

Top 3 benefits of IBM WebSphere Automation

Increase the security observability and reduce operational complexity of your entire WebSphere estate.

Automated security detection and identification

Register your WebSphere servers for continuous security awareness with automated vulnerability identification, notification, and reporting.

Automated vulnerability remediation and tracking

Streamline and automate security resolution with asset tracking, vulnerability status, and compliance reporting – including APIs and webhooks for integration with other tools, like IBM Instana and ServiceNow.

Memory leak analysis and insights

Memory leak analysis and insights with manual invocation or, with Instana, automated detection and invocation.

Beyond your WebSphere estate, Instana software provides observability and optimization across all your application environments and infrastructure.
