

Get gen AI-driven insights that put you in control with IBM Concert

Simplify and optimize application management and technology operations with AI

The scale and complexity of tooling needed for managing and maintaining modern applications are overwhelming and can lead to operational inefficiency and exposure to vulnerabilities. But what if you could communicate directly with your applications using a chatbot to better understand their health status and take the actions needed to make them run better?

IBM® Concert® provides generative AI-powered insights that put you in control so you can simplify and optimize your operations—across your on-prem and hybrid cloud environments. Powered by IBM watsonx™, Concert uses generative AI to cut through the complexity of application management, enabling application owners and site reliability engineers to perform near real-time data and dependency mapping to proactively uncover and address operational challenges—and predict issues such as risk exposure.

By drawing data from various environments, applications and toolsets, Concert analyzes dependencies and connections to provide a 360-degree view of your application so you can generate outcome-driven business insights about risk, compliance, cost, security and more. Using a natural language interface and data visualization, you can easily drill down into the most pressing application issues with a list of relevant suggestions to improve your applications.

Gain full application visibility

Concert provides a 360-degree view of the entire application lifecycle to help you proactively identify critical IT challenges and opportunities across siloed environments, applications and toolsets.

Uncover actionable insights with generative AI

Concert integrates generative AI capabilities into your existing tools to help improve decision-making and enable continuous application optimization.

Manage and mitigate application risks

Concert ranks common vulnerabilities and exposures according to their impact on your application—including operational disruptions and the cascading effects of expired certificates—to enable focused and efficient risk mitigation.

Maintain application compliance

Concert helps prevent deviations from security and compliance standards by assessing the impact of development decisions on your application security and compliance requirements in near-real time.

With Concert, your IT teams can identify and understand issues through proactive gap discovery to uncover insights and prioritize the actions you need to take to improve business-critical applications—at the right time for the right outcome.

Take the next step in your application management journey with Concert.
