit icon. From the **Modify user** window, you can update the following properties:

- Account status: set to **Enabled** or **Disabled**.
- Username: change the name of the user.
- Privilege: change the account privileges of the user to **Administrator**, **Operator**, **ReadOnly**, or **NoAccess (Callback)**.
- User password: update the password of the user.

You can modify user account policy settings by clicking **Account policy settings**. From the **Account policy settings** window, you can update the following properties:

- Maximum failed login attempts: change the number of allowed failed login attempts.
- User unlock method: set to **Automatic after timeout** or **manual**.
- Only non-root accounts can be locked out.

You can view privilege role descriptions by clicking **View privilege role descriptions**.

Table 31. Privilege role descriptions

Role	Privileges	Guidance
Administrator	Can configure the BMC and manage users and sessions. Operational control over BMC functions.	Use this role for the most trusted users.
Operator	Operational control over BMC functions.	Use this role for users who manage routine operations.
ReadOnly	Read-only access to BMC functions.	Use this role for users who need to monitor the BMC, but do not need to operate it.
NoAccess (Callback)	No access to BMC functions.	Use this role for users who do not need access to the web interface or REST APIs.

SSL certificates
Learn how to generate a certificate signing request (CSR), add new certificates, and replace existing certificates.

Generating a CSR

To generate a new CSR, complete the following steps:

1. Click **Generate CSR**.
2. Complete the required fields under the **General** section.
3. Under **Private key** > **Key Pair Algorithm**, select the algorithm as **EC** or **RSA**.
4. Click **Generate CSR**.

Certificates

To add a new certificate, complete the following steps:

1. Click **Add new certificate**.
2. Select the certificate type as **HTTPS Certificate**, **LDAP Certificate**, or **CA Certificate**.
3. Click **Choose file** to select the certificate.
4. Click **Open**.
5. Click **Save**.

To replace certificates, complete the following steps:

1. Select the certificate that you want to replace from the table.
2. Click the refresh icon.
3. Click **Choose file** to select the new certificate.
4. Click **Open**.
5. Click **Replace**.

Managing the system by using DMTF Redfish APIs
OpenBMC-based systems can be managed by using the DMTF Redfish APIs.

Overview

Redfish is a REST API used for platform management and is standardized by the Distributed Management Task Force, Inc. (http://www.dmtf.org/standards/redfish).

Redfish enables platform management tasks to be controlled by client scripts that are developed by using secure and modern programming paradigms.

The Redfish API enables provisioning of tunable parameters for better utilization of power.

IBM OpenBMC-based systems support DMTF Redfish API (DSP0266, version 1.7.0, published on 20 May 2019) for systems management.

A copy of the Redfish schema files that are in JSON format are published by DMTF (http://redfish.dmtf.org/schemas/v1/) and are packaged in the firmware image.

The schema files that are distributed in the chip enable proper functioning of the APIs in deployments that have no wide area network (WAN) connectivity.

Note: The Redfish API is enabled by default and the Redfish service cannot be enabled or disabled by the user.

Firmware levels

Redfish APIs are supported on OpenPOWER (OP) firmware level OP940, or later.

Communication prerequisites for Redfish on OpenBMC-based servers

Depending on the current firmware level and network deployment, complete the following prerequisite tasks:

- Upgrade the server firmware level to OP940, or later.
- Identify the IP address of the BMC.
- Install and run cURL (https://curl.haxx.se/) with the method, Uniform Resource Indicator (URI), and the request body as parameters to communicate with the Redfish service.
- Install Python on the client system (typically a Linux host).
- Optionally, install and run DMTF Redfishtool (https://github.com/DMTF/Redfishtool).

Interacting with the Redfish service

To interact with the Redfish service, complete the following steps.

1. Create an authenticated login session (POST method on the `/redfish/v1/SessionService/Sessions` resource).
2. Extract and save the following details:
   - Authentication token (found in the **X-Auth-Token** header of the response)
   - Session URI (found in the **Location** header of the response)
3. To read the properties of a resource, send a **GET** request with the **X-Auth-Token** header for the URI of the resource.
4. To set a property of a resource, send a **PATCH** request with the **X-Auth-Token** header for the URI of the resource, the property name, type, and value encoded as a JSON body.
5. Extract and parse the response from the Redfish service that contains the JSON body.

Redfish service home page URI

The Redfish service home page URI (also known as the service ROOT) can be accessed by retrieving the URI: `https://<`*`ip:port`*`>/redfish/v1`. The response to this URI is a high-level site map that enables a traversal of the Redfish service by using a hypermedia API paradigm.

Interpreting the data returned by the Redfish service

The format and structure of the data is defined in the schema files. Schema files are JSON files that describe the data that is sent by the Redfish service. You can use the schema files to understand the data that is sent by the Redfish service and to validate the response that is sent by the Redfish service.

Location of the schema files

DMTF publishes the schema files for the standard data that is used in Redfish.

The Redfish schema files in JSON format are hosted in the DMTF schema repository at http://redfish.dmtf.org/schemas/v1/

Supported schema files

The following schema files are supported for OpenBMC-based systems:

- Account
- AccountCollection
- AccountService
- Certificate
- CertificateCollection

- CertificateLocations
- CertificateService
- Chassis
- ChassisCollection
- ComputerSystem
- ComputerSystemCollection
- EthernetInterface
- EthernetInterfaceCollection
- LogEntry
- LogService
- LogServiceCollection
- Manager
- ManagerCollection
- ManagerNetworkProtocol
- Memory
- MemoryCollection
- Processor
- ProcessorCollection
- Role
- RoleCollection
- ServiceRoot
- Session
- SessionCollection
- SessionService
- SoftwareInventory
- SoftwareInventoryCollection
- ThermalPower
- UpdateService

Accessing the common system management functions on the Redfish service by using cURL command

The following examples show the client URL (cURL) commands that can be used to access the common functions that are supported by the OpenBMC Redfish APIs:

Note: In all cURL commands, *${BMC}* is the IP address of the BMC.

- To view major collections, run the following commands:
  - Chassis collection:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Chassis
    ```

  - Manager collection:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Managers
    ```

  - System collection:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Systems
    ```

- To view the chassis, manager, and system resources, run the following commands:
  - Chassis resource:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Chassis/chassis
    ```

  - Manager resource:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Managers/bmc
    ```

  - System resource:

    ```
    curl -u root:0penBmc -k -s  https://${BMC}/redfish/v1/Systems/system
    ```

- To perform host power control operations, run the following commands:
  - Host power on:

    ```
    -X POST https://${BMC}/redfish/v1/Systems/system/Actions/ComputerSystem.Reset -d
    '{"ResetType": "On"}'
    ```

  - Host soft power off:

    ```
    -X POST https://${BMC}/redfish/v1/Systems/system/Actions/ComputerSystem.Reset -d
    '{"ResetType": "GracefulShutdown"}'
    ```

  - Host hard power off:

    ```
    -X POST https://${BMC}/redfish/v1/Systems/system/Actions/ComputerSystem.Reset -d
    '{"ResetType": "ForceOff"}'
    ```

  - Restart host:

    ```
    -X POST https://${BMC}/redfish/v1/Systems/system/Actions/ComputerSystem.Reset -d
    '{"ResetType": "GracefulRestart"}'
    ```

- To view the host power control resource, run the following command:

  ```
  curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Systems/system/Actions/
  ```

- To view the log resource, run the following command:

  ```
  curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Systems/system/LogServices/EventLog/
  Entries
  ```

- To view sensor resources, run the following commands:
  - Power resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/chassis/Power
    ```

  - Thermal resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/chassis/Thermal
    ```

  - Sensor resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/chassis/Sensors
    ```

- To view inventory resources, run the following commands:
  - Memory resource:

    ```
    curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Systems/system/Memory
    ```

  - Processor resource:

```
curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Systems/system/Processors
```

  - Power supply 0 resource:

```
curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/powersupply0
```

  - Power supply 1 resource:

```
curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/powersupply1
```

  - Motherboard resource:

```
curl -u root:0penBmc -k -s https://${BMC}/redfish/v1/Chassis/motherboard
```

- To update the firmware, run the following commands:
  - By using an image file from your system:

```
curl -u root:0penBmc -curl k -s  -H "Content-Type: application/octet-stream" -X POST -T
<image file path> https://${BMC}/redfish/v1/UpdateService
```

  - By using a Trivial File Transfer Protocol (TFTP) server:

```
curl -u root:0penBmc -k -s -d '{"ImageURI":"<TFTP IP Address>/<File name on
TFTP server>","TransferProtocol":"TFTP"}' -X POST https://${BMC}/redfish/v1/UpdateService/
Actions/UpdateService.SimpleUpdate
```

- To create a new local account, run the following command:
  -

```
curl -X POST https://${BMC}/redfish/v1/AccountService/Accounts/ -d '{"UserName": "admin",
"Password": "NEWPASSWORD", "RoleId": "Administrator"}'
```

Where `admin` is the name of the user that you want to create, `NEWPASSWORD` is the new password, and `RoleId` maps to the privilege role.

- To change the account password, run the following command:
  -

```
curl -X POST https://${BMC}/redfish/v1/AccountService/Accounts/root -d '{"Password":
"NEWPASSWORD"}'
```

Where `root` is the account name or user ID and `NEWPASSWORD` is the new password.

For more information about selecting a username, password, or role, see "Local users" on page 57.

Configure BMC connectivity (7063-CR2)
You can configure or view the network settings on the BMC for the management console.

Notes:

- This task applies only to the 7063-CR2. This connection is required to access the baseboard management controller (BMC) on the HMC.
- The settings in this task are applicable only to the dedicated IPMI or BMC network port.

To configure the BMC connection, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change BMC/IPMI network settings**.
3. Select the connection mode (**DHCP** or **Static**).

   If you select **Static** mode, complete the following addresses:

   - **IP address**
   - **Subnet mask**
   - **Gateway**
4. Click **OK**.

You can also configure the BMC network connection by using the Petitboot bootloader interface. For more information, see Configuring the firmware IP address.

Setting the IPv4 address
Learn how to set your IPv4 address on the HMC.

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. Click the **Basic Settings** tab.
6. Select an IPv4 address.
7. If you selected to specify an IP address, enter the TCP/IP interface address and the TCP/IP interface network mask.
8. Click **OK**.

Setting the IPv6 address
Learn how to set your IPv6 address on the HMC.

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. Click the **IPv6 Settings** tab.
6. Select an **Autoconfig** option or add a static IP address.
7. If you added an IP address, enter the IPv6 address and the prefix length and click **OK**.
8. Click **OK**.

Using only IPv6 addresses
Learn how to configure the HMC so that it uses only IPv6 addresses.

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. Select **No IPv4 address**.
6. Click the **IPv6 Settings** tab.
7. Select **Use DHCPv6 to configure IP settings** or add static IP addresses, then click **OK**.

What to do next

After you click **OK**, you must restart your HMC for these changes to take effect.

Changing HMC firewall settings

In an open network, a firewall is used to control outside access to your company network. The HMC also has a firewall on each of its Ethernet adapters. To control the HMC remotely or give remote access to others, modify the firewall settings of the Ethernet adapter on the HMC that is connected to your open network.

About this task

To configure a firewall, use the following steps:

Procedure

1. In the navigation area, click the **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change network settings**.
3. Click the **LAN Adapters** tab.
4. Select the LAN adapter that you want to work with and click **Details**.
5. Click the **Firewall** tab.
6. Using one of the following methods, you can allow any IP address by using a particular application through the firewall, or you can specify one or more IP addresses:
   - Allow any IP address by using a particular application through the firewall:
     a. From the top box, highlight the application.
     b. Click **Allow Incoming**. The application displays in the bottom box to signify that it is selected.
   - Specify which IP addresses to allow through the firewall:
     a. From the top box, highlight an application.
     b. Click **Allow Incoming by IP Address**.
     c. On the Hosts Allowed window, enter the IP address and the network mask.
     d. Click **Add** and click **OK**.
7. Click **OK**.

   Notes:

   - For more information about enabling remote restricted shell access, see "Enabling remote restricted shell access" on page 65.
   - For more information about enabling remote web access, see "Enabling remote web access" on page 66.

Enabling remote restricted shell access
You can enable remote restricted shell access when you configure a firewall.

About this task

To enable remote restricted shell access, complete the following steps:

Procedure

1. In the navigation area, click **Users and Security** > **Systems and Console Security**.
2. Click **Enable Remote Command Execution**.
3. Select **Enable remote command execution using the ssh facility** and then click **OK**.

What to do next

Now remote restricted shell access is enabled.

Enabling remote web access

You can enable remote web access to your Hardware Management Console (HMC).

About this task

To enable remote web access, complete the following steps:

Procedure

1. In the navigation area, click **Users and Security** > **Systems and Console Security**.
2. Click **Enable Remote Command Execution**.
3. Select **Enable** and then click **OK**.

What to do next

Now remote web access is enabled.

Configuring a routing entry as the default gateway

Learn how to configure a routing entry as the default gateway. This task is available when you are using an open network.

Before you begin

To configure a routing entry as the default gateway, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change network settings**. The Customize Network Settings window opens.
3. Click the **Routing** tab.
4. In the Default gateway information section, enter the gateway address and gateway device of the routing entry you want to set as the default gateway.
5. Click **OK**.

Configuring domain name services

If you plan to set up an open network, configure domain name services.

About this task

If you plan to set up an open network, configure domain name services. Domain Name System (DNS) is a distributed database system for managing host names and their associated Internet Protocol (IP) addresses. Configuring domain name services includes enabling DNS and specifying the domain suffix search order.

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change network settings**. The Change Network Settings window opens.
3. Click the **Name Services** tab.
4. Select **DNS enabled** to enable DNS.
5. Specify the DNS server and domain suffix search order and click **Add**.
6. Click **OK**.

Configuring domain suffixes

The list of domain suffixes is used to resolve an IP address that starts with the first entry in the list.

About this task

The domain suffix is a string that is appended to a host name that is used to help resolve its IP address. For example, a host name of `myname` might not be resolved. However, if the string `myloc.mycompany.com` is an element in the domain suffix table, then an attempt is made to resolve `myname.mloc.mycompany.com`.

To configure a domain suffix entry, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change network settings**. The Customize Network Settings window opens.
3. Click the **Name Services** tab.
4. Enter a string to be used as a domain suffix entry.
5. Click **Add** to add it to the list.

Configuring the HMC so that it uses LDAP remote authentication

You can configure your Hardware Management Console (HMC) so that it uses LDAP (Lightweight Directory Access Protocol) remote authentication.

Before you begin

When a user logs in to the HMC, authentication is first performed against a local password file. If a local password file is not found, the HMC can contact a remote LDAP server for authentication. You must configure your HMC so that it uses LDAP remote authentication.

Note: Before you configure the HMC so that it uses LDAP authentication, you must ensure that a working network connection exists between the HMC and the LDAP servers.

About this task

To configure your HMC so that it uses LDAP authentication, complete the following steps:

Procedure

1. In the navigation area, click **Users and Security**, and then select **Systems and Console Security**.
2. In the content pane, select **Manage LDAP**. The LDAP Server Definition window opens.
3. Select **Enable LDAP**.
4. Define an LDAP server to use for authentication.
5. Define the LDAP attribute that is used to identify the user that is being authenticated. The default is **uid**, but you can use your own attributes.
6. Define the distinguished name tree, also known as the search base, for the LDAP server.
7. Click **OK**.
8. If a user wants to use LDAP authentication, the user must configure their profile so that it uses LDAP remote authentication instead of local authentication.

Configuring the HMC so that it uses Key Distribution Center servers for Kerberos remote authentication

You can configure the HMC so that it uses Key Distribution Center (KDC) servers for Kerberos remote authentication.

Before you begin

When a user logs in to the HMC, authentication is first verifies against a local password file. If a local password file is not found, the HMC can contact a remote Kerberos server for authentication. You must configure your HMC so that it uses Kerberos remote authentication.

Note: Before you configure the HMC so that it uses KDC servers for Kerberos remote authentication, you must ensure that a working network connection exists between the HMC and the KDC servers.

About this task

To configure the HMC so that it uses KDC servers for Kerberos remote authentication, complete the following steps:

Procedure

1. Enable the Network Time Protocol (NTP) service on the HMC and set the HMC and the KDC servers to synchronize time with the same NTP server. To enable the NTP service on the HMC, complete the following steps:
   a) In the navigation area, click **Console Management**, and then select **Console Settings**.
   b) In the content pane, select **Change Date and Time**.
   c) Select the **NTP Configuration** tab.
   d) Select **Enable NTP service on this HMC**.
   e) Click **OK**.
2. Configure each remote HMC user's profile so that it uses Kerberos remote authentication instead of local authentication.
3. Optionally, you can import a service-key file into this HMC. The service-key file contains the host principal that identifies the HMC to the KDC server. Service-key files are also known as *keytabs*. To import a service-key file into this HMC, complete the following steps:
   a) In the navigation area, click **Users and Security**, and then select **Systems and Console Security**.
   b) In the content pane, select **Manage KDC**.
   c) Select **Actions > Import Service Key**. The Import Service Key window opens.
   d) Type the location of the service key file.
   e) Click **OK**.
4. Add a new KDC server to this HMC. To add a new KDC server to this HMC, complete the following steps:
   a) In the navigation area, click **Users and Security**, and then select **Systems and Console Security**.
   b) In the content pane, select **Manage KDC**.
   c) Select **Actions > Add KDC Server**. The Import Service Key window opens.
   d) Type the realm and the host name or IP address of the KDC server.
   e) Click **OK**.

Configuring the local console to report errors to service and support

Configure this HMC so that it can call-home errors by using LAN connectivity.

Configuring the HMC so that it can connect to service and support by using the call-home setup wizard
Configure the HMC so that it is a call-home server by using the call-home wizard.

Before you begin

This procedure describes how to configure the HMC as a call-home server by using direct (LAN-based) and indirect (SSL) connections to the internet.

Before you begin this task, ensure that:

- The network administrator verifies that connectivity is allowed.
- If you are configuring internet support through a proxy server, you must also have the following information:
  - The IP address and port of the proxy server
  - The proxy authentication information
- The adapter that is designated as **eth1** (the one that is designated as an open network) is used. For more information, see "Choosing network settings on the HMC" on page 15.
- An Ethernet cable physically connects the HMC to the LAN.

To configure the HMC so that it is a call-home server by using the call-home wizard, complete the following steps:

Procedure

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Call-Home Setup Wizard**. The Connectivity and Call-Home Servers wizard opens. Follow the instructions in the wizard to configure call-home.

Configuring the local console to report errors to service and support
Configure this HMC so that it can call-home errors by using LAN connectivity.

Configuring an HMC to contact service and support by using LAN-based internet and SSL
Describes how to configure the HMC as a call-home server by using direct (LAN-based) and indirect (SSL) connections to the internet.

Before you begin

Before you begin this task, ensure that:

- The network administrator verifies that connectivity is allowed..
- Customer contact information is configured. Verify the contact information by going to the HMC interface and clicking **Serviceability>Service Management > Manage Customer Information**.
- If you are configuring internet support through a proxy server, you must also have the following information:
  - The IP address and port of the proxy server
  - The proxy authentication information
- You need at least one open network interface configured. For more information, see "Private and open networks in the HMC environment" on page 17.
- An Ethernet cable physically connects the HMC to the LAN.

About this task

To configure the HMC as a Call Home server by using LAN-based internet and SSL, complete the following steps:

Procedure

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the Connectivity section, click **Manage Outbound Connectivity**. The Call-home Server Consoles window opens.
3. Click **Configure.**
4. In the Outbound Connectivity Settings window, check **Enable local system as call-home server**.
5. Accept the agreement.
6. In the Outbound Connectivity Settings window, select the **Internet** page.
7. Check the **Allow an existing internet connections for service** box.
8. If you are using an SSL proxy, check the **Use SSL proxy** box.
9. If you are using an SSL proxy, complete the proxy's address and port. Obtain this information from the network administrator.
10. If you checked **Use SSL proxy** and the proxy requires user ID and password authentication, check the **Authenticate with the SSL proxy** box. Type the user ID and password. Obtain the user ID and password from the network administrator.
11. Select the **Protocol to Internet** you want to use.
12. On the **Internet** page, click **Test**.
13. In the Test internet window, click **Start**.
14. Verify that the test completes successfully.
15. In the Test internet window, click **Cancel**.
16. In the Outbound Connectivity Settings window, click **OK**.

Choosing existing call-home servers to connect to service and support for this HMC
Choose existing Hardware Management Console (HMC) call-home servers that are recognized or discovered by the HMC to report errors.

Before you begin

Discovered HMCs are HMCs that are enabled as call-home servers and are either on the same subnet or manage the same managed system as this HMC.

To choose a discovered HMC to call home when the HMC reports errors, complete the following steps:

Procedure

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Manage Outbound Connectivity**. The Call-Home Server Consoles window opens.
3. Click **Use discovered call-home server consoles**. The HMC displays the IP address or host name of the HMCs configured for call-home.
4. Click **OK**.

Results

You can also manually add existing HMC call-home servers that are on a different subnet. Select the IP address or host name of the HMC that is configured for call home and click **Add** and then click **OK**.

Verifying that your connection to service and support is working
Test problem reporting to ensure that connection to service and support is working.

About this task

To verify that your call-home configuration is working, complete the following steps:

Procedure

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Create Event**.
3. Select **Test Automatic problem Reporting** and type a comment.
4. Click **Request Service**. Wait a few minutes for the request to be sent.
5. In the Service Management window, select **Manage Events**.
6. Select **All open problems**.
7. Verify that a PMH event and number is assigned to the problem number you opened.
8. Select that event and click **Close**.
9. On the **Close** window, type your name and a brief comment.

Authorizing users to view collected system data
You must authorize users to view data about your systems.

Before you begin

Before you authorize users to view collected system data, you must obtain an IBM ID. For more information about obtaining an IBM ID, see “Preinstallation configuration worksheet for the HMC” on page 24.

About this task

To authorize users to view collected system data, complete the following steps:

Procedure

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, select **Authorize User**.
3. Enter your IBM ID.
4. Click **OK**.

Transmitting service information
You can transmit information to your service provider immediately, or you can schedule the information to be sent regularly.

Before you begin

IBM provides personalized web functions that use information that is collected by IBM Electronic Service Agent. To use these functions, you must first register on the IBM Registration website at http://www.ibm.com/account/profile. To authorize users to use the Electronic Service Agent information to personalize the web functions, see “Authorizing users to view collected system data” on page 71. For more information about the benefits of registering an IBM ID with your systems, see http://www.ibm.com/support/electronic.

Note: You must transmit service provider information as soon as the HMC is installed and configured for use.

About this task

To transmit service information, complete the following steps:

Procedure

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Transmit Service Information.**
3. Complete the tasks in the **Transmit Service Information** window, and click **OK**.

Configuring the Events Manager for Call Home

Learn how to configure the Events Manager for Call Home task. You can monitor and approve any data that is being transmitted from an HMC to IBM through this task.

The Events Manager for Call Home mode (enabled or disabled) is set by using the HMC command line interface. Enabling the Events Manager for Call Home task blocks the HMC from automatically calling home events as they occur. To prevent events that are called home without approval, all HMCs running in this environment must have the Events Manager for Call Home enabled.

To enable or disable the Events Manager for Call Home task, run the following command:

```
chhmc -c emch

-s {enable | disable}

[--callhome {enable | disable}]

[--help]
```

Note: Enabling the Events Manager for Call Home task holds call home events until they are approved for the call home task. If you disable the Events Manager for Call Home task, it does not automatically enable the call home feature. This setup prevents any unintended call home of data back to IBM. Choose from the following command options to set up the required configuration:

- To enable the Events Manager for Call Home task: **`chhmc -c emch -s enable`**
- To disable the Events Manager for Call Home task and to re-enable automatic call home: **`chhmc -c emch -s disable --callhome enable`**
- To disable the Events Manager for Call Home task and not re-enable automatic call home: **`chhmc -c emch -s disable --callhome disable`**

Ensure that the HMC can communicate with other HMCs deployed in this environment. The Events Manager for Call Home has a test connection function when an HMC is registered.

You can register the HMC with the Events Manager for Call Home. After you register the HMC, the events manager queries the registered HMC for any events that are waiting to be called home to IBM. The Events Manager shows what data is being sent back to IBM and approves these events. After approval, the Event Manager notifies the registered HMC that it can proceed with the call home operation.

The Events Manager for Call Home task can be run from any HMC or from multiple HMCs. To register a management console with the Events Manager for Call Home task, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Events Manager for Call Home**.
2. From the **Events Manager for Call Home** pane, click **Manage Consoles**.
3. From the **Manage Registered Consoles** window, click **Add Console** to enter information to register a management console with the Events Manager for Call Home task.
4. Click **OK** to commit the changes to the list of registered management console.

Note: The Events Manager for Call Home can be used with the event manager mode disabled. You can still register the HMC and view events in the events manager, but Events Manager does not control when the events are called home.

Setting passwords for the managed system

You must set passwords for both your server and Advanced System Management (ASM). Read more about how to use the HMC interface to set these passwords.

Before you begin

If you received the message `Authentication Pending`, the HMC prompts you to set the passwords for the managed system.

About this task

If you did not receive the message Authentication Pending, complete the following steps to set the passwords for the managed system.

Updating your server password

Before you begin

To update your server password, complete the following steps:

Procedure

1. In the navigation area, select the managed system and click **Users and Security**, and then select **Users and Roles**.
2. Click **Change Password**. The Update Password window opens.
3. Type the required information and click **OK**.

Updating your Advanced System Management (ASM) general password

Before you begin

Note: The default password for the general user ID is `general`, and the default password for the administrator ID is `admin`.

To update your ASM general password, complete the following steps:

Procedure

1. In the navigation area of the HMC, select the managed system.
2. In the Tasks area, click **Operations**.
3. Click **Advanced System Management (ASM)**. The Launch ASM Interface window opens.
4. Select a Service Processor IP Address and click **OK**. The ASM interface opens.
5. On the ASMI Welcome pane, specify your user ID and password, and click **Log In**.
6. In the navigation area, expand **Login Profile**.
7. Select **Change Password**.
8. Specify the required information, and click **Continue**.

Resetting the Advanced System Management (ASM) administrator password

Before you begin

To reset the administrator password, contact an authorized service provider.

Testing the connection between the HMC and the managed system

Learn how to verify that you are properly connected to the network.

About this task

To test the network connectivity, you must be a member of one of the following roles:

- Super administrator
- Service representative

To test the connection between the HMC and the managed system, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Settings**.

2. In the content pane, click **Test Network Connectivity**.
3. In the Ping tab, type the host name or IP address of any system to which you want to connect. To test an open network, type the gateway. Click **Ping**.

Results

If you have not created any logical partitions, you cannot ping the addresses. You can use the HMC to create logical partitions on your server. For more information, see Logical partitioning.

To understand how the HMC can be used in a network, see "HMC network connections" on page 15.

For more information about configuring the HMC to connect to a network, see "Configuring the HMC by using the menus " on page 31.

Postconfiguration steps

After you install and configure the HMC, back up HMC data as necessary.

Backing up management console data

This task backs up (or archives) the data that is stored on your HMC hard disk that is critical to support HMC operations.

Before you begin

Your remote system must have Network File System (NFS) or Secure Shell (ssh) configured, and this network must be accessible from the HMC. To complete this task, you must shut down and reboot the HMC. Use only the HMC to perform these tasks.

About this task

To back up the HMC hard disk drive to a remote system, you must be a member of one of the following roles:

- Super administrator
- Operator
- Service representative

Back up the HMC data after changes have been made to the HMC or information associated with logical partitions.

The HMC data stored on the HMC hard drive can be saved to a DVD-RAM on a local system, a remote system mounted to the HMC file system (such as NFS), or sent to a remote site using File Transfer Protocol (FTP).

Note: For HMC model 7063-CR1, you can connect an external USB DVD drive.

Using the HMC, you can back up all important data, such as the following:

- User-preference files
- User information
- HMC platform-configuration files
- HMC log files
- HMC updates through Install Corrective Service.

To back up the HMC hard drive to a remote system, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Managment**.
2. In the content pane, click **Backup Management Console Data**.

3. From the **Backup Management Console Data** window, select the archive option you want to perform.
4. Click **Next**, then follow the appropriate instructions depending on the option you chose.
5. Click **OK** to continue with the backup process.

Updating, upgrading, and migrating your HMC machine code

Updates and upgrades are periodically released for the HMC to add new functionality and to improve existing features. Learn more about the differences between updating, upgrading, and migrating your HMC machine code. Also learn how to perform an HMC machine code update, upgrade, or migration.

When you are finished with each of these tasks, the HMC reboots but the partitions do not.

Updating HMC code

Applies maintenance to an existing HMC level

Does not require that you perform the **Save upgrade data** task

Upgrading HMC code

Replaces HMC software with a new release or fix level of the same program

Requires that you boot from recovery media

Migrating HMC code

Moves HMC data from one HMC version to another

A migration is a type of upgrade.

Note: For HMC model 7063-CR1, you can connect an external USB DVD drive.

Determining your HMC machine code version and release

Find out how to view the HMC machine code version and release.

About this task

The level of machine code on the HMC determines the available features, including concurrent server firmware maintenance and enhancements to upgrading to a new release.

To view the HMC machine code version and release, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the **Current HMC Driver Information** heading, including: the HMC version, release, maintenance level, build level, and base versions.

Obtaining and applying machine code updates for the HMC with an Internet connection

Learn how to obtain machine code updates for the HMC when the HMC has an Internet connection.

About this task

To obtain machine code updates for the HMC, complete all steps.

Step 1. Ensure that you have an Internet connection

About this task

To download updates from the service and support system or website to your HMC or server, you must have one of the following connections:

- SSL connectivity with or without a SSL proxy
- Internet VPN

To ensure that you have an Internet connection, do the following:

Procedure

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, **Manage Outbound Connectivity**.
3. Select the tab for the type of outbound connectivity that you chose for your HMC (Internet VPN or SSL connectivity).

   Note: If a connection to service and support does not exist, set up the service connection before proceeding with this procedure. For instructions on how to set up a connection to service and support, see Setting up your server to connect to IBM service and support.
4. Click **Test**.
5. Verify that the test completes successfully.

   If the test is not successful, troubleshoot your connectivity and correct the problem before proceeding with this procedure. Alternatively, you can obtain the update on DVD.

   Note: For HMC model 7063-CR1, you can connect an external USB DVD drive.
6. Continue with "Step 2. View the existing HMC machine code level" on page 76.

Step 2. View the existing HMC machine code level

About this task

To view the existing HMC machine code level, complete the following steps:

Procedure

1. In the navigation area, click the **Console Management**, and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver Information heading, including: the HMC version, release, maintenance level, build level, and base versions.
4. Continue with "Step 3. View the available HMC machine code levels" on page 76.

Step 3. View the available HMC machine code levels

About this task

To view the available HMC machine code levels, complete the following steps:

To find out if there are new HMC machine code updates available, contact service and support.

Procedure

1. From a computer or server with an Internet connection, go to http://www.ibm.com/eserver/support/fixes.
2. Select the appropriate family in the Product family list.
3. Select **Hardware Management Console** in the Product or fix type list.
4. Click **Continue**.

   The Hardware Management Console site is displayed.
5. Scroll down to your HMC Version level to view available HMC levels.

Note: If you prefer, you can contact service and support.

6. Continue with "Step 4. Apply the HMC machine code update" on page 77.

Step 4. Apply the HMC machine code update

About this task

To apply the HMC machine code update, complete the following steps:

Procedure

1. Before you install updates to the HMC machine code, back up critical console information on your HMC.

   For instructions, see "Backing up management console data" on page 74. Then continue with the next step.
2. In the navigation area, click **Console Management**, and then select **Console Management**.
3. In the content pane, click **Update the Hardware Management Console**. The Install Corrective Service Wizard opens.
4. Follow the instructions in the Wizard to install the update.
5. Shut down and then restart the HMC for the update to take effect.
6. Click **Log on and launch the Hardware Management Console web application**.
7. Log in to the HMC interface.

Step 5. Verify that the HMC machine code update installed successfully

About this task

To verify that the HMC machine code update installed correctly, complete the following steps:

Procedure

1. In the navigation area, click the **Console Management**, and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver Information heading, including: the HMC version, release, maintenance level, build level, and base versions.
4. Verify that the version and release match the update that you installed.
5. If the level of code displayed is not the level that you installed, perform the following steps:

   a. Select the network connection on the HMC.

   b. Retry the firmware update using a different repository.

   c. If the problem persists, contact your next level of support.

Obtaining and applying machine code updates for the HMC using DVD or an FTP server

Learn how to obtain machine code updates for the Hardware Management Console (HMC) by using DVD or an FTP server.

About this task

To obtain HMC machine code updates, complete all steps.

Note: For HMC model 7063-CR1, you can connect an external USB DVD drive.

Step 1. View the existing HMC machine code level

Before you begin

To view the existing HMC machine code level, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver Information heading, including: the HMC version, release, maintenance level, build level, and base versions.
4. Continue with "Step 2. View the available HMC machine code levels" on page 78.

Step 2. View the available HMC machine code levels

Before you begin

To view the available HMC machine code levels, complete the following steps:

About this task

To find out if there are new HMC machine code updates available, contact IBM service and support.

Procedure

1. From a computer or server with an internet connection, go to the Fix Central website.
2. Scroll down to your HMC Version level to view available HMC levels.

   Note: If you prefer, you can contact IBM service and support.
3. Continue with "Step 3. Obtain the HMC machine code update" on page 78.

Step 3. Obtain the HMC machine code update

Before you begin

To obtain the HMC machine code update, complete the following steps:

About this task

To order the HMC machine code update on removable media, contact service and support.

You can order the HMC machine code update through the Fix Central website, contact service and support, or download it to an FTP server.

Ordering the HMC machine code update through the Fix Central website

1. From a computer or server with an Internet connection, go to the Fix Central website.
2. Under Supported HMC products, select the latest HMC level.
3. Scroll down to the File names / Package area and locate the update that you want to order.
4. In the Order column, select **Go**.
5. Click **Continue** to sign in with your IBM ID.
6. Follow the on-screen prompts to submit your order.

Downloading the HMC machine code update to removable media

1. From a computer or server with an Internet connection, go to Fix Central website.

2. Under Supported HMC products, select the latest HMC level.
3. Scroll down to the File names / Package area and locate the update that you want to download.
4. Click the update that you want to download.
5. Accept the license agreement, and save the update to your removable media.

What to do next

When you are finished, continue with "Step 4. Apply the HMC machine code update" on page 79.

Step 4. Apply the HMC machine code update

Before you begin

To apply the HMC machine code update, complete the following steps:

Procedure

1. Before you install updates to the HMC machine code, back up HMC data. For more information, see "Backing up management console data" on page 74.
2. If you obtained or created the update on DVD-RAM, insert it into the DVD drive on the HMC. If you obtained or created the update on a USB memory device, insert the memory device.
3. Before you install updates to the HMC machine code, back up critical console information on your HMC.

   For instructions, see "Backing up management console data" on page 74. Then continue with the next step.
4. In the navigation area, click **Console Management**, and then select **Console Management**.
5. In the content pane, click **Update the Hardware Management Console**. The Install Corrective Service Wizard opens.
6. Follow the instructions in the Wizard to install the update.
7. Shut down, restart, and log back in to the HMC for the update to take effect.
8. Continue with "Step 5. Verify that the HMC machine code update installed successfully" on page 79.

Step 5. Verify that the HMC machine code update installed successfully

Before you begin

To verify that the HMC machine code update installed successfully, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver Information heading, including: the HMC version, release, maintenance level, build level, and base versions.
4. Verify that the version and release match the update that you installed.
5. If the level of code that is displayed is not the level that you installed, perform the following steps:
   a. Retry the machine code update. If you created a DVD for this procedure, use a new media.
   b. If the problem persists, contact your next level of support.

Upgrading your HMC software

Learn how to upgrade the software on an HMC from one release to the next while you maintain your HMC configuration data.

About this task

To upgrade the machine code on an HMC, complete all steps.

Note: For HMC models 7063-CR1 and 7063-CR2, you can connect an external USB DVD drive.

Step 1. Obtain the upgrade

About this task

To order the HMC machine code upgrade on DVD-RAM, contact service and support.

You can order the HMC machine code upgrade through the Fix Central website.

To obtain the upgrade through the Fix Central website, complete the following steps:

Procedure

1. From a computer or server with an internet connection, go to the Hardware Management Console website at http://www-933.ibm.com/support/fixcentral/.
2. Click **Continue**.

   The Hardware Management Console site is displayed.
3. Navigate to the HMC version you want to upgrade to.
4. Locate the download and ordering section.

   Note: If you do not have access to the internet, contact IBM service and support to order the upgrade on DVD.
5. Follow the on-screen prompts to submit your order.
6. After you have the upgrade, continue with "Step 2. View the existing HMC machine code level" on page 80.

Step 2. View the existing HMC machine code level

About this task

To determine the existing level of machine code on an HMC, follow these steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Management**. In the navigation area, click **Updates**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver information heading, including the HMC version, release, maintenance level, build level, and base versions.
4. Continue with "Step 3. Back up the managed system's profile data" on page 80.

Step 3. Back up the managed system's profile data

About this task

To back up the managed system's profile data, complete the following steps:

Procedure

1. Select the system that you want to save the profile data.
2. Click **Actions** > **View All Actions** > **Legacy** > **Manage Partition Data** > **Backup**.
3. Type a backup file name and record this information.
4. Click **OK**.
5. Repeat these steps for each system.
6. Continue with "Step 4. Back up HMC data" on page 81.

Step 4. Back up HMC data

About this task

Back up HMC data before you install a new version of HMC software so that previous levels can be restored in the event of a problem while you upgrade the software. Do not use this critical console data after a successful upgrade to a new version of the HMC software.

Note: To back up to removable media, you need to have that media available.

To back up HMC data, complete the following steps:

Procedure

1. If you plan to back up to media, perform the following steps to format the media:
   a. Insert the media into the drive.
   b. In the navigation area, click **Serviceability**, and then select **Service Management**.
   c. In the content pane, click **Format Media**.
   d. Select the media type.
   e. Select the format type.
   f. Click **OK**.
2. In the navigation area, click **Console Management**, and then select **Console Management**.
3. In the content pane, click **Backup Management Console Data**.

   The **Backup Management Console Data** window opens.
4. Select an archive option.

   You can back up to media on a local system, a remote system that is mounted to the HMC file system (for example, NFS), or send the backup to a remote site by using File Transfer Protocol (FTP).

   - To back up to a local system, choose **Back up to media on local system** and follow the instructions.
   - To back up to a mounted remote system, choose **Back up to mounted remote system** and follow the instructions.
   - To back up to a remote FTP site, choose **Send back up critical data to remote site** and follow the instructions.
5. Continue with "Step 5. Record the current HMC configuration information" on page 81.

Step 5. Record the current HMC configuration information

About this task

Before you upgrade to a new version of HMC software, as a precautionary measure, record HMC configuration information.

To record the current HMC configuration, complete the following steps:

Procedure

1. Select a managed system or any partitions that you want to record HMC configuration information.
2. From the menu pod, select **Actions** > **Schedule Operations**.

   All scheduled operations for the target that you selected are displayed.
3. Select **Sort** > **By Object**.
4. Select each object and record the following details:
   - Object Name
   - Schedule date
   - Operation Time (displayed in 24-hour format)
   - Repetitive (if Yes, complete the following steps):
     a. Select **View** > **Schedule Details**.
     b. Record the interval information.
     c. Close the scheduled operations window.
     d. Repeat for each scheduled operation.
5. Close the **Customize Scheduled Operations** window.
6. Continue with "Step 6. Record remote command status" on page 82.

Step 6. Record remote command status

About this task

To record remote command status, complete the following steps:

Procedure

1. In the navigation area, click **Users and Security**, and then select **Systems and Console Security**.
2. In the content pane, click **Enable Remote Command Execution**.
3. Record whether the **Enable remote command execution using the ssh facility** check box is selected.
4. Click **Cancel**.
5. Continue with "Step 7. Save upgrade data" on page 82.

Step 7. Save upgrade data

About this task

You can save the current HMC configuration in a designated disk partition on the HMC or to local media. Save upgrade data only immediately before you upgrade your HMC software to a new release. You can restore the HMC configuration settings after you upgrade.

Note: Only one level of backup data is allowed. Each time that you save upgrade data, the previous level is overwritten.

To save upgrade data, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Management**.
2. In the content pane, click **Save Upgrade Data**. The **Save Upgrade Data** wizard opens.
3. Select the media on which you want to save the upgrade data. If you choose to save to removable media, insert the media now. Click **Next**.
4. Click **Finish**.
5. Wait for the task to complete.

If the Save Upgrade Data task fails, contact your next level of support before proceeding.

Note: If the save upgrade data task fails, do not continue the upgrade process.

6. Click **OK**.
7. Continue with "Step 8. Upgrade the HMC software" on page 83.

Step 8. Upgrade the HMC software

About this task

To upgrade the HMC software, restart the system with the removable media in the DVD drive.

Procedure

1. Insert the HMC Product Installation media into the DVD drive.
2. In the navigation area, click **Console Management**, and then select **Console Management**.
3. In the content pane, select **Shutdown or Restart the Managment Console**.
4. Ensure **Restart the HMC** is selected.
5. Click **OK**.

   The HMC restarts and system information scrolls on the window.
6. Select **Upgrade** and click **Next**.
7. Choose from the following options:
   - If you saved the upgrade data during the previous task, continue with the next step.
   - If you did not save the upgrade data previously in this procedure, you must save the upgrade data now before you continue.
8. Select **Upgrade from media** and click **Next**.
9. Confirm the settings and click **Finish**.
10. Follow the prompts.

    Note:

    - If the screen goes blank, press the space bar to view the information.
    - The first DVD can take approximately 20 minutes to install.
11. At the login prompt, log in using your user ID and password.

    The HMC code installation is complete.
12. Continue with "Step 9. Verify that the HMC machine code upgrade installed successfully" on page 83.

Step 9. Verify that the HMC machine code upgrade installed successfully

About this task

To verify that the HMC upgrade is installed successfully, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**.
3. In the new window, view and record the information that appears under the Current HMC Driver information heading, including the HMC version, release, maintenance level, build level, and base versions.
4. Verify that the version and release match the update that you installed.
5. If the level of code that is displayed is not the level that you installed, retry the upgrade task by using a new DVD. If the problem persists, contact your next level of support.

Upgrading HMC from remote location by using network upgrade images

Learn how to upgrade the software on an HMC from a remote location by using network upgrade images.

About this task

Learn how to upgrade the software on an HMC from a remote location by using network upgrade images.

Procedure

1. From a computer or server with an internet connection, go to the Hardware Management Console Support and downloads website (http://www14.software.ibm.com/webapp/set2/sas/f/hmcl/home.html).
2. Download the appropriate HMC V9 network images and save them on an FTP server.

   You cannot download these files directly to the HMC. You must download the image files to a server that accepts FTP requests.
3. Ensure that you download the following files:
   - img2a
   - img3a
   - base.img
   - disk1.img
   - hmcnetworkfiles.sum
4. Save the upgrade data on the HMC. Run the following commands to save the upgrade data:
   - To save data on both DVD and HDD, run the following commands:

     ```
     mount /media/cdrom
     ```

     ```
     saveupgdata -r diskdvd
     ```
   - To save data on the HDD, run the following command:

     ```
     saveupgdata -r disk
     ```
5. Copy the upgrade files to the bootable disk partition on the HMC. Run the **getupgfiles** command to copy the files.

   Example: **getupgfiles -h <ftp server> -u <user id> -d <remote directory>**

   Where,
   - **ftp server** is the host name or IP address of the FTP server where you download the HMC network images.
   - **user id** is a valid user ID on the FTP server. If you do not specify the password with the `--passwd` argument, you are prompted for a password.
   - **remote directory** is the directory on your FTP server where the HMC network images are saved.
6. Restart the HMC to upgrade the code that is copied to the bootable disk partition. Run the **chhmc -c altdiskboot -s enable --mode upgrade** to restart the HMC.
7. Restart the HMC and start the upgrade. Run the **hmcshutdown -r -t now** command to start the upgrade.

Securing the HMC

Learn how to enhance the security of your Hardware Management Console (HMC) that is based on your corporate security standards.

The default configuration of the HMC provides ample security for most enterprise users. With the Hardware Management Console (HMC) Version 8.4.0, or later, you can further enhance the security of the HMC that is based on your corporate security standards. To enhance the security for the HMC, you must set the HMC to a minimum of Level 1 security. You may choose Level 2 and Level 3 security depending on your environment and the corporate security requirements.

Note: Before changing the security level, check with your corporate security compliance team.

Level 1 security

To secure the HMC (level 1 security), complete the following steps:

1. Change the predefined password for the default `hscroot` user. For more information about password policy, see "Enhanced password policy" on page 86.
2. If the HMC does not belong to a physically secure environment, set the `grub` password by running the following command: `chhmc -c grubpasswd -s enable --passwd <new grub password>`
3. If you have configured the Integrated Management Module (IMM) on the HMC, set a strong IMM password.
4. Set a strong password for the *admin* user and general users on all servers.
5. Update the HMC with the latest released security fixes. For more information about the security fixes, see IBM Fix Central.

Level 2 security

If you have multiple users, complete the following steps to enhance the security for the HMC:

1. Create an account for each user on the HMC and assign the required roles and resources to users. For more information about the various roles in the HMC, see HMC tasks, user roles, IDs, and associated commands.

   Note: Ensure that you assign only the required resources and roles for users that are created on HMC. If necessary, you can also create custom roles.
2. Enable user data replication between different Hardware Management Consoles. The user data replication can be performed in Primary HMC-Secondary HMC mode or Peer-Peer mode. For more information about user data replication, see Manage Data Replication.
3. Import a certificate that is signed by the Certificate Authority.

Level 3 security

If you have multiple Hardware Management Consoles and system administrators, complete the following steps to enhance the security for the HMC:

1. Use centralized authentication such as Lightweight Directory Access Protocol (LDAP) or Kerberos. For more information about configuring LDAP, see How to Configure LDAP on HMC.
2. Enable user data replication between different Hardware Management Consoles.
3. Ensure that the HMC is in NIST SP 800-131A mode so that the HMC uses only strong ciphers.
4. Block ports that are not required in the firewall. For information about the HMC ports that can be used, see the following table:

Table 32. Port used by the user for interaction with HMC

Port	Description	Type	Protocol version (Default mode)	Protocol Version (NIST mode)
22	Open SSH	TCP	SSH v3	SSH v3
123	NTP	UDP	NTP	NTP
161	SNMP Agent	UDP	SNMP v3	SNMP v3
162	SNMP Trap	UDP	SNMP v3	SNMP v3
427	SLP	UDP	N/A	N/A

Table 32. Port used by the user for interaction with HMC (continued)

Port	Description	Type	Protocol version (Default mode)	Protocol Version (NIST mode)
443	HMC GUI and REST API	TCP	HTTPS (TLS 1.2)	HTTPS (TLS 1.2)
657	RMC	TCP/UDP	RSCT (Plain text + hash and sign)	RSCT (Plain text + hash and sign)
2300	5250 Terminal for IBM i	TCP	Plain text	Plain text
2301	5250 Secure terminal for IBM i	TCP	TLS 1.2	TLS 1.2
5989	CIM (legacy port, non-functional)	TCP	Non-functional	Non-functional
9900	FCS: HMC-HMC discovery	UDP	FCS	FCS
9920	FCS: HMC-HMC communication	TCP	HTTPS (TLS 1.2)	HTTPS (TLS 1.2)
9960	VTerm applet in GUI	TCP	HTTPS (TLS 1.2)	HTTPS (TLS 1.2)
12443	HMC REST API (legacy port)	TCP	HTTPS (TLS 1.2)	HTTPS (TLS 1.2)
12347	RSCT Peer Domain	UDP	RSCT (Plain text + hash and sign)	RSCT (Plain text + hash and sign)
12348	RSCT Peer Domain	UDP	RSCT (Plain text + hash and sign)	RSCT (Plain text + hash and sign)

Notes:

- You must use only SSH (port 22), HTTPS (port 443 and port 12443), 5250 secure terminal for IBM i (port 2301), and VTerm (port 9960) that are exposed to an intranet. All other ports must be used in a private or isolated network. You can use a separate Ethernet port and VLAN for the Resource Monitoring and Control (RMC) (port 657), FCS (port 9900 and port 9920), and RSCT Peer Domain (port 12347 and port 12348).
- Ports listed in the **`netstat`** command are used for internal processes only.

Enhanced password policy

You can enforce password requirements for locally authenticated users by using the Hardware Management Console (HMC). The enhanced password policy function allows the system administrator to set password restrictions. The enhanced password policy applies to the systems in which an HMC is installed.

System administrators can use the enhanced password policy to define a single password policy for all users. The HMC provides a medium security password policy, which can be activated by the system administrators to set password restrictions. The system administrator can also choose to activate the medium security policy or a new user-defined policy. The HMC medium security password policy cannot be removed from the system. The following table lists the attributes of the medium security policy and the default values.

Table 33. Password attributes for the HMC medium security password policy

Attribute	Description	Default value
`min_pwage`	The minimum number of days for which a password must remain active.	1
`pwage`	The maximum number of days for which a password might remain active.	365
`min_length`	The minimum length of a password.	8
`hist_size`	The number of previously saved passwords that cannot be reused.	10
`warn_pwage`	When the password is about to expire, the number of days before which a user is warned that the password is about to expire.	7
`min_digits`	The minimum number of digits that are required to be used in the password.	None
`min_uppercase`	The minimum number of upper case characters.	1
`min_lowercase`	The minimum number of lower case characters.	6
`min_special_chars`	The minimum number of special characters that must be used in the password.	None
`inactivity_expiration`	The number of days that can elapse before an HMC user account is disabled due to inactivity.	180

Consider the following items about the HMC medium security password policy:

- The policy features for password age, login disablement and inactivity expiration are not applicable to the **hscroot**, **hscpe**, and **root** user IDs. The password character validation is applicable for these user IDs.
- The policy affects only the locally authenticated users that are managed by the HMC and the policy cannot be enforced on LDAP or Kerberos users.
- The HMC medium security password policy or the user-defined policy allows the system administrators to set password reuse restrictions.
- The HMC medium security password is read-only and the attributes of HMC medium security password cannot be changed. You can create a new user-defined password to set password restriction.

You can use the following commands to configure the HMC medium security password policy:

mkpwdpolicy
Imports the password policy from a file, which contains all the parameters, or creates a password policy.

lspwdpolicy
Lists all the available password policy profiles and searches for specific parameters. You can also view the password policy that is currently active.

rmpwdpolicy
Removes an existing inactive password policy.

Note: You cannot remove an active medium security policy and the default read-only password policy.

chpwdpolicy
Changes parameters of an inactive password policy.

Solving common problems while securing the HMC

Learn how to solve some problems that you might encounter when you secure the HMC.

How to secure the connection between the Hardware Management Console (HMC) and the system?

The HMC connects to the system through the Flexible Service Processor (FSP). A proprietary binary protocol called Network Client protocol (NETC) is used for managing both FSP and Power hypervisor. The following table lists ports that are used by the HMC:

Table 34. Ports on FSP that are used to interact with the HMC

Port on FSP	Description	Protocol version (Default mode)	Protocol Version (NIST mode)
443	Advanced System Management Interface	HTTPS (TLS 1.2)	HTTPS (TLS 1.2)
30000	NETC	NETC (TLS 1.2). Falls back to SSLv3 for support of older firmware.	NETC (TLS 1.2)
30001	VTerm	NETC (TLS 1.2). Falls back to SSLv3 for support of older firmware.	NETC (TLS 1.2)

How to lock the HMC?

If you want to enhance the security for your infrastructure, you can use an Intrusion Prevention System (IPS) device or add all Hardware Management Consoles and IBM Power systems servers behind a firewall. Also, you can disable network services on the HMC if you do not use it remotely or if you want to lock the HMC down. To disable network services on the HMC, complete the following steps:

1. Disable remote command execution by using the SSH port.
2. Disable remote virtual terminal (VTerm port).
3. Disable remote web access (HMC graphical user interface and REST API).
4. Block ports in firewall by using HMC network settings for each configured Ethernet port.

How to set the HMC in NIST SP 800-131A compliance mode?

With HMC Version 8.1.0, or later, when you set the HMC in the compliance mode, only strong ciphers listed by NIST SP 800-131A are supported. You might not be able to connect to older Power systems servers such as, POWER5 servers that do not support Transport Layer Security (TLS 1.2). For more information about changing the security mode, see HMC V8R8 NIST mode.

How to view and change ciphers that are used by the HMC?

With HMC Version 8.1.0, or later, the HMC supports more secure cipher sets that are defined in NIST 800-131A. Ciphers that are used in the default mode are strong. For more information about encryption ciphers that are used by the HMC, run the **lshmcencr** command. If your corporate standards requires the use of a different set of ciphers, run the **chhmcencr** command to modify the encryption ciphers.

To list the encryption ciphers that are used by the HMC to encrypt user password, run the following command:

```
lshmcencr -c passwd -t c
```

To list the encryption ciphers that can currently be used by the HMC web user interface and REST API, run the following command:

```
lshmcencr -c webui -t c
```

To list the encryption ciphers and MAC algorithm that can currently be used by the HMC SSH interface, run the following command:

```
lshmcencr -c ssh -t c
```

```
lshmcencr -c sshmac -t c
```

How to check the strength of the certificate on the HMC?

The self-signed certificates on the HMC use SHA256 with 2048-bit RSA encryption, which is strong. If you are using CA signed certificates, ensure that you are not using the 1024-bit encryption, which is weak. The following certificates can be used for the HMC:

- The CA signed certificate can be used for the HMC graphical user interface and REST API (ports 443 and 12443).
- The port 9920 is used for HMC to HMC communication. You cannot replace this certificate with your own certificate.

How to choose between a self-signed certificate (default) or a CA signed certificate?

The HMC auto-generates a certificate during installation. However, you can generate a Certificate Signing Request (CSR) from the HMC and get a new certificate that is issued by a Certificate Authority. You can import this certificate into HMC. Ensure that you also obtain a domain name for the HMC. For more details about managing the certificates in HMC, see Manage Certificates.

How to audit the HMC?

The audit on the Hardware Management Consoles focuses on configured ciphers and the usage activity of the various HMC users. Use the following commands to view the usage activity of various HMC users:

Table 35. Ciphers that are used by the HMC

Purpose	Command
Password encryption (global setting)	`lshmcencr -c passwd -t c`
Password encryption for each user	`lshmcusr -Fname:password_encryption`
SSH ciphers	`lshmcencr -c ssh -t c`
SSH MAC	`lshmcencr -c sshmac -t c`
Cipher that are used for the HMC graphical user interface and REST API	`lshmcencr -c webui -t c`

Use the following commands to monitor various console and serviceable events information for uses in the HMC:

Table 36. Commands to view the logged on users and console or serviceable events information in the HMC

Information	Command
GUI users	`lslogon –r webui –u`
GUI tasks	`lslogon –r webui –t`

Table 36. Commands to view the logged on users and console or serviceable events information in the HMC (continued)

Information	Command
CLI users	`lslogon –r ssh –u`
CLI tasks	`lslogon –r ssh –t`
Operations on HMC	`lssvcevents -t console -d <number of days>`
Operations on System	`lssvcevents –t hardware –m <managed system> -d <number of days>`

Centralized monitoring events for the HMC: If you have many Hardware Management Consoles, set the `rsyslog` file to collect all the usage data.

How does IBM fix the HMC security vulnerabilities?

IBM has a security incidence response process named IBM Product Security Incident Response Team (PSIRT). The IBM Product Security Incident Response Team (PSIRT) is a global team that manages the receipt, investigation and internal coordination of security vulnerability information related to IBM offerings. Open Source and IBM components that are shipped with the HMC are actively monitored and analyzed. Interim fixes and security fixes are provided by IBM for all supported releases of the HMC.

How to track new interim fixes on the HMC?

The security bulletin contains information about the vulnerability and interim fixes for supported HMC versions. To track interim fixes on the HMC, you can:

- Search the latest security bulletins at IBM Security Bulletin.
- Follow @IBMPowereSupp on Twitter for notifications.
- Subscribe to email notifications at IBM Support.

Security profiles: Global Data Protection Regulation (GDPR) and Payment Card Industry Data Security Standard (PCI-DSS)

Learn about how the Hardware Management Console (HMC) handles the privacy information of the users.

The Hardware Management Console (HMC) is a closed appliance that does not store any cardholder data. Hence, only a subset of requirements and security assessment procedures of IT security that are defined by PCI-DSS are applicable for the HMC. Only trusted code that is distributed by IBM can be installed on the HMC. When any vulnerability is known through the IBM PSIRT process, interim fixes are published. The requirements and recommendations include the following items:

GDPR queries

Table 37. GDPR queries . The table provides information about the questions related to GDPR.

Questions	Answers
What kind of data is stored in the HMC?	HMC stores configuration information of Power hardware, PowerVM virtualization, and the performance metrics information.
Does the HMC process any personal data?	You can provide contact information for the call home function. Providing contact information for the call home function is optional.

Table 37. GDPR queries . The table provides information about the questions related to GDPR. *(continued)*

Questions	Answers
Which predefined accounts are used for system administration of the HMC?	The system administrator user uses the *hscroot* username.
Do any of the accounts in the HMC relate to a specific person?	No.
Is it mandatory to provide personal data in the HMC?	No. You do not need to provide personal data information. However, providing this information is optional.
Does the HMC log file have any personal data information?	No.
Is it possible to delete personal data completely and permanently?	Yes. Unconfigure the call home function.

PCI-DSS queries

Table 38. PCI-DSS queries . The table provides information about the questions related to PCI-DSS

Questions	Answers
How to install and maintain a firewall configuration to protect the data of the cardholder?	The HMC does not store or access any cardholder data. However, the HMC has a firewall configuration and the user can control and enable specific ports.
Can I use vendor-supplied default value for system passwords and other security parameters?	Before you install a system on the network, change all the predefined passwords of the *hscroot* user.
How does the HMC protect the stored data of the cardholder?	The HMC does not store or access any cardholder data.
How does the HMC encrypt the data of the cardholder when the data is transmitted across open public networks?	The HMC does not store or access any cardholder data.
How to use and regularly update anti-virus software programs?	The HMC is a closed appliance. Therefore, malware cannot infect the HMC.
How to develop and maintain secure systems and applications?	You must install the required patches to your system manually from the IBM Fix Central website. Only trusted code that are distributed by IBM can be installed on the HMC.
Does the HMC restrict access to the cardholder data?	The HMC does not store or access any cardholder data.
How to assign a unique ID to each person who has access to the computer?	You can implement this requirement by ensuring that there are no shared IDs and by following the password policies.
How to restrict the physical access to the data of the cardholder?	The HMC does not store or access any cardholder data
How to track and monitor the access to network resources and to the cardholder data?	The HMC does not store or access any cardholder data.

Table 38. PCI-DSS queries . The table provides information about the questions related to PCI-DSS *(continued)*	
Questions	**Answers**
How does the HMC test the security of the system and processes?	Scan tools are used to run security scans on all the released versions of the HMC. The scan tools include: *Qualys*, *Nessus*, *testssl*, *sslscan* and *ASoC*.
How to maintain a security policy that includes information security for employees and contractors?	System administrator disables the remote user login, activates the user login on a need basis, and deactivates the user login when the access is no longer required.

HMC port locations

You can find port locations by using location codes. Use the HMC port location illustrations to map a location code to the HMC port position on the server.

Model 9080-HEX HMC port locations

Use this diagram and table to map the HMC ports on the 9080-HEX.

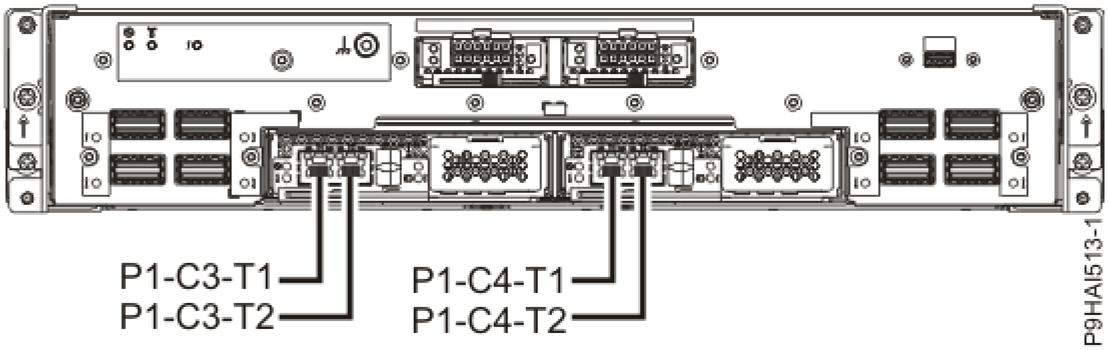

Figure 6. 9080-HEX HMC port locations

Table 39. 9080-HEX HMC port locations		
Port	**Physical port location**	**Identify LED**
Service processor card 1 - HMC port 1	Un-P1-C3-T1	No
Service processor card 1 - HMC port 2	Un-P1-C3-T2	No
Service processor card 2 - HMC port 1	Un-P1-C4-T1	No
Service processor card 2 - HMC port 2	Un-P1-C4-T2	No
For more information about HMC port locations on the 9080-HEX , see Part location and location codes.		

Notices

This information was developed for products and services offered in the US.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

Some jurisdictions do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM websites are provided for convenience only and do not in any manner serve as an endorsement of those websites. The materials at those websites are not part of the materials for this IBM product and use of those websites is at your own risk.

IBM may use or distribute any of the information you provide in any way it believes appropriate without incurring any obligation to you.

The performance data and client examples cited are presented for illustrative purposes only. Actual performance results may vary depending on specific configurations and operating conditions.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

All IBM prices shown are IBM's suggested retail prices, are current and are subject to change without notice. Dealer prices may vary.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to actual people or business enterprises is entirely coincidental.

If you are viewing this information in softcopy, the photographs and color illustrations may not appear.

The drawings and specifications contained herein shall not be reproduced in whole or in part without the written permission of IBM.

IBM has prepared this information for use with the specific machines indicated. IBM makes no representations that it is suitable for any other purpose.

IBM's computer systems contain mechanisms designed to reduce the possibility of undetected data corruption or loss. This risk, however, cannot be eliminated. Users who experience unplanned outages, system failures, power fluctuations or outages, or component failures must verify the accuracy of operations performed and data saved or transmitted by the system at or near the time of the outage or failure. In addition, users must establish procedures to ensure that there is independent data verification before relying on such data in sensitive or critical operations. Users should periodically check IBM's support websites for updated information and fixes applicable to the system and related software.

Homologation statement

This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Contact an IBM representative or reseller for any questions.

Accessibility features for IBM Power servers

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Power servers include the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Power servers use the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with ICT Accessibility 508 Standards and 255 Guidelines (https://www.access-board.gov/ict/) and Web Content Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the IBM Power servers.

The IBM Power servers online product documentation in IBM Documentation is enabled for accessibility. For more information about IBM's commitment to accessibility, see the IBM accessibility website at IBM Accessibility (https://www.ibm.com/able/).

Keyboard navigation

This product uses standard navigation keys.

Interface information

The IBM Power servers user interfaces do not have content that flashes 2 - 55 times per second.

The IBM Power servers web user interface relies on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

The IBM Power servers web user interface includes WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Power servers include certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

Depending upon the configurations deployed, this Software Offering may use session cookies that collect each user's user name and IP address for purposes of session management. These cookies can be disabled, but disabling them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at http://www.ibm.com/privacy and IBM's Online Privacy Statement at http://www.ibm.com/privacy/details the section entitled "Cookies, Web Beacons and Other Technologies" and the "IBM Software Products and Software-as-a-Service Privacy Statement" at http://www.ibm.com/software/info/product-privacy.

Trademarks

IBM, the IBM logo, and ibm.com are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information.

The registered trademark Linux is used pursuant to a sublicense from the Linux Foundation, the exclusive licensee of Linus Torvalds, owner of the mark on a worldwide basis.

Red Hat®, JBoss®, OpenShift®, Fedora®, Hibernate®, Ansible®, CloudForms®, RHCA®, RHCE®, RHCSA®, Ceph®, and Gluster® are trademarks or registered trademarks of Red Hat, Inc. or its subsidiaries in the United States and other countries.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Electronic emission notices

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

Class A Notices

The following Class A statements apply to the IBM servers that contain the Power10 processor and its features unless designated as electromagnetic compatibility (EMC) Class B in the feature information.

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

The following Class A statements apply to the servers.

Canada Notice

CAN ICES-3 (A)/NMB-3(A)

European Community and Morocco Notice

This product is in conformity with the protection requirements of Directive 2014/30/EU of the European Parliament and of the Council on the harmonization of the laws of the Member States relating to electromagnetic compatibility. IBM cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-IBM option cards.

This product may cause interference if used in residential areas. Such use must be avoided unless the user takes special measures to reduce electromagnetic emissions to prevent interference to the reception of radio and television broadcasts.

Warning: This equipment is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

Germany Notice

Deutschsprachiger EU Hinweis: Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit

Dieses Produkt entspricht den Schutzanforderungen der EU-Richtlinie 2014/30/EU zur Angleichung der Rechtsvorschriften über die elektromagnetische Verträglichkeit in den EU-Mitgliedsstaatenund hält die Grenzwerte der EN 55022 / EN 55032 Klasse A ein.

Um dieses sicherzustellen, sind die Geräte wie in den Handbüchern beschrieben zu installieren und zu betreiben. Des Weiteren dürfen auch nur von der IBM empfohlene Kabel angeschlossen werden. IBM übernimmt keine Verantwortung für die Einhaltung der Schutzanforderungen, wenn das Produkt ohne Zustimmung von IBM verändert bzw. wenn Erweiterungskomponenten von Fremdherstellern ohne Empfehlung von IBM gesteckt/eingebaut werden.

EN 55032 Klasse A Geräte müssen mit folgendem Warnhinweis versehen werden:

"Warnung: Dieses ist eine Einrichtung der Klasse A. Diese Einrichtung kann im Wohnbereich Funk-Störungen verursachen; in diesem Fall kann vom Betreiber verlangt werden, angemessene Maßnahmen zu ergreifen und dafür aufzukommen."

Deutschland: Einhaltung des Gesetzes über die elektromagnetische Verträglichkeit von Geräten

Dieses Produkt entspricht dem “Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG)“. Dies ist die Umsetzung der EU-Richtlinie 2014/30/EU in der Bundesrepublik Deutschland.

Zulassungsbescheinigung laut dem Deutschen Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) (bzw. der EMC Richtlinie 2014/30/EU) für Geräte der Klasse A

Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen.

Verantwortlich für die Einhaltung der EMV Vorschriften ist der Hersteller:
International Business Machines Corp.
New Orchard Road
Armonk, New York 10504
Tel: 914-499-1900

Der verantwortliche Ansprechpartner des Herstellers in der EU ist:
IBM Deutschland GmbH
Technical Relations Europe, Abteilung M456

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Responsible Party:
International Business Machines Corporation
New Orchard Road
Armonk, NY 10504
Contact for FCC compliance information only: fccinfo@us.ibm.com

United Kingdom Notice

This product may cause interference if used in residential areas. Such use must be avoided unless the user takes special measures to reduce electromagnetic emissions to prevent interference to the reception of radio and television broadcasts.

Class B Notices

The following Class B statements apply to features designated as electromagnetic compatibility (EMC) Class B in the feature installation information.

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

Canada Notice

CAN ICES-3 (B)/NMB-3(B)

European Community and Morocco Notice

This product is in conformity with the protection requirements of Directive 2014/30/EU of the European Parliament and of the Council on the harmonization of the laws of the Member States relating to electromagnetic compatibility. IBM cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-IBM option cards.

German Notice

Deutschsprachiger EU Hinweis: Hinweis für Geräte der Klasse B EU-Richtlinie zur Elektromagnetischen Verträglichkeit

Dieses Produkt entspricht den Schutzanforderungen der EU-Richtlinie 2014/30/EU zur Angleichung der Rechtsvorschriften über die elektromagnetische Verträglichkeit in den EU-Mitgliedsstaatenund hält die Grenzwerte der EN 55022/ EN 55032 Klasse B ein.

Um dieses sicherzustellen, sind die Geräte wie in den Handbüchern beschrieben zu installieren und zu betreiben. Des Weiteren dürfen auch nur von der IBM empfohlene Kabel angeschlossen werden. IBM übernimmt keine Verantwortung für die Einhaltung der Schutzanforderungen, wenn das Produkt ohne Zustimmung von IBM verändert bzw. wenn Erweiterungskomponenten von Fremdherstellern ohne Empfehlung von IBM gesteckt/eingebaut werden.

Deutschland: Einhaltung des Gesetzes über die elektromagnetische Verträglichkeit von Geräten

Dieses Produkt entspricht dem “Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG)“. Dies ist die Umsetzung der EU-Richtlinie 2014/30/EU in der Bundesrepublik Deutschland.

Zulassungsbescheinigung laut dem Deutschen Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) (bzw. der EMC Richtlinie 2014/30/EU) für Geräte der Klasse B

Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen.

Verantwortlich für die Einhaltung der EMV Vorschriften ist der Hersteller:
International Business Machines Corp.
New Orchard Road
Armonk, New York 10504
Tel: 914-499-1900

Der verantwortliche Ansprechpartner des Herstellers in der EU ist:
IBM Deutschland GmbH
Technical Relations Europe, Abteilung M456
IBM-Allee 1, 71139 Ehningen, Germany
Tel: +49 (0) 800 225 5426
email: HalloIBM@de.ibm.com

Generelle Informationen:

Das Gerät erfüllt die Schutzanforderungen nach EN 55024 und EN 55032 Klasse B

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult an IBM-authorized dealer or service representative for help.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions:

(1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Responsible Party:

International Business Machines Corporation
New Orchard Road
Armonk, New York 10504
Contact for FCC compliance information only: fccinfo@us.ibm.com

Terms and conditions

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Personal Use: You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative works of these publications, or any portion thereof, without the express consent of IBM.

Commercial Use: You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights: Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

Managing the Hardware Management Console

IBM

Note

Before using this information and the product it supports, read the information in "Notices" on page 109.

This edition applies to IBM Hardware Management Console Version 10 Release 1 Maintenance Level 1010 and to all subsequent releases and modifications until otherwise indicated in new editions.

Contents

Managing the HMC

Learn how to use the Hardware Management Console (HMC).

About this task

Learn about the tasks that you can use on the console and how to navigate by using the web-based user interface with graphical views of managed systems and simplified navigation.

Note: Many of the HMC tasks that are listed here can also be performed by using PowerVC. For more information about the tasks that you can perform by using PowerVC, see HMC and PowerVC.

What's new in Managing the HMC

Read about new or significantly changed information in Managing the HMC since the previous update of this topic collection.

September 2021

- Updated the menu icons for the HMC Graphical User Interface.
- Updated the following topics:
  - “Using the web-based user interface” on page 3
  - “Overview of menu options” on page 4
  - “Power Management” on page 31
  - “Processor, Memory, I/O” on page 42
  - “PowerVM” on page 44
  - “Partition Properties” on page 56
  - “Schedule Operations” on page 59
  - “Validate Maintenance Readiness and Prepare” on page 60
  - “Console Default Settings” on page 71
  - “Manage Data Replication” on page 75
  - “Manage Virtual I/O Server Backups” on page 78
  - “Manage KDC” on page 86

Introduction to the HMC

Learn about some of the concepts and functions of the Hardware Management Console (HMC) and the user interface that is used for accessing those functions.

You can configure and manage servers on the HMC. One HMC can manage multiple servers, and dual HMCs can provide redundant support by managing the same system. To ensure consistent function, each HMC is shipped preinstalled with the HMC Licensed Machine Code Version 9, Release 1.

To provide flexibility and availability, you can implement HMCs in several configurations.

HMC as the DHCP server

An HMC that is connected by either a private network to the systems it manages might be a DHCP server for the service processors of the systems. An HMC might also manage a system over an open network, where the managed system's service processor IP address is assigned by a customer-supplied DHCP server or manually assigned by using the Advanced System Management Interface (ASMI).

Physical proximity

Before HMC Version 7, at least one local HMC was required to be physically located near the managed systems. As an alternative to the local HMC, you can use a supported device, such as a personal computer that has connectivity and authority to operate through a remotely attached HMC. The local device must be in the same room as your server and at a distance of 8 m (26 ft) from your server. The local device must have the functional capability that is equivalent to the HMC that it replaces and that is needed by the service representative to service the system. For a virtual HMC, the functional capabilities also include the method of transferring service data, such as firmware updates or diagnostic data, and transferring the log information to and from the HMC.

Redundant or Dual HMCs

A server might be managed by either 1 or 2 Hardware Management Consoles. When two Hardware Management Consoles manage one system, they are peers, and each HMC can be used to control the managed system. The best practice is to attach one HMC to the supported networks or HMC ports of the managed systems. The networks are intended to be independent. Each HMC might be the DCHP server for a service network. Because the networks are independent, the DHCP servers must be set up to provide IP addresses on two unique and nonroutable IP ranges.

Redundant or Dual HMCs that manage the same server must not be at different version and release levels. For example, an HMC at Version 7 Release 7.1.0 and an HMC at Version 7 Release 3.5.0 cannot manage the same server. The HMCs must be at the same version and release level.

When the server is connected to the higher version of the management console, the partition configuration is upgraded to the latest version. After the partition configuration upgrade, lower levels of the management consoles will not be able to interpret the data correctly. After the server is managed by the higher version of the management console, you must first initialize the server before you can go back to the lower version of the management console. You can restore a backup that is taken at the older level or re-create the partitions. If the server is not initialized, one of the following outcomes can occur depending on the version of the lower-level HMC:

- HMC Version 7 Release 7.8.0 and later reports a connection error of **Version mismatch** with reference code **Save Area Version Mismatch**.
- HMC Version 7 Release 7.7.0 and earlier might report a server state of **Incomplete** or **Recovery**. In addition, partition configuration corruption can also occur.

Logging on to the Hardware Management Console (HMC) when PowerSC MFA is configured on the HMC

Learn how to log in to the HMC when IBM PowerSC Multi-factor Authentication (MFA) is configured on the HMC.

If IBM PowerSCMFA is enabled on the HMC and the user is configured on the PowerSC MFA server, you can choose to log in to the HMC by first entering the user ID and a policy name that is provided by your security administrator. You are then prompted to provide additional credentials.

In the HMC login page, if you click **Policy Name**, the authentication mechanism is set to the in-band authentication type. For example, if the policy that you want to use is associated with the Rivest-Shamir-Adleman (RSA) authentication method, you can enter the secure ID passcode that you received from the RSA secure ID device or the application. Then, click **Next or Sign In** to log in to the HMC.

Notes:

- If MFA is not enabled on the HMC, you can log in to the HMC with the user ID and password.
- If you obtain a cache token credential (CTC) code from the PowerSC MFA server that is configured by your security administrator, enter the CTC code in the **Password** field.

Predefined user IDs and passwords

Predefined user IDs and passwords are included with the Hardware Management Console (HMC). It is imperative to the security of your system that you change the `hscroot` predefined password immediately.

If the password expires when you try to log in to the HMC, complete the following steps:

1. Enter the **Current Password** and the **New Password**.
2. Re-enter the new password in the **Confirmation new password** field.
3. Click **OK**. If the new password complies with the current password policy, the password for the HMC is changed.

The following predefined user IDs and passwords are included with the HMC:

Table 1. Predefined HMC user IDs and passwords

User ID	Password	Purpose
`hscroot`	`abc123`	The `hscroot` user ID and password are used to log in to the HMC for the first time. They are case-sensitive and can be used only by a member of the super administrator role.

Using the web-based user interface

You can use the web-based user interface to perform tasks on the Hardware Management Console (HMC) or on your managed resources.

This user interface comprises several major components: the title bar, the navigation area, the content pane, the menu pod, and the dock pod.

The *title bar*, across the top of the workplace window, identifies the product, help options, task log, serviceable events, and any user that is logged in.

The *navigation area*, in the left portion of the window, contains the primary navigation links for selecting your system and starting tasks for your HMC.

The *content pane*, in the middle portion of the window, displays information that is based on the current selection from the navigation area. For example, when **All Systems** is selected by clicking on **Resources** in the navigation area, all the available systems are shown in the content pane.

The *menu pod*, in the left portion of the window, is displayed after you select a system and provides quick access to commonly used HMC tasks and views of resources and properties.

You can resize the panes of the HMC workplace by moving the mouse pointer over the border that separates the navigation pane from the work pane until the mouse pointer changes to a double-pointed arrow. When the pointer changes shape, press and hold the left mouse button while you drag the mouse pointer to the left or right. Release the button and your navigation pane or work pane is now larger or smaller in size. You can also do this task within the work pane border that separates the resources table from the taskpad.

You can change the layout of the *content pane* according to your preference by clicking **Display Gallery View**, **Display Table View**, or **Display Relationship View**.

You can reposition columns in tables by selecting and dragging a column to a new position. You can also select which columns to display by clicking the drop-down menu that is located next to the last column of each table. You can save your preferences by clicking the **Save User Preferences** icon.

You can change how many rows are displayed in tables on each page by clicking one of the **Items per page** (**10**, **20**, **30**, or **50**) icons that are located below each table.

Note: Pop-up windows must be enabled for full functionality of the HMC.

Overview of menu options

Learn about the menu options and associated tasks that are available in the Hardware Management Console (HMC).

The menu options and tasks that are described in this section are available in the HMC interface.

Table 2. HMC menu options

Menu	Submenu	Options/Tasks
Resources	All Systems	View All Systems
	All Partitions	View All Partitions
	All Virtual I/O Servers	View All Virtual I/O Servers
	All Power Enterprise Pools	View All Power Enterprise Pools
	All Shared Storage Pool Clusters	View All Shared Storage Pool Clusters
	All Groups	View All Groups

Table 2. HMC menu options (continued)

Menu	Submenu	Options/Tasks
Console Management	Console Settings	Launch Guided Setup Wizard
		View Network Topology
		Test Network Connectivity
		Change Network Settings
		Change Performance Management Settings
		Change Date and Time
		Change Language and Locale
	Console Management	Shut Down or Restart the Management Console
		Schedule Operations
		View Licences
		Update the Hardware Management Console
		Manage Install Resources
		Manage Virtual I/O Server Image Repository
		Format Media
		Backup Management Console Data
		Restore Management Console Data
		Save Upgrade Data
		Manage Data Replication
	Template Library	System and Partition Library
	Updates	Not available (use the Update the Hardware Management Console option instead)

Table 2. HMC menu options (continued)

Menu	Submenu	Options/Tasks
Users and Security	Users and Roles	Change User Password
		Manage User Profiles and Access
		Manage Users and Tasks
		Manage Task and Resource Roles
	Systems and Console Security	Manage Certificates
		Manage LDAP
		Manage KDC
		Enable Remote Command Execution
		Enable Remote Operation
		Enable Remote Virtual Terminal

Table 2. HMC menu options (continued)

Menu	Submenu	Options/Tasks
Serviceability	Console Events Logs	View Console Events window
	Serviceable Events Manager	Serviceable Events Manager window
	Events Manager for Call Home	Events Manager for Call Home window
	Service Management	Create Serviceable Event

		View Component Logs
		Electronic Service Agent Setup Wizard
		Authorize User
		Enable Electronic Service Agent
		Manage Outbound Connectivity
		Manage Inbound Connectivity
		Manage Customer Information
		Manage Serviceable Event Notification
		Manage Connection Monitoring

Tasks and roles

Each HMC user can be a member of a different role. Each of these roles allows the user to access different parts of the HMC and complete different tasks on the managed system. HMC roles are either predefined or customized.

The roles that are discussed refer to HMC users; operating systems that are running on logical partitions have their own set of users and roles. When you create an HMC user, you must assign that user a task role. Each task role allows the user different levels of access to tasks available on the HMC interface. For more information about the tasks each HMC user role can perform, see "HMC tasks, user roles, IDs, and associated commands" on page 8.

You can assign managed systems and logical partitions to individual HMC users. This action allows you to create a user that has access to managed system A but not to managed system B. Each grouping of managed resource access is called a managed resource role.

The **predefined** HMC roles, which are the default on the HMC, are as follows:

Table 3. Predefined HMC Roles

Role	Description	HMC User ID
Operator	The operator is responsible for daily system operation.	**hmcoperator**
Super administrator	The super administrator acts as the root user, or manager, of the HMC system. The super administrator has unrestricted authority to access and modify most of the HMC system.	**hmcsuperadmin**
Product engineer	A product engineer helps support situations, but cannot access HMC user management functions. To provide support access for your system, you must create and administer user IDs with the product engineer role.	
Service representative	A service representative is an employee who is at your location to install, configure, or repair the system.	**hmcservicerep**
Viewer	A viewer can view HMC information, but cannot change any configuration information.	**hmcviewer**
Client live update	The client live update role is intended for use when you are using the AIX® Live Update capability on a partition of a managed system. A client live update user has authority that is limited to what is necessary to complete a live update on AIX.	**hmcclientliveupdate**

You can create **customized** HMC roles by modifying predefined HMC roles. Creating customized HMC roles is useful for restricting or granting specific task privileges to a certain user.

HMC tasks, user roles, IDs, and associated commands

The roles discussed in this section refer to HMC users; operating systems running on logical partitions has its own set of users and roles.

Each HMC user has an associated task role and a resource role. The task role defines the operations the user can perform. The resource role defines the systems and partitions for performing the tasks. The users may share task or resource roles. The HMC is installed with five predefined task roles. The single predefined resource role allows access to all resources. The operator can add customized task roles, customized resource roles, and customized user IDs.

Some tasks have an associated command. For more information about accessing the HMC command line, see “Using the HMC remote command line” on page 101.

Some tasks can only be performed using the command line. For a listing of those tasks, see Table 9 on page 25.

For more information about where to find task information, see the following table:

Table 4. HMC task groupings

Session handling

Learn about session limitations in the Hardware Management Console (HMC).

Session limitations

The HMC does not support disconnected sessions. A session logoff and a session disconnect are both considered as a session logoff. This means that you cannot reconnect to the same session to resume your task or tasks that were initiated from a previous session. Every login through the HMC creates a new session.

1. If you initiate long running tasks from the HMC interface and then log off from the session, the long running tasks continue to run in the background. However, when you log in again, a new session is created and the task progress panels (which helps track the progress of the previous tasks) are no longer available. In this scenario, if you need to check the progress of the tasks that were initiated from a previous session, you can run the respective command line interface (CLI) commands, check the state of the managed resource, or check the console event logs.

   Note: Some examples of long running tasks include the following tasks:

   System management for servers:

   - Deploy system plan
   - Code update
   - Hardware - Prepare for hot repair or upgrade

   System management for partitions:

- DLPAR memory in large units in the order of Terabytes
- Live Partition Mobility (LPM)
- Suspend or resume

HMC management:

- Backup management console data
- Restore management console data
- Save upgrade data

2. If you fail to reauthenticate within the time that is specified in the verify timeout settings, you are automatically logged off from the current session.
3. The idle timeout user property task is not functional. The HMC interface uses the default value of **0** for the idle timeout setting. If you set a different value for this setting, it is ignored.

   Note: Session, idle, and verify timeout properties are set for a user and it can be different for different users on the same HMC.

Version mismatch state for a managed system

The **Version mismatch** state can occur when the redundant or dual Hardware Management Consoles (HMCs) that manage the same server are at different version and release levels.

The **Version mismatch** state can occur for any of the following reasons:

- FSP firmware and HMC versions are incompatible.
- An HMC Version 7.7.8 or later is connected to a server that was managed by a newer version of the HMC.
- An HMC Version 7.7.8 or later is connected to a server that was managed by a lower version of the HMC and does not have enough space present to upgrade the data to HMC Version 7.7.8 or later.
- The hypervisor or server brand or model is not supported by this version of the HMC.

To recover from the **Version mismatch** state, select the appropriate action, depending on the reference code that is displayed:

- **Save Area Version Mismatch**

  HMC Version 7.7.8 and later blocks attempts to manage a server with a configuration at a newer level by posting a new **Connection error** state and reference code. If an HMC Version 7.7.8 or later is connected to a server that was managed by a newer version of the HMC that updated the configuration format, then the HMC reports a connection error of **Version mismatch** with the reference code **Save Area Version Mismatch**. This error prevents accidental corruption of the configuration.

  If you want to continue on a lower HMC version, then you must first initialize the server in the lower version of the HMC before you proceed to run any operation.

- **Profile Data Save Area is full**

  The HMC uses a storage area on each managed server to store the server configuration, primarily PowerVM partition profiles. HMC Version 7.8.0 and later increases the usage of the storage area by adding another (mostly hidden) profile for each partition. Servers that already contain many profiles might not have sufficient space to allow the HMC Version 7.8.0 and later to run properly.

  HMC Version 7.8.0 and later checks for sufficient space in this storage area and stops the connection process with a connection state of **Version mismatch** and a reference code of **Profile Data Save Area is full** if sufficient space does not exist.

- **Connecting 0000-0000-00000000 (Unsupported Hypervisor)**

  A connection state of **Version mismatch** and a reference code of **Connecting 0000-0000-00000000 (Unsupported Hypervisor)** is returned when the server is configured for a hypervisor other than PowerVM.

To recover from this state, first start the ASM by selecting the server with the **Version mismatch** and selecting **Operations** and then **Launch Advanced System Manager (ASM)**.

On models that support multiple hypervisors, the hypervisor mode setting can be found in the ASM by selecting **System Configuration** and then **Hypervisor Configuration**. The hypervisor mode shows a setting of either PowerVM or OPAL.

If OPAL is the wanted configuration, then you must remove this connection from the HMC by selecting **Connections** and then **Reset or Remove Connections**. Next, select **Remove Connections** and click **OK**.

Note: The OPAL hypervisor is not supported on the HMC.

If PowerVM is the wanted configuration, select **PowerVM** from the hypervisor mode menu and click **Continue**.

Note: The setting can be changed only when the server is powered off. To power off the server select **Power/Restart Control** and then **Power On/Off System**. Click **Save Settings and Power off** .

- **Connection not allowed**

  A connection state of **Version mismatch** and a reference code of **Connection not allowed 0009-0008-00000000** is returned when the FSP firmware and HMC versions are incompatible.

  To recover from this state, install an HMC version that supports the managed server model.

For more information about correction a **Version mismatch** state, see Version mismatch errors.

Systems Management for Servers

Systems Management displays tasks to manage servers and logical partitions. Use these tasks to set up, configure, view current status, troubleshoot, and apply solutions for servers.

These tasks are listed when a managed system is selected. The tasks listed in the menu pod change as selections are made in the work area.

System content pane

View and monitor the state, health, and capacity information of all the systems that are connected to the management console.

The content pane, in the middle portion of the window, displays all the available systems and the associated information for each server. You can choose to display the information in a table view or a gallery view.

Each system displays the current state of the system, the number of central processing units (CPUs) that are in use, CPUs that are available, the amount of random access memory (RAM) that is in use, and the RAM that is available. Additionally, if you choose a tabular format view, you can filter the information to be displayed by selecting the drop-down arrow in the upper-right corner of the table. Select the check box corresponding to the field that you want to display on the table. If you are using HMC Version 9.1.930, in the **All Systems** table, you can also view information about the activated and deferred firmware levels.

You can click the **properties** icon to display the following information:

- Current state
- Reference code
- Machine type
- Serial number
- System location
- Firmware level
- Group tags
- Attention LED

You can click the **capacity** icon to display the following information:

- Date of collection.
- Processor usage (installed, activated, available, average, and peak). The bar graph and the numerical value show the average usage (average divided by activated) in a percentage. The threshold line on the bar graph shows the peak threshold (peak divided by activated). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Memory allocation (installed, activated, available, average, and peak). The bar graph and the numerical value show the average usage (average divided by activated) in a percentage. The threshold line on the bar graph shows the peak threshold (peak divided by activated). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Network I/O usage (sent and received in kilobytes per second and in packets per second). The bar graph and the numerical value show the average usage ((average transferred bytes divided by the number of adapters) divided by the maximum transferred bytes) in a percentage. The threshold line on the bar graph shows the high threshold (maximum transferred bytes). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Storage I/O usage (written and read information in kilobytes per second). The bar graph and the numerical value show the average usage ((average transferred bytes divided by the number of adapters) divided by the maximum transferred bytes) in a percentage. The threshold line on the bar graph shows the high threshold (maximum transferred bytes). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Data collection.

You can hover over the systems in the **All systems** window to view the system model description.

Operations

Operations contains the tasks for operating managed systems.

Power Off

Shut down the managed system. Powering off the managed system will make all partitions unavailable until the system is again powered on.

Before you power off the managed system, ensure that all logical partitions have been shut down and that their states have changed from `Running` to `Not Activated`. For more information on shutting down a logical partition, see "Shut Down" on page 58

If you do not shut down all logical partitions on the managed system before you power off the managed system, the managed system shuts down each logical partition before the managed system itself powers off. This can cause a substantial delay in powering off the managed system, particularly if the logical partitions are not responsive. Further, the logical partitions might shut down abnormally, which could result in data loss and further delays when you activate the logical partitions once more.

Choose from the following options:

Normal power off

The Normal power off mode shuts down the system's operations in a controlled manner. During the shutdown, programs running active jobs are allowed to perform cleanup (end-of-job processing).

Fast power off

The Fast power off mode shuts down the system by stopping all active jobs immediately. The programs running those jobs are not allowed to perform any cleanup. Use this option when you need to shut down the system because of an urgent or critical situation.

Power On

Use the **Power On** task to start a managed system.

Choose from the following options to power on your managed system:

Normal: Select this option to specify that the HMC uses the current setting for the partition start policy to determine how to power on the managed system. The current setting can be one of the following values:

- **Auto-Start Always**: This option specifies that the HMC power on logical partitions automatically after the managed system powers on. If powering on the managed system is the result of a user action, the HMC starts all partitions that are configured for automatic startup. If powering on the managed system is the result of an automatic recovery process, the HMC starts only those logical partitions that were running at the time the system is powered off. This option is always available for selection.
- **Stop at Partition Standby**: This option specifies that logical partition startup is in standby mode after the managed system powers on and the HMC does not start any logical partitions when the managed system powers on. If powering on the managed system is the result of an automatic recovery process and the HMC is used to start a logical partition, the HMC starts all logical partitions that were running at the time the system is powered off. This option is available for selection only when the firmware for the managed system does not support advanced IPL capabilities.
- **Auto-Start for Auto-Recovery**: This option specifies that the HMC power on logical partitions automatically only after the managed system powers on as the result of an automatic recovery process. This option is available for selection only when the firmware for the managed system supports this advanced IPL capability.
- **User-Initiated**: This option specifies that the HMC does not start any logical partitions when the managed system powers on. You must start logical partitions manually on the managed system by using the HMC. This option is available for selection only when the firmware for the managed system supports this advanced IPL capability.

You can set the partition start policy from the **Power On Parameters** page of the **Properties** task for the managed system.

System profile: Selecting this power-on option specifies that the HMC power on the system and its logical partitions based on a predefined system profile. When you select this power-on option, you must select the partition profile that you want the HMC to use to activate logical partitions on the managed system.

Hardware Discovery: Selecting this power-on option specifies that the HMC run the hardware discovery process when the managed system powers on. The hardware discovery process captures information about all I/O devices, in particular those devices that are not currently assigned to partitions. When you select the hardware discovery **power on** option for a managed system, the managed system is powered on into a special mode that performs the hardware discovery. After the Hardware Discovery process is complete, the system will be in Operating state with any partitions in the power-off state. The hardware discovery process records the hardware inventory in a cache on the managed system. The collected information is then available for use when you display data for I/O devices or when you create a system plan based on the managed system. This option is available only if the system is capable of using the hardware discovery process to capture I/O hardware inventory for the managed system.

Power Management

You can reduce the processor power consumption of the managed system by enabling power saver mode.

About this task

To enable power saver mode, complete the following steps:

Procedure

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to enable the power saver mode and click **Actions** > **View All Actions**.
3. Select **Power Management** under **Operations**.
4. Choose from any of the following Power Saver mode options:
   - **Static**: Reduces the power consumption by reducing the processor clock frequency and the voltage to fixed values. This option delivers predictable performance while reducing the power consumption.

- **Dynamic Power Saver mode**: Delivers power savings by varying the processor frequency and voltage that is based on the utilization of the system processors. In Dynamic Power Saver Mode, the system firmware balances performance and power consumption.
- **Maximum Performance mode**: Causes the processor frequency to be set at a specified fixed value. You can set the maximum limit of the processor frequency and power consumption of the system.

Note: If you enable a Power Saver mode, processor frequencies, processor usage will change, and power consumption will change. It also causes varying performance.

5. You can also choose to enable or disable the **Idle Power Saver** mode. When it is enabled, it reduces the energy consumption when the system is in idle state.

   Note: Setting the Power Saver and Idle Power Saver modes are independent operations.

Schedule Operations

Create a schedule for certain operations to be performed on the managed system without operator assistance.

Scheduled operations are helpful for situations where automatic, delayed, or repetitious processing of system operations is necessary. A scheduled operation is started at a specified time, without operator assistance to perform the operation. A schedule can be set for one operation or repeated many times.

For example, you might schedule power on or off operations for a managed system.

The Scheduled Operations task displays the following information for each operation:

- The processor that is the object of the operation.
- The scheduled date
- The scheduled time
- The operation
- The number of remaining repetitions

From the **Scheduled Operations** window, you can perform the following tasks:

- Schedule an operation to run later.
- Define operations to repeat at regular intervals.
- Delete a previously scheduled operation.
- View details for a currently scheduled operation.
- View scheduled operations within a specified time range.
- Sort scheduled operations by date, operation, or managed system.

You can schedule an operation to occur once or you can schedule it to repeat. You must provide the time and date that you want the operation to occur. If you want the operation to repeat, you are asked to select the following options:

- The day or days of the week that you want the operation to occur. (optional)
- The interval, or time between each occurrence. (required)
- The total number of repetitions. (required)

The operations that you can schedule for the managed system include the following operations:

Activate on a System Profile
Schedules an operation on a selected system for scheduling activation of a selected system profile.

Backup Profile Data
Schedules an operation to back up profile data for a managed system.

Power Off Managed System
Schedules an operation for a system power off at regular intervals for a managed system.

Power On Managed System
Schedules an operation for a system power-on at regular intervals for a managed system.

Manage Utility CoD processors
Schedules an operation for managing how your Utility CoD processors are used.

Manage Utility CoD processor minute usage limit
Creates a limit for Utility CoD processor usage.

Modify a Shared Processor Pool
Schedules an operation for modifying a shared processor pool.

Move a partition to a different pool
Schedules an operation for moving a partition to a different processor pool.

Change power saver mode on a managed system
Schedules an operation for changing a managed system's power saver mode.

Monitor/Perform Dynamic Platform Optimize
Schedules an operation for performing dynamic platform optimization and for sending an email notification alert to a user.

To schedule operations on the managed system, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select one or more managed systems and click **Actions** > **Schedule Operations**.
3. From the **Scheduled Operations** window, click **Options** from the menu bar to display the next level of options:
   - To add a scheduled operation, click **Options** and then click **New**.
   - To delete a scheduled operation, select the operation that you want to delete, point to **Options** and then click **Delete**.
   - To update the list of scheduled operations with the current schedules for the selected objects, point to **Options** and then click **Refresh**.
   - To view a scheduled operation, select the operation that you want to view, point to **View** and then click **Schedule Details**.
   - To change the time of a scheduled operation, select the operation that you want to view, point to **View** and then click **New Time Range...**.
   - To sort the scheduled operations, point to **Sort** and then click one of the sort categories that appears.
4. To close the window, click **Options** and then click **Exit**.

Launch ASM Interface

The Hardware Management Console (HMC) can connect directly to the Advanced System Management Interface (ASMI) for a selected system.

The ASMI is an interface to the service processor that allows you to manage the operation of the server, such as auto power restart, and to view information about the server, such as the error log and vital product data.

To connect to the Advanced System Management Interface, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. In the content area, select one or more managed systems and click **Actions** > **View All Actions** > **Launch Advanced System Management (ASM)**.

Rebuild

You can extract the configuration information from the managed system and rebuild the information on the Hardware Management Console (HMC).

This task does not disrupt the operation of the running server.

Rebuilding the managed system updates the information on the HMC about the managed system. Rebuilding the managed system is useful when the state of the managed system is `Incomplete`. The Incomplete state means that the HMC cannot gather complete information from the managed system about logical partitions, profiles, or resources.

Rebuilding the managed system is different from refreshing the **HMC** window. When the managed system is rebuilt, the HMC extracts the information from the managed system. You cannot start other tasks while the HMC rebuilds the managed system. This process can take several minutes.

Change Password

Change the Hardware Management Console (HMC) access password on the selected managed system.

After the password is changed, you must update the HMC access password for all other HMCs from which you want to access this managed system.

Enter the current password and then, enter a new password and verify it by entering it again.

Attention LED

View system attention LED information, light specific LEDs to identify a system component, and test all LEDs on a managed system.

The system provides several LEDs that help identify various components, such as enclosures or field replaceable units (FRUs), in the system. For this reason, they are called **Identify** LEDs. Individual LEDs are on or near the components. The LEDs are located either on the component itself or on the carrier of the component (for example, memory card, fan, memory module, or processor). LEDs are either green or amber. Green LEDs indicate either of the following states:

- Electrical power is present.
- Activity is occurring on a link. (The system might be sending or receiving information).

Amber LEDs indicate a fault or identify condition. If your system or one of the components on your system has an amber LED turned on or flashing, identify the problem and take the appropriate action to restore the system back to normal.

You can activate or deactivate the following types of identify LEDs:

Identify LED for an enclosure
If you want to add an adapter to a specific drawer (enclosure), you need to know the machine type, model, and serial number (MTMS) of the drawer. To determine whether you have the correct MTMS for the drawer that needs the new adapter, you can activate the LED for a drawer and verify that the MTMS corresponds to the drawer that requires the new adapter.

Identify LED for a FRU associated with a specified enclosure
If you want to attach a cable to a specific I/O adapter, you can activate the LED for the adapter that is a field replaceable unit (FRU), and then physically verify where to attach the cable. This step can be especially useful when you have several adapters with open ports.

You can deactivate a system attention LED or a logical partition LED. For example, you might determine that a problem is not a high priority and decide to repair the problem later. However, you want to be alerted if another problem occurs, so you must deactivate the system attention LED so that it can be activated again if another problem occurs.

Choose from the following options:

Turn Attention LED Off
From this task, you can deactivate the system attention LED.

Identify Attention LED
Displays the current Identify LED states for all the location codes that are contained in the selected enclosure. From this task, you can select a single location code or multiple location codes to operate against and activate or deactivate one or more LEDs by selecting the corresponding button.

Test Attention LED

Initiates an LED Lamp Test against the selected system. All LEDs activate for several minutes.

Connections

You can view the Hardware Management Console (HMC) connection status to service processors or frames, reset those connections, connect another HMC to the selected managed system, or disconnect another HMC.

If you select a managed system in the work area, the following tasks pertain to that managed system. If you select a frame, the tasks pertain to that frame.

Service Processor Status

View information about the status of the Hardware Management Console (HMC) connection to the service processors on the managed system.

About this task

To show the service processor connection status to the service processors on the managed system, complete the following steps:

Procedure

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to view the service processor connection status and click **Actions** > **View All Actions** > **Service Processor Status**.

Reset or Remove Connections

Reset or remove a managed system from the Hardware Management Console (HMC) interface.

About this task

To reset or remove connections, complete the following steps:

Procedure

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server that you want to reset or remove and click **Actions** > **Reset or Remove System Connection**.
3. Select one of the options from **Reset Connection** or **Remove Connection** and click **OK**.

Disconnect Another HMC

You can disconnect a connection between a selected Hardware Management Console (HMC) and the managed server.

About this task

To disconnect another HMC, complete the following steps:

Procedure

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to disconnect another Management Console and click **Actions** > **View All Actions** > **Disconnect Another HMC**.
3. Select an HMC from the list and click **OK**.

System Templates

System templates contain configuration details for resources such as system properties, shared processor pools, reserved storage pool, shared memory pool, Host Ethernet adapters, and SR-IOV adapters. Many of the system settings that you previously configured by using separate tasks are available in the **Deploy System from Template** wizard. For example, you can configure the Virtual I/O Servers, virtual network bridges, and virtual storage settings when you use the wizard to deploy a system from a system template.

The template library includes predefined system templates, which contain configuration settings based on common usage scenarios. Predefined system templates are available for your immediate use.

You can also create custom system templates that contain configuration settings that are specific to your environment. You can create a custom template by copying a predefined template and changing it to fit your needs. Or, you can capture the configuration of an existing system and save the details in a template. Then, you can deploy that template to other systems that require the same configuration.

Deploy System from Template

You can deploy systems by using system templates that are available in the template library of the Hardware Management Console (HMC). The Deploy System from Template wizard guides you to provide target system-specific information that is required to complete the deployment of the selected system.

Create Partition from Template

You can create a partition by using partition templates that are available in the template library of the Hardware Management Console (HMC). The Create a Partition from Template wizard guides you through the deployment process and configuration steps.

Capture Configuration as Template

You can capture the configuration details of a running server and save the information as a custom system template by using the Hardware Management Console (HMC). This function is useful if you want to deploy multiple servers with the same configuration. If you want to use a predefined template, you do not need to complete this task.

To capture configuration as a template, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to view the system information and click **Actions** > **View All Actions**
3. Click **Capture Configuration as Template with Physical I/O** or **Capture Configuration as Template without Physical I/O**.
4. Enter a template name and description, and then click **OK**.

Use the online Help if you need additional information about capturing the configuration as a template.

Updates

Display tasks to view system information, manage updates on your Hardware Management Console (HMC), or check system readiness.

View System Information

Display information on a selected system from the Hardware Management Console (HMC).

To view the network topology, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to view the system information and click **Actions** > **Updates** > **View System Information**.

3. Select a LIC repository from the list and click **OK**.
4. When you have completed this task, click **Close**.

Use the online Help if you need additional information for viewing system information of the HMC.

Change Licensed Internal Code

Change the Licensed Internal Code of a managed system by using your Hardware Management Console (HMC).

You can change the Licensed Internal Code for the current release or to a new release.

To change the Licensed Internal Code, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to view the system information and click **Actions** > **Updates**.
3. Select **Change Licensed Internal Code** > **for the Current Release** or **Change Licensed Internal Code** > **to a New Release**.

   Note: Click **Start Change Licensed Internal Code** wizard to start a guided update of managed system, power, and I/O Licensed Internal Code (LIC). Click **View System Information** to examine current LIC levels, including retrievable levels. Click **Select Advanced Features** to update the managed system and power the LIC with more options and more targeting choices.
4. Select an action from the list and click **OK**.
5. When you complete this task, click **Close**.

Use the online Help if you need additional information for changing the Licensed Internal Code of the HMC.

Check System Readiness

Check the readiness of the Licensed Internal Code of a selected system from the Hardware Management Console (HMC).

To check system readiness, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to view the system information and click **Actions** > **Updates** > **Check System Readiness**.
3. When you have completed this task, click **OK**.

Use the online Help if you need additional information for checking system readiness of the HMC.

SR-IOV Firmware Update

Update the driver firmware for SR-IOV adapters on your Hardware Management Console (HMC).

Note: The adapter must be in shared mode.

To update the firmware for SR-IOV adapters, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to view the system information and click **Actions** > **Updates** > **SR-IOV Firmware Update**.
3. Select and right-click an adapter or adapters to get the context menu.
4. Select the type of firmware update to start.

   Note: Either the adapter driver firmware can be updated or both the adapter driver and adapter firmware can be updated. During the update operation of the adapter or adapter driver firmware, configured logical ports on the adapter might experience a temporary disruption of network traffic. Each adapter can take between 2 - 5 minutes to update. Updates are performed serially.

5. When you have completed this task, click **Close**.

Use the online Help if you need additional information for updating the driver or firmware for SR-IOV adapters.

Legacy

You can view **legacy** tasks that are available on the Hardware Management Console (HMC).

If you select a managed system in the work area, the following **legacy** tasks pertain to that managed system.

Partition Availability Priority

Use this task to specify the partition-availability priority of each logical partition on this managed system.

The managed system uses partition-availability priorities when a processor fails. If a processor fails on a logical partition and unassigned processors are not available on the managed system, then the logical partition can acquire a replacement processor from logical partitions with a lower partition-availability priority. This task allows the logical partition with the higher partition-availability priority to continue running after a processor failure.

You can change the partition availability priority for a partition by selecting a partition and by choosing an availability priority from the list.

Use the online Help if you need additional information about prioritizing partitions.

View Workload Management Groups

Display a detailed view of the workload management groups that you specify for the managed system.

Each group displays the total number of processors, processing units for partitions that use shared mode processing, and the total amount of memory that is allocated to the partitions in the group.

Manage System Profiles

A system profile is an ordered list of partition profiles that is used by the Hardware Management Console (HMC) to start the logical partitions on a managed system in a specific configuration.

When you activate the system profile, the managed system attempts to activate each partition profile in the system profile in the order specified. A system profile helps you to activate or change the managed system from one set of logical partition configurations to another.

You can create a system profile that has a partition profile with overcommitted resources. You can use the HMC to validate the system profile against the currently available system resources and against the total system resources. Validating your system profile ensures that your I/O devices and processing resources are not overcommitted, and it increases the likelihood that the system profile can be activated. The validation process estimates the amount of memory that is needed to activate all of the partition profiles in the system profile. A system profile can pass validation and yet not have enough memory to be activated.

Use this task to complete the following tasks:

- Create new system profiles.
- Create a copy of a system profile.
- Validate the resources that are specified in the system profile against the resources available on the managed system. The validation process indicates whether any of the logical partitions in the system profile are already active and whether the uncommitted resources on the managed system can meet the minimum resources that are specified in the partition profile.
- View the properties of a system profile. From this task, you can view or change an existing system profile.
- Delete a system profile.

- Activate a system profile. When you activate a system profile, the managed system attempts to activate the partition profiles in the order that is specified in the system profile.

Use the online Help if you need additional information about managing system profiles.

Manage Partition Data

A partition profile is a record on the HMC that specifies a possible configuration for a logical partition. When you activate a partition profile, the managed system attempts to start the logical partition by using the configuration information in the partition profile.

A partition profile specifies the wanted system resources for the logical partition and the minimum and maximum amounts of system resources that the logical partition can have. The system resources that are specified within a partition profile includes processors, memory, and I/O resources. The partition profile can also specify certain operating settings for the logical partition. For example, you can set a partition profile such that, when the partition profile is activated, the logical partition is set to start automatically the next time that you power on the managed system.

Each logical partition on a managed system that is managed by an HMC has at least one partition profile. You can create more partition profiles with different resource specifications for your logical partition. If you create multiple partition profiles, you can designate any partition profile on the logical partition to be the default partition profile. The HMC activates the default profile if you do not select a specific partition profile to be activated. Only one partition profile can be active at one time. To activate another partition profile for a logical partition, you must shut down the logical partition before you activate the other partition profile.

A partition profile is identified by partition ID and profile name. Partition IDs are whole numbers that are used to identify each logical partition that you create on a managed system, and profile names identify the partition profiles that you create for each logical partition. Each partition profile on a logical partition must have a unique profile name, but you can use a profile name for different logical partitions on a single managed system. For example, logical partition 1 cannot have more than one partition profile with a profile name of normal, but you can create a profile named normal for each logical partition on the managed system.

When you create a partition profile, the HMC shows you all of the resources available on your system. The HMC does not verify whether another partition profile is using a portion of these resources. Therefore, it is possible for you to overcommit resources. When you activate a profile, the system attempts to allocate the resources that you assigned to the profile. If you overcommit resources, the partition profile is not activated.

For example, you have four processors on your managed system. Partition 1 profile A has three processors, and partition 2 profile B has two processors. If you attempt to activate both of these partition profiles at the same time, partition 2 profile B fails to activate because you overcommitted processor resources.

When you shut down a logical partition and reactivate the logical partition by using a partition profile, the partition profile overlays the resource specifications of the logical partition with the resource specifications in the partition profile. Any resource changes that you made to the logical partition by using dynamic logical partitioning are lost when you reactivate the logical partition that uses a partition profile. This action is required when you want to undo dynamic logical partitioning changes for the logical partition. However, this action is not required if you want to reactivate the logical partition that uses the resource specifications that the logical partition had when you shut down the managed system. Therefore, keep your partition profiles up to date with the latest resource specifications. You can save the current configuration of the logical partition as a partition profile. This task avoids having to change partition profiles manually.

If you shut down a logical partition whose partition profiles are not up to date, and if the logical partition is set to start automatically when the managed system starts, you can preserve the resource specifications on that logical partition by restarting the entire managed system by using the partition autostart power-on mode. When the logical partitions start automatically, the logical partitions have the resource specifications that the logical partitions had when you shut down the managed system.

Use the Manage Partition Data tasks to complete the following tasks:

- Restore partition data. If you lose partition profile data, use the restore task in one of the following ways:
  - Restore partition data from a backup file. Profile modifications that are completed after the selected backup file was created are lost.
  - Restore merged data from your backup file and recent profile activity. The data in the backup file takes priority over recent profile activity if the information conflicts.
  - Restore merged data from recent profile activity and your backup file. The data from recent profile activity takes priority over your backup file if the information conflicts.
- Initialize partition data. Initializing the partition data for a managed system deletes all of the currently defined system profiles, partitions, and partition profiles.
- Back up a partition profile to a file.
- Back up partition data to a file.

Use the online Help if you need additional information about managing partition data.

Utilization Data

You can set the Hardware Management Console (HMC) to collect resource utilization data for a specific managed system or for all systems the HMC manages.

The HMC collects utilization data for memory and processor resources. You can use this data to analyze trends and make resource adjustments. The data is collected into records that are called events. Events are created at the following times:

- At periodic intervals (30 seconds, 1 minute, 5 minutes, 30 minutes, hourly, daily, and monthly).
- When you make system-level and partition-level state and configuration changes that affect resource utilization.
- When you start, shut down, and change the local time on the HMC.

You must set the HMC to collect utilization data for a managed system before utilization data can display for the managed system.

Use the **Change Sampling Rate** task to enable, set and change the sampling rate, or to disable sampling collection.

Create Partition

You can quickly create partitions with minimum resources.

To create a partition, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to create a partition and click **Actions** > **View System Partitions**.
3. Click **Create Partition**.
4. Complete the required information in the **Basic Partition Configuration**, **Processor Configuration**, and **Memory Configuration** tabs. If you want to assign all the system resources to the partition, select the **Assign all system resources** check box.
5. To create multiple partitions, move the slider to the right and select the **Multiple Partitions View**.
6. To add a new partition definition, click the **(+)** sign located on the top of the partition table.
7. Select the added partition and complete the required information in the **Basic Partition Configuration**, **Processor Configuration**, and **Memory Configuration** tabs. In the **Basic Partition Configuration** tab, you can provide details about the number of partition instances that you want to create. You can create a maximum of 20 partition instances.
8. To remove an existing partition, select the partition that you want to remove and click the **(-)** sign.

9. Click **OK**.

Use the online Help if you need additional information about this task.

Note: If the managed system supports virtual serial number and if the managed system is not in an Enterprise Pool 2.0, the **Virtual Serial Number** can be specified in the **Basic Partition Configuration** tab.

When the firmware level is at FW950 and the managed system has logical partitions that are assigned with virtual serial numbers, the managed system cannot be added to an Enterprise Pool 2.0. Also, if the managed system is in an Enterprise Pool 2.0, virtual serial number cannot be assigned to the logical partitions.

Properties

Displays the properties of the selected managed system. This information is useful in system and partition planning and resource allocation.

To open the properties tasks that are available for your system, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Properties** and then select the properties task that you want to perform from the list.

General Settings

View or change the general and advanced settings for the managed system.

These properties include the following tabs:

General Properties

The **General Properties** tab displays the system's name, serial number, model and type, state, attention led state, service processor version, maximum number of partitions, assigned service partition (if designated), and power off policy information.

Migration

View the partition mobility properties and change the migration policy for inactive partitions on the managed system.

Power-On Parameters

From the **Power-On Parameters** tab, you can change the power-on parameters for the next restart by changing the values in the **Next Value** fields. These changes are only valid for the next managed system restart.

Advanced

The **Advanced** tab displays huge page memory capabilities on the managed system, including available huge page memory, configurable huge page memory, current page size, and current maximum huge page memory. To change memory allocation on systems with huge page table support, set the Requested huge page memory (in pages) field to the wanted memory. To change the requested value for huge page memory, the system must be powered off.

The **Barrier Synchronization Register (BSR)** option displays array information.

The **Processor Performance** option displays the TurboCore mode and the System Partition Processor Limit (SPPL). You can set the next TurboCore mode and the next SPPL value. The SPPL applies to both dedicated processor partitions and shared processor partitions.

The **Memory Mirroring** option displays the current mirroring mode and the current system firmware mirroring status. You can set the next mirroring mode. You can also start the memory optimization tool.

You can view the VTPM settings.

Processor, Memory, I/O

View or change the memory, processor, and physical I/O resource settings for the managed system.

These properties include the following tabs:

Processor

The **Processor** tab displays information about the processors of the managed system, which includes:

- installed processing units
- unconfigured processing units
- available processor units
- available with stealable processor units
- configurable processing units
- minimum number of processing units per virtual processor
- maximum number of shared processor pools

The **Available with stealable** field displays the information about the available processing units, which is the sum of the available processing units in the managed system and the number of stealable processing units.

The stealable processor units value is the sum of the processor resources that are assigned to all the powered off or hibernated partitions on the managed system.

Notes:

- The information about stealable processor units is available only when the managed system is in the standby state or in the operating state.
- If the managed system is licensed with Power® IFL processor and if the firmware level is at FW910, or later, the **Available (with stealable)** field is displayed.
- When a Power10 system is licensed with some IFL processors, the tab also displays the information about the remaining processors that are available for running the AIX or IBM i partitions.

Memory

The **Memory** tab displays information about the memory of the managed system, which includes:

- installed memory
- unconfigured memory
- available memory
- available with stealable memory
- configurable memory
- memory region size with `Current Value` and `Next Value` fields that specify the current and next available value.

  Note: You can change the size of the Logical Memory Block (LMB) by changing the values in the `Next Value` field. The changes of this field are applied only after the next managed system restart.
- current memory available for partition usage
- system firmware current memory

The **Available with stealable** field displays the information about the available memory, which is the sum of available memory in the managed system and the amount of stealable memory resources. The tab also displays the maximum number of memory pools that are available.

Note: The information about stealable memory resources is available only when the managed system is in the standby state or in the operating state.

Physical I/O adapters

The **Physical I/O Adapters** tab displays the physical I/O resources for the managed system. The assignment of I/O slots and partition, the adapter-type, and the slot LP limit information are displayed. The physical I/O resources information is grouped by units.

- The **Adapter Description** column displays the physical description of each resource.
- The **Physical Location Code** column displays the physical location code of each resource.
- The **Owner** column displays who currently owns the physical I/O. The value of this column can be any of the following values:
  - When a single root I/O virtualization (SR-IOV) adapter is in the shared mode, **Hypervisor** is displayed in this column.
  - When an SR-IOV adapter is in the dedicated mode, **Unassigned** is displayed when the adapter is not assigned to any partition as a dedicated physical I/O.
  - When an SR-IOV adapter is in the dedicated mode, the logical partition name is displayed when the adapter is assigned to any logical partition as a dedicated physical I/O.
- The **Bus Number** column displays the bus number of the resource.
- The **I/O Pools** button displays all of the I/O pools found in the system and the partitions that are participating in the pools.

Persistent Memory

The **Persistent Memory** tab displays details about the Virtual Persistent Memory and Hybrid Memory Subsystem (devices or volumes) of the managed system.

Hybrid Memory Subsystem (HMS)

The **HMS** pane displays all the persistent memory devices and persistent memory volumes of the managed system.

The **Persistent Memory Devices** table displays information about the persistent memory devices, which includes:

- **Location code**: Displays the location code of the persistent memory device.
- **Status**: Indicates whether the persistent memory device is functional.
- **Device**: Displays the device unique ID of the persistent memory device.
- **Block size**: Displays the block size of the persistent memory device.
- **Available size**: Displays the available size of the persistent memory device.
- **Total size**: Displays the total size of the persistent memory device.
- **Erase Capable**: Indicates whether the HMS device supports initiating the Erase operation for the persistent memory device data.
- **Serial number**: Displays the serial number of the persistent memory device.
- **WWID**: Displays the worldwide ID of the persistent memory device.
- **Current volumes**: Displays the current size of the HMS volume that is allocated from the HMS device.
- **Maximum volumes**: Displays the maximum volume size that can be allocated to the persistent memory device.

You can perform the following operations on a persistent memory device of the managed system:

- To create volume for a persistent memory device, select a persistent memory device from the **Persistent Memory Devices** table and then click **Action** > **Create Volume**.
- To format a persistent memory device, select a persistent memory device from the **Persistent Memory Devices** table and then click **Action** > **Format**.
- To format and restore a persistent memory device, select a persistent memory device from the **Persistent Memory Devices** table and then click **Action** > **Format and Restore**.

- To initiate erase for a persistent memory device, select a persistent memory device displayed in the **Persistent Memory Devices** table and click **Action** > **Initiate Erase**.

The **Persistent Memory Volumes** table displays information about Persistent Memory (PMEM) volumes that are associated with the persistent memory device, which includes:

- **Name**: Displays the name of the persistent memory volume.
- **Size**: Displays the total size of the persistent memory volume.
- **Assigned partition**: Displays the name of the logical partition that is assigned to the persistent memory volume.
- **WWID**: Displays the worldwide ID of the persistent memory volume.
- **Current size**: Displays the current size of a HMS volume that is allocated from the HMS device.
- **Device**: Displays the device unique ID of the persistent memory device that is associated with the persistent memory volume
- **In use**: Indicates whether the persistent memory volume is active.

You can perform the following operations on a persistent memory volume that is associated with the persistent memory device:

- To modify a persistent memory volume, select a persistent memory volume from the **Persistent Memory Volumes** table and then click **Action** > **Modify**.
- To format a persistent memory volume, select a persistent memory volume from the **Persistent Memory Volumes** table and then click **Action** > **Format**.
- To delete a persistent memory volume, select a persistent memory volume from the **Persistent Memory Volumes** table and then click **Action** > **Delete**.

Virtual Persistent Memory

The **Virtual Persistent Memory** pane displays information about the persistent memory volumes, which includes:

- **Name**: Displays the name of the virtual persistent memory.
- **Size**: Displays the size of the virtual persistent memory.
- **Assigned partition**: Displays the name of the logical partition that is associated with the virtual persistent memory.
- **Current size**: Displays the size of the volume that is allocated to the virtual persistent memory from the total volume size.
- **Affinity**: Indicates whether the virtual persistent memory is internally divided into multiple smaller virtual persistent memory.

PowerVM

You can use the PowerVM function on the Hardware Management Console (HMC) to manage the system-level virtualization capabilities of your IBM Power Systems servers.

You can use the PowerVM task to manage virtual resources that are associated with a system, such as configuring a Virtual I/O Server (VIOS), virtual networks, and virtual storage. You can manage the PowerVM functions at the managed system level in response to changes in workloads or to enhance performance.

The PowerVM functions include the following tasks:

- Managing Virtual I/O Servers
- Managing virtual networks
- Managing virtual storage
- Managing hardware virtualized I/O (SR-IOV adapters)
- Managing a reserved processor pool
- Managing shared processor pools

- Managing a shared memory pool

Use the online Help if you need additional information about managing PowerVM.

Capacity on Demand

Activate disabled processors or memory that is installed on your managed server.

You can use Capacity on Demand (CoD) to nondisruptively activate (no startup needed) processors and memory. Capacity on Demand also gives you the option to temporarily activate capacity to meet intermittent performance needs, to activate extra capacity on a trial basis, and to access capacity to support operations in times of need.

Capacity on Demand Functions

Learn about the different Capacity on Demand functions that are available for your system.

You can use Capacity on Demand (CoD) to nondisruptively activate (no startup needed) processors and memory. Capacity on Demand also gives you the option to temporarily activate capacity to meet intermittent performance needs, to activate extra capacity on a trial basis, and to access capacity to support operations in times of need.

The **Capacity on Demand Processor** functions include the following tasks:

- View processor settings
- CUoD (permanent) processor
  - View CUoD code information
- On/Off processor
  - Manage
  - View billing information
  - View capacity settings
  - View code information
- Utility processor
  - Manage
  - View capacity settings
  - View code information
  - View shared processor utilization
- Trial processor
  - Stop trial
  - View capacity settings
  - View code information

The **Capacity on Demand Memory** functions include the following tasks:

- View memory settings
- CUoD (permanent) memory
  - View CUoD code information
- On/Off memory
  - Manage
  - View billing information
  - View capacity settings
  - View code information

- Trial memory
  - Stop trial
  - View capacity settings
  - View code information

Use the online Help if you need additional information about Capacity on Demand functions.

Licensed Capabilities

View and edit the runtime capabilities that are supported by the managed system.

You can view which licensed capabilities are active on your managed system. To activate a new licensed capability, click **Enter Activation Code** and enter the activation code.

The licensed functions that are available on the managed system include the following capabilities:

- Active Memory Sharing Capable
- Live Partition Mobility Capable
- Micro-Partitioning® Capable
- PowerVM Partition Simplified Remote Restart Capable
- SR-IOV Capable (Logical Port Limit)
- Virtual I/O Server Capable
- Active Memory Expansion Capable
- Active Memory Mirroring for Hypervisor Capable
- Coherent Accelerator Processor Interface (CAPI)
- AIX Enablement for 256-Core Partition Capable
- Dynamic Platform Optimization Capable
- IBM i 5250 Application Capable

Use the online Help if you need additional information about licensed capabilities.

Serviceability

Problem Analysis on the HMC automatically detects error conditions and reports to you any problem that requires service to repair it.

These problems are reported to you as serviceable events. Use the **Serviceable Events Manager** task to view specific events for selected systems. However, if you notice a problem occurred or you suspect a problem is affecting the system but Problem Analysis has not reported it to you, use the **Create Serviceable Event** task to report the problem to your service provider.

To open the serviceability tasks that are available for your system, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Serviceability** and then click **Serviceability**.
4. Select the serviceability task that you want to perform from the list.

Tasks Log

View all the tasks that are currently running or completed on the Hardware Management Console (HMC).

To view the tasks log, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Tasks Log**.
2. You can view the following tabs in the tasks log:

- **Task name**: Displays the name of task.
- **Status**: Displays the current state of the task (running or completed).
- **Resource**: Displays the name of the resource.
- **Resource type**: Displays the type of resource.
- **Initiator**: Displays the name of the user that initiated the task.
- **Start time**: Displays the time that the task was initiated.
- **Duration**: Displays the amount of time that the task took to complete.

Use the online Help for additional information about viewing the tasks log.

Serviceability

Problem Analysis on the Hardware Management Console (HMC) automatically detects error conditions and reports to you any problem that requires service to repair it.

These problems are reported to you as serviceable events. Use the **Serviceable Events Manager** task to view specific events for selected systems. However, if you notice a problem occurred or you suspect a problem is affecting the system but Problem Analysis has not reported it to you, use the **Create Serviceable Event** task to report the problem to your service provider.

To open the serviceability tasks that are available for your system, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Serviceability** and then click **Serviceability**.
4. Select the serviceability task that you want to perform from the list.

Serviceable Events Manager

Problems on your managed system are reported to the Hardware Management Console (HMC) as serviceable events. You can view the problem, manage problem data, call home the event to your service provider, or repair the problem.

To set the criteria for the serviceable events you to view, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage serviceable events.
3. In the menu pod, expand **Serviceability** and then click **Serviceability**.
4. Click **Serviceable Events Manager**.
5. Provide event criteria, error criteria, and FRU criteria. If you do not want the results to be filtered, select **ALL**. Click **Refresh** to refresh the list of serviceable events based on the criteria filter values.

The **Serviceable Events Overview** window displays all of the events that match your criteria. The information that is displayed in the compact table view includes the following information:

- Problem Number
- PMH Number
- Reference Code - Click the Reference code to display a description of the problem reported and actions that can be taken to fix the problem.
- Status of the problem
- Last reported time of the problem
- Failing MTMS of the problem
- Originating HMC

The full table view includes more detailed information, including reporting partition ID, primary data event timestamp, duplicate count, notification type, first reported time, reporting name, reporting MTMS, firmware fix, and serviceable event text.

Select a serviceable event and use the **Action** menu to:

- **View Details**: Field-replaceable units (FRUs) associated with this event and their descriptions.
- **View Files**: View the files associated with the selected serviceable event.
- **View Reference Code Description**: View the description of the reference code associated with the selected serviceable event. The option will not be available if additional description is not available.
- **Call Home**: Report the event to your service provider.
- **Repair**: Start a guided repair procedure, if available.
- **Close Event**: After the problem is solved, add comments and close the event.
- **Add PMH Comment**: Add a comment to a PMH for a selected serviceable event. If a PMH number does not exist for a given problem, the Add PMH Comment option is not available.

Use the online Help if you need additional information on managing serviceable events.

Create Serviceable Event

This task reports problems that occurred on your Hardware Management Console (HMC) to the service provider (for example, the mouse does not work) or lets you test problem reporting.

Submitting a problem is dependent upon whether you have customized this Hardware Management Console to use the Remote Support Facility (RSF) and if it is authorized to automatically call for service. If so, the problem information and service request is sent to the service provider automatically with a modem transmission.

To report a problem on your Hardware Management Console, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Create Serviceable Event**.
3. From the **Create Serviceable Event** window, select a problem type from the list displayed.
4. Enter a brief description of your problem in the **Problem Description** input field and then click **Request Service**.

To test problem reporting from the **Report a Problem** window:

1. Select **Test automatic problem reporting** and enter *This is just a test* in the **Problem Description** input field.
2. Click **Request Service**. The problems are reported to the service provider for the Hardware Management Console. Reporting a problem sends to the service provider the information you provide on **Report a Problem** window, and machine information that identifies the console.

Use the online Help if you need additional information for reporting a problem or testing if problem reporting works.

Manage Dumps

Manage system, service processor, and power subsystem dumps for systems that are managed by the Hardware Management Console (HMC).

system dump
A collection of data from server hardware and firmware, either after a system failure or a manual request. Perform a system dump only under the direction of your next level of support or your service provider.

service processor dump
A collection of data from a service processor either after a failure, external reset, or manual request.

power subsystem dump

A collection of data from Bulk Power Control service processor. This process is only applicable to certain models of managed systems.

Use the **Manage Dump** task to complete the following tasks:

- Initiate a system dump, a service processor dump, or a power subsystem dump.
- Modify the dump capability parameters for a dump type before you initiate a dump.
- Delete a dump.
- Copy a dump to media.
- Copy a dump to another system by using file transfer protocol (FTP).
- Call home a dump by using the Call Home feature to transmit the dump back to your service provider, for example IBM Remote Support, for further analysis.
- View the offload status of a dump as it progresses.

Use the online Help if you need additional information for managing dumps.

Collect VPD

Copy Vital Product Data (VPD) to removable media.

The managed system has VPD that is stored internally. The VPD consists of information such as how much memory is installed, and how many processors are installed. These records can provide valuable information that can be used by remote service and service representatives so that they can help you keep the firmware and software on your managed system up to date.

Note: To collect VPD, you must have at least one operational partition. For more information, see Logical Partitioning.

The information in the VPD file can be used to complete the following types of orders for your managed system:

- Install or remove a sales feature.
- Upgrade or rollback a model.
- Upgrade or rollback a feature.

Using this task, this information can be sent to removable media (diskette or memory key) for use by you or your service provider.

Use the online Help if you need additional information for collecting VPD.

Type, Model, Feature

Edit or display the model, type, machine type model serial (MTMS), or configuration ID of an enclosure.

The MTMS value or configuration ID for an expansion unit might need to be edited during a replacement procedure.

Use the online Help if you need additional information for editing MTMS.

Hardware Operations

Add, exchange, or remove hardware from the managed system. Display a list of installed FRUs or enclosures and their locations. Select a FRU or an enclosure and launch a step-by-step procedure to add, exchange, or remove the unit.

To open the hardware tasks that are available for your system, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage hardware tasks.
3. In the menu pod, expand **Serviceability** and then click **Serviceability**.
4. Select the hardware operations task that you want to perform from the list.

Prepare for Hot Repair or Upgrade
Provides a summary of required actions to be performed to isolate a particular hardware component as part of a service procedure.

From the **Component List** table, you can select the component to be repaired using the location code on the system to be repaired as directed by an Authorized Service Representative.

Power On/Off Unit
Use the **Power On/Off Unit** task to power on or off an I/O unit.

Only units or slots that reside in a power domain can be powered on or off. The corresponding power on/off buttons are disabled for location codes that are not controllable by the HMC.

Add FRU
Locate and add a Field Replaceable Unit (FRU).

To add a FRU to a POWER10 system, complete the following steps:

1. Select an enclosure type from the **Enclosure** menu.
2. Select a FRU type from the displayed list of FRU types for this enclosure, and click **Next**.
3. Select a FRU location, then click **Next** to start the Add FRU procedure for the selected location.
4. Follow the **Procedure** details listed in the window. The **Operation** list displays the correct operations for the procedure that you want to execute. The procedures direct when to perform each operation. Wait until advised to perform the operation before selecting the operation in the **Operation** list. Click **Next** to continue to the next service procedure.

   Note: Select the FRU location image on the header to display the location of the part to be serviced. To see a larger version of the FRU location image in a separate window, click **Display FRU Location**.
5. Click **Finish** to end the service when you have completed the last service procedure.

When the managed system is a POWER8® or earlier, to add a FRU, complete the following steps:

1. Select an enclosure type from the **Add FRU** menu.
2. Select a FRU type from the menu.
3. Click **Next**.
4. Select a location code from the displayed menu.
5. Click **Add**.
6. Click **Launch Procedure**.
7. When you complete the FRU installation process, click **Finish**.

Exchange FRU
Use the **Exchange FRU** task to exchange one field replaceable unit (FRU) with another FRU.

When the managed system is a POWER10 or later, to exchange a FRU, complete the following steps:

1. Select an installed enclosure type from the **Enclosure** menu.
2. Select a FRU type to be replaced, from the displayed list of FRU types for this enclosure and click **Next**.
3. Select a installed FRU location, then click **Next** to start the Exchange / Replace FRU procedure for the selected FRU.
4. Follow the **Procedure** details listed in the window. The **Operation** list displays the correct operations for the procedure that you want to execute. The procedures direct when to perform each operation. Wait until advised to perform the operation before selecting the operation in the **Operation** list. Click **Next** to continue to the next service procedure.

   Note: Select the FRU location image on the header to display the location of the part to be serviced. To see a larger version of the FRU location image in a separate window, click **Display FRU Location**.
5. Click **Finish** when you complete the exchange procedure.

When the managed system is a POWER8 or earlier, to exchange a FRU, complete the following steps:

1. Select an installed enclosure type from the **Exchange FRU** menu.
2. From the displayed list of FRU types for this enclosure, select a FRU type.
3. Click **Next** to display a list of locations for the FRU type.
4. Select a location code for a specific FRU.
5. Click **Add** to add the FRU location to **Pending Actions**.
6. Select **Launch Procedure** to begin replacing the FRUs that are listed in **Pending Actions**.
7. Click **Finish** when you complete the installation.

Remove FRU
Use the **Remove FRU** task to remove a FRU from your managed system.

When the managed system is a POWER10 or later, to remove a FRU, complete the following steps:

1. Select an enclosure from the menu to display a list of FRU types that are currently installed in the selected enclosure.
2. Select a FRU type from the displayed list of FRU types available for removal from the selected system and click **Next**.
3. Select a FRU location, then click **Next** to start the Remove FRU procedure for the selected FRU .
4. Follow the **Procedure** details listed in the window. The **Operation** list displays the correct operations for the procedure you want to execute. The procedures direct when to perform each operation. Wait until advised to perform the operation before selecting the operation in the **Operation** list. Click **Next** to continue to the next service procedure.

   Note: Select the FRU location image on the header to display the location of the part to be serviced. To see a larger version of the FRU location image in a separate window, click **Display FRU Location**.
5. Click **Finish** when you complete the removal procedure.

When the managed system is a POWER8 or earlier, to remove a FRU, complete the following steps:

1. Select an enclosure from the menu to display a list FRU types that are currently installed in the selected enclosure.
2. From the displayed list of FRU types for this enclosure, select a FRU type.
3. Click **Next** to display a list of locations for the FRU type.
4. Select a location code for a specific FRU.
5. Click **Add** to add the FRU location to **Pending Actions**.
6. Select **Launch Procedure** to begin removing the FRUs listed in **Pending Actions**.
7. Click **Finish** when you complete the removal procedure.

Add Enclosure
Learn how to locate and add an enclosure.

To add an enclosure, complete the following steps:

1. Select an enclosure type, then click **Add**.
2. Click **Launch Procedure**.
3. When you complete the enclosure installation process, click **Finish**.

Remove Enclosure
Use the **Remove Enclosure** task to remove an enclosure.

To remove an enclosure, complete the following steps:

1. Select an enclosure type, then click **Add** to add the selected enclosure type's location code to **Pending Actions**.
2. Click **Launch Procedure** to begin removing the enclosures that are identified in **Pending Actions** from the selected system.

3. Click **Finish** when you complete the enclosure removal process.

Open MES
View MES order numbers and their states, for any MES operations active or inactive for the Hardware Management Console (HMC).

Use **Add MES Order Number** to add a new order number to the list. To add an order number, complete the following steps:

1. Click **Add MES Order Number**.
2. Enter new MES order number.
3. Click **OK**.

Close MES
Close MES order numbers.

Use **Close MES** to close a MES. To close a MES, complete the following steps:

1. Select an open MES order number from the table.
2. Click **OK**.

Setup FSP Failover
Set up a secondary service processor if your managed system's primary service processor fails.

FSP Failover is designed to reduce customer outages due to service processor hardware failures. If a redundant service processor is supported for the current system configuration, select **Setup** to set up FSP Failover for the selected managed system.

To set up the FSP failover, complete the following steps:

1. In the content pane under **FSP failover**, click **Setup**.
2. Click **OK** to enable automatic failover for the selected system.

Initiate FSP Failover
Initiate a secondary service processor if your managed system's primary service processor fails.

FSP Failover is designed to reduce customer outages due to service processor hardware failures. Select **Initiate** to start the FSP Failover for the selected managed system.

To start the FSP failover, complete the following steps:

1. In the content pane under **FSP failover**, click **Initiate**.
2. Click **OK** to start the automatic failover for the selected system.

Reference Code Log

Reference codes provide general diagnostic, troubleshooting, and debugging information.

View reference codes that are generated for the selected managed system. Reference codes are diagnostic aids that help you determine the source of a hardware or operating system problem.

To view the reference code history, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Serviceability** and then click **Reference Code Log**.
4. Select a specific reference code to view the details.

Use the online Help if you need additional information about this task.

RIO Configuration

View the current hardware topology and the last valid hardware topology.

Displays the current hardware and last valid hardware topology. Any discrepancies between the current topology and the last valid topology are identified as errors.

To view the hardware topology, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Serviceability** and then click **RIO Configuration**.
4. View the hardware topology information.

Use the online Help if you need additional information about this task.

PCI Configuration

View information about the Peripheral Component Interconnect Express (PCIe) hardware topology.

The PCIe hardware topology utility provides information about the PCIe links that exist for each system.

To view the PCIe hardware topology, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Serviceability** and then click **PCI Configuration**.
4. View the PCIe hardware topology.

Use the online Help if you need additional information about this task.

Topology diagrams

Learn how to view the topology diagrams of a partition.

You can use the Hardware Management Console (HMC) to view the topology diagrams of a partition.

Viewing virtual networking diagrams

You can view the end-to-end network configuration for the selected system, by using the Hardware Management Console (HMC). The view of the virtual networks begins with the physical adapter cards and the physical ports that are connected to them. As you scroll down, you can see the defined virtual bridges, link aggregation devices, virtual switches, virtual networks, and partitions in the VIOS.

You can click a resource and drag to pan across the diagram. You can also double-click a resource to highlight that resource and the relationship between its various virtual and physical components in the network. To remove the highlighting, double-click in an empty area of the network diagram. To view more detailed information about a resource, you can right-click a resource and additional information is displayed in a click card. Alternatively, you can hover over the label of a resource area to display the name of the resource as a tooltip.

To view the end-to-end network configuration for the selected system by using the HMC, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Topology** and then click **Virtual Networking Diagram**.
4. Right-click a resource for the selected system to view more detailed information in a click card. You can also hover over the label of a resource area to display the name of the resource as a tooltip.

5. In the upper-right corner of the work pane, click the **zoom in** and **zoom out** icons to achieve the required level of magnification.

   Note: You can also zoom in and zoom out by using the scroll wheel on the mouse from within the diagram.
6. In the upper-right corner of the work pane, click the **Legend** icon to view an explanation of the symbols that are used in the virtual networking diagram.

Use the online Help if you need additional information about this task.

Viewing virtual storage diagrams

Two types of virtual storage diagrams are available; systems storage and partition storage. You can view the virtual storage configuration for the selected system, including the physical and virtual components of system storage, by using the HMC. You can also view the virtual storage configuration for a single partition in a particular system, including the physical and virtual components of storage assigned to that particular partition, by using the Hardware Management Console (HMC).

This diagram displays a high-level overview of the contents of the system or a single partition, and not specific component relationships. You can click a resource and drag to pan across the diagram. You can also double-click a resource to highlight that resource and the relationship between its various virtual and physical components in the network. To remove the highlighting, double-click in an empty area of the storage diagram. To view more detailed information about a resource, you can right-click a resource and additional information is displayed in a click card. Alternatively, you can hover over the label of a resource area to display the name of the resource as a tooltip.

To view the virtual storage configuration for the selected system or a single partition by using the HMC, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Topology** and then click **Virtual Storage Diagram**.

   Note: To view the virtual storage diagrams of a single partition in a particular system, select the partition of your choice and then expand **Topology** and click **Partition Virtual Storage Diagram**
4. Right-click a resource for the selected system to view more detailed information in a click card. You can also hover over the label of a resource area to display the name of the resource as a tooltip.
5. In the upper-right corner of the work pane, click the **zoom in** and **zoom out** icons to achieve the required level of magnification.

   Note: You can also zoom in and zoom out by using the scroll wheel on the mouse from within the diagram.
6. In the upper-right corner of the work pane, click the **Legend** icon to view an explanation of the symbols that are used in the virtual storage diagram.

Use the online Help if you need additional information about this task.

Viewing SR-IOV and vNIC diagrams

You can view the SR-IOV and virtual Network Interface Controllers (vNIC) configuration for the selected system, including the physical and virtual components, by using the Hardware Management Console (HMC).

This diagram displays the relationships between SR-IOV adapters and other virtual components, such as vNIC. You can click a resource and drag to pan across the diagram. You can also double-click a resource to highlight that resource and the relationship between its various virtual and physical components in the network. To remove the highlighting, double-click in an empty area of the SR-IOV and vNIC diagram. To view more detailed information about a resource, you can right-click a resource and additional information is displayed in a click card. Alternatively, you can hover over the label of a resource area to display the name of the resource as a tooltip.

To view the end-to-end network configuration for the selected system by using the HMC, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage serviceability tasks and click **Actions** > **View System Partitions**.
3. In the menu pod, expand **Topology** and then click **SR-IOV vNIC Diagram**.
4. Right-click a resource for the selected system to view more detailed information in a click card. You can also hover over the label of a resource area to display the name of the resource as a tooltip.
5. In the upper-right corner of the work pane, click the **zoom in** and **zoom out** icons to achieve the required level of magnification.

   Note: You can also zoom in and zoom out by using the scroll wheel on the mouse from within the diagram.
6. In the upper-right corner of the work pane, click the **Legend** icon to view an explanation of the symbols that are used in the SR-IOV and vNIC diagram.

Use the online Help if you need additional information about this task.

Systems Management for Partitions

Systems Management displays tasks that you can perform to manage servers and logical partitions. Use these tasks to set up, configure, view current status, troubleshoot, and apply solutions for partitions.

The following sets of tasks are represented when a partition is selected and is shown in the menu pod or content pane. The tasks that are listed in the menu pod change as selections are made in the work area.

Partition content pane

View and monitor the state, health, and capacity information of all the partitions that are connected to the management console.

The content pane, in the middle portion of the window, displays all the available partition and the associated information for each partition.

Each partition displays the current state of the partition, the reference code, the number of virtual processors that are allocated, and the amount of random access memory (RAM) that is allocated. Additionally, if you choose a tabular format view, you can filter the information to be displayed by selecting the drop-down arrow in the upper-right corner of the table. Select the check box corresponding to the field that you want to display on the table. If you are using HMC Version 9.1.930, or later, in the **All partition** table, you can also view the memory mode of all partitions that are associated with the managed system.

You can click the **properties** icon to display the following information:

- Current state
- System name
- Reference code
- Partition ID
- IP address
- Environment
- OS version
- RMC connection
- Last activated profile
- Contains physical I/O
- Group tags

- Attention LED

You can click the **capacity** icon to display the following information:

- Date of collection.
- Processor usage (type (dedicated, uncapped, or capped), entitled capacity, and virtual processors). When the processor type is dedicated, the bar graph and the numerical value show the used processor usage (used divided by assigned) in a percentage. The threshold line on the bar graph shows the peak threshold (peak divided by assigned). When the processor type is uncapped, the bar graph and the numerical value show the used processor usage (used divided by the number of virtual processors) in a percentage. The threshold line on the bar graph shows the peak threshold (peak divided by the number of virtual processors). When the processor type is capped, then the bar graph and the numerical value show the used processor usage (used divided by entitled) in a percentage. The threshold line on the bar graph shows the peak threshold (peak divided by entitled). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Memory allocation (allocated).
- Network I/O usage (sent and received in terabytes per second and in packets per second). The bar graph and the numerical value show the average usage ((average transferred bytes divided by the number of adapters) divided by the maximum transferred bytes) in a percentage. The threshold line on the bar graph shows the high threshold (maximum transferred bytes). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Storage I/O usage (written and read information in kilobytes per second). The bar graph and the numerical value show the average usage ((average transferred bytes divided by the number of adapters) divided by the maximum transferred bytes) in a percentage. The threshold line on the bar graph shows the high threshold (maximum transferred bytes). When the value exceeds the threshold, the bar graph changes to a dashed line format.
- Data collection.

Partition Properties

The **View Partition Properties** task displays the selected partition's properties. This information is useful in resource allocation and partition management. These properties include:

General

The **General** tab displays the partition's name, ID, environment, state, resource configuration, version of the operating system that is installed on the partition, boot mode to start the operating system, and the system on which the partition is located.

Notes:

- On Power10 processor-based systems, the image date of the OS that is installed on the partition and the expiration date of the AIX Update Access Key (UAK) for the managed system are displayed for AIX and AIX/Linux partitions.
- If the managed system supports virtual serial number and if the managed system is not in an Enterprise Pool 2.0, the Virtual Serial Number property is displayed in the **General** tab.

Click **Advanced settings** to also view the list of supported hardware accelerators for a logical partition and Quality of Service (QoS) credits for a specific hardware accelerator. This section is not displayed if the managed system does not support hardware accelerators.

Note: When the HMC is at V9.2.950.0, or later, and when the firmware is at level FW950, or later, the **KeyStore Size** value can be chosen in the range 4 KB - 64 KB as the keystore size of the logical partition. The value of 0 KB indicates that the keystore function is disabled for the logical partition.

Processor

The **Processor** tab displays the current usage of processors.

Note: When the operating system and the hypervisor support a minimum entitlement of 0.05 processor per virtual processor, the minimum, maximum, and desired processing units can be set to the lowest supported value of 0.05.

Memory

The **Memory** tab displays properties of the running logical partition that is using the dedicated or the shared memory.

Persistent Memory

The **Persistent Memory** tab displays the list of persistent memory volumes that are used by the logical partition. You can also add or remove the persistent memory volume for the logical partition. The Hybrid Memory Subsystem (HMS) view displays information about the persistent memory volumes that are created through the HMS and are associated with the logical partition. You can **Modify**, **Remove**, and **Format** the persistent memory volumes. You can also create a persistent memory volume by using the **Add** menu option under HMS view, which creates a new persistent memory volume and associates the new persistent memory volume with the logical partition.

Note: The Persistent Memory function is currently supported only on the SUSE Linux® operating system.

Physical I/O adapter

The **Physical I/O Adapter** tab displays the properties of all the physical I/O adapters that are available for the managed system and that can be assigned to a partition. You can also add and remove an adapter in a partition.

Change Default Profile

Change the default profile for the partition.

Select a profile from the drop down list to be the new default profile.

Operations

Operations contains the tasks for operating partitions.

About this task

To open the operations tasks that are available for your partitions, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Partitions**.
2. Select the partition for which you want to manage operations tasks. Click **Actions** > **View Partition Properties**
3. In the menu pod, expand **Partition Actions** and then expand **Operations**.
4. Select the operations task that you want to perform from the list.

Activate

Use the **Activate** task to activate a partition on your managed system that is in the **Not Activated** state.

Select the partition profile from the list of profiles and click **OK** to activate the partition. On the **Advanced** tab, select the **No VSI Profile** check box to ignore the failure while configuring the Virtual Station Interface (VSI) profile.

Note: As of HMC Version 7.7, or later, you can install a Virtual I/O Server (VIOS) on a logical partition from an HMC by using a DVD, a saved image, or a Network Installation Management (NIM) server.

Netboot

Use the **netboot** task to network boot an AIX, Linux, or an IBM i partition on your managed system that is in the **Not Activated** state.

The **Network boot** wizard guides you through the steps of installing the operating system on the partition and then activating the partition. Select a partition profile to install the operating system on the partition. Click **Next** to configure the network settings for the logical partition.

Note: For Virtual I/O Server, you must choose the **Install** option from the **Actions** menu to install the VIOS on your managed system that is in the **Not Activated** state.

Restart

Restart the selected logical partition or partitions.

For IBM i logical partitions, use this window only if you cannot restart the IBM i logical partition from the command line of the operating system. Using this window to restart an IBM i logical partition results in an abnormal IPL.

If you choose to restart VIOS partitions that are acting as the Paging Service Partition (PSP) for a number of client partitions, a warning displays, indicating that you must shut down the client partitions before you shut down the VIOS partition.

Choose one of the following options. The Operating System option and the Operating System Immediate option are enabled only if Resource Monitoring and Control (RMC) is up and configured.

Dump
The HMC shuts down the logical partition and initiates a main storage or system memory dump. For AIX and Linux logical partitions, the HMC also notifies the logical partition to shut down. For IBM i logical partitions, the processors are stopped immediately. After the shutdown is complete, the logical partition is immediately restarted. (IBM i logical partitions are restarted multiple times so that the logical partition can store the dump information.) Use this option if a portion of the operation system appears hung and you want a dump of the logical partition for analysis.

Operating System
The HMC shuts down the logical partition normally by issuing a shutdown -r command to the logical partition. During this operation, the logical partition performs any necessary shutdown activities. After the shutdown is complete, the logical partition is immediately restarted. This option is only available for AIX logical partitions. Immediate: The HMC shuts down the logical partition immediately. The HMC ends all active jobs immediately. The programs that are running in those jobs are not allowed to perform any job cleanup. This option might cause undesirable results if data is partially updated. Use this option only after a controlled end is unsuccessfully attempted.

Operating System Immediate
The HMC shuts down the logical partition immediately by issuing a shutdown -Fr command to the logical partition. During this operation, the logical partition bypasses messages to other users and other shutdown activities. After the shutdown is complete, the logical partition is immediately restarted. This option is only available for AIX logical partitions.

Dump Retry
The HMC retries a main storage or system memory dump on the logical partition. After this operation is complete, the logical partition is shut down and restarted. Use this option only if you previously tried the **Dump** option without success. This option is only available for IBM i logical partitions.

Shut Down

Shut down the selected logical partition or partitions.

For IBM i logical partitions, use this window only if you cannot shut down the IBM i logical partition from the command line of the operating system. Using this window to shut down an IBM i logical partition will result in an abnormal IPL.

If you choose to shut down VIOS partitions that are acting as the Paging Service Partition (PSP) for a number of client partitions, a warning displays, indicating that you should shut down the client partitions before shutting down the VIOS partition.

Choose from the following options:

Delayed
The HMC shuts down the logical partition using the delayed power-off sequence. This allows the logical partition time to end jobs and write data to disks. If the logical partition is unable to shut down

within the predetermined amount of time, it will end abnormally and the next restart may be longer than normal.

Immediate
The HMC shuts down the logical partition immediately. The HMC ends all active jobs immediately. The programs running in those jobs are not allowed to perform any job cleanup. This option might cause undesirable results if data has been partially updated. Use this option only after a controlled shutdown has been unsuccessfully attempted.

Operating System
The HMC shuts down the logical partition normally by issuing a shutdown command to the logical partition. During this operation, the logical partition performs any necessary shutdown activities. This option is only available for AIX logical partitions.

Operating System Immediate
The HMC shuts down the logical partition immediately by issuing a shutdown -F command to the logical partition. During this operation, the logical partition bypasses messages to other users and other shutdown activities. This option is only available for AIX logical partitions.

Delete

Use the **Delete** task to delete the selected partition.

The Delete task deletes the selected partition and all of the partition profiles associated with the partition from the managed system. When you delete a partition, all hardware resources currently assigned to that partition become available to other partitions.

Schedule Operations

Create a schedule for certain operations to be performed on the logical partition.

Scheduled operations are helpful for situations where automatic, delayed, or repetitious processing of system operations is necessary. A scheduled operation is started at a specified time, without operator assistance to perform the operation. A schedule can be set for one operation or repeated many times.

For example, you might schedule an operation to remove resources from a logical partition or move resources from one logical partition to another.

The Scheduled Operations task displays the following information for each operation:

- The processor that is the object of the operation
- The scheduled date
- The scheduled time
- The operation
- The number of remaining repetitions

From the **Scheduled Operations** window you can perform the following operations:

- Schedule an operation to run later.
- Define operations to repeat at regular intervals.
- Delete a previously scheduled operation.
- View details for a currently scheduled operation.
- View scheduled operations within a specified time range.
- Sort scheduled operations by date, operation, or managed system.

You can schedule an operation to occur once or you can schedule it to repeat. You must provide the time and date that you want the operation to occur. If you want the operation to repeat, you are asked to select the following time intervals:

- The day or days of the week that you want the operation to occur. (optional)
- The interval, or time between each occurrence. (required)

- The total number of repetitions. (required)

The operations that you can schedule for a logical partition include the following operations:

Activate on an LPAR
Schedules an operation on a selected profile for activation of the selected logical partition.

Dynamic Reconfiguration
Schedules an operation for adding, removing, or moving a resource (processors or megabytes of memory).

Operating System Shutdown (on a partition)
Schedules a shutdown of the selected logical partition.

Backup I/O Configuration
Schedules a backup I/O configuration operation for a selected Virtual I/O Server.

To schedule operations on the HMC, complete the following steps:

1. In the Navigation area, click **Systems Management**.
2. In the work pane, select one or more partitions.
3. In the taskpad, select the **Operations** task category, then click **Schedule Operations**. The **Customize Scheduled Operations** window opens.
4. From the **Customize Scheduled Operations** window, click **Options** from the menu bar to display the next level of options:
   - To add a scheduled operation, click **Options** and then click **New**.
   - To delete a scheduled operation, select the operation that you want to delete, point to **Options** and then click **Delete**.
   - To update the list of scheduled operations with the current schedules for the selected objects, point to **Options** and then click **Refresh**.
   - To view a scheduled operation, select the operation that you want to view, point to **View** and then click **Schedule Details**.
   - To change the time of a scheduled operation, select the operation that you want to view, point to **View** and then click **New Time Range**.
   - To sort the scheduled operations, point to **Sort** and then click one of the sort categories that appears.
5. To return to the HMC workplace, point to **Operations** and then click **Exit**.

Validate Maintenance Readiness and Prepare

Use the **Validate Maintenance Readiness** task to validate the readiness of the Virtual I/O Server (VIOS) for maintenance. The VIOS must be in **Running** state with an active Resource Monitoring Control (RMC) connection to perform the validation operation on the VIOS. To complete the validation operation, you must have access to all the partitions of the managed system.

The Hardware Management Console (HMC) validates the readiness of the VIOS for the maintenance. When you execute the maintenance readiness operation, the HMC validates all the client logical partitions that use Virtual I/O Servers for Multi-path I/O operation or redundancy setup for the network and storage that is attached to a logical partition. To check the redundancy setup of the network or storage, the HMC gets the inventory information of other Virtual I/O Servers that are associated with the managed system. However, if other VIOS partitions in the system do not have a proper RMC connection, the validation process continues, and results are shown based on the current states of the Virtual I/O Servers.

The page also displays information about all the impacted client partitions that do not have a redundant Virtual SCSI Storage, Virtual Fibre Channel, Virtual networks, and Virtual NIC that is provided by the VIOS.

You can click **Prepare for Maintenance** in the upper-right corner of the **Validate Maintenance Readiness** window to prepare the VIOS for maintenance. You can select the **Continue with prepare even if there are errors/warnings** checkbox to prepare the VIOS for maintenance even when there are errors and warning.

The **Prepare for Maintenance** task unconfigures the virtual SCSI and virtual Fibre Channel devices in the VIOS to switch the path of the redundant virtual SCSI and the virtual Fibre Channel storage. It also changes the high availability mode of the redundant Shared Ethernet Adapter (SEA) of the VIOS to the Standby state. This task also performs the failover of the vNIC by activating the vNIC backing device that is on an another VIOS. Any failures during these steps are reported at the end of the procedure.

You can click **View System VIOS** in the upper-right corner of the **Validate Maintenance Readiness** window to view information about the Virtual I/O Server of the managed system.

Mobility

Use the Mobility task to migrate your partition to another server, ensure that the requirements for the migration are met, and recover if the partition is in an invalid state.

Migrate

Migrate a partition to another managed system.

About this task

To migrate a partition to another system, complete the following steps:

Procedure

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. In the content pane, select the server. Click **Actions** > **View System Partitions**.
3. In the content pane, select the partition that you want to migrate to another system.
4. Click **Actions** > **Mobility** > **Migrate**. The Partition Migration wizard opens.
5. Complete the steps in the Partition Migration wizard and click **Finish**.

Validate

Validate the settings for moving the partition from the source system to the destination system.

About this task

To validate the settings, complete the following steps:

Procedure

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. In the content pane, select the server. Click **Actions** > **View System Partitions**.
3. In the content pane, select the partition for which you want to validate the settings.
4. Click **Actions** > **Mobility** > **Validate**. The Partition Migration Validation window opens.
5. Fill in the information in the fields, and click **Validate**.

Recover

Recover this partition from a migration that did not complete.

About this task

To recover this partition from a migration that did not complete, complete the following steps:

Procedure

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. In the content pane, select the server. Click **Actions** > **View System Partitions**.
3. In the content pane, select the partition that you want to recover.
4. Click **Actions** > **Mobility** > **Recover**. The Migration Recovery window opens.

5. Complete the information as necessary and click **Recover**.

Partition Templates

Partition templates contain details for partition resources, such as physical adapters, virtual networks, and storage configuration. You can create client partitions from the quick-start templates that are available in the template library or from your own user-defined templates on the Hardware Management Console (HMC).

Capture Partition as a Template

You can capture the configuration details of a running partition and save the information as a partition template by using the Hardware Management Console (HMC).

To capture the configuration as a template, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Partitions**.
2. Select the partition for which you want to capture as a template.
3. Click **Actions** > **Templates** > **Capture Partition as a Template**.
4. Enter a template name and description.
5. Click **OK**.

Use the online Help if you need additional information about this task.

Profiles

Learn about the tasks that are available in the **Profiles** menu.

Manage Profiles

Use the **Manage Profiles** task to create, edit, copy, delete, or activate a profile for the selected partition.

A partition profile contains the resource configuration for the partition. You can modify the processor, memory, and adapter assignments for a profile by editing the profile.

The default partition profile for a logical partition is the partition profile that is used to activate the logical partition if no other partition profile is selected. You cannot delete the default partition profile unless you first designate another partition profile as the default partition profile. The default profile is defined in the status column.

Choose **Copy** to create an exact copy of the selected partition profile. This allows you to create multiple partition profiles that are nearly identical to one another by copying a partition profile and changing the copies as needed.

Manage Custom Groups

Groups are comprised of logical collections of objects. You can report status on a group basis, allowing you to monitor your system in a way that you prefer. You can also nest groups (a group contained within a group) to provide hierarchical or topology views.

One or more user-defined groups might already be defined on your Hardware Management Console (HMC). Default groups are listed under **Custom Groups** node under **Configuration**. The default groups are **All Partitions** and **All Objects**. You can create others, delete the ones that were created, add to created groups, create groups using the pattern match method, or delete from created groups by using the **Manage Custom Groups** task.

Use the online Help if you need additional information for managing custom groups.

Save Current Configuration

Save the current configuration of a logical partition to a new partition profile by entering a new profile name.

This procedure is useful if you change the configuration of a logical partition using dynamic logical partitioning and you do not want to lose the changes when you restart the logical partition. You can perform this procedure at any time after you initially activate a logical partition.

Delete Partition

You can delete a partition and the associated partition profile by using the Hardware Management Console (HMC).

To delete a partition, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Partitions**.
2. Select the partition for which you want to delete.
3. Click **Actions** > **Delete Partition**.
4. Select any options that you want.
5. Click **OK**.

Use the online Help if you need additional information about this task.

Serviceability

Problem Analysis on the HMC automatically detects error conditions and reports to you any problem that requires service to repair it.

These problems are reported to you as serviceable events. Use the **Serviceable Events Manager** task to view specific events for selected systems. However, if you notice a problem occurred or you suspect a problem is affecting the system but Problem Analysis has not reported it to you, use the **Create Serviceable Event** task to report the problem to your service provider.

Serviceable Events Manager

Problems on your managed partitions are reported to the Hardware Management Console (HMC) as serviceable events. You can view the problem, manage problem data, call home the event to your service provider, or repair the problem.

To set the criteria for the serviceable events you to view, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to manage serviceable events.
3. In the menu pod, expand **Serviceability** and then click **Serviceability**.
4. Click **Serviceable Events Manager**.
5. Provide event criteria, error criteria, and FRU criteria. If you do not want the results that are filtered, select **ALL**. Click **Refresh** to refresh the list of serviceable events based on the criteria filter values.

The **Serviceable Events Overview** window displays all of the events that match your criteria. The information that is displayed in the compact table view includes the following information:

- Problem Number
- PMH Number
- Reference Code - Click the Reference code to display a description of the problem reported and actions that can be taken to fix the problem.
- Status of the problem
- Last reported time of the problem
- Failing MTMS of the problem

- Originating HMC

The full table view includes more detailed information, including reporting partition ID, primary data event timestamp, duplicate count, notification type, first reported time, reporting name, reporting MTMS, firmware fix, and serviceable event text.

Select a serviceable event and use the **Action** drop-down menu to:

- **View Details**: Field-replaceable units (FRUs) associated with this event and their descriptions.
- **View Files**: View the files associated with the selected serviceable event.
- **View Reference Code Description**: View the description of the reference code associated with the selected serviceable event. The option will not be available if additional description is not available.
- **Call Home**: Report the event to your service provider.
- **Repair**: Start a guided repair procedure, if available.
- **Close Event**: After the problem is solved, add comments and close the event.
- **Add PMH Comment**: Add a comment to a PMH for a selected serviceable event. If a PMH number does not exist for a given problem, the Add PMH Comment option is not available.

Use the online Help if you need additional information on managing serviceable events.

Reference Code Log

Use the **Reference Code Log** task to view reference codes that have been generated for the selected logical partition. Reference codes are diagnostic aids that help you determine the source of a hardware or operating system problem.

By default, only the most recent reference codes that the logical partition has generated are displayed. To view more reference codes, enter the number of reference codes that you want to view into **View history** and click **Refresh**. The window displays that number of the latest reference codes, with the date and time at which each reference code was generated. The window can display up to the maximum number of reference codes stored for the logical partition.

Control Panel Functions

This task displays the available virtual control panel functions for the selected IBM i partition. The tasks are:

(21) Activate Dedicated Service Tools
Starts Dedicated Service Tools (DST) on the partition.

(65) Disable Remote Service
Deactivates remote service on the partition.

(66) Enable Remote Service
Activates remote service on the partition.

(68) Concurrent Maintenance Power Off Domain
Concurrent maintenance power domain Power Off.

(69) Concurrent Maintenance Power On Domain
Concurrent maintenance power domain Power On.

Virtual I/O

Learn how to view the virtual networks, virtual network interface controllers, and virtual storage of a partition.

You can use the Hardware Management Console (HMC) to view the virtual topology of a partition.

Virtual Networks

You can view and add virtual networks that are associated with the selected logical partition.

The **Virtual Networks** table lists the virtual network name, VLAN ID, virtual switch, virtual network bridge, and virtual Ethernet adapter ID that are associated with each virtual network. You can click **Attach Virtual Network** to view the available virtual networks and attach additional virtual networks to the logical partition.

To view the virtual networks for the selected partitions by using the HMC, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Partitions**.
2. Select the partition for which you want to manage serviceability tasks and click **Actions** > **View Partition Properties**.
3. In the menu pod, expand **Virtual I/O** and then click **Virtual Networks**.

Use the online Help if you need additional information about this task.

Virtual NIC

You can manage all aspects of the virtual Network Interface Controller (NIC) configuration that is associated with the partition.

A virtual NIC is a type of virtual adapter that can be configured on logical partitions to provide a network interface. Each virtual NIC client adapter is backed by an SR-IOV logical port that is owned by the hosting partition.

The **Virtual NIC** table lists all virtual NICs that are configured for the selected partition. A virtual NIC can have one or more backing devices. The maximum number of backing devices per virtual NIC depends on the system. If the virtual NIC has more than one backing device, you can expand the node to view all the backing devices. If the virtual NIC has only one backing device, that backing device is the active backing device. The active backing device is the one that is in use by the virtual NIC. If the managed system is not failover capable, the table displays virtual NICs that have a single backing device.

You can add a virtual NIC to the partition. To add a virtual NIC, click **Add Virtual NIC**. You can configure the virtual NIC only in dedicated mode. You can also modify and view virtual NIC properties. To modify properties of a virtual NIC, select the virtual NIC in the table and click **Action** > **Modify vNIC** . To view the properties of a virtual NIC, select the virtual NIC in the table and click **Action** > **View vNIC**.

To view the virtual NIC for the selected partition by using the HMC, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Partitions**.
2. Select the partition for which you want to manage serviceability tasks and click **Actions** > **View Partition Properties**.
3. In the menu pod, expand **Virtual I/O** and then click **Virtual NICs**.

Use the online Help if you need additional information about this task.

Virtual Storage

You can create, view, and manage the storage capability of the logical partition.

The **Virtual Storage** table displays the Virtual Small Computer Serial Interface (SCSI) devices that are configured to a logical partition. You can also view the information about the physical volume groups, shared storage pool volume, and the logical volume.

You can add the virtual storage resources to a partition. Click **Adapter View** to create, view the adapter configuration of the virtual storage devices that are allocated for the logical partition. Click **Storage View** to view and manage the storage capability of the logical partition.

Physical volumes can be exported to partitions as virtual SCSI disks. Click **Show assigned physical volumes** to view the assigned physical volumes that are assigned to the logical partition.

To add physical volumes to a partition, select the physical volumes from the list and specify the **User Defined Name** for each physical volume that you want to add to the partition and then click **OK**. If you want to change the server adapter ID that is assigned to each physical volume, click **Edit** for each of the physical volumes that you want to update. The **Edit connection** window is displayed. You can specify up to 3 Virtual I/O servers, and then enter the new server adapter ID that you want to assign for the adapter connection.

To add different types of virtual storage devices to a partition, click **Add Virtual SCSI Device**. Select the available virtual storage that you want to add. You can select the virtual storage types such as **Physical Volume**, **Shared Storage Pool Volume**, or **Logical Volume**.

To view the virtual storage for the selected partition by using the HMC, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Partitions**.
2. Select the partition for which you want to manage serviceability tasks and click **Actions** > **View Partition Properties**.
3. In the menu pod, expand **Virtual I/O** and then click **Virtual Storage**.

Use the online Help if you need additional information about this task.

Hardware Virtualized I/O

You can view and change the settings of hardware virtualized I/O adapters, such as single root I/O virtualization (SR-IOV) port adapters for a partition by using the Hardware Management Console (HMC).

To view the hardware virtualized I/O adapters for the selected partition by using the HMC, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Partitions**.
2. Select the partition for which you want to manage serviceability tasks and click **Actions** > **View Partition Properties**.
3. In the menu pod, expand **Virtual I/O** and then click **Hardware Virtualized I/O**.
4. You can add an SR-IOV logical port to the partition or change the settings of the SR-IOV logical ports. In the **SR-IOV logical port** table, you can also view the information about the logical ports that can be migrated and the information about the backing device that is configured for the logical ports.

   Notes:

   - With HMC Version 9.1.930, or later, the HMC also supports the RDMA over Converged Ethernet (RoCE) adapter.
   - If you are using HMC Version 9.1.940, with firmware at level FW940, or later, you can create logical partitions that have an SR-IOV logical port that can be migrated. You can migrate a logical partition with SR-IOV logical ports when the Migratable option is used to create a backup virtual device when creating a logical port. The backup device can be either a virtual Ethernet or a virtual Network Interface Controller (NIC) adapter. When the HMC is at Version 9.1.940.x, and when the firmware is at level FW940, the Migratable option for the Hybrid Network Virtualization capability is available as a Technology Preview only and is not intended for production deployments. However, when the HMC is at Version 9.1.941.0, or later, and when the firmware is at level FW940.10, or later, the Migratable option for the Hybrid Network Virtualization capability is supported.

   Use the online Help if you need additional information about this task.

Manage Groups

The **All groups** view provides a mechanism for you to group system resources together in a single view.

Groups may be nested to create customized system resources view.

You can view all the groups that are created by the users of the management console, including cumulative state information for system resources in a group. A custom group can consist of any systems, partitions, and Virtual I/O Servers that are managed by the management console.

To create a new group, complete the following steps:

1. Click **Create group** on the toolbar.
2. In the **Create group** window, specify a group name and description for the group. You can also tag a color to the group that you want to create.
3. Select one or more resources (for example: servers, partitions, or frames) that you want to include in the group that you want to work with.
4. Click **OK** to save the changes and to close the window.

You can edit an existing group to add or remove the resources from the group.

Note: When the last member (resources) of the group is removed, a message is displayed to confirm whether you want to delete the group. Click **Cancel** to retain the group in the **All groups** view.

Power Enterprise Pools

Systems Management for Power Enterprise Pool displays Power Enterprise Pool tasks that you can perform.

You can perform the following operations by using the Power Enterprise Pool offering:

- Add processors or memory to a server.
- Remove processors or memory from a server.
- Update the pool configuration.
- Add a server to the pool.
- Remove an existing server from the pool.
- Add processors or memory to the pool.
- View the following Power Enterprise Pool information:
  - Pool membership information
  - Pool resource information
  - Pool compliance information
  - Pool history log

Console Management tasks

Learn about the tasks that are available on the Hardware Management Console (HMC) under **Console Management**.

To open these tasks, see "HMC tasks, user roles, IDs, and associated commands" on page 8.

Note: Depending on the task roles that are assigned to your user ID, you might not have access to all the tasks. See Table 3 on page 8 for a listing of the tasks and the user roles that are allowed to access them.

Launch Guided Setup Wizard

This task uses a wizard to set up your system and HMC.

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Launch Guided Setup Wizard**.
3. From the **Launch Guided Setup Wizard - Welcome** window it is recommended that you have certain prerequisites on hand. Click **Prerequisites** in the **Launch Guided Setup Wizard - Welcome** window for the information. When you have completed that, this wizard takes you through the following tasks required to set up your system and HMC. As you complete each task, click **Next** to proceed.

   a. Change HMC Date and Time
   b. Change HMC passwords
   c. Create additional HMC users
   d. Configure HMC Network Settings (This task cannot be performed if you are accessing the **Launch Guided Setup Wizard** remotely.)
   e. Specify contact information
   f. Configure connectivity information
   g. Authorize users to use the Electronic Service Agent software tool and configure notification of problem events.
4. Click **Finish** when you have completed all the tasks in the wizard.

View Network Topology

This task allows you to view and ping the connectivity between various network nodes within the Hardware Management Console (HMC).

To view the network topology, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **View Network Topology**.
3. From the **View Network Topology** window, you can ping current and saved nodes.
4. Click **Close** when you have completed this task.

Use the online Help if you need additional information about viewing the network topology.

Test Network Connectivity

This task allows you to view network diagnostic information about the network protocols for the Hardware Management Console (HMC).

To test the network connectivity, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Test Network Connectivity**.
3. From the **Test Network Connectivity** window, you can work with the following tabs:

   Ping
   You can ping the TCP/IP address or name.

   Interfaces
   Displays the statistics for the network interfaces that are currently configured. To update the information that is currently displayed with the most recent information, click **Refresh**.

   Ethernet Settings
   Displays the settings for the Ethernet cards that are currently configured. To update the information that is currently displayed with the most recent information, click **Refresh**.

   Address
   Display the TCP/IP addresses for the configured network interfaces. To update the information that is currently displayed with the most recent information, click **Refresh**.

   Routes
   Displays the Kernel IP and IPv6 routing tables and corresponding network interfaces. To update the information that is currently displayed with the most recent information, click **Refresh**.

ARP
Displays the contents of the Address Resolution Protocol (ARP) connections. To update the information that is currently displayed with the most recent information, click **Refresh**.

Sockets
Displays information about TCP/IP sockets. To update the information that is currently displayed with the most recent information, click **Refresh**.

TCP
Displays information about Transmission Control Protocol (TCP) connections. To update the information that is currently displayed with the most recent information, click **Refresh**.

IP Tables
Displays information (in table format) about the Internet Protocol (IP) packet filter rules. To update the information that is currently displayed with the most recent information, click **Refresh**.

UDP
Displays information about User Datagram Protocol (UDP) statistics. To update the information that is currently displayed with the most recent information, click **Refresh**.

4. Click **Cancel** when you have completed this task.

Use the online Help if you need additional information about testing the network connectivity.

Change Network Settings

This task allows you to view the current network information for the HMC and to change network settings.

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change Network Settings**.
3. From the **Change Network Settings** window, you can work with the following tabs:

Identification
Contains the host name, domain name, and console description of the HMC.

LAN Adapters
A summarized list of all (visible) Local Area Network (LAN) adapters. You can select any of these and click **Details...** to open a window allowing you to change addressing, routing, other LAN adapter characteristics, and firewall settings.

Bond LAN Adapters
Create or delete a Bond LAN adapter. A Bond LAN adapter combines two Ethernet interfaces into a single logical link. To change the settings of the Bond LAN adapter, select a Bond LAN adapter and click **Edit**. You can change the IP address, IP network mask, gateway, and the firewall settings of the Bond LAN adapter.

Name Services
Specify the DNS and domain suffix values for configuring the console network settings.

Routing
Specify the routing information and default gateway information for configuring the console network settings.

The **Gateway address** is the route to all networks. The default gateway address (if defined) informs this HMC where to send data if the target station does not reside on the same subnet as the source. If your machine can reach all stations on the same subnet (usually a building or a sector within a building), but cannot communicate outside the area, it is usually because of an incorrectly configured default gateway.

You can assign a specific LAN to be the **Gateway device** or you can choose “any.”

You can select **Enable ’routed’** to start the routed daemon, which allows it to run and allows any routing information to be exported from the HMC.

4. Click **OK** when you have completed this task.

Note: Depending on the type of change that you make, the network or console automatically restarts or the console automatically reboots.

Use the online Help to get additional information for customizing the network settings.

Change Performance Monitoring Settings

The Performance and Capacity Monitor tool collects allocation and usage data for virtualized server resources. It displays data in the form of graphs and tables, which are viewable from the Performance and Capacity Monitor home page.

The Performance and Capacity Monitor gathers data and provides capacity reporting and performance monitoring. This information can help you to determine the available capacity and whether your resources might be overextended or underused. In addition, your interpretation of the graphs and tables might be useful for capacity planning and troubleshooting. For more information about The Performance and Capacity Monitor tool, see Using the Performance and Capacity Monitor.

The Performance and Capacity Monitor captures data only from the servers for which you choose to enable data collection.

To enable data collection, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change Performance Monitoring Settings**.
3. Specify the number of days for which you want to store performance data by typing in a number 1 - 366. Alternatively, you can click the up or down arrows next to **Number of days to store performance data** under **Performance Data Storage**.

   Note: By default, the HMC stores data for 180 days. However, you can specify the maximum number of days that the HMC stores data to 366 days.
4. Click the toggle switch in the **Collection** column next to the name of the server for which you want to collect data. Alternatively, you can click **All On** to enable data collection for all of the servers in your environment that the HMC manages.

   Note: You might be prevented from collecting data from all of the servers in your environment because storage space is limited. The HMC prohibits you from enabling data collection from more servers when the HMC determines that it might run out of estimated storage space.
5. Click **OK** to apply the changes and close the window. You can now review the collected data when you access the Performance and Capacity Monitor home page.

Change Date and Time

Change the time and date of the battery-operated Hardware Management Console (HMC) clock and add or remove time servers for the Network Time Protocol (NTP) service.

Use this task in the following situations:

- If the battery is replaced in the HMC.
- If your system is physically moved to a different time zone.

Note: The time setting adjusts automatically for Daylight Saving Time in the time zone you select.

To change the date and time, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change Date and Time**.
3. Click the **Customize Console Date and Time** tab.
4. Enter the date and time information.
5. Click **OK**.

To change the time server information, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change Date and Time**.
3. Click the **NTP Configuration** tab.
4. Provide the appropriate information for the time server.
5. Click **OK**.

If you need additional information for changing the date and time of the HMC or for adding or removing time servers for the Network Time Protocol (NTP) service, use the online Help.

Change Language and Locale

This task sets the language and location for the HMC. After you select a language, you can select a locale associated with that language.

The language and locale settings determine the language, the character set, and other settings specific to the country or region (such as formats for date, time, numbers, and monetary units). Changes made in the **Change Language and Locale** window affect only the language and locale for the HMC itself. If you access the HMC remotely, the language and locale settings on your browser determine the settings that the browser uses to display the HMC interface.

To change the language and locale on the HMC:

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Change Language and Locale**.
3. From the **Change Language and Locale** window, choose the applicable language and locale.
4. Click **OK** to apply the change.

Use the online Help if you need additional information for changing the language and locale of the HMC.

Create Welcome Text

Create and display a welcome message or display a warning message that appears before users log on to the Hardware Management Console (HMC).

The text that you enter in the message input area for this task appears on the **Welcome** window after you initially access the console. You can use this text to notify users about certain corporate policies or security restrictions that apply to the system.

To create a welcome text, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Settings**.
2. In the content pane, click **Create Welcome Text**.
3. Enter the welcome text that you want to display in the text box.

   Note: A maximum of 8192 characters is allowed.
4. Click **OK**.

For more information about this task, use the online Help.

Console Default Settings

You can modify the default console settings on the Hardware Management Console (HMC).

You can also modify the number of days for which a certificate is valid.

Note: The certificate can be valid for maximum of 3650 days.

To modify the console default settings, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Settings**.

2. In the content pane, click **Console Default Settings**.
3. In the **Console Default Settings** window, you can specify the number of days for which the certificate is valid. You can also configure the following user settings:
   - `Idle Time Out` to specify idle time out settings for an HMC session in minutes.
   - `Session Time out` to specify session time out settings for an HMC session in minutes.
   - `Max Web UI Login Attempts` to specify the maximum number of login attempts to the HMC graphical user interface (GUI). You can enter a value in the range of 3 - 50.
   - `Web UI Suspend Time` to specify the login suspension time for HMC GUI. You can enter a value in the range of 1 - 1440 minutes

     Note: After the maximum number of failed login attempts is reached, the account is suspended for the number of specified minutes in the `Web UI Suspend Time` field.
4. When you complete the task, click **OK**.

Use the online Help if you need additional information about this task.

Shut Down or Restart

This task enables you to shut down (power off the console) or to restart the console.

1. In the navigation area, click **Console Management**, and then select **Console Managment**.
2. In the content pane, click **Shut Down or Restart**.
3. From the **Shut Down or Restart** window, you can:
   - Select **Restart the HMC** to automatically restart the HMC once the shut down has occurred.
   - Do not select **Restart the HMC** if you do not want to automatically restart the HMC.
4. Click **OK** to proceed with the shut down, otherwise click **Cancel** to exit the task.

Use the online Help if you need additional information about shutting down or restarting the HMC.

Schedule Operations

Create a schedule for certain operations to be performed on the Hardware Management Console (HMC) itself without operator assistance.

Scheduled operations are helpful for situations where automatic, delayed, or repetitious processing of system operations is necessary. A scheduled operation is started at a specified time, without operator assistance to perform the operation. A schedule can be set for one operation or repeated many times.

For example, you might schedule a backup of important HMC information to DVD to occur once, or set up a repeating schedule.

The **Scheduled Operations** task displays the following information for each operation:

- The processor that is the object of the operation.
- The scheduled date.
- The scheduled time.
- The operation.
- The number of remaining repetitions.

From the **Scheduled Operations** window you can:

- Schedule an operation to run later.
- Define operations to repeat at regular intervals.
- Delete a previously scheduled operation.
- View details for a currently scheduled operation.

- View scheduled operations within a specified time range.
- Sort scheduled operations by date, operation, or managed system.

An operation can be scheduled to occur one time or it can be scheduled to be repeated. You are required to provide the time and date that you want the operation to occur. If the operation is scheduled to be repeated, you are asked to select:

- The day or days of the week that you want the operation to occur. (optional)
- The interval, or time between each occurrence. (required)
- The total number of repetitions. (required)

The operation that can be scheduled for the HMC is:

Backup Critical Console Data
Schedules an operation to back up the critical console hard disk information for the HMC.

To schedule operations on the HMC, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Managment**.
2. In the content pane, click **Schedule Operations**.
3. From the **Schedule Operations** window, click **Options** from the menu bar to display the next level of options:
   - To add a scheduled operation, point to **Options** and then click **New**.
   - To delete a scheduled operation, select the operation that you want to delete, point to **Options** and then click **Delete**.
   - To update the list of scheduled operations with the current schedules for the selected objects, point to **Options** and then click **Refresh**.
   - To view a scheduled operation, select the operation that you want to view, point to **View** and then click **Schedule Details**.
   - To change the time of a scheduled operation, select the operation that you want to view, point to **View** and then click **New Time Range**.
   - To sort the scheduled operations, point to **Sort** and then click one of the sort categories that appears.
4. To return to the HMC workplace, point to **Options** and then click **Exit**.

Use the online Help to get additional information for scheduling an operation.

View Licenses

View the Licensed Internal Code that you agreed to for this Hardware Management Console (HMC).

You can view licenses at any time. To view licenses, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Managment**.
2. In the content pane, click **View Licenses**.
3. Click any of the license links to view more information.

   Note: This list does not include programs and code that is provided under separate license agreements.
4. Click **OK**.

Update the Hardware Management Console

Learn how to update the internal code of the Hardware Management Console (HMC) and view system information and system readiness.

To update the HMC, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Management**.
2. In the content pane, click **Update the Hardware Management Console**. The **Install HMC Corrective Service Wizard** opens.
3. Click **Next** to start the update process.
4. Follow the steps in the wizard to complete the update operation.
5. Click **Finish** when you have completed this task.

Use the online Help if you need additional information about updating the Hardware Management Console.

Format Media

This task formats a diskette or USB 2.0 Flash Drive Memory Key.

You can format a diskette by supplying a user-specified label.

To format a diskette or USB 2.0 Flash Drive Memory Key, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Managment**.
2. In the content pane, click **Format Media**.
3. From the **Format Media** window, select the type of media you want to format, then click **OK**.
4. Make sure that your media is correctly inserted, then click **Format**. The **Format Media** progress window is displayed. When the media is formatted, the **Format Media Completed** window is displayed.
5. Click **OK** and then click **Close** to end the task.

Use the online Help if you need additional information about this task.

Backup Management Console Data

This task backs up (or archives) the data that is stored on your Hardware Management Console (HMC) hard disk that is critical to support HMC operations.

Back up the HMC data after changes are made to the HMC or information that is associated with logical partitions.

The HMC data that is stored on the HMC hard disk drive can be saved to a DVD-RAM on a local system, a remote system that is mounted to the HMC file system (such as NFS), or sent to a remote site by using File Transfer Protocol (FTP).

By using the HMC, you can back up all important data, such as the following data:

- User-preference files
- User information
- HMC platform-configuration files
- HMC log files
- HMC updates through Install Corrective Service.

Note: Use the archived data only along with a reinstallation of the HMC from the product CDs.

To back up the HMC critical data, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Managment**.
2. In the content pane, click **Backup Management Console Data**.
3. From the **Backup Management Console Data** window, choose the archive option that you want to complete.

4. Click **Next**, then follow the appropriate instructions that are associated with the option you chose.
5. Click **OK** to continue with the backup process.

Use the online Help if you need additional information for backing up the HMC data.

Note:

- <li>For the HMC model 7063-CR1, DVD media is not supported.
- If you are using HMC Version 9.1.940, or later, you can specify a name for the generated backup file. If the backup file exists on the server, select the **Replace file** to replace the contents of the existing file that has the same name.

Restore Management Console Data

This task is used to select a remote repository for restoring critical backup data for the HMC.

1. In the navigation area, click **Console Management**, and then select **Console Managment**.
2. In the content pane, click **Restore Management Console Data**.
3. From the **Restore Management Console Data** window, click **Restore from a remote Network File System (NFS) server**, **Restore from a remote File Transfer Protocol (FTP) server**, **Restore from a remote Secure Shell File Transfer Protocol (SFTP) server**, or **Restore from a remote removable media**.
4. Click **Next** to proceed or **Cancel** to exit the task without making any changes.

Use the online Help if you need additional information about restoring critical backup data for this HMC.

Save Upgrade Data

This task uses a wizard to save upgrade data to selected media. This data consists of files that were created or customized while running the current software level. Saving this data to selected media is performed prior to an HMC software upgrade.

1. In the navigation area, click **Console Management**, and then select **Console Managment**.
2. In the content pane, click **Save Upgrade Data**.
3. From the **Save Upgrade Data** window, this wizard takes you through the steps required for saving your data. Select the type of media you want to save your data to, then click **Next** to proceed through the task windows.
4. Click **Finish** when you have completed the task.

Use the online Help if you need additional information for saving upgrade data.

Manage Data Replication

This task enables or disables customized data replication. Customized data replication allows another HMC to obtain customized console data from or send data to this HMC.

The following types of data can be configured:

- User profiles data
  - User identification
  - Authentication methods
  - Resource roles and task roles that are managed by the user
  - Logon session properties
  - Remote access settings

- Group data
  - All user-defined group definitions

  Note: When you configure **Group Data**, the complete group data is transferred from the source HMC and replaced on the secondary HMC. If the secondary HMC does not have a resource that is part of a group, the resource is not shown in that particular group.
- Multi-Factor Authentication data
  - PowerSC MFA hostname that is used by the HMC for Multi-Factor Authentication.
- Kerberos configuration data
  - Key Distribution Center (KDC), realm, and hostname that is used by the HMC for Kerberos authentication
- LDAP configuration data
  - LDAP server name and distinguished name tree that is used by the HMC for LDAP authentication.
- Password policy configuration data
  - Password policy name
  - Password policy description
  - Configured attributes of the password policy (such as min_pwage, pwage, min_length, hist_size, warn_pwage, min_digits, min_uppercase, min_lowercase, and min_special_chars)
- Outbound connectivity data
  - Information for dialing out (such as whether to enable the local system as a call-home server, or whether to allow dialing to use the local modem, the dial prefix, or phone numbers)

Note: Customizable console data is accepted from other HMCs only after specific HMCs and their associated allowable customizable data types are configured.

To manage data replication, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Management**.
2. In the content pane, click **Manage Data Replication**.
3. From the **Manage Data Replication** window, choose the appropriate option that you want to perform.

Use the online Help to get additional information for enabling or disabling customizable data replication.

Templates and OS Images

System templates contain configuration details for resources such as system properties, shared processor pools, reserved storage pool, shared memory pool, Host Ethernet adapters, and SR-IOV adapters. Many of the system settings that you previously configured by using separate tasks are available in the Deploy System from Template wizard. For example, you can configure the Virtual I/O Servers, virtual network bridges, and virtual storage settings when you use the wizard to deploy a system from a system template.

The template library includes predefined system templates, which contain configuration settings based on common usage scenarios. Predefined system templates are available for your immediate use. You can view, modify, deploy, copy, import, export, or delete templates that are available in the template library.

You can also create custom system templates that contain configuration settings that are specific to your environment. You can create a custom template by copying a predefined template and changing it to fit your needs. Or, you can capture the configuration of an existing system and save the details in a template. Then, you can deploy that template to other systems that require the same configuration.

To access the Template Library, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Templates and OS Images**.
2. From the **Templates and OS Images** window, you can access:

- **System**
- **Partition**
- **OS and VIOS Images**

3. When you complete this task, click **Close**.

System Templates

System templates contain configuration information about resources such shared processor pools, reserved storage pool, shared memory pool, physical I/O adapters, Host Ethernet adapters, single root I/O virtualization (SRIOV) adapters, Virtual I/O Server (VIOS), virtual networks, and virtual storage.

You can create custom system templates that contain configuration settings that are specific to your environment. You can also create a custom template by copying a predefined template and changing it to fit your needs. Or, you can capture the configuration of an existing system and save the details in a template. Then, you can deploy that template to other systems that require the same configuration. Click the template name to see the details about the template. Select a system template from the list to view, edit, copy, delete, deploy, or export a template.

Use the online Help if you need additional information on system templates.

Partition Templates

Partition templates contain details about partition resources, such as physical adapters, virtual networks, and storage configuration.

You can create custom partition templates that contain configuration settings that are specific to your environment. You can also create a custom template by copying a predefined template and changing it to fit your needs. Or, you can capture the configuration of an existing system and save the details in a template. Then, you can deploy that template to other systems that require the same configuration. Click the template name to see the details about the template. Select a partition template from the list to view, edit, copy, delete, deploy, or export a template.

Notes:

- If you are using HMC Version 9.1.940, or later, and if you are using a non-captured template to create a logical partition, you can configure an SR-IOV logical port that can be migrated. Select **migratable** in the **Edit** menu of the partition template. You can migrate the logical partition by using the SR-IOV logical port by creating a backup device and associate the SR-IOV logical port to the logical partition. The backup device can either be a virtual Ethernet adapter or a virtual Network Interface Controller (NIC) adapter.
- When the HMC is at Version 9.1.940.x, and when the firmware is at level FW940, the Migratable option for the Hybrid Network Virtualization capability is available as a Technology Preview only and is not intended for production deployments. However, when the HMC is at Version 9.1.941.0, or later, and when the firmware is at level FW940.10, or later, the Migratable option for the Hybrid Network Virtualization capability is supported.

Use the online Help if you need additional information on partition templates.

VIOS Images

Define VIOS images and installation resources for the operating environment that the Hardware Management Console (HMC) can access and use.

You can access the following tasks:

Manage Virtual I/O Server Image Repository

As of HMC version 7.7, or later, you can store the Virtual I/O Server (VIOS) images from a DVD, a saved image, or a Network Installation Management (NIM) server on the HMC. The stored VIOS images can be used for VIOS installation. You must be an HMC super administrator (hmcsuperadmin) to install the VIOS image.

About this task

To manage or to import the VIOS image repository, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Templates and OS Images**.
2. From the **Templates and OS Images** window, select the **OS and VIOS Images** tab, and then click **Manage Virtual I/O Server Image Repository**.
3. In the Virtual I/O Server Image Repository window, click **Import New Virtual I/O Server Image**.
4. In the Import New Virtual I/O Server Image window, choose to import the VIOS images from a DVD or from a file system.

   - To import VIOS images from a DVD to the HMC, complete the following steps:

     a. In the Import Virtual I/O Server Image window, select **Management console DVD**.

     b. In the **Name** field, enter the VIOS image name that you want to import from the DVD.

     c. Click **OK**.

   - To import VIOS images from a Network File System (NFS), File Transfer Protocol (FTP), or Secure Shell File Transfer Protocol (SFTP), complete the following steps:

     a. In the Import Virtual I/O Server Image window, select **File System**.

     b. Select **Remote NFS Server**, **Remote FTP Server**, or **Remote SFTP Server**.

     c. Enter the required details and click **OK**.

Manage Virtual I/O Server Backups

With HMC version 9.2.950, or later, you can manage the I/O configuration of Virtual I/O Servers and manage the backup of the VIOS image on the management console.

About this task

To manage the backup or restore operation of the I/O configuration of the VIOS and to manage the VIOS image, complete the following steps:

Procedure

1. In the navigation area, click **Console Management**, and then select **Templates and OS Images**.
2. From the **Templates and OS Images** window, select the **VIOS Images** tab, and then click **Manage Virtual I/O Server Backups**.
3. In the **Manage Virtual I/O Server Backups** window, select the **Virtual I/O Server Configuration Backup** tab. A table is displayed that lists all the backup files of the VIOS configuration that is taken by the HMC. Additionally, you can view the time at which the configuration file was last edited.

   a) To take the backup of the input/output configuration of a VIOS, click **Backup I/O configuration**. In the Backup I/O configuration window, select the managed system and the VIOS for which the back up is created, and then specify a name for the backup file.

   The name you specify must consist of 1 - 40 characters including file extension **`.tar.gz`**. You can use the characters A - Z and a - z, the numbers of 0 - 9, the dot (.), the dash (-) and the underscore (_) characters.

   b) To rename an existing backup file that is stored in the HMC, select a configuration file from the table and click **Action** > **Rename**.

   c) To restore the VIOS input/output configuration, select a backup file which contains the I/O configuration of the VIOS that you want to restore, and click **Action** > **Restore**.

   d) To export the backup files to the remote system, select one or more Virtual I/O Server backup files that are saved on the HMC and click **Action** > **Export**. You can export the backup files to the remote systems by specifying the proper credentials of the remote server where the backup files are copied.

   e) To import the backup files from the remote system, click **Import**. After specifying the proper credentials of the remote server, select the Virtual I/O Server where the backup files are imported.

4. In the **Manage Virtual I/O Server Backups** window, click the **Virtual I/O Server Backup** tab. A table is displayed that list all the VIOS image backup that are taken in the HMC. Additionally, you can also view the name and size of the VIOS image, the time when the VIOS image file was last edited, the managed system and the VIOS from which the image was captured.

   a) To take the backup of the VIOS image, click **Create Backup**. In the Create Backup window, select the managed system and the VIOS for which the back up is created, and then specify a name for the backup file.

      The name you specify must consist of 1 - 40 characters including file extension `.tar`. You can use the characters A - Z and a - z, the numbers of 0 - 9, the dot (.), the dash (-) and the underscore (_) characters.

   b) To rename an existing VIOS image backup file that is stored in the HMC, select a backup file from the table and click **Action** > **Rename**.

   c) To remove a VIOS image backup file from the HMC, select a backup file which contains the VIOS configuration that you want to remove from the table, and click **Action** > **Remove**.

   d) To export the Virtual I/O Server backup files to the remote system, select one or more backup files that are saved on the HMC and click **Action** > **Export**. You can export the backup files to the remote systems by specifying the proper credentials of the remote server where the backup files are copied.

   e) To import the backup files from the remote system, click **Import**. After specifying the proper credentials of the remote server, select the target Virtual I/O Server where the backup files are imported.

5. In the **Manage Virtual I/O Server Backups** window, click the **Shared Storage Pool Cluster Backup** tab. A table is displayed that lists all the VIOS image backups that are taken in the HMC. Additionally, you can also view the **Managed System, Virtual I/O Server**, and **Backup Created time**.

   a) To take a back up of the VIOS Shared Storage Pool Cluster (SSP) configuration, click **Create Shared Storage Pool Cluster Backup**. In the **Create SSP Cluster Backup** window, select the Managed System and the Virtual I/O Server that the backup is created for, and then specify a name for it.

      The name that you specify must consist of 1 - 40 characters including file extension `.tar.gz`. You can use the characters A - Z and a - z, the numbers of 0 - 9, the dot (.), the dash (-) and the underscore (_) characters.

   b) To restore the Shared Storage Pool Cluster configuration, select the backup file that contains the configuration of the SSP cluster that you want to restore, and click **Action** > **Restore**.

   c) To rename one of the existing SSP cluster configuration backup files, select a configuration from the table and click **Action** > **Rename**.

   d) To remove a SSP cluster configuration backup, select a backup file which contains the SSP cluster configuration that you want to remove, and click **Action > Delete**.

   e) To export the Virtual I/O Server backup files to the remote system, select one or more backup files that are saved on the HMC and click **Action** > **Export**. You can export the backup files to the remote systems by specifying the proper credentials of the remote server where the backup files are copied.

   f) To import the backup files from the remote system, click **Import**. After specifying the proper credentials of the remote server, select the target Virtual I/O Server where the backup files are imported.

6. Click **OK**.

All System Plans

A system plan is a specification of the logical partition configuration of a single managed system.

The table lists all the system plans that can be used to configure a managed system. You can create your own system plan or import an existing system plan.

Create System Plan

You can create a new system plan for a system that this Hardware Management Console (HMC) manages. The new system plan contains specifications for the logical partitions and partition profiles of the managed system that you used to create the plan.

1. Click **Create**.
2. Select a managed system from the available list and complete the **System plan name** and **Plan description** fields.
3. Check any options that you want.
4. Click **Create**.

Import System Plan

You can import a system plan file to the Hardware Management Console (HMC). The new system plan contains specifications for the logical partitions and partition profiles of the managed system that you used to create the plan.

1. Click **Import**.
2. Select a source to import the system plan file to the HMC.
3. Click **Import**.

Export System Plan

You can export a system plan file from the Hardware Management Console (HMC).

1. Select the system plan from the list and click **Actions** > **Export**.
2. Select a source to export the system plan file to the HMC.
3. Click **Export**.

Deploy System Plan

You can deploy a system plan file to one or more systems that the HMC manages. The managed system that you deploy the system plan on must have hardware that is identical to the hardware in the system plan.

1. Select the system plan from the list and click **Actions** > **Deploy**.
2. Follow the instructions on the **Deploy System Plan** wizard.

Delete System Plan

You can delete a system plan file from the Hardware Management Console (HMC).

1. Select the system plan from the list and click **Actions** > **Delete**.

Refresh

You can refresh the table to see any recent changes to the available system plans.

1. Click **Refresh** to update the table with the latest data.

Use the online Help if you need additional information about this task.

Users and Security tasks

The tasks that are available on the HMC for the **Users and Security** tasks are described.

Note: Depending on the task roles assigned to your user ID you may not have access to all the tasks. See "HMC tasks, user roles, IDs, and associated commands" on page 8 for a listing of the tasks and the user roles allowed to access them.

Change User Password

This task allows you to change your existing password that is used for logging on to the Hardware Management Console (HMC). A password verifies your user ID and your authority to log in to the console.

To change your password, complete the following steps:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Change User Password**.
3. From the **Change User Password** window, specify your current password, specify a new password that you want to use, and re-specify the new password for confirmation in the fields provided.

   Note: The new password that you specify must have at least eight characters.
4. Click **OK** to proceed with the changes.

Use the online Help if you need additional information for changing your password.

Manage User Profiles and Access

Manage your system users that log on to the HMC. A user profile is a combination of a user ID, server authentication method, permissions, and a text description. Permissions represent the authority levels assigned to the user profile for the objects the user has permission to access.

Users can be authenticated using local authentication on the HMC, by using Kerberos remote authentication, or by using LDAP authentication. For more information on setting up Kerberos authentication on the HMC, see "Manage KDC" on page 86. For more information about LDAP authentication, see "Manage LDAP" on page 86.

For security reasons, remotely authenticated Kerberos or LDAP users cannot lock the local console.

If you are using local authentication, the user ID and password are used to verify a user's authorization to log on the HMC. The user ID must start with an alphabetic character and consist of 1 to 32 characters. The password has the following rules:

- Must begin with an alphanumeric character.
- Must contain at least 8 characters, however, this limit can be changed by your system administrator.
- The characters must be standard 7-bit ASCII characters.
- Valid characters to use for the password can be: A-Z, a-z, 0-9 and special characters (~ ! @ # $ % ^ & * ( ) _ + - = { } [ ] \ : " ; ').

If you are using Kerberos authentication, specify a Kerberos remote user ID.

If you select LDAP authentication, no additional information is required.

The user profile includes managed resource roles and task roles that are assigned to the user. The *managed resource roles* assign permissions for a managed object or group of objects and the *task roles* define the access level for a user to perform on a managed object or group of objects. You can choose from a list of available default managed resource roles, task roles, or customized roles that are created by using the **Manage Task and Resource Roles** task.

See "HMC tasks, user roles, IDs, and associated commands" on page 8 for a listing of all the HMC tasks and the predefined default user IDs that can perform each task.

The default managed resource roles include:

- All System Resources

The default task roles include:

- hmcservicerep (Service Representative)
- hmcviewer (Viewer)
- hmcoperator (Operator)
- hmcpe (Product Engineer)
- hmcsuperadmin (Super Administrator).

To add or customize a user profile, complete the following steps:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Manage User Profiles and Access**.
3. Complete one of the following steps:
   - From the **User Profiles** window, if you are creating a new user ID, point to **User** on the menu bar and when its menu is displayed, click **Add**. The **Add User** window is displayed.
   - From the **User Profiles** window, if you are creating a user ID with the same attributes as an existing profile, point to **User** on the menu bar and when its menu is displayed, click **Copy**. The **Copy User** window is displayed.

     Note: Some user profiles are predefined, such as a default ID, and those permissions cannot be changed. However, you can copy a default user profile, such as operator, and then modify the resulting new user profile. The newly defined user cannot have greater permissions than the original copied user profile.
   - From the **User Profiles** window, if you are deleting a user ID, point to **User** on the menu bar and when its menu is displayed, click **Remove**. The **Remove User** window is displayed.
   - From the **User Profiles** window, if the user ID exists in the window, select the user ID from the list, and then point to **User** on the menu bar and when its menu is displayed, click **Modify**. The **Modify User** window is displayed.
     - To specify timeout and inactivity values, click **User Properties** from the **Modify User** window.
4. Complete or change the fields in the window, click **OK** when you are done.

Use the online Help if you need additional information for creating, modifying, copying, or removing a user profile and modifying timeout and inactivity values.

Adding, Copying, or Modifying User Profiles

Learn how to add, copy, or modify user profiles.

Users who remotely authenticate through Kerberos or Lightweight Directory Access Protocol (LDAP) must have their profiles set appropriately. You must set the user profile of each remotely authenticated Kerberos or LDAP user to use that type of authentication instead of local authentication. A user that is set to use Kerberos or LDAP remote authentication always uses that type of authentication, even when the user logs into the HMC locally.

Note: The use of Kerberos authentication requires configuration of a key distribution center (KDC) server by using the **KDC Configuration** task. The use of LDAP authentication requires configuration of an LDAP server by using the **LDAP Configuration** task. You do not need to set all users to use Kerberos or LDAP remote authentication. You can set some user profiles so that the users can use local authentication only.

From the Adding, Copying, or Modifying User Profiles window, you can modify the following attributes:

- **User ID**: Enter the user ID for the user profile you are creating or managing. The user name must start with an alphabetic character and consist of 1 to 32 characters.
- **Description**: Enter a meaningful description for your own records.
- **Password**: Enter the password for the user ID.
- **Confirm password**: Enter the password again for verification.
- **Password expires in (days)**: Specify the number of days a password is valid before it expires. This input field is available when **Enforce strict password rules** check box is selected.
- **Manage resource roles**: Displays the managed resource roles that are currently available. Select one or more managed resource roles to define access permissions for this user ID.
- **Task roles**: Displays the task roles that are currently available. Select one task role for this user ID.

Use the online Help if you need additional information about creating, modifying, copying, or removing a user profile and modifying timeout and inactivity values.

User Properties

Learn how to specify timeout and inactivity values for the selected user.

You can specify the amount of time for the following timeout and inactivity tasks:

Timeout Values

- **Session timeout minutes**: Specifies the number of minutes during a logon session that a user is prompted for identity verification. If a value other than zero is specified, the user is prompted after the specified time is reached to reenter their password. If a password is not reentered within the specified amount of time in the **Verify timeout minutes** field, the session is disconnected.
- **Verify timeout minutes**: Specifies the amount of time that is required for the user to reenter their password when prompted, if a value was specified in the **Session timeout minutes** field. If the password is not reentered within the specified time, the session is disconnected.
- **Idle timeout minutes**: Specifies the number of minutes the user's session can be idle. If the user does not interact with the session in the specified amount of time, the session is locked and the screen saver starts. Clicking anywhere on the screen prompts the user for identity verification.
- **Minimum time in days between password changes**: Specifies the minimum amount of time in days that must elapse between changes for the user's password.

Note: A note of zero in any of these fields indicates that there is no expiration of time and it is the default value. You can specify up to a maximum value of 525600 minutes (equivalent to one year).

Inactivity Values

- **Disable for inactivity in days**: Specifies the amount of time in days a user is temporarily disabled after the maximum number of days of inactivity is reached.
- **Never disable for inactivity**: Option to never disable a user's session due to inactivity.
- **Allow remote access via the web**: Option to enable remote web server access for the user you are managing.

Manage Users and Tasks

Display the logged on users and the tasks they are running.

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Manage Users and Tasks**.
3. In the Manage Users and Tasks window, the following information displays:
   - User you are logged in as
   - Time you logged in
   - Number of tasks running

- Your access location
- Information about tasks that are running:
  - Task ID
  - Task name
  - Targets (if any)
  - Session ID

4. Choose to log off or disconnect from a session that is currently running by selecting the session from the Users **Logged On** list, then click **Logoff** or **Disconnect**.

   Alternately, you can choose to switch to another task or end a task by selecting the task from the **Running Tasks** list, then click **Switch To** or **Terminate**.
5. When you have completed this task, click **Close**.

Manage Task and Resource Roles

Use this task to define and customize user roles.

Note: Predefined roles (default roles) cannot be modified.

A *user role* is a collection of authorizations. A user role can be created to define the set of tasks allowed for a given class of user (*task roles*) or it can be created to define the set of managed objects that are manageable for a user (*managed resource roles*). Once you have defined or customized the user roles you can use the **Manage User Profiles and Access** task to create new users with their own permissions.

If the automatic resource role update function is enabled on the Hardware Management Console (HMC) either through the command line interface or through the Rest API CLI runner job, the HMC user can automatically receive permission to the logical partition that is created. If the logical partition is deleted, the permission is automatically revoked.

The predefined managed resource roles include:

- All System Resources

The predefined task roles include:

- hmcservicerep (Service Representative)
- hmcviewer (Viewer)
- hmcoperator (Operator)
- hmcpe (Product Engineer)
- hmcsuperadmin (Super Administrator)

To customize managed resource roles or task roles:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Manage Task and Resource Roles**.
3. From the **Manage Task and Resource Roles** window, select either **Managed Resource Roles** or **Task Roles**.
4. To add a role, click **Edit** from the menu bar, then click **Add** to create a new role.

   or

   To copy, remove, or modify an existing role, select the object you want to customize, click **Edit** from the menu bar, then click **Copy**, **Remove**, or **Modify**.
5. Click **Exit** when you are have completed the task.

Use the online Help to get additional information for customizing managed resource roles and task roles.

Manage Certificates

Use this task to manage the certificates used on your HMC. It provides the capability of getting information on the certificates used on the console. This task allows you to create a new certificate for the console, change the property values of the certificate, and work with existing and archived certificates or signing certificates.

All remote browser access to the HMC must use Secure Sockets Layer (SSL) encryption. With SSL encryption required for all remote access to the HMC, a certificate is required to provide the keys for this encryption. The HMC provides a self-signed certificate that allows this encryption to occur.

To manage your certificates:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Manage Certificates**.
3. Use the menu bar from the **Manage Certificates** window for the actions you want to take with the certificates:
   - To create a new certificate for the console, click **Create**, then select **New Certificate**. Determine whether your certificate will be self-signed or signed by a Certificate Authority (CA), then click **OK**.
   - To modify the property values of the self-signed certificate, click **Selected**, then select **Modify**. Make the appropriate changes, then click **OK**.

     Note: If you have a certificate signed by a Certificate Authority (CA) that consists of a root certificate, intermediate certificate, and a client or leaf certificate, complete the following steps to upload the certificate to the HMC:

     - Open the CA signed certificate file by using a text-based editor and split the content of the file and save as three separate files. The first file is the client or leaf certificate, the second file is the intermediate certificate, and the third file is the root certificate.
     - Log in to the HMC to import the certificate. First upload the client certificate and click **Yes** for uploading more files. In the new window, upload the intermediate certificate and the root certificate.
     - Click **OK** to restart the console.
   - To work with existing and archived certificates or signing certificates, click **Advanced**. Then you can choose the following options:
     - Delete existing certificates
     - Work with archived certificates
     - Import certificates
     - View issuer certificates
4. Click **Apply** for all changes to take effect.

Use the online Help if you need additional information for managing your certificates.

Manage Certificate Revocation List

Use this task to create, modify, delete, and import the certificate revocation list that is used on your Hardware Management Console (HMC).

All remote browsers that are accessing the HMC must use Secure Sockets Layer (SSL) encryption. A certificate is required to provide the keys for this encryption. The HMC provides a self-signed certificate that allows this encryption to occur.

To manage your certificate revocation list, complete the following steps:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.

2. In the content pane, click **Manage Certificate Revocation List**.
3. Use the menu bar from the **Manage Certificate Revocation List** window for the actions you want to take with the certificates:
   - To create a new certificate revocation list for the console, click **Import**, then select **New CRL**. Determine whether your certification revocation list is imported from removable media on the console or from the file system on the system that is running the web browser.

     Note: If the list is from removable media, then the certificate revocation list file must be in the top directory on the media.
   - To modify a certificate revocation list on the console, select the certification revocation list from the table, and make appropriate changes, then click **Apply**.
   - To delete a certificate revocation list from the console, click **Selected**, then select **Delete CRL**. Select the certification revocation list, then click **OK**.
   - To work with existing and archived certificates or signing certificates, click **Advanced**.

Use the online Help if you need additional information for managing your certificate revocation list.

Manage LDAP

Configure your HMC so that it uses LDAP (Lightweight Directory Access Protocol) authentication.

Before you begin

Note: Before you configure the HMC so that it uses LDAP authentication, you must ensure that a working network connection exists between the HMC and the LDAP servers.

About this task

To configure your HMC so that it uses LDAP authentication, complete the following steps:

Procedure

1. In the navigation area, click **Users and Security**, and then select **Systems and Console Security**.
2. In the content pane, click **Manage LDAP**. The **LDAP Server Definition** window opens.
3. Select **Enable LDAP**.
4. Define an LDAP server to use for authentication (for example, Microsoft Active Directory, Tivoli®, and Open LDAP).
5. Define the LDAP attribute that is used to identify the authenticated user. The default is **uid**, but you can use your own attributes. For Microsoft Active Directory, use **sAMAccountName** as the attribute.
6. Define the distinguished name tree, also known as the search base, for the LDAP server.
7. Click **OK**.

What to do next

If you want to use LDAP authentication, you must configure each remote user's profile so that it uses LDAP remote authentication instead of local authentication.

Manage KDC

View the key distribution center (KDC) servers that are used by this Hardware Management Console (HMC) for Kerberos remote authentication.

From this task, you can complete the following tasks:

- View existing KDC servers.
- Modify existing KDC server parameters that include realm, ticket lifetime, and clock skew.
- Add and configure a KDC server on the HMC.

- Remove a KDC server.
- Import a service key.
- Remove a service key.

Kerberos is a network authentication protocol that is designed to provide strong authentication for client/server applications by using secret-key cryptography.

Under Kerberos, a client (generally either a user or a service) sends a request for a ticket to the KDC. The KDC creates a ticket-granting ticket (TGT) for the client, encrypts it using the client's password as the key, and sends the encrypted TGT back to the client. The client then attempts to decrypt the TGT, by using its password. If the client successfully decrypts the TGT (for example, if the client gave the correct password), it keeps the decrypted TGT, which indicates proof of the client's identity.

The tickets have a time availability period. Kerberos requires the clocks of the involved hosts to be synchronized. If the HMC clock is not synchronized with the clock of KDC server, authentication fails.

A Kerberos realm is an administrative domain, site, or logical network that uses Kerberos remote authentication. Each realm uses a primary Kerberos database that is stored on a KDC server and that contains information about the users and services for that realm. A realm might also have one or more secondary KDC servers, that store read-only copies of the primary Kerberos database for that realm.

To prevent KDC spoofing, the HMC can be configured to use a service key to authenticate to the KDC. Service key files are also known as keytabs. Kerberos verifies that the TGT requested was issued by the same KDC that issued the service key file for the HMC. Before you can import a service key file into an HMC, you must generate a service key for the host principal of the HMC client.

Note: For MIT Kerberos V5 *nix distributions, create a service key file by running the `kadmin` utility on a KDC and by using the `ktadd` command. Other Kerberos implementations might require a different process to create a service key.

You can import a service key file from one of these sources:

- Removable media that is mounted to the HMC, such as optical discs or USB Mass Storage devices. You must use this option locally at the HMC (not remotely), and you must mount the removable media to the HMC before you use this option.
- A remote site that uses secure FTP. You can import a service-key file from any remote site with SSH installed and running.

To use Kerberos remote authentication for this HMC, complete the following tasks:

- You must enable the Network Time Protocol (NTP) service on the HMC and set the HMC and the KDC servers to synchronize time with the same NTP server. You can enable the NTP service on the HMC by accessing the "Change Date and Time" on page 70 task from **Console Management**, and then selecting **Console Settings**.
- You must set the user profile of each remote user to use Kerberos remote authentication instead of local authentication. A user that is set to use Kerberos remote authentication always uses Kerberos remote authentication, even when the user logs on to the HMC locally.

  Note: You do not need to set all users to use Kerberos remote authentication. You can set some user profiles so that the users can use local authentication only.
- Use of a service key file is optional. Before you use a service key file, you must import it into the HMC. If a service key is installed on the HMC, realm names must be equivalent to the network domain name. The following example shows how to create the service key file on a Kerberos server by using the **kadmin.local** command, assuming the HMC hostname is `hmc1`, the DNS domain is `example.com`, and the Kerberos realm name is `EXAMPLE.COM`:

  – `# kadmin_local kadmin.local: ktadd -k /etc/krb5.keytab host/hmc1.example.com@EXAMPLE.COM`

  Using the Kerberos ktutil on the Kerberos server, verify the service key file contents. The output looks like the following example:

  – `# ktutil`

```
ktutil: rkt /etc/krb5.keytab
ktutil: l
slot KVNO Principal
---- ----
---------------------------------------------------------------------
1 9 host/hmc1.example.com@EXAMPLE.COM
2 9 host/hmc1.example.com@EXAMPLE.COM
```

- The HMC Kerberos configuration can be modified for SSH (Secure Shell) login without a password by using GSSAPI. For remote login without a password through Kerberos to an HMC, configure the HMC to use a service key. After the configuration is completed, use `kinit -f principal` to obtain forwardable credentials on a remote Kerberos client machine. You can then enter the following command to log in to the HMC without having to enter a password: `$ ssh -o PreferredAuthentications=gssapi-with-mic user@host`.

To manage the KDC, complete the following steps:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. From the **Manage KDC** window, select the appropriate task from the available options under the **Actions** menu.
4. When you complete the task, click **OK**.

Use the online Help if you need additional information for Managing KDC.

View KDC Server

Display existing key distribution center (KDC) servers on the Hardware Management Console (HMC).

To view existing KDC Servers on your HMC, click **Users and Security**, and then select **Users and Roles**. In the content pane, click **Configure KDC**. If no servers exist and NTP has not yet been enabled, a warning panel message displays. Enable the NTP service on the HMC and configure a new KDC server as desired.

Modify KDC Server

Learn how to modify the key distribution center (KDC) on your Hardware Management Console (HMC).

To modify existing key distribution center (KDC) server parameters, complete the following steps:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. Select a KDC Server.
4. Select a value to modify:
   - **Realm**. A realm is an authentication administrative domain. Normally, realms always appear in upper case letters. It is good practice to create a realm name that is the same as your DNS domain (in upper case letters). A user belongs to a realm if and only if the user shares a key with the authentication server of that realm. Realm names must be equivalent to the network domain name if a service key file is installed on the HMC.
   - **Ticket Lifetime**. Ticket lifetime sets the lifetime for credentials. The format is an integer number followed by one of **s** seconds, **m** minutes, **h** hours, or **d** days. Enter a Kerberos lifetime string such as *2d4h10m*.
   - **Clock skew**. Clock skew sets the maximum allowable amount of clock skew between the HMC and the KDC server before Kerberos considers messages invalid. The format is an integer number that represents number of seconds.
5. Click **OK**.

Add KDC server

Add a Key Distribution Center (KDC) server to this Hardware Management Console (HMC).

To add a new KDC server, complete the following steps:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. From the **Actions** drop down list, select **Add KDC Server**.
4. Enter the host name or IP address of the KDC server.
5. Enter the KDC server realm.
6. Click **OK**.

Remove KDC server

Kerberos authentication on the Hardware Management Console (HMC) remains enabled until all key distribution center (KDC) servers are removed.

To remove a KDC server:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. Select the KDC server from the list.
4. From the **Actions** drop down list, select **Remove KDC Server**.
5. Click **OK**.

Import Service Key

Before you can import a service key file into an Hardware Management Console (HMC), a service key file must first be created on the Kerberos server for the HMC host. The service key file contains the host principal of the HMC client, for example, `host/example.com@EXAMPLE.COM`. In addition to KDC Authentication, the host service key file is used to enable password-less SSH (Secure Shell) login using GSSAPI.

Note: For MIT Kerberos V5 *nix distributions, create a service key file by running the `kadmin` utility on a KDC and using the `ktadd` command. Other Kerberos implementations may require a different process to create a service key.

To import a service key, complete the following steps:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. From the **Actions** drop down list, select **Import Service Key**.
4. Select from one of the following:
   - **Local** - The service key must be located on removable media currently mounted on the HMC. You must use this option locally at the HMC (not remotely), and you must mount the removable media to the HMC before using this option. Specify the full path of the service key file on the media.
   - **Remote** - The service key must be located on a remote site available to the HMC via secure FTP. You can import a service key file from any remote site that has SSH (Secure Shell) installed and running. Specify the hostname of the site, a user ID and password for the site, and the full path of the service key file on the remote site.
5. Click **OK**.

Implementation of the service key file will not take effect until the HMC is rebooted.

Remove Service Key

Learn how to remove a service key from your Hardware Management Console (HMC).

To remove the service key from the HMC, complete the following steps:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Manage KDC**.
3. From the **Actions** drop down list, select **Remove Service Key**.
4. Click **OK**.

You must reboot the HMC after removing the service key. Failure to reboot may cause login errors.

Manage MFA

Learn how to enable Multi-Factor Authentication (MFA) on the Hardware Management Console (HMC).

Notes:

1. Multi-Factor Authentication is disabled on the HMC by default.
2. For HMC GUI login, when MFA is enabled and the user is configured on the PowerSC MFA server, enter the Cache Token Credential (CTC) code in the password field.
3. For Secure Shell (SSH) login:

   When MFA is enabled, all users that login through SSH are prompted for a CTC code. If the user is configured on the PowerSC MFA server, then you can enter the CTC code at the prompt. If the user is not configured on the PowerSC MFA server, press `Enter` when prompted for CTC code, and then enter the password of the user at the prompt.

To enable Multi-Factor Authentication, complete the following steps:

1. In the navigation area, click **Users and Security**, and then select **Systems and Console Security**.
2. In the content pane, click **Manage MFA**.
3. From the **Manage MFA** window, select the **Enable multi factor authentication** check box.
4. Enter the following information:
   - **Host name or IP address of the authentication server**
   - **Port of the authentication server**
5. Click **OK**.

Use the online Help if you need additional information about this task.

Enable Remote Command Execution

This task is used to enable remote command execution using the ssh facility.

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Enable Remote Command Execution**.
3. From the **Enable Remote Command Execution** window, select **Enable remote command execution using the ssh facility**.
4. Click **OK**.

Enable Remote Operation

This task is used to allow the HMC to be accessed at a remote workstation through a web browser.

To enable the HMC remote access:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Enable Remote Operation**.
3. Select **Enabled** from the Remote Operation drop-down list, then click **OK**. The HMC can be accessed from a remote workstation using a Web browser.

Use the online Help to get additional information for allowing remote access to the HMC.

Enable Remote Virtual Terminal

A Remote Virtual Terminal connection is a terminal connection to a logical partition from another remote HMC. Use this task to enable Remote Virtual Terminal access for remote clients.

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Enable Remote Virtual Terminal**.
3. From the **Enable Remote Virtual Terminal** window, you can enable this task by selecting Enable remote virtual terminal connections.
4. Click **OK** to activate your changes.

Use the online Help to get additional information for enabling a remote terminal connection.

Serviceability tasks

The tasks that are available on the HMC for the **Serviceability** tasks are described.

Note: Depending on the task roles assigned to your user ID you may not have access to all the tasks. See "HMC tasks, user roles, IDs, and associated commands" on page 8 for a listing of the tasks and the user roles allowed to access them.

Tasks Log

View all the tasks that are currently running or completed on the Hardware Management Console (HMC).

To view the tasks log, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Tasks Log**.
2. You can view the following tabs in the tasks log:
   - **Task name**: Displays the name of task.
   - **Status**: Displays the current state of the task (running or completed).
   - **Resource**: Displays the name of the resource.
   - **Resource type**: Displays the type of resource.
   - **Initiator**: Displays the name of the user that initiated the task.
   - **Start time**: Displays the time that the task was initiated.
   - **Duration**: Displays the amount of time that the task took to complete.

Use the online Help for additional information about viewing the tasks log.

Console Events Logs

View a record of system events occurring on the Hardware Management Console (HMC). System events are individual activities that indicate when processes occur, begin and end, succeed or fail.

To view console events legs, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Console Events Logs**.

2. Use the menu bar to change to a different time range, or to change how the events display in the summary. You can also use the table icons or the **Select Action** menu on the table toolbar to display different variations of the table.
3. When you are done viewing the events, select **View** on the menu bar, then click **Exit**.

Use the online Help for additional information about viewing HMC events.

Serviceable Events Manager

This task allows you to select the criteria for the set of serviceable events you want to view. When you finish selecting the criteria, you can view the serviceable events that match your specified criteria.

To set the criteria for the serviceable events you want to view, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Serviceable Events Manager**.
2. From the **Serviceable Events Manager** window, provide event criteria, error criteria, and FRU criteria.
3. Click **OK** when you have specified the criteria you want for the serviceable events you want to view.

Use the online Help if you need additional information managing events.

Events Manager for Call Home

Learn how to monitor and approve any data that is being transmitted from an HMC to IBM.

1. In the navigation area, click **Serviceability**, and then select **Events Manager for Call Home**.
2. From the **Events Manager for Call Home** window, select **Manage Consoles** to manage the list of registered management consoles. You can use the **Event Criteria** to specify the approval state, status, and originating HMC to filter the list of events that are available for all registered management consoles. You can use the criteria to filter the view and select events to view details, view files, and complete call home operations.
3. Click **OK** to exit Events Manager for Call Home and to save the filter values.

Use the online Help if you need additional information about this task.

Create Serviceable Event

This task reports problems that occurred on your Hardware Management Console (HMC) to the service provider (for example, the mouse does not work) or lets you test problem reporting.

Submitting a problem is dependent upon whether you have customized this Hardware Management Console to use the Remote Support Facility (RSF) and if it is authorized to automatically call for service. If so, the problem information and service request is sent to the service provider automatically with a modem transmission.

To report a problem on your Hardware Management Console, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Create Serviceable Event**.
3. From the **Create Serviceable Event** window, select a problem type from the list displayed.
4. Enter a brief description of your problem in the **Problem Description** input field and then click **Request Service**.

To test problem reporting from the **Report a Problem** window:

1. Select **Test automatic problem reporting** and enter *This is just a test* in the **Problem Description** input field.

2. Click **Request Service**. The problems are reported to the service provider for the Hardware Management Console. Reporting a problem sends to the service provider the information you provide on **Report a Problem** window, and machine information that identifies the console.

Use the online Help if you need additional information for reporting a problem or testing if problem reporting works.

Manage Dumps

Learn how to manage the procedures for dumps of selected systems on your Hardware Management Console (HMC).

To manage a dump, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Manage Dumps**.
3. From the **Manage Dumps** window, select a dump and perform one of the following dump-related tasks:

   From **Selected** on the menu bar:

   - Copy the dump to media.
   - Copy the dump to a remote system.
   - Use the call home feature to transmit the dump to your service provider.
   - Delete a dump.

   From **Actions** on the menu bar:

   - Initiate a dump of the hardware and server firmware for the managed system.
   - Initiate a dump of the service processor.
   - Initiate a dump of the Bulk Power Control service processor.
   - Modify the dump capability parameters for a dump type.

   From **Status** on the menu bar, you can view the offload progress of the dump.
4. Click **OK** when you complete this task.

Use the online Help to get additional information for managing dumps.

Transmit Service Information

Transmit service information to your service provider immediately or schedule when to transmit service information for use for problem determination.

To schedule or transmit service information, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Transmit Service Information**.
3. In the content pane, click the **Schedule and Send Data** tab to schedule the service information.

   Note: You can also click the following tabs to select the data that you want to send and to configure FTP connections:

   - **Schedule and Send Data**: Transmit information to your service provider immediately or schedule the transmission.
   - **Configure FTP Connection**: Provide configuration data to allow the use of FTP to offload service information.
   - **Send Problem Reports**: Select the data that you want and the destination for the data.

4. Select the types of service information that you want to enable regular transmissions or to send immediately.
   - **Operational Test (Heartbeat) Information -- always enabled**: Send the Problem Event log file.
   - **Hardware Service Information (VPD)**: Send the Vital Product Data (VPD) for all managed systems that are attached to this HMC.
   - **Software Service Information**: Send the VPD for all software that is running on the partitions.
   - **Performance Management Information**: Gather and send the performance management information.
   - **Update Access Key Information**: Verifies and updates Access Key information.
5. Select the interval (in days) and the time to schedule repeating transmissions. To transmit the information immediately, click **Send Now**.
6. Click **OK**.

Use the online Help for additional information about scheduling service information.

Format Media

This task formats a diskette or USB 2.0 Flash Drive Memory Key.

You can format a diskette by supplying a user-specified label.

To format a diskette or USB 2.0 Flash Drive Memory Key, complete the following steps:

1. In the navigation area, click **Console Management**, and then select **Console Managment**.
2. In the content pane, click **Format Media**.
3. From the **Format Media** window, select the type of media you want to format, then click **OK**.
4. Make sure that your media is correctly inserted, then click **Format**. The **Format Media** progress window is displayed. When the media is formatted, the **Format Media Completed** window is displayed.
5. Click **OK** and then click **Close** to end the task.

Use the online Help if you need additional information about this task.

Electronic Service Agent Setup Wizard

Learn how to open the Electronic Service Agent Setup wizard using the Hardware Management Console (HMC) interface.

About this task

To open the Electronic Service Agent Setup wizard, complete the following steps:

Procedure

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the contents pane, select **Electronic Service Agent Setup Wizard**. The Electronic Service Agent wizard opens. Follow the instructions in the wizard to configure call-home tasks.

Authorize User

Request authorization for Electronic Service Agent. Electronic Service Agent associates your system with a user ID and allows access to system information through the Electronic Service Agent facility. This registration is also used by your operating system to automate service processes for your AIX or IBM i operation system.

To register a user ID, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Authorize User**.
3. Provide a user ID that is registered with the Electronic Service Agent. If you need a user ID, you can register at the IBM Registration website.
4. Click **OK**.

Use the online Help if you need additional information for registering a customer user ID with the eService website.

Enable Electronic Service Agent

This task allows you enable or disable the call-home state for managed systems.

Note: If Customizable Data Replication is **Enabled** on this HMC (using the **Manage Data Replication** task), the data specified in this task may change depending on automatic replication from other HMCs configured on your network. For more information on data replication, see "Manage Data Replication" on page 75.

By enabling the call-home state for a managed system this causes the console to automatically contact a service center when a serviceable event occurs. When a managed system is disabled, your service representative is not informed of serviceable events.

To manage call-home for the system(s):

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Enable Electronic Service Agent**.
3. From the **Enable Electronic Service Agent** window, select a system or systems you want to enable or disable the call-home state.
4. Click **OK** when you have completed the task.

Use the online Help if you need additional information for enabling the Electronic Service Agent.

Manage Outbound Connectivity

Customize the means for outbound connectivity for the Hardware Management Console (HMC) to use to connect to remote service.

Note: If Customizable Data Replication is **Enabled** on this HMC (using the **Manage Data Replication** task), the data specified in this task may change depending on automatic replication from other HMCs configured on your network. For more information on data replication, see "Manage Data Replication" on page 75.

You can configure this HMC to attempt connections through the local modem, Internet, Internet Virtual Private Network (VPN), or through a remote pass-through system. Remote service is a two-way communication between the HMC and the IBM Service Support System for the purpose of conducting automated service operations. The connection can only be initiated by the HMC. IBM Service Support System cannot and never attempts to initiate a connection to the HMC.

You can configure this HMC to attempt connections through the local modem, Internet, Internet Virtual Private Network (VPN), or through a remote pass-through system. Remote service is a two-way communication between the HMC and your support system for the purpose of conducting automated service operations. The connection can only be initiated by the HMC.

To customize your connectivity information, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Manage Outbound Connectivity**.
3. From the **Manage Outbound Connectivity** window select **Enable local server as call-home server** (a check mark appears) before proceeding with the task.

Note: You must first **Accept** the terms described about the information you provided in this task.

This allows the local HMC to connect to your service provider's remote support facility for call-home requests.

4. The dial information window displays the following tabs for providing input:

   - Local Modem
   - Internet
   - Internet VPN
   - Pass-Through Systems

5. If you want to allow connectivity over a modem, use the **Local Modem** tab, then select **Allow local modem dialing for service** .

   a. If your location requires a prefix to be dialed in order to reach an outside line, click **Modern Configuration** and enter the **Dial prefix** in the **Customize Modem Settings** window required by your location. Click **OK** to accept the setting.

   b. Click **Add** from the **Local Modem** tab page to add a telephone number. When local modem dialing is allowed, there must be at least one telephone number configured.

6. If you want to allow connectivity over the Internet, use the **Internet** tab, then select **Allow an existing internet connection for service**.
7. If you want to configure the use of a VPN over an existing Internet connection to connect from the local HMC to your service provider's remote support facility, use the **Internet VPN** tab.
8. If you want to allow the HMC to use the pass-through systems as configured by the TCP/IP address or host name, use the **Pass-Through Systems** tab.
9. When you complete all the necessary fields, click **OK** to save your changes.

Use the online Help if you need additional information for customizing outbound connectivity information.

Manage Inbound Connectivity

Learn how to allow your service provider to temporarily access your local console, such as the Hardware Management Console (HMC), or the partitions of a managed system.

To manage inbound connectivity, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Manage Inbound Connectivity**.
3. From the **Manage Inbound Connectivity** settings window, you can perform the following tasks:

   - Use the **Remote Service** tab to provide the information necessary to start an attended remote service session.
   - Use the **Call Answer** tab to provide the information necessary to accept incoming calls from your service provider to start an unattended remote service session.

4. Click **OK** to proceed with your selections.

Use the online Help if you need additional information about this task.

Manage Customer Information

This task enables you to customize the customer information for the Hardware Management Console (HMC).

Note: If Customizable Data Replication is *Enabled* on this HMC (using the **Manage Data Replication** task), the data specified in this task may change depending on automatic replication from other HMCs configured on your network. For more information on data replication, see "Manage Data Replication" on page 75.

The **Manage Customer Information** window displays the following tabs for providing input:

- Administrator
- System
- Account

To customize your customer information, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Manage Customer Information**.
3. From the **Manage Customer Information** window, provide the appropriate information on the **Administrator** page.

   Note: Information is required for fields with an asterisk (*).
4. Select the **System** and **Account** tabs from the **Manage Customer Information** window to provide additional information.
5. Click **OK** when you have completed the task.

Use the online Help to get additional information about customizing your account information.

Manage Event Notification

This task adds email addresses that notify you when problem events occur on your system and configures how you want to receive notification of system events from the Electronic Service Agent.

To set up notification, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Manage Event Notification**.
3. From the **Manage Event Notification** window, you can complete the following tasks:
   - Use the **Email** tab to add the email addresses that are notified when problem events occur on your system and when scheduled operations are planned for your system.
   - Use the **SNMP Trap Configuration** tab to specify locations for sending Simple Network Management Protocol (SNMP) trap messages for Hardware Management Console application programming interface events.
4. Click **OK** when you complete this task.

Use the online Help if you need additional information about this task.

Manage Connection Monitoring

Learn how to configure the timers that the connection monitoring uses to detect outages and enables or disables connection monitoring for selected machines.

You can view and, if authorized, change connection monitoring settings by machine. Connection monitoring generates serviceable events when communication problems are detected between the HMC and managed systems. If you disable connection monitoring, no serviceable events are generated for networking problems between the selected machine and this HMC.

To monitor the connections, complete the following steps:

1. In the navigation area, click **Serviceability**, and then select **Service Management**.
2. In the content pane, click **Manage Connection Monitoring**.

3. From the **Manage Connection Monitoring** window, adjust the timer settings, if required, and enable or disable the server.
4. Click **OK** when you have completed the task.

Use the online Help if you need additional information about connection monitoring.

Remote operations

Connect to and use the Hardware Management Console (HMC) remotely.

Remote operations use the GUI used by a local HMC operator or the command line interface (CLI) on the HMC. You can perform operations remotely in the following ways:

- Use a remote HMC.
- Use a web browser to connect to a local HMC.
- Use an HMC remote command line.

The remote HMC is an HMC that is on a different subnet from the service processor, therefore the service processor cannot be auto discovered with IP multicast.

To determine whether to use a remote HMC or web browser that is connected to a local HMC, consider the scope of control that you need. A remote HMC defines a specific set of managed objects that are directly controlled by the remote HMC, while a web browser to a local HMC has control over the same set of managed objects as the local HMC. The communications connectivity and communications speed is an extra consideration. LAN connectivity provides acceptable communications for either a remote HMC or web browser control.

Using a remote HMC

A remote HMC gives the most complete set of functions because it is a complete HMC. Only the process of configuring the managed objects is different from a local HMC.

As a complete HMC, a remote HMC has the same setup and maintenance requirements as a local Hardware Management Console. A remote HMC needs LAN TCP/IP connectivity to each managed object (service processor) that is to be managed; therefore, any customer firewall that might exist between the remote HMC and its managed objects must allow the HMC to service processor communications to occur. A remote HMC might also need communication with another HMC for service and support. Table 10 on page 98 shows the ports that a remote HMC uses for communications.

Table 10. Ports used by a Remote HMC for Communications

Port	Use
udp 9900	HMC to HMC discovery
tcp 9920	HMC to HMC commands

A remote HMC needs connectivity to IBM (or another HMC that has connectivity to IBM) for service and support. The connectivity to IBM might be in the form of access to the internet (through a company firewall).

Performance and the availability of the status information and access to the control functions of the service processor depends on the reliability, availability, and responsiveness of the customer network that interconnects the remote HMC with the managed object. A remote HMC monitors the connection to each service processor and attempts to recover any lost connections and can report those connections that cannot be recovered.

Security for a remote HMC is provided by the HMC user-login procedures in the same way as a local HMC. As with a local HMC, all communication between a remote HMC and each service processor is encrypted. Certificates for secure communications are provided, and can be changed by the user if wanted.

TCP/IP access to the remote HMC is controlled through its internally managed firewall and is limited to HMC-related functions.

Using a web browser

If you need occasional monitoring and control of managed objects that are connected to a single local Hardware Management Console (HMC), use a web browser. An example of using the web browser might be an off-hours monitor from home by an operator or system programmer.

Each HMC contains a web server that can be configured to allow remote access for a specified set of users. If a customer firewall exists between the web browser and the local HMC, the ports must be accessible and the firewall setup to allow incoming requests on these ports. Table 11 on page 99 shows the ports that a web browser needs for communicating with an HMC.

Table 11. Ports that are used by a web browser for communications to the HMC

Port	Use
TCP 443	Secure (HTTPS) remote interface communication
TCP 8443	Secure browser access to web server communication
TCP 9960	Browser applet communication

[1] This port is opened in the HMC firewall when remote access is enabled in HMC Version 7.8.0 and later. This port must also be opened in any firewall that is between the remote client and the HMC.

After an HMC is configured to allow web browser access, a web browser gives an enabled user access to all the configured functions of a local HMC, except those functions that require physical access to the HMC, such as those that use the local diskette or DVD media. The user interface that is presented to the remote web browser user is the same as that of the local HMC and is subject to the same constraints as the local HMC.

The web browser can be connected to the local HMC by using a LAN TCP/IP connection and by using only encrypted (HTTPS) protocols. Logon security for a web browser is provided by the HMC user-login procedures. Certificates for secure communications are provided, and can be changed by the user.

Performance and the availability of the status information and access to the control functions of the managed objects depends on the reliability, availability, and responsiveness of the network that interconnects the web browser with the local HMC. Because there is no direct connection between the web browser and the individual managed objects, the web browser does not monitor the connection to each service processor, does not perform any recovery, and does not report any lost connections. These functions are handled by the local HMC

The web browser system does not require connectivity to IBM for service or support. Maintenance of the browser and system level is the responsibility of the customer.

If the URL of the HMC is specified by using the format https://*xxx.xxx.xxx.xxx* (where *xxx.xxx.xxx.xxx* is the IP address) and Microsoft Internet Explorer is used as the browser, a host name mismatch message is displayed. To avoid this message, a Firefox browser is used or a host name is configured for the HMC, by using the **Change Network Settings** task (see "Change Network Settings" on page 69), and this host name is specified in the URL instead of an IP address. For example, you can use the format https://*host name.domain_name* or https://*host name* (for example, by using https://hmc1.ibm.com or https://hmc1).

Preparing to use the web browser

Perform the necessary steps to prepare to use a web browser to access the Hardware Management Console (HMC).

Before you can use a web browser to access an HMC, you must complete the following tasks:

- Configure the HMC to allow remote control for specified users.

- For LAN-based connections, you must know the TCP/IP address of the HMC to be controlled, and correctly set up any firewall access between the HMC and the web browser.
- Have a valid user ID and password that is assigned by the access administrator for HMC web access.

Web browser requirements

Learn about the requirements your web browser must meet to monitor and control the Hardware Management Console (HMC).

HMC web browser support requires HTML 2.0, JavaScript 1.0, Java™ Virtual Machine (JVM), Java Runtime Environment (JRE) Version 7, and cookie support in browsers that connect to the HMC. Contact your support personnel to assist you in determining whether your browser is configured with a Java Virtual Machine. The web browser must use HTTP 1.1. If you are using a proxy server, HTTP 1.1 must be enabled for the proxy connections. Additionally, pop-up windows must be enabled for all HMCs addressed in the browser if the browser is running with pop-up windows disabled. The following browsers have been tested:

Google Chrome

HMC Version 8.1 supports Google Chrome Version 33.

Microsoft Internet Explorer

HMC Version 8.1 supports Internet Explorer 9.0, Internet Explorer 10.0, and Internet Explorer 11.0.

Note: The performance CEC task is not supported in Internet Explorer 9.0.

- If your browser is configured to use an Internet proxy, then local IP addresses are included in the exception list. For more information, see your network administrator. If you still need to use the proxy to get to the Hardware Management Console, enable Use **HTTP 1.1 through proxy connections** under the **Advanced** tab in your Internet Options window.

Mozilla Firefox

HMC Version 8.1 supports Mozilla Firefox Version 17 and Mozilla Firefox Version 24 Extended Support Release (ESR). Ensure that the JavaScript options to raise or lower windows and to move or resize existing windows are enabled. To enable these options, click the **Content** tab in the browser's Options dialog, click **Advanced** next to the Enable JavaScript option, and then select the Raise or lower windows option and the Move or resize existing windows options. Use these options to easily switch between HMC tasks. For more information about the latest Mozilla Firefox ESR levels, see Security Advisories for Firefox ESR.

Note: The following restrictions apply when you are using Mozilla Firefox while the HMC is in NIST SP 800-131a security mode:

- Mozilla Firefox cannot be used for the remote client.
- The local console cannot be used.

Other web browser considerations

Session cookies need to be enabled in order for ASMI to work when connected to HMC remotely. The ASM proxy code saves session information and uses it.

Internet Explorer

1. Click **Tools** > **Internet Options**.
2. Click the **Privacy** tab and select **Advanced**.
3. Determine whether **Always allow session cookies** is checked.
4. If not checked, select **Override automatic cookie handling** and **Always allow session cookies**.
5. For the First-party Cookies and Third-party Cookies, choose block, prompt, or accept. Prompt is preferred, in which case you are prompted every time that a site tries to write cookies. Some sites need to be allowed to write cookies.

Firefox

1. Click **Tools** > **Options**.

2. Click the **Cookies** Tab.
3. Select **Allow sites to set cookies**.
4. If you want to allow only specific sites, select **Exceptions**, and add this HMC to allow access.

Using the HMC remote command line

An alternative to performing tasks on the HMC graphical user interface is using the command line interface (CLI).

You can use the command line interface in the following situations:

- When consistent results are required. If you must administer several managed systems, you can achieve consistent results by using the command line interface. The command sequence can be stored in scripts and run remotely.
- When automated operations are required. After you develop a consistent way to manage the managed systems, you can automate the operations by starting the scripts from batch-processing applications, such as the **cron** daemon, from other systems.

On a local HMC, you can use the command line interface in the console window.

Setting up secure script execution between SSH clients and the HMC

You must ensure that your script executions between Secure Shell (SSH) clients and the Hardware Management Console (HMC) are secure.

HMCs typically are placed inside the server room where managed systems are located, so you might not have physical access to the HMC. In this case, you can remotely access it using either a remote web browser or the remote command line interface.

Note: To enable scripts to run unattended between an SSH client and an HMC, the SSH protocol must already be installed on the client's operating system.

To enable scripts to run unattended between an SSH client and an HMC, complete the following steps:

1. Enable remote command execution. For more information, see "Enable Remote Command Execution" on page 90.
2. On the client's operating system, run the SSH protocol key generator. To run the SSH protocol key generator, complete the following steps:

   a. To store the keys, create a directory that is named `$HOME/.ssh` (either RSA or DSA keys can be used).

   b. To generate public and private keys, run the following command:

      ```
      ssh-keygen -t rsa
      ```

      The following files are created in the $HOME/.ssh directory:

      ```
      private key: id_rsa
      public key: id_rsa.pub
      ```

      The write bits for both group and other are turned off. Ensure that the private key has a permission of 600.“
3. On the client's operating system, use ssh and run the `mkauthkeys` command to update the HMC user's authorized_keys2 file on the HMC by using the following command:

   ```
   ssh hmcuser@hmchostname mkauthkeys -–add <the contents of $HOME/.ssh/
   id_rsa.pub>
   ```

   Note: Double quotes (“) are used in commands to ensure that the remote shell can properly process the command. For example:

   ```
   ssh "mkauthkeys hscuser@somehmchost --add 'ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQDa+Zc8+hn1+
   TjEXu640LqnVNB+UsixIE3c649Cgj20gaVWnFKTjcpWVahK/duCLac/zteMtVAfCx7/ae2g5RTPu7FudF2xjs4r
   +NadVXhoIqmA53a
   ```

```
NjE4GILpfe5vOF25xkBdG9wxigGtJyOKeJHzgnElP7RlEeOBijJDKo5gGE12NVfBxboChm6LtKnDxLi9ahhOYtLlFehJr
6pV/lMAEu
Lhd6ax1hWvwrhf/
h5Ym6J8JbLVL3EeKbCsuG9E4iN1z4HrPkT5OQLqtvC1Ajch1ravsaQqYloMTWNFzM4Qo5O3fZbLc6RuJjtJv8C5t
4/SZUGHZxSPnQmkuii1z9hxt hscpe@vhmccloudvm179'"
```

To delete the key from the HMC, you can use the following command:

```
ssh hmcuser@hmchostname mkauthkeys --remove joe@somehost
```

To enable passwords that prompts for all hosts that access the HMC through SSH, use the `scp` command to copy the key file from the HMC: `scp hmcuser@hmchostname:.ssh/authorized_keys2 authorized_keys2`

Edit the `authorized_keys2` file and remove all lines in this file and then, copy it back to the HMC: `scp authorized_keys2 hmcuser@hmchostname:.ssh/authorized_keys2`

Enabling and disabling HMC remote commands

You can enable or disable the remote command line interface access to the Hardware Management Console (HMC).

To enable or disable remote commands, complete the following steps:

1. In the navigation area, click **Users and Security**, and then select **Users and Roles**.
2. In the content pane, click **Enable Remote Command Execution**.
3. From the **Enable Remote Command Execution** window, select from the following options:
   - To enable remote commands, select **Enable remote command execution using the ssh facility**.
   - To disable remote commands, make sure **Enable remote command execution using the ssh facility** is not selected.
4. Click **OK**.

Logging in to the HMC from a LAN-connected web browser

Log in to the Hardware Management Console (HMC) remotely from a LAN-connected web browser.

Use the following steps to log in to the HMC from a LAN-connected web browser:

1. Ensure that your web browser has LAN connectivity to the wanted HMC.
2. From your web browser, enter the URL of the wanted HMC in the format `https://hostname.domain_name` (for example: `https://hmc1.ibm.com`) or `https://xxx.xxx.xxx.xxx`.

   If this connection is the first access of the HMC for the current web browser session, you might receive a certificate error. This certificate error is displayed if any of the following conditions occur:

   - The web server that is contained in the HMC is configured to use a self-signed certificate and the browser is not configured to trust the HMC as an issuer of certificates.
   - The HMC is configured to use a certificate that is signed by a certificate authority (CA) and the browser is not configured to trust this CA.

   In either case, if you know that the certificate that is being displayed to the browser is the one used by the HMC, you can continue and all communications to the HMC is encrypted.

   If you do not want to receive notification of a certificate error for the first access of any browser session, you can configure the browser to trust the HMC or the CA. In general, to configure the browser, use one of the following methods:

   - You must indicate that the browser permanently trusts the issuer of the certificate.
   - By viewing the certificate and installing to the database of trusted CAs, the certificate of the CA that issues the certificate is used by the HMC.

   If the certificate is self-signed, the HMC itself is considered the CA that issues the certificate.

3. When prompted, enter the user name and password that is assigned by your administrator.

Managing OpenBMC-based and BMC-based systems by using the HMC

Learn how to manage OpenBMC-based and BMC-based systems by using the Hardware Management Console (HMC).

About this task

Learn about the tasks that you perform from the console and how to navigate the baseboard management controller (BMC) by using the web-based user interface with graphical views of managed systems and simplified navigation.

Note: You cannot manage OpenBMC-based and BMC-based systems while the HMC is running in NIST mode.

Add Managed Systems

Learn how to add a managed Baseboard Management Controller (BMC) system to the Hardware Management Console (HMC).

To add one or more managed BMC systems to the HMC, complete the following steps:

1. From the HMC dashboard, click **Connect Systems**
2. From the **Add Managed Systems** window, you can add a BMC system by completing the following fields:

   - **IP Address/Host name**
   - **Username (BMC system)**
   - **Password**

   Alternatively, you can specify a range of IP addresses and click **OK** to view a list of systems that were discovered. You can select one or more discovered systems to add to the HMC.

   Note: The discovery process can take a long time to complete.
3. Click **OK** to add the managed system to the HMC.

Use the online Help if you need additional information about this task.

Systems Management for Servers

Systems Management displays tasks to manage servers. Use these tasks to set up, configure, view status, troubleshoot, and apply solutions for servers.

These tasks are listed when a managed system is selected. The tasks that are listed in the menu pod change as selections are made in the work area.

Operations

Operations contains the tasks for operating managed systems.

Power Off

Shut down the managed system.

Choose from the following options:

Normal power off

The Normal power off mode shuts down the system's operations in a controlled manner. During the shutdown, programs running active jobs are allowed to perform cleanup (end-of-job processing).

Power On

Use the **Power On** task to start a managed system.

Choose from the following options to power on your managed system:

Normal: Select this option to specify that the HMC uses the current setting for the partition start policy to determine how to power on the managed system. The default setting is set to the following value:

- **Auto-Start Always**: This option specifies that the HMC power on logical partitions automatically after the managed system powers on. If powering on the managed system is the result of a user action, the HMC starts all partitions that are configured for automatic startup. If powering on the managed system is the result of an automatic recovery process, the HMC starts only those logical partitions that were running at the time the system is powered off. This option is always available for selection.

Schedule Operations

Create a schedule for certain operations to be performed on the managed system without operator assistance.

Scheduled operations are helpful for situations where automatic, delayed, or repetitious processing of system operations is necessary. A scheduled operation is started at a specified time, without operator assistance to perform the operation. A schedule can be set for one operation or repeated many times.

For example, you might schedule power on or off operations for a managed system.

The Scheduled Operations task displays the following information for each operation:

- The processor that is the object of the operation.
- The scheduled date
- The scheduled time
- The operation
- The number of remaining repetitions

From the **Scheduled Operations** window, you can perform the following tasks:

- Schedule an operation to run later.
- Define operations to repeat at regular intervals.
- Delete a previously scheduled operation.
- View details for a currently scheduled operation.
- View scheduled operations within a specified time range.
- Sort scheduled operations by date, operation, or managed system.

You can schedule an operation to occur once or you can schedule it to repeat. You must provide the time and date that you want the operation to occur. If you want the operation to repeat, you are asked to select the following options:

- The day or days of the week that you want the operation to occur. (optional)
- The interval, or time between each occurrence. (required)
- The total number of repetitions. (required)

The operations that you can schedule for the managed system include the following operations:

Power Off Managed System
Schedules an operation for a system power off at regular intervals for a managed system.

Power On Managed System
Schedules an operation for a system power-on at regular intervals for a managed system.

To schedule operations on the managed system, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. In the content pane, select one or more managed systems.

3. In the menu pod, select **Actions** > **View All Actions** > **Operations** > **Schedule Operations**.
4. From the **Scheduled Operations** window, click **Options** from the menu bar to display the next level of options:
   - To add a scheduled operation, click **Options** and then click **New**.
   - To delete a scheduled operation, select the operation that you want to delete, point to **Options** and then click **Delete**.
   - To update the list of scheduled operations with the current schedules for the selected objects, point to **Options** and then click **Refresh**.
   - To view a scheduled operation, select the operation that you want to view, point to **View** and then click **Schedule Details**.
   - To change the time of a scheduled operation, select the operation that you want to view, point to **View** and then click **New Time Range**.
   - To sort the scheduled operations, point to **Sort** and then click one of the sort categories that appears.
5. To return to the HMC workplace, point to **Operations** and then click **Exit**.

Launch BMC System Management

The Hardware Management Console (HMC) can connect directly to the Baseboard Management Controller (BMC) for a selected system.

The BMC system management is an interface to the service processor that allows you to manage the operation of the server, such as auto power restart, and to view information about the server, such as the error log and vital product data.

To connect to the BMC, complete the following steps:

Note: To access the BMC user interface, you must be at the console or have access to the BMC by using a supported web browser.

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. In the content pane, select one or more managed systems.
3. In the menu pod, select **Actions** > **View All actions** > **Operations** > **Launch BMC System Management**.
4. Click **Continue**.

Configuring Call Home

Problems on your BMC-based managed system are reported to the Hardware Management Console (HMC) as events. You can set up alerts to be automatically notified of any events.

Note: You must enable SNMP traps in the HMC to receive alerts. To enable SNMP traps, navigate to **Console Settings** > **Change Network Settings** > **LAN Adapters** > **Details** > **Firewall Settings**. Select **SNMP Traps** and **SNMP Agent** from the table and then click **Allow Incoming**.

To set up alerts for call home, complete the following steps:

1. From the **BMC System Management** window, click **Configuration** > **Alerts**.
2. Select any alert from the table and click **Modify**.

   Note: You can set up multiple HMCs to receive traps. Duplicate reporting of events by multiple HMCs is possible as duplicate event verification is not performed.
3. Complete the following fields:
   - **Event Severity**
   - **Destination IP**
4. Click **Save**.
5. Verify the new alert in the table.

Use the online Help if you need additional information about this task.

Rebuild

You can extract the configuration information from the managed system and rebuild the information on the Hardware Management Console (HMC).

This task does not disrupt the operation of the running server.

Rebuilding the managed system updates the information on the HMC about the managed system. Rebuilding the managed system is useful when the state of the managed system is `Incomplete`. The Incomplete state means that the HMC cannot gather complete information from the managed system about logical partitions, profiles, or resources.

Rebuilding the managed system is different from refreshing the **HMC** window. When the managed system is rebuilt, the HMC extracts the information from the managed system. You cannot start other tasks while the HMC rebuilds the managed system. This process can take several minutes.

Updates

Display tasks to view system information, manage updates on your Hardware Management Console (HMC), or check system readiness.

Change Licensed Internal Code

Change the Licensed Internal Code of a managed BMC system by using your Hardware Management Console (HMC).

The system firmware is a combination of the BMC firmware and the PNOR firmware. You must update both the BMC firmware and the PNOR firmware for the system to operate properly. If you update only one type of firmware, but do not update the other type of firmware, system errors might occur.

To change the Licensed Internal Code, complete the following steps:

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to view system information.
3. In the menu pod, expand **Actions** and then expand **Updates**.
4. Select **Change Licensed Internal Code** > **BMC Change Licensed Internal Code**.
5. Follow the onscreen instructions in the **BMC Change Licensed Internal Code** guided wizard.

   Note: The BMC system must be in the powered off state before you can proceed with the wizard.
6. When you complete this task, click **Close**.

Use the online Help if you need additional information about this task.

Attention LED

View system attention LED information, light specific LEDs to identify a system component, and test all LEDs on a managed system.

The system provides several LEDs that help identify various components, such as enclosures or field replaceable units (FRUs), in the system. For this reason, they are called **Identify** LEDs. Individual LEDs are on or near the components. The LEDs are located either on the component itself or on the carrier of the component (for example, memory card, fan, memory module, or processor). LEDs are either green or amber. Green LEDs indicate either of the following states:

- Electrical power is present.
- Activity is occurring on a link. (The system might be sending or receiving information).

Amber LEDs indicate a fault or identify condition. If your system or one of the components on your system has an amber LED turned on or flashing, identify the problem and take the appropriate action to restore the system back to normal.

You can activate or deactivate the following types of identify LEDs:

Identify LED for an enclosure

If you want to add an adapter to a specific drawer (enclosure), you need to know the machine type, model, and serial number (MTMS) of the drawer. To determine whether you have the correct MTMS for the drawer that needs the new adapter, you can activate the LED for a drawer and verify that the MTMS corresponds to the drawer that requires the new adapter.

You can deactivate a system attention LED. For example, you might determine that a problem is not a high priority and decide to repair the problem later. However, you want to be alerted if another problem occurs, so you must deactivate the system attention LED so that it can be activated again if another problem occurs.

Connections

You can view the Hardware Management Console (HMC) connection status to service processors, reset those connections, connect another HMC to the selected managed system, or disconnect another HMC.

If you select a managed system in the work area, the following tasks pertain to that managed system.

Service Processor Status

View information about the status of the Hardware Management Console (HMC) connection to the service processors on the managed system.

About this task

To show the service processor connection status to the service processors on the managed system, complete the following steps:

Procedure

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server for which you want to view service processor connection status.
3. In the menu pod, select **Actions** > **View All Actions** > **Connections** > **Service Processor Status**.

Reset or Remove Connections

Reset or remove a managed system from the Hardware Management Console (HMC) interface.

About this task

To reset or remove connections, complete the following steps:

Procedure

1. In the navigation area, click **Resources**, and then select **All Systems**.
2. Select the server that you want to reset or remove.
3. In the menu pod, select **Actions** > **View All Actions** > **Connections** > **Reset or Remove Connections**.
4. Select **Reset Connection** or **Remove Connection**.
5. Click **OK**.

Notices

This information was developed for products and services offered in the US.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive, MD-NC119
Armonk, NY 10504-1785
US

For license inquiries regarding double-byte character set (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Some jurisdictions do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM websites are provided for convenience only and do not in any manner serve as an endorsement of those websites. The materials at those websites are not part of the materials for this IBM product and use of those websites is at your own risk.

IBM may use or distribute any of the information you provide in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM Director of Licensing
IBM Corporation
North Castle Drive, MD-NC119
Armonk, NY 10504-1785
US

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any equivalent agreement between us.

The performance data and client examples cited are presented for illustrative purposes only. Actual performance results may vary depending on specific configurations and operating conditions.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

All IBM prices shown are IBM's suggested retail prices, are current and are subject to change without notice. Dealer prices may vary.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to actual people or business enterprises is entirely coincidental.

COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

Each copy or any portion of these sample programs or any derivative work must include a copyright notice as follows:

© (your company name) (year).
Portions of this code are derived from IBM Corp. Sample Programs.
© Copyright IBM Corp. _enter the year or years_.

Accessibility features for IBM Power servers

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Power servers include the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Power servers use the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with ICT Accessibility 508 Standards and 255 Guidelines (https://www.access-board.gov/ict/) and Web Content Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the IBM Power servers.

The IBM Power servers online product documentation in IBM Documentation is enabled for accessibility. For more information about IBM's commitment to accessibility, see the IBM accessibility website at IBM Accessibility (https://www.ibm.com/able/).

Keyboard navigation

This product uses standard navigation keys.

Interface information

The IBM Power servers user interfaces do not have content that flashes 2 - 55 times per second.

The IBM Power servers web user interface relies on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

The IBM Power servers web user interface includes WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Power servers include certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Privacy policy considerations

IBM Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

Depending upon the configurations deployed, this Software Offering may use session cookies that collect each user’s user name and IP address for purposes of session management. These cookies can be disabled, but disabling them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM’s Privacy Policy at http://www.ibm.com/privacy and IBM’s Online Privacy Statement at http://

www.ibm.com/privacy/details the section entitled “Cookies, Web Beacons and Other Technologies” and the “IBM Software Products and Software-as-a-Service Privacy Statement” at http://www.ibm.com/software/info/product-privacy.

Programming interface information

This Managing the Hardware Management Console publication documents intended Programming Interfaces that allow the customer to write programs to obtain the services of IBM Hardware Management Console Version 10 Release 1 Maintenance Level 1010.

Trademarks

IBM, the IBM logo, and ibm.com are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information.

The registered trademark Linux is used pursuant to a sublicense from the Linux Foundation, the exclusive licensee of Linus Torvalds, owner of the mark on a worldwide basis.

Microsoft is a trademark of Microsoft Corporation in the United States, other countries, or both.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Terms and conditions

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Personal Use: You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative works of these publications, or any portion thereof, without the express consent of IBM.

Commercial Use: You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights: Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

Power Systems

Problem analysis, system parts, and locations for the IBM Power systems HMC (7063-CR2)

Note

Before using this information and the product it supports, read the information in “Safety notices” on page v, “Notices” on page 23, the *IBM Systems Safety Notices* manual, G229-9054, and the *IBM Environmental Notices and User Guide*, Z125–5823.

This edition applies to IBM® Power® servers that contain the Power10 processor and to all associated models.

Contents

Safety notices

Safety notices may be printed throughout this guide:

- **DANGER** notices call attention to a situation that is potentially lethal or extremely hazardous to people.
- **CAUTION** notices call attention to a situation that is potentially hazardous to people because of some existing condition.
- **Attention** notices call attention to the possibility of damage to a program, device, system, or data.

World Trade safety information

Several countries require the safety information contained in product publications to be presented in their national languages. If this requirement applies to your country, safety information documentation is included in the publications package (such as in printed documentation, on DVD, or as part of the product) shipped with the product. The documentation contains the safety information in your national language with references to the U.S. English source. Before using a U.S. English publication to install, operate, or service this product, you must first become familiar with the related safety information documentation. You should also refer to the safety information documentation any time you do not clearly understand any safety information in the U.S. English publications.

Replacement or additional copies of safety information documentation can be obtained by calling the IBM Hotline at 1-800-300-8751.

German safety information

Das Produkt ist nicht für den Einsatz an Bildschirmarbeitsplätzen im Sinne § 2 der Bildschirmarbeitsverordnung geeignet.

Laser safety information

IBM servers can use I/O cards or features that are fiber-optic based and that utilize lasers or LEDs.

Laser compliance

IBM servers may be installed inside or outside of an IT equipment rack.

DANGER: When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard: If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product. Do not open or service any power supply assembly. Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.

- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords. For AC power, disconnect all power cords from their AC power source. For racks with a DC power distribution panel (PDP), disconnect the customer's DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected. For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate. For racks with a DC power distribution panel (PDP), connect the customer's DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.
- Connect any equipment that will be attached to this product to properly wired outlets.

- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- When performing a machine inspection: Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements. Do not attempt to switch power to the machine until all possible unsafe conditions are corrected. Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.
- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

  To Disconnect: 1) Turn off everything (unless instructed otherwise). 2) For AC power, remove the power cords from the outlets. 3) For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source. 4) Remove the signal cables from the connectors. 5) Remove all cables from the devices.

  To Connect: 1) Turn off everything (unless instructed otherwise). 2) Attach all cables to the devices. 3) Attach the signal cables to the connectors. 4) For AC power, attach the power cords to the outlets. 5) For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP. 6) Turn on the devices.
- Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

(R001 part 1 of 2):

DANGER: Observe the following precautions when working on or around your IT rack system:

- Heavy equipment–personal injury or equipment damage might result if mishandled.
- Always lower the leveling pads on the rack cabinet.
- Always install stabilizer brackets on the rack cabinet if provided, unless the earthquake option is to be installed.
- To avoid hazardous conditions due to uneven mechanical loading, always install the heaviest devices in the bottom of the rack cabinet. Always install servers and optional devices starting from the bottom of the rack cabinet.
- Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack mounted devices and do not use them to stabilize your body position (for example, when working from a ladder).
- Stability hazard:
  - The rack may tip over causing serious personal injury.
  - Before extending the rack to the installation position, read the installation instructions.
  - Do not put any load on the slide-rail mounted equipment mounted in the installation position.
  - Do not leave the slide-rail mounted equipment in the installation position.
- Each rack cabinet might have more than one power cord.
  - For AC powered racks, be sure to disconnect all power cords in the rack cabinet when directed to disconnect power during servicing.

- For racks with a DC power distribution panel (PDP), turn off the circuit breaker that controls the power to the system unit(s), or disconnect the customer's DC power source, when directed to disconnect power during servicing.

- Connect all devices installed in a rack cabinet to power devices installed in the same rack cabinet. Do not plug a power cord from a device installed in one rack cabinet into a power device installed in a different rack cabinet.
- An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (R001 part 1 of 2)

(R001 part 2 of 2):

⚠ **CAUTION:**

- Do not install a unit in a rack where the internal rack ambient temperatures will exceed the manufacturer's recommended ambient temperature for all your rack-mounted devices.
- Do not install a unit in a rack where the air flow is compromised. Ensure that air flow is not blocked or reduced on any side, front, or back of a unit used for air flow through the unit.
- Consideration should be given to the connection of the equipment to the supply circuit so that overloading of the circuits does not compromise the supply wiring or overcurrent protection. To provide the correct power connection to a rack, refer to the rating labels located on the equipment in the rack to determine the total power requirement of the supply circuit.
- *(For sliding drawers.)* Do not pull out or install any drawer or feature if the rack stabilizer brackets are not attached to the rack or if the rack is not bolted to the floor. Do not pull out more than one drawer at a time. The rack might become unstable if you pull out more than one drawer at a time.

- *(For fixed drawers.)* This drawer is a fixed drawer and must not be moved for servicing unless specified by the manufacturer. Attempting to move the drawer partially or completely out of the rack might cause the rack to become unstable or cause the drawer to fall out of the rack. (R001 part 2 of 2)

⚠ **CAUTION:** Removing components from the upper positions in the rack cabinet improves rack stability during relocation. Follow these general guidelines whenever you relocate a populated rack cabinet within a room or building.

- Reduce the weight of the rack cabinet by removing equipment starting at the top of the rack cabinet. When possible, restore the rack cabinet to the configuration of the rack cabinet as you received it. If this configuration is not known, you must observe the following precautions:
  - Remove all devices in the 32U position (compliance ID RACK-001 or 22U (compliance ID RR001) and above.
  - Ensure that the heaviest devices are installed in the bottom of the rack cabinet.

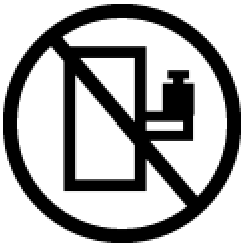
  - Ensure that there are little-to-no empty U-levels between devices installed in the rack cabinet below the 32U (compliance ID RACK-001 or 22U (compliance ID RR001) level, unless the received configuration specifically allowed it.
- If the rack cabinet you are relocating is part of a suite of rack cabinets, detach the rack cabinet from the suite.
- If the rack cabinet you are relocating was supplied with removable outriggers they must be reinstalled before the cabinet is relocated.
- Inspect the route that you plan to take to eliminate potential hazards.
- Verify that the route that you choose can support the weight of the loaded rack cabinet. Refer to the documentation that comes with your rack cabinet for the weight of a loaded rack cabinet.
- Verify that all door openings are at least 760 x 2083 mm (30 x 82 in.).
- Ensure that all devices, shelves, drawers, doors, and cables are secure.
- Ensure that the four leveling pads are raised to their highest position.
- Ensure that there is no stabilizer bracket installed on the rack cabinet during movement.
- Do not use a ramp inclined at more than 10 degrees.
- When the rack cabinet is in the new location, complete the following steps:
  - Lower the four leveling pads.
  - Install stabilizer brackets on the rack cabinet or in an earthquake environment bolt the rack to the floor.
  - If you removed any devices from the rack cabinet, repopulate the rack cabinet from the lowest position to the highest position.
- If a long-distance relocation is required, restore the rack cabinet to the configuration of the rack cabinet as you received it. Pack the rack cabinet in the original packaging material, or equivalent. Also lower the leveling pads to raise the casters off of the pallet and bolt the rack cabinet to the pallet.

(R002)

(L001)

⚠ **DANGER:** Hazardous voltage, current, or energy levels are present inside any component that has this label attached. Do not open any cover or barrier that contains this label. (L001)

(L002)



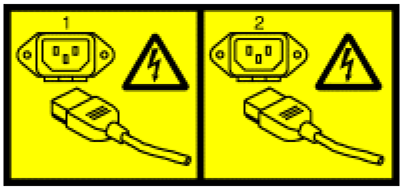
⚠ **DANGER:** Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack-mounted devices and do not use them to stabilize your body position (for example, when working from a ladder). Stability hazard:

- The rack may tip over causing serious personal injury.

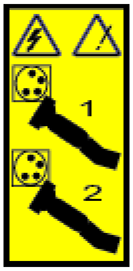
- Before extending the rack to the installation position, read the installation instructions.
- Do not put any load on the slide-rail mounted equipment mounted in the installation position.
- Do not leave the slide-rail mounted equipment in the installation position.

(L002)

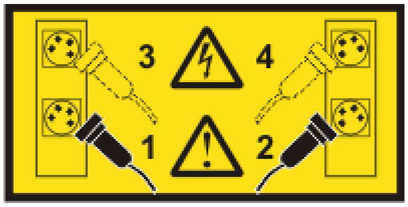
(L003)



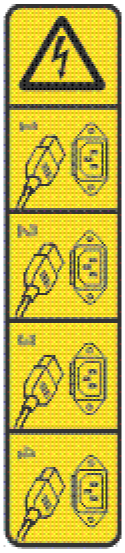
or



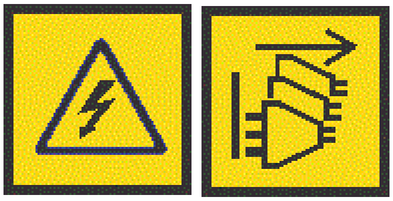
or

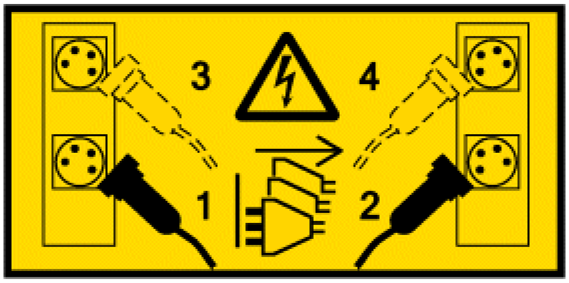


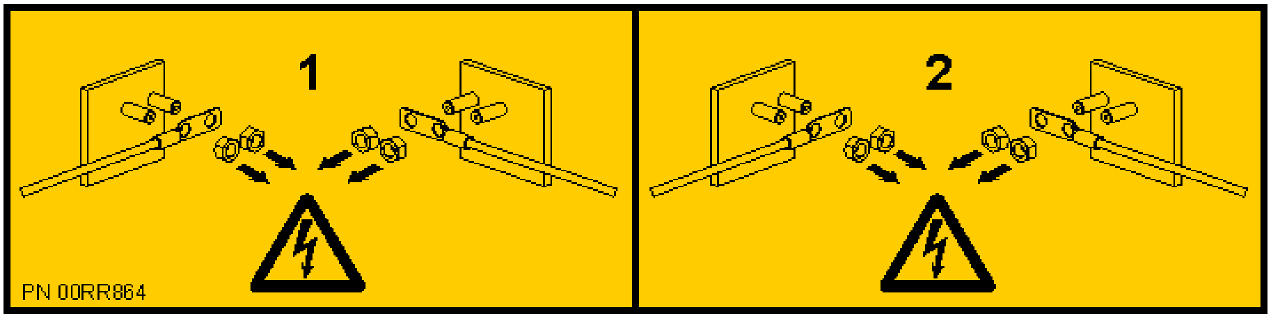
or



or





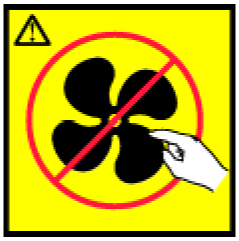


DANGER: Multiple power cords. The product might be equipped with multiple AC power cords or multiple DC power cables. To remove all hazardous voltages, disconnect all power cords and power cables. (L003)

(L007)

CAUTION: A hot surface nearby. (L007)

(L008)



CAUTION: Hazardous moving parts nearby. (L008)

(L018)

or

CAUTION: High levels of acoustical noise are (or could be under certain circumstances) present. Use approved hearing protection and/ or provide mitigation or limit exposure. (L018)

All lasers are certified in the U.S. to conform to the requirements of DHHS 21 CFR Subchapter J for class 1 laser products. Outside the U.S., they are certified to be in compliance with IEC 60825 as a class 1 laser product. Consult the label on each part for laser certification numbers and approval information.

CAUTION: This product might contain one or more of the following devices: CD-ROM drive, DVD-ROM drive, DVD-RAM drive, or laser module, which are Class 1 laser products. Note the following information:

- Do not remove the covers. Removing the covers of the laser product could result in exposure to hazardous laser radiation. There are no serviceable parts inside the device.
- Use of the controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

(C026)

CAUTION: Data processing environments can contain equipment transmitting on system links with laser modules that operate at greater than Class 1 power levels. For this reason, never look into the end of an optical fiber cable or open receptacle. Although shining light into one end and looking into the other end of a disconnected optical fiber to verify the continuity of optic fibers may not injure the eye, this procedure is potentially dangerous. Therefore, verifying the continuity of optical fibers by shining light into one end and looking at the other end is not recommended. To verify continuity of a fiber optic cable, use an optical light source and power meter. (C027)

CAUTION: This product contains a Class 1M laser. Do not view directly with optical instruments. (C028)

CAUTION: Some laser products contain an embedded Class 3A or Class 3B laser diode. Note the following information:

- Laser radiation when open.
- Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam. (C030)

(C030)

CAUTION: The battery contains lithium. To avoid possible explosion, do not burn or charge the battery.

Do Not:

- Throw or immerse into water
- Heat to more than 100 degrees C (212 degrees F)
- Repair or disassemble

Exchange only with the IBM-approvedapproved part. Recycle or discard the battery as instructed by local regulations. In the United States, IBM has a process for the collection of this battery. For information, call 1-800-426-4333. Have the IBM part number for the battery unit available when you call. (C003)(C003a)

CAUTION: Regarding IBM providedprovided VENDOR LIFT TOOL:

- Operation of LIFT TOOL by authorized personnel only.
- LIFT TOOL intended for use to assist, lift, install, remove units (load) up into rack elevations. It is not to be used loaded transporting over major ramps nor as a replacement for such designated tools like pallet jacks, walkies, fork trucks and such related relocation practices. When this is not practicable, specially trained persons or services must be used (for instance, riggers or movers).
- Read and completely understand the contents of LIFT TOOL operator's manual before using. Failure to read, understand, obey safety rules, and follow instructions may result in property damage and/or personal injury. If there are questions, contact the vendor's service and support. Local paper manual must remain with machine in provided storage sleeve area. Latest revision manual available on vendor's web site.

- Test verify stabilizer brake function before each use. Do not over-force moving or rolling the LIFT TOOL with stabilizer brake engaged.
- Do not raise, lower or slide platform load shelf unless stabilizer (brake pedal jack) is fully engaged. Keep stabilizer brake engaged when not in use or motion.
- Do not move LIFT TOOL while platform is raised, except for minor positioning.
- Do not exceed rated load capacity. See LOAD CAPACITY CHART regarding maximum loads at center versus edge of extended platform.
- Only raise load if properly centered on platform. Do not place more than 200 lb (91 kg) on edge of sliding platform shelf also considering the load's center of mass/gravity (CoG).
- Do not corner load the platforms, tilt riser, angled unit install wedge or other such accessory options. Secure such platforms -- riser tilt, wedge, etc options to main lift shelf or forks in all four (4x or all other provisioned mounting) locations with provided hardware only, prior to use. Load objects are designed to slide on/off smooth platforms without appreciable force, so take care not to push or lean. Keep riser tilt [adjustable angling platform] option flat at all times except for final minor angle adjustment when needed.
- Do not stand under overhanging load.
- Do not use on uneven surface, incline or decline (major ramps).
- Do not stack loads.
- Do not operate while under the influence of drugs or alcohol.
- Do not support ladder against LIFT TOOL (unless the specific allowance is provided for one following qualified procedures for working at elevations with this TOOL).
- Tipping hazard. Do not push or lean against load with raised platform.
- Do not use as a personnel lifting platform or step. No riders.
- Do not stand on any part of lift. Not a step.
- Do not climb on mast.
- Do not operate a damaged or malfunctioning LIFT TOOL machine.
- Crush and pinch point hazard below platform. Only lower load in areas clear of personnel and obstructions. Keep hands and feet clear during operation.
- No Forks. Never lift or move bare LIFT TOOL MACHINE with pallet truck, jack or fork lift.
- Mast extends higher than platform. Be aware of ceiling height, cable trays, sprinklers, lights, and other overhead objects.
- Do not leave LIFT TOOL machine unattended with an elevated load.
- Watch and keep hands, fingers, and clothing clear when equipment is in motion.
- Turn Winch with hand power only. If winch handle cannot be cranked easily with one hand, it is probably over-loaded. Do not continue to turn winch past top or bottom of platform travel. Excessive unwinding will detach handle and damage cable. Always hold handle when lowering, unwinding. Always assure self that winch is holding load before releasing winch handle.
- A winch accident could cause serious injury. Not for moving humans. Make certain clicking sound is heard as the equipment is being raised. Be sure winch is locked in position before releasing handle. Read instruction page before operating this winch. Never allow winch to unwind freely. Freewheeling will cause uneven cable wrapping around winch drum, damage cable, and may cause serious injury.
- This TOOL must be maintained correctly for IBM Service personnel to use it. IBM shall inspect condition and verify maintenance history before operation. Personnel reserve the right not to use TOOL if inadequate. (C048)

Power and cabling information for NEBS (Network Equipment-Building System) GR-1089-CORE

The following comments apply to the IBM servers that have been designated as conforming to NEBS (Network Equipment-Building System) GR-1089-CORE:

The equipment is suitable for installation in the following:

- Network telecommunications facilities
- Locations where the NEC (National Electrical Code) applies

The intra-building ports of this equipment are suitable for connection to intra-building or unexposed wiring or cabling only. The intra-building ports of this equipment *must not* be metallically connected to the interfaces that connect to the OSP (outside plant) or its wiring. These interfaces are designed for use as intrabuilding interfaces only (Type 2 or Type 4 ports as described in GR-1089-CORE) and require isolation from the exposed OSP cabling. The addition of primary protectors is not sufficient protection to connect these interfaces metallically to OSP wiring.

Note: All Ethernet cables must be shielded and grounded at both ends.

The AC-powered system does not require the use of an external surge protection device (SPD).

The DC-powered system employs an isolated DC return (DC-I) design. The DC battery return terminal *shall not* be connected to the chassis or frame ground.

The DC-powered system is intended to be installed in a common bonding network (CBN) as described in GR-1089-CORE.

Beginning troubleshooting and problem analysis

This information provides a starting point for analyzing problems.

This information is the starting point for diagnosing and repairing systems. From this point, you are guided to the appropriate information to help you diagnose problems, determine the appropriate repair action, and then complete the necessary steps to repair the system.

Notes:

- Update the system firmware to the latest level before you start problem analysis. If you update the system firmware, you have the latest available fixes and improvements for error handling, reporting, and isolation. For instructions about updating the system firmware, see Getting fixes.
- Some service procedures use OpenBMC tool commands. To download and install the OpenBMC tool, see Downloading and installing the OpenBMC tool.

What type of problem are you dealing with?	Problem analysis procedure
You do not know the type of problem.	Go to "Determining the problem analysis procedure to perform" on page 1.
You have an FQPSP*xxxxxxx* event code.	Go to FQPSP*xxxxxxx* Event Codes.
A baseboard management controller (BMC) access problem occurred.	Go to "Resolving a BMC access problem" on page 2.
The system does not power on (the power button or the BMC power on command does not power on the system).	Go to "Resolving a power problem" on page 4.
A system firmware boot failure occurred (the system started but was not able to boot to the Petitboot menu).	Go to "Resolving a system firmware boot failure" on page 5.
A video graphics array (VGA) monitor problem occurred (the system started but no video is displayed on the monitor).	Go to "Resolving a VGA monitor problem" on page 6.
An operating system boot failure occurred (the system booted to the Petitboot menu but the operating system did not start).	Go to "Resolving an operating system boot failure" on page 6.
A processor, memory, power, or cooling hardware failure occurred.	Go to "Resolving a hardware problem" on page 7.
Missing or faulty PCIe adapter or device.	Go to "Resolving a PCIe adapter or device problem" on page 7.

Determining the problem analysis procedure to perform

Learn how to identify the correct problem analysis procedure to perform.

About this task

To determine the correct problem analysis procedure to perform, complete the following steps:

Procedure

1. After you apply power to the system, are the power supply LEDs green?

If	Then
Yes:	Continue with the next step.
No:	Go to "Resolving a power problem" on page 4.

2. Can you access the baseboard management controller (BMC) across the network?

If	Then
Yes:	Continue with the next step.
No:	Go to "Resolving a BMC access problem" on page 2.

3. Can you boot the system to the Petitboot menu?

If	Then
Yes:	Continue with the next step.
No:	Go to "Resolving a system firmware boot failure" on page 5.

4. Is video displayed on the video graphics array (VGA) monitor?

If	Then
Yes:	Continue with the next step.
No:	Go to "Resolving a VGA monitor problem" on page 6.

5. Can you start the operating system?

If	Then
Yes:	Continue with the next step.
No:	Go to "Resolving an operating system boot failure" on page 6.

6. Go to "Resolving a hardware problem" on page 7. **This ends the procedure.**

Resolving a BMC access problem

Learn how to identify the service action that is needed to resolve a baseboard management controller (BMC) access problem.

Procedure

1. Ensure that the BMC password is not set to the default password. For information about changing the default password, see Logging on to the OpenBMC GUI. Does the problem persist?

If	Then
Yes:	Continue with the next step.
No:	**This ends the procedure.**

2. Are both ends of the network cable seated securely?

If	Then
Yes:	Continue with the next step.
No:	Seat both ends of the cable securely. If the problem persists, continue with the next step.

3. Is the operating system available?

If	Then
Yes:	Continue with the next step.
No:	Continue with step "5" on page 3.

4. Verify that the BMC network settings are correct.
   a) In the navigation area, click **HMC Management**, and then select **Console Settings**.
   b) In the content pane, click **Change BMC/IPMI network settings**.
   c) Verify that the MAC address and the IP address settings are correct.

   Does the BMC access problem persist?

If	Then
Yes:	Continue with the next step.
No:	**This ends the procedure.**

5. Power off the system and disconnect all AC power cords for 30 seconds. Then, reconnect the AC power cords and power on the system. Does the BMC access problem persist?

If	Then
Yes:	Continue with the next step.
No:	**This ends the procedure.**

6. Verify that the BMC network settings are correct.

   Note: To verify the BMC network settings, you must have a cabled serial connection or a monitor and keyboard.

   a) Power on the system by using the power button on the front of the system. Wait 1 - 2 minutes for the system to display the Petitboot menu.
   b) When the Petitboot menu is displayed, press any key to interrupt the boot process. Then, select Exit to Shell.
   c) For a shared BMC Ethernet port, type the following command and press Enter:

```
ipmitool lan print 1
```

   For a dedicated BMC Ethernet port, type the following command and press Enter:

```
ipmitool lan print 2
```

   To determine the location of the shared and dedicated BMC Ethernet ports, see Table 1 on page 3.

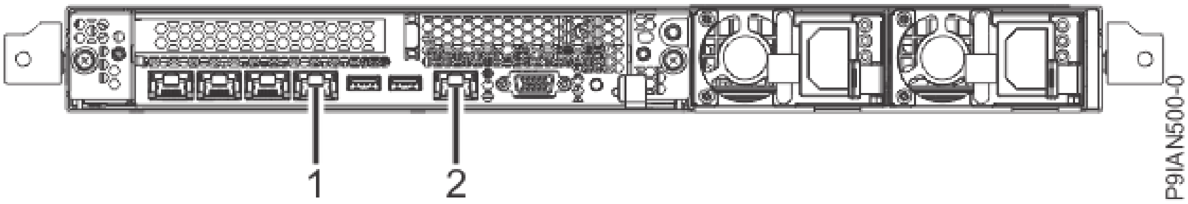


Figure 1. Rear BMC Ethernet ports

Table 1. BMC Ethernet ports

Identifier	Description
1	Shared BMC Ethernet
2	Dedicated BMC Ethernet

   d) Verify that the MAC address and the IP address settings are correct. Then, continue with the next step.

   Note: If the IP address setting is incorrect, go to Configuring the BMC IP address. If the MAC address is 00:00:00:00:00:00, go to “Contacting IBM service and support” on page 12.

7. Complete the following actions:

a. Power on to the Petitboot menu.

b. Update the system firmware. For instructions, see Getting fixes.

Are you able to access the BMC?

If	Then
Yes:	**This ends the procedure.**
No:	Continue with the next step.

8. Replace the system backplane. Go to "7063-CR2 locations" on page 13 to identify the physical location and the removal and replacement procedure. **This ends the procedure.**

Resolving a power problem

Learn how to identify the service action that is needed to resolve a power problem.

Procedure

1. Is the amber LED (bottom LED) of a power supply on solid and is the amber LED on the front of the system turned off?

If	Then
Yes:	Ensure that the power cords for both power supplies are fully seated and that the power distribution units (PDUs) and power outlets are supplying electricity. **This ends the procedure.**
No:	Continue with the next step.

2. Are the power supply LEDs turned off?

If	Then
Yes:	Continue with the next step.
No:	Continue with step "4" on page 4.

3. Perform the following actions, one at a time until the problem is resolved:

   a. Ensure that all of the power cords are fully seated in the power supplies.

   b. Ensure that all of the power cords are fully seated in the power distribution units (PDUs) or wall outlets.

   c. If the power cords are plugged into PDUs, ensure that the PDUs are turned on.

   d. Ensure that all of the power cords are plugged into PDUs or wall outlets that are supplying electricity.

   e. Replace the power cords.

   f. Replace the power supplies. Go to "7063-CR2 locations" on page 13 to identify the physical location and the removal and replacement procedure. **This ends the procedure**.

4. Is the amber LED of a power supply on solid and is the amber system attention LED on the front of the system on solid?

If	Then
Yes:	Continue with the next step.
No:	Go to "Contacting IBM service and support" on page 12. **This ends the procedure.**

5. Perform the following actions, one at a time until the problem is resolved:

   a. Resolve any serviceable alerts that are in the event log. Go to "Resolving a hardware problem" on page 7.

   b. Ensure that the power supply is fully seated in the system.

c. Ensure that the power supply fan is not blocked.

d. Replace the power supply. Go to “7063-CR2 locations” on page 13 to identify the physical location and the removal and replacement procedure. **This ends the procedure**.

Resolving a system firmware boot failure

Learn how to identify the service action that is needed to resolve a failure while booting your system firmware.

Procedure

1. After you press the power button, did the system turn on but fail to display the Petitboot menu?

If	Then
Yes:	Continue with the next step.
No:	Continue with step “6” on page 5.

2. Does the baseboard management controller (BMC) respond to commands?

   Note: To determine whether the BMC responds to commands, run the following OpenBMC tool command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> chassis power status
```

If	Then
Yes:	Continue with the next step.
No:	Continue with step “4” on page 5.

3. Complete the following actions:

   a. Update the system firmware. For instructions, see Getting fixes.

   b. Check the system event logs. For instructions, see “Identifying a service action by using system event logs” on page 10. Then, continue with step “6” on page 5.

4. Disconnect the power cords from the system for 30 seconds. Reconnect the power cords, wait 5 minutes, and then continue with the next step.

5. Does the baseboard management controller (BMC) respond to commands?

   Note: To determine whether the BMC responds to commands, run the following OpenBMC tool command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> chassis power status
```

If	Then
Yes:	Update the system firmware. For instructions, see Getting fixes. **This ends the procedure.**
No:	Replace the system backplane. Go to “7063-CR2 locations” on page 13 to identify the physical location and the removal and replacement procedure. **This ends the procedure.**

6. Power off the system and disconnect all AC power cords for 30 seconds. Then, reconnect the AC power cords and power on the system. Does the system boot successfully?

If	Then
Yes:	**This ends the procedure.**
No:	Go to “Resolving a hardware problem” on page 7. **This ends the procedure.**

Resolving a VGA monitor problem

Learn how to identify the service action that is needed to resolve a video graphics array (VGA) monitor problem.

Procedure

1. Is the system powered on and is the VGA monitor connected to the VGA display port, but no video is displayed?

If	Then
Yes:	Continue with the next step.
No:	Power on the system. **This ends the procedure.**

2. Complete the following steps, one at a time until the problem is resolved:
   a) Ensure that the network image that is specified is a valid boot image.
   b) Ensure that the VGA cable is properly seated to the server port and to the monitor port.
   c) Verify that your monitor and your VGA cable are working properly by testing them on a system that is known to be working properly. If the monitor or the VGA cable does not work properly, replace it.
   d) Verify that the system is powered on by activating a serial over LAN (SOL) session through the baseboard management controller (BMC). If the system is not active, go to "Resolving a system firmware boot failure" on page 5.
   e) Replace the system backplane. Go to "7063-CR2 locations" on page 13 to identify the physical location and the removal and replacement procedure. **This ends the procedure**.

Resolving an operating system boot failure

Learn how to identify the service action that is needed to resolve a failure while booting your operating system.

Procedure

1. Was the system recently installed, serviced, moved, or upgraded?

If	Then
Yes:	Ensure that all cables are properly seated in the connection path to the designated boot device. **This ends the procedure.**
No:	Continue with the next step.

2. Petitboot displays all recognized bootable images to use by default. Is the boot image recognized by Petitboot?

If	Then
Yes:	Continue with the next step.
No:	Select the Petitboot menu option to refresh the boot images. If the problem persists, go to "Resolving a storage device problem" on page 9. **This ends the procedure.**

3. Does an operating system error occur during the boot?

If	Then
Yes:	Recover the operating system with the tools provided for the operating system. If that does not resolve the problem, reinstall the operating system. **This ends the procedure.**
No:	Reinstall the operating system. **This ends the procedure.**

Resolving a hardware problem

Learn how to identify the service action that is needed to resolve a hardware problem.

Procedure

1. If you have not already done so, manually boot the system.
2. Go to "Identifying a service action by using system event logs" on page 10. Then, continue with the next step.
3. Was a service action identified?

If	Then
Yes:	Continue with the next step.
No:	Go to step "5" on page 7.

4. Did the service action fix the problem?

If	Then
Yes:	**This ends the procedure.**
No:	Go to step "5" on page 7.

5. Go to "Resolving a PCIe adapter or device problem" on page 7. Then, continue with the next step.
6. Was a service action identified?

If	Then
Yes:	Continue with the next step.
No:	Go to "Collecting diagnostic data" on page 11. Then, go to "Contacting IBM service and support" on page 12. **This ends the procedure.**

7. Did the service action fix the problem?

If	Then
Yes:	**This ends the procedure.**
No:	Go to "Collecting diagnostic data" on page 11. Then, go to "Contacting IBM service and support" on page 12. **This ends the procedure.**

Resolving a PCIe adapter or device problem

Learn how to access log files, information to identify types of events, and a list of potential problems and service actions.

Procedure

1. To identify the correct service procedure to perform by using operating system log information, complete the following steps:
   a) Log in as the **hscroot** user.
   b) To display the operating system logs, type `less /var/log/messages` and press **Enter**.
2. Scan the operating system logs that occurred around the time that the problem started for the first occurrence of keywords, such as fail, failure, or failed. When you find a keyword that accompanies one or more of the resource names in the following table, a service action is required. Use the following table to determine the service procedure to perform for your type of problem.

Table 2. Resource names, examples, and service procedures for different types of operating system logs.

Resource name	Example of a log requiring a service action	Type of problem	Service procedure
eth1, eth2, eth3, enP*xxxxx*, where *xxxxx* indicates the network port.	`Failed to re-initialize device`	Network	Go to "Resolving a network adapter problem" on page 8.

tg3	`PCI I/O error detected.`
	`Link is Down`
		Network	Go to "Resolving a network adapter problem" on page 8.

sda, sdb, sdc	`FAILED Result`	Storage	Go to "Resolving a storage device problem" on page 9.
EEH	`Detected error on PHB#`*xxx*, where *xxx* is the PHB number.	PCIe bus or adapter	Resolve any device driver errors that are related to I/O and that occurred near the time of this operating system log entry.
	xxx `has failed 6 times in the last hour and has been permanently disabled`, where *xxx* is the PCI bus number.	PCIe bus or adapter	Ensure that the correct device drivers are properly installed for the device. If the problem persists, replace the adapter in the PCIe slot that is specified in the operating system log entry.

Resolving a network adapter problem

Learn about the possible problems and service actions that you can perform to resolve a network adapter problem.

About this task

Table 3. Network adapter problems and service actions

Problem	Service action
System unable to find adapter	1. Verify that the most recent firmware is installed on the system. Otherwise, install the most recent firmware if it is not already installed. 2. Restart the system. 3. Replace the adapter. 4. Replace the system backplane. 5. Replace the central processing unit (CPU).

Table 3. Network adapter problems and service actions (continued)

Problem	Service action
Adapter stops working suddenly	1. If the system was recently installed, moved, serviced, or upgraded, verify that the adapter is seated properly and all associated cables are correctly connected. 2. Inspect the PCIe socket and verify that there is no dirt or debris in the socket. 3. Inspect the card and verify that it is not physically damaged. 4. Verify that all cables are properly seated and are not physically damaged. 5. Replace the adapter. 6. Replace the system backplane. 7. Replace the CPU.
Link indicator light on the adapter is off	1. Verify that the cable functions properly by testing it with a known working connection. 2. Verify that the port or ports on the switch are enabled and functional. 3. Verify that the switch and adapter are compatible. 4. Replace the adapter.
Link light on the adapter is on, but there is no communication from the adapter	1. Verify that the most recent driver is installed, or install the most recent driver if it is not already installed. 2. Verify that the adapter and its link have compatible settings, such as speed and duplex configuration.

Resolving a storage device problem

Learn about the possible problems and service actions that you can perform to resolve a storage device problem.

About this task

Note: To determine the location of the storage device, see Removing and replacing a drive in the 7063-CR2.

Table 4. Storage device problems and service actions

Problem	Service action
System unable to find a storage device that is at the front of the system	1. If the system was recently installed, moved, serviced, or upgraded, verify that the device is seated and installed properly. 2. Verify that the device is compatible with your system. 3. Verify that all internal cables are properly seated and are not physically damaged. 4. Verify that the most recent firmware is installed on the system. Otherwise, install the most recent firmware if it is not already installed. 5. Replace the drive. 6. Replace the cable. 7. Replace the drive holder.
Drive stops working suddenly	1. Verify that all internal cables are properly seated and are not physically damaged. 2. Check the system logs to verify whether the system detected a problem. 3. Replace the drive. 4. Replace the cable.
Other problems	Check the messages and resolve any other problems that were detected. Then, test the drive again. If the drive continues not to function, refer to the documentation for the drive.

Identifying a service action by using system event logs

Use the OpenBMC tool to examine system event logs (SELs) to identify a service action.

Procedure

1. From a system that has the OpenBMC tool installed, type the following command and press Enter:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> sel print
```

2. Is there an **Active Alerts** section displayed in the output of the command?

If	Then
Yes:	Continue with the next step.
No	No service action is required. **This ends the procedure.** **Note:** Alerts that are displayed in the **Historical Alerts** section do not require service.

3. Is there an entry in the **Active Alerts** section with a value of **Yes** in the **Serviceable** column?

If	Then
Yes:	Continue with the next step.
No	No service action is required. **This ends the procedure.** **Note:** Alerts with a value of **No** that are displayed in the **Serviceable** column do not require service.

4. Starting with the first entry in the **Active Alerts** section with a value of **Yes** in the **Serviceable** column, complete the following steps until all entries are resolved:

   a. Record the log number that is displayed in the **Entry** column.

   b. Record the FQPSP*xxxxxxx* value that is displayed in the **ID** column. Then, go to FQPSP*xxxxxxx* Event Codes and complete the service action that is indicated for the FQPSP*xxxxxxx* event code.

   c. After the service action is complete and the problem is resolved, type the following command and press Enter:

   `openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> sel resolve -n` *x*, where *x* is the log number that you recorded in step "4.a" on page 11.

This ends the procedure.

Verifying a repair

Learn how to verify hardware operation after you make repairs to the system.

Procedure

1. Power on the system.
2. Scan the system event logs (SELs) for serviceable events that occurred after system hardware was replaced. For information about SELs that require a service action, see "Identifying a service action by using system event logs" on page 10.
3. Did any serviceable SEL events occur after hardware was replaced?

If	Then
Yes:	The problem is not resolved. Go to "Identifying a service action by using system event logs" on page 10 and complete the service actions indicated. **This ends the procedure.**
No:	The problem is resolved. **This ends the procedure.**

Collecting diagnostic data

Learn how to collect diagnostic data to send to IBM service and support.

About this task

To collect diagnostic data, complete the following steps:

Procedure

1. Are you able to log on to the Hardware Management Console (HMC)?

If	Then
Yes:	Continue with the next step.
No:	Go to step "3" on page 11.

2. Collect diagnostic data from the 7063-CR2 by using the **`PEDBG`** command on the HMC. To collect diagnostic data, go to HMC Enhanced View: Collecting PEDBG from the HMC (http://www.ibm.com/support/pages/hmc-enhanced-view-collecting-pedbg-hmc) and complete the steps that are indicated. Send the data that you collected during this procedure to IBM service and support. **This ends the procedure.**
3. Can you boot the system to the Petitboot menu or is another system available that has the Linux® operating system?

If	Then
Yes:	Continue with the next step.
No:	Go to "Contacting IBM service and support" on page 12.

4. To collect system event logs, complete the following steps:
   a) Go to the IBM Support Portal (http://www.ibm.com/mysupport/s/).
   b) In the search field, type `Scale-out LC System Event Log Collection Tool`.
   c) Click the **Scale-out LC System Event Log Collection Tool** entry and follow the instructions to install and run the system event log collection tool. Then, continue with the next step.
5. Send the data that you collected during this procedure to IBM service and support. **This ends the procedure.**

Contacting IBM service and support

You can contact IBM service and support by telephone or through the IBM Support Portal.

Before you contact IBM service and support, go to "Beginning troubleshooting and problem analysis" on page 1 and complete all of the service actions indicated. If the service actions do not resolve the problem, or if you are directed to contact support, go to "Collecting diagnostic data" on page 11. Then, use the information below to contact IBM service and support.

Customers in the United States, United States territories, or Canada can place a hardware service request online. To place a hardware service request online, go to the IBM Support Portal (http://www.ibm.com/support/entry/portal/product/power/scale-out_lc).

For up-to-date telephone contact information, go to the Directory of worldwide contacts website (www.ibm.com/planetwide/).

Table 5. Service and support contacts

Type of problem	Call
• Advice • Migrating • "How to" • Operating • Configuring • Ordering • Performance • General information	• 1-800-IBM-CALL (1–800–426–2255) • 1-800-IBM-4YOU (1–800–426–4968)
Software: • Fix information • Operating system problem • IBM application program • Loop, hang, or message Hardware: • IBM system hardware broken • Hardware reference code • IBM input/output (I/O) problem • Upgrade	1-800-IBM-SERV (1–800–426–7378)

Finding parts and locations

Locate physical part locations and identify parts with system diagrams.

Locate the FRU

Use the graphics and tables to locate the field-replaceable unit (FRU) and identify the FRU part number.

7063-CR2 locations

Use this information to find the location of a field-replaceable unit (FRU) in the system unit.

Rack views

The following diagrams show FRU layouts in the system. Use these diagrams with the following tables.

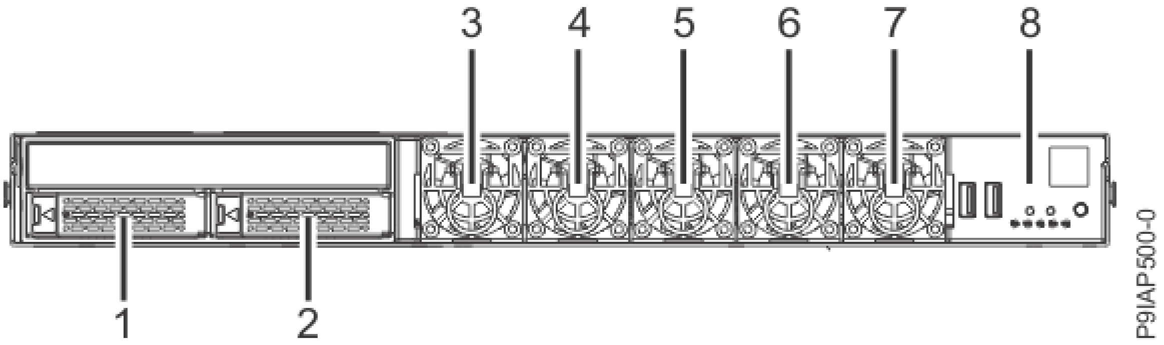

Figure 2. Front view

Table 6. Front view locations

Index number	FRU description	FRU removal and replacement procedures
1	Drive 0	See Removing and replacing a drive in the 7063-CR2.
2	Drive 1	
3	Fan 0	See Removing and replacing fans in the 7063-CR2.
4	Fan 1	
5	Fan 2	
6	Fan 3	
7	Fan 4	
8	Control panel	See Removing and replacing the control panel in the 7063-CR2.

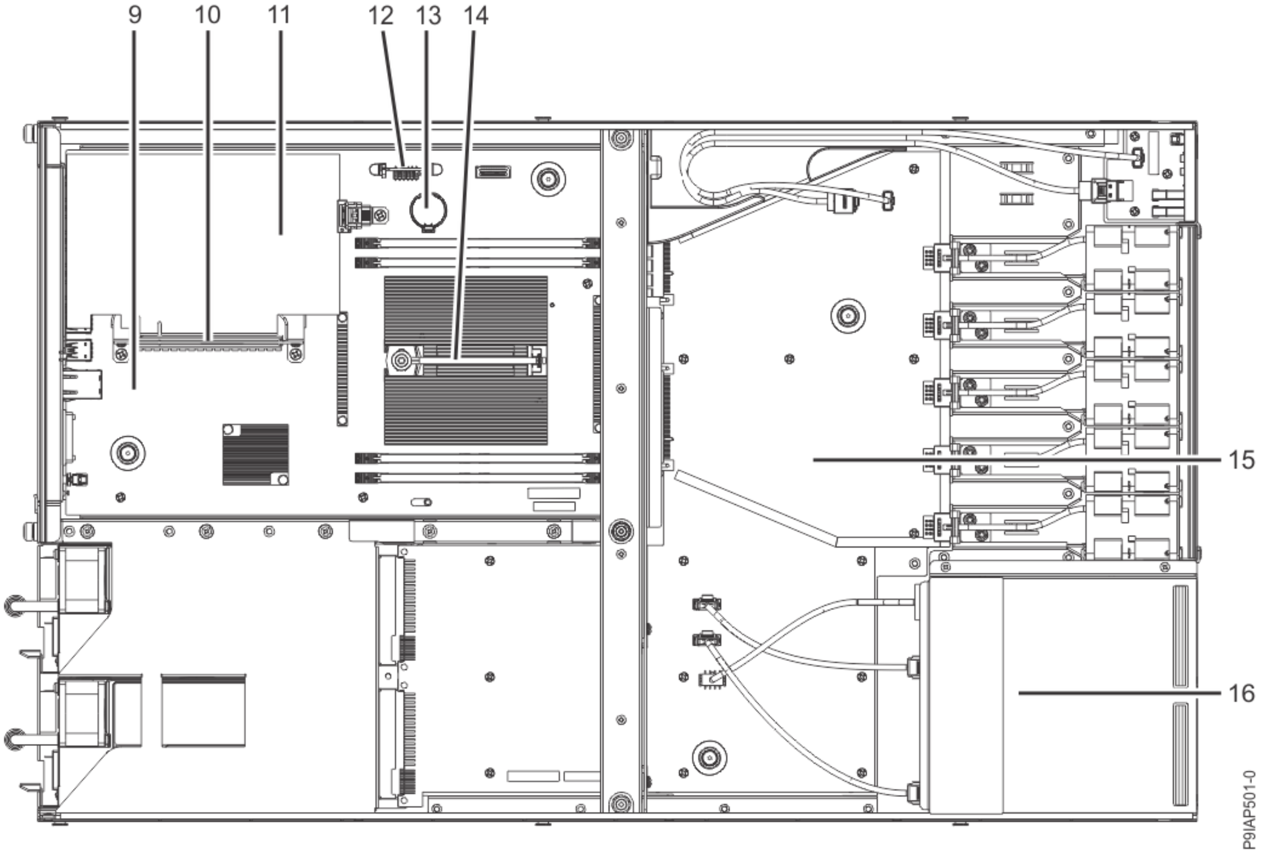

Figure 3. Top view

Table 7. Top view locations		
Index number	**FRU description**	**FRU removal and replacement procedures**
9	System backplane	See Removing and replacing the system backplane in the 7063-CR2.
10	Riser	See Removing and replacing the PCIe riser in the 7063-CR2.
11	PCIe adapter	See Removing and replacing PCIe adapters in the 7063-CR2.
12	Trusted platform module	See Removing and replacing the trusted platform module in the 7063-CR2.
13	Time-of-day battery	See Removing and replacing the time-of-day battery in the 7063-CR2.
14	CPU 0	See Removing and replacing the system processor module in the 7063-CR2.
15	Power distribution board	See Removing and replacing the power distribution board in the 7063-CR2.

Table 7. Top view locations (continued)

Index number	FRU description	FRU removal and replacement procedures
16	Drive holder	See Removing and replacing the drive holder in the 7063-CR2.

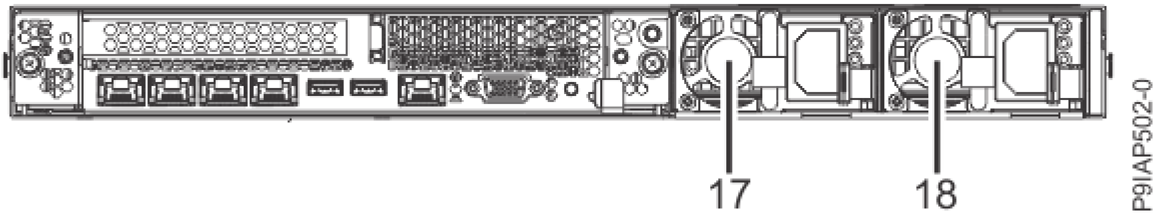

Figure 4. Rear view

Table 8. Rear view locations

Index number	FRU description	FRU removal and replacement procedures
17	Power supply unit 1 (PSU 1)*	See Removing and replacing a power supply in the 7063-CR2.
18	Power supply unit 0 (PSU 0)*	

* The E*x* labels on the chassis do not match the power supply unit number.

Memory locations

The following diagram shows memory DIMMs and their corresponding field-replaceable unit (FRU) layouts in the system. Use this diagram with the following table.

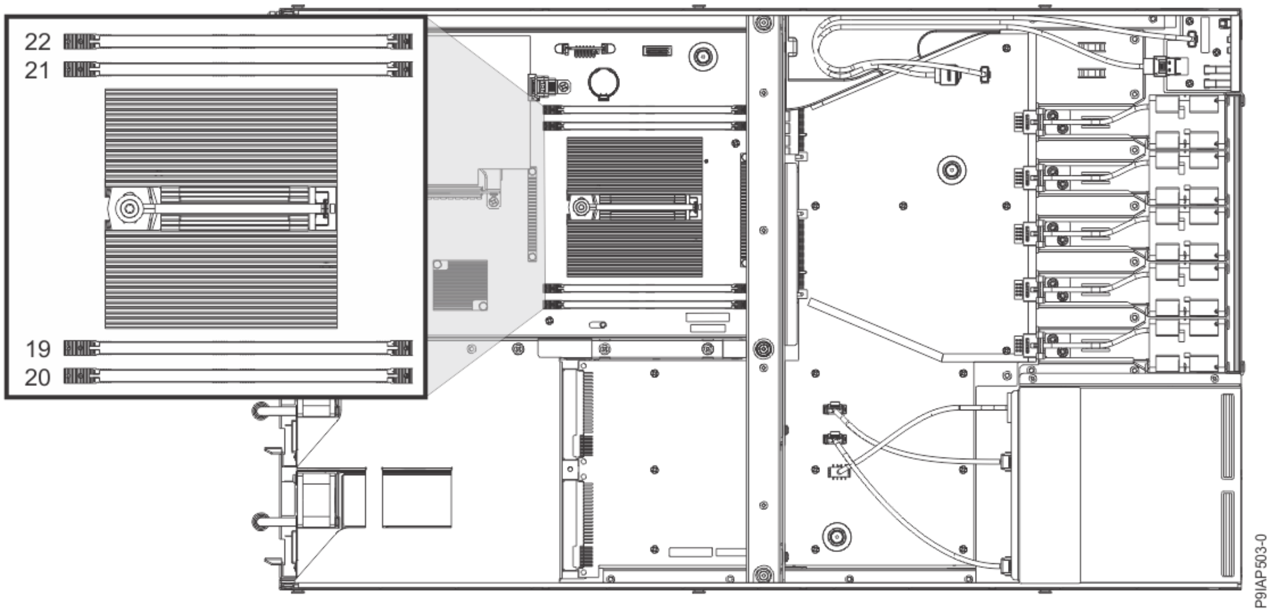

Figure 5. Memory locations

Table 9. Memory locations

Index number	FRU description	FRU removal and replacement procedures
19	DIMM 0	See Removing and replacing memory in the 7063-CR2.
20	DIMM 1	
21	DIMM 2	
22	DIMM 3	

7063-CR2 parts

Use this information to find the field-replaceable unit (FRU) part number.

After you identify the part number of the part that you want to order, go to Advanced Part Exchange Warranty Service. Registration is required. If you are not able to identify the part number, go to Contacting IBM service and support.

Rack final assembly

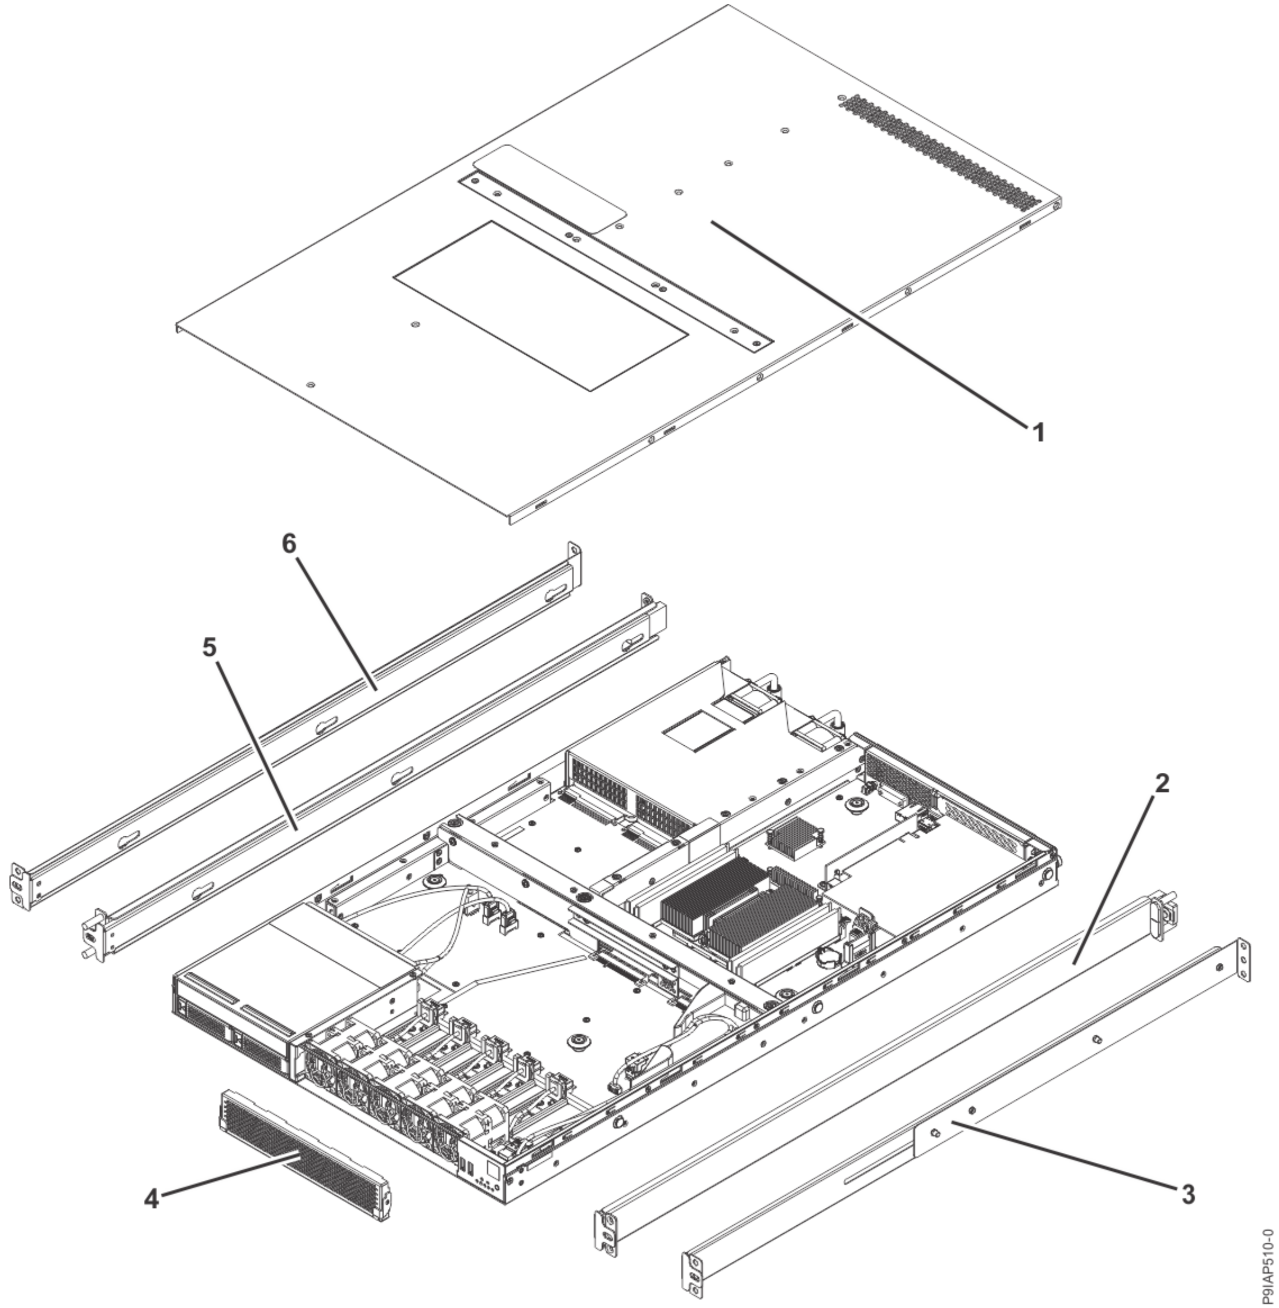

Figure 6. Rack final assembly

Table 10. Rack final assembly part numbers

Index number	Part number	Units per assembly	Description
1		1	Top cover assembly
2	03GM910	1	Fixed rail kit - contains left rail, right rail, attaching screws, and shipping brackets
3	03GM955	1	Fixed rail kit (adjustable in length) - contains left rail, right rail, and attaching screws
4	03GM764	1	Front bezel

Table 10. Rack final assembly part numbers (continued)

Index number	Part number	Units per assembly	Description
5	03GM910	1	Fixed rail kit - contains left rail, right rail, attaching screws, and shipping brackets
6	03GM955	1	Fixed rail kit (adjustable in length) - contains left rail, right rail, and attaching screws

System parts

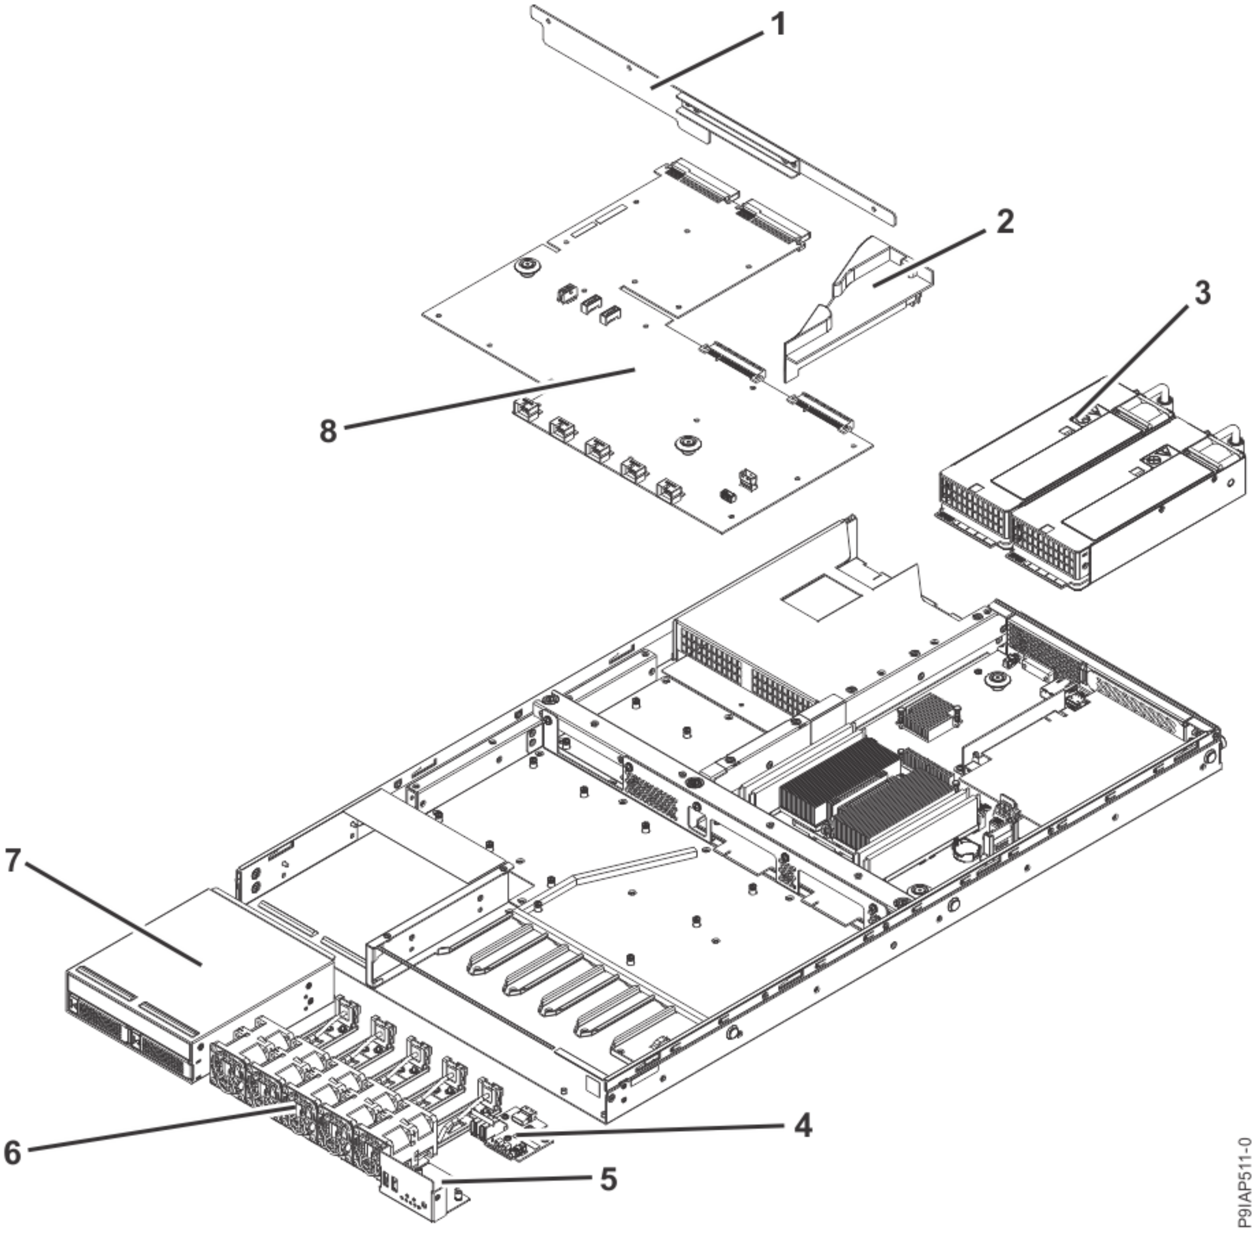

Figure 7. System parts

Table 11. System parts

Index number	Part number	Units per assembly	Description
1	03GM757	1	Air baffle (left)
2	03GM759	1	Air baffle (right)
3	03FP372	2	Power supply
4	02WF445	1	Control panel card
5		1	Control panel cover
6	03GM774	5	Fan
7	03GM776	1	Drive holder
	03GM792	2	1.8 TB 2.5 inch SAS disk drive (includes drive and carrier)
	03GM803	2	Drive carrier
8	02WF441	1	Power distribution board

Additional system parts

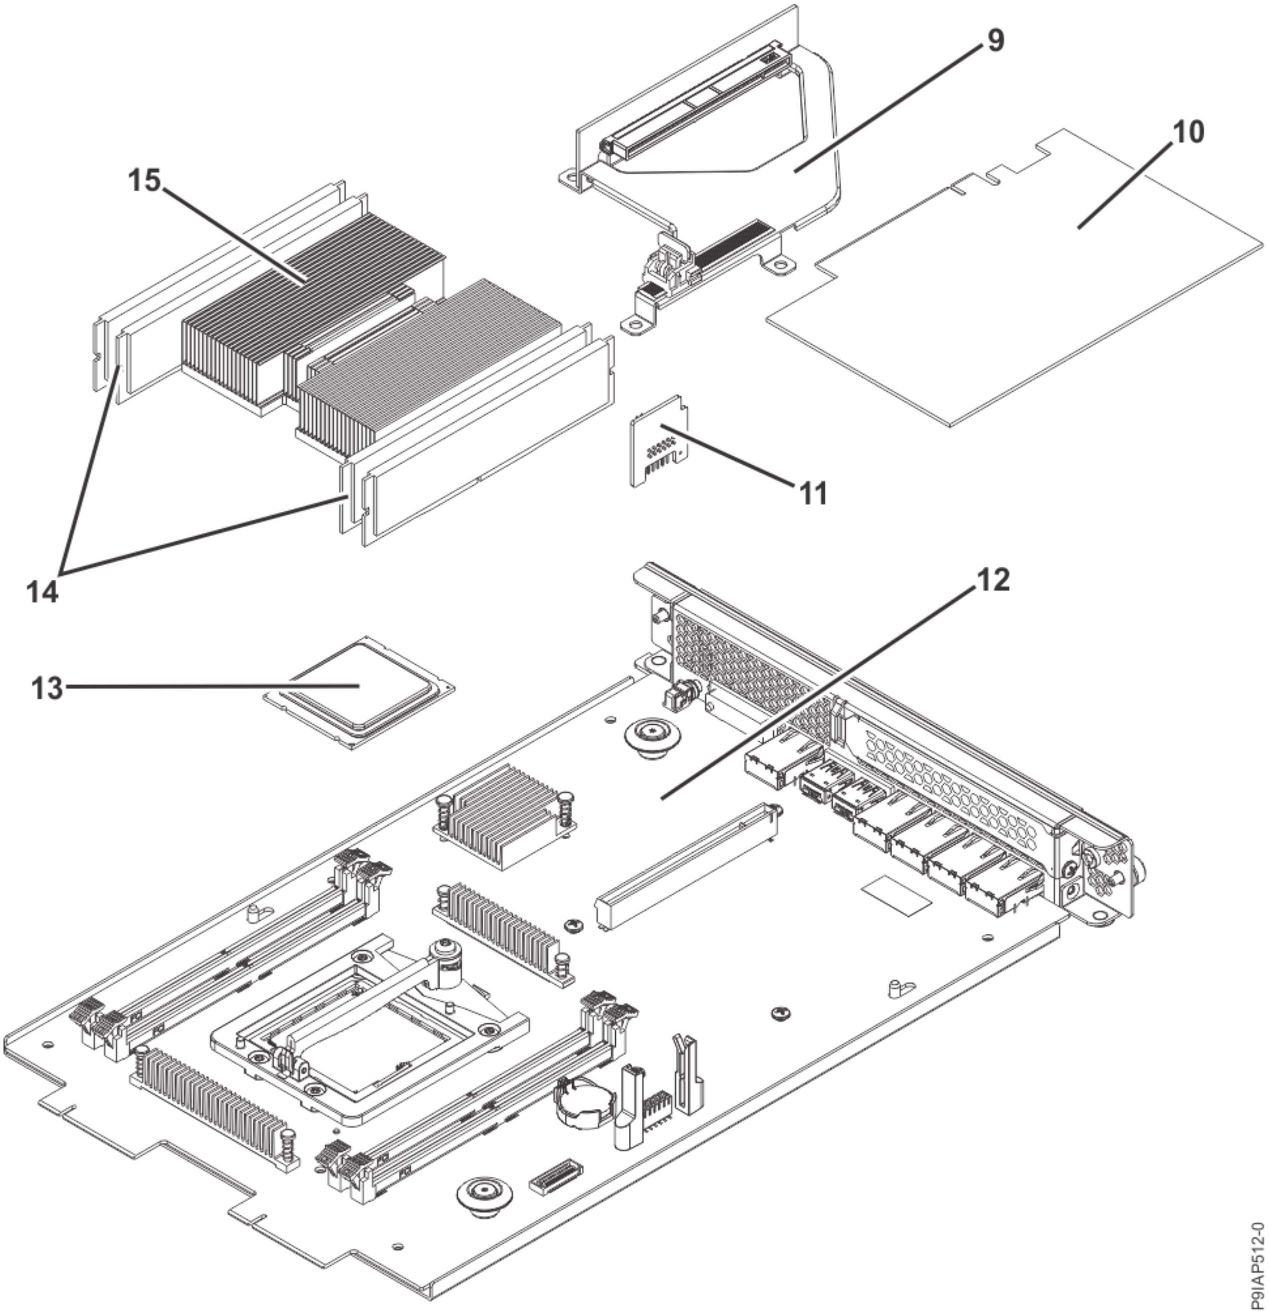

Figure 8. Additional system parts

Table 12. Additional system parts

Index numbe r	Part number	Units per assembly	Description
9	02WF443	1	PCIe riser
10	02JD569	1	PCIe2 2-port 10 GbE BaseT RJ45 adapter
11	00VK865	1	Trusted platform module

Table 12. Additional system parts (continued)

Index number	Part number	Units per assembly	Description
12	02WF439	1	System backplane kit (includes time-of-day battery, PCIe riser, PCIe tailstock filler, system processor module removal tool, and thermal interface material)
13	03GM808	1	6 core 3.0 GHz system processor module kit (includes system processor module, thermal interface material, tweezers, and system processor module removal tool)
14	78P6722	4	16 GB 2RX4 DDR4 IS RDIMM (Micron Technology, Inc.)
	78P4197	4	16 GB 2RX4 DDR4 IS RDIMM (Samsung Electronics Co., Ltd. or SK hynix, Inc.)
	78P4198	4	32 GB 2RX4 DDR4 IS RDIMM (Micron Technology, Inc., Samsung Electronics Co., Ltd., or SK hynix, Inc.)
15	03GM989	1	Heat sink kit (includes heat sink and thermal interface material)

Table 13. Miscellaneous parts

Description	Part number
USB cable	03GM778
Control panel cable	03GM780
Drive signal cable	03GM782
Drive power cable	03GM784
CR2032 Lithium time-of-day battery	00RY543
Chassis crossbar	03GM755

Some jurisdictions do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM websites are provided for convenience only and do not in any manner serve as an endorsement of those websites. The materials at those websites are not part of the materials for this IBM product and use of those websites is at your own risk.

IBM may use or distribute any of the information you provide in any way it believes appropriate without incurring any obligation to you.

The performance data and client examples cited are presented for illustrative purposes only. Actual performance results may vary depending on specific configurations and operating conditions.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

All IBM prices shown are IBM's suggested retail prices, are current and are subject to change without notice. Dealer prices may vary.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to actual people or business enterprises is entirely coincidental.

If you are viewing this information in softcopy, the photographs and color illustrations may not appear.

The drawings and specifications contained herein shall not be reproduced in whole or in part without the written permission of IBM.

IBM has prepared this information for use with the specific machines indicated. IBM makes no representations that it is suitable for any other purpose.

IBM's computer systems contain mechanisms designed to reduce the possibility of undetected data corruption or loss. This risk, however, cannot be eliminated. Users who experience unplanned outages, system failures, power fluctuations or outages, or component failures must verify the accuracy of operations performed and data saved or transmitted by the system at or near the time of the outage or failure. In addition, users must establish procedures to ensure that there is independent data verification before relying on such data in sensitive or critical operations. Users should periodically check IBM's support websites for updated information and fixes applicable to the system and related software.

Homologation statement

This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Contact an IBM representative or reseller for any questions.

Accessibility features for IBM Power servers

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Power servers include the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Power servers use the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with ICT Accessibility 508 Standards and 255 Guidelines (https://www.access-board.gov/ict/) and Web Content Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the IBM Power servers.

The IBM Power servers online product documentation in IBM Documentation is enabled for accessibility. For more information about IBM's commitment to accessibility, see the IBM accessibility website at IBM Accessibility (https://www.ibm.com/able/).

Keyboard navigation

This product uses standard navigation keys.

Interface information

The IBM Power servers user interfaces do not have content that flashes 2 - 55 times per second.

The IBM Power servers web user interface relies on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

The IBM Power servers web user interface includes WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Power servers include certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as the customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at http://www.ibm.com/privacy and IBM's Online Privacy Statement at http://www.ibm.com/privacy/details the section entitled "Cookies, Web Beacons and Other Technologies" and the "IBM Software Products and Software-as-a-Service Privacy Statement" at http://www.ibm.com/software/info/product-privacy.

Trademarks

IBM, the IBM logo, and ibm.com are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information.

The registered trademark Linux is used pursuant to a sublicense from the Linux Foundation, the exclusive licensee of Linus Torvalds, owner of the mark on a worldwide basis.

Electronic emission notices

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

Class A Notices

The following Class A statements apply to the IBM servers that contain the Power10 processor and its features unless designated as electromagnetic compatibility (EMC) Class B in the feature information.

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

The following Class A statements apply to the servers.

Canada Notice

CAN ICES-3 (A)/NMB-3(A)

European Community and Morocco Notice

This product is in conformity with the protection requirements of Directive 2014/30/EU of the European Parliament and of the Council on the harmonization of the laws of the Member States relating to electromagnetic compatibility. IBM cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-IBM option cards.

This product may cause interference if used in residential areas. Such use must be avoided unless the user takes special measures to reduce electromagnetic emissions to prevent interference to the reception of radio and television broadcasts.

Warning: This equipment is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

Germany Notice

Deutschsprachiger EU Hinweis: Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit

Dieses Produkt entspricht den Schutzanforderungen der EU-Richtlinie 2014/30/EU zur Angleichung der Rechtsvorschriften über die elektromagnetische Verträglichkeit in den EU-Mitgliedsstaatenund hält die Grenzwerte der EN 55022 / EN 55032 Klasse A ein.

Um dieses sicherzustellen, sind die Geräte wie in den Handbüchern beschrieben zu installieren und zu betreiben. Des Weiteren dürfen auch nur von der IBM empfohlene Kabel angeschlossen werden. IBM übernimmt keine Verantwortung für die Einhaltung der Schutzanforderungen, wenn das Produkt ohne Zustimmung von IBM verändert bzw. wenn Erweiterungskomponenten von Fremdherstellern ohne Empfehlung von IBM gesteckt/eingebaut werden.

EN 55032 Klasse A Geräte müssen mit folgendem Warnhinweis versehen werden:

"Warnung: Dieses ist eine Einrichtung der Klasse A. Diese Einrichtung kann im Wohnbereich Funk-Störungen verursachen; in diesem Fall kann vom Betreiber verlangt werden, angemessene Maßnahmen zu ergreifen und dafür aufzukommen."

Deutschland: Einhaltung des Gesetzes über die elektromagnetische Verträglichkeit von Geräten

Dieses Produkt entspricht dem “Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG)“. Dies ist die Umsetzung der EU-Richtlinie 2014/30/EU in der Bundesrepublik Deutschland.

Zulassungsbescheinigung laut dem Deutschen Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) (bzw. der EMC Richtlinie 2014/30/EU) für Geräte der Klasse A

Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen.

Verantwortlich für die Einhaltung der EMV Vorschriften ist der Hersteller:
International Business Machines Corp.
New Orchard Road

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Responsible Party:
International Business Machines Corporation
New Orchard Road
Armonk, NY 10504
Contact for FCC compliance information only: fccinfo@us.ibm.com

United Kingdom Notice

This product may cause interference if used in residential areas. Such use must be avoided unless the user takes special measures to reduce electromagnetic emissions to prevent interference to the reception of radio and television broadcasts.

Class B Notices

The following Class B statements apply to features designated as electromagnetic compatibility (EMC) Class B in the feature installation information.

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

Canada Notice

CAN ICES-3 (B)/NMB-3(B)

European Community and Morocco Notice

This product is in conformity with the protection requirements of Directive 2014/30/EU of the European Parliament and of the Council on the harmonization of the laws of the Member States relating to electromagnetic compatibility. IBM cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-IBM option cards.

Taiwan Notice

台灣IBM 產品服務聯絡方式：
台灣國際商業機器股份有限公司
台北市松仁路7號3樓
電話：0800-016-888

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult an IBM-authorized dealer or service representative for help.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions:

(1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Terms and conditions

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Power Systems

Servicing the IBM Power Systems HMC (7063-CR2)

IBM

Note

Before using this information and the product it supports, read the information in "Safety notices" on page v, "Notices" on page 109, the *IBM Systems Safety Notices* manual, G229-9054, and the *IBM Environmental Notices and User Guide*, Z125–5823.

This edition applies to IBM® Power® servers that contain the Power10 processor and to all associated models.

Contents

Safety notices

Safety notices may be printed throughout this guide:

- **DANGER** notices call attention to a situation that is potentially lethal or extremely hazardous to people.
- **CAUTION** notices call attention to a situation that is potentially hazardous to people because of some existing condition.
- **Attention** notices call attention to the possibility of damage to a program, device, system, or data.

World Trade safety information

Several countries require the safety information contained in product publications to be presented in their national languages. If this requirement applies to your country, safety information documentation is included in the publications package (such as in printed documentation, on DVD, or as part of the product) shipped with the product. The documentation contains the safety information in your national language with references to the U.S. English source. Before using a U.S. English publication to install, operate, or service this product, you must first become familiar with the related safety information documentation. You should also refer to the safety information documentation any time you do not clearly understand any safety information in the U.S. English publications.

Replacement or additional copies of safety information documentation can be obtained by calling the IBM Hotline at 1-800-300-8751.

German safety information

Das Produkt ist nicht für den Einsatz an Bildschirmarbeitsplätzen im Sinne § 2 der Bildschirmarbeitsverordnung geeignet.

Laser safety information

IBM servers can use I/O cards or features that are fiber-optic based and that utilize lasers or LEDs.

Laser compliance

IBM servers may be installed inside or outside of an IT equipment rack.

⚠ **DANGER:** When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard: If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product. Do not open or service any power supply assembly. Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.

- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords. For AC power, disconnect all power cords from their AC power source. For racks with a DC power distribution panel (PDP), disconnect the customer's DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected. For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate. For racks with a DC power distribution panel (PDP), connect the customer's DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.
- Connect any equipment that will be attached to this product to properly wired outlets.

- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- When performing a machine inspection: Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements. Do not attempt to switch power to the machine until all possible unsafe conditions are corrected. Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.
- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

  To Disconnect: 1) Turn off everything (unless instructed otherwise). 2) For AC power, remove the power cords from the outlets. 3) For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source. 4) Remove the signal cables from the connectors. 5) Remove all cables from the devices.

  To Connect: 1) Turn off everything (unless instructed otherwise). 2) Attach all cables to the devices. 3) Attach the signal cables to the connectors. 4) For AC power, attach the power cords to the outlets. 5) For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP. 6) Turn on the devices.
-  Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

(R001 part 1 of 2):

DANGER: Observe the following precautions when working on or around your IT rack system:

- Heavy equipment–personal injury or equipment damage might result if mishandled.
- Always lower the leveling pads on the rack cabinet.
- Always install stabilizer brackets on the rack cabinet if provided, unless the earthquake option is to be installed.
- To avoid hazardous conditions due to uneven mechanical loading, always install the heaviest devices in the bottom of the rack cabinet. Always install servers and optional devices starting from the bottom of the rack cabinet.
- Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack mounted devices and do not use them to stabilize your body position (for example, when working from a ladder).

- Stability hazard:
  - The rack may tip over causing serious personal injury.
  - Before extending the rack to the installation position, read the installation instructions.
  - Do not put any load on the slide-rail mounted equipment mounted in the installation position.
  - Do not leave the slide-rail mounted equipment in the installation position.
- Each rack cabinet might have more than one power cord.
  - For AC powered racks, be sure to disconnect all power cords in the rack cabinet when directed to disconnect power during servicing.

  - For racks with a DC power distribution panel (PDP), turn off the circuit breaker that controls the power to the system unit(s), or disconnect the customer's DC power source, when directed to disconnect power during servicing.
- Connect all devices installed in a rack cabinet to power devices installed in the same rack cabinet. Do not plug a power cord from a device installed in one rack cabinet into a power device installed in a different rack cabinet.
- An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (R001 part 1 of 2)

(R001 part 2 of 2):

⚠ **CAUTION:**

- Do not install a unit in a rack where the internal rack ambient temperatures will exceed the manufacturer's recommended ambient temperature for all your rack-mounted devices.
- Do not install a unit in a rack where the air flow is compromised. Ensure that air flow is not blocked or reduced on any side, front, or back of a unit used for air flow through the unit.
- Consideration should be given to the connection of the equipment to the supply circuit so that overloading of the circuits does not compromise the supply wiring or overcurrent protection. To provide the correct power connection to a rack, refer to the rating labels located on the equipment in the rack to determine the total power requirement of the supply circuit.
- *(For sliding drawers.)* Do not pull out or install any drawer or feature if the rack stabilizer brackets are not attached to the rack or if the rack is not bolted to the floor. Do not pull out more than one drawer at a time. The rack might become unstable if you pull out more than one drawer at a time.

- *(For fixed drawers.)* This drawer is a fixed drawer and must not be moved for servicing unless specified by the manufacturer. Attempting to move the drawer partially or completely out of the rack might cause the rack to become unstable or cause the drawer to fall out of the rack. (R001 part 2 of 2)

⚠ **CAUTION:** Removing components from the upper positions in the rack cabinet improves rack stability during relocation. Follow these general guidelines whenever you relocate a populated rack cabinet within a room or building.

- Reduce the weight of the rack cabinet by removing equipment starting at the top of the rack cabinet. When possible, restore the rack cabinet to the configuration of the rack cabinet as you received it. If this configuration is not known, you must observe the following precautions:
  - Remove all devices in the 32U position (compliance ID RACK-001 or 22U (compliance ID RR001) and above.
  - Ensure that the heaviest devices are installed in the bottom of the rack cabinet.

  - Ensure that there are little-to-no empty U-levels between devices installed in the rack cabinet below the 32U (compliance ID RACK-001 or 22U (compliance ID RR001) level, unless the received configuration specifically allowed it.
- If the rack cabinet you are relocating is part of a suite of rack cabinets, detach the rack cabinet from the suite.
- If the rack cabinet you are relocating was supplied with removable outriggers they must be reinstalled before the cabinet is relocated.
- Inspect the route that you plan to take to eliminate potential hazards.
- Verify that the route that you choose can support the weight of the loaded rack cabinet. Refer to the documentation that comes with your rack cabinet for the weight of a loaded rack cabinet.
- Verify that all door openings are at least 760 x 2083 mm (30 x 82 in.).
- Ensure that all devices, shelves, drawers, doors, and cables are secure.
- Ensure that the four leveling pads are raised to their highest position.
- Ensure that there is no stabilizer bracket installed on the rack cabinet during movement.
- Do not use a ramp inclined at more than 10 degrees.
- When the rack cabinet is in the new location, complete the following steps:
  - Lower the four leveling pads.
  - Install stabilizer brackets on the rack cabinet or in an earthquake environment bolt the rack to the floor.
  - If you removed any devices from the rack cabinet, repopulate the rack cabinet from the lowest position to the highest position.
- If a long-distance relocation is required, restore the rack cabinet to the configuration of the rack cabinet as you received it. Pack the rack cabinet in the original packaging material, or equivalent. Also lower the leveling pads to raise the casters off of the pallet and bolt the rack cabinet to the pallet.

All lasers are certified in the U.S. to conform to the requirements of DHHS 21 CFR Subchapter J for class 1 laser products. Outside the U.S., they are certified to be in compliance with IEC 60825 as a class 1 laser product. Consult the label on each part for laser certification numbers and approval information.

⚠ **CAUTION:** This product might contain one or more of the following devices: CD-ROM drive, DVD-ROM drive, DVD-RAM drive, or laser module, which are Class 1 laser products. Note the following information:

- Do not remove the covers. Removing the covers of the laser product could result in exposure to hazardous laser radiation. There are no serviceable parts inside the device.
- Use of the controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

(C026)

⚠ **CAUTION:** Data processing environments can contain equipment transmitting on system links with laser modules that operate at greater than Class 1 power levels. For this reason, never look into the end of an optical fiber cable or open receptacle. Although shining light into one end and looking into the other end of a disconnected optical fiber to verify the continuity of optic fibers may not injure the eye, this procedure is potentially dangerous. Therefore, verifying the continuity of optical fibers by shining light into one end and looking at the other end is not recommended. To verify continuity of a fiber optic cable, use an optical light source and power meter. (C027)

⚠ **CAUTION:** This product contains a Class 1M laser. Do not view directly with optical instruments. (C028)

⚠ **CAUTION:** Some laser products contain an embedded Class 3A or Class 3B laser diode. Note the following information:

- Laser radiation when open.
- Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam. (C030)

(C030)

⚠ **CAUTION:** The battery contains lithium. To avoid possible explosion, do not burn or charge the battery.

Do Not:

- Throw or immerse into water
- Heat to more than 100 degrees C (212 degrees F)
- Repair or disassemble

Exchange only with the IBM-approvedapproved part. Recycle or discard the battery as instructed by local regulations. In the United States, IBM has a process for the collection of this battery. For information, call 1-800-426-4333. Have the IBM part number for the battery unit available when you call. (C003)(C003a)

⚠ **CAUTION:** Regarding IBM providedprovided VENDOR LIFT TOOL:

- Operation of LIFT TOOL by authorized personnel only.
- LIFT TOOL intended for use to assist, lift, install, remove units (load) up into rack elevations. It is not to be used loaded transporting over major ramps nor as a replacement for such designated tools like pallet jacks, walkies, fork trucks and such related relocation practices. When this is not practicable, specially trained persons or services must be used (for instance, riggers or movers).
- Read and completely understand the contents of LIFT TOOL operator's manual before using. Failure to read, understand, obey safety rules, and follow instructions may result in property damage and/or personal injury. If there are questions, contact the vendor's service and support. Local paper manual must remain with machine in provided storage sleeve area. Latest revision manual available on vendor's web site.

- Test verify stabilizer brake function before each use. Do not over-force moving or rolling the LIFT TOOL with stabilizer brake engaged.
- Do not raise, lower or slide platform load shelf unless stabilizer (brake pedal jack) is fully engaged. Keep stabilizer brake engaged when not in use or motion.
- Do not move LIFT TOOL while platform is raised, except for minor positioning.
- Do not exceed rated load capacity. See LOAD CAPACITY CHART regarding maximum loads at center versus edge of extended platform.
- Only raise load if properly centered on platform. Do not place more than 200 lb (91 kg) on edge of sliding platform shelf also considering the load's center of mass/gravity (CoG).
- Do not corner load the platforms, tilt riser, angled unit install wedge or other such accessory options. Secure such platforms -- riser tilt, wedge, etc options to main lift shelf or forks in all four (4x or all other provisioned mounting) locations with provided hardware only, prior to use. Load objects are designed to slide on/off smooth platforms without appreciable force, so take care not to push or lean. Keep riser tilt [adjustable angling platform] option flat at all times except for final minor angle adjustment when needed.
- Do not stand under overhanging load.
- Do not use on uneven surface, incline or decline (major ramps).
- Do not stack loads.
- Do not operate while under the influence of drugs or alcohol.
- Do not support ladder against LIFT TOOL (unless the specific allowance is provided for one following qualified procedures for working at elevations with this TOOL).
- Tipping hazard. Do not push or lean against load with raised platform.
- Do not use as a personnel lifting platform or step. No riders.
- Do not stand on any part of lift. Not a step.
- Do not climb on mast.
- Do not operate a damaged or malfunctioning LIFT TOOL machine.
- Crush and pinch point hazard below platform. Only lower load in areas clear of personnel and obstructions. Keep hands and feet clear during operation.
- No Forks. Never lift or move bare LIFT TOOL MACHINE with pallet truck, jack or fork lift.
- Mast extends higher than platform. Be aware of ceiling height, cable trays, sprinklers, lights, and other overhead objects.
- Do not leave LIFT TOOL machine unattended with an elevated load.
- Watch and keep hands, fingers, and clothing clear when equipment is in motion.
- Turn Winch with hand power only. If winch handle cannot be cranked easily with one hand, it is probably over-loaded. Do not continue to turn winch past top or bottom of platform travel. Excessive unwinding will detach handle and damage cable. Always hold handle when lowering, unwinding. Always assure self that winch is holding load before releasing winch handle.
- A winch accident could cause serious injury. Not for moving humans. Make certain clicking sound is heard as the equipment is being raised. Be sure winch is locked in position before releasing handle. Read instruction page before operating this winch. Never allow winch to unwind freely. Freewheeling will cause uneven cable wrapping around winch drum, damage cable, and may cause serious injury.
- This TOOL must be maintained correctly for IBM Service personnel to use it. IBM shall inspect condition and verify maintenance history before operation. Personnel reserve the right not to use TOOL if inadequate. (C048)

Power and cabling information for NEBS (Network Equipment-Building System) GR-1089-CORE

The following comments apply to the IBM servers that have been designated as conforming to NEBS (Network Equipment-Building System) GR-1089-CORE:

The equipment is suitable for installation in the following:

- Network telecommunications facilities
- Locations where the NEC (National Electrical Code) applies

The intra-building ports of this equipment are suitable for connection to intra-building or unexposed wiring or cabling only. The intra-building ports of this equipment *must not* be metallically connected to the interfaces that connect to the OSP (outside plant) or its wiring. These interfaces are designed for use as intrabuilding interfaces only (Type 2 or Type 4 ports as described in GR-1089-CORE) and require isolation from the exposed OSP cabling. The addition of primary protectors is not sufficient protection to connect these interfaces metallically to OSP wiring.

Note: All Ethernet cables must be shielded and grounded at both ends.

The AC-powered system does not require the use of an external surge protection device (SPD).

The DC-powered system employs an isolated DC return (DC-I) design. The DC battery return terminal *shall not* be connected to the chassis or frame ground.

The DC-powered system is intended to be installed in a common bonding network (CBN) as described in GR-1089-CORE.

Removing and replacing parts in the 7063-CR2

Use these procedures to remove and replace failing parts in the IBM Power Systems HMC (7063-CR2). These parts are referred to as field replaceable units (FRUs).

Note: See the International Information Bulletin for Customers - Installation of IBM Machines (http://www.ibm.com/e-business/linkweb/publications/servlet/pbi.wss). This bulletin (Publication number SC27-6601-00) provides a list of the key IBM system installation activities and those activities that might be billable activities.

Before you begin a replacement, complete these tasks:

1. If you are completing a replacement procedure that might put your data at risk, ensure that you have a current backup of your system or logical partition (including operating systems, licensed programs, and data).
2. Review the installation or replacement procedure for the feature or part.
3. Blue on a part of the hardware indicates a touch point where you can grip the hardware to remove it from or install it in the system, or open or close a latch.
4. Ensure that you have access to a medium, flat-blade screwdriver, and a Phillips screwdriver.
5. If parts are incorrect, missing, or visibly damaged, contact the provider of the part or your next level of support.

⚠ **DANGER:** When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard: If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product. Do not open or service any power supply assembly. Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.

- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords. For AC power, disconnect all power cords from their AC power source. For racks with a DC power distribution panel (PDP), disconnect the customer's DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected. For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate. For racks with a DC power distribution panel (PDP), connect the customer's DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.
- Connect any equipment that will be attached to this product to properly wired outlets.
- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- When performing a machine inspection: Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements. Do not attempt to switch power to the machine until all possible unsafe conditions are corrected. Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.
- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

To Disconnect: 1) Turn off everything (unless instructed otherwise). 2) For AC power, remove the power cords from the outlets. 3) For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source. 4) Remove the signal cables from the connectors. 5) Remove all cables from the devices.

To Connect: 1) Turn off everything (unless instructed otherwise). 2) Attach all cables to the devices. 3) Attach the signal cables to the connectors. 4) For AC power, attach the power cords to the outlets. 5) For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP. 6) Turn on the devices.

- Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

⚠ **Attention:**

Failure to follow the step-by-step sequence for FRU removal or installation might result in FRU or system damage.

For safety, airflow purposes and thermal performance, the service access cover must be installed and fully seated before you power on the system.

For safety and airflow purposes and thermal performance, if you remove parts from the system, you must ensure that PCIe tail-stock fillers are present.

Use the following precautions whenever you handle electronic components or cables.

- The electrostatic discharge (ESD) kit and the ESD wrist strap must be used when you handle logic cards, single chip modules (SCM), multi-chip modules (MCM), electronic boards, and drives.
- Keep all electronic components in the shipping container or envelope until you are ready to install them.
- If you remove and then reinstall an electronic component, temporarily place the component on an ESD pad or blanket.

Removing and replacing cables in the 7063-CR2

Learn how to remove and replace cables in the IBM Power Systems HMC (7063-CR2) system.

Removing and replacing the drive power cable in the 7063-CR2

Learn how to remove and replace the drive power cable in the IBM Power Systems HMC (7063-CR2) system.

Removing the drive power cable from the 7063-CR2 system

To remove the drive power cable from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   ⚠ **Attention:**

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.

- When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
- If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.

2. Power off the system.

   For instructions, see "Stopping the 7063-CR2 system" on page 99.

3. Place the system in the service position on an ESD surface on a table.

   For instructions, see "Placing a 7063-CR2 system into the service position" on page 101.

4. Remove the service access cover.

   For instructions, see "Removing the service access cover from a 7063-CR2 system" on page 104.

5. Remove the drive power cable.

   a) Label where the drive power cable **(A)** connects to the power distribution board and to the drive holder.

      This cable is a "Y" cable that connects to the drive holder in two places.

   b) Remove the drive power cable from the power distribution board and from the drive holder.

      Use your thumb or finger to press the release latch on the connector to remove the cable from the power distribution board.

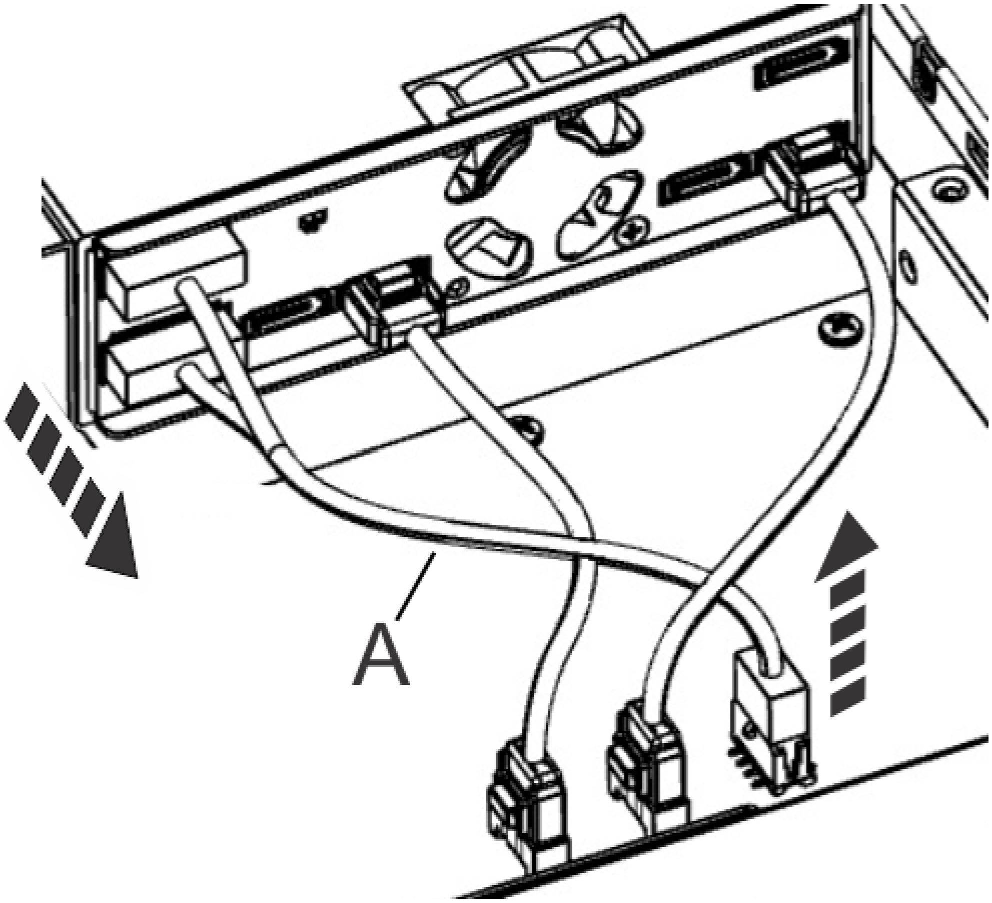

Figure 1. Disconnecting the drive power cable

Replacing the drive power cable in the 7063-CR2 system

To replace the drive power cable in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Ensure that you have the electrostatic discharge (ESD) wrist strap on and that the ESD clip is plugged into a ground jack or connected to an unpainted metal surface. If not, do so now.
2. Using your labels, replace the drive power cable into the power distribution board and into the drive holder.

   Ensure that the cable latch clip snaps into place in the connector on the power distribution board.

   
   Figure 2. Connecting the drive power cable
3. Install the service access cover.

   For instructions, see “Installing the service access cover on a 7063-CR2 system” on page 105.
4. Replace the system in the rack and replace the components that you removed.

   For instructions, see “Placing a 7063-CR2 system into the operating position” on page 103.
5. Power on the system for operation.

   For instructions, see “Starting the 7063-CR2 system ” on page 98.

Removing and replacing a drive signal cable in the 7063-CR2

Learn how to remove and replace a drive signal cable in the IBM Power Systems HMC (7063-CR2) system.

Removing a drive signal cable from the 7063-CR2 system

To remove a drive signal cable from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   Attention:

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
   - When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
   - If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.
2. The system has two drive signal cables. Identify which drive cable has the issue.
3. Power off the system.

   For instructions, see "Stopping the 7063-CR2 system" on page 99.
4. Place the system in the service position on an ESD surface on a table.

   For instructions, see "Placing a 7063-CR2 system into the service position" on page 101.
5. Remove the service access cover.

   For instructions, see "Removing the service access cover from a 7063-CR2 system" on page 104.
6. Remove the previously identified drive signal cable.

   a) Label where the drive signal cable **(A)** connects to the power distribution board and to the drive holder.

   b) Remove the drive signal cable from the power distribution board and from the drive holder.

   Use your thumb or finger to press the release latch on the connector to remove the cable.

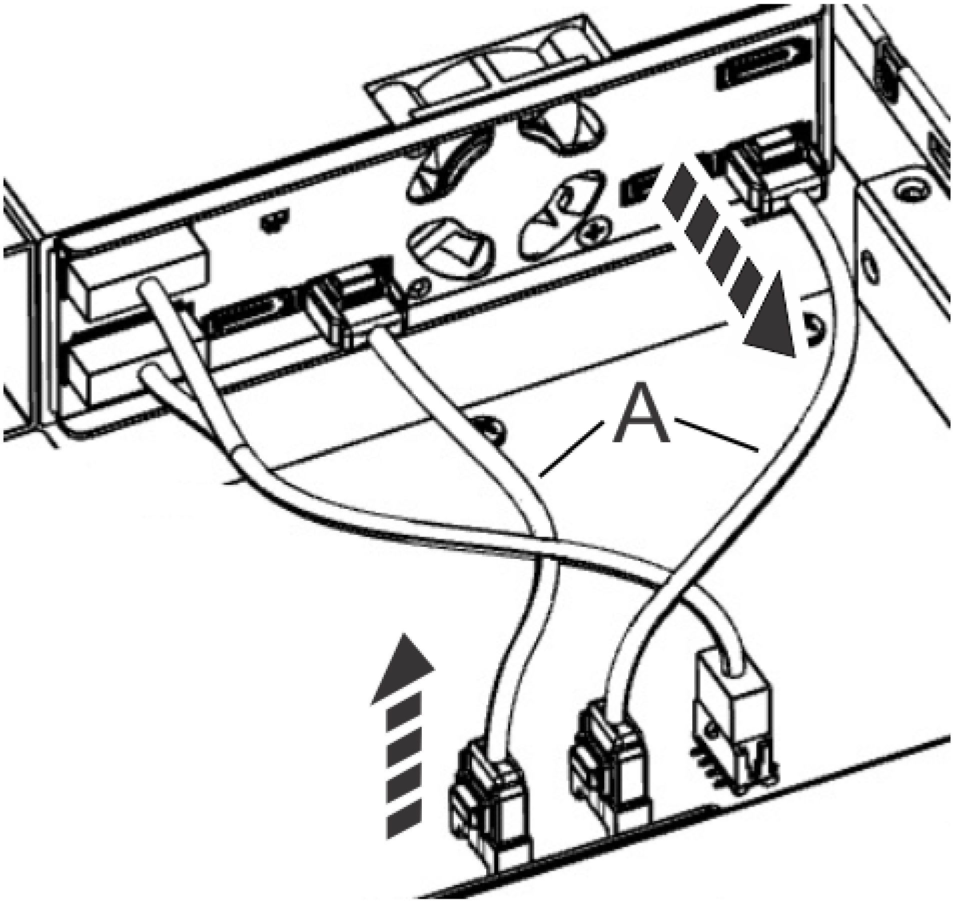

Figure 3. Disconnecting the drive signal cable

Replacing a drive signal cable in the 7063-CR2 system

Removing and replacing a drive in the 7063-CR2

Learn how to remove and replace a drive in the IBM Power Systems HMC (7063-CR2) system.

About this task

The system has two physical drives. These drives are configured as a single virtual drive, as a RAID1 array. The drives have an ID of 0. If one of the drives needs to be replaced, use the "Drive commands for the 7063-CR2 system" on page 99 to check the status of the drives, the IDs of the drives, and to rebuild the RAID1 array. The drive can be replaced with power on; the HMC continues to function normally.

Removing a drive from the 7063-CR2 system

To remove a drive from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

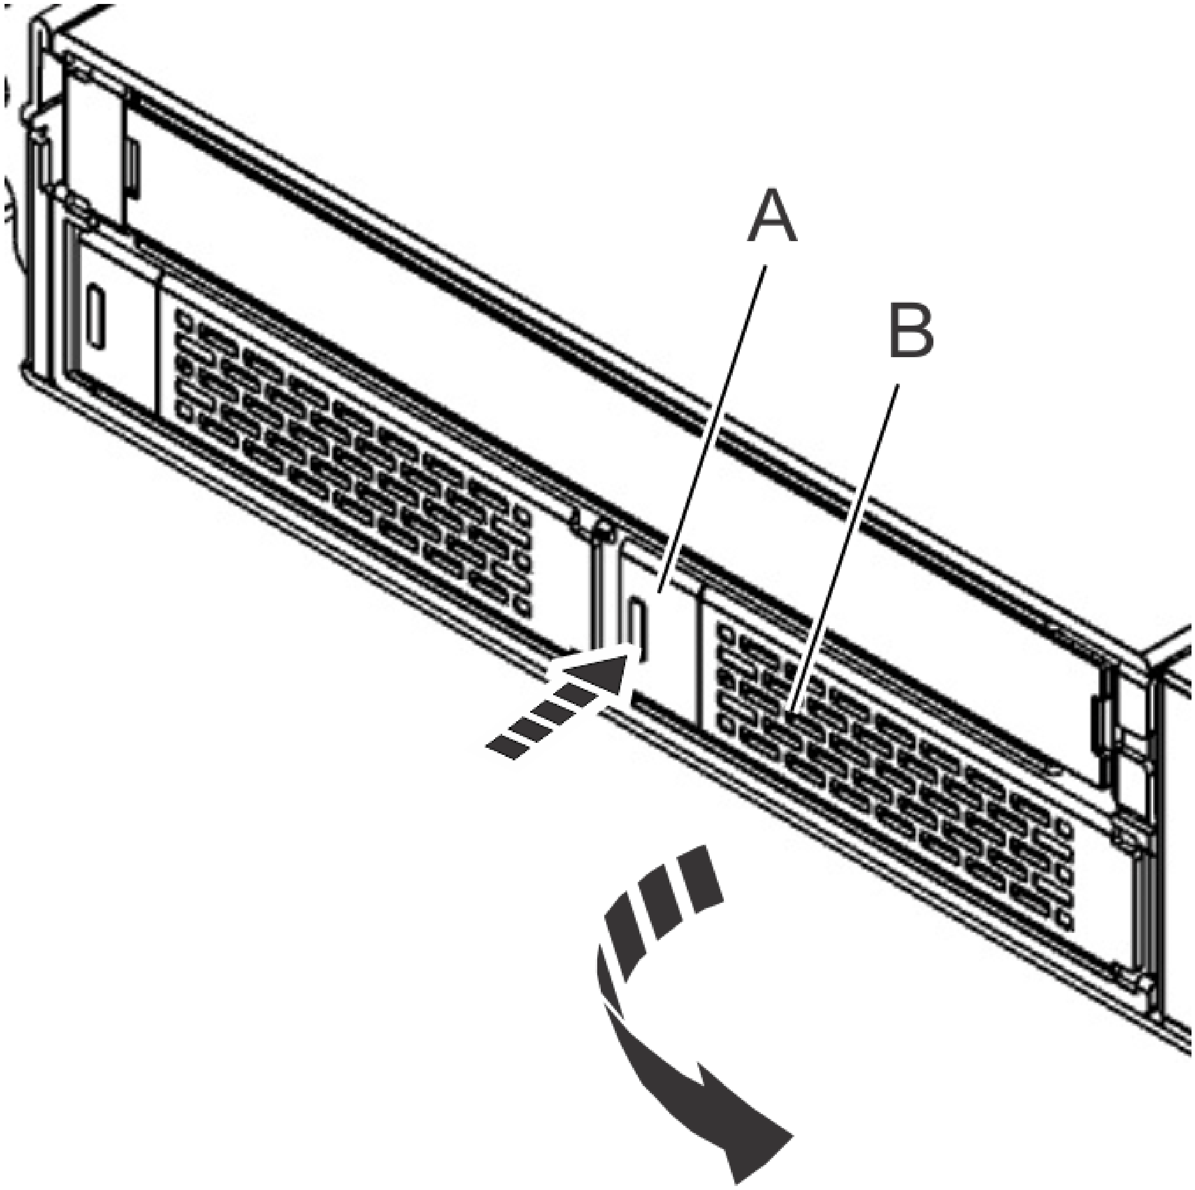
1. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   Attention:

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
   - When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
   - If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.
2. Remove the drive. Use the position information indicated by the service log.
   a) Push in the left side of the handle release latch **(A)** to unlock the drive bay handle **(B)**.
   b) Pull out the drive bay handle **(B)** toward you. If the drive bay handle is not all the way out, the drive cannot slide out of the system.
   c) Support the bottom of the drive as you slide it out of the system. Do not hold the drive by the handle.
   d) Place the drive on an ESD surface.

   Figure 9. Removing a drive



Replacing a drive in the 7063-CR2 system

To replace a drive in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Ensure that you have the electrostatic discharge (ESD) wrist strap on and that the ESD clip is plugged into a ground jack or connected to an unpainted metal surface. If not, do so now.
2. Replace the drive.
   a) Support the drive by the bottom as you position the drive, and insert it into the drive slot.

      Important: Ensure that the drive is fully seated and is all the way into the system.

   b) Lock the drive bay handle **(A)** by pushing in the handle release latch until it locks into place.

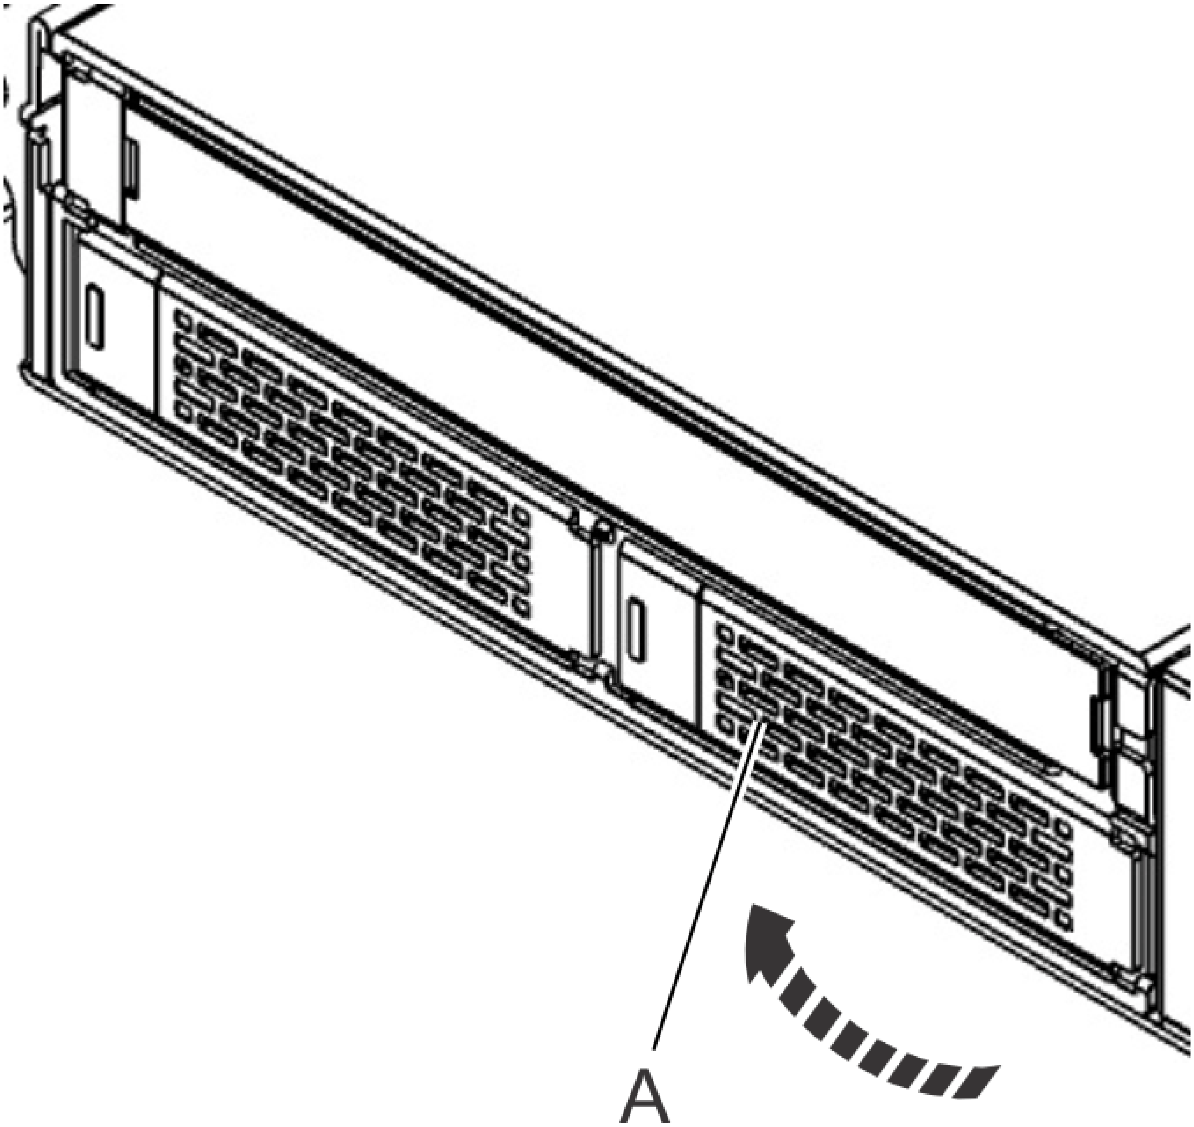


Figure 10. Installing a drive

3. The drive rebuild operation starts automatically.

Removing and replacing the drive holder in the 7063-CR2

Learn how to remove and replace the drive holder in the IBM Power Systems HMC (7063-CR2) system.

Removing the drive holder from the 7063-CR2 system

To remove the drive holder from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

About this task

You can use a magnetic tip screwdriver to remove and replace the screws.

Procedure

1. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

Attention:

- Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
- When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
- If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.

2. Power off the system.

   For instructions, see “Stopping the 7063-CR2 system” on page 99.

3. Place the system in the service position on an ESD surface on a table.

   For instructions, see “Placing a 7063-CR2 system into the service position” on page 101.

4. Label and remove the two drives from the system.

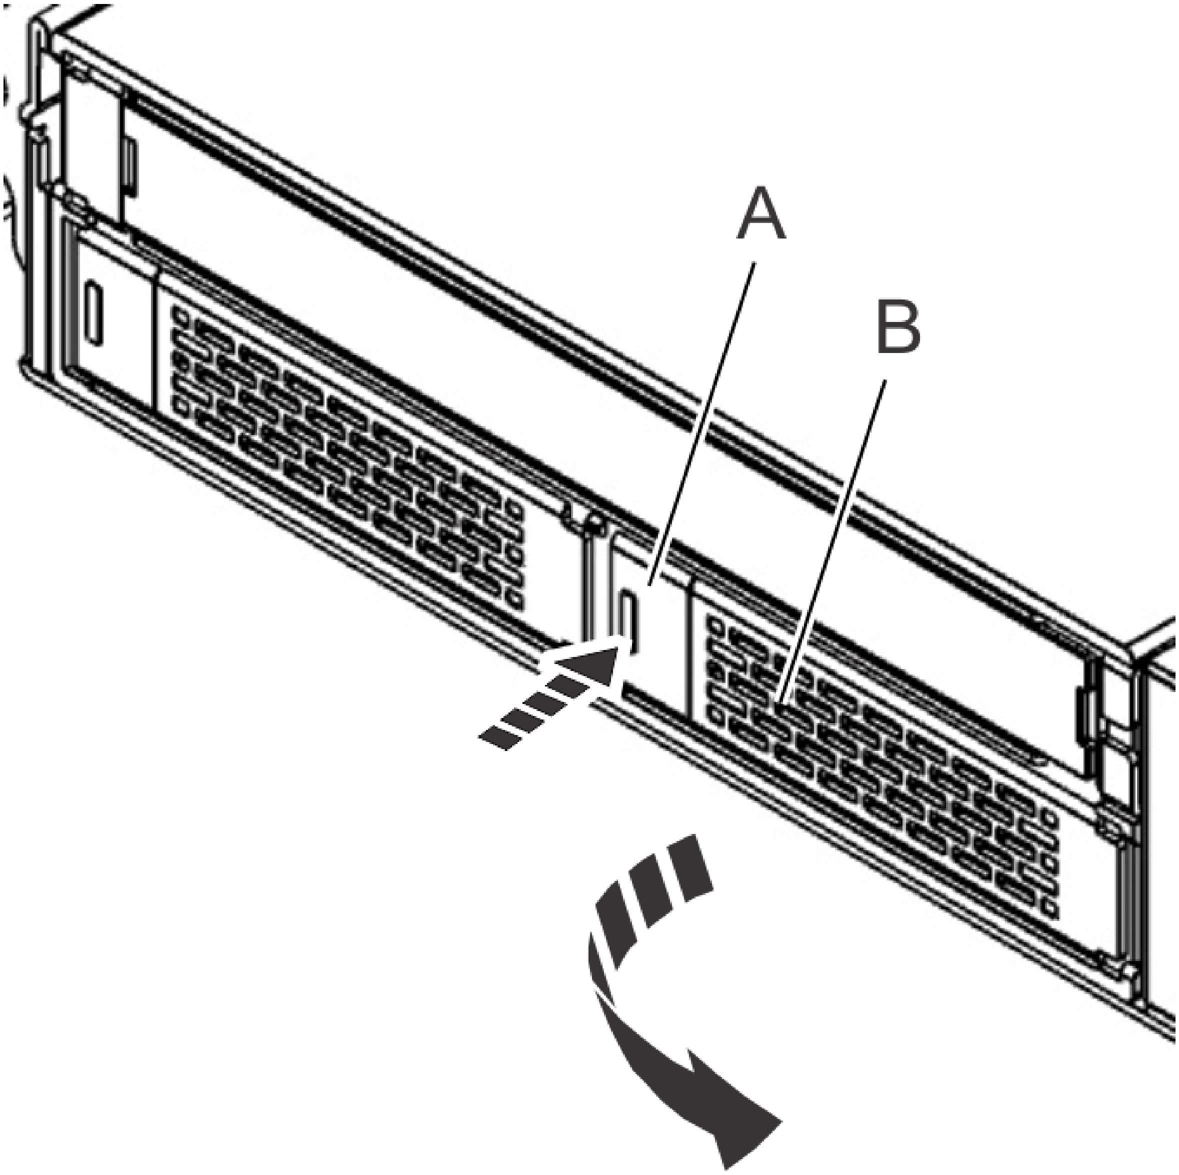
   a) Push in the left side of the handle release latch **(A)** to unlock the drive bay handle **(B)**.

   b) Pull out the drive bay handle **(B)** toward you. If the drive bay handle is not all the way out, the drive cannot slide out of the system.

   c) Support the bottom of the drive as you slide it out of the system. Do not hold the drive by the handle.

   d) Place the drive on an ESD surface.

   Figure 11. Removing a drive



5. Remove all of the fans from the system.

   For instructions, see "Removing a fan from the 7063-CR2 system" on page 18.

6. Remove the service access cover.

   For instructions, see "Removing the service access cover from a 7063-CR2 system" on page 104.

7. Label and disconnect the cables from the rear of drive holder.

   For instructions, see "Removing the drive power cable from the 7063-CR2 system" on page 2 and "Removing a drive signal cable from the 7063-CR2 system" on page 5.

8. Remove left rail from the system.
9. Remove the four screws from the drive holder. The holder has two screws on each side.

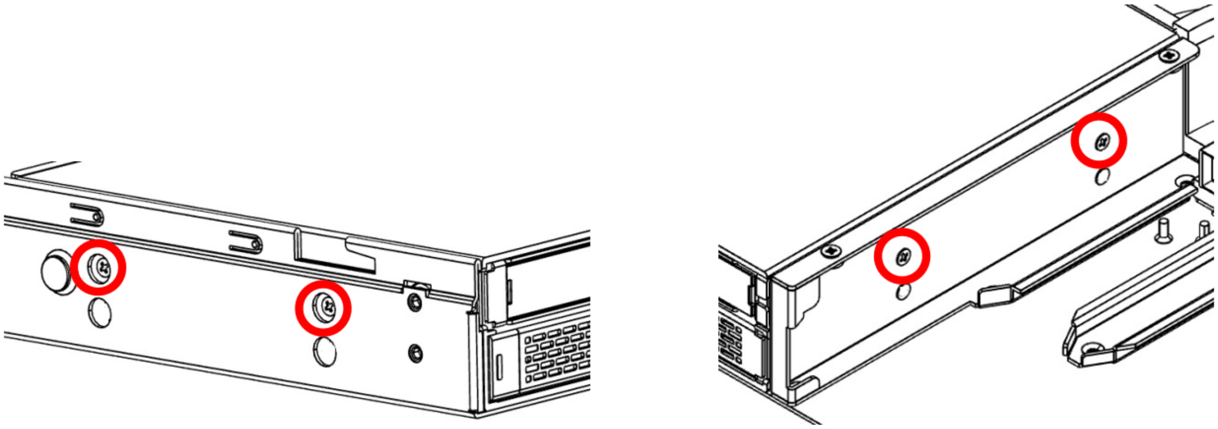


Figure 12. Drive holder screws

10. Remove the drive holder from the system.
11. Place the drive holder and cables on the table.

Replacing the drive holder in the 7063-CR2 system

To replace the drive holder in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

About this task

You can use a magnetic tip screwdriver to remove and replace the screws.

Procedure

1. Ensure that you have the electrostatic discharge (ESD) wrist strap on and that the ESD clip is plugged into a ground jack or connected to an unpainted metal surface. If not, do so now.
2. Insert the drive holder into the system.
3. Install the four screws for the drive holder. The holder has two screws on each side; use the top screw holes.

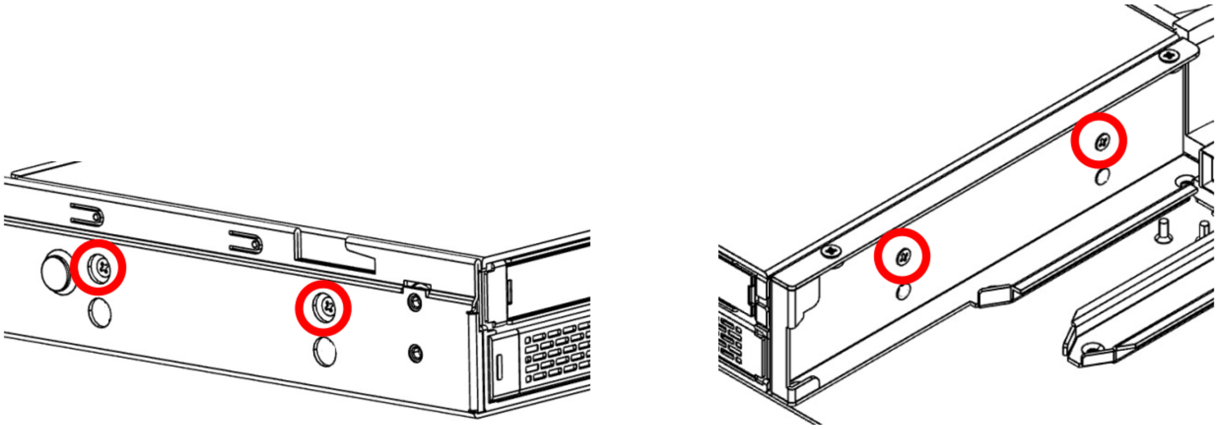

Figure 13. Drive holder screws

4. Install the left rail onto the system.
5. Using your labels, replace the cables into the rear of the drive holder.
6. Install the service access cover.

   For instructions, see "Installing the service access cover on a 7063-CR2 system" on page 105.
7. Replace all of the fans into the system.

For instructions, see “Replacing a fan in the 7063-CR2 system” on page 20.

8. Using your labels, replace the two drives into the system.
   a) Support the drive by the bottom as you position the drive, and insert it into the drive slot.

      Important: Ensure that the drive is fully seated and is all the way into the system.

   b) Lock the drive bay handle **(A)** by pushing in the handle release latch until it locks into place.

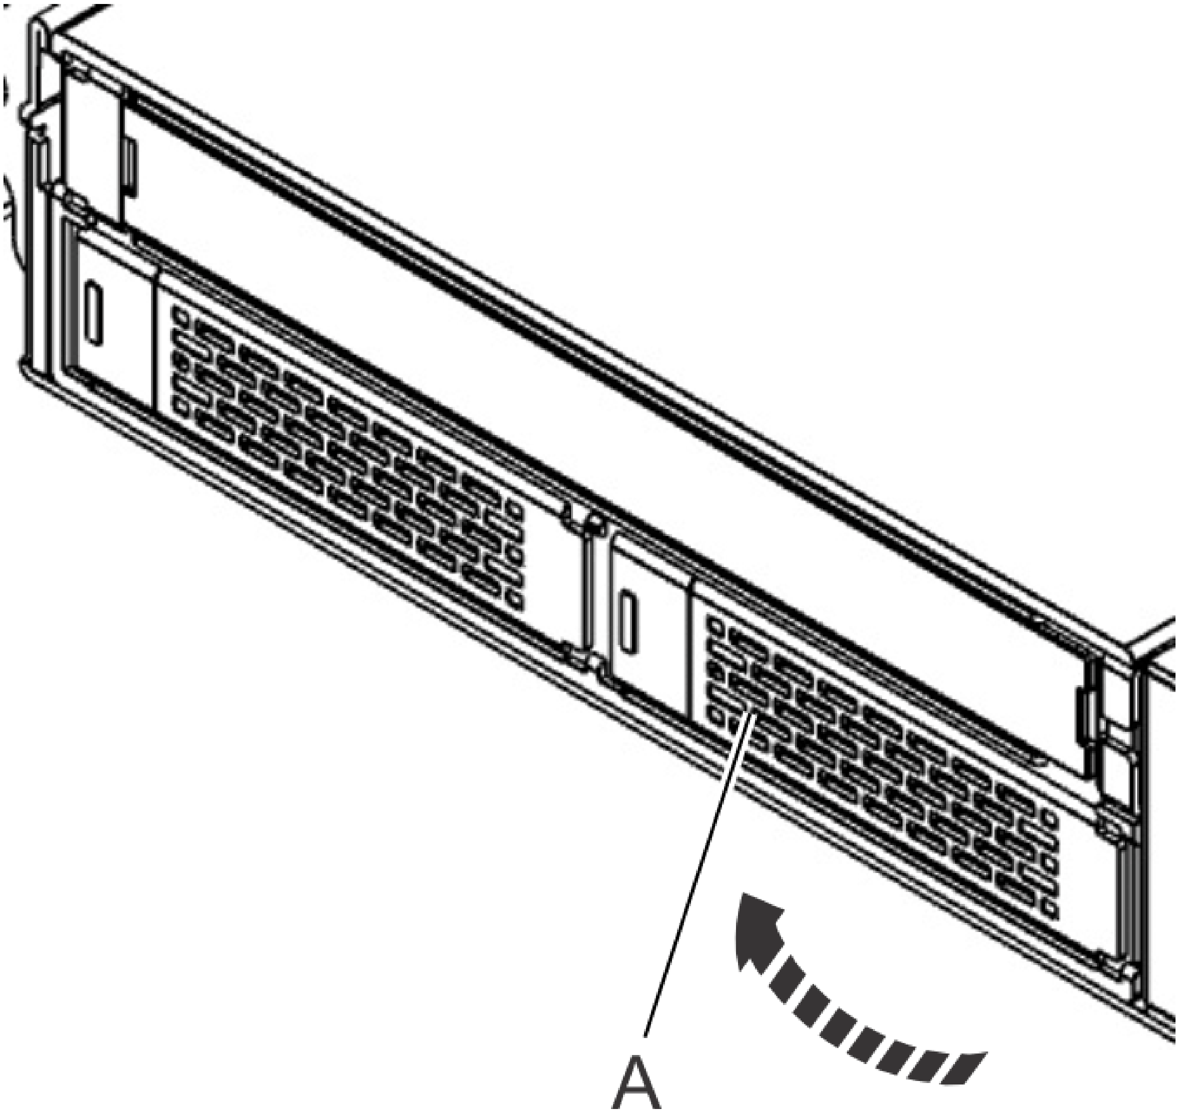

Figure 14. Installing a drive

9. Replace the system in the rack and replace the components that you removed.

   For instructions, see “Placing a 7063-CR2 system into the operating position” on page 103.

10. Power on the system for operation.

    For instructions, see “Starting the 7063-CR2 system ” on page 98.

Removing and replacing fans in the 7063-CR2

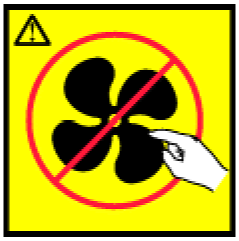
Learn how to remove and replace fans in the IBM Power Systems HMC (7063-CR2) system.

Removing a fan from the 7063-CR2 system

To remove a fan from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Before you begin

(L008)



⚠ **CAUTION:** Hazardous moving parts nearby. (L008)

About this task

If a single fan failed, it can be replaced while the system is running.

Procedure

1. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   ⚠ **Attention:**

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
   - When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
   - If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.
2. Remove the fan cover from the front of the system.

   a) Rotate the two levers **(A)** on each side of the fan cover up and out to unlock the fan cover.

   b) Pull the cover away from the system.

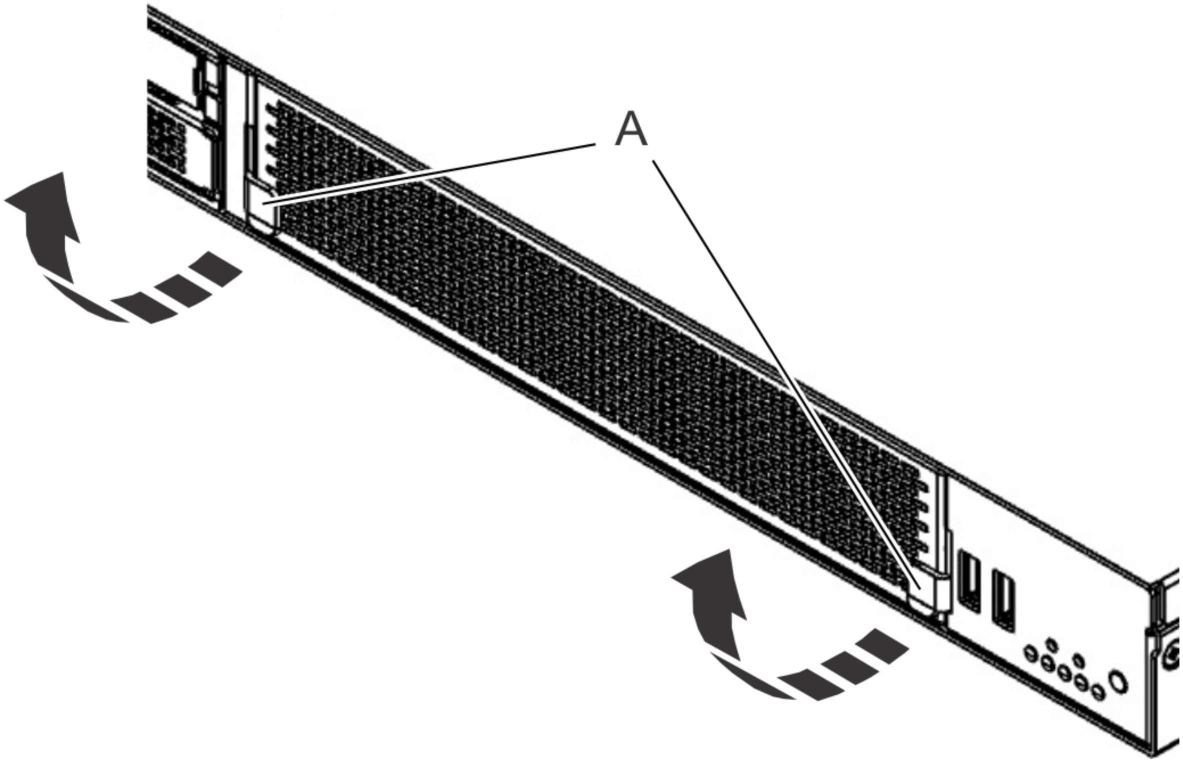


Figure 15. Removing the fan cover

3. Remove the fan assembly from the system.

   ⚠ **Warning:** If the system is powered on and you remove two or more fans, the system powers down.

   a) Use the ring **(A)** on the front of the fan to pull the fan from the system.

   b) Support the bottom of the fan as you slide it out of the system. Do not hold the fan by the ring.

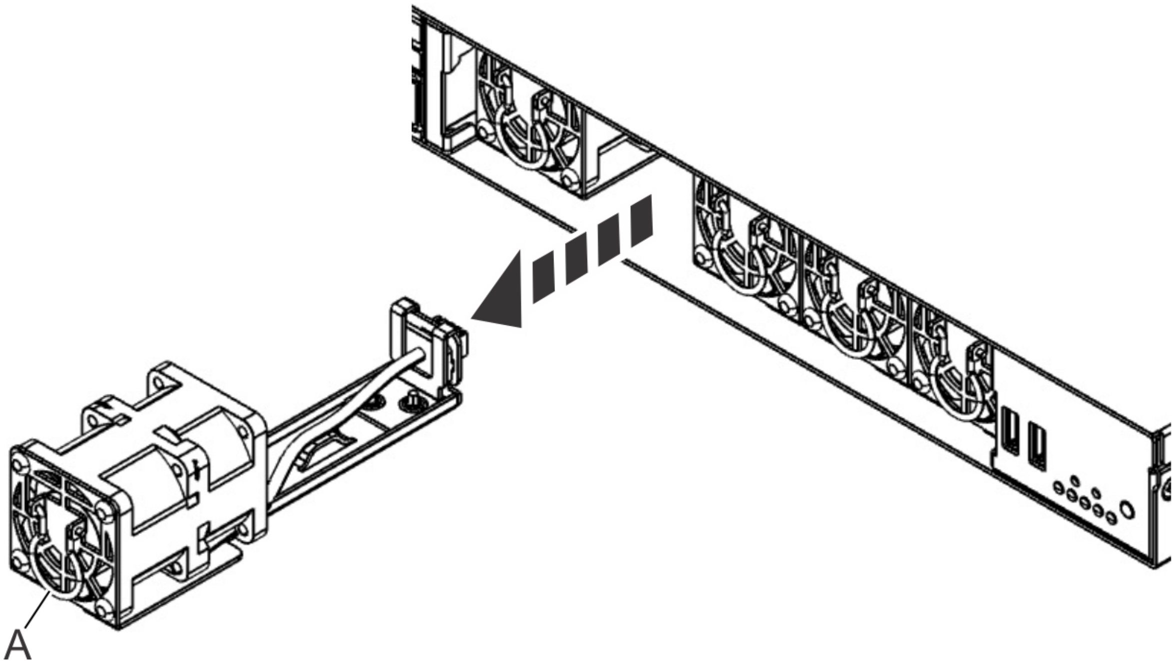

Figure 16. Removing a fan

Replacing a fan in the 7063-CR2 system

To replace a fan in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Ensure that you have the electrostatic discharge (ESD) wrist strap on and that the ESD clip is plugged into a ground jack or connected to an unpainted metal surface. If not, do so now.
2. Replace the fan in the system. The top side of the fan assembly has an arrow that shows the airflow direction; the metal alignment plate is the bottom of the fan assembly. Ensure that you align the fan housing under the internal fan rails. Push the fan into the system until the fan is fully seated.

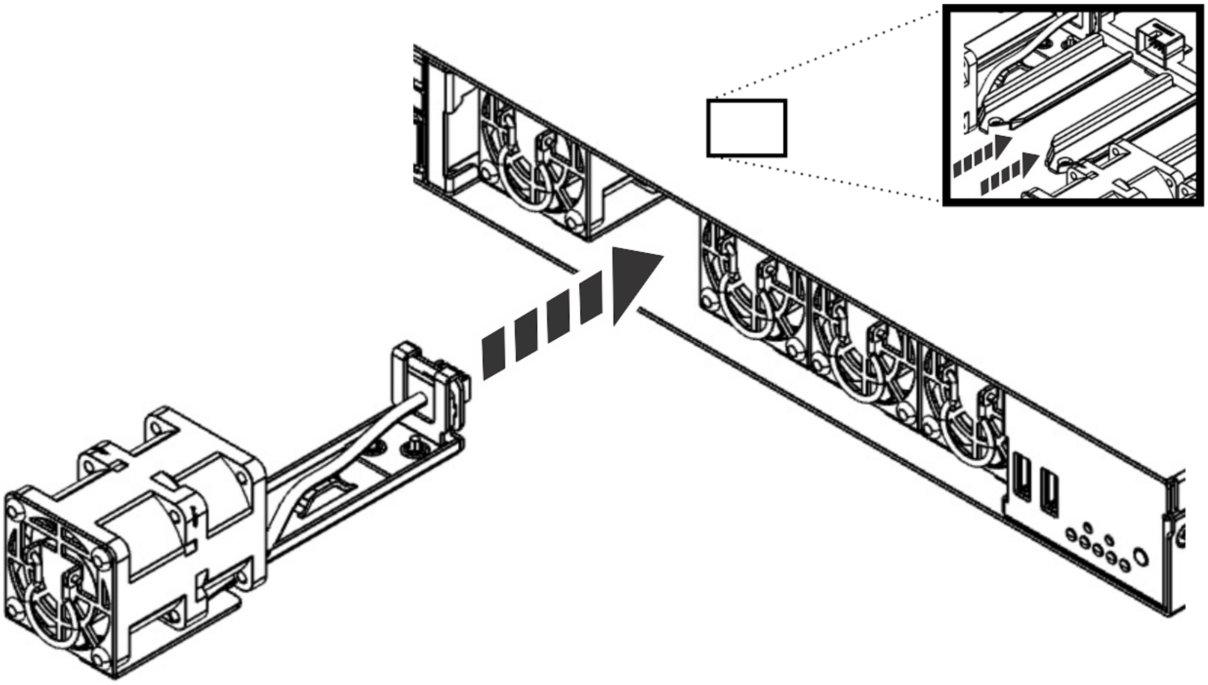

Figure 17. Replacing a fan

3. Replace the fan cover.
   a) Ensure that the two levers are open.
   b) Put the fan cover in place.
   c) Rotate the two levers on each side of the fan cover down and in to secure the cover to the system.

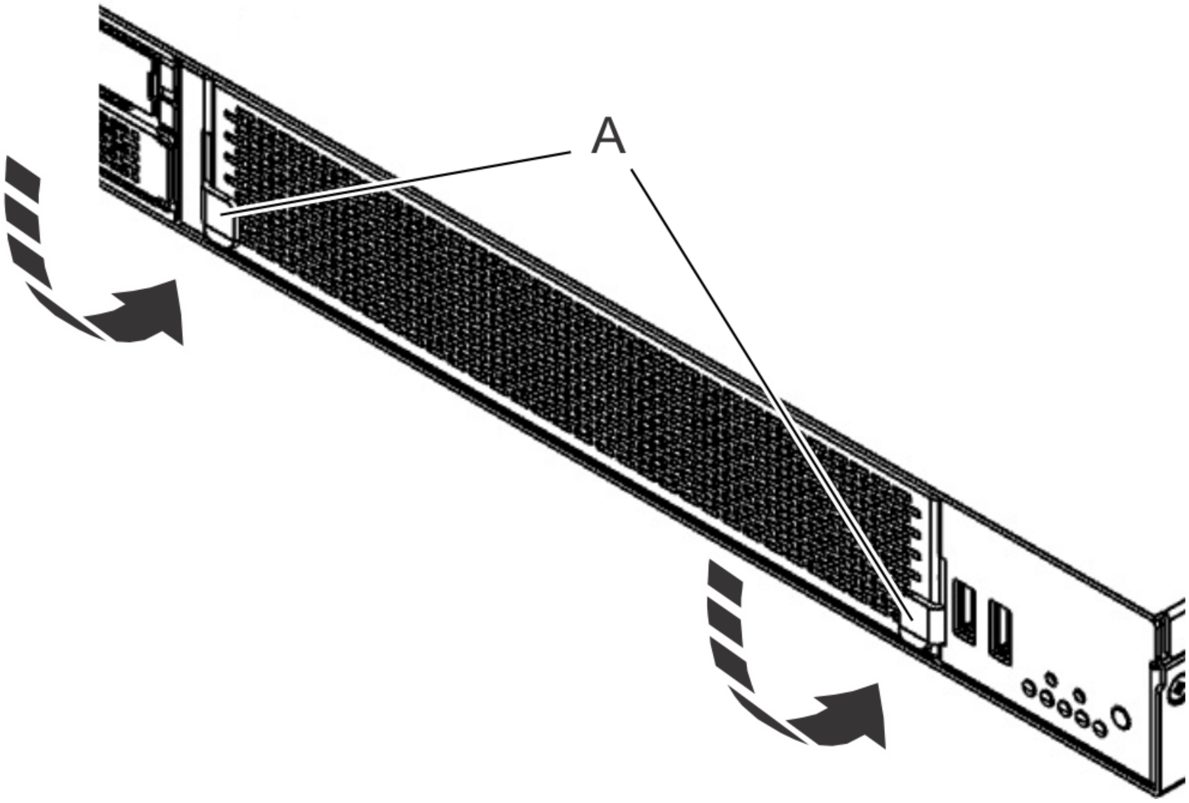

Figure 18. Replacing the fan cover

Removing and replacing memory in the 7063-CR2

To remove and replace memory in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

About this task

The four memory modules must be the same size and type. Mixing of memory module types is not allowed. The following table lists the supported memory feature codes.

Table 1. Memory feature codes

Feature code	Size
EM62	4 x 16 GB = 64 GB
EM63	4 x 32 GB = 128 GB

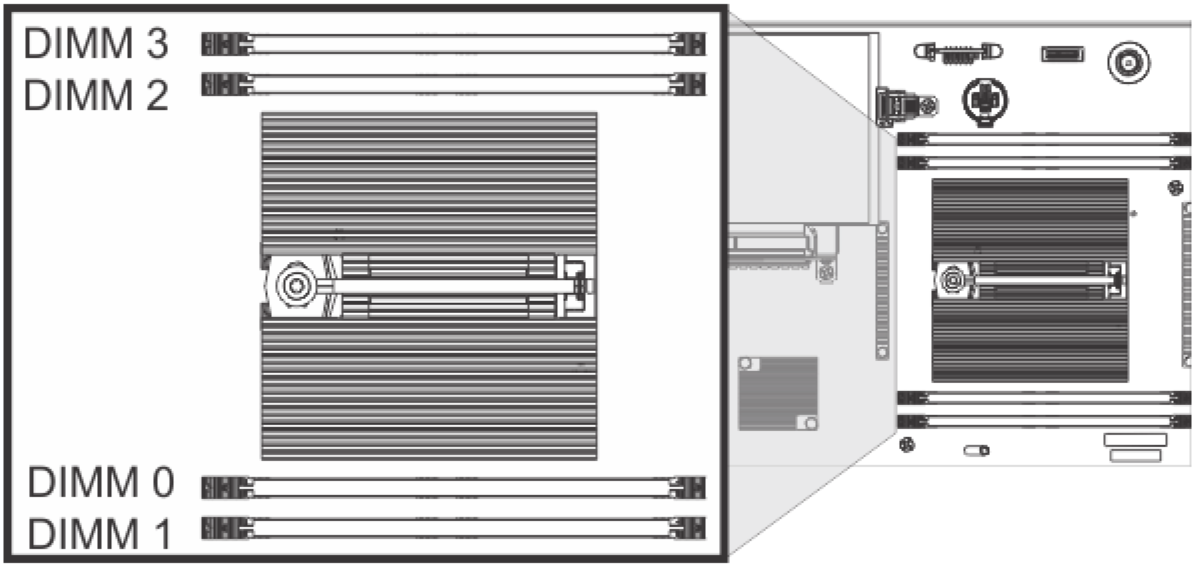

Figure 19. Memory locations

Procedure

1. Power off the system.

   For instructions, see "Stopping the 7063-CR2 system" on page 99.

2. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   Attention:

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
   - When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
   - If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.

3. Remove the system backplane from the rear of the system.

   a) Label and remove the two power cables.

   For instructions, see "Disconnecting the power cords from a 7063-CR2 system" on page 100.

   b) Label and remove the signal cables from the rear of the system.

   c) Loosen the two screws **(A)** on the sides of the system backplane as shown in the following figure.

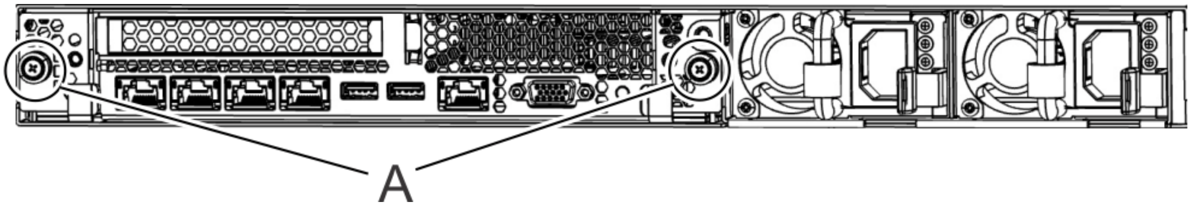

Figure 20. Removing the system backplane screws

d) Simultaneously rotate the two levers **(A)** on each side of the system backplane out and to the side to unlock the system backplane from the system.

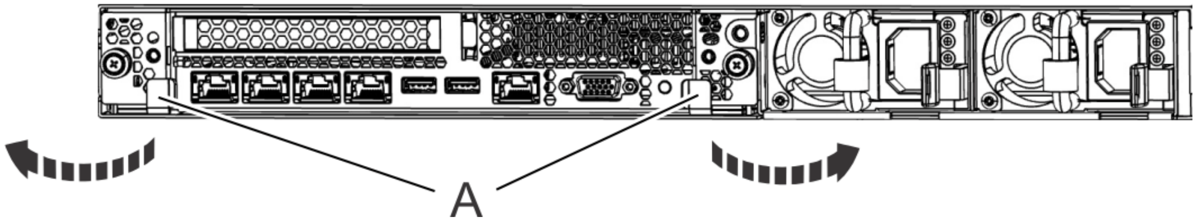

Figure 21. Unlatching the system backplane

e) Support the system backplane by the bottom as you slide it from the system.

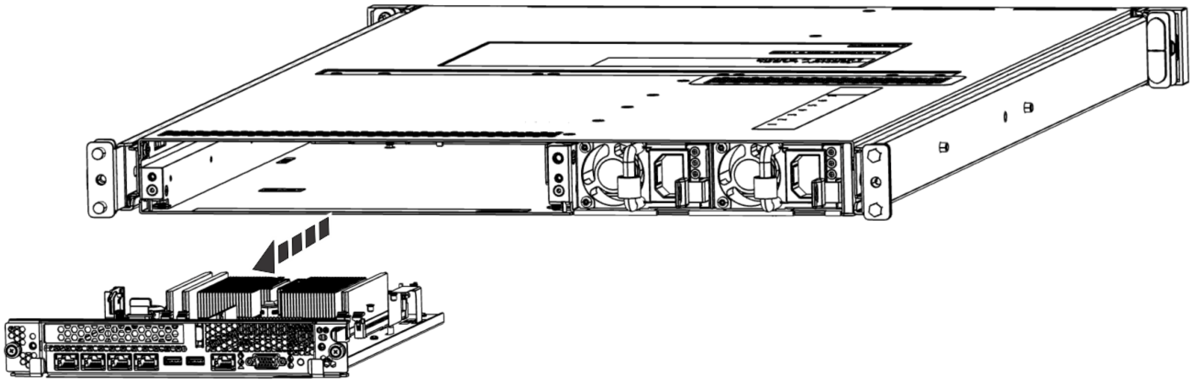

Figure 22. Removing the system backplane

f) Place the system backplane on an ESD surface.

Note: You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

4. Remove the memory DIMM.

a) Locate the memory DIMM that you want to remove.

b) Unlock the memory DIMM by simultaneously pushing the locking tabs away from the memory DIMM. Be sure to unlock both tabs at the same time. The lever action of opening the tabs pushes the memory DIMM out of the slot.

c) Hold the memory DIMM by the edges and pull it out of the slot.

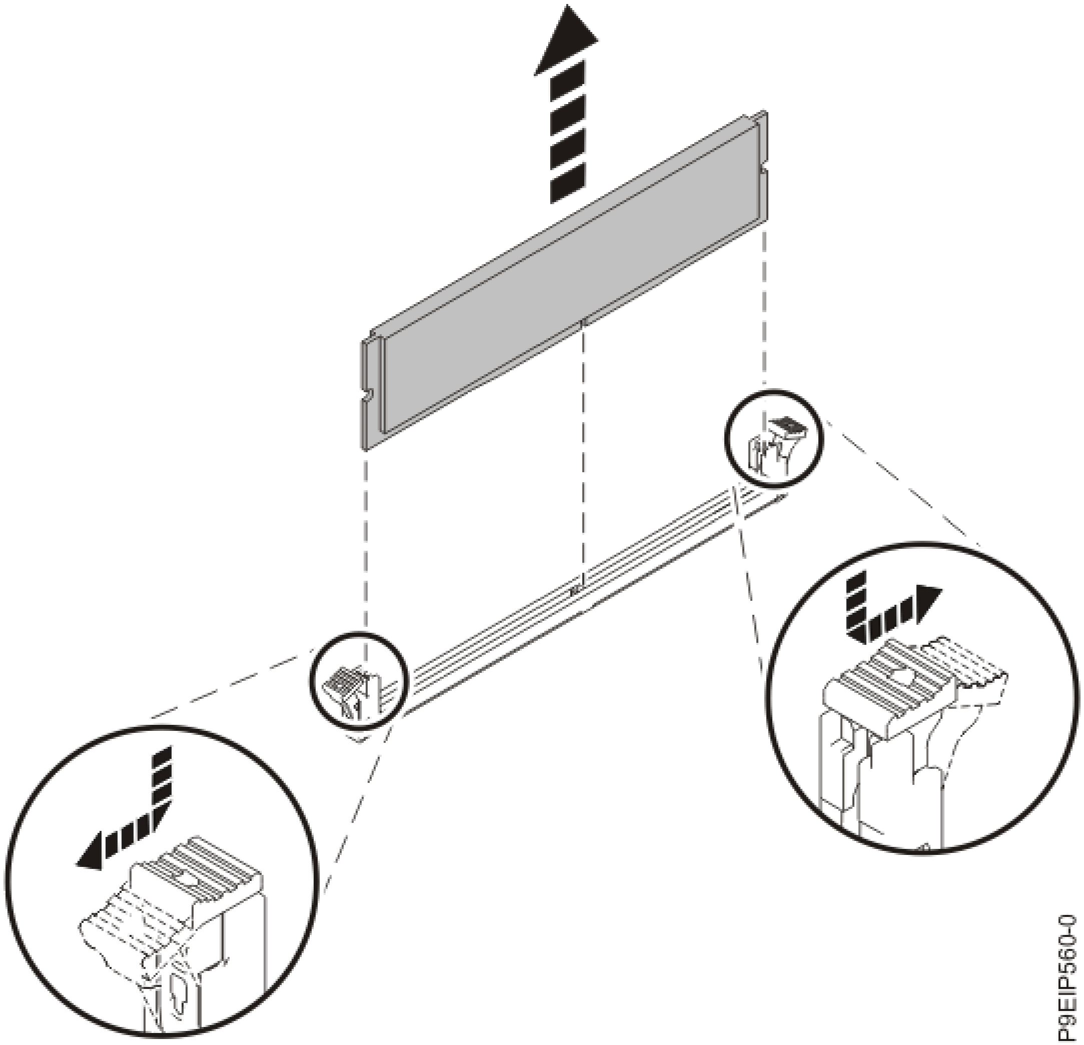

Figure 23. Removing the memory DIMM

5. Insert the memory DIMM.

   a) Grasp the memory DIMM along its edges and align it with the slot on the system backplane.

   ⚠ **Attention:** Memory is keyed to prevent it from being installed incorrectly. Note the location of the key tab within the memory connector before you attempt to install it.

   b) Press firmly on each side of the memory DIMM until the locking tab locks in place with an audible click.

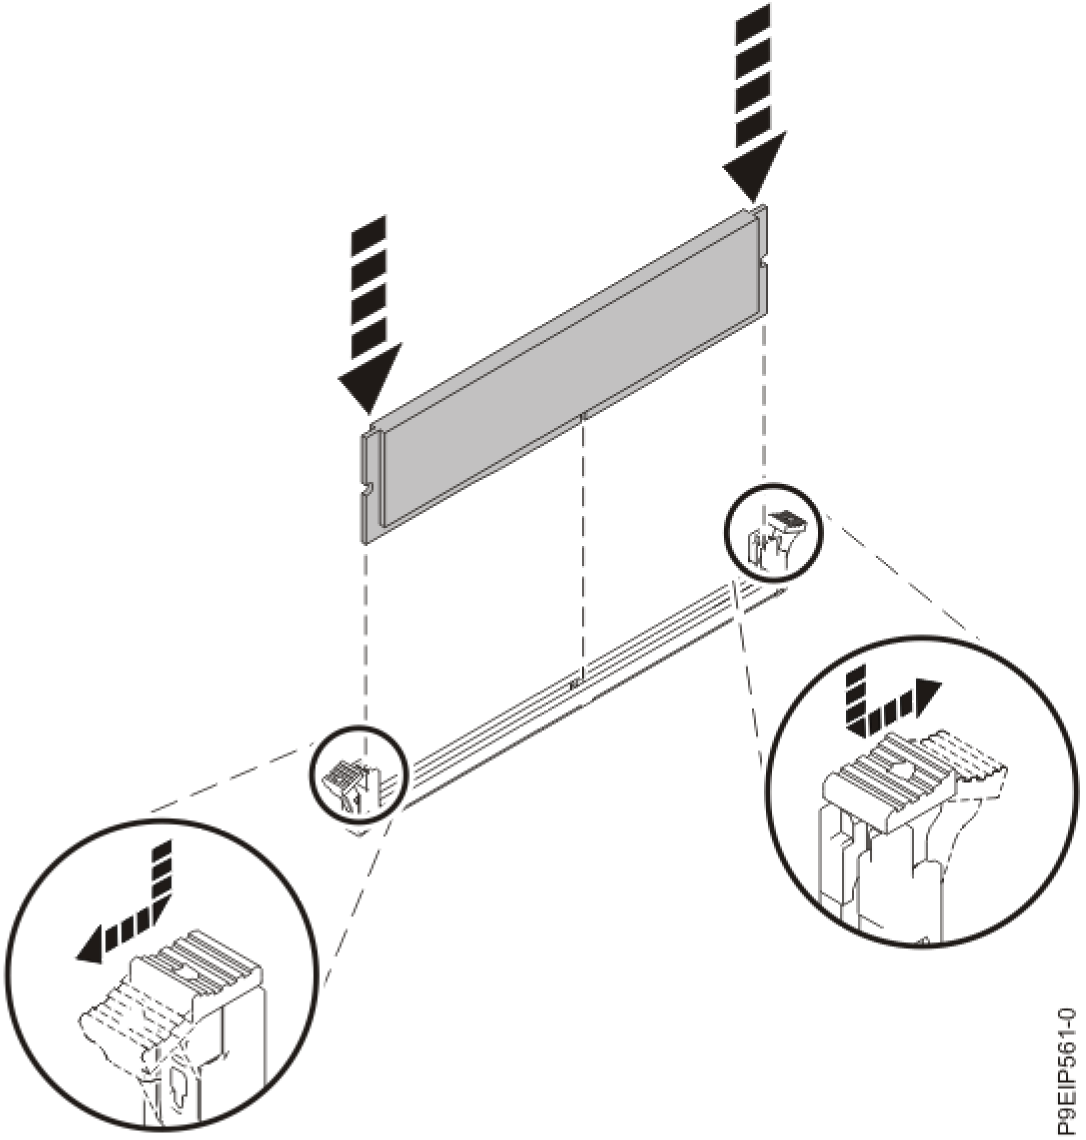

Figure 24. Inserting the memory DIMM

6. Replace the system backplane into the rear of the system.
   a) Ensure that the two system backplane levers are open.
   b) Support the system backplane by the bottom as you position the system backplane and insert it into the system until it is fully seated.

      Important:

      - Use care when you insert the system backplane so that no damage occurs to the components at the socket edge of the backplane.
      - Ensure that the system backplane is fully seated and is all the way into the system.
      - You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

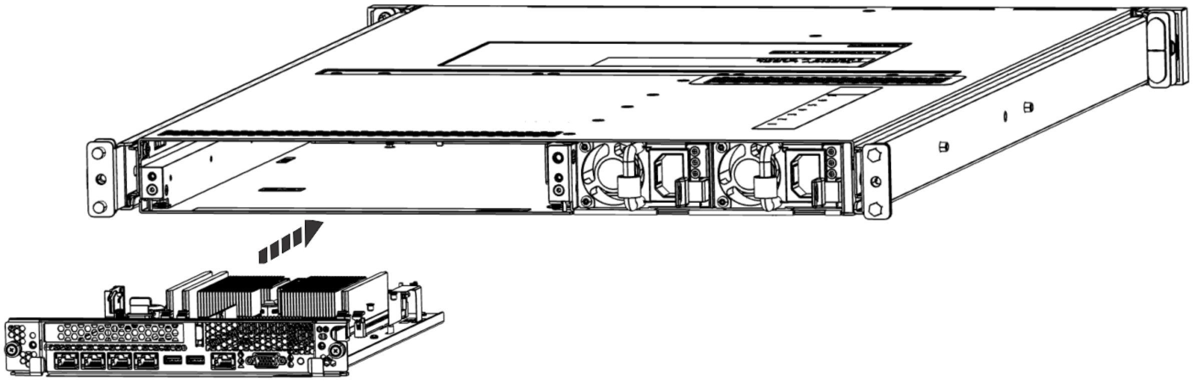

Figure 25. Replacing the system backplane

c) Simultaneously rotate the two levers on each side of the system backplane in to secure the system backplane to the system.

d) Tighten the two screws on the sides of the system backplane.

e) Using your labels, replace the signal cables into the rear of the system.

f) Using your labels, replace the two power cords at the rear of the system.

For instructions, see "Connecting the power cords to a 7063-CR2 system" on page 101.

7. Power on the system for operation.

   For instructions, see "Starting the 7063-CR2 system " on page 98.

Removing and replacing the control panel in the 7063-CR2

Learn how to remove and replace the control panel in the IBM Power Systems HMC (7063-CR2) system.

Removing the control panel from the 7063-CR2 system

To remove the control panel from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   ⚠ **Attention:**

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
   - When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
   - If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.

2. Power off the system.

   For instructions, see "Stopping the 7063-CR2 system" on page 99.

3. Place the system in the service position on an ESD surface on a table.

   For instructions, see "Placing a 7063-CR2 system into the service position" on page 101.

4. Turn the system upside down on the ESD surface.
5. Remove the two screws **(A)** that secure the control panel to the bottom of the system.

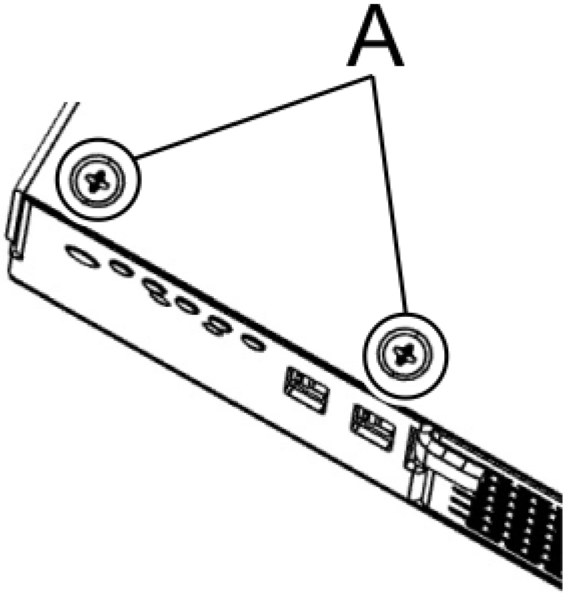

Figure 26. Removing the control panel bottom screws

6. Turn the system right side up on the ESD surface.
7. Remove the screw **(A)** that secures the control panel to the right side of the system.

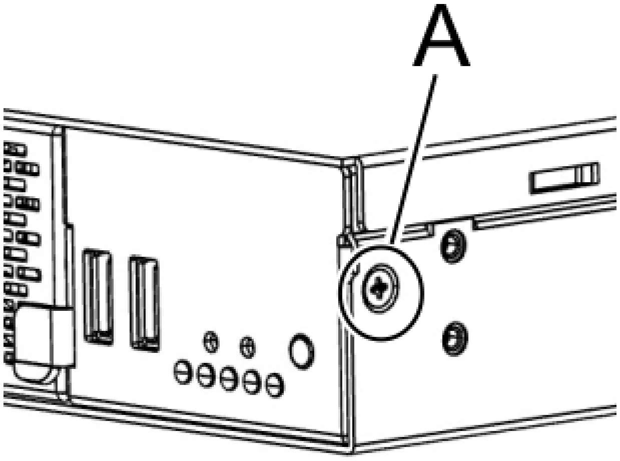

Figure 27. Removing the control panel side screw

8. Remove the fan cover from the front of the system.
   a) Rotate the two levers **(A)** on each side of the fan cover up and out to unlock the fan cover.
   b) Pull the cover away from the system.

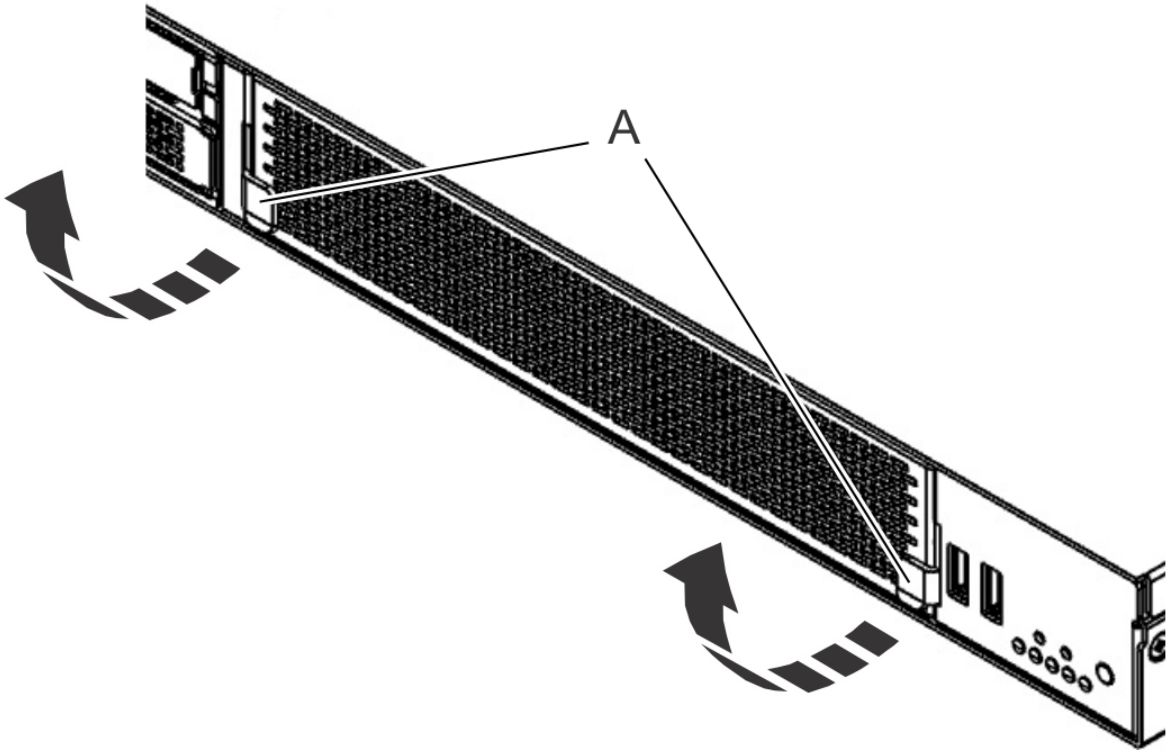

Figure 28. Removing the fan cover

9. Slide the control panel out of the system. Be careful with the cables that are attached to the control panel.

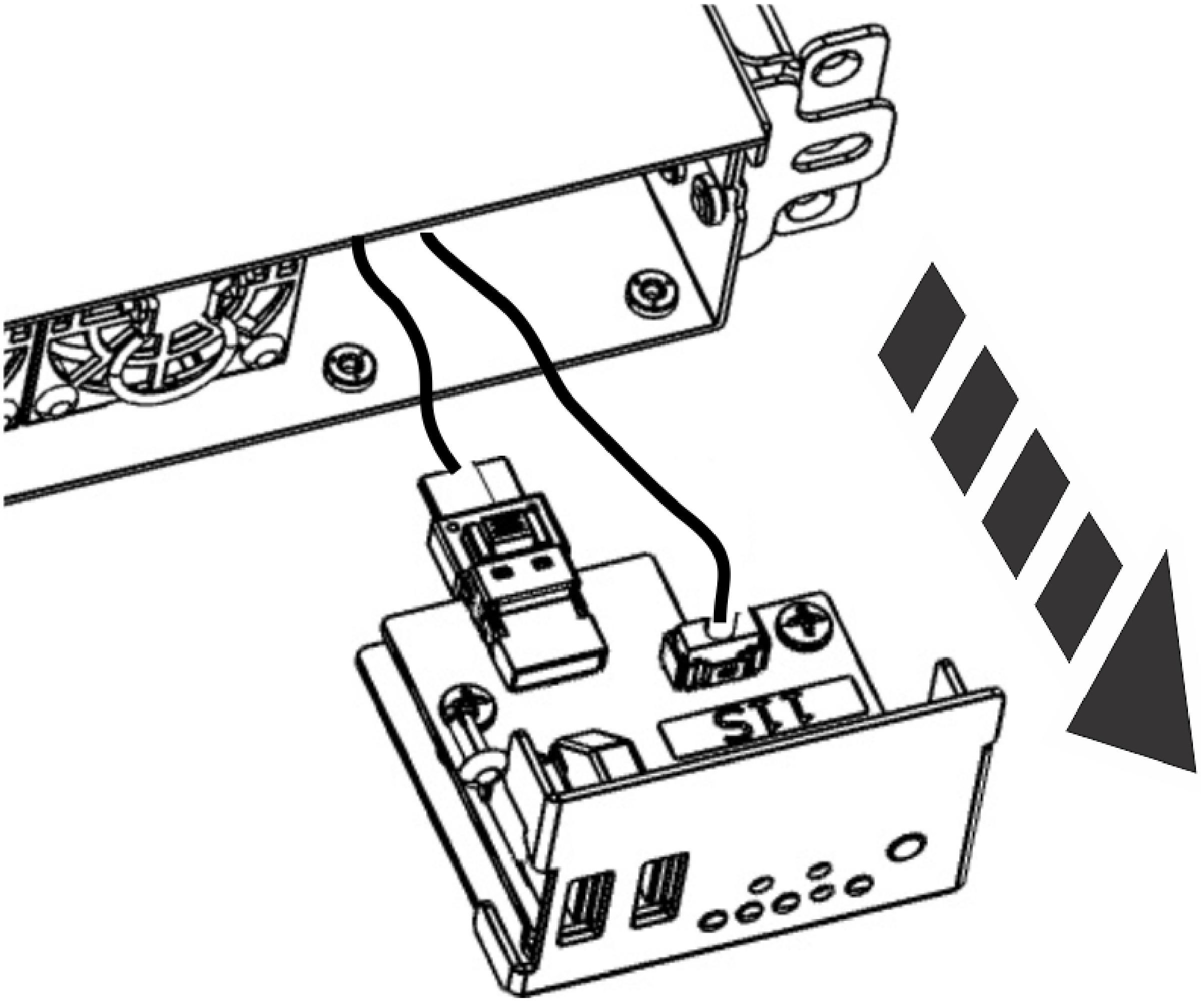

Figure 29. Removing the control panel from the system

10. Disconnect the USB cable and the control panel cable from the control panel.

    Use your thumb or finger to press the release latch on the connector to remove the cable.

11. Remove the three screws that secure the control panel card to the control panel cover.

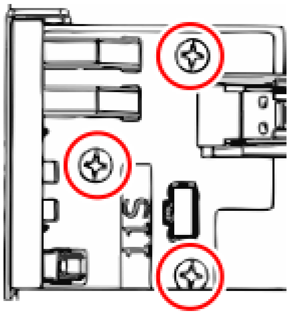

Figure 30. Removing the control panel screws

Replacing the control panel in the 7063-CR2 system

To replace the control panel in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Ensure that you have the electrostatic discharge (ESD) wrist strap on and that the ESD clip is plugged into a ground jack or connected to an unpainted metal surface. If not, do so now.
2. Remove the new control panel card from new control panel cover.
3. Align the new control panel card on the current control panel cover.

   The current control panel cover has the system serial number and needs to be used.
4. Replace the three screws that secure the control panel card to the control panel cover.

   
   Figure 31. Replacing the control panel screws
5. Connect the USB cable and the control panel cable to the control panel.
6. Install the control panel into the system.

   Ensure that the USB and power switch cables are not pinched when your insert the control panel.

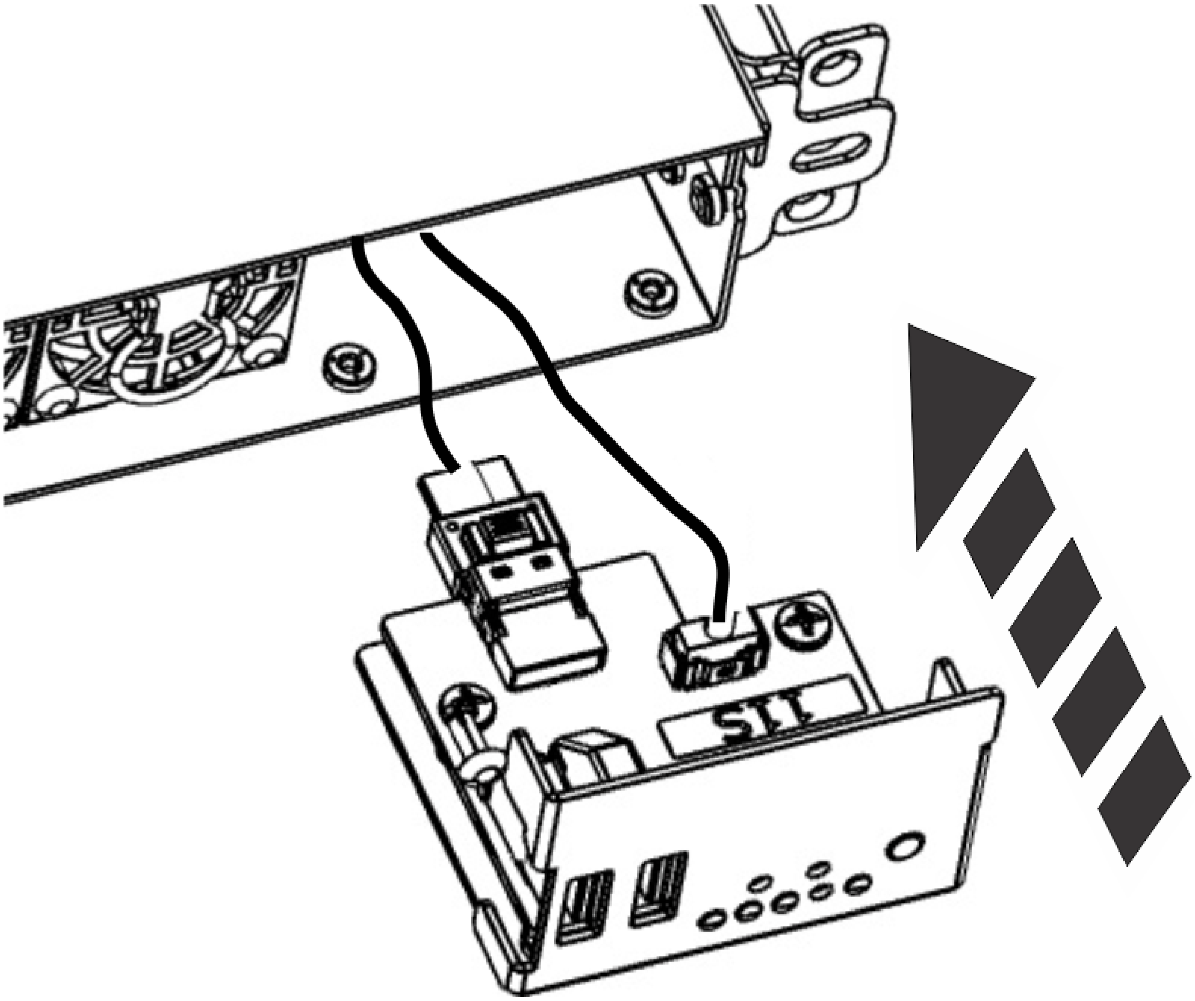

Figure 32. Installing the control panel into the system

7. Install the screw **(A)** to secure the control panel to the right side of the system.

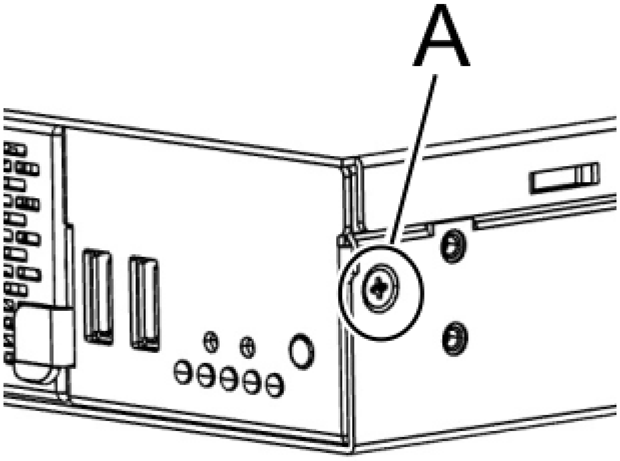

Figure 33. Installing the control panel side screw

8. Turn the system upside down on the ESD surface.
9. Install the two screws **(A)** to secure the control panel to the bottom of the system.

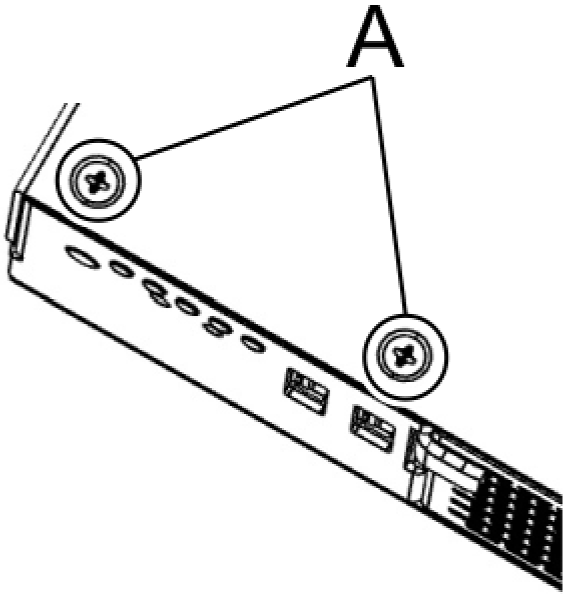

Figure 34. Installing the control panel bottom screws

10. Turn the system right side up on the ESD surface.
11. Replace the fan cover.
    a) Ensure that the two levers are open.
    b) Put the fan cover in place.
    c) Rotate the two levers on each side of the fan cover down and in to secure the cover to the system.

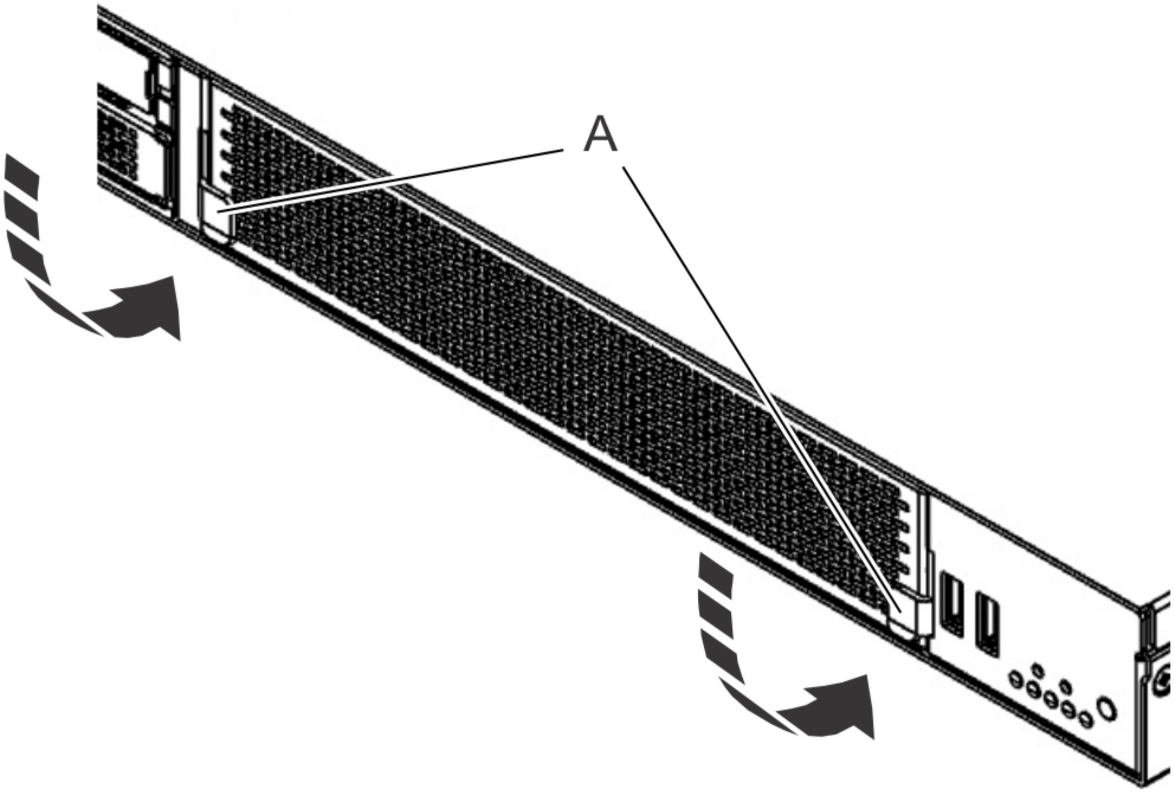

Figure 35. Replacing the fan cover

12. Replace the system in the rack and replace the components that you removed.
    For instructions, see "Placing a 7063-CR2 system into the operating position" on page 103.

13. Power on the system for operation.

    For instructions, see "Starting the 7063-CR2 system " on page 98.

Removing and replacing PCIe adapters in the 7063-CR2

Learn how to remove and replace Peripheral Component Interconnect (PCI) Express (PCIe) adapters in the IBM Power Systems HMC (7063-CR2) system.

About this task

Attention: For safety and airflow purposes, if you remove a PCIe adapter from the system, you must ensure that a PCIe filler and a PCIe tail-stock filler are present.

Parts must be replaced with the identical part in the exact same place.

Removing a PCIe adapter from the 7063-CR2 system

To remove a PCIe adapter from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

About this task

Attention: For safety and airflow purposes, if you remove a PCIe adapter from the system, you must ensure that a PCIe filler and a PCIe tail-stock filler are present.

Parts must be replaced with the identical part in the exact same place.

Procedure

1. Power off the system.

   For instructions, see "Stopping the 7063-CR2 system" on page 99.
2. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   Attention:

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
   - When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
   - If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.
3. Remove the system backplane from the rear of the system.

   a) Label and remove the two power cables.

      For instructions, see "Disconnecting the power cords from a 7063-CR2 system" on page 100.

   b) Label and remove the signal cables from the rear of the system.

   c) Loosen the two screws **(A)** on the sides of the system backplane as shown in the following figure.

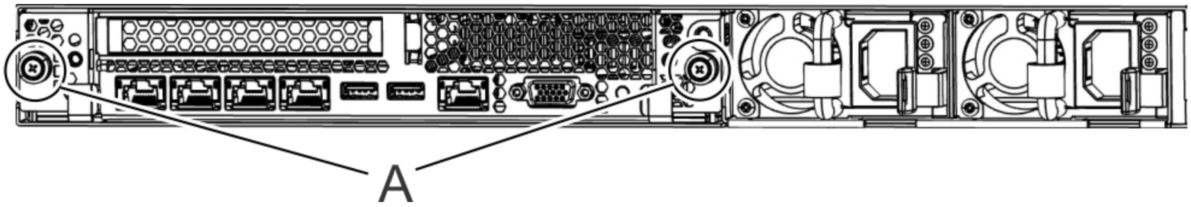

Figure 36. Removing the system backplane screws

d) Simultaneously rotate the two levers **(A)** on each side of the system backplane out and to the side to unlock the system backplane from the system.

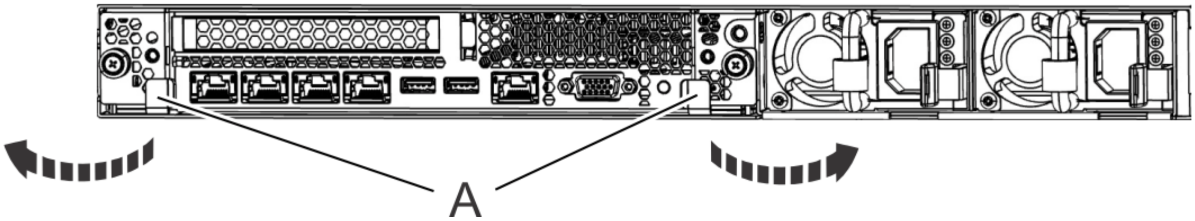

Figure 37. Unlatching the system backplane

e) Support the system backplane by the bottom as you slide it from the system.

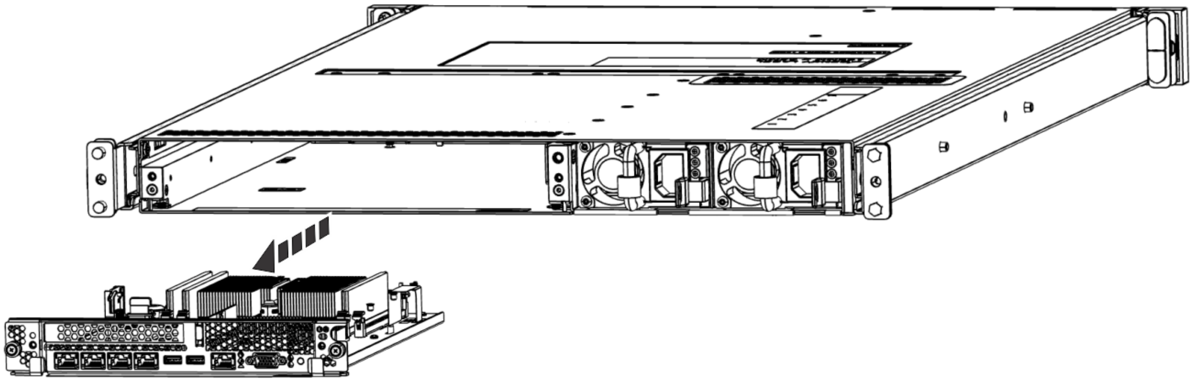

Figure 38. Removing the system backplane

f) Place the system backplane on an ESD surface.

Note: You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

4. Remove the PCIe adapter from the PCIe riser.

a) Remove the screw that secures the PCIe adapter to the system backplane.

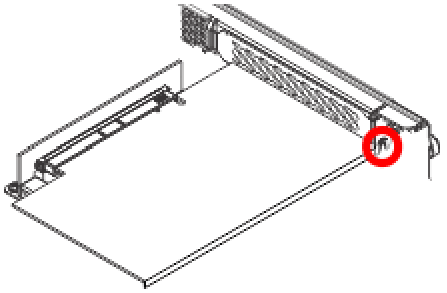

Figure 39. Removing the tail-stock screw

b) Open the retainer clip that secures the PCIe adapter to the PCIe riser, by moving the blue lever to the unlocked position.

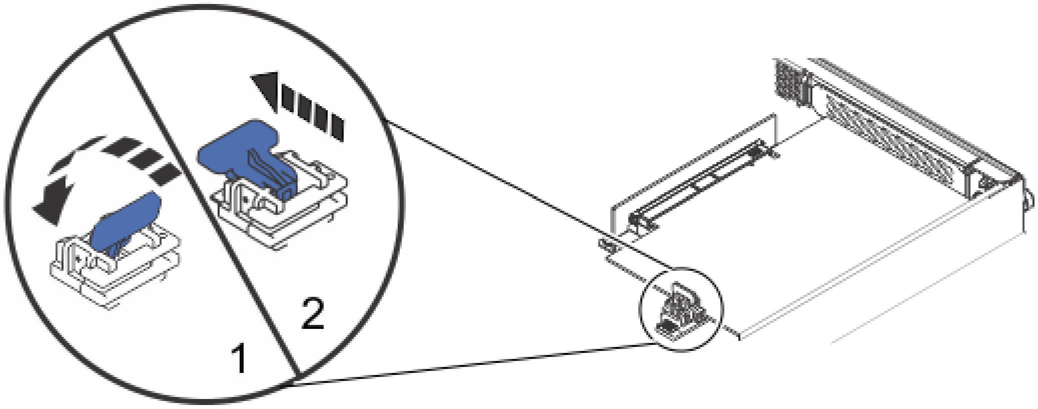

Figure 40. Removing the PCIe adapter retaining latch

c) Move the retainer clip away from the PCIe adapter.

d) Remove the PCIe adapter from the PCIe riser.

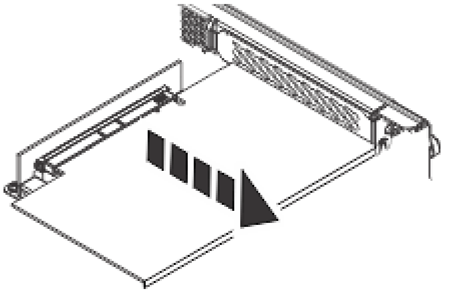

Figure 41. Removing the PCIe adapter

Replacing a PCIe adapter in the 7063-CR2 system

To replace a PCIe adapter in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Ensure that you have the electrostatic discharge (ESD) wrist strap on and that the ESD clip is plugged into a ground jack or connected to an unpainted metal surface. If not, do so now.
2. Replace the PCIe adapter.

a) Replace the PCIe adapter into the PCIe riser.

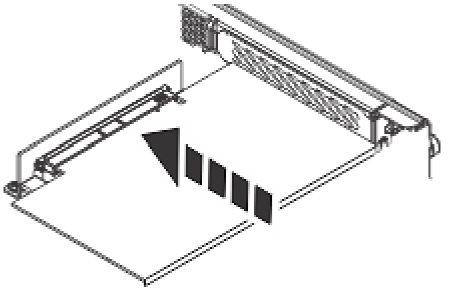

Figure 42. Replacing the PCIe adapter

b) Replace the screw that secures the PCIe adapter to the system backplane.

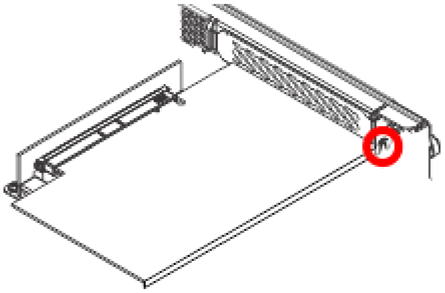

Figure 43. Replacing the tail-stock screw

c) Move the retainer clip to secure the PCIe adapter to the PCIe riser. Ensure that the clip is fully seated around the edge of the adapter.

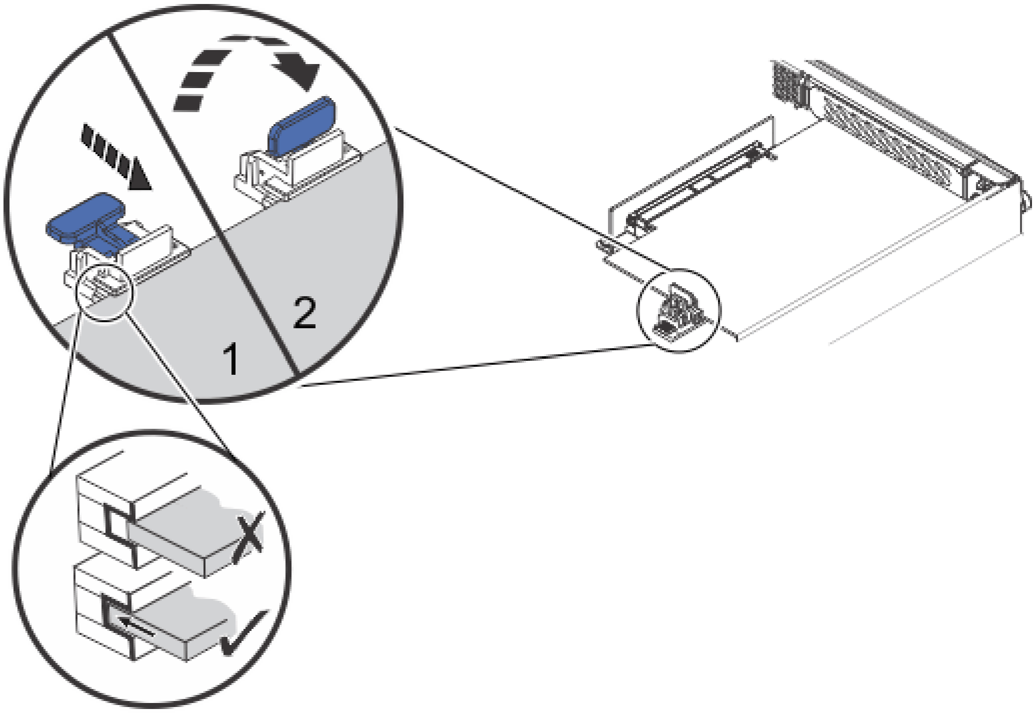

Figure 44. Replacing the PCIe adapter retaining latch

d) Close the retainer clip that secures the PCIe adapter to the PCIe riser.

3. Replace the system backplane into the rear of the system.

   a) Ensure that the two system backplane levers are open.

   b) Support the system backplane by the bottom as you position the system backplane and insert it into the system until it is fully seated.

   Important:

   - Use care when you insert the system backplane so that no damage occurs to the components at the socket edge of the backplane.
   - Ensure that the system backplane is fully seated and is all the way into the system.
   - You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

Removing and replacing the power distribution board in the 7063-CR2

Learn how to remove and replace the power distribution board in the IBM Power Systems HMC (7063-CR2) system.

Removing the power distribution board from the 7063-CR2 system

To remove the power distribution board from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

About this task

You can use a magnetic tip screwdriver to remove and replace the screws.

Procedure

1. Power off the system.

   For instructions, see "Stopping the 7063-CR2 system" on page 99.

2. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   ⚠ **Attention:**

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
   - When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
   - If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.

3. Remove all the fans from the system.

   For instructions, see "Removing a fan from the 7063-CR2 system" on page 18.

4. Remove the system backplane from the rear of the system.

   a) Label and remove the two power cables.

   For instructions, see "Disconnecting the power cords from a 7063-CR2 system" on page 100.

   b) Label and remove the signal cables from the rear of the system.

   c) Loosen the two screws **(A)** on the sides of the system backplane as shown in the following figure.

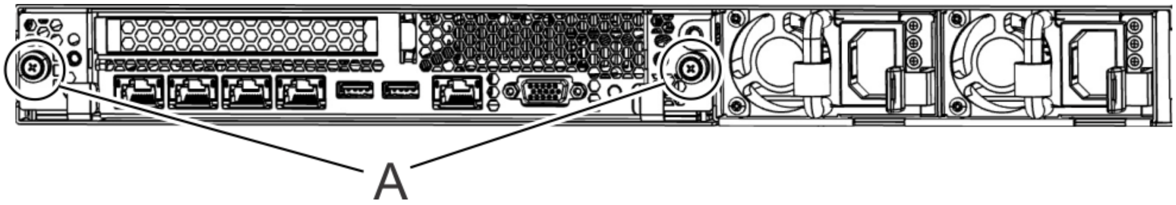

Figure 52. Removing the system backplane screws

d) Simultaneously rotate the two levers **(A)** on each side of the system backplane out and to the side to unlock the system backplane from the system.

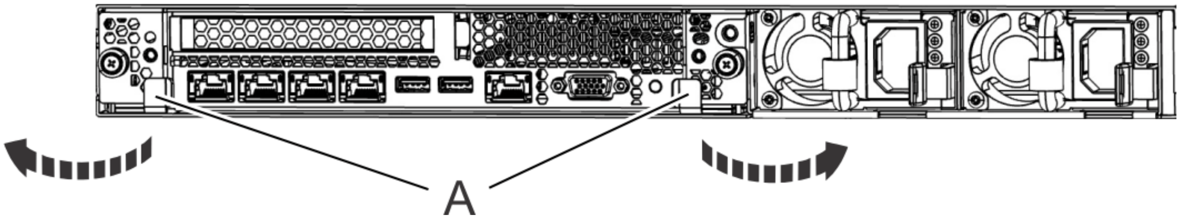

Figure 53. Unlatching the system backplane

e) Support the system backplane by the bottom as you slide it from the system.

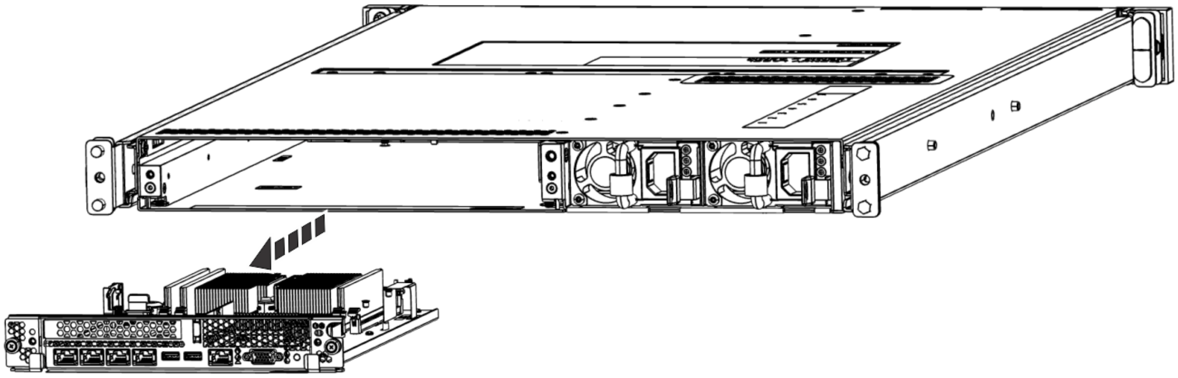

Figure 54. Removing the system backplane

f) Place the system backplane on an ESD surface.

Note: You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

5. Place the system in the service position on an ESD surface on a table.

   For instructions, see “Placing a 7063-CR2 system into the service position” on page 101.

6. Remove the service access cover.

   For instructions, see “Removing the service access cover from a 7063-CR2 system” on page 104.

7. Label and unplug the five cables **(A)** from the power distribution board. Unplug the drive cables from the rear of the drive holder.

   Use your thumb or finger to press the release latch on the connector to remove the cable.

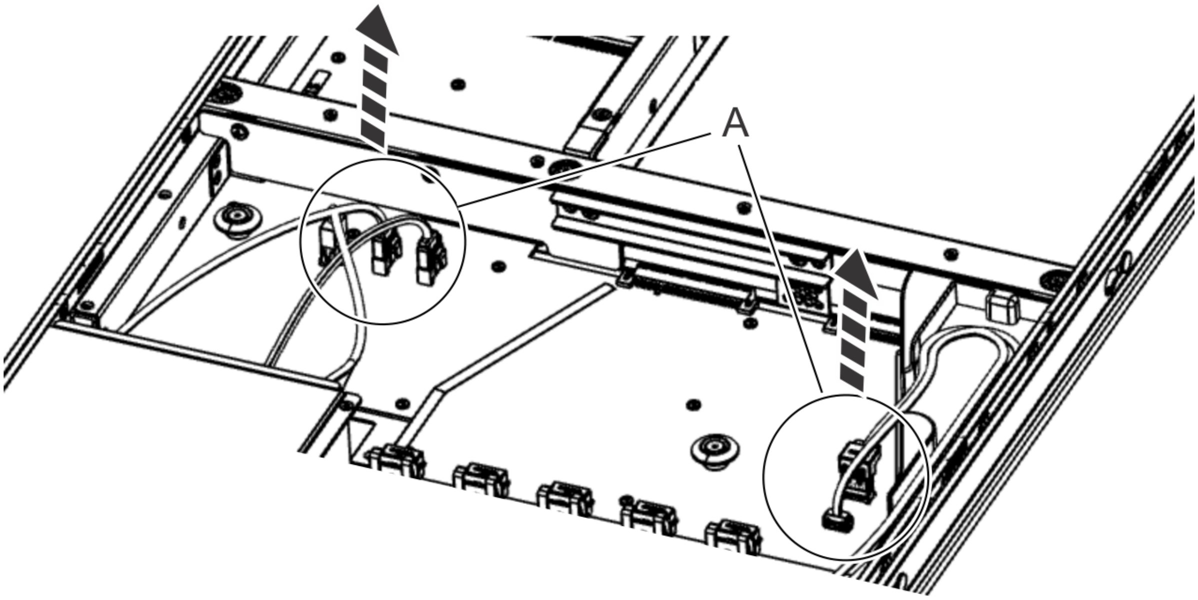

Figure 55. Removing cables from the power distribution board

8. Remove the right plastic air baffle **(A)** from the right edge of the system; lift it straight up.

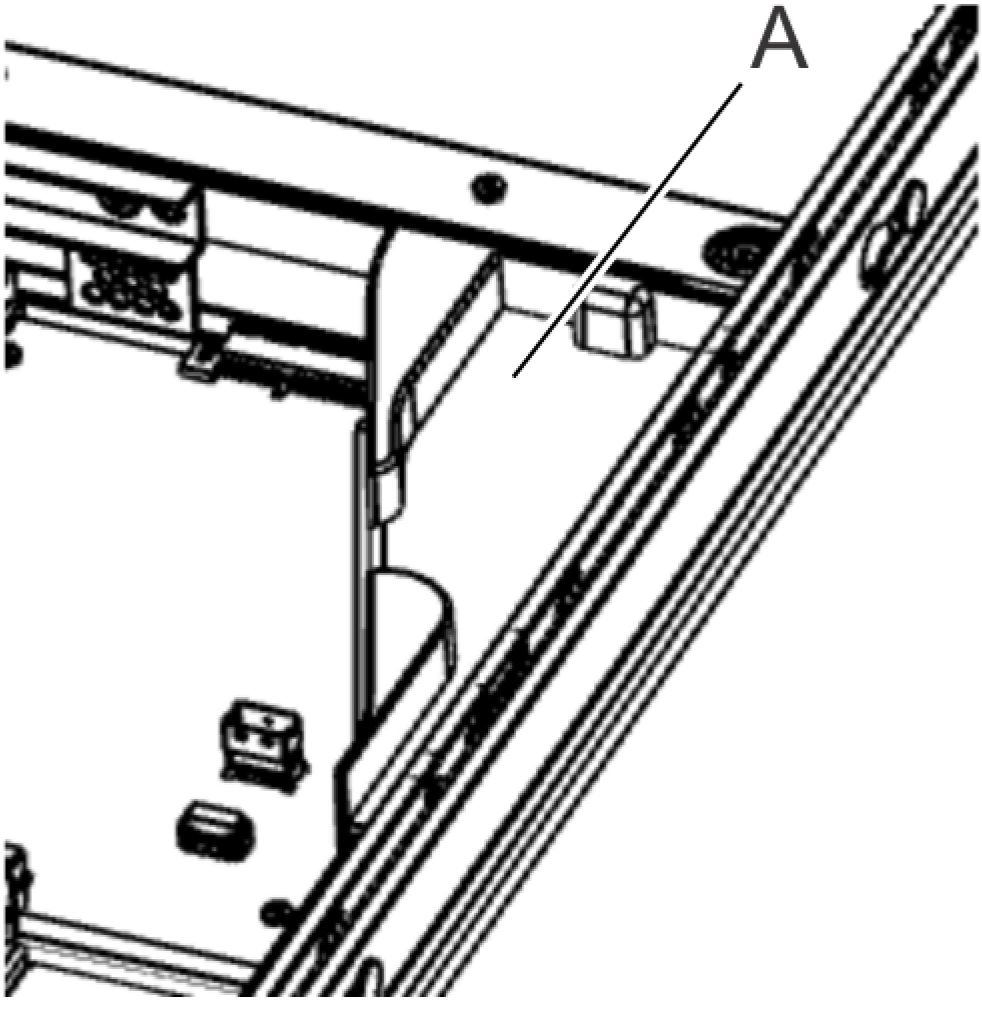

Figure 56. Right air baffle

9. Remove the cross bar from inside the system.

a) Remove the five screws from the front of the cross bar.

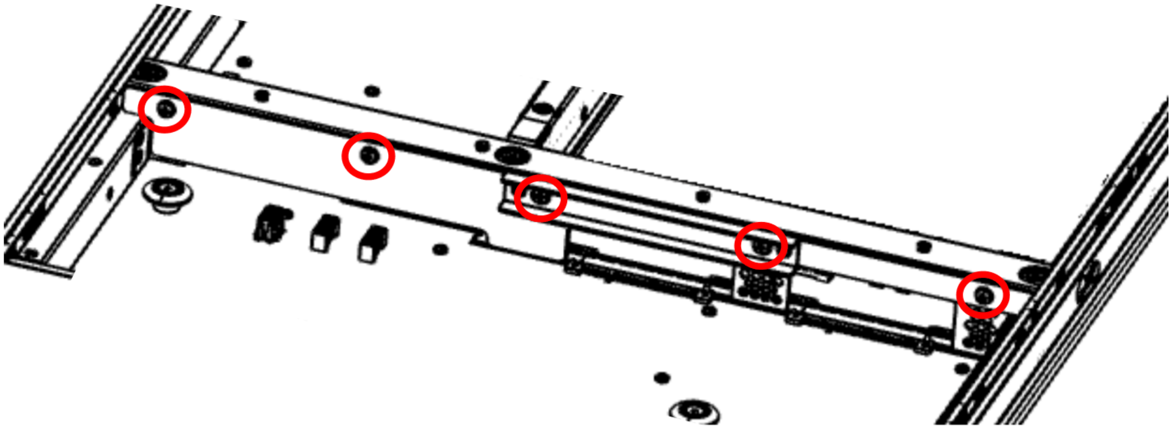

Figure 57. Cross bar front screws

b) Remove the air baffle **(A)** from the cross bar.

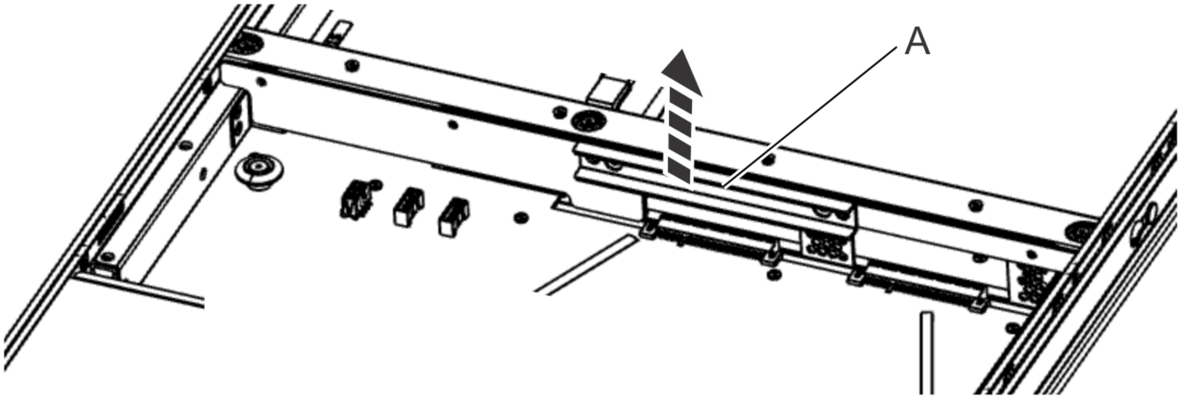

Figure 58. Removing the air baffle

c) Loosen the three screws at the top of the cross bar.

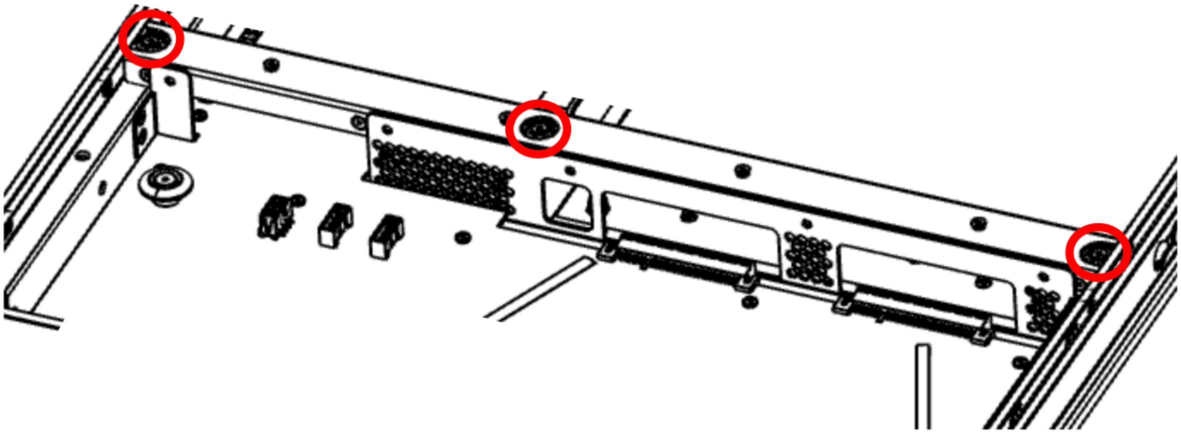

Figure 59. Cross bar top screws

d) Lift the cross bar out of the system.

10. Remove the 19 screws that secure the power distribution board to the system.

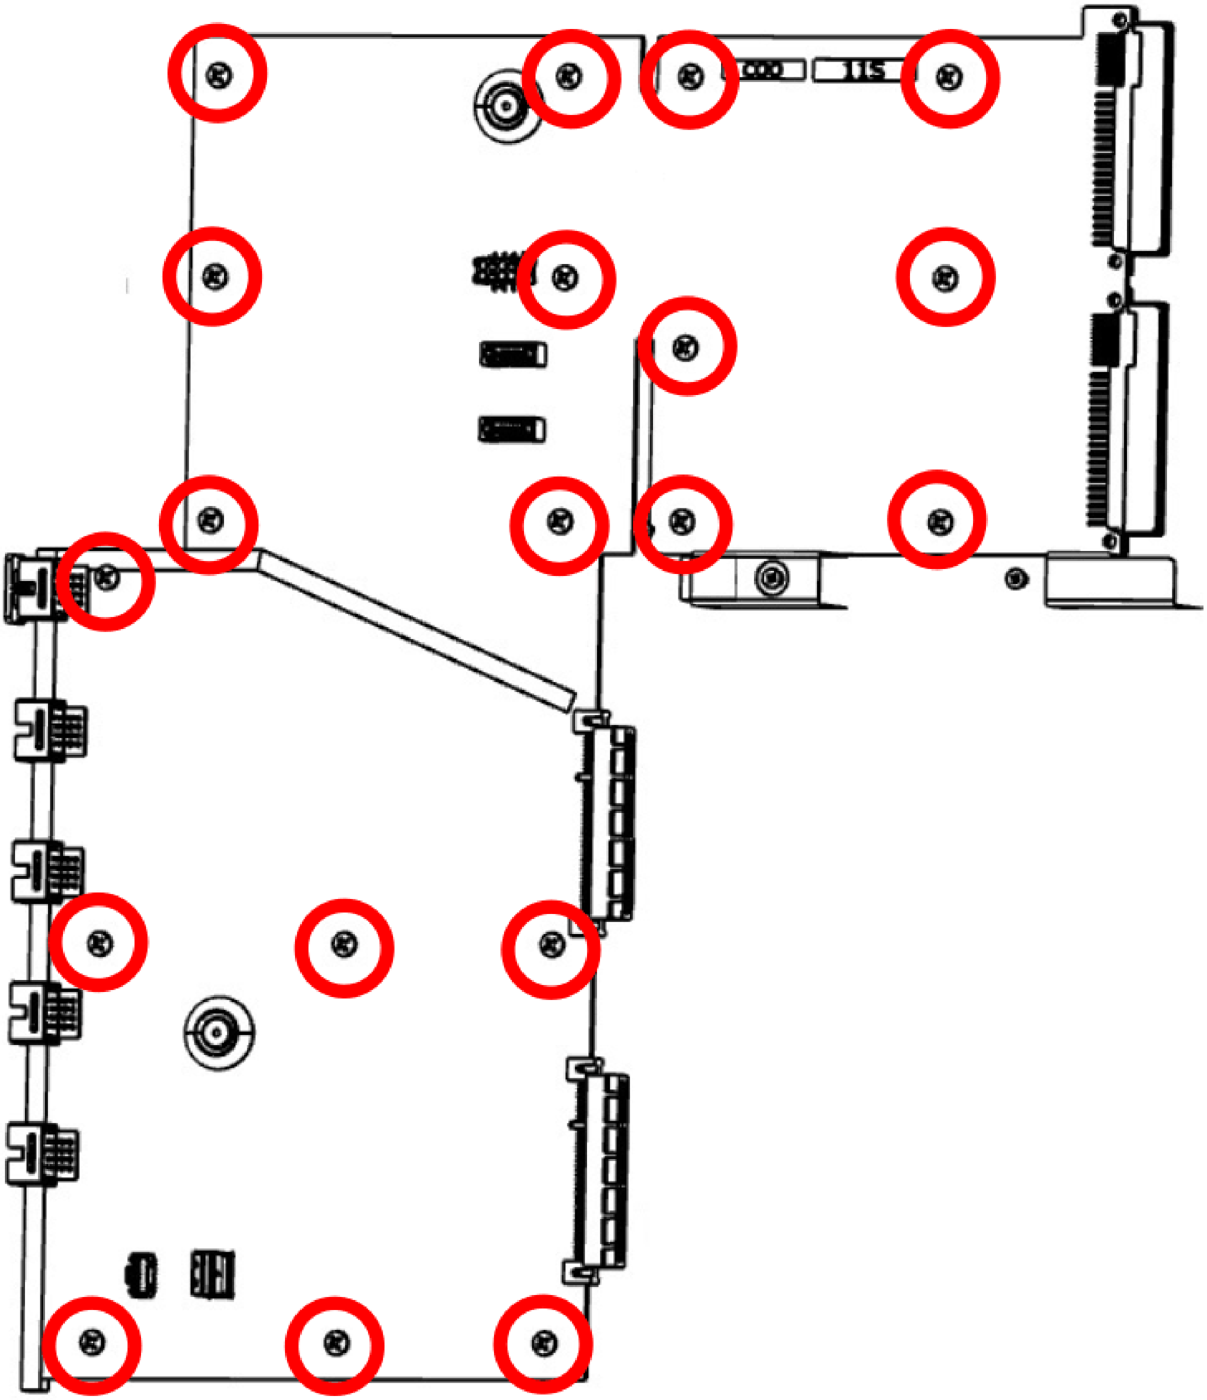

Figure 60. Power distribution board screws

11. Use the two finger grips to lift the power distribution board up and out of the system.
12. Place the power distribution board on an ESD surface.

Replacing the power distribution board in the 7063-CR2 system

To replace the power distribution board in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Ensure that you have the electrostatic discharge (ESD) wrist strap on and that the ESD clip is plugged into a ground jack or connected to an unpainted metal surface. If not, do so now.
2. Use the two finger grips to lift the power distribution board and set the power distribution board into the system.
3. Replace the 19 screws to secure the power distribution board to the system.

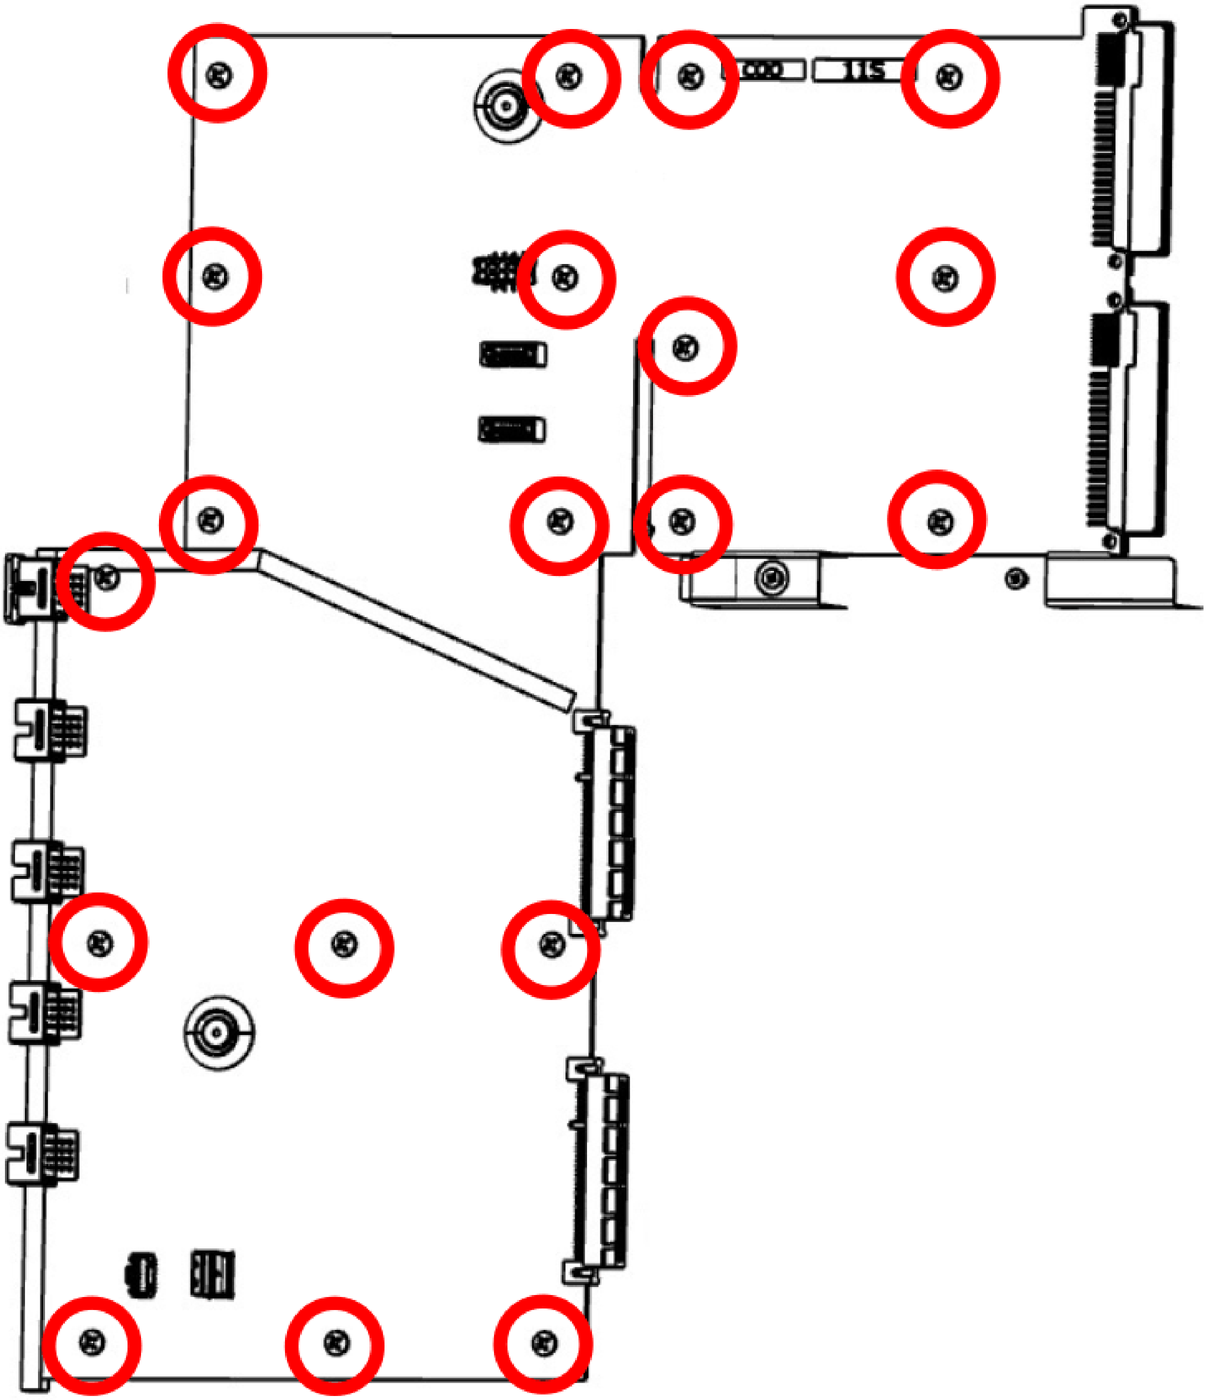

Figure 61. Power distribution board screws

4. Replace the cross bar inside the system.
   a) Put the cross bar into its location inside the system. Ensure that the five screw holes face the front.
   b) Tighten the three screws at the top of the cross bar.

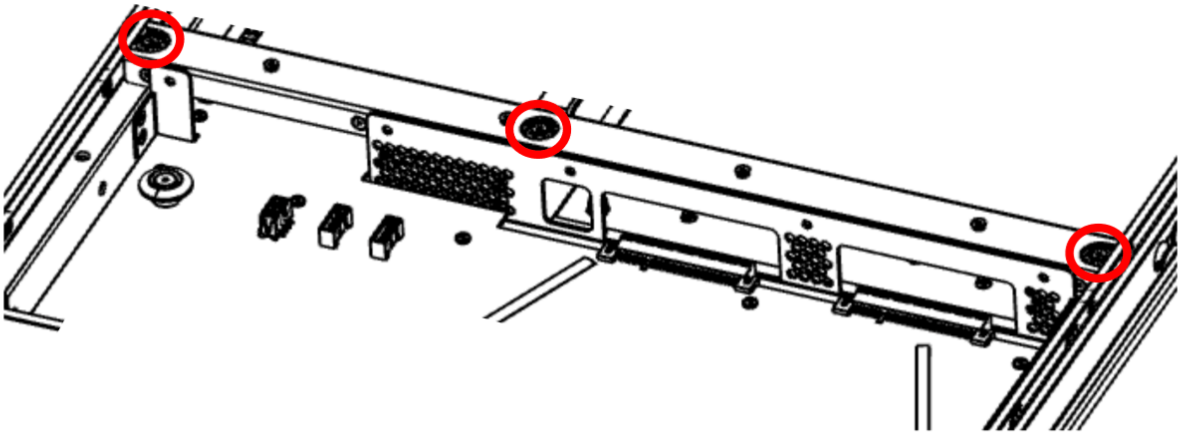

Figure 62. Cross bar top screws

c) Replace the air baffle **(A)** into the system, placing it against the front side of the cross bar.

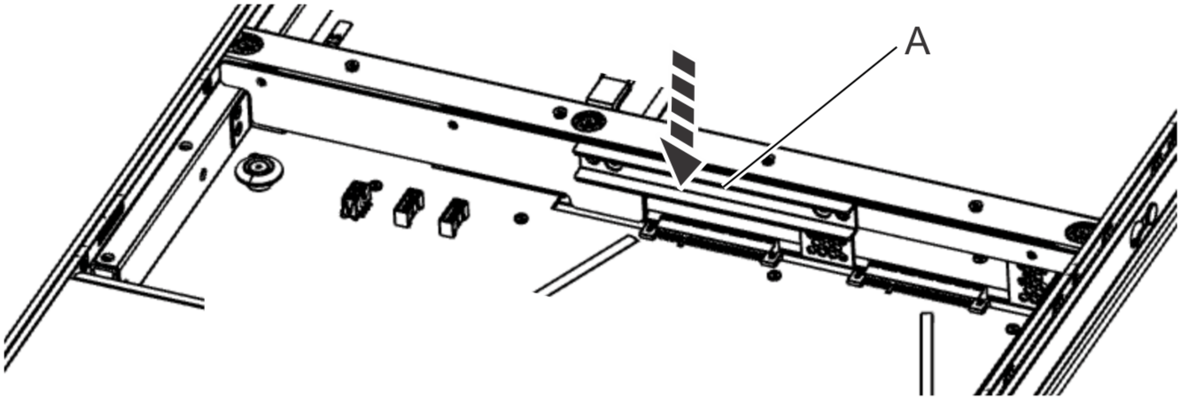

Figure 63. Replacing the air baffle

d) Replace the five screws into the front of the cross bar.

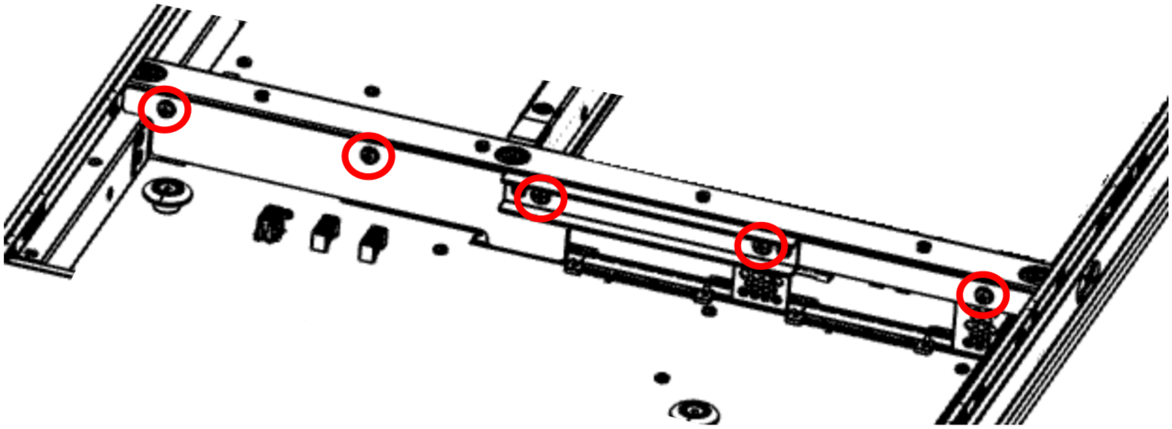

Figure 64. Cross bar front screws

5. Replace the plastic air baffle **(A)** on the right edge of the system; place it straight down.

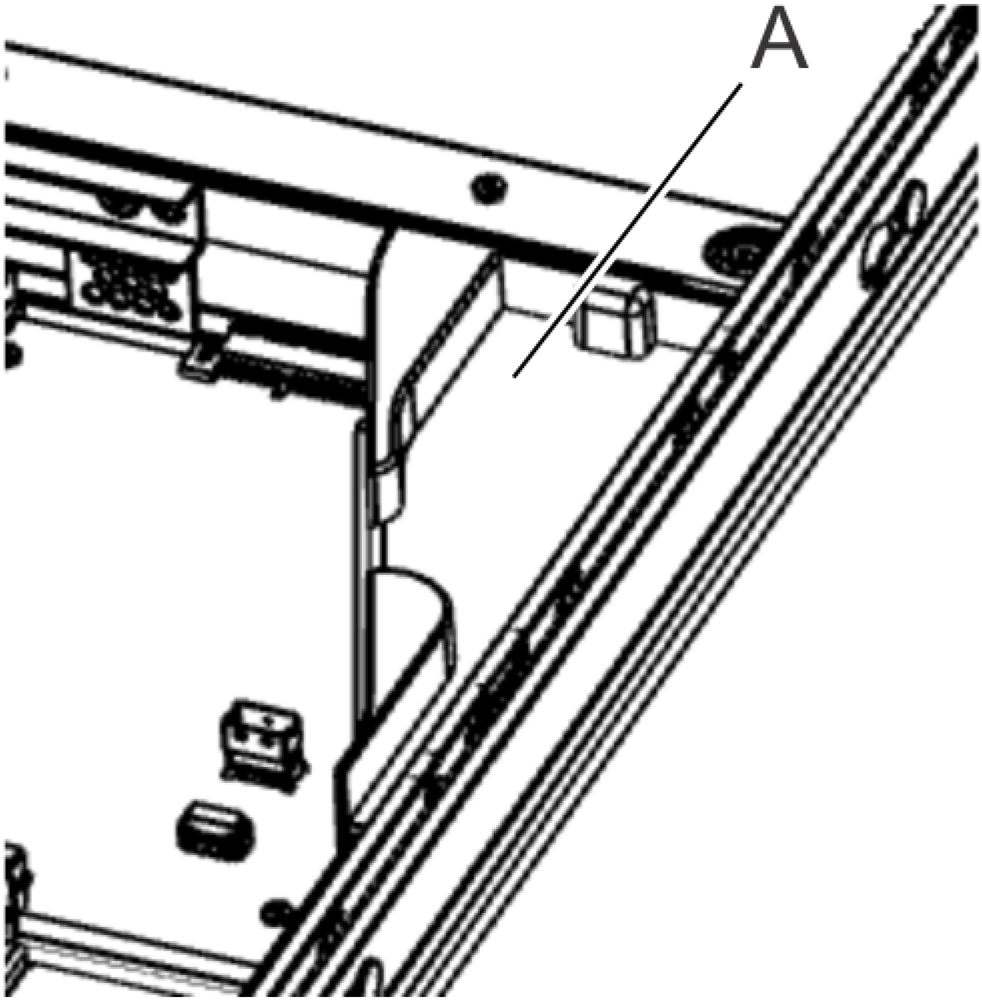

Figure 65. Right air baffle

6. Using your labels, replace the five cables **(A)** into the power distribution board. Reconnect the drive cables to the rear of the drive holder. The USB cable nests inside the control panel power cable in the right air baffle.

   Ensure that the cable latch clips snap into place on the connectors.

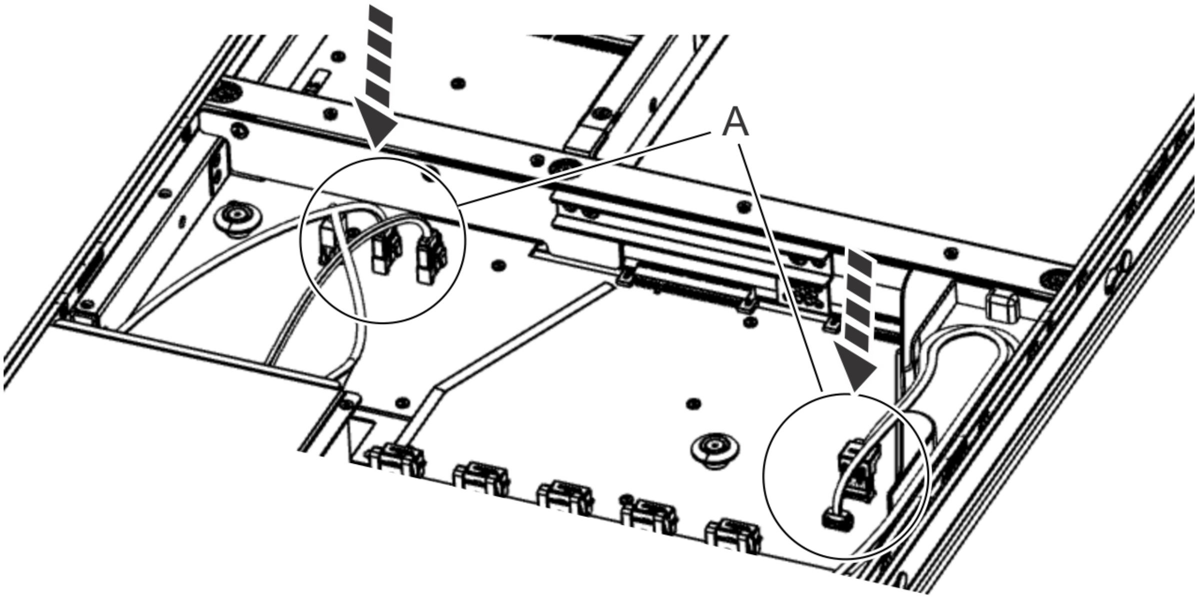

Figure 66. Replacing cables from the power distribution board

7. Install the service access cover.

   For instructions, see "Installing the service access cover on a 7063-CR2 system" on page 105.

8. Replace the system in the rack and replace the components that you removed.

   For instructions, see "Placing a 7063-CR2 system into the operating position" on page 103.

9. Replace the system backplane into the rear of the system.

   a) Ensure that the two system backplane levers are open.

   b) Support the system backplane by the bottom as you position the system backplane and insert it into the system until it is fully seated.

      Important:

      - Use care when you insert the system backplane so that no damage occurs to the components at the socket edge of the backplane.
      - Ensure that the system backplane is fully seated and is all the way into the system.
      - You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

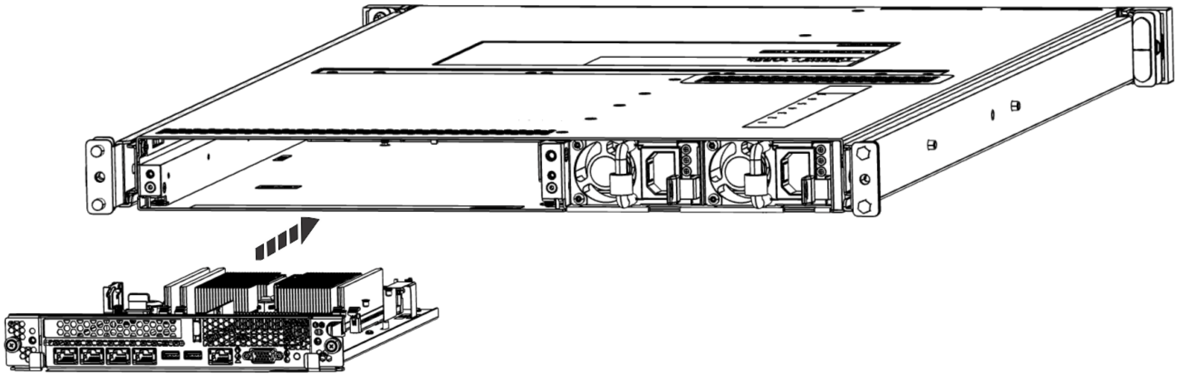

Figure 67. Replacing the system backplane

   c) Simultaneously rotate the two levers on each side of the system backplane in to secure the system backplane to the system.

    d) Tighten the two screws on the sides of the system backplane.

    e) Using your labels, replace the signal cables into the rear of the system.

    f) Using your labels, replace the two power cords at the rear of the system.

       For instructions, see “Connecting the power cords to a 7063-CR2 system” on page 101.

10. Replace all the fans into the system.

    For instructions, see “Replacing a fan in the 7063-CR2 system” on page 20.

11. Power on the system for operation.

    For instructions, see “Starting the 7063-CR2 system ” on page 98.

Removing and replacing a power supply in the 7063-CR2

Learn how to remove and replace power supplies in the IBM Power Systems HMC (7063-CR2) systems.

Removing a power supply from the 7063-CR2 system

To remove a power supply from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

About this task

If a single power supply failed, it can be replaced while the system is running.

Procedure

1. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   ⚠ **Attention:**

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
   - When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
   - If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.

2. Label and remove the power cord from the power supply that you want to remove.

   For instructions, see “Disconnecting the power cords from a 7063-CR2 system” on page 100.

3. To remove the power supply from the system, complete the following steps:

   a) To unseat the power supply from its position in the system, push the locking-tab **(A)** to the left as shown in the following figure.

   b) Grasp the power supply handle with one hand, and pull the power supply partially out of the system.

   c) Place your other hand underneath the power supply and pull the power supply out of the system and place it on an ESD mat.

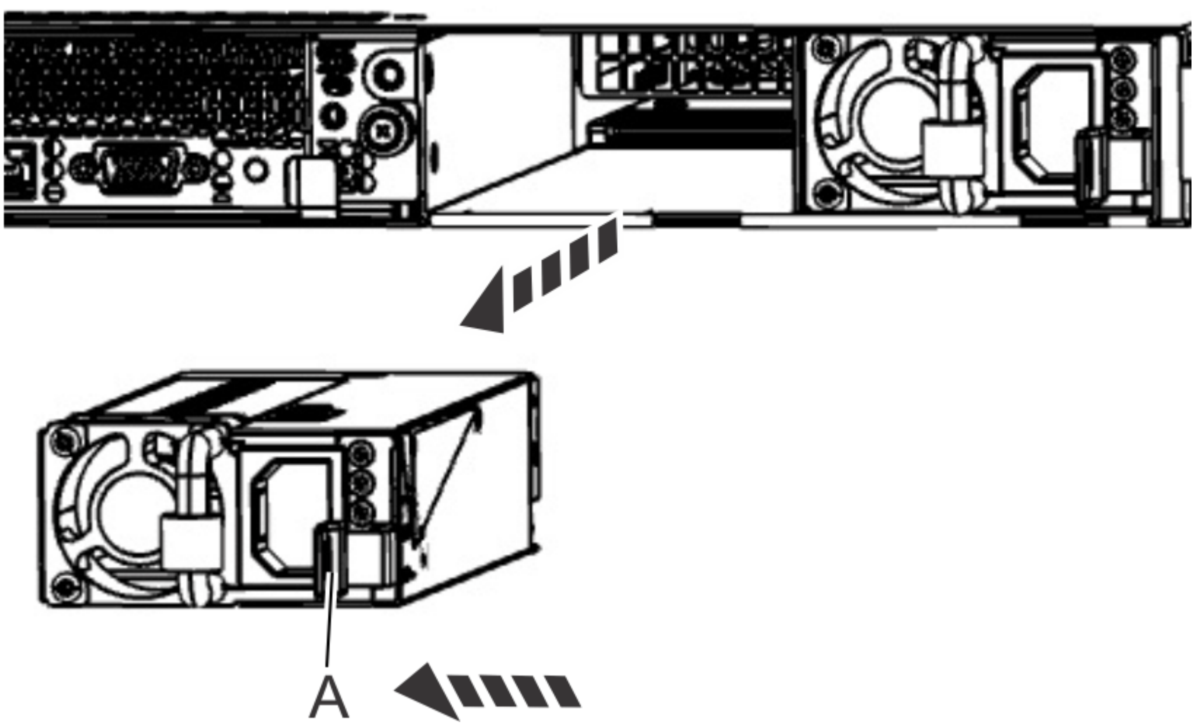

Figure 68. Removing a power supply from the system

Replacing a power supply in the 7063-CR2 system

To replace a power supply in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Ensure that you have the electrostatic discharge (ESD) wrist strap on and that the ESD clip is plugged into a ground jack or connected to an unpainted metal surface. If not, do so now.
2. Wait 30 seconds after you remove a power supply before you install a power supply.
3. To install a power supply in the system, complete the following steps:
   a) Align the power supply with the bay as shown in the following figure. The fan is on the left; the plug is on the right.
   b) Slide the power supply into the system until the latch locks in place.

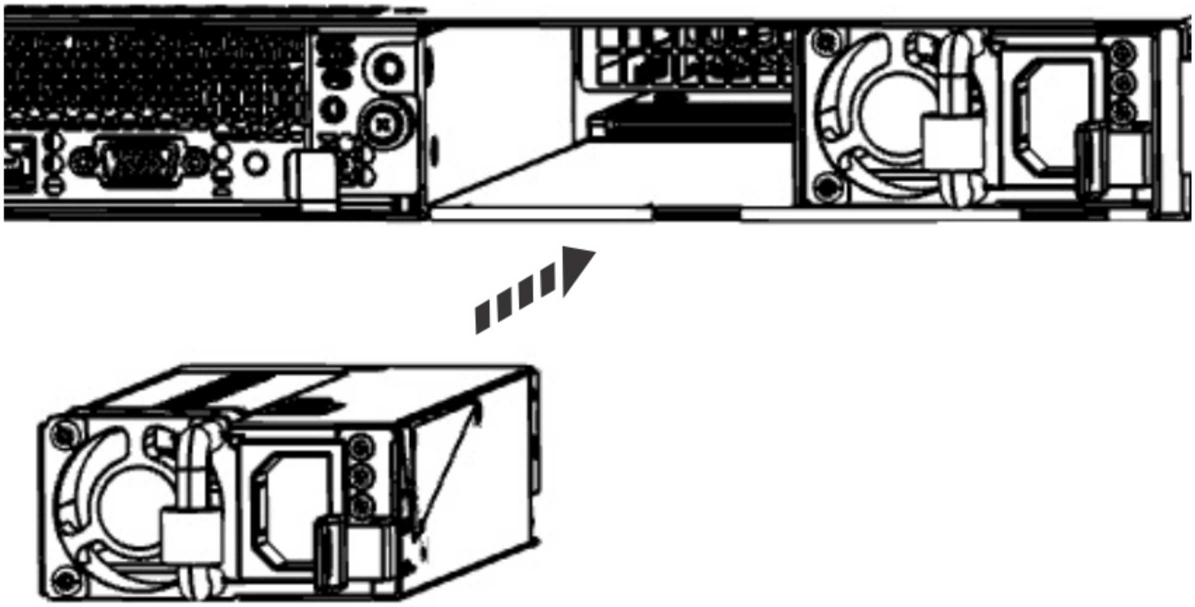

Figure 69. Installing a power supply in the system

4. Reconnect the power cord.

   For instructions, see "Connecting the power cords to a 7063-CR2 system" on page 101.

Removing and replacing the system backplane in the 7063-CR2

Learn how to remove and replace the system backplane in the IBM Power Systems HMC (7063-CR2) system.

Before you begin

Removing or replacing this part is a customer task. You can complete this task yourself, or contact a service provider to complete the task for you. You might be charged a fee by the service provider for this service.

Before you begin replacing the system backplane, write down the system serial number and machine model type. After you replace the system backplane, you must set the system serial number and machine model type in the system backplane.

Preparing the 7063-CR2 system to remove the system backplane

To prepare to remove the system backplane from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Make note of the system serial number and the machine model type. After you replace the system backplane, you must set the system serial number and machine model type in the system backplane.
2. Make note of the BMC network settings. Record the BMC IP settings.

   After you replace the system backplane, you might need to reconfigure the BMC network settings.

Removing the system backplane from the 7063-CR2 system

To remove the system backplane from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

About this task

You can use a magnetic tip screwdriver to remove and replace the screws.

As part of the system backplane replacement, the system processor modules are moved from the old system backplane to the new system backplane.

Procedure

1. Power off the system.

   For instructions, see "Stopping the 7063-CR2 system" on page 99.
2. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   ⚠ **Attention:**

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
   - When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
   - If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.
3. Remove the system backplane from the rear of the system.

   a) Label and remove the two power cables.

   For instructions, see "Disconnecting the power cords from a 7063-CR2 system" on page 100.

   b) Label and remove the signal cables from the rear of the system.

   c) Loosen the two screws **(A)** on the sides of the system backplane as shown in the following figure.

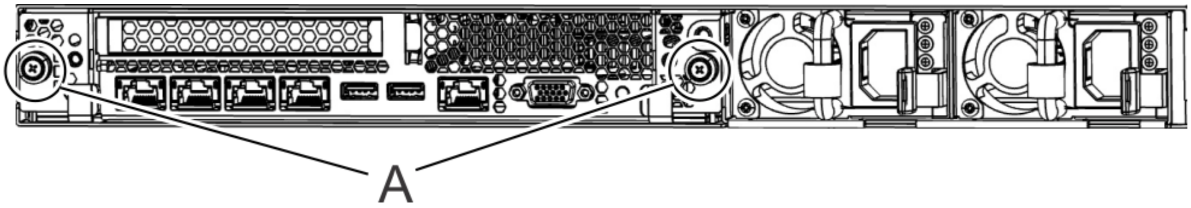

Figure 70. Removing the system backplane screws

   d) Simultaneously rotate the two levers **(A)** on each side of the system backplane out and to the side to unlock the system backplane from the system.

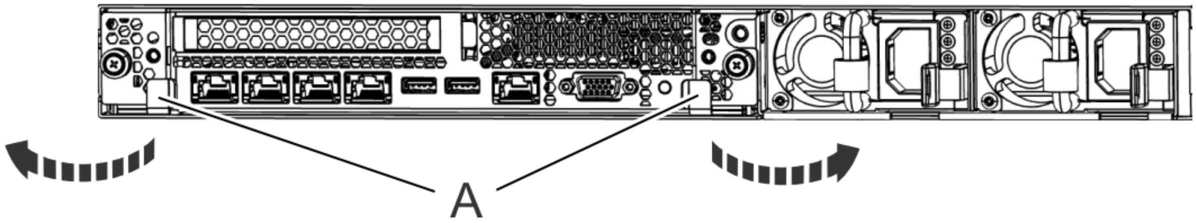

Figure 71. Unlatching the system backplane

e) Support the system backplane by the bottom as you slide it from the system.

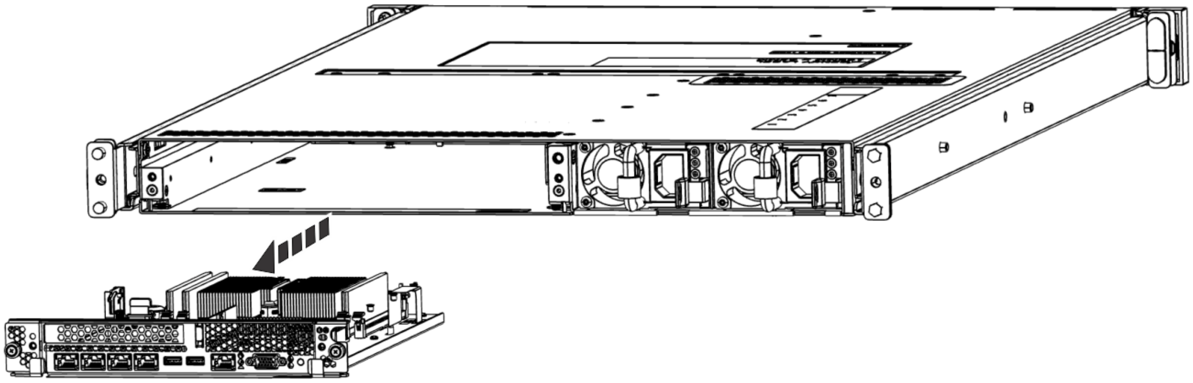

Figure 72. Removing the system backplane

f) Place the system backplane on an ESD surface.

Note: You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

Replacing the system backplane in the 7063-CR2 system

To replace the system backplane in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Ensure that you have the electrostatic discharge (ESD) wrist strap on and that the ESD clip is plugged into a ground jack or connected to an unpainted metal surface. If not, do so now.
2. Remove the replacement system backplane from the static-protective package and place it on an ESD mat next to the old system backplane.

The following steps move the system processor module from the old system backplane to the new system backplane:

3. Loosen the load arm screw **(A)** of the system processor heat sink **(B)** that you are removing with a T20 hexalobular driver. The load arm pivots up in the direction that is shown in the following figure.

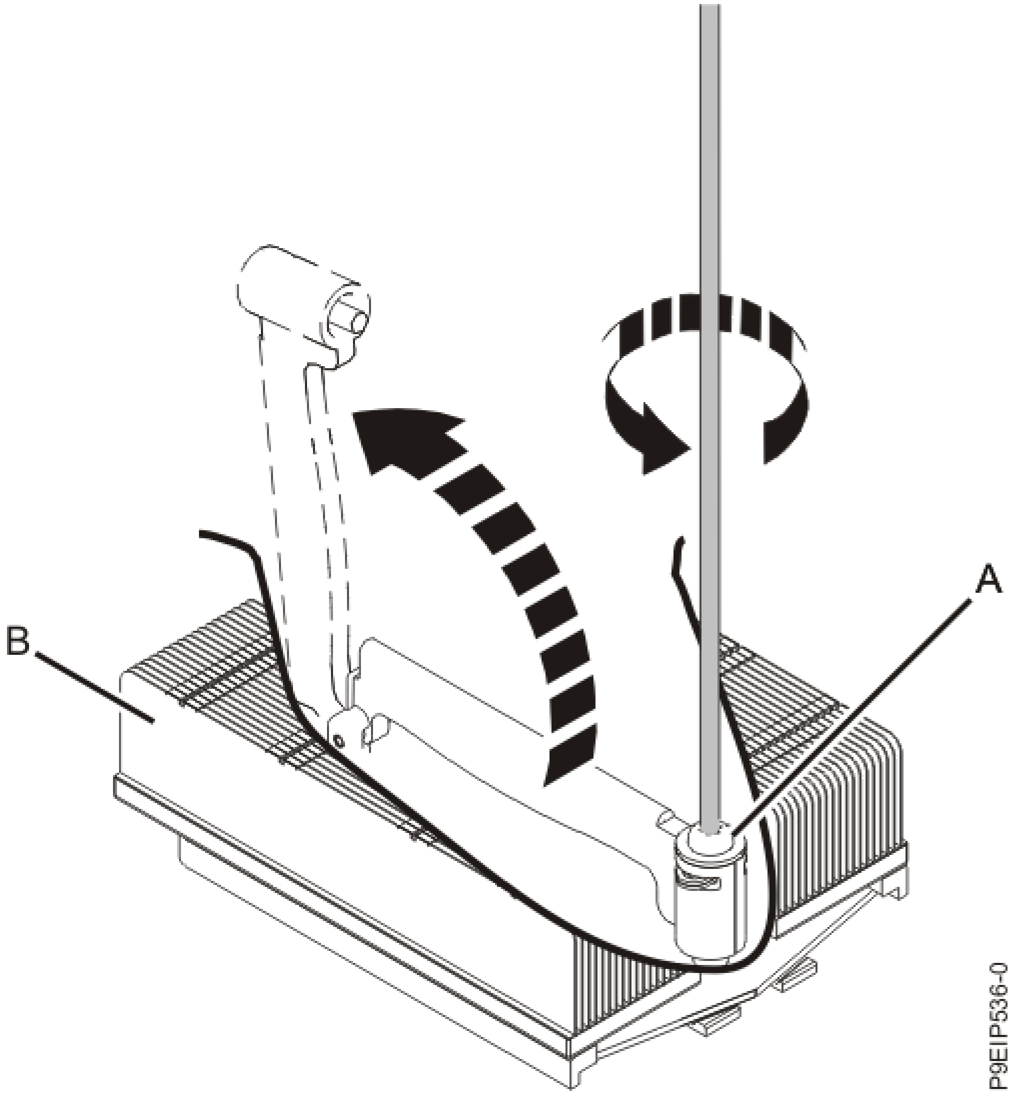

Figure 73. Loosening the load arm screw of the heat sink

4. Grip the heat sink and remove it by lifting it straight up as shown in the following figure.

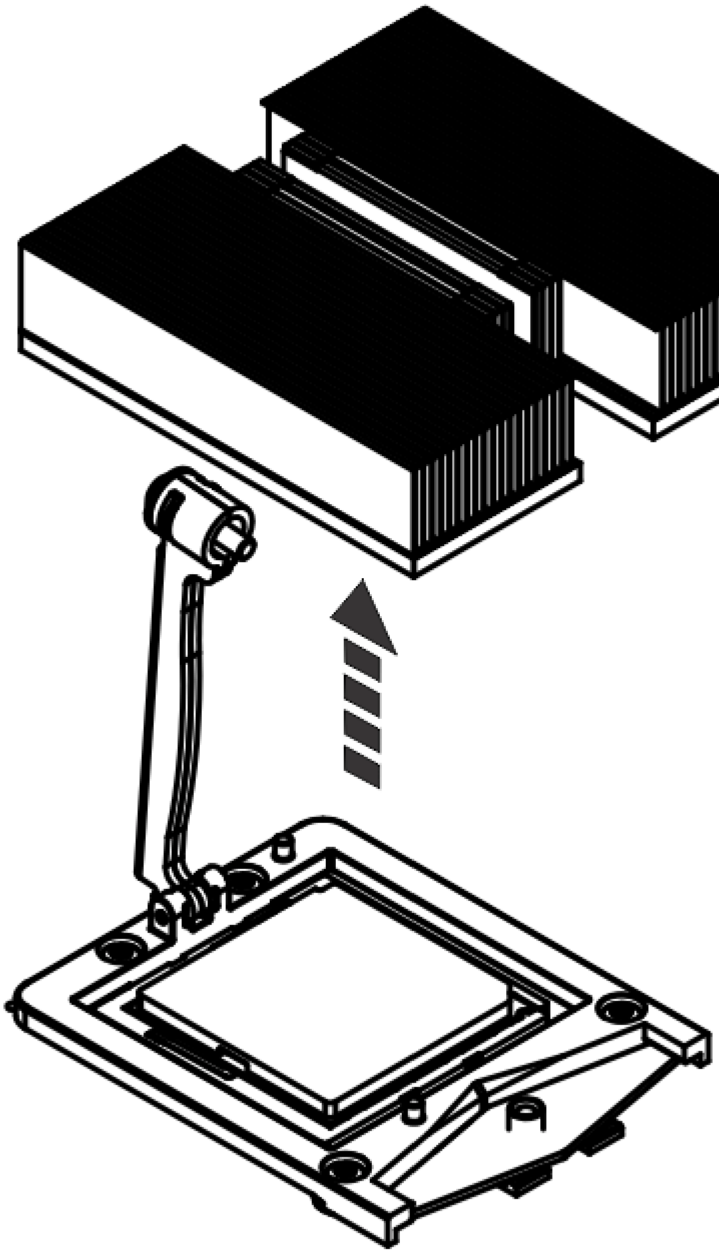

Figure 74. Removing the heat sink

5. Place the heat sink upside down on a clean surface.
6. Using tweezers, carefully remove the TIM from the top of the system processor module and place it in a clean, dry area.

   The TIM can tear easily.
7. Remove the cover from the system processor socket on the new system backplane
8. Inspect the system processor socket area and remove any dust or debris (use a can of compressed air).
9. Align the tool with the beveled edge **(A)** of the system processor module as shown in the following figure. Lower the tool over the system processor module by ensuring the two guide pins **(C)** are inserted into the alignment holes **(B)** on each side of the tool.

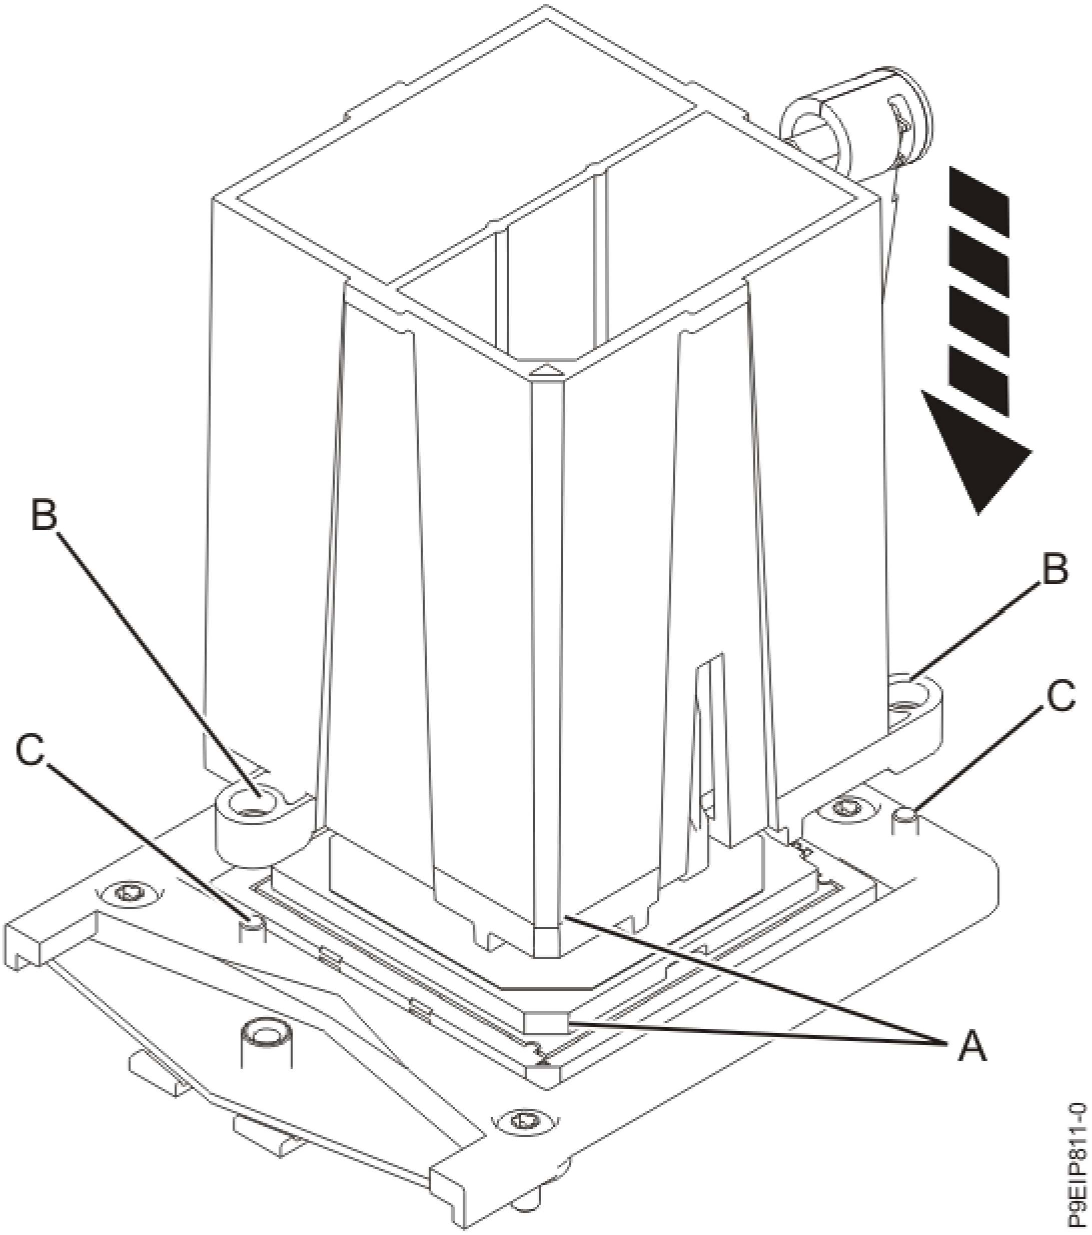

Figure 75. Lowering the removal tool onto the system processor module

10. Using the lift tool, move the system processor module from the old system backplane socket to transfer it to the new system backplane socket.
11. With the removal tool **(A)** sitting on top of the system processor module, push down on the tool to lock the system processor module into the tool as shown in the following figure.

    The tool drops slightly when you push down on the system processor module so that the jaws can grab the bottom of the module. Make sure that both of the tool jaws are locked on the system processor module. Do not press the blue release tabs until directed to do so later.

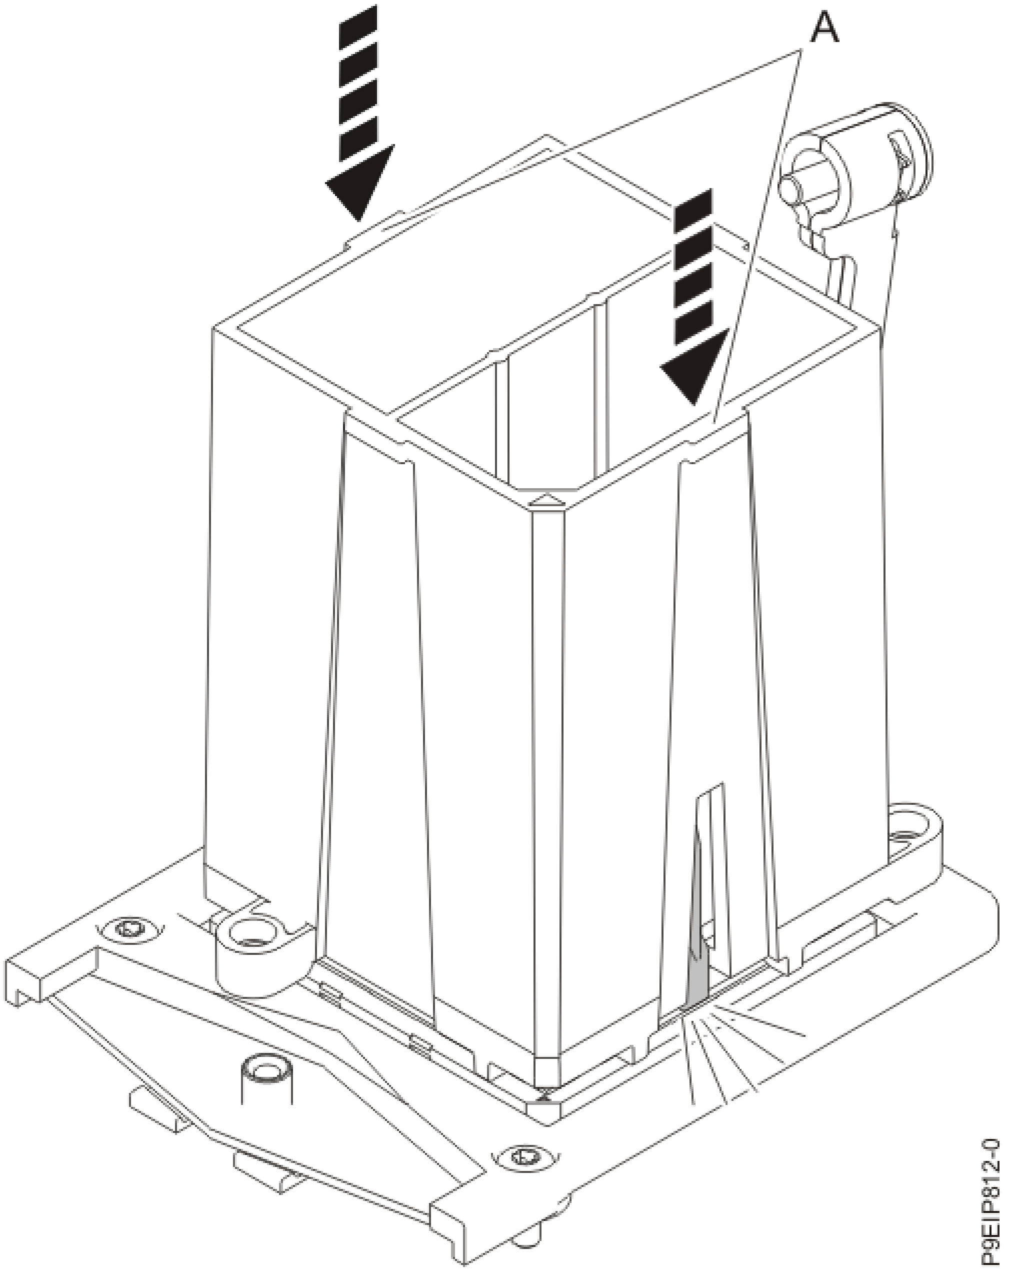

Figure 76. Locking the system processor module into the tool

12. Lower the tool and system processor module onto the socket. Align the beveled corner **(A)** of the tool with the beveled corner on the socket as shown in the following figure.

    Ensure that the two guide pins **(C)** are inserted into the alignment holes **(B)** on each side of the tool. Use care to lower the tool evenly without tilting the tool. Do not attempt to slide the tool and the system processor module in any direction while the system processor module is touching the socket. If the tool and the system processor module are not aligned with the guide pins, lift the tool and the system processor module and reposition them.

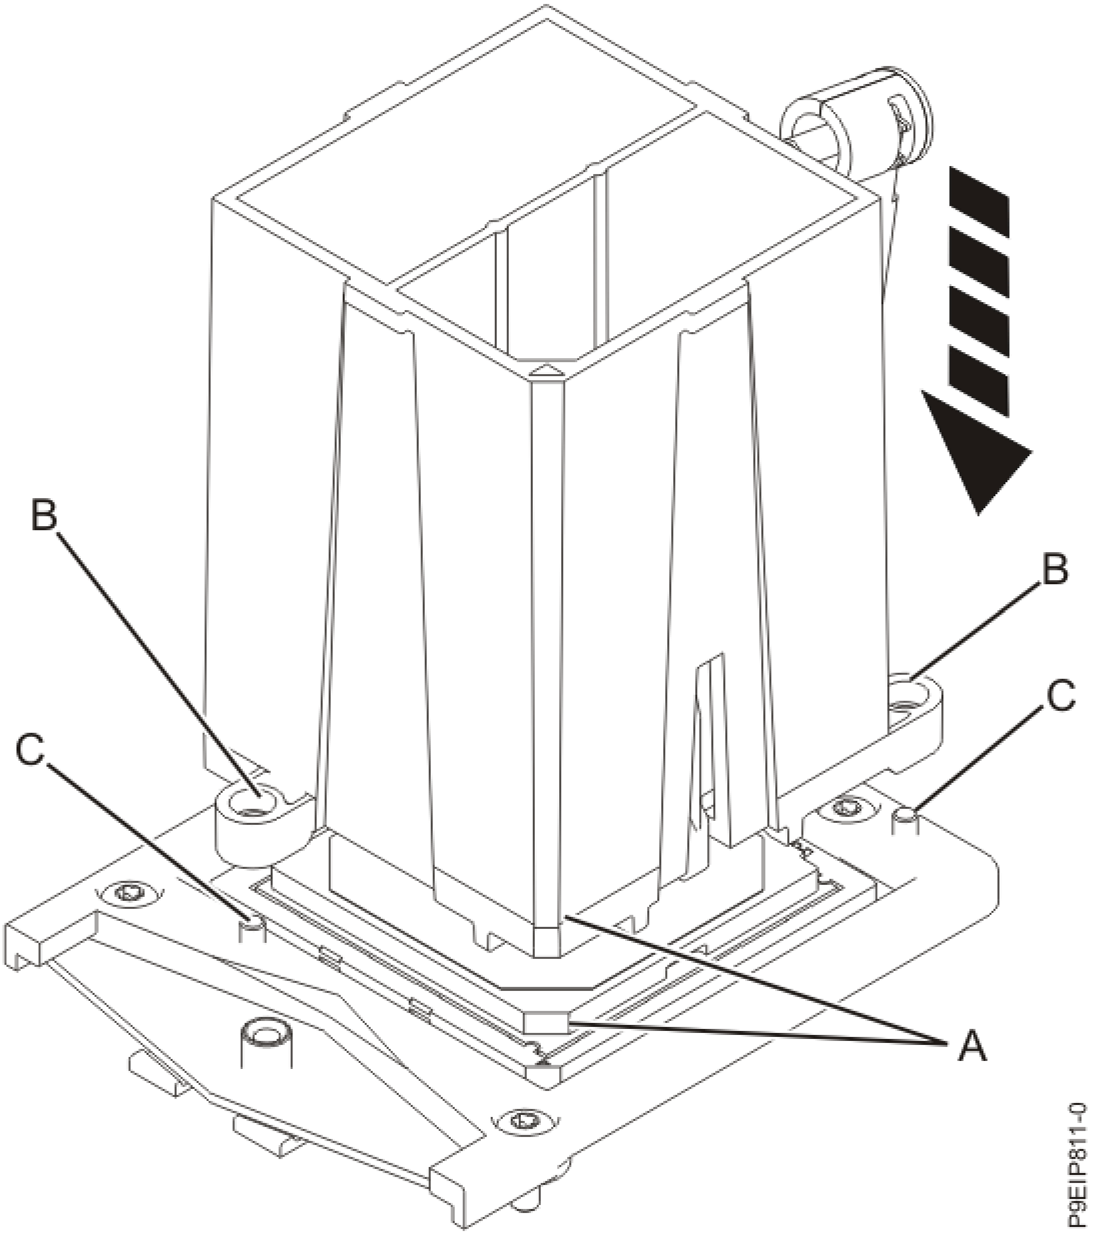

Figure 77. Installing the system processor module

13. After the tool and system processor module holes and guide pins are properly aligned, squeeze and hold the two blue release tabs **(A)** together until a firm stop is reached as shown in the following figure.

    Then, lift the tool off the system processor module.

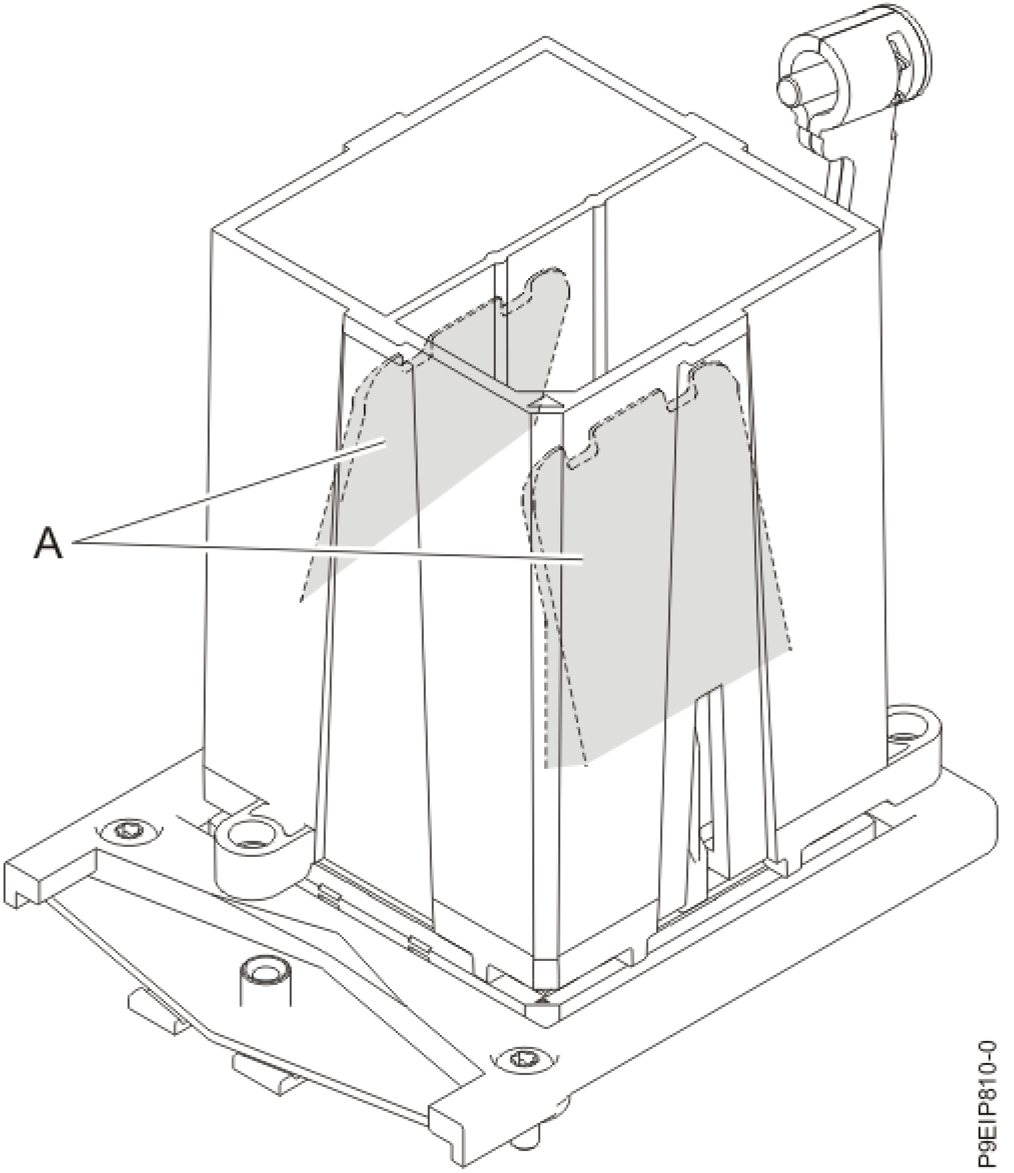

Figure 78. Removing the system processor module tool

14. Inspect the thermal interface material (TIM) for visible signs of damage. If you see folds, tears, bends, or if you have doubts about the TIM, replace it.

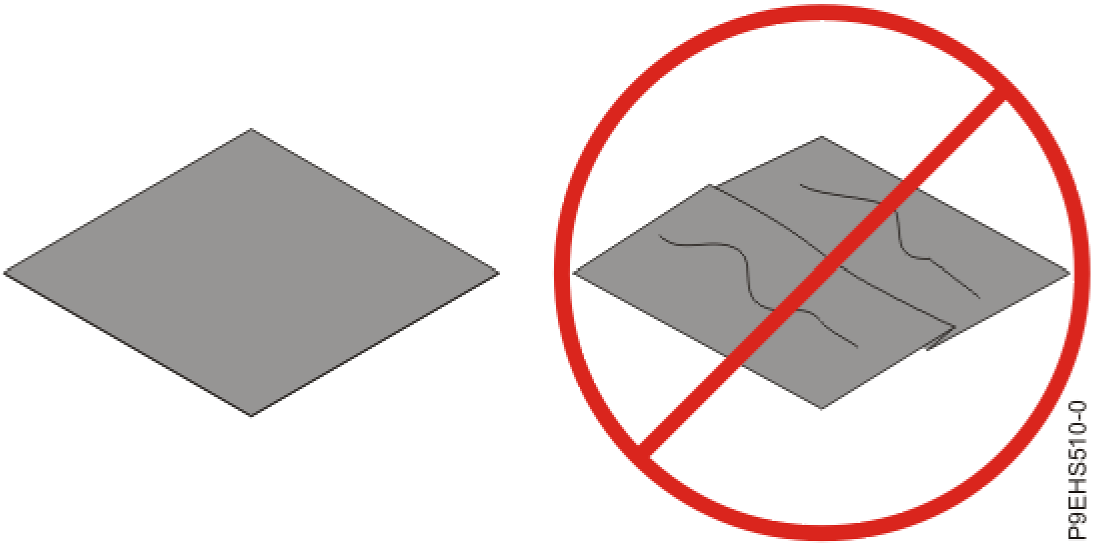

Figure 79. Inspecting the thermal interface material

15. Choose one of the following repair options:

Option	Description
Is the TIM damaged?	It is damaged. Proceed to step “16” on page 62 to replace the TIM and install the existing heat sink.
Is the TIM OK?	It is not damaged and can be reused. Proceed to step “18” on page 62 to reuse the TIM and install the existing heat sink.

16. Use this step to install a new TIM and reuse the existing heat sink.
    a) Open the TIM packaging and carefully remove the TIM, holding it by the edges of the carrier strip and holding it away from the shipping container.
    b) Remove the protective film from the clear carrier strip by using the supplied tweezers.

       Note: The TIM must remain flat. Small wrinkles are acceptable, but folds are not acceptable.
    c) Using the tweezers, remove the TIM from the carrier strip and center it onto the system processor module.

       The TIM has no preferred up side. The TIM can be placed on the system processor module and centered..
17. Continue with step “19” on page 62.
18. Use this step to reuse the existing undamaged TIM and heat sink.
    a) Using the tweezers, move the old TIM from the clean, dry surface and center it onto the new system processor module.

       The TIM has no preferred up side. The TIM can be placed on the system processor module and centered.
19. Carefully lower the heat sink over the system processor module, ensuring that the holes in the heat sink align with the two guide pins **(A)** on the socket, as shown in the following figure.

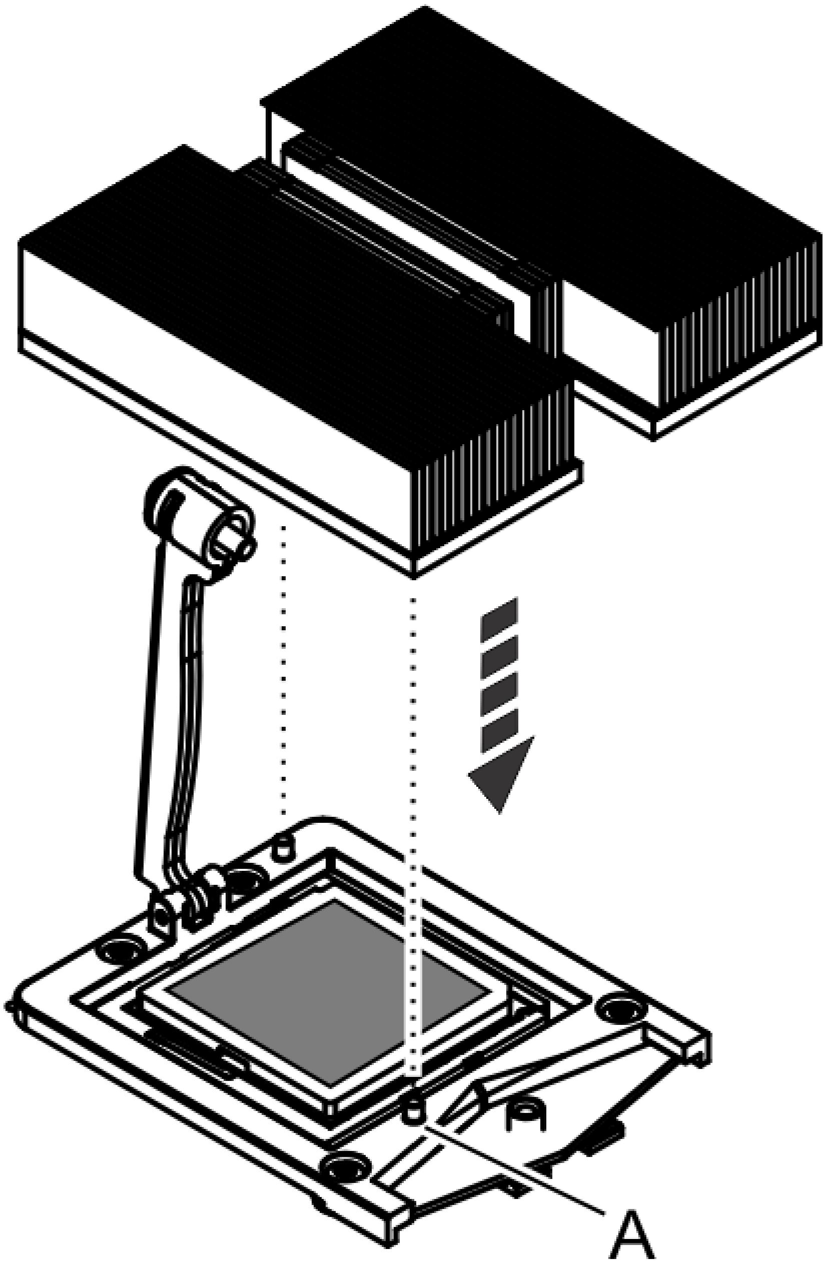

Figure 80. Installing the heat sink

20. Move the load arm **(A)** into position over the heat sink **(B)** and tighten the load arm screw with a T20 hexalobular driver, as shown in the following figure.

    Note: Do not over tighten the load arm screw.

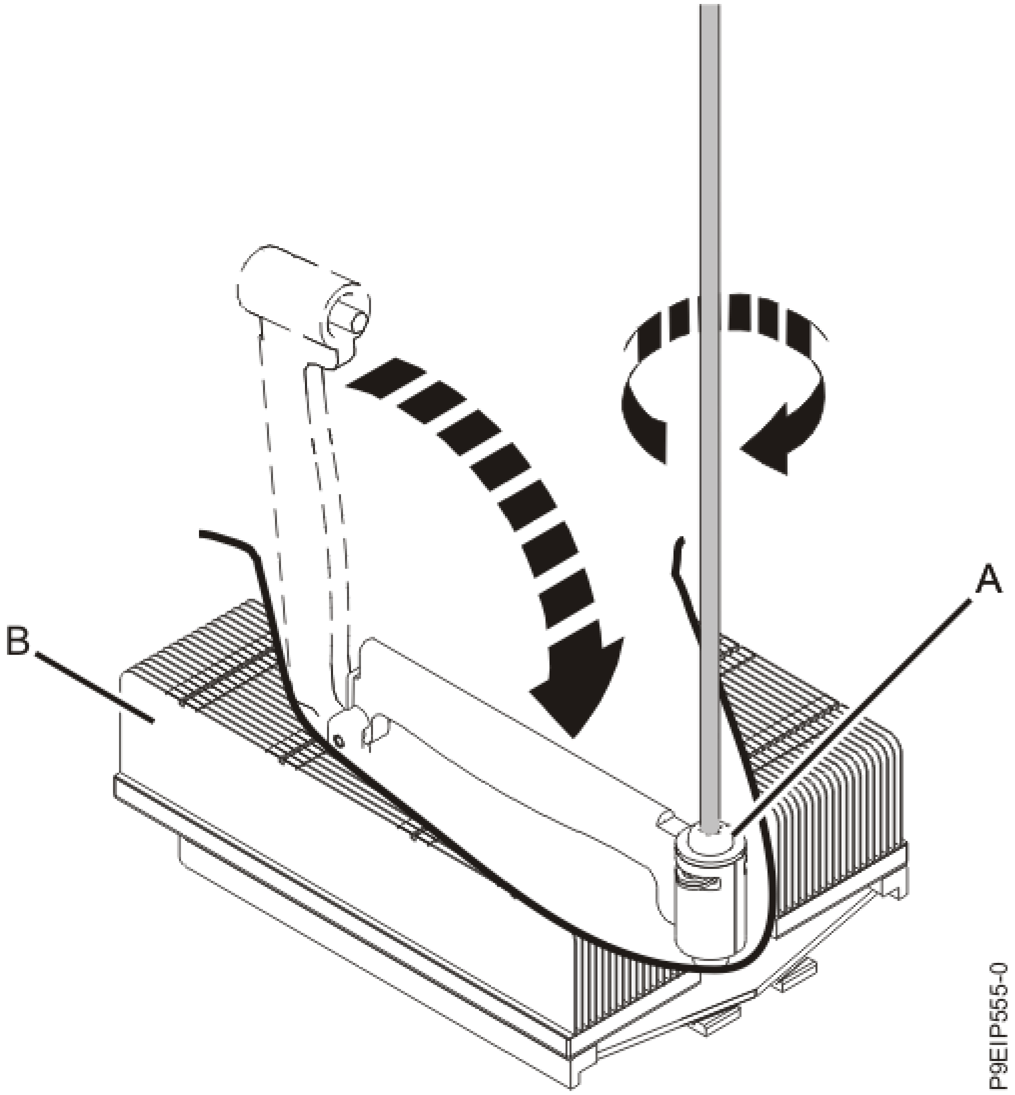

Figure 81. Tightening the load arm screw

The following steps move the remaining parts from the old system backplane to the new system backplane:

21. Move the memory DIMMs from the old system backplane to the corresponding location on the new system backplane.

    For instructions, see "Removing and replacing memory in the 7063-CR2" on page 21.

22. Move the TPM card from the old system backplane to the corresponding location on the new system backplane.

    For instructions, see "Removing and replacing the trusted platform module in the 7063-CR2" on page 89.

23. If applicable, move the PCIe adapter from the old system backplane to the corresponding location on the new system backplane.

    a) Remove the screw that secures the PCIe adapter to the system backplane.

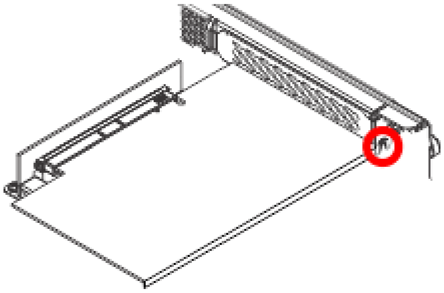

Figure 82. Removing the tail-stock screw

b) Open the retainer clip that secures the PCIe adapter to the PCIe riser, by moving the blue lever to the unlocked position.

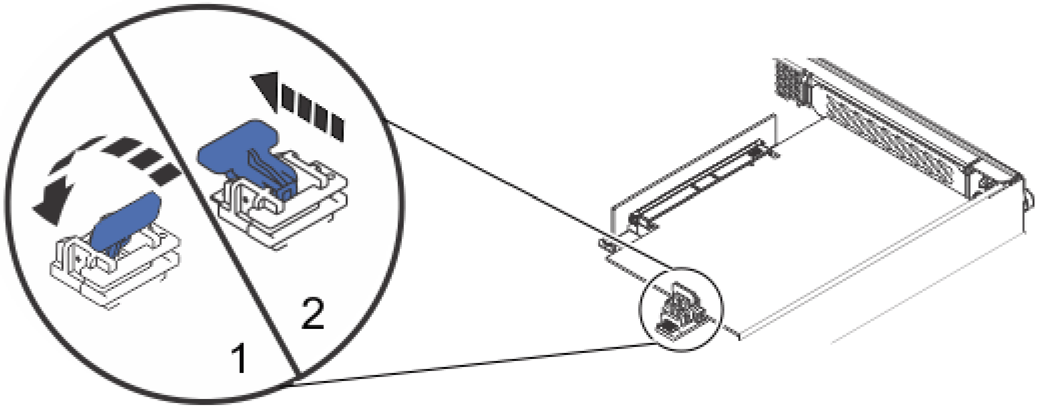

Figure 83. Removing the PCIe adapter retaining latch

c) Move the retainer clip away from the PCIe adapter.

d) Remove the PCIe adapter from the PCIe riser on the old system backplane.

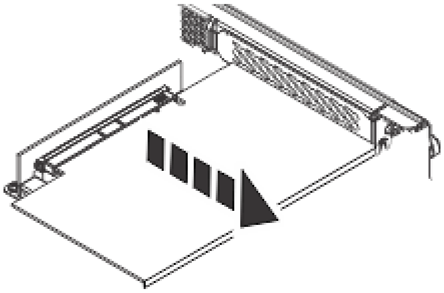

Figure 84. Removing the PCIe adapter

e) Replace the PCIe adapter into the PCIe riser on the new system backplane

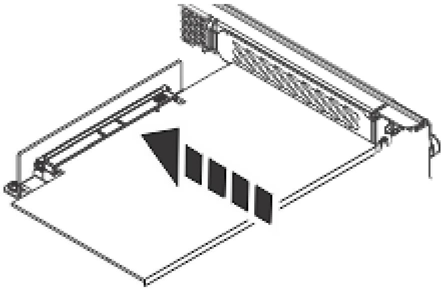

Figure 85. Replacing the PCIe adapter

f) Replace the screw that secures the PCIe adapter to the system backplane.

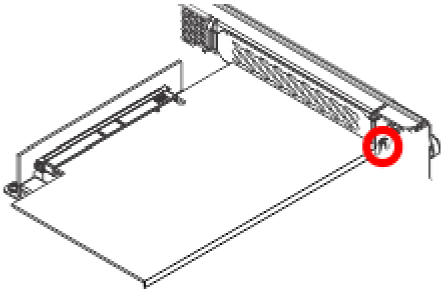

Figure 86. Replacing the tail-stock screw

g) Move the retainer clip to secure the PCIe adapter to the PCIe riser. Ensure that the clip is fully seated around the edge of the adapter.

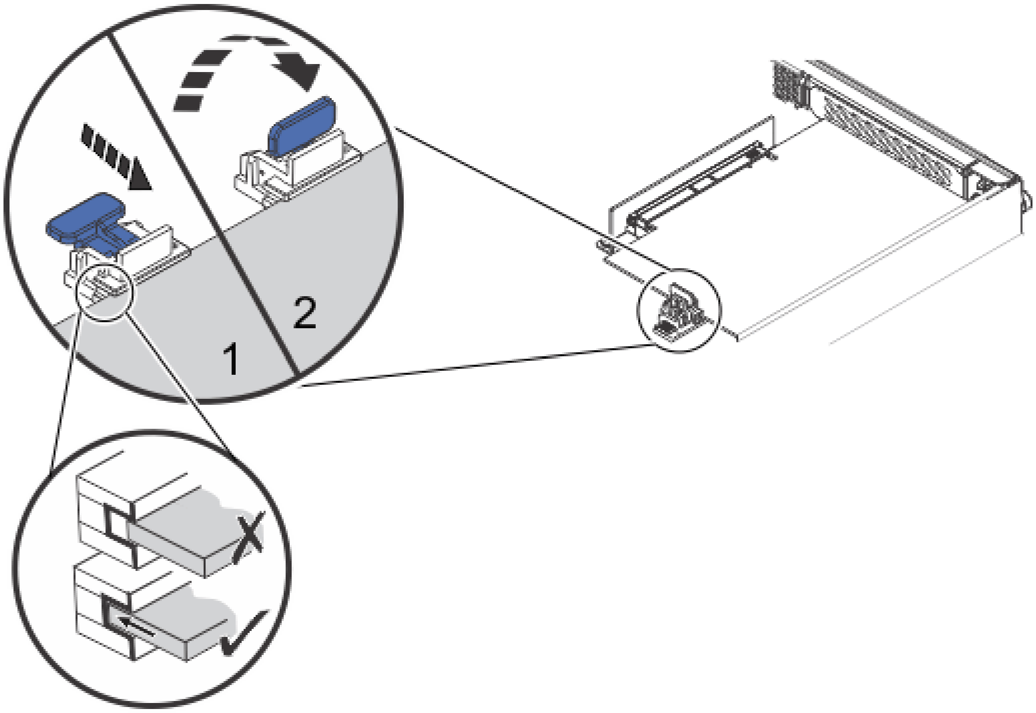

Figure 87. Replacing the PCIe adapter retaining latch

h) Close the retainer clip that secures the PCIe adapter to the PCIe riser.

24. Remove the blue protective insulator from the battery.
25. Replace the system backplane into the rear of the system.

a) Ensure that the two system backplane levers are open.

b) Support the system backplane by the bottom as you position the system backplane and insert it into the system until it is fully seated.

Important:

- Use care when you insert the system backplane so that no damage occurs to the components at the socket edge of the backplane.
- Ensure that the system backplane is fully seated and is all the way into the system.
- You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

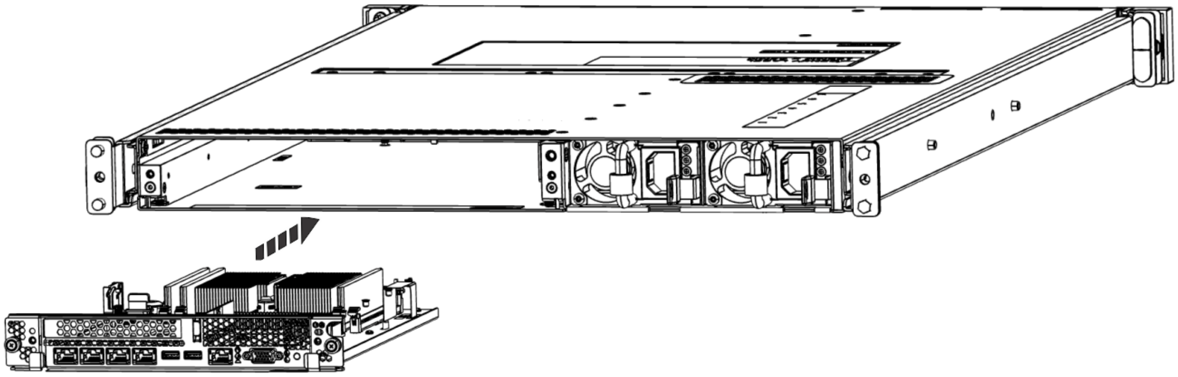

Figure 88. Replacing the system backplane

c) Simultaneously rotate the two levers on each side of the system backplane in to secure the system backplane to the system.

d) Tighten the two screws on the sides of the system backplane.

e) Using your labels, replace the signal cables into the rear of the system.

f) Using your labels, replace the two power cords at the rear of the system.

For instructions, see "Connecting the power cords to a 7063-CR2 system" on page 101.

Preparing the 7063-CR2 system for operation after removing and replacing the system backplane

To prepare the IBM Power Systems HMC (7063-CR2) system for operation after removing and replacing the system backplane, complete the steps in this procedure.

Procedure

1. The serial number needs to be set before the operating system starts to avoid issues.

   Follow the steps listed here: Scale-out LC system VPD update tool (www14.software.ibm.com/webapp/set2/sas/f/lopdiags/scaleOutLCdebugtool.html#OpenPOWER).
2. Ensure that the BMC network settings are correct. For instructions, see Configuring the BMC IP address.
3. The date and time needs to be set before the operating system starts to avoid issues.

   Follow these petitboot steps:

   a) From the petitboot menu, select **Exit to shell**.

   b) Run the following two commands to check the date and time:

   ```
   date
   ipmitool sel time get
   ```

   c) To set the correct date and time in UTC use the following format:

   ```
   date -s YYYY.MM.DD-HH:MM
   ```

   d) Run the following ipmitool command to set the system entry log (SEL) date and time to the new values:

   ```
   ipmitool sel time set now
   ```

   e) Verify that the ipmitool and date commands now show the correct values by running the following commands again:

   ```
   date
   ipmitool sel time get
   ```

   f) To leave the petitboot shell, type **exit**.

4. The operating system of the HMC needs to have valid credentials with which to access the BMC.

   The credentials are set during the setup of the HMC. The credentials can also be set by running a task. If the credentials are not set up, the HMC cannot run the call-home functions for itself. Reconfigure the credentials after you sign in to the HMC.

   To run the task, click the **HMC Management** icon, then select **Console Settings** > **Console Inband Communication Credentials**
5. If secure boot option is enabled before the replacement of the system backplane, then the user needs to re-enable the secure boot option by following the steps in Enabling secure boot on 7063-CR2 HMC.

Removing and replacing the system processor module in the 7063-CR2

Learn how to remove and replace the system processor module in the IBM Power Systems HMC (7063-CR2) system.

Before you begin

Removing or replacing this part is a customer task. You can complete this task yourself, or contact a service provider to complete the task for you. You might be charged a fee by the service provider for this service.

Removing the system processor module from the 7063-CR2 system

To remove the system processor module from the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

About this task

(L007)

CAUTION: A hot surface nearby. (L007)

Procedure

1. Power off the system.

   For instructions, see "Stopping the 7063-CR2 system" on page 99.
2. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   Attention:

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
   - When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.

- If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.

3. Remove the system backplane from the rear of the system.
   a) Label and remove the two power cables.

      For instructions, see "Disconnecting the power cords from a 7063-CR2 system" on page 100.
   b) Label and remove the signal cables from the rear of the system.
   c) Loosen the two screws **(A)** on the sides of the system backplane as shown in the following figure.

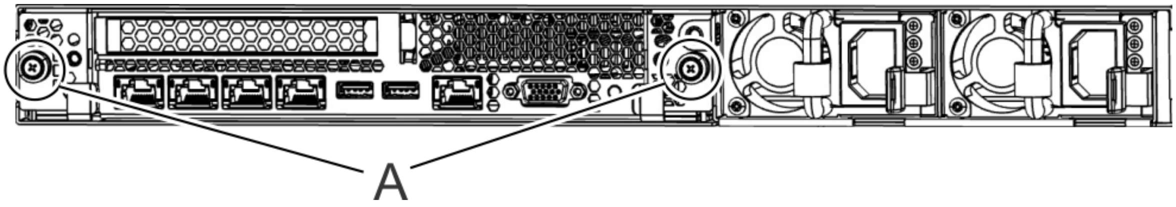

Figure 89. Removing the system backplane screws

   d) Simultaneously rotate the two levers **(A)** on each side of the system backplane out and to the side to unlock the system backplane from the system.

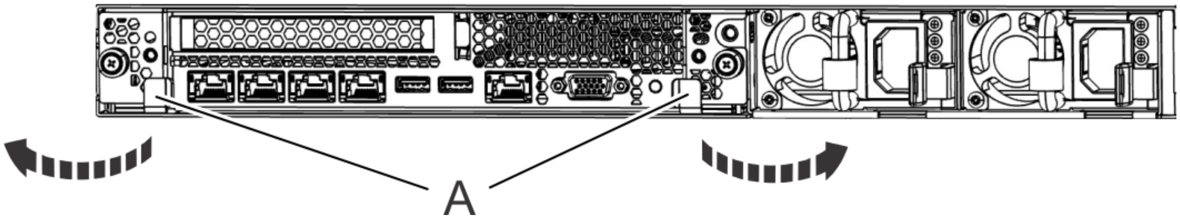

Figure 90. Unlatching the system backplane

   e) Support the system backplane by the bottom as you slide it from the system.

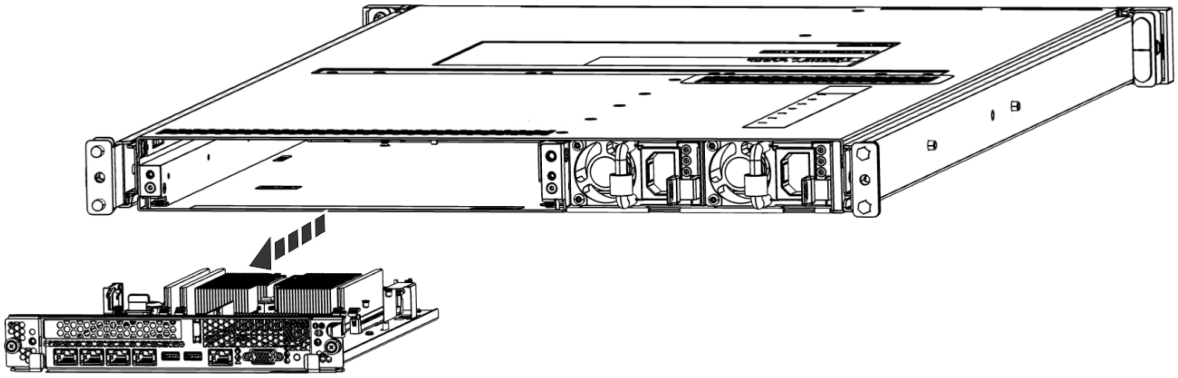

Figure 91. Removing the system backplane

   f) Place the system backplane on an ESD surface.

Note: You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

4. Open the packaging of the new system processor module and place the cover upside down next to the tray, as shown in the following figure. The cover is used for the system processor module that you want to replace.

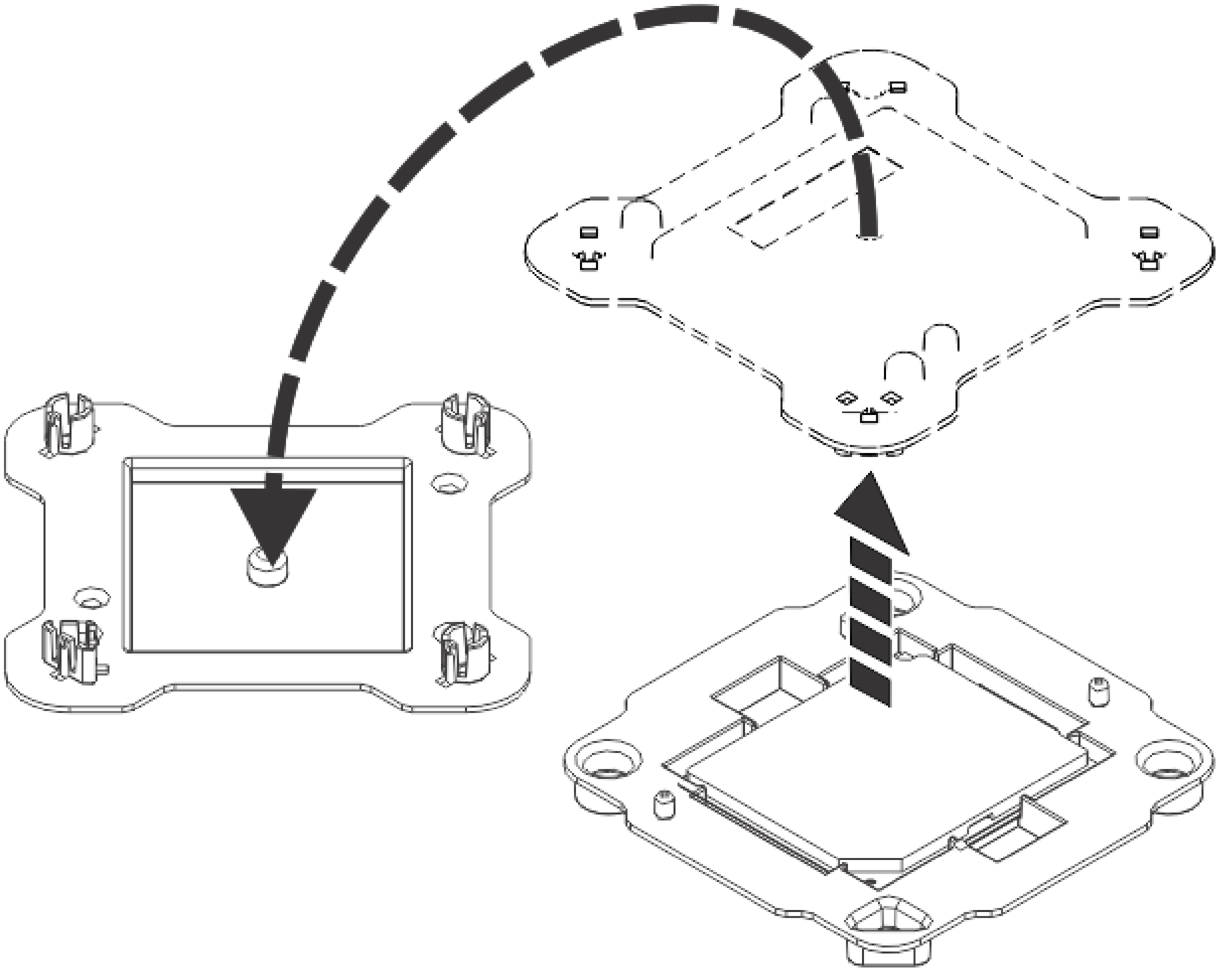

Figure 92. Opening the system processor module packaging

5. Loosen the load arm screw **(A)** of the system processor heat sink **(B)** that you are removing with a T20 hexalobular driver. The load arm pivots up in the direction that is shown in the following figure.

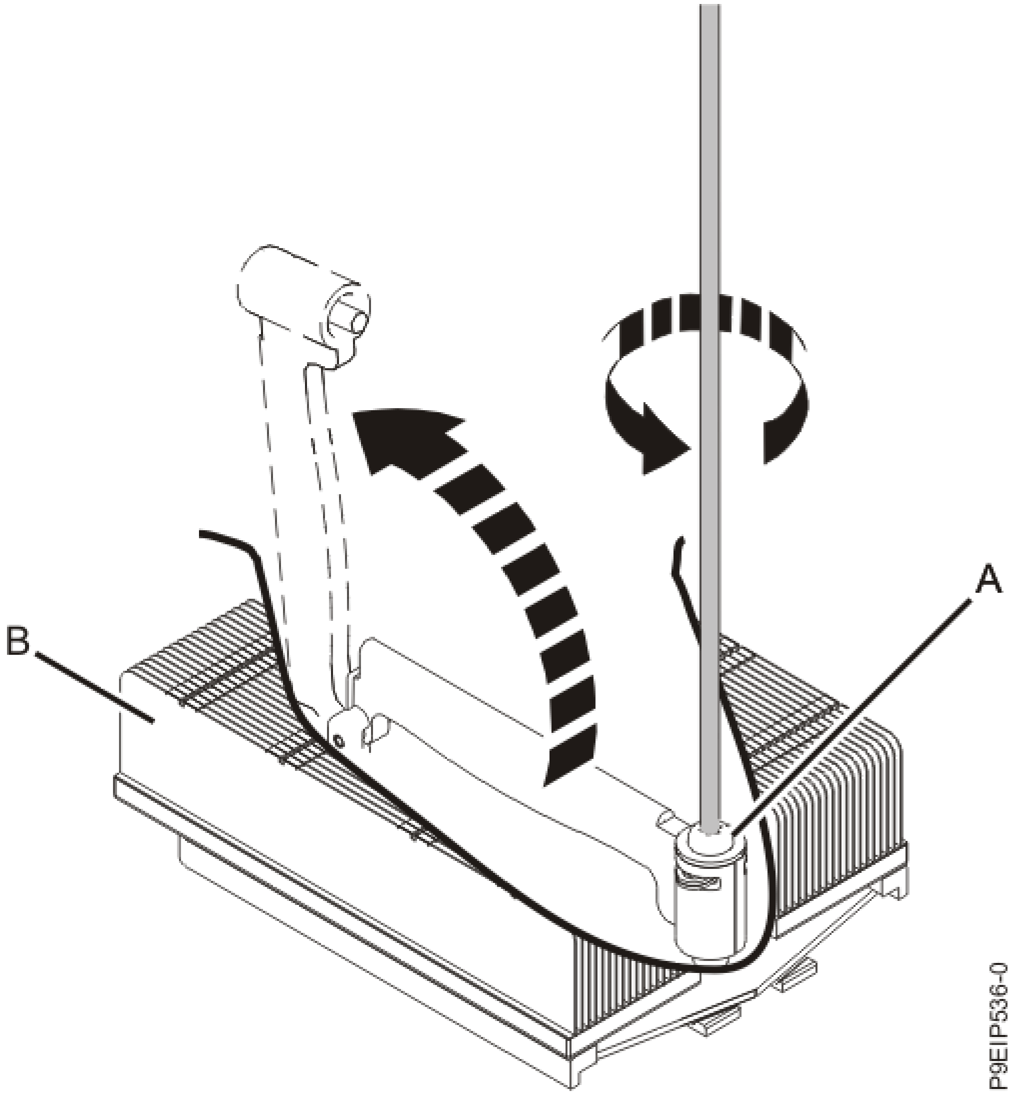

Figure 93. Loosening the load arm screw of the heat sink

6. Grip the heat sink and remove it by lifting it straight up as shown in the following figure.

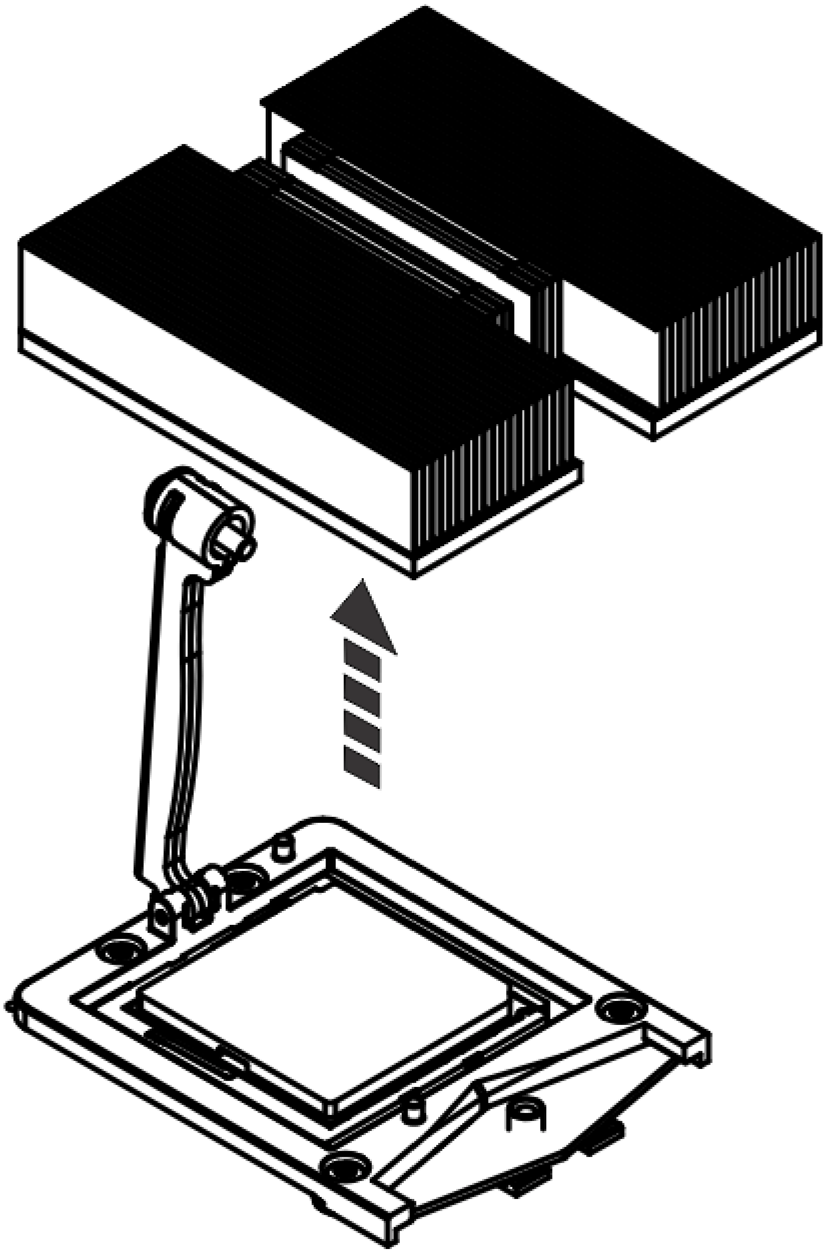

Figure 94. Removing the heat sink

7. Place the heat sink upside down on a clean surface.
8. Using tweezers, carefully remove the TIM from the top of the system processor module and place it in a clean, dry area.

   The TIM can tear easily.
9. Inspect the system processor socket area and remove any dust or debris (use a can of compressed air).
10. Align the tool with the beveled edge **(A)** of the system processor module as shown in the following figure. Lower the tool over the system processor module by ensuring the two guide pins **(C)** are inserted into the alignment holes **(B)** on each side of the tool.

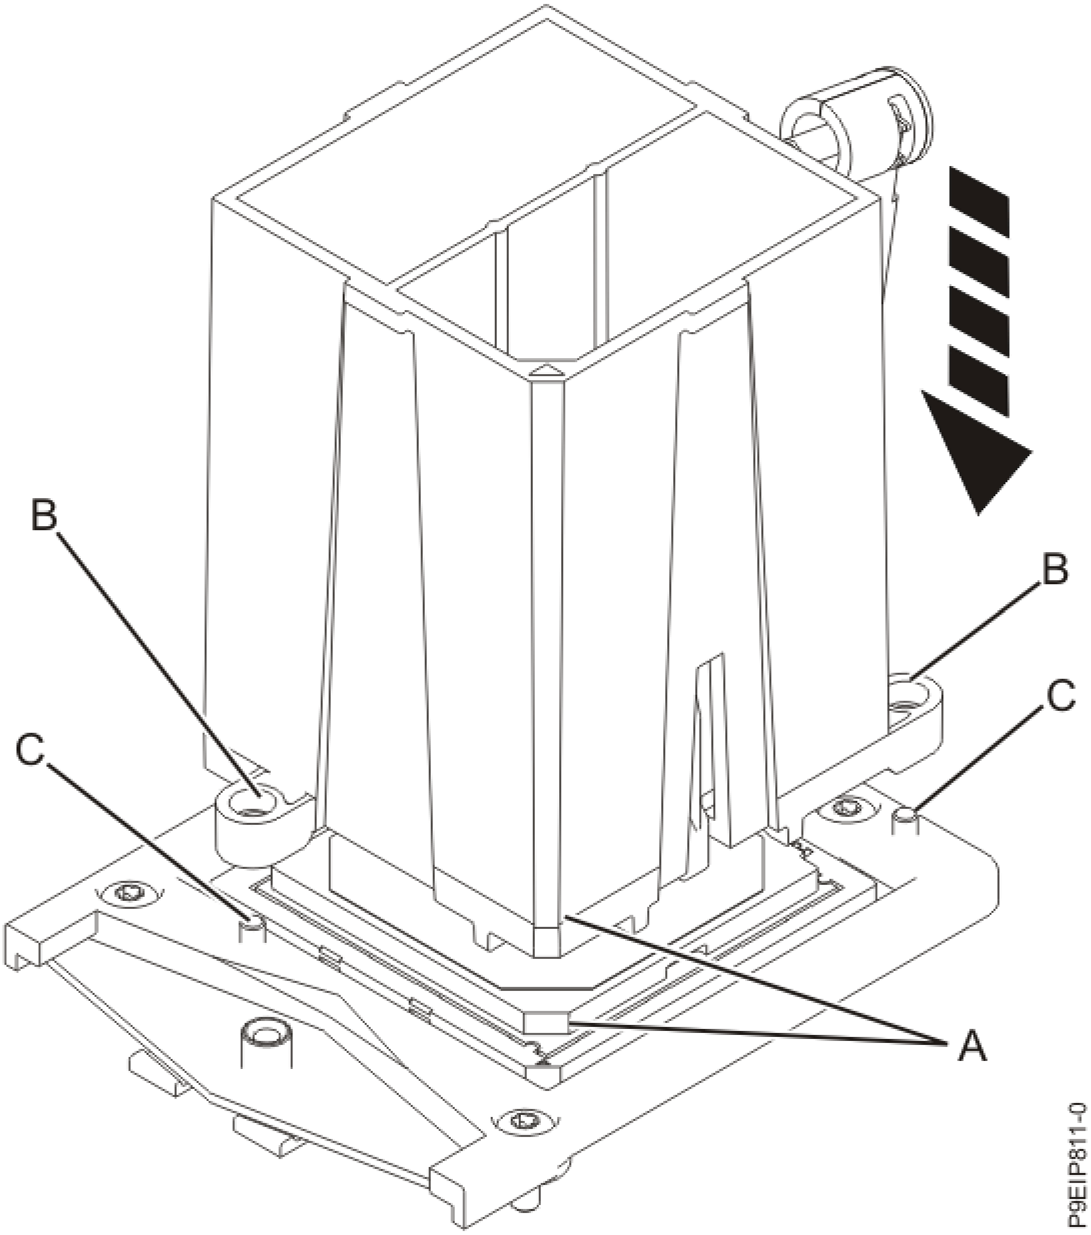

Figure 95. Lowering the removal tool onto the system processor module

11. With the removal tool **(A)** sitting on top of the system processor module, push down on the tool to lock the system processor module into the tool as shown in the following figure.

    The tool drops slightly when you push down on the system processor module so that the jaws can grab the bottom of the module. Make sure that both of the tool jaws are locked on the system processor module. Do not press the blue release tabs until directed to do so later.

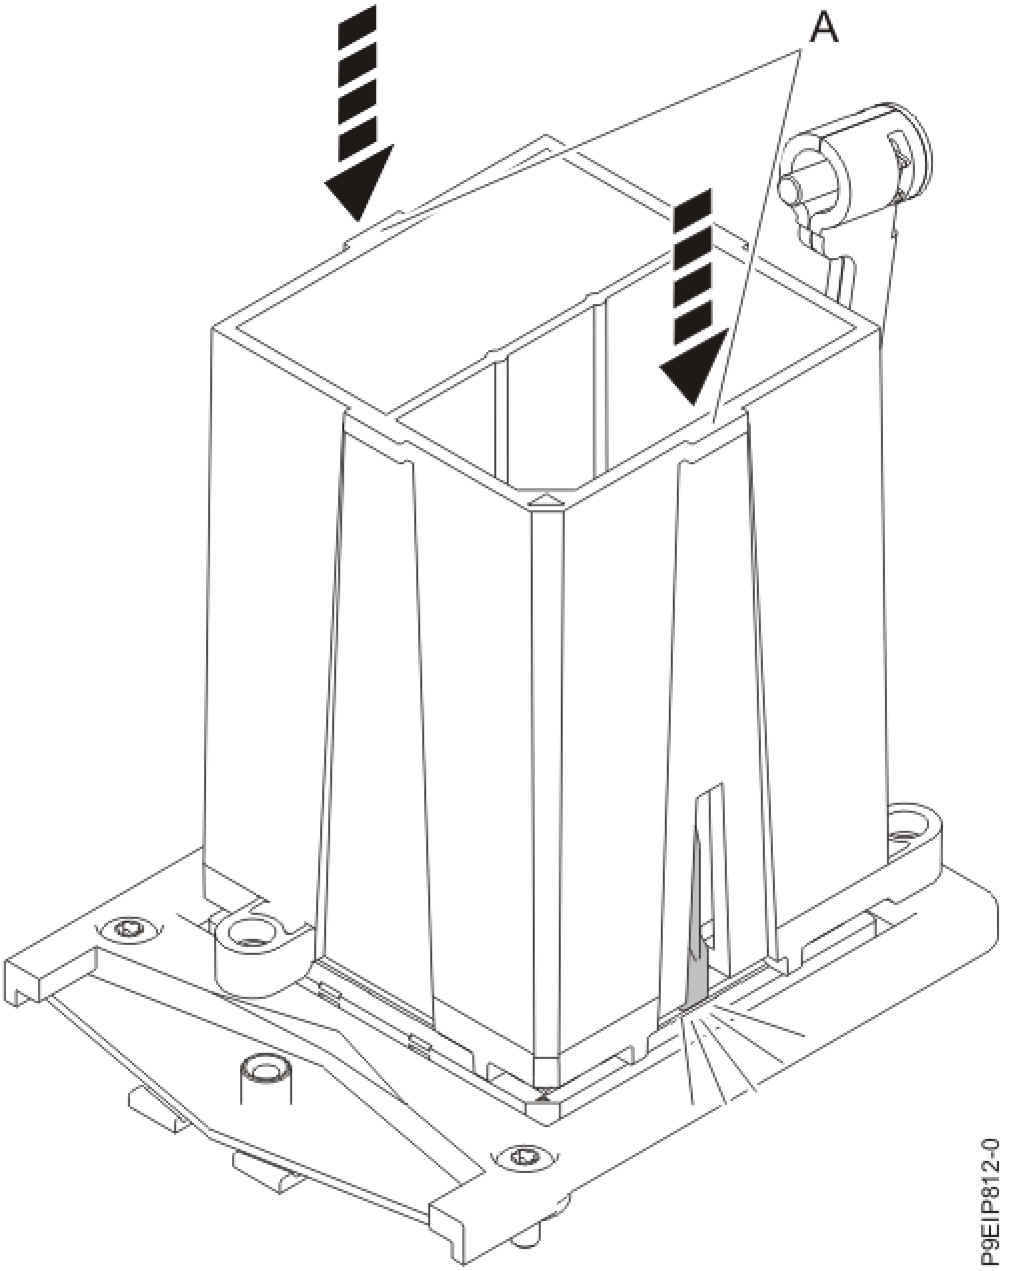

Figure 96. Locking the system processor module into the tool

12. Hold the outside of the tool and lift the tool and system processor module from the socket. Place them at an angle on the top cover of the system processor module packaging as shown in the following figure.

    Setting the system processor module at an angle on the top cover of the system processor module packaging will make it easier to pick up and place in the packaging after you replace the system processor module.

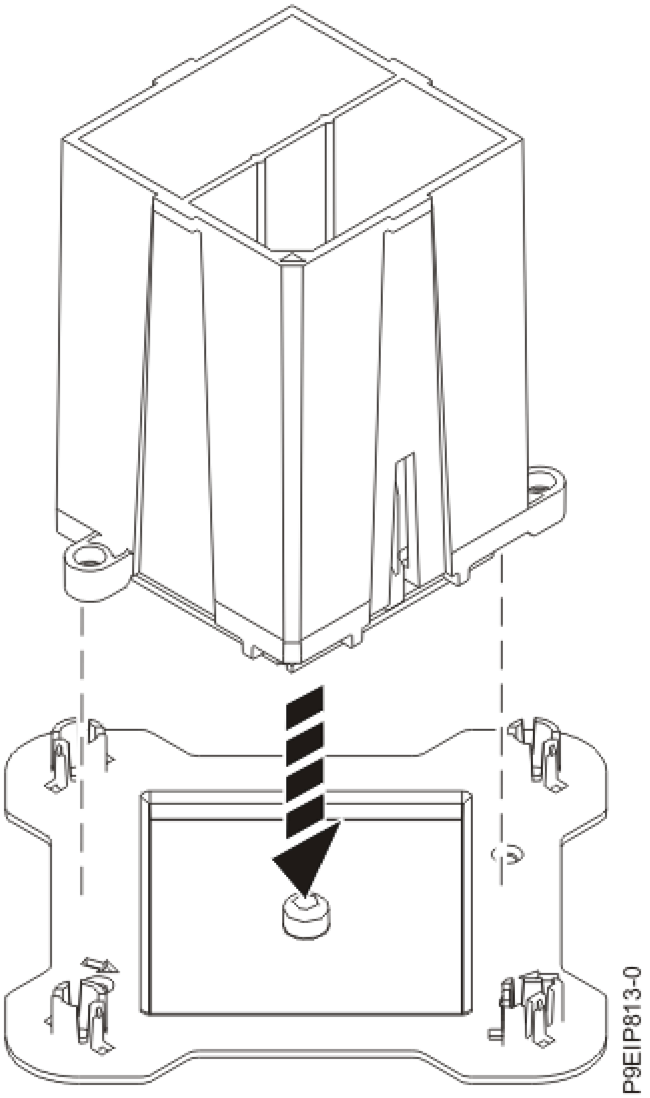

Figure 97. Placing the system processor module at an angle on the top cover of the packaging

13. Squeeze the two blue tabs to release the system processor module from the tool as shown in the following figure.

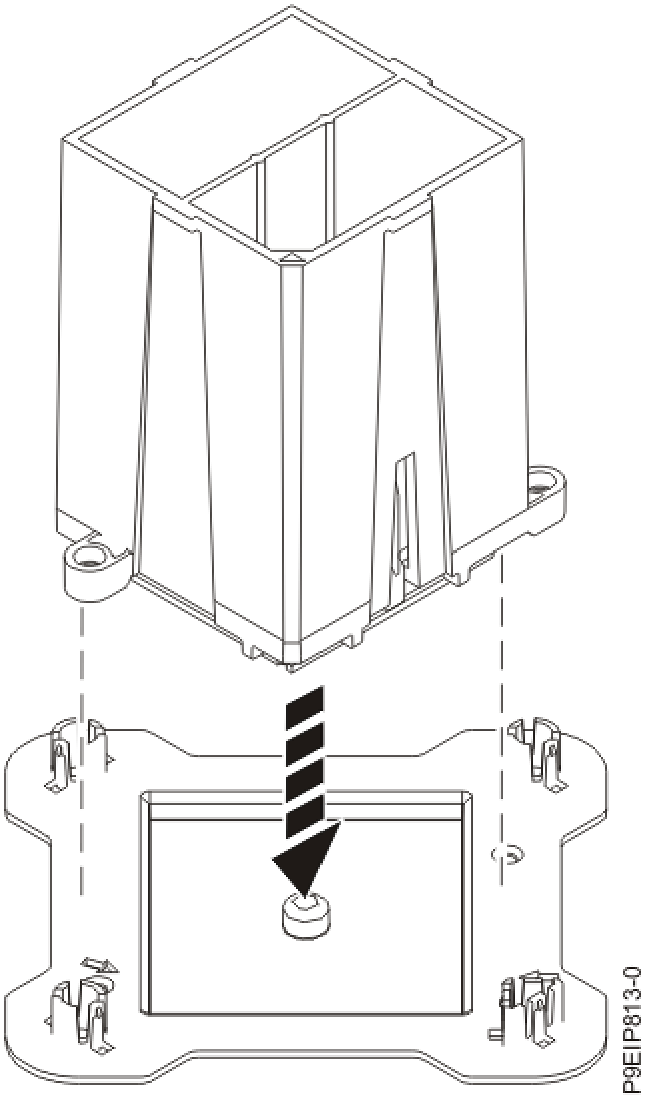

Figure 98. Releasing the system processor module from the tool

Replacing the system processor module in the 7063-CR2 system

To replace the system processor module in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Ensure that you have the electrostatic discharge (ESD) wrist strap on and that the ESD clip is plugged into a ground jack or connected to an unpainted metal surface. If not, do so now.
2. Inspect the system processor socket area and remove any dust or debris (use a can of compressed air).
3. Remove the replacement processor module from the shipping tray. Align the beveled corner **(A)** of the tool over the beveled corner of the module as shown in the following figure. Ensure that the guide **(B)** fits into the alignment pin **(C)**.

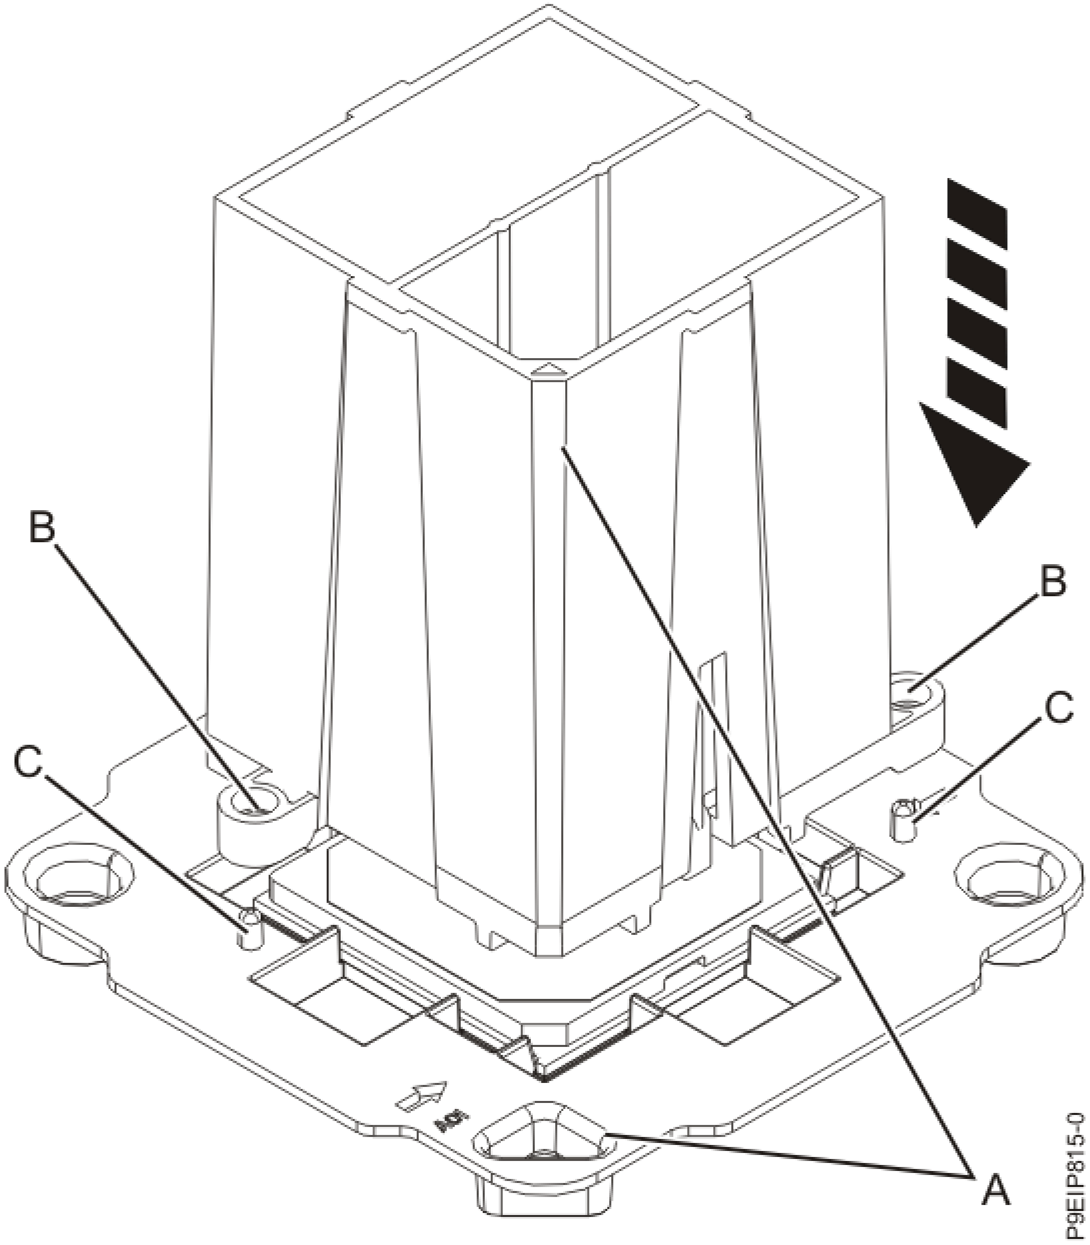

Figure 99. Aligning the removal tool

4. With the removal tool sitting on top of the system processor module, push down on the tool to lock the system processor module into the tool as shown in the following figure.

   The tool drops slightly when you push down on the system processor module so that the jaws can grab the bottom of the module. Make sure that both of the tool jaws are locked on the system processor module. Do not press the blue release tabs until directed to do so later.

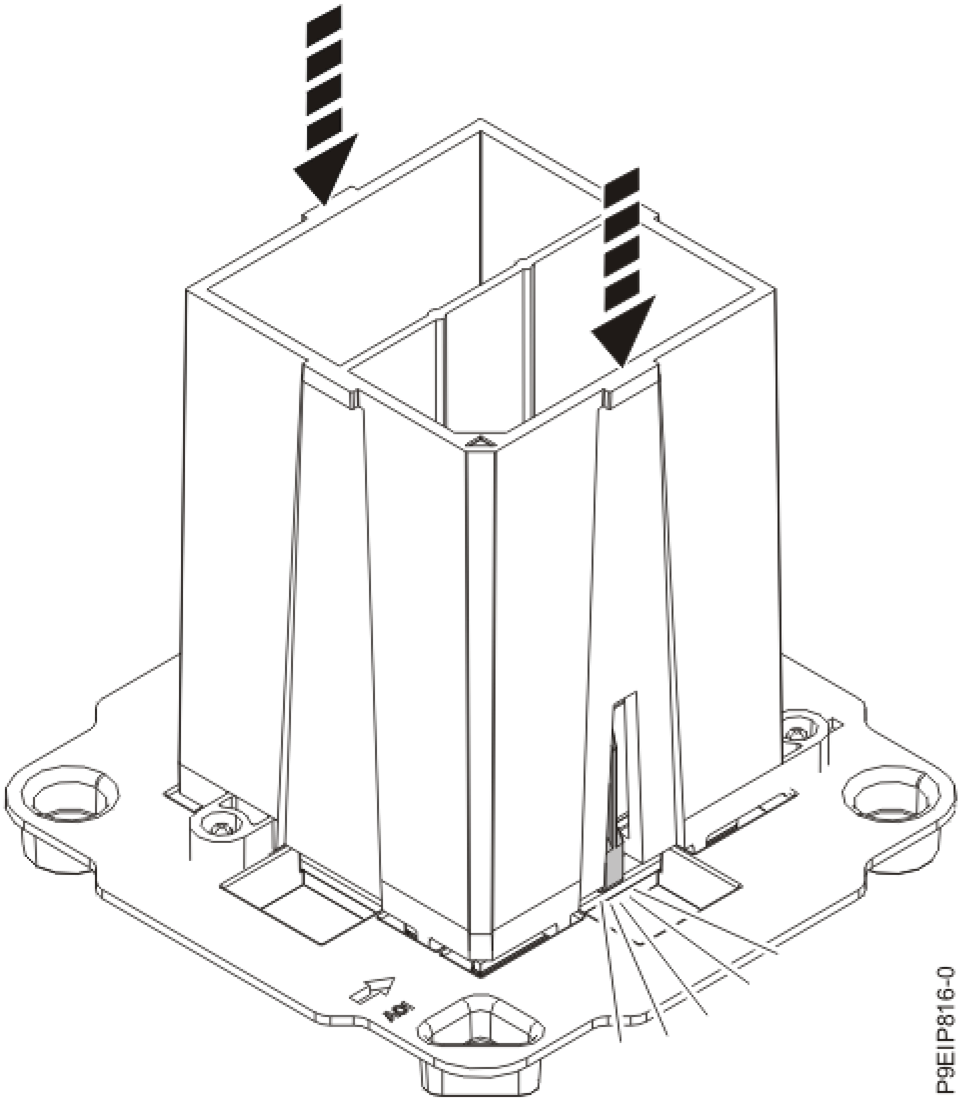

Figure 100. Locking the system processor module into the tool

5. Lift the system processor module from the packaging tray as shown in the following figure.

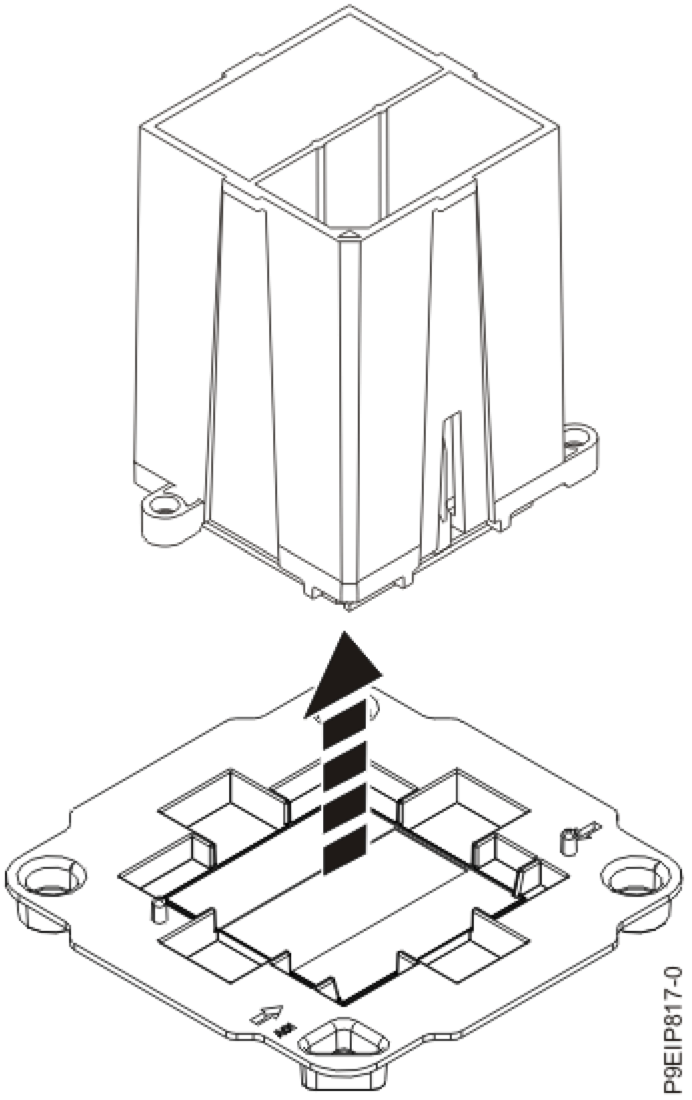

Figure 101. Lifting the system processor module from the packaging tray

6. Lower the tool and system processor module onto the socket. Align the beveled corner **(A)** of the tool with the beveled corner on the socket as shown in the following figure.

   Ensure that the two guide pins **(C)** are inserted into the alignment holes **(B)** on each side of the tool. Use care to lower the tool evenly without tilting the tool. Do not attempt to slide the tool and the system processor module in any direction while the system processor module is touching the socket. If the tool and the system processor module are not aligned with the guide pins, lift the tool and the system processor module and reposition them.

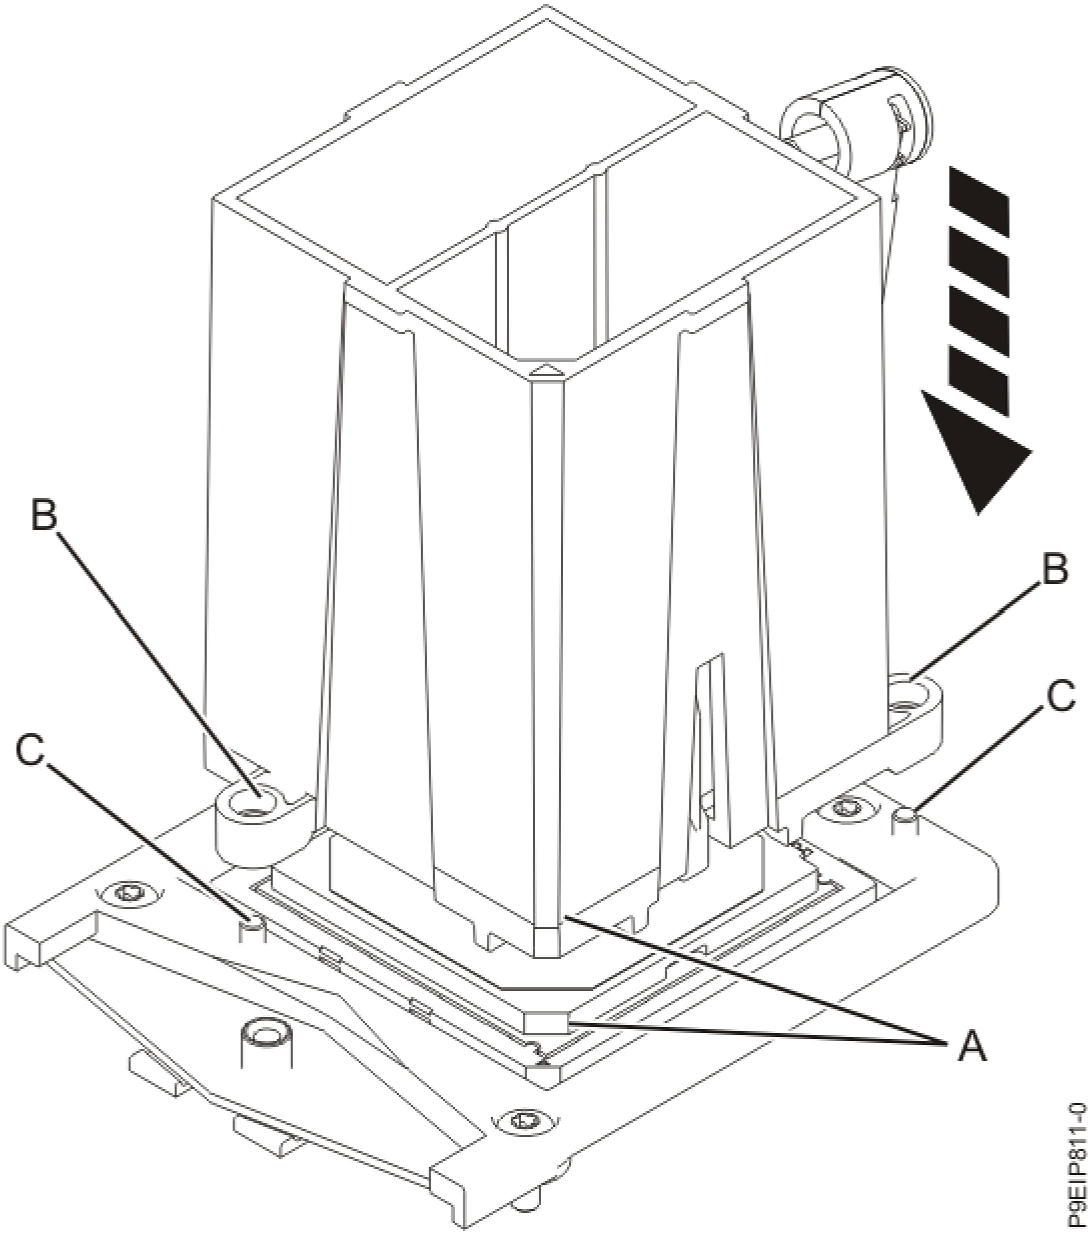

Figure 102. Installing the system processor module

7. After the tool and system processor module holes and guide pins are properly aligned, squeeze and hold the two blue release tabs **(A)** together until a firm stop is reached as shown in the following figure.

   Then, lift the tool off the system processor module.

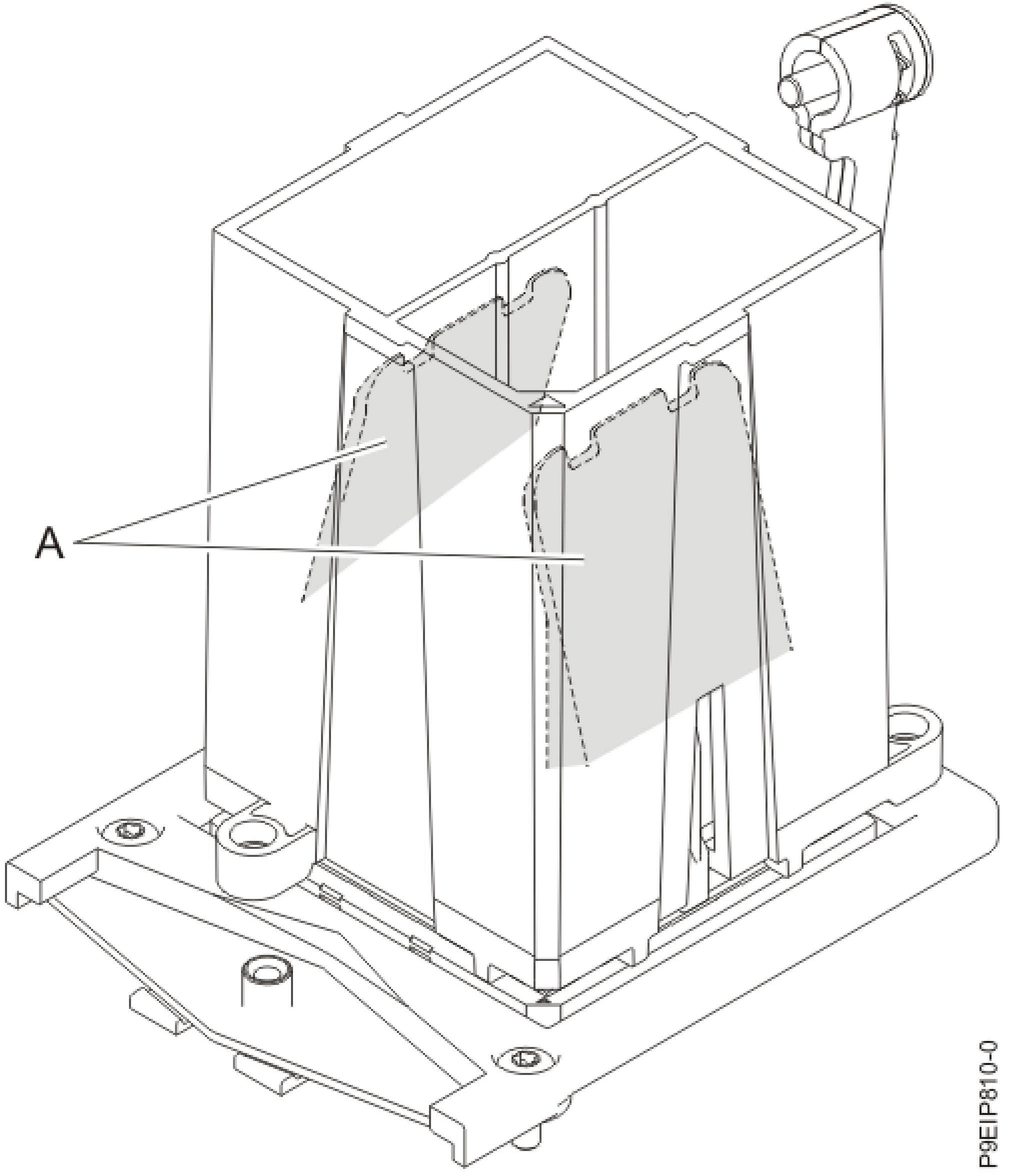

Figure 103. Removing the system processor module tool

8. Inspect the thermal interface material (TIM) for visible signs of damage. If you see folds, tears, bends, or if you have doubts about the TIM, replace it.

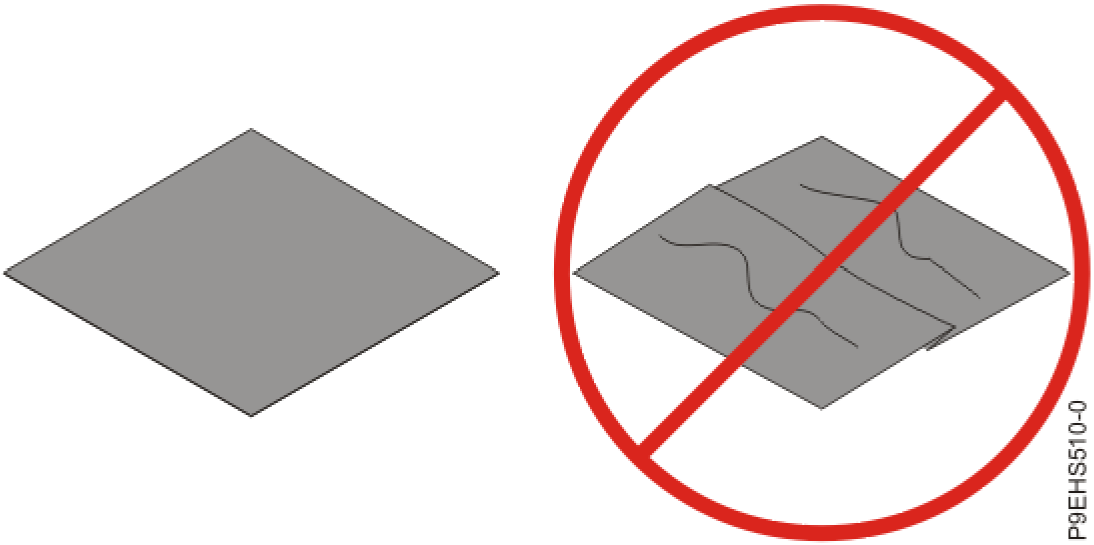

Figure 104. Inspecting the thermal interface material

9. Choose one of the following repair options:

Option	Description
Is the TIM damaged?	It is damaged. Proceed to step "10" on page 82 to replace the TIM and install the existing heat sink.
Is the TIM OK?	It is not damaged and can be reused. Proceed to step "12" on page 82 to reuse the TIM and install the existing heat sink.

10. Use this step to install a new TIM and reuse the existing heat sink.
    a) Open the TIM packaging and carefully remove the TIM, holding it by the edges of the carrier strip and holding it away from the shipping container.
    b) Remove the protective film from the clear carrier strip by using the supplied tweezers.

       Note: The TIM must remain flat. Small wrinkles are acceptable, but folds are not acceptable.
    c) Using the tweezers, remove the TIM from the carrier strip and center it onto the system processor module.

       The TIM has no preferred up side. The TIM can be placed on the system processor module and centered..
11. Continue with step "13" on page 82.
12. Use this step to reuse the existing undamaged TIM and heat sink.
    a) Using the tweezers, move the old TIM from the clean, dry surface and center it onto the new system processor module.

       The TIM has no preferred up side. The TIM can be placed on the system processor module and centered.
13. Carefully lower the heat sink over the system processor module, ensuring that the holes in the heat sink align with the two guide pins **(A)** on the socket, as shown in the following figure.

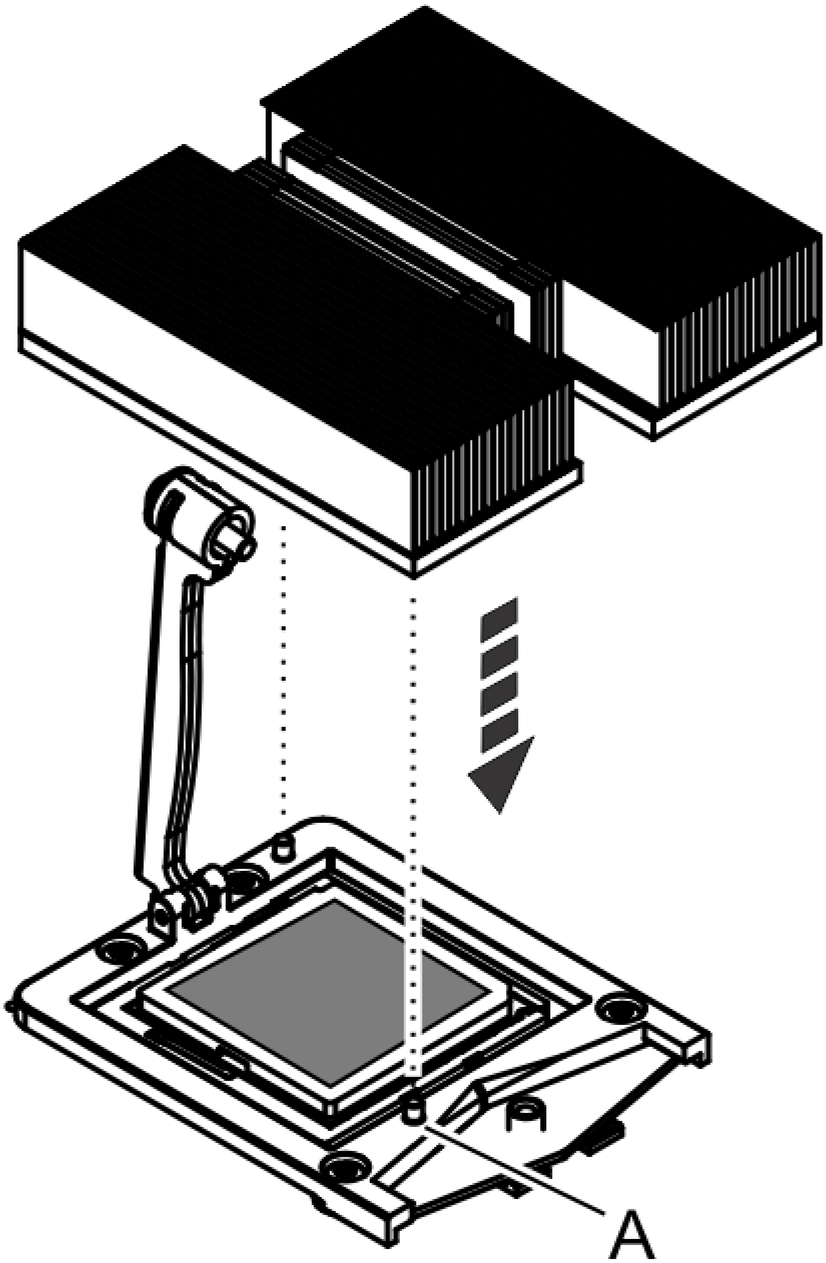

Figure 105. Installing the heat sink

14. Move the load arm **(A)** into position over the heat sink **(B)** and tighten the load arm screw with a T20 hexalobular driver, as shown in the following figure.

    Note: Do not over tighten the load arm screw.

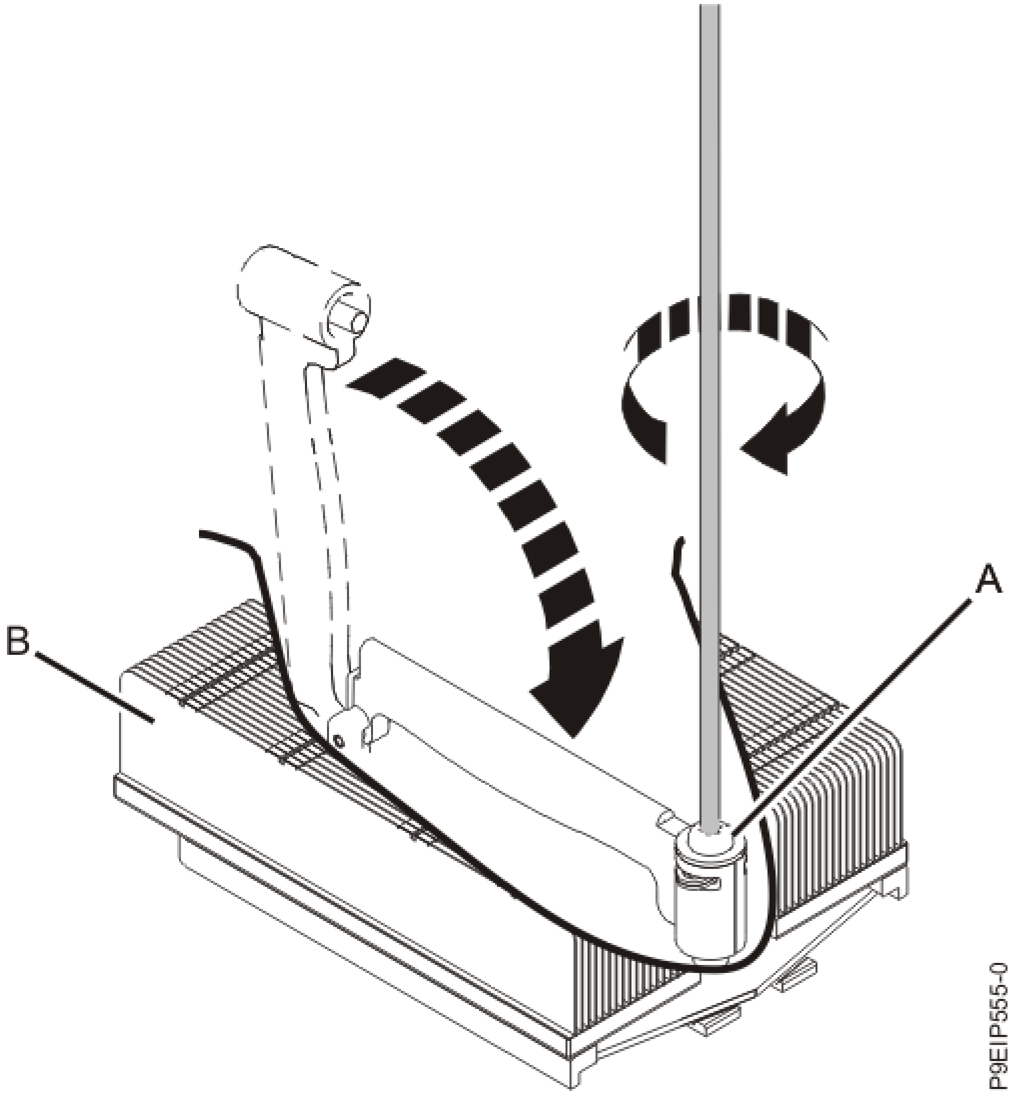

Figure 106. Tightening the load arm screw

15. Lightly grip the system processor module that you replaced by the edges and lift it off the shipping cover. Align the beveled corner of the module **(A)** to the corner of the tray with the triangle **(B)** and place it in the tray, as shown in the following figure.

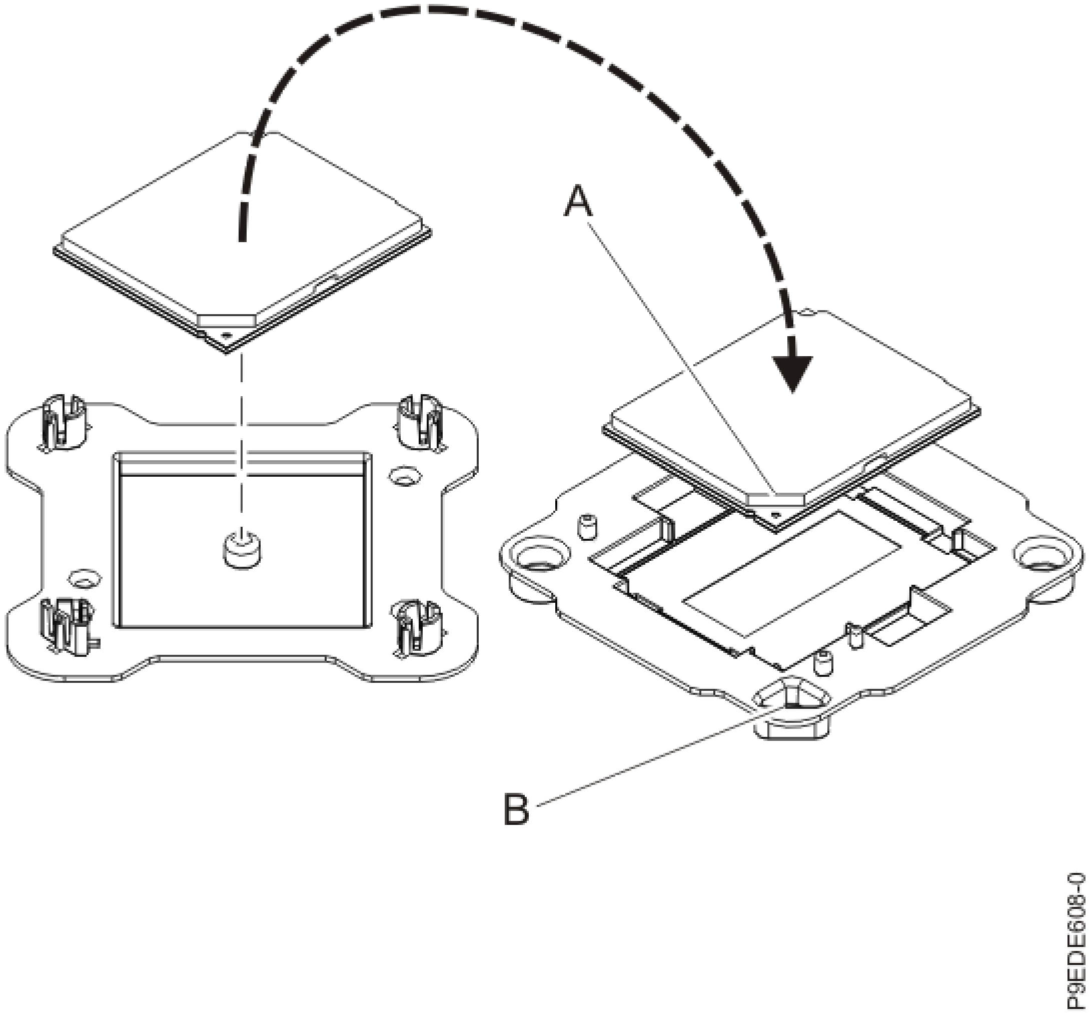

Figure 107. Placing the system processor module into the shipping tray

16. Replace the system backplane into the rear of the system.
    a) Ensure that the two system backplane levers are open.
    b) Support the system backplane by the bottom as you position the system backplane and insert it into the system until it is fully seated.

    Important:

    - Use care when you insert the system backplane so that no damage occurs to the components at the socket edge of the backplane.
    - Ensure that the system backplane is fully seated and is all the way into the system.
    - You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

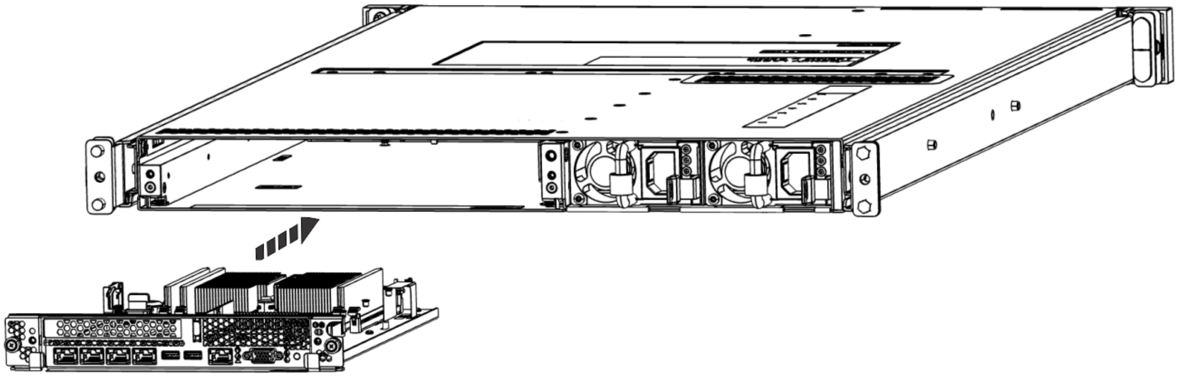

Figure 108. Replacing the system backplane

c) Simultaneously rotate the two levers on each side of the system backplane in to secure the system backplane to the system.

d) Tighten the two screws on the sides of the system backplane.

e) Using your labels, replace the signal cables into the rear of the system.

f) Using your labels, replace the two power cords at the rear of the system.

For instructions, see "Connecting the power cords to a 7063-CR2 system" on page 101.

17. Power on the system for operation.

For instructions, see "Starting the 7063-CR2 system " on page 98.

Removing and replacing the time-of-day battery in the 7063-CR2

To remove and replace the time-of-day battery in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Power off the system.

   For instructions, see "Stopping the 7063-CR2 system" on page 99.

2. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   ⚠ **Attention:**

   - Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
   - When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
   - If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.

3. Remove the system backplane from the rear of the system.

   a) Label and remove the two power cables.

   For instructions, see "Disconnecting the power cords from a 7063-CR2 system" on page 100.

   b) Label and remove the signal cables from the rear of the system.

   c) Loosen the two screws **(A)** on the sides of the system backplane as shown in the following figure.

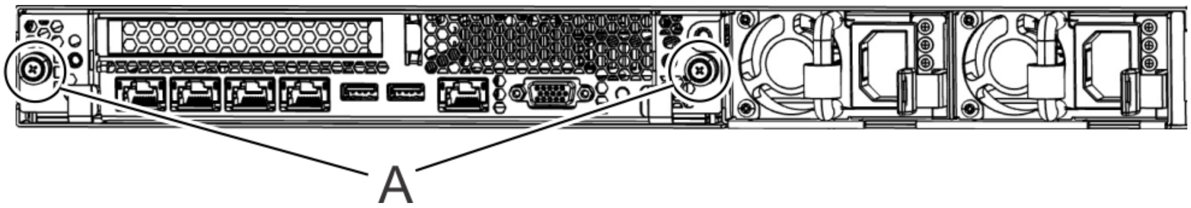

Figure 109. Removing the system backplane screws

d) Simultaneously rotate the two levers **(A)** on each side of the system backplane out and to the side to unlock the system backplane from the system.

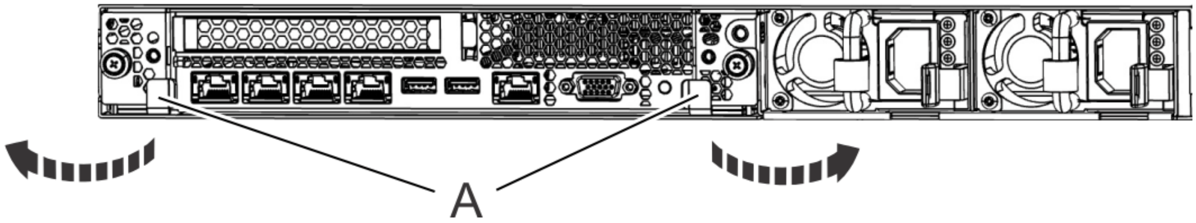

Figure 110. Unlatching the system backplane

e) Support the system backplane by the bottom as you slide it from the system.

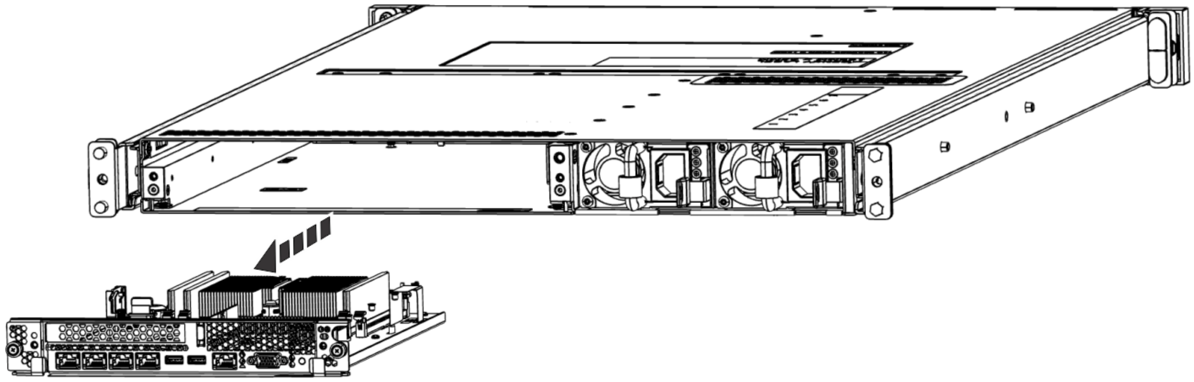

Figure 111. Removing the system backplane

f) Place the system backplane on an ESD surface.

Note: You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

4. Remove the time-of-day battery **(A)** by using your thumb to press the spring latch toward the back of the system to release the time-of-day battery. Lift the time-of-day battery from the battery socket.

   When you remove the time-of-day battery, do not use a metallic tool to disengage it from its slot.

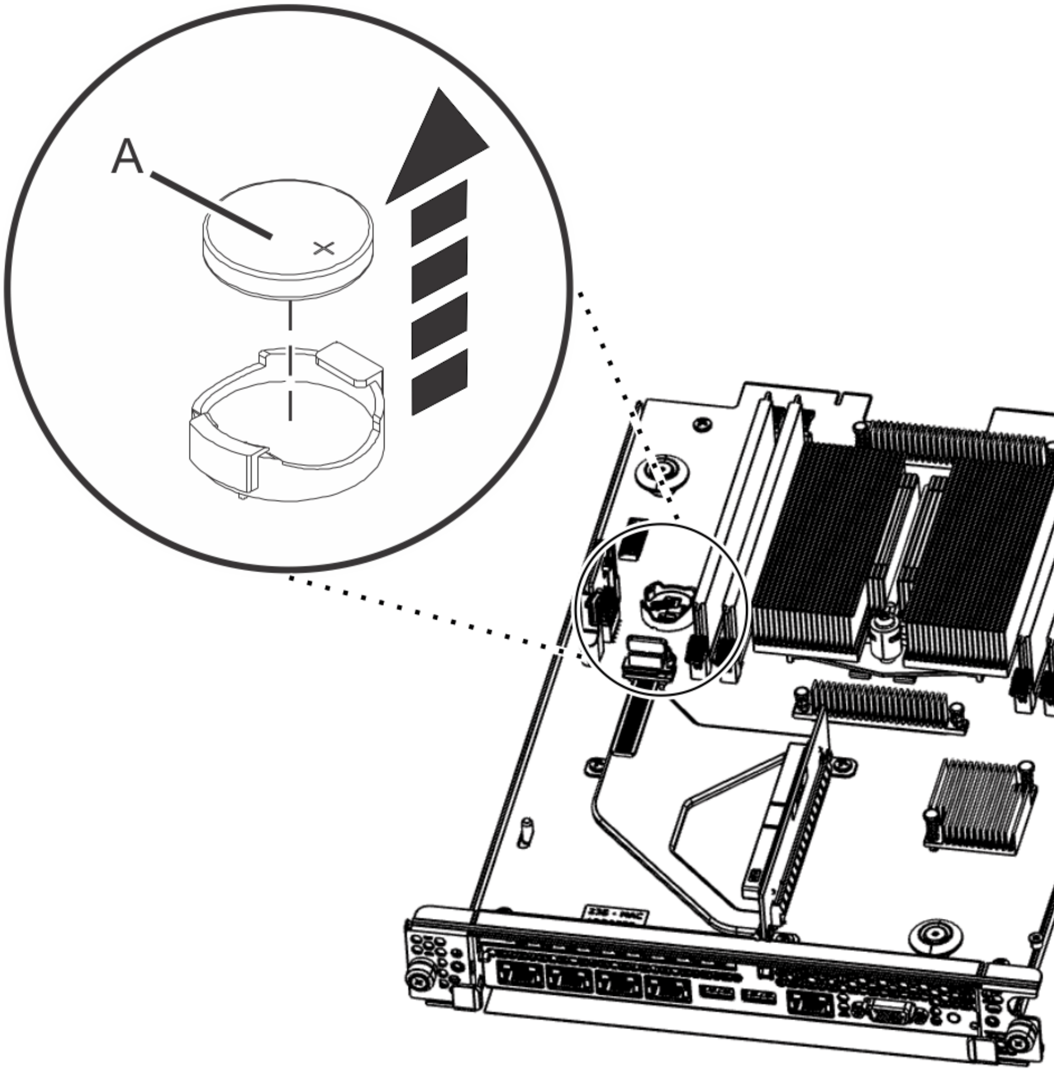

Figure 112. Removing the time-of-day battery

5. To replace the time-of-day battery, use your thumb to press the battery socket spring latch and replace the time-of-day battery.

   The orientation of the + of the battery is up.

6. Replace the system backplane into the rear of the system.

   a) Ensure that the two system backplane levers are open.

   b) Support the system backplane by the bottom as you position the system backplane and insert it into the system until it is fully seated.

      Important:

      - Use care when you insert the system backplane so that no damage occurs to the components at the socket edge of the backplane.
      - Ensure that the system backplane is fully seated and is all the way into the system.
      - You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

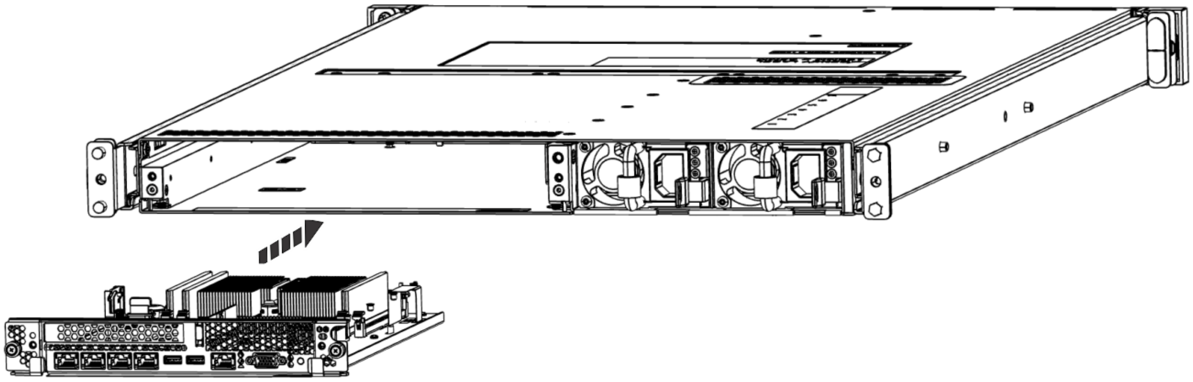

Figure 113. Replacing the system backplane

c) Simultaneously rotate the two levers on each side of the system backplane in to secure the system backplane to the system.

d) Tighten the two screws on the sides of the system backplane.

e) Using your labels, replace the signal cables into the rear of the system.

f) Using your labels, replace the two power cords at the rear of the system.

For instructions, see "Connecting the power cords to a 7063-CR2 system" on page 101.

7. The date and time needs to be set before the operating system starts to avoid issues.

   Follow these petitboot steps:

   a) From the petitboot menu, select **Exit to shell**.

   b) Run the following two commands to check the date and time:

```
date
ipmitool sel time get
```

   c) To set the correct date and time in UTC use the following format:

```
date -s YYYY.MM.DD-HH:MM
```

   d) Run the following ipmitool command to set the system entry log (SEL) date and time to the new values:

```
ipmitool sel time set now
```

   e) Verify that the ipmitool and date commands now show the correct values by running the following commands again:

```
date
ipmitool sel time get
```

   f) To leave the petitboot shell, type **exit**.

8. Power on the system for operation.

   For instructions, see "Starting the 7063-CR2 system " on page 98.

Removing and replacing the trusted platform module in the 7063-CR2

To remove and replace the trusted platform module in the IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Attach the electrostatic discharge (ESD) wrist strap.

The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

Attention:

- Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
- When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
- If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.

2. Remove the system backplane from the rear of the system.
   a) Label and remove the two power cables.

      For instructions, see "Disconnecting the power cords from a 7063-CR2 system" on page 100.
   b) Label and remove the signal cables from the rear of the system.
   c) Loosen the two screws **(A)** on the sides of the system backplane as shown in the following figure.

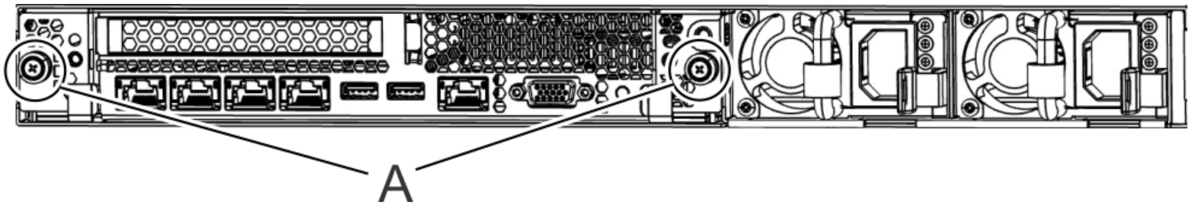

Figure 114. Removing the system backplane screws

   d) Simultaneously rotate the two levers **(A)** on each side of the system backplane out and to the side to unlock the system backplane from the system.

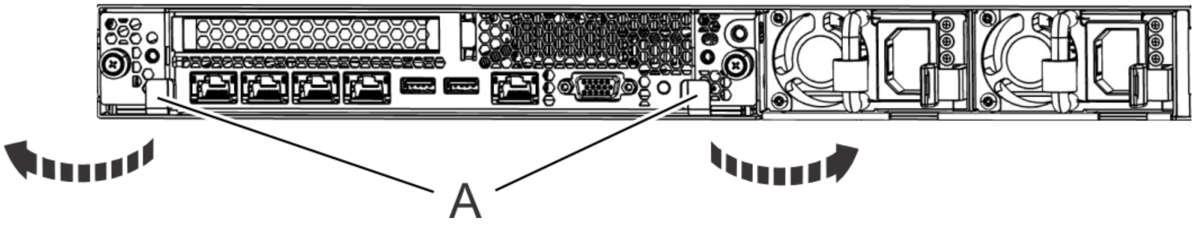

Figure 115. Unlatching the system backplane

   e) Support the system backplane by the bottom as you slide it from the system.

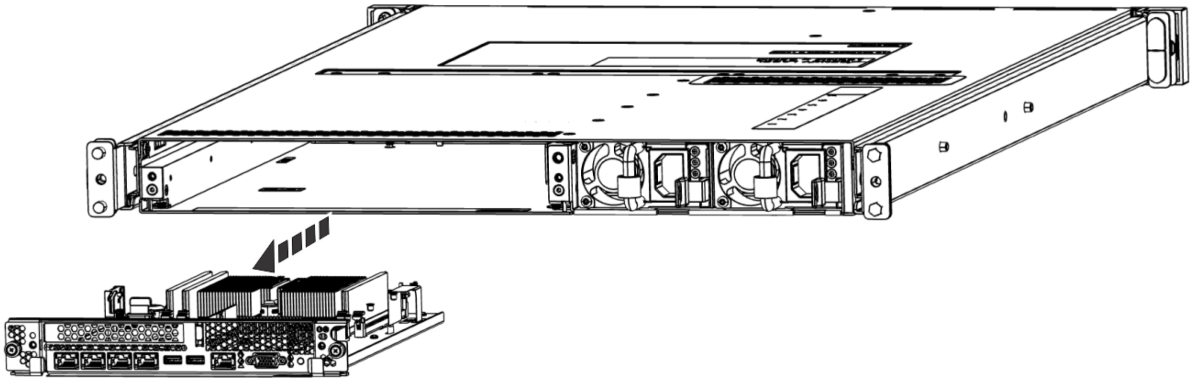

Figure 116. Removing the system backplane

f) Place the system backplane on an ESD surface.

Note: You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

3. Pull small the lever **(A)** slightly away from the trusted platform module to release the module and lift the module straight up from its slot on the system backplane.

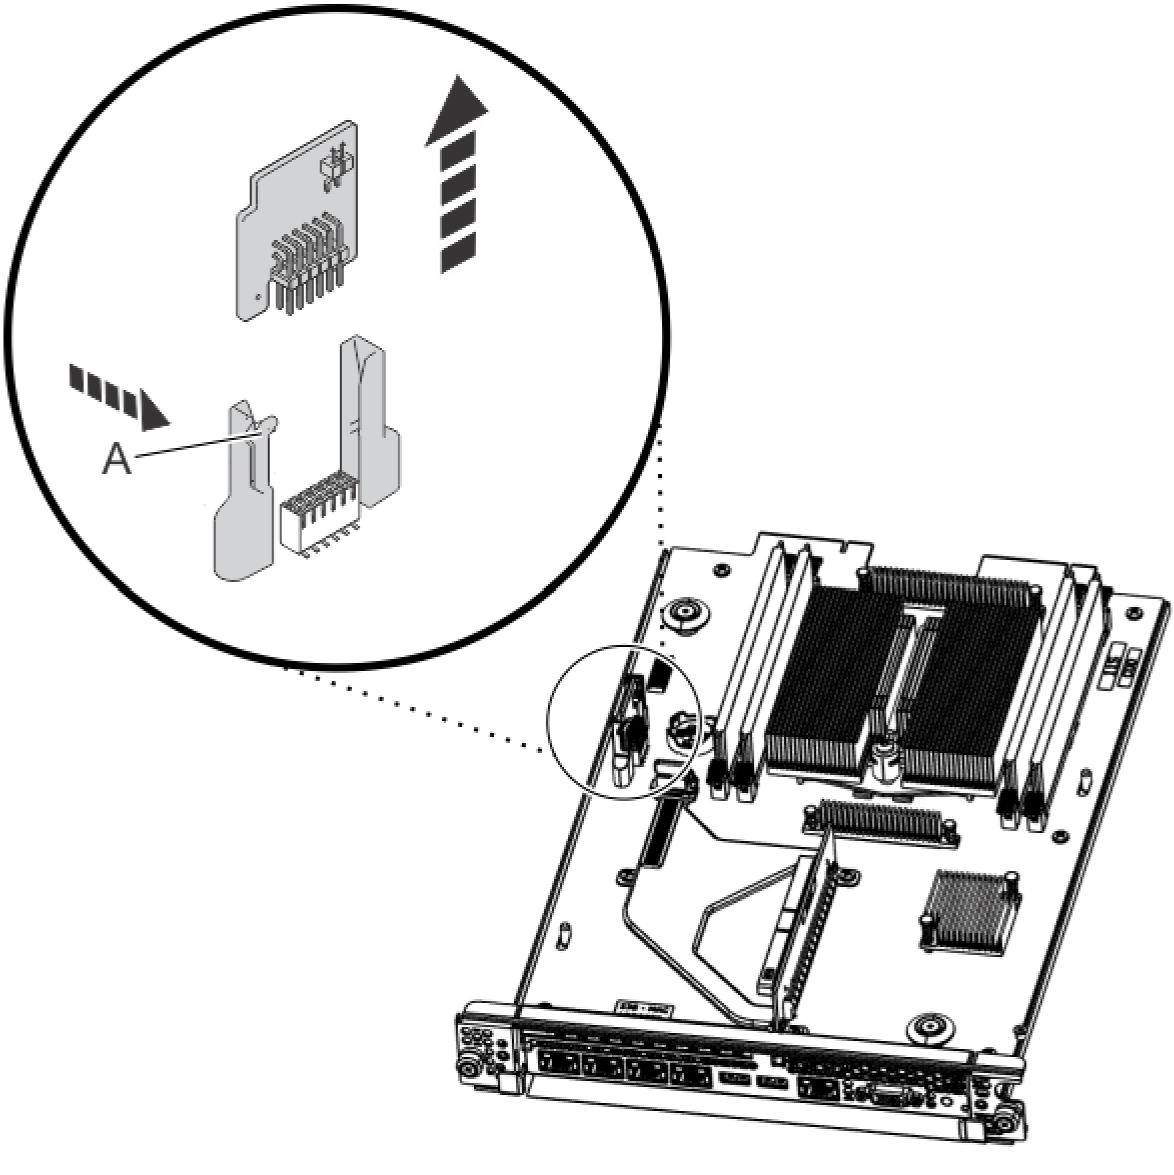

Figure 117. Removing the trusted platform module

4. Align the trusted platform module with the plastic guides and push the trusted platform module straight into the system backplane until it is fully seated and the lever **(A)** clicks into place.
5. Replace the system backplane into the rear of the system.

   a) Ensure that the two system backplane levers are open.

   b) Support the system backplane by the bottom as you position the system backplane and insert it into the system until it is fully seated.

   Important:

   - Use care when you insert the system backplane so that no damage occurs to the components at the socket edge of the backplane.

- Ensure that the system backplane is fully seated and is all the way into the system.
- You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

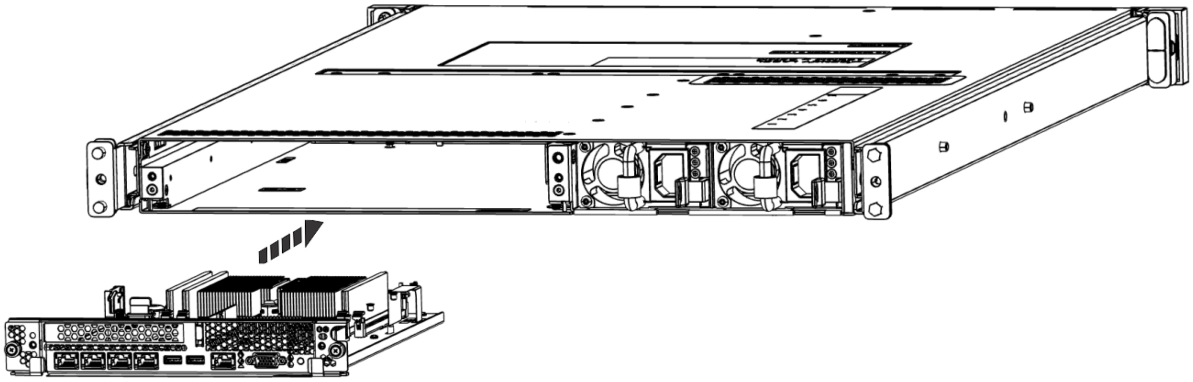

Figure 118. Replacing the system backplane

c) Simultaneously rotate the two levers on each side of the system backplane in to secure the system backplane to the system.

d) Tighten the two screws on the sides of the system backplane.

e) Using your labels, replace the signal cables into the rear of the system.

f) Using your labels, replace the two power cords at the rear of the system.

For instructions, see “Connecting the power cords to a 7063-CR2 system” on page 101.

6. If secure boot option is enabled before the replacement of the trusted platform module, then the user needs to re-enable the secure boot option by following the steps in Enabling secure boot on 7063-CR2 HMC.

Common procedures for servicing the 7063-CR2

Learn about the common procedures related to removing and replacing parts in the IBM Power Systems HMC (7063-CR2) system.

Before you begin

Observe these precautions when you are installing, removing, or replacing features and parts.

About this task

These precautions are intended to create a safe environment to service your system and do not provide steps for servicing your system. The installation, removal, and replacement procedures provide the step-by-step processes that are required to service your system.

DANGER: When working on or around the system, observe the following precautions:

Electrical voltage and current from power, telephone, and communication cables are hazardous. To avoid a shock hazard: If IBM supplied the power cord(s), connect power to this unit only with the IBM provided power cord. Do not use the IBM provided power cord for any other product. Do not open or service any power supply assembly. Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.

- The product might be equipped with multiple power cords. To remove all hazardous voltages, disconnect all power cords. For AC power, disconnect all power cords from their AC power source. For racks with a DC power distribution panel (PDP), disconnect the customer’s DC power source to the PDP.
- When connecting power to the product ensure all power cables are properly connected. For racks with AC power, connect all power cords to a properly wired and grounded electrical outlet. Ensure that the outlet supplies proper voltage and phase rotation according to the system rating plate. For racks with a DC power distribution panel (PDP), connect the customer’s DC power source to the PDP. Ensure that the proper polarity is used when attaching the DC power and DC power return wiring.
- Connect any equipment that will be attached to this product to properly wired outlets.
- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Do not attempt to switch on power to the machine until all possible unsafe conditions are corrected.
- When performing a machine inspection: Assume that an electrical safety hazard is present. Perform all continuity, grounding, and power checks specified during the subsystem installation procedures to ensure that the machine meets safety requirements. Do not attempt to switch power to the machine until all possible unsafe conditions are corrected. Before you open the device covers, unless instructed otherwise in the installation and configuration procedures: Disconnect the attached AC power cords, turn off the applicable circuit breakers located in the rack power distribution panel (PDP), and disconnect any telecommunications systems, networks, and modems.
- Connect and disconnect cables as described in the following procedures when installing, moving, or opening covers on this product or attached devices.

  To Disconnect: 1) Turn off everything (unless instructed otherwise). 2) For AC power, remove the power cords from the outlets. 3) For racks with a DC power distribution panel (PDP), turn off the circuit breakers located in the PDP and remove the power from the Customer's DC power source. 4) Remove the signal cables from the connectors. 5) Remove all cables from the devices.

  To Connect: 1) Turn off everything (unless instructed otherwise). 2) Attach all cables to the devices. 3) Attach the signal cables to the connectors. 4) For AC power, attach the power cords to the outlets. 5)

For racks with a DC power distribution panel (PDP), restore the power from the Customer's DC power source and turn on the circuit breakers located in the PDP. 6) Turn on the devices.

- Sharp edges, corners and joints may be present in and around the system. Use care when handling equipment to avoid cuts, scrapes and pinching. (D005)

(R001 part 1 of 2):

DANGER: Observe the following precautions when working on or around your IT rack system:

- Heavy equipment–personal injury or equipment damage might result if mishandled.
- Always lower the leveling pads on the rack cabinet.
- Always install stabilizer brackets on the rack cabinet if provided, unless the earthquake option is to be installed.
- To avoid hazardous conditions due to uneven mechanical loading, always install the heaviest devices in the bottom of the rack cabinet. Always install servers and optional devices starting from the bottom of the rack cabinet.
- Rack-mounted devices are not to be used as shelves or work spaces. Do not place objects on top of rack-mounted devices. In addition, do not lean on rack mounted devices and do not use them to stabilize your body position (for example, when working from a ladder).
- Stability hazard:
  - The rack may tip over causing serious personal injury.
  - Before extending the rack to the installation position, read the installation instructions.
  - Do not put any load on the slide-rail mounted equipment mounted in the installation position.
  - Do not leave the slide-rail mounted equipment in the installation position.
- Each rack cabinet might have more than one power cord.
  - For AC powered racks, be sure to disconnect all power cords in the rack cabinet when directed to disconnect power during servicing.
  - For racks with a DC power distribution panel (PDP), turn off the circuit breaker that controls the power to the system unit(s), or disconnect the customer's DC power source, when directed to disconnect power during servicing.
- Connect all devices installed in a rack cabinet to power devices installed in the same rack cabinet. Do not plug a power cord from a device installed in one rack cabinet into a power device installed in a different rack cabinet.
- An electrical outlet that is not correctly wired could place hazardous voltage on the metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock. (R001 part 1 of 2)

(R001 part 2 of 2):

CAUTION:

- Do not install a unit in a rack where the internal rack ambient temperatures will exceed the manufacturer's recommended ambient temperature for all your rack-mounted devices.
- Do not install a unit in a rack where the air flow is compromised. Ensure that air flow is not blocked or reduced on any side, front, or back of a unit used for air flow through the unit.
- Consideration should be given to the connection of the equipment to the supply circuit so that overloading of the circuits does not compromise the supply wiring or overcurrent protection.

To provide the correct power connection to a rack, refer to the rating labels located on the equipment in the rack to determine the total power requirement of the supply circuit.

- *(For sliding drawers.)* Do not pull out or install any drawer or feature if the rack stabilizer brackets are not attached to the rack or if the rack is not bolted to the floor. Do not pull out more than one drawer at a time. The rack might become unstable if you pull out more than one drawer at a time.

- *(For fixed drawers.)* This drawer is a fixed drawer and must not be moved for servicing unless specified by the manufacturer. Attempting to move the drawer partially or completely out of the rack might cause the rack to become unstable or cause the drawer to fall out of the rack. (R001 part 2 of 2)

Procedure

1. If you are installing a new feature, ensure that you have the software that is required to support the new feature. See IBM Prerequisite.
2. If you are installing or replacing something that might put your data at risk, ensure, wherever possible, that you have a current backup of your system or logical partition (including operating systems, licensed programs, and data).
3. Review the installation or replacement procedure for the feature or part.
4. Note the significance of color on your system.

   Blue on a part of the hardware indicates a touch point where you can grip the hardware to remove it from or install it in the system, or open or close a latch.
5. Ensure that you have access to a medium flat-blade screwdriver, a Phillips screwdriver, and a pair of scissors.
6. If parts are incorrect, missing, or visibly damaged, do the following steps:
   - If you are replacing a part, contact the provider of your parts or next level of support.
   - If you are installing a feature, contact one of the following service organizations:
     - The provider of your parts or next level of support.
     - In the United States, the IBM Rochester Manufacturing Automated Information Line (R-MAIL) at 1-800-300-8751.

   In countries and regions outside of the United States, use the following website to locate your service and support telephone numbers:

   ```
   http://www.ibm.com/planetwide
   ```
7. If you encounter difficulties during the installation, contact your service provider, your IBM reseller, or your next level of support.
8. For thermal performance, ensure that the top cover is on when the system is running.

9. If you are installing new hardware in a logical partition, you need to understand and plan for the implications of partitioning your system. For information, see Logical Partitioning.

Identifying the 7063-CR2 system that contains the part to replace

Learn how to determine which system has the part you want to replace.

LEDs on the 7063-CR2 system

Use this information as a guide to the LEDs on the IBM Power Systems HMC (7063-CR2) system.

The LEDs indicate various system statuses. If the part does not have a problem indicator LED, you can use a troubleshooting program such as **`impitool`** to identify the issue.

The front control panel LEDs are shown in the following figure.

- The green LED **(6)** indicates the power status (on or off). The LED flashes when the BMC is at standby. The LED is solid when the system is running.
- The blue identify LED **(8)** identifies the system to be serviced.
- The amber LED **(7)** indicates a system fault.
- The fan LEDs **(1)** - **(5)** indicate an issue with the corresponding fan.

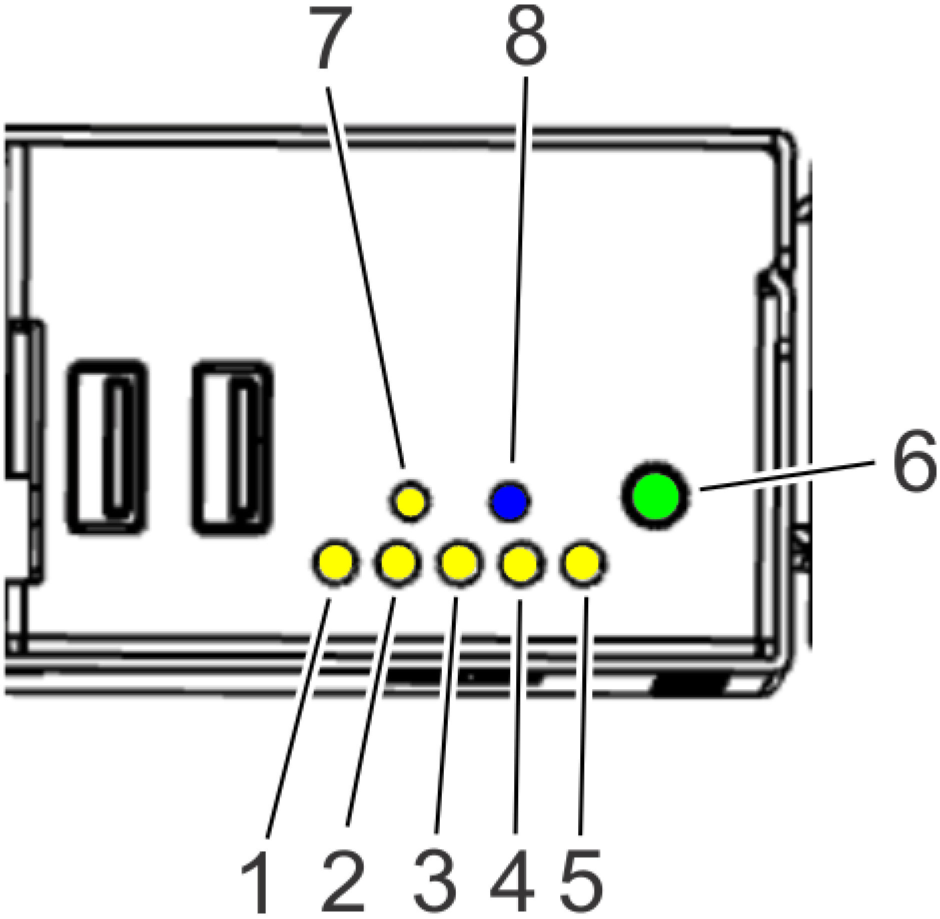

Figure 119. Control panel LEDs

The drive LEDs are shown in the following figure.

- The green LED indicates the power status (on or off).
- The amber LED flashes when there is activity.

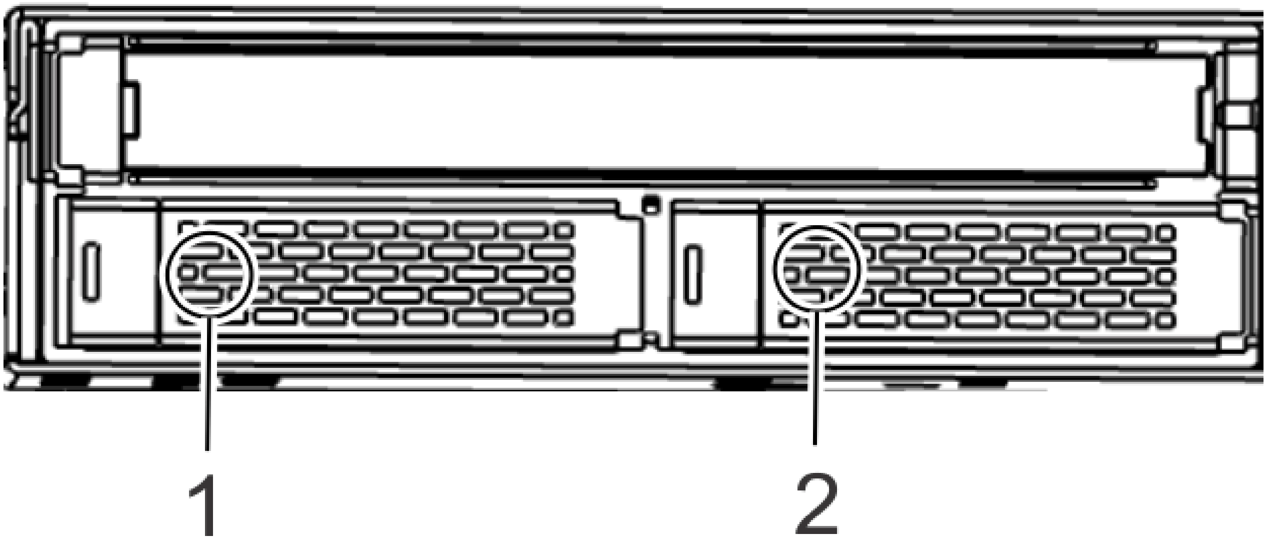

Figure 120. Drive LEDs

LEDs are also on the rear of the system; see the following figure.

- The blue identify LED **(1)** identifies the system to be serviced.
- The amber LED **(2)** indicates a system fault.

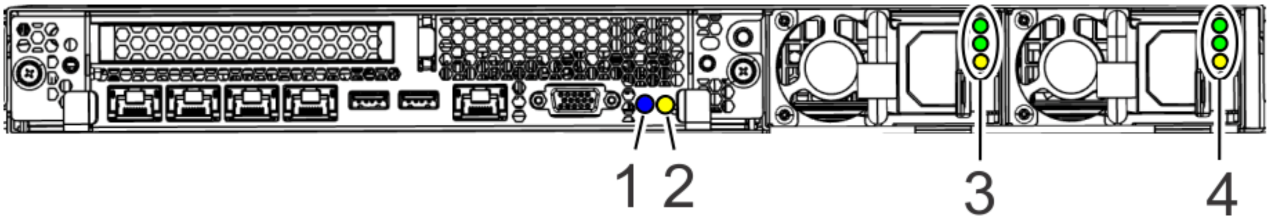

Figure 121. LEDs on the rear of the system

Power supply LEDs **(3)** and **(4)** can indicate the following states:

- The top green LED indicates AC power (on or off). The LED is solid during system standby.
- The middle green LED indicates DC power (on or off). The LED flashes during system standby.
- The bottom amber LED indicates a power fault.

Identifying the 7063-CR2 that needs servicing

Use the Intelligent Platform Management Interface (IPMI) program to turn on the blue identify LED to help you find the IBM Power Systems HMC (7063-CR2) system that needs servicing.

Procedure

You can use the following command to activate the blue system identify LED:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> chassis identify on
```

To turn off the blue system identify LED, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> chassis identify
off
```

To check the status of the blue system identify LED, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> chassis identify
status
```

Also visually check the LED.

Starting and stopping the 7063-CR2

Learn how to start and stop the IBM Power Systems HMC (7063-CR2) system to perform a service action or system upgrade.

Starting the 7063-CR2 system

You can use the power button to start the IBM Power Systems HMC (7063-CR2) systems.

About this task

⚠ **Attention:** For safety, airflow purposes and thermal performance, the service access cover must be installed and fully seated before you power on the system.

You can use this procedure to power on the system, or you can use a console and the IPMI tool to power on the system.

Procedure

1. Before you press the power button, ensure that the power supplies are connected to the system unit and that the power cables are connected to a power source.
2. Press the power button **(6)** shown in the following figure.

   The power-on light stops flashing and remains on, indicating that the system power is on.

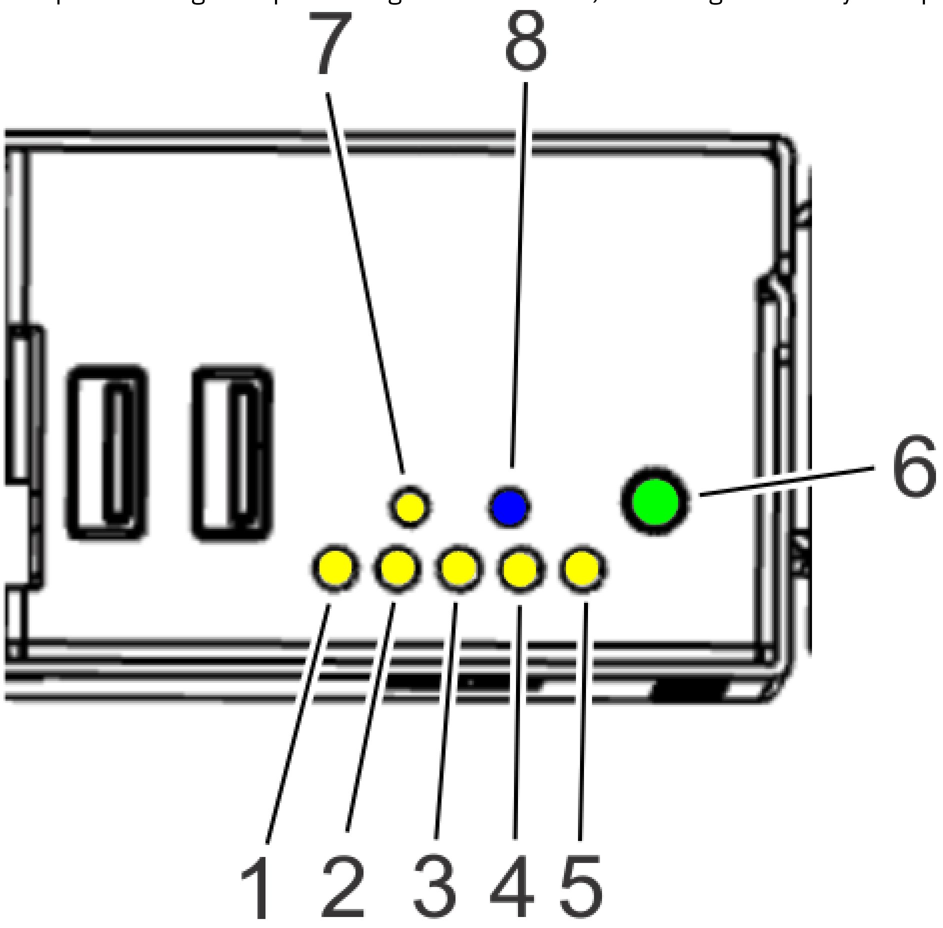

Figure 122. Power switch for the 7063-CR2 system

What to do next

If you press the power button and the system does not start, contact your next level of support or your service provider.

Stopping the 7063-CR2 system

To stop the IBM Power Systems HMC (7063-CR2) systems, complete the steps in this procedure.

Procedure

You can use the **`hmcshutdown`** command to stop and power down the system.

For example, the following command shuts down the system now.

```
hmcshutdown -t now
```

Drive commands for the 7063-CR2 system

Learn about the drive commands for the IBM Power Systems HMC (7063-CR2) system.

The system uses the `arcconf` command. The command is included in Petitboot. In Petitboot shell, run the command including the `bin` folder; for example:

```
/bin/arcconf
```

When you run the `arcconf` command from the operating system, you must be logged in as root.

To list the drive and device configurations, use the following `arcconf` command.

```
arcconf getconfig 1 pd
```

Note the Channel and Device numbers of the desired drive. In the following example, the channel number is 0 and the device number is 1.

```
Reported Channel,Device(T:L)       : 0,1(1:0)
```

Identify the fault LED on the drive using the following command. The command uses the Channel and Device numbers from the **`arcconf getconfig`** command:

```
arcconf identify 1 device 0 1
```

Take the drive off line. Run the following **`arcconf setstate`** command. The command uses the Channel and Device numbers from the **`arcconf getconfig`** command:

```
arcconf setstate 1 device 0 1 ddd
```

Creating the virtual drive on the 7063-CR2 system

Follow the steps in this procedure in the unlikely event that you need to re-create the virtual drive on the IBM Power Systems HMC (7063-CR2).

About this task

This procedure assumes that:

- The system was erroneously shipped without an already created and preinstalled virtual disk.
- The existing virtual disk is somehow damaged and needs to be re-created.

These are rare events.

CAUTION: This procedure results in loss of data. This procedure must be used only if the HMC operating system is either not installed, incorrectly installed, or corrupted.

To create the RAID1 logical drive and to rebuild the content on that drive, run the following commands from the Petitboot shell:

1. Create the RAID1 logical drive:

   ```
   /bin/arcconf create 1 logicaldrive name “HMC Disk” max 1 0,0 0,1
   ```

2. Display the logical drive to confirm that is was created:

   ```
   /bin/arcconf getconfig 1 ld
   ```

3. Enable the automatic rebuild of the logical drive:

   ```
   /bin/arcconf setcontrollerparam 1 spareactivationmode 1
   ```

If you need to remove the RAID1 logical drive:

```
/bin/arcconf delete 1 logicaldrive 0
```

Sensor status

You can check the sensor status to quickly determine the general health of the system without using the event codes.

To view the sensor status, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> fru status
```

To view the sensor status and any corresponding event codes, use the following command:

```
openbmctool -U <username> -P <password> -H <BMC IP address or BMC host name> fru status -v
```

Sensors that have a status of **present** and **functional** do not require a service action. Sensors that have a status of **present** and **not functional** require a service action.

Some occurrences of errors in the system might not appear in the sensor status. After you view the sensor status, look for event codes to determine whether a service action is required.

Removing and replacing power cords on a 7063-CR2 system

Learn how to disconnect and connect the power cords on IBM Power Systems HMC (7063-CR2) systems.

Disconnecting the power cords from a 7063-CR2 system

To disconnect the power cords from an IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Before you begin

Note: This system might be equipped with two or more power supplies. If the removing and replacing procedures require the power to be off, then ensure that all power sources to the system are disconnected.

Procedure

1. Identify the system unit that you are servicing in the rack.

   For instructions, see “Identifying the 7063-CR2 system that contains the part to replace” on page 96.
2. Unfasten the hook-and-loop fasteners from the power cords.

3. Label and disconnect the power cords from the system unit as shown in the following figure.

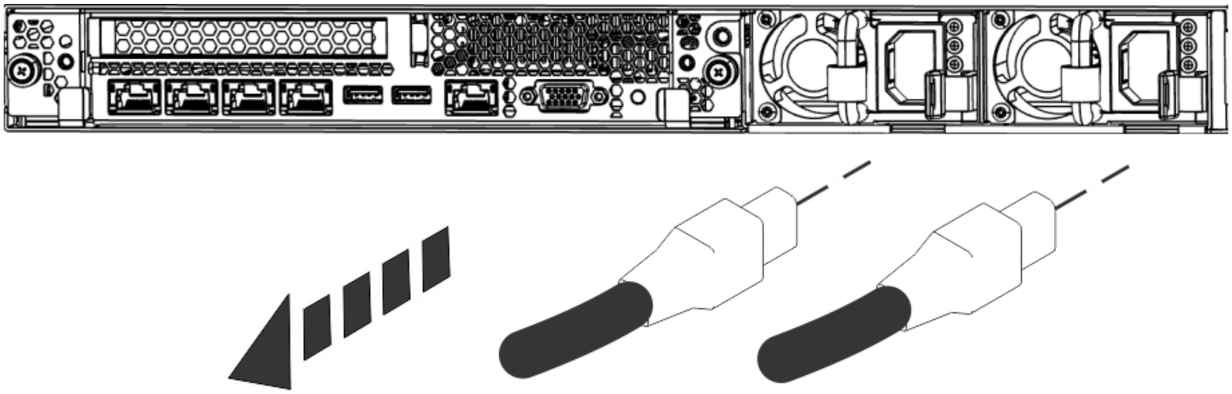

Figure 123. Removing the power cords from the system

Connecting the power cords to a 7063-CR2 system

To connect the power cords to an IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

Procedure

1. Using your labels, reconnect the power cords to the system unit as shown in the following figure.

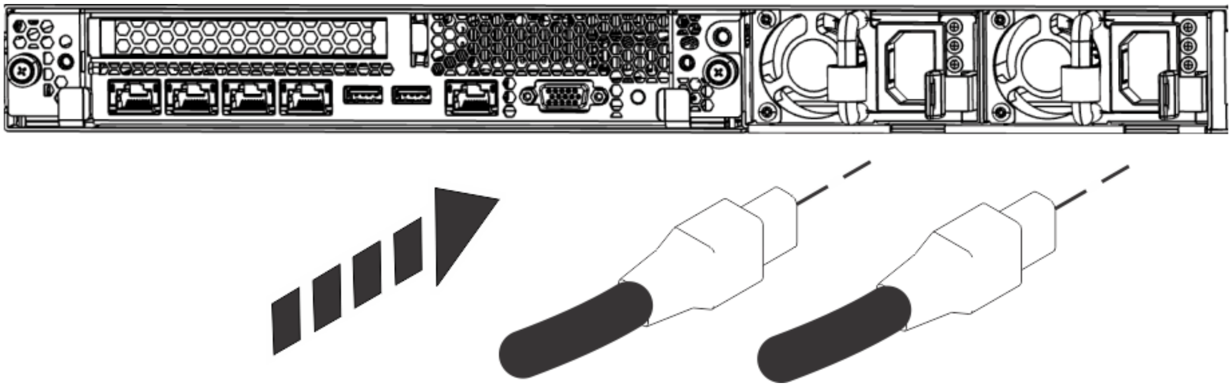

Figure 124. Connecting the power cords to the system

2. Fasten the hook-and-loop fasteners to secure the power cords.

Service and operating positions for the 7063-CR2 system

Learn how to place an IBM Power Systems HMC (7063-CR2) system into the service or operating position.

Placing a 7063-CR2 system into the service position

To place an IBM Power Systems HMC (7063-CR2) system into the service position, complete the steps in this procedure.

Before you begin

The systems must be removed from the rails for servicing some internal parts.

⚠ **CAUTION:** This part or unit is heavy but has a weight smaller than 18 kg (39.7 lb). Use care when lifting, removing, or installing this part or unit. (C008)

Note: When you move a system out of a rack, ensure that all stability plates are firmly installed to prevent the rack from toppling. Slide only one system out at a time.

Procedure

1. Label and remove the two power cords from the rear of the system.

   For instructions, see "Disconnecting the power cords from a 7063-CR2 system" on page 100.
2. Label and remove all cables from the rear of the system.
3. Lighten the system by removing the two power supplies.

   For instructions, see "Removing a power supply from the 7063-CR2 system" on page 51.
4. Lighten the system by removing the system backplane from the rear of the system.

   a) Label and remove the signal cables from the rear of the system.

   b) Loosen the two screws **(A)** on the sides of the system backplane as shown in the following figure.

   
   Figure 125. Removing the system backplane screws

   c) Simultaneously rotate the two levers **(A)** on each side of the system backplane out and to the side to unlock the system backplane from the system.

   
   Figure 126. Unlatching the system backplane

   d) Support the system backplane by the bottom as you slide it from the system.

   
   Figure 127. Removing the system backplane

   e) Place the system backplane on an ESD surface.

   Note: You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.
5. Remove the front screws that secure the system to the rack from both sides of the system as shown in the following figure.

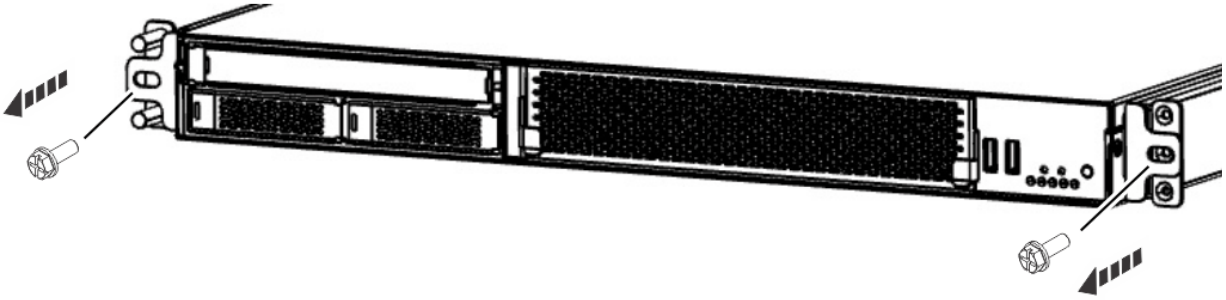

Figure 128. Removing the front screws

6. From the rear of the system, push the system forwards approximately 5 cm (2 in).
7. From the front of the system, while you support the system from underneath, slide the system out of the rack.

   Be careful when removing the system. The rails have no intermediate stopping point. Be sure to support the system from underneath.
8. Carefully set the system on a table with an appropriate ESD surface.

Placing a 7063-CR2 system into the operating position

To place an IBM Power Systems HMC (7063-CR2) system into the operating position, complete the steps in this procedure.

About this task

⚠ **CAUTION:** This part or unit is heavy but has a weight smaller than 18 kg (39.7 lb). Use care when lifting, removing, or installing this part or unit. (C008)

Procedure

1. Lift the system from the table.
2. Align the rails on each side of the system with the rack slide rails.
3. Push the system into the rack.
4. Fasten the two front screws to secure the system to the rack.

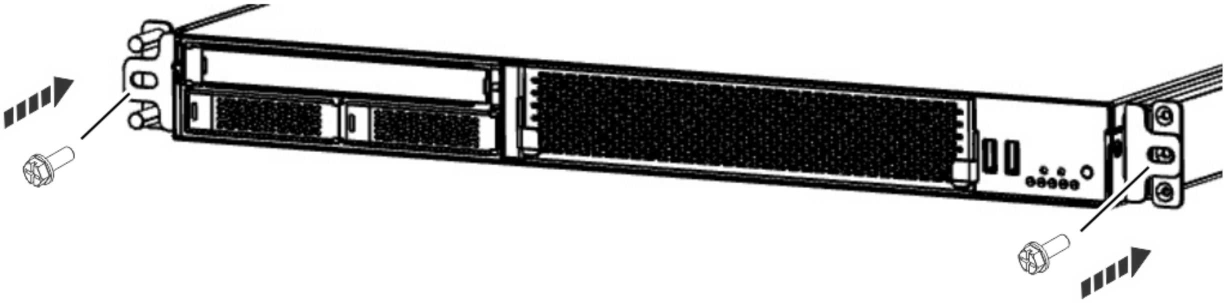

Figure 129. Replacing the front screws

5. If you removed the two power supplies, replace them.

   For instructions, see "Replacing a power supply in the 7063-CR2 system" on page 52.
6. If you removed the system backplane, replace it.
   a) Ensure that the two system backplane levers are open.
   b) Support the system backplane by the bottom as you position the system backplane and insert it into the system until it is fully seated.

      Important:

- Use care when you insert the system backplane so that no damage occurs to the components at the socket edge of the backplane.
- Ensure that the system backplane is fully seated and is all the way into the system.
- You must remove and replace the system backplane at a flat angle. The ventilation holes in the top cover can come into contact with the DIMMs in the system backplane if the insertion of the backplane is at an angle or is rushed. As a result of possible contact, DIMMs can be scratched and can leave residue on the top cover.

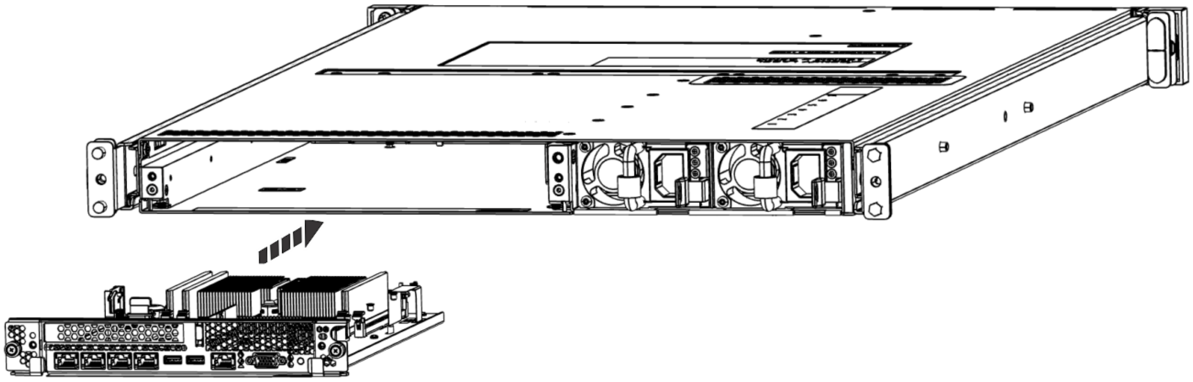

Figure 130. Replacing the system backplane

c) Simultaneously rotate the two levers on each side of the system backplane in to secure the system backplane to the system.

d) Tighten the two screws on the sides of the system backplane.

e) Using your labels, replace the signal cables into the rear of the system.

7. Using your labels, reconnect the cables at the rear of the system unit.
8. Using your labels, replace the two power cords at the rear of the system.

   For instructions, see "Connecting the power cords to a 7063-CR2 system" on page 101.

Removing and replacing covers on a 7063-CR2 system

Learn how to remove and replace the covers on an IBM Power Systems HMC (7063-CR2) system so that you can access the hardware parts or service the system.

Removing the service access cover from a 7063-CR2 system

To remove the service access cover from an IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

About this task

⚠ **Attention:** For safety, airflow purposes and thermal performance, the service access cover must be installed and fully seated before you power on the system.

Procedure

1. **If the system is not already powered off and in the service position**, complete these steps: "Placing a 7063-CR2 system into the service position" on page 101
2. Attach the electrostatic discharge (ESD) wrist strap.

   The ESD wrist strap must be connected to an unpainted metal surface until the service procedure is completed, and if applicable, until the service access cover is replaced.

   ⚠ **Attention:**

- Attach an electrostatic discharge (ESD) wrist strap to the front ESD jack, to the rear ESD jack, or to an unpainted metal surface of your hardware to prevent the electrostatic discharge from damaging your hardware.
- When you use an ESD wrist strap, follow all electrical safety procedures. An ESD wrist strap is used for static control. It does not increase or decrease your risk of receiving electric shock when using or working on electrical equipment.
- If you do not have an ESD wrist strap, just prior to removing the product from ESD packaging and installing or replacing hardware, touch an unpainted metal surface of the system for a minimum of 5 seconds. If at any point in this service process you move away from the system, it is important to again discharge yourself by touching an unpainted metal surface for at least 5 seconds before you continue with the service process.

3. Ensure that you removed both power cords from the system. For instructions, see "Disconnecting the power cords from a 7063-CR2 system" on page 100.
4. Remove the rails from both sides of the system.

   a) Remove the two screws that secure the rail to the front of the system.

   b) Slide the rail back and remove the rail from the support pins on side of the system.
5. Remove the 19 screws from the cover as shown in the following figure.

   The system has 4 screws on each side, and 11 screws on the top surface. Use a #2 Phillips screwdriver.

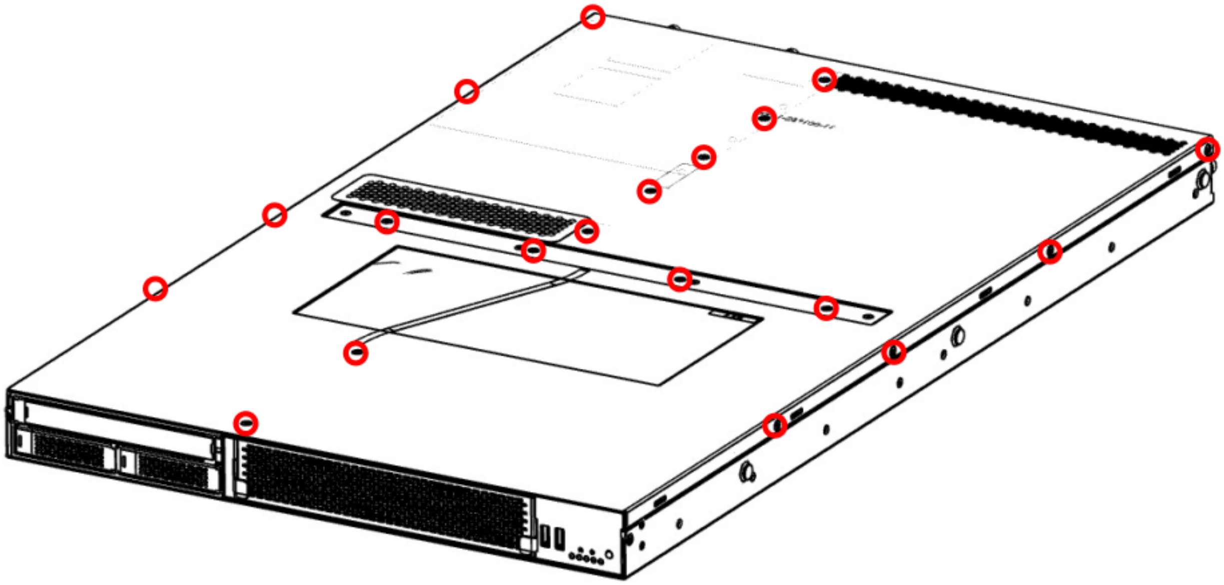

Figure 131. Removing the cover screws

6. Slide the cover to the rear and lift the cover from the system.

Installing the service access cover on a 7063-CR2 system

To install the service access cover on a rack-mounted IBM Power Systems HMC (7063-CR2) system, complete the steps in this procedure.

About this task

⚠ **Attention:** For safety, airflow purposes and thermal performance, the service access cover must be installed and fully seated before you power on the system.

Procedure

1. Ensure that you have the electrostatic discharge (ESD) wrist strap on and that the ESD clip is plugged into a ground jack or connected to an unpainted metal surface. If not, do so now.

2. Place the cover on the system. Align the pins inside the cover with the slots on the top of the chassis as shown in the following figure.

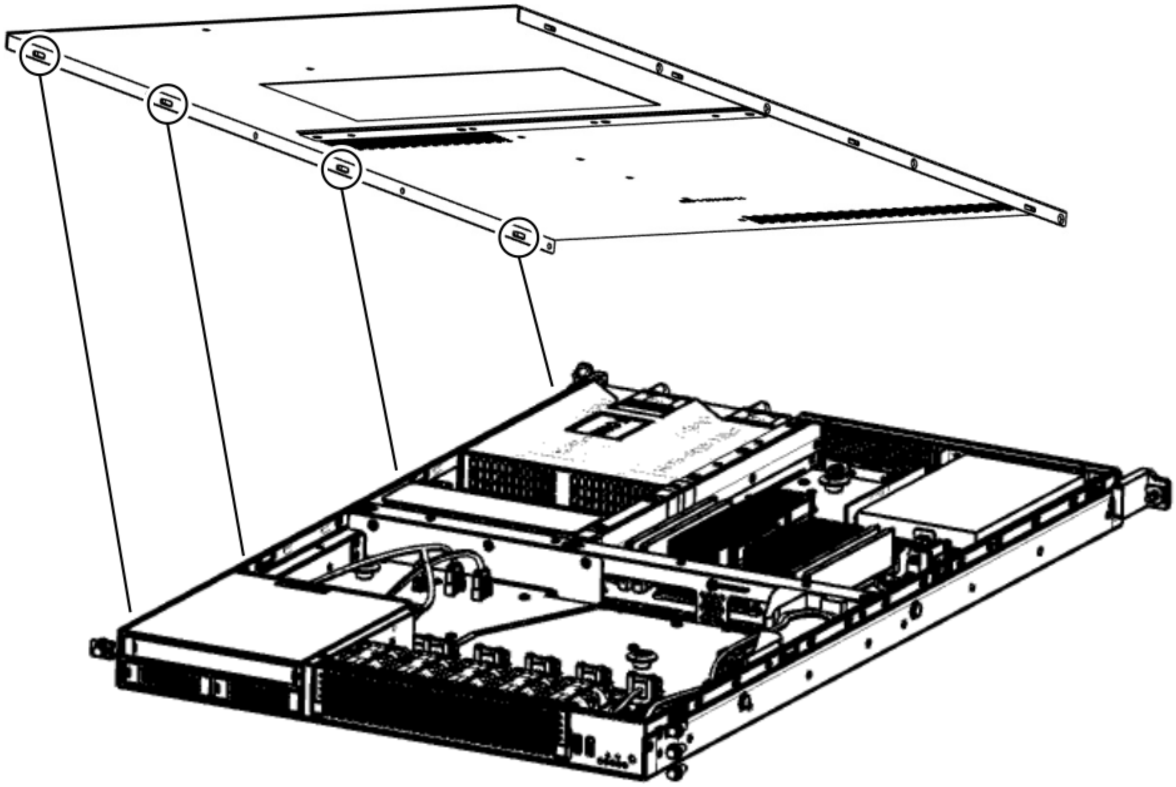

Figure 132. Replacing and securing the cover

3. Slide the cover forwards until it latches into place.
4. Replace the 19 screws to secure the cover as shown in the following figure.

   The system has 4 screws on each side, and 11 screws on the top surface. Use a #2 Phillips screwdriver.

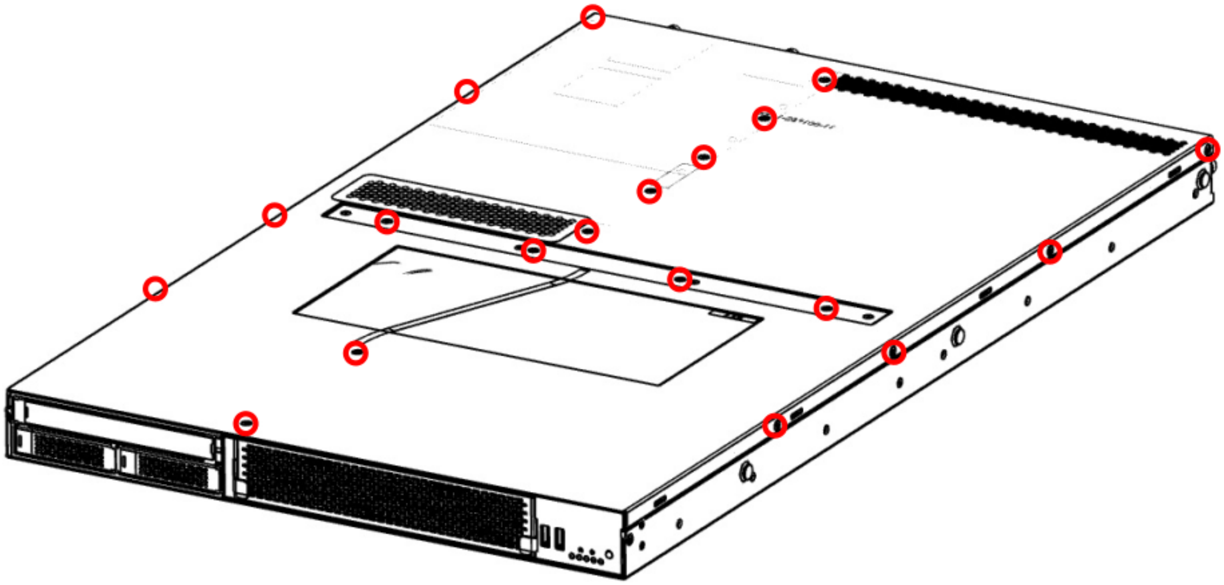

Figure 133. Replacing the cover screws

5. Replace the rails on both sides of the system.
   a) Attach the rail to the system by placing the rail over the three support pins on the side of the system. Ensure that each of the three support pins goes through the rail.

b) Slide the rail forwards onto the support pins.

c) Replace the two screws that secure the rail to the front of the system.

Notices

This information was developed for products and services offered in the US.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

Some jurisdictions do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM websites are provided for convenience only and do not in any manner serve as an endorsement of those websites. The materials at those websites are not part of the materials for this IBM product and use of those websites is at your own risk.

IBM may use or distribute any of the information you provide in any way it believes appropriate without incurring any obligation to you.

The performance data and client examples cited are presented for illustrative purposes only. Actual performance results may vary depending on specific configurations and operating conditions.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

All IBM prices shown are IBM's suggested retail prices, are current and are subject to change without notice. Dealer prices may vary.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to actual people or business enterprises is entirely coincidental.

If you are viewing this information in softcopy, the photographs and color illustrations may not appear.

The drawings and specifications contained herein shall not be reproduced in whole or in part without the written permission of IBM.

IBM has prepared this information for use with the specific machines indicated. IBM makes no representations that it is suitable for any other purpose.

IBM's computer systems contain mechanisms designed to reduce the possibility of undetected data corruption or loss. This risk, however, cannot be eliminated. Users who experience unplanned outages, system failures, power fluctuations or outages, or component failures must verify the accuracy of operations performed and data saved or transmitted by the system at or near the time of the outage or failure. In addition, users must establish procedures to ensure that there is independent data verification before relying on such data in sensitive or critical operations. Users should periodically check IBM's support websites for updated information and fixes applicable to the system and related software.

Homologation statement

This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Contact an IBM representative or reseller for any questions.

Accessibility features for IBM Power servers

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

Overview

The IBM Power servers include the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Power servers use the latest W3C Standard, WAI-ARIA 1.0 (www.w3.org/TR/wai-aria/), to ensure compliance with ICT Accessibility 508 Standards and 255 Guidelines (https://www.access-board.gov/ict/) and Web Content Accessibility Guidelines (WCAG) 2.0 (www.w3.org/TR/WCAG20/). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the IBM Power servers.

The IBM Power servers online product documentation in IBM Documentation is enabled for accessibility. For more information about IBM's commitment to accessibility, see the IBM accessibility website at IBM Accessibility (https://www.ibm.com/able/).

Keyboard navigation

This product uses standard navigation keys.

Interface information

The IBM Power servers user interfaces do not have content that flashes 2 - 55 times per second.

The IBM Power servers web user interface relies on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

The IBM Power servers web user interface includes WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

Vendor software

The IBM Power servers include certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service
800-IBM-3383 (800-426-3383)
(within North America)

For more information about the commitment that IBM has to accessibility, see IBM Accessibility (www.ibm.com/able).

Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as the customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at http://www.ibm.com/privacy and IBM's Online Privacy Statement at http://www.ibm.com/privacy/details the section entitled "Cookies, Web Beacons and Other Technologies" and the "IBM Software Products and Software-as-a-Service Privacy Statement" at http://www.ibm.com/software/info/product-privacy.

Trademarks

IBM, the IBM logo, and ibm.com are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information.

Electronic emission notices

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

Class A Notices

The following Class A statements apply to the IBM servers that contain the Power10 processor and its features unless designated as electromagnetic compatibility (EMC) Class B in the feature information.

When attaching a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices supplied with the monitor.

The following Class A statements apply to the servers.

Canada Notice

CAN ICES-3 (A)/NMB-3(A)

European Community and Morocco Notice

This product is in conformity with the protection requirements of Directive 2014/30/EU of the European Parliament and of the Council on the harmonization of the laws of the Member States relating to electromagnetic compatibility. IBM cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-IBM option cards.

This product may cause interference if used in residential areas. Such use must be avoided unless the user takes special measures to reduce electromagnetic emissions to prevent interference to the reception of radio and television broadcasts.

Warning: This equipment is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

Germany Notice

Deutschsprachiger EU Hinweis: Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit

Dieses Produkt entspricht den Schutzanforderungen der EU-Richtlinie 2014/30/EU zur Angleichung der Rechtsvorschriften über die elektromagnetische Verträglichkeit in den EU-Mitgliedsstaatenund hält die Grenzwerte der EN 55022 / EN 55032 Klasse A ein.

Um dieses sicherzustellen, sind die Geräte wie in den Handbüchern beschrieben zu installieren und zu betreiben. Des Weiteren dürfen auch nur von der IBM empfohlene Kabel angeschlossen werden. IBM übernimmt keine Verantwortung für die Einhaltung der Schutzanforderungen, wenn das Produkt ohne Zustimmung von IBM verändert bzw. wenn Erweiterungskomponenten von Fremdherstellern ohne Empfehlung von IBM gesteckt/eingebaut werden.

EN 55032 Klasse A Geräte müssen mit folgendem Warnhinweis versehen werden:

"Warnung: Dieses ist eine Einrichtung der Klasse A. Diese Einrichtung kann im Wohnbereich Funk-Störungen verursachen; in diesem Fall kann vom Betreiber verlangt werden, angemessene Maßnahmen zu ergreifen und dafür aufzukommen."

Deutschland: Einhaltung des Gesetzes über die elektromagnetische Verträglichkeit von Geräten

Dieses Produkt entspricht dem “Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG)“. Dies ist die Umsetzung der EU-Richtlinie 2014/30/EU in der Bundesrepublik Deutschland.

Zulassungsbescheinigung laut dem Deutschen Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) (bzw. der EMC Richtlinie 2014/30/EU) für Geräte der Klasse A

Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen.

Verantwortlich für die Einhaltung der EMV Vorschriften ist der Hersteller:

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Responsible Party:
International Business Machines Corporation
New Orchard Road
Armonk, NY 10504

United States Federal Communications Commission (FCC) Notice

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult an IBM-authorized dealer or service representative for help.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Proper cables and connectors are available from IBM-authorized dealers. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions:

(1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.
