Explanation: A batch program attempted to perform the function *FUNC* against the VSAM file *FILE*, but the attempt failed. The I/O request is from module *MODULE*.

System action: The job is terminated.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log for I/O errors that immediately precede this message. This message usually comes with another error message that describes the error in more detail. If you cannot fix the problem, contact IBM Software Support.

User response: Contact your system programmer.

EQQ0955E FUNC REQUESTED FOR FILE FILE WHICH IS NOT OPEN CALLING MODULE IS MODULE

Explanation: A batch program attempted to perform the function *FUNC* against the file *FILE*, but the file had not been opened. The I/O request is from module *MODULE*.

System action: The job is terminated.

System programmer response: Review the IBM Tivoli

Workload Scheduler for z/OS message log for I/O errors that immediately precede this message. If you cannot fix the problem, contact IBM Software Support.

User response: Contact your system programmer.

EQQ0956E *FUNC FAILED FOR FILE, CALLING MODULE IS MODULE REASON FOR FAILURE IS WRONG RECORD LENGTH*

Explanation: A batch program attempted to perform the function *FUNC* against the file *FILE*, but the attempt failed. The I/O request is from module *MODULE*. The program forces the failure because of a mismatch among the allowed record length and the one specified in the JCL submitting the batch. This might happen if you used the old LTP batch skeleton after migrating to version 8.5.1.

System action: The job is terminated.

System programmer response: Check the correct record length to be used, set it in the JCL submitting the batch and rerun it.

User response: Contact your system programmer.

EQQ0957E *LOGICAL END OF FILE ON FILE-DS: FUNC,KEY*

Explanation: A batch program attempted to read a record in the data set *FILE*, but the record no longer exists in the data set.

System action: The job is terminated.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log for I/O errors that immediately precede this message. If you cannot fix the problem, contact IBM Software Support.

User response: Contact your system programmer.

EQQ0958E *FUNC FAILED FOR FILE, CALLING MODULE IS MODULE*

Explanation: A batch program attempted to perform the function *FUNC* against the file *FILE*, but the attempt failed. The I/O request is from module *MODULE*.

System action: The job is terminated.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log for I/O errors that immediately precede this message. If you cannot fix the problem, contact IBM Software Support.

User response: Contact your system programmer.

EQQ0959E *FUNC FAILED FOR FILE MSG: SYNADMSG CALLING MODULE IS MODULE*

Explanation: A batch program attempted to perform the function *FUNC* against the file *FILE*, but the attempt failed. The I/O request is from module *MODULE*.

System action: The job is terminated.

System programmer response: Determine the cause of the error and take the appropriate action.

User response: Contact your system programmer.

Problem determination: The SYNAD routine collects information such as jobname, stepname, unit address, device type, ddname, operation, error description, and access method. The SYNADAF macro is used to extract this information. For a detailed description of the layout refer to the appropriate documentation for the MVS/DFP product installed on this system.

EQQ0971E *MAXIMUM NUMBER OF OCCURRENCES HAS BEEN REACHED FOR APPLICATION ADID*

Explanation: No more occurrences of this application can be added. The current plan can contain approximately 970 occurrences of each application.

When the IBM Tivoli Workload Scheduler for z/OS panel is used to add occurrences, a lower limit (approximately 870) is used.

System action: The daily planning batch program ends, but no new current plan is created.

User response: Complete or delete occurrences of this application that are no longer needed. This prevents these occurrences from being included if the daily plan is rerun. If necessary, use a shorter planning period. Resubmit the daily planning job.

EQQ0972E *MAXIMUM NUMBER OF OCCURRENCES REACHED*

Explanation: No more occurrences can be added to the current plan because the maximum number of occurrences has been reached.

System action: The daily planning batch program ends, but no new current plan is created. If a current plan existed prior to the running of the daily planning job, IBM Tivoli Workload Scheduler for z/OS continues to use the existing current plan.

User response: Check the value specified in the MAXOCCNUM parameter of BATCHOPT. If no value is specified, IBM Tivoli Workload Scheduler for z/OS defaults the value to 32767.

Review problem determination and take any appropriate actions. Resubmit the daily planning job.

Problem determination: Check the long-term plan for instances of an unusually high number of occurrences of a particular application. If you see such an application, look in the application description database and make sure that the run cycles for the application are correct. If the current plan contains a significant number of completed or deleted occurrences, submit a daily plan REPLAN.

If you use event-triggered tracking (ETT), program interface (PIF), or Automatic Recovery, check that these functions are working correctly. For example, make sure that you do not have an endless ETT loop, where the availability of a special resource is set to YES by a job that ETT adds, when it detects that this same resource is set to YES.

When you specify PREVRES(YES) in the BATCHOPT initialization statement, information about completed and deleted occurrences is carried forward, for reporting purposes, into a new current plan. If your current plan regularly contains a large number of occurrences and you specify YES for PREVRES, you should consider changing this value to NO.

EQQ0981E THE INPUT DATA SET, DDNAME = EQQUSRIN, COULD NOT BE OPENED.

Explanation: The EQQUPTOP program failed to open the data set referenced by the EQQUSRIN DD statement. The statement was incorrectly specified, or it is missing.

System action: The EQQUPTOP program ends with RC=8. No encryption action is performed.

User response: Check the EQQE2EPW job and ensure that:

- The data set name in the EQQUSRIN DD statement is correctly specified.
- The data set name includes the member name.

Correct the submitted JCL and resubmit it.

EQQ0982E THE INPUT DATA SET, DDNAME = SYSIN, COULD NOT BE OPENED.

Explanation: The EQQUPTOP program failed to open the data set referenced by the SYSIN DD statement. The statement was incorrectly specified, or it is missing.

System action: The EQQUPTOP program ends with RC=8. No encryption action is performed.

User response: Check the EQQE2EPW job and ensure that the data set name specified in the SYSIN DD statement is correctly specified. Correct the submitted JCL and resubmit it.

EQQ0983E LOGICAL RECORD SIZE FOR THE DDNAME = EQQUSRIN IS NOT VALID.

Explanation: The EQQUPTOP program failed to read the contents of the data set referenced by the EQQUSRIN DD statement. The logical record length is not equal to 80 bytes.

System action: The EQQUPTOP program ends with RC=8. No encryption action is performed.

User response: Check that the EQQUSRIN DD statement is correctly specified in the EQQE2EPW job. Correct the submitted JCL and resubmit it.

EQQ0984E LOGICAL RECORD SIZE FOR THE DDNAME = SYSIN IS NOT VALID.

Explanation: The EQQUPTOP program failed to read the contents of the data set referenced by the SYSIN DD statement. The logical record length is not equal to 80 bytes.

System action: The EQQUPTOP program ends with RC=8. No encryption action is performed.

User response: Check that the SYSIN DD statement is correctly specified in the EQQE2EPW job. If necessary, copy the SYSIN data to a file with record size equal to 80 bytes. Correct the submitted JCL and resubmit it.

EQQ0985I DDNAME SYSIN IS MISSING OR SPECIFIES DD DUMMY.

Explanation: The EQQE2EPW password encryption job does not specify any SYSIN DD statement or specifies a DUMMY DD statement.

System action: The processing continues without reading the SYSIN data set, and encrypts only the passwords contained in the specified member of the EQQUSRIN data set.

User response: No action is requested if you do not need to specify a SYSIN data set, otherwise add the proper SYSIN DD statement and resubmit the EQQE2EPW job. Check that the SYSIN DD statement is correctly specified in the EQQE2EPW job.

EQQ0986E EQQUPTOP PROGRAM TERMINATED BECAUSE OF UNRECOVERABLE ERRORS.

Explanation: A severe error occurred during the execution of the EQQUPTOP program.

System action: The EQQUPTOP program ends.

User response: Review the EQQMLOG data set and the SYSUDUMP data set to determine the cause of the error. Correct the submitted JCL and resubmit it. If you cannot determine the cause of the error and if the error persists, contact IBM Software Support, providing

message log and system dump.

EQQ0987E END-TO-END EQQZTWST LOAD
MODULE COULD NOT BE LOADED.

Explanation: The scheduler could not locate the load module shown in the message text for the end-to-end function.

System action: The EQQE2EPW job ends.

System programmer response: Ensure that the job references a library that contains the load module shown in the message text, and then resubmit the job.

EQQ0988E THE SYSIN DATA SET IS EMPTY.

Explanation: The SYSIN DD statement in the EQQE2EPW job references an empty data set.

System action: The EQQE2EPW job ends.

System programmer response: Check that the SYSIN DD statement is correctly defined and uses the correct data set name. Correct the submitted JCL and resubmit it.

EQQ0989E I/O ERROR READING SYSIN.

Explanation: The data set referenced by the SYSIN DD statement could not be read, an I/O error occurred.

System action: The EQQE2EPW job ends.

System programmer response: Correct the submitted JCL and resubmit it.

Problem determination: Review any preceding messages in the output of the job or in the system log to determine the exact reason for this error.

EQQ0991E KEYWORD IS A MISSING USRREC
KEYWORD.

Explanation: The error occurred while processing the SYSIN data referenced by the EQQE2EPW JCL. The EQQUPTOP program expects to find a sequence of triplets, each one containing the USRCPU, USRNAM, and USRPSW keywords, combined without repetition. Each of the triplets must correspond to a consistent set of keywords for a USRREC statement. All the three keywords must be present in the SYSIN, and only one keyword per row is allowed. The message variable shows the keyword that is missing.

System action: The EQQE2EPW job ends.

System programmer response: Correct the SYSIN data and resubmit the EQQE2EPW job.

Problem determination: The error might have been caused by processing stopped due to a previous syntax error (for example, duplicate keywords or more than one keyword on a row). Review the SYSIN and any previous message in the output of the job or in the

system log, to determine the exact reason for this error.

EQQ0992W AN INTERNAL ERROR OCCURRED
WHILE PERFORMING ENCRYPTION
OF CARD .

Explanation: An internal error occurred in the routine performing the encryption of the password contained in the USRPSW keyword CARD.

System action: The EQQE2EPW job processing continues.

System programmer response: Correct EQQE2EPW job and resubmit it. If the problem persists, generate a dump by defining a slip trap based on this message and contact IBM Software Support.

Problem determination: Review any preceding messages in the output of the job and check the resulting contents of the EQQUSRIN data set.

EQQ0993W AN ERROR OCCURRED WHILE
WRITING DATA TO THE EQQUSRIN
DATA SET.

Explanation: An I/O error occurred in the routine performing the encryption of the password contained in the USRPSW keyword.

System action: The EQQE2EPW job processing continues.

System programmer response: Correct any error present in the job and resubmit it. If the problem persists, generate a dump by defining a slip trap based on this message and contact IBM Software Support.

Problem determination: Review any preceding messages in the output of the job and check the resulting contents of the EQQUSRIN data set.

EQQ0994I AN OLD USRREC STATEMENT HAS
BEEN REPLACED BY A NEWER ONE.
USRCPU = CPU, USRNAM = NAM.

Explanation: A duplicate USRREC statement was found in the SYSIN data set, in the specified member of the EQQUSRIN data set, or while copying the SYSIN data to the EQQUSRIN data set member. The last statement was kept while the oldest one was removed. CPU and NAM correspond to the statement key.

System action: The EQQE2EPW job processing continues.

System programmer response: If you are not replacing statements due to password change, review the output of the job and check the resulting contents of the EQQUSRIN data set.

EQQ0995I USRPSW KEYWORD SPECIFIES AN EMPTY VALUE. IT IS NOT ENCRYPTED.

Explanation: When processing the USRPSW keyword of the USRREC statement, the EQQE2EPW JCL detected that no password was supplied. USRPSW("") was specified.

System action: The statement processing continues. The USRPSW keyword is stored as it is in the specified member of the EQQUSRIN data set. The result is the same as having a user ID with no password assigned.

User response: No action is requested. If you want to specify a password for encryption, set it in the USRPSW keyword and resubmit the EQQE2EPW JCL.

EQQ1457E NO OUTPUT FILE COULD BE OPENED. PLEASE CHECK JCL

Explanation: The daily planning print program could not open any output data set.

System action: The job is terminated.

User response: Check the JCL. There must be at least a SYSPRINT DD statement present. Resubmit the job.

EQQ1458I DAILY PLANNING REPORT USER EXIT IS ACTIVE FOR THIS PRINTOUT

Explanation: The exit for daily planning print is activated.

System action: The job continues processing.

User response: None.

EQQ1459I DAILY PLANNING REPORT USER EXIT IS NOT ACTIVE FOR THIS PRINTOUT

Explanation: The exit for daily planning print is not activated.

System action: The job continues processing.

User response: None

EQQ1594E INVALID PARAMETER SPECIFIED IN SYSIN

Explanation: Parameters in the SYSIN statement must be a character string. Valid values are 01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11, 12, 13, and 14.

System action: The job is terminated.

System programmer response: Check the batch job submit panels and make sure that the IBM Tivoli Workload Scheduler for z/OS input field verification logic has not been removed or changed. If the panels

were not removed or changed, contact IBM Software Support.

User response: If the job was submitted outside IBM Tivoli Workload Scheduler for z/OS, correct the parameters and resubmit the job. If the job was submitted from the Application Description panel, contact your system programmer.

EQQ1595I OUTPUT FIELDS HAVE BEEN TRUNCATED

Explanation: Lines longer than 120 characters have been truncated in the report.

System action: The run cycle description and special resource fields are truncated.

User response: None.

EQQ1596E NO PARAMETERS SPECIFIED

Explanation: No parameters were specified in the SYSIN statement for a batch job.

System action: The job is terminated and a return code of 8 is issued.

User response: Specify the necessary parameters and resubmit the job.

EQQ2010E DAILY PLAN ENDS DUE TO ERRORS IN INPUT DATA. REFER TO DIAGNOSTIC FILE EQQDUMP FOR MORE INFORMATION

Explanation: The daily planning program has detected an error in the input data. The validation error action specified in the BATCHOPT statement is to end the daily planning program.

System action: The daily planning program ends. No new current plan is created.

User response: If necessary, use the IBM Tivoli Workload Scheduler for z/OS panel to remove incorrect records. After making corrections, resubmit the daily planning job.

Problem determination: Refer to the preceding validation error message and data in the dump data set, EQQDUMP, to determine the cause of the error.

EQQ2011W A PREDECESSOR TO APPLICATION APPLIADATEIATIME WAS NOT FOUND

Explanation: The daily planning program was unable to find a predecessor to the occurrence defined by this message.

System action: The daily planning program takes the action defined by the VALEACTION keyword of the BATCHOPT statement.

User response: If no new plan is produced, resubmit the daily planning job with VALEACTION(W) specified in the BATCHOPT statement. If a new plan has been created, use the IBM Tivoli Workload Scheduler for z/OS panel to verify that dependencies have been correctly created for the identified occurrence. The panel can be used to repair the inconsistency in the current plan or long-term plan records. It may be necessary to delete and add again the predecessor occurrence or the identified occurrence. In some instances it may be sufficient to delete a predecessor specification.

Problem determination: Refer to the data in the dump data set, EQQDUMP, to determine the cause of the error.

**EQQ2012W A SUCCESSOR TO APPLICATION
APPLIADATEIATIME WAS NOT
FOUND**

Explanation: The daily planning program was unable to find a successor to the occurrence defined by this message.

System action: The daily planning program takes the action defined by the VALEACTION keyword of the BATCHOPT statement.

User response: If no new plan is produced, resubmit the daily planning job with VALEACTION(W) specified in the BATCHOPT statement. If a new plan has been created, use the IBM Tivoli Workload Scheduler for z/OS panel to verify that dependencies have been correctly created for the identified occurrence. The panel can be used to repair the inconsistency in the current plan or long-term plan records. It may be necessary to delete and add again the successor occurrence or the identified occurrence. In some instances it may be sufficient to delete a successor specification.

Problem determination: Refer to the data in the dump data set, EQQDUMP, to determine the cause of the error.

**EQQ2013W A RERUN RECORD WITHOUT A
MATCHING OCCURRENCE RECORD
WAS FOUND**

Explanation: The daily planning program was unable to find an occurrence record for an occurrence referenced in a rerun record (record type 09).

System action: The daily planning program takes the action defined by the VALEACTION keyword of the BATCHOPT statement.

User response: If no new plan is produced, resubmit the daily planning job with VALEACTION(W) specified in the BATCHOPT statement.

Problem determination: Refer to the data in the dump

data set, EQQDUMP, to determine the cause of the error.

**EQQ2014W A READY LIST ENTRY WITHOUT A
MATCHING OCCURRENCE RECORD
WAS FOUND FOR WORK STATION
WSNAME**

Explanation: The daily planning program was unable to find an occurrence record for an occurrence referenced in a ready list record (record type 11).

System action: The daily planning program takes the action defined by the VALEACTION keyword of the BATCHOPT statement.

User response: If no new plan is produced, resubmit the daily planning job with VALEACTION(W) specified in the BATCHOPT statement.

Problem determination: Refer to the data in the dump data set, EQQDUMP, to determine the cause of the error.

**EQQ2015W AN INTERNAL PREDECESSOR IN
APPLICATION APPLIADATEIATIME
WAS NOT FOUND**

Explanation: The daily planning program was unable to find an operation record for an operation defined as an internal predecessor to an operation in the occurrence defined by this message.

System action: The daily planning program takes the action defined by the VALEACTION keyword of the BATCHOPT statement.

User response: If no new plan is produced, resubmit the daily planning job with VALEACTION(W) specified in the BATCHOPT statement. If a new plan has been created, use the IBM Tivoli Workload Scheduler for z/OS panel to verify that dependencies have been correctly created for the identified occurrence.

Problem determination: Refer to the data in the dump data set, EQQDUMP, to determine the cause of the error.

**EQQ2016E OPERATION OPERNR IN
APPLICATION APPLID IS TOO LARGE
TO BE SAVED IN THE NEW
CURRENT PLAN DATA SET. THE
FAILING OPERATION CONTAINS
PREDNR DEPENDENCIES AND
SPECNR SPECIAL RESOURCES**

Explanation: The daily planning program was unable to create an operation record because it would be too large for the output data set defined by the EQQNCPDS DD statement.

System action: The daily planning program terminates processing.

User response: Reduce the number of dependencies or special resources for the failing application until all operations in the application can be saved in the new current plan data set. Resubmit the daily planning batch job.

**EQQ2017W AN OCCURRENCE WITH JOBNAME
JOBNAME AND JOBNUMBER
JOBNUMB FOR OPERATION OPNUM
IS MISSING IN THE CURRENT PLAN
RECORD TYPE 05 WITH INDEX
NUMBER OCCNUM**

Explanation: The daily planning program was unable to find an index entry in the current plan record type 05 for the occurrence with the specified operation.

System action: For occurrences that have been completed or deleted, the daily planning program takes the action defined by the VALEACTION keyword of the BATCHOPT statement. In other instances, the daily planning program is terminated with a return code of 08.

User response: If no new plan is produced and the occurrence causing the problem is completed or deleted, resubmit the daily planning job with VALEACTION(W) specified in the BATCHOPT statement. In other instances, save the EQQDUMP output, create an APAR tape and contact IBM Software Support.

Problem determination: Refer to the data in the dump data set, EQQDUMP, to determine the cause of the error.

**EQQ2018W SPECIAL RESOURCE ERROR,
REASON RSN**

Explanation: The daily planning program found an error when processing special resources.

System action: The daily planning program takes the action defined by the VALEACTION keyword of the BATCHOPT statement.

System programmer response: If no new plan is produced, resubmit the daily planning job with VALEACTION(W) specified in the BATCHOPT statement. If a new plan has been created, use the IBM Tivoli Workload Scheduler for z/OS panel to verify that the special resource and operations using the special resource are correct. The panel can be used to repair the inconsistency in the current plan or current plan extension records. Take a copy of the EQQDUMP. If VALEACTION(A) was specified, save the dump and contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Refer to the data in the dump data set, EQQDUMP, to determine the cause of the error.

**EQQ2019E ADID: ADID, WS: WSID, OP: OPNO,
JOBNAME: JOBNAME, IA: IAD1IAT1
HAS AN INVALID DEPENDENCY TO
OPERATION ADID: ADI2, WS: WSID,
OP: OPN2, JOBNAME: JOBNAM2, IA:
IAD2IAT2**

Explanation: The daily planning program found an invalid external dependency in an operation.

System action: The daily planning program is terminated with a return code of 08 without creating a new current plan.

User response: Use the Modify Current Plan panel to validate the external dependencies in the operation that is indicated first in the message.

**EQQ2020W AN INTERNAL CONDITIONAL
PREDECESSOR IN OCCURRENCE
APPLIADATEIATIME WAS NOT
FOUND**

Explanation: The daily planning program was unable to find an operation record for an operation defined as an internal conditional predecessor to an operation in the occurrence defined by this message.

System action: The daily planning program takes the action defined by the VALEACTION keyword of the BATCHOPT statement.

User response: If no new plan is produced, resubmit the daily planning job with VALEACTION(W) specified in the BATCHOPT statement. If a new plan has been created, use the IBM Tivoli Workload Scheduler for z/OS panel to verify that dependencies have been correctly created for the identified occurrence.

Problem determination: Refer to the data in the dump data set, EQQDUMP, to determine the cause of the error.

**EQQ2021W A CONDITIONAL SUCCESSOR TO
OCCURRENCE APPLIADATEIATIME
WAS NOT FOUND**

Explanation: The daily planning program was unable to find a conditional successor to the occurrence defined by this message.

System action: The daily planning program takes the action defined by the VALEACTION keyword of the BATCHOPT statement.

User response: If no new plan is produced, resubmit the daily planning job with VALEACTION(W) specified in the BATCHOPT statement. If a new plan has been created, use the IBM Tivoli Workload Scheduler for z/OS panel to verify that dependencies have been correctly created for the identified occurrence. The panel can be used to repair the inconsistency in the current plan or long-term plan records. It may be necessary to delete and add again the successor

EQQ2022E • EQQ3001E

occurrence or the identified occurrence. In some instances it may be sufficient to delete a successor specification.

Problem determination: Refer to the data in the dump data set, EQQDUMP, to determine the cause of the error.

EQQ2022E NO CONDITION DEPENDENCY REFERRING TO CONDITIONAL PREDECESSOR *APPL IADATE IATIME OPNUM* WAS FOUND IN CONDITION *COND* FOR OPERATION *OWNAP OWNIAD OWNIAT OWNOP*.

Explanation: While processing internal control blocks, the daily planning program was unable to find the indicated condition dependency.

System action: The daily planning program ends without producing a new current plan.

User response: Keep the EQQDUMP data and contact IBM Software Support.

Problem determination: Refer to the data in the dump data set, EQQDUMP, to determine the cause of the error.

EQQ2022W NO CONDITION DEPENDENCY REFERRING TO CONDITIONAL PREDECESSOR *APPL IADATE IATIME OPNUM* WAS FOUND IN CONDITION *COND* FOR OPERATION *OWNAP OWNIAD OWNIAT OWNOP*.

Explanation: While processing internal control blocks, the daily planning program was unable to find the indicated condition dependency.

System action: The daily planning program tries to bypass detected errors. If the errors can be bypassed, the daily planning program produces a new current plan that might contain inconsistencies, for example unresolved dependencies.

User response: If the daily planning program produced a new current plan, check the resulting data.

Problem determination: Refer to the data in the dump data set, EQQDUMP, to determine the cause of the error.

EQQ2023E INCONSISTENT DEPENDENCY DATA BETWEEN OPERATIONS *APPL IADATE IATIME OPNUM* AND *APP2 IADAT2 IATIM2 OPNU2*.

Explanation: While trying to add a default dependency, the daily planning program detected an inconsistent conditional dependency already present for the current operation.

System action: The daily planning program ends

without producing a new current plan.

User response: Check for dependencies manually added to the LTP for the indicated occurrences and verify the original dependencies definition in the database.

EQQ2024E CONDITION *CONDID* IN OPERATION *OPERNR* FOR APPLICATION *APPLID* IS TOO LARGE TO BE SAVED IN THE NEW CURRENT PLAN DATA SET.

Explanation: A daily plan extend request failed because the record containing the all information on condition *CONDID* for application *APPLID* and operation number *OPERNR* is out of size.

System action: The daily plan batch fails with RC=12 and message EQQ2024E is issued in MLOG.

User response: Check that the amount of information about the condition dependencies contained in that specific condition does not make the condition record exceed the 32 KB size, which is the maximum size for a VSAM record. If it does, rework the condition to prevent the failure from occurring again.

EQQ2025E TOO MANY USER FIELDS IN OPERATION *OPERNR* FOR APPLICATION *APPLID* .

Explanation: A daily plan extend request failed, because the user field record for application *APPLID* and operation number *OPERNR* exceeds the maximum size.

System action: The daily plan batch fails with RC=12 and message EQQ2025E is logged in MLOG.

User response: Check that the number of user fields for the specified operation does not exceed the maximum limit.

EQQ3000W DOMAIN DEFINITION DISCARDED FOR DOMAIN *DOM1*: THE DOMAIN MANAGER *CPU1* BELONGS TO ANOTHER DOMAIN

Explanation: User has defined two domains with the same workstation as domain manager..

System action: One definition is discarded.

User response: Review the domain definitions (DOMREC) in the topology member (for example, tplginfo) of EQQPARM, and then renew the symphony.

EQQ3001E PARAMETER DOMAINPARENT MISSING IN TOPOLOGY INFORMATION MEMBER

Explanation: In topology information member missing some DOMAINPARENT into DOMREC definition.

User response: You must review the domain definitions (DOMREC) in Topology Information Member (*tplginfo*) of EQQPARM and then Controller or Batch depending on where you were.

EQQ3002E THE DOMAIN DEFINITION IS INCORRECT: AT LEAST ONE DOMAIN MUST BE SPECIFIED

Explanation: No domain definition has been specified in the topology member (for example, *tplginfo*) of EQQPARM, but some workstation definition (CPUREC) is present.

System action: The symphony file is not produced.

User response: You must add the needed domain definitions (DOMREC) in the topology member (ex.: *tplginfo*) of EQQPARM and then renew the symphony.

EQQ3003E THE DOMAIN DEFINITION IS INCORRECT: AT LEAST ONE FIRST LEVEL DOMAIN MUST EXIST

Explanation: No first level domains have been defined. This implies the presence of a loop in the network.

System action: The symphony file is not created.

User response: Eliminate the loop in the network to correct the domain definition and renew the symphony.

EQQ3004E NO VALID DOMAIN MANAGERS OF FIRST LEVEL

Explanation: User has defined at least a first level domain with a manager workstation that is not in the symphony.

System action: The symphony file is not created..

User response: Review the domain definitions and correct the domain manager. Then renew the symphony.

EQQ3005I THE DOMAIN DEFINITION IS INCORRECT: THE MASTER DOMAIN BECOMES PARENT FOR DOMAIN *DOM1*

Explanation: Domain *DOM1* specifies a parent domain that does not exist.

System action: The scheduler forces the master domain as parent.

User response: If you do not want this domain to have the master domain as parent, review the domain definition, specify a valid domain parent, and renew the symphony.

EQQ3006I THE WORKSTATION CANNOT BE ASSIGNED TO MASTERDM: WORKSTATION *CPU1* ASSIGNED TO DOMAIN *DOM1*

Explanation: User has defined workstation *CPU1* as belonging to MASTERDM, but this is not allowed.

System action: The scheduler forces the first level domain *DOM1* as domain for *CPU1*.

User response: If you do not want to assign *CPU1* to this domain, change its CPUREC definition and then renew the Symphony file.

EQQ3007W DOMAIN DEFINITION DISCARDED FOR DOMAIN *DOM1*: DOMAIN MANAGER CANNOT BE THE MASTER DOMAIN MANAGER

Explanation: User has defined a domain with the scheduler as domain manager workstation. This is not allowed.

System action: The domain definition is discarded.

User response: If you do not want this domain definition to be discarded, change the domain manager and renew the symphony..

EQQ3008I DOMAIN MANAGER *CPU1* MUST HAVE CPUTYPE SET TO FTA

Explanation: A domain definition has specified as manager a workstation that has not the CPUTYPE keyword set to FTA.

System action: The scheduler adjusts the definition to make the workstation a domain manager.

User response: If you do not want this workstation to be a domain manager, find the domain definition that specifies it as manager, and insert a different workstation name then renew the symphony.

EQQ3009I DOMAIN MANAGER *CPU1* IS NOT IN FULLSTATUS: FULLSTATUS IS FORCED

Explanation: Domain manager must be in fullstatus mode.

System action: The scheduler forces fullstatus mode.

User response: If you do not want this workstation to be a domain manager, find the domain definition that specifies it as manager, and insert a different workstation name then renew the symphony.

EQQ3010I WORKSTATION *CPU1* SPECIFIES AN INCORRECT DOMAIN NAME *DOM1*. THE DOMAIN IS CHANGED TO ITS HOST DOMAIN *DOM2*

Explanation: The domain has not been specified in the CPUREC definition.

System action: The scheduler forces as domain the *DOM2*, the host domain of *CPU1*.

User response: If you do not want the *CPU1* to belong to this domain, specify a correct domain name in the CPUREC definition and renew the symphony.

EQQ3011I WORKSTATION *CPU1* SET AS DOMAIN MANAGER FOR DOMAIN *DOM1*

Explanation: This message states that *CPU1* is set as domain manager for domain *DOM1*.

User response: If you do not want *CPU1* to be a domain manager, find the domain definition that specifies it as manager, and insert a different workstation name and renew the symphony.

EQQ3012W DOMAIN DEFINITION DISCARDED FOR DOMAIN *DOM1*: DOMAIN MANAGER *CPU1* NOT FOUND

Explanation: The domain definition specifies a manager that is not in the symphony.

System action: The domain definition is discarded.

User response: If you do not want this domain definition to be discarded, do one of the following:

- Change the specified domain definition by inserting a different CPU name.
- Add the *CPU1* definition (CPUREC) in the Topology Member (ex: *tplginfo*) of *EQQPARM* and define the workstation in the workstation database.

Then renew the symphony.

EQQ3013I EXTENDED OR STANDARD AGENT *CPU1* DOES NOT SPECIFY HOST

Explanation: The extended or standard agent CPUREC definition does not specify a host name.

System action: The scheduler tries to set the domain manager of the *CPU1* domain as host, or forces the domain manager of a first level domain..

User response: If you do not want the *CPU1* to be hosted by its domain manager or by a first level domain manager, change the specified CPUREC definition by inserting the desired host name and renew the symphony.

EQQ3014E CIRCULAR REFERENCE BETWEEN DOMAINS DETECTED

Explanation: A circular reference between domains has been detected.

System action: The symphony file is not created.

User response: Correct the domains definition by specifying valid parent domains then renew the symphony.

EQQ3015I DOMAIN MANAGER *CPU1* BECOMES HOST FOR *CPU2*

Explanation: The extended or standard agent CPUREC definition does not specify a host name.

System action: The scheduler forces as host the domain manager of the domain referenced in the CPUREC definition; if no domain is referenced, the domain manager of a first level domain is specified..

User response: If you do not want this domain manager to host the workstation, change the specified CPUREC definition by inserting the desired host name and renew the symphony.

EQQ3016I AGENT *CPU1* NOW BELONGS TO DOMAIN *DOM1* WITH DOMAIN MANAGER *CPU2*

Explanation: A host for the agent is specified but the agent and the host workstations belong to different domains.

System action: The scheduler forces the agent domain to the host domain.

User response: If you do not want this workstation to belong to this domain, change the specified CPUREC definition by inserting the desired host name and renew the symphony.

EQQ3017I CPU *HCPU* CANNOT HOST AGENT *CPU1*. AGENT *CPU1* IS NOW HOSTED BY *CPUM* DOMAIN MANAGER IN DOMAIN *DOM1*

Explanation: The CPUREC definition of the referred extended or standard agent *CPU1* has incorrect info in the CPUHOST parameter: either a host name is specified for which no workstation does exist in the workstation database, or for this host name no CPUREC exists.

System action: The scheduler forces the domain manager of the domain child of *MASTERDM* as host.

User response: Update the CPUHOST value entered according to the criteria in the above explanation. Otherwise, the *CPU1* agent will be hosted by *CPUM* in *DOM1*.

EQQ3018I DOMAIN MANAGER CPU1 NOW HOSTS STANDARD AGENT CPU2

Explanation: Standard agent *CPU2* specifies a host that is not a domain manager.

System action: The standard agent is re-hosted to the manager of its domain.

User response: If you do not want this domain manager to host the workstation, change the specified CPUREC definition by inserting the desired host name and renew the symphony.

EQQ3019I WORKSTATION CPU1 SPECIFIES AN INCORRECT DOMAIN NAME DOM1. WORKSTATION DOMAIN CHANGED TO THE FIRST LEVEL DOMAIN DOM2

Explanation: The domain specified in the CPUREC definition does not exist or is not defined.

System action: The scheduler forces as domain a first level domain.

User response: If you do not want the workstation to belong to this domain, specify the right domain name in the CPUREC definition and renew the symphony.

EQQ3020I IN CPU1 CPUREC DEFINITION THE DOMAIN IS FORCED TO DOM1

Explanation: The *CPU1* was selected to be the domain manager of the *DOM1* domain, but its domain specification differs from *DOM1*.

System action: *DOM1* is forced.

User response: If you do not want CPU1 to be the domain manager of *DOM1* domain, change the domain manager name in the *DOM1* definition and run the batch again.

EQQ3021E CPUNAME KEYWORD IS MISSING

Explanation: CPUREC statement was specified without a CPUNAME keyword.

System action: The CPU parsing process ends.

User response: In the EQQPARM member of topology information (for example, TPLGINFO), find the CPUREC statement without the CPUNAME keyword and specify a valid name for the CPU. This name must be the name of a fault-tolerant workstation present in the scheduler WS database. Restart Batch.

EQQ3022E CPUNAME CPU1 IS NOT UNIQUE

Explanation: CPUNAME keyword specifies a CPU name that already exists, but it must be unique.

System action: The CPU parsing process ends.

User response: In the EQQPARM member of topology information (for example, TPLGINFO), find the CPUREC statements with the CPUNAME value and delete the redundant CPU definitions. Alternatively, change the CPUNAME values. A valid name for a CPU is the name of a fault-tolerant workstation present in the scheduler WS database. Restart Batch.

EQQ3023E CPUNAME CPU1 DOES NOT HAVE CPUOS KEYWORD SPECIFIED

Explanation: CPUREC statement does not have CPUOS keyword.

System action: The CPU parsing process ends.

User response: In the EQQPARM member of topology information (for example, TPLGINFO), find the CPUREC statement with that CPUNAME value and add the CPUOS keyword. Restart Batch.

EQQ3024E CPUNAME CPU1 DOES NOT HAVE CPUNODE KEYWORD SPECIFIED

Explanation: The CPUREC statement does not have a CPUNODE keyword.

System action: The CPU parsing process ends.

User response: In the EQQPARM member of topology information (for example, TPLGINFO), find the CPUREC statement with that CPUNAME value and add the CPUNODE keyword. Restart Batch.

EQQ3025I STANDARD AGENT CPU1 MUST HAVE HOST SPECIFIED

Explanation: A CPUREC statement for a standard agent does not have CPUHOST keyword.

System action: The scheduler uses either the manager of the domain child of MASTERDM or the manger of the domain eventually specified in the CPUDOMAIN keyword.

User response: If you do not want this CPU to be the host or manager of the domain child of MASTERDM or of domain specified, change the CPU definition to specify a valid host name. Restart Batch.

EQQ3026I ACCESS METHOD, FULLSTATUS AND RESOLVE DEPENDENCIES ATTRIBUTES ARE NOT COMPATIBLE FOR STANDARD AGENT TYPE CPU CPU1

Explanation: A CPUREC statement for a standard agent does not support access method, fullstatus, and resolve dependencies.

System action: Specifications are ignored.

User response: If you want to, either delete the wrong

keywords from the CPUREC statement or change the CPU type. Restart Batch.

EQQ3027E EXTENDED AGENT *CPU1* MUST HAVE HOST AND ACCESS METHOD SPECIFIED

Explanation: The CPUREC statement for an Extended Agent must have access method and host CPU specified.

System action: The CPU parsing process continues.

User response: Find the *CPU1* definition in the topology information member and specify both the access method and the host where the method resides. If you do not specify this information correctly, the workstation will fail when trying to execute the access method. Renew the Symphony.

EQQ3028I AUTOLINK, FULLSTATUS, RESOLVE DEPENDENCIES AND SERVER ATTRIBUTES ARE NOT COMPATIBLE FOR EXTENDED AGENT TYPE CPU *CPU1*

Explanation: The CPUREC statement for an Extended agent does not support autolink, fullstatus, resolve dependencies, and server attributes.

System action: Specifications are ignored.

User response: Delete the wrong keywords from the CPUREC statement or change the CPU type. Renew the Symphony.

EQQ3029I HOST AND ACCESS METHOD ATTRIBUTES ARE NOT COMPATIBLE FOR FTW TYPE CPU *CPU1*

Explanation: The CPUREC statement for a fault-tolerant agent does not support host and access method attributes.

System action: Specifications are ignored.

User response: Delete the wrong keywords from the CPUREC statement or change the CPU type. Renew the Symphony.

EQQ3030I DOMAIN MANAGER *CPU1* MUST HAVE SERVER ATTRIBUTE SET TO BLANK

Explanation: The CPUREC statement for a domain manager does not support the server attribute.

System action: Specifications are ignored.

User response: Delete the wrong keyword from the CPUREC statement or change the domain definition that specifies *CPU1* as manager and renew the symphony.

EQQ3031E HOST IS A REQUIRED ATTRIBUTE FOR EXTENDED AGENT CPU *CPU1*

Explanation: The CPUREC statement for an Extended Agent must specify the host CPU. The CPU parsing process will end.

System action: The CPU parsing process ends.

User response: Find the *CPU1* definition in the topology information member and specify both the access method and the host where the method resides. If you do not specify this information correctly, the workstation will fail when trying to execute the access method. Restart the Batch or the Controller.

EQQ3032E DOMAIN KEYWORD IS MISSING

Explanation: The DOMAIN keyword is missing from the DOMREC statement.

System action: The Domains parsing process ends.

User response: In the EQQPARM member of topology information (for example, TPLGINFO), find the DOMREC statements without the DOMAIN keyword and specify a valid name for the domain. Restart the Controller or Batch, as appropriate.

EQQ3033E DOMAIN NAME *DOM1* IS NOT UNIQUE

Explanation: The DOMAIN keyword specifies a domain name that already exists, but it must be unique.

System action: The domains parsing process ends.

User response: In the EQQPARM member of topology information (for example, TPLGINFO), find the DOMREC statements without the DOMAIN keyword and delete the redundant Domain definitions, or change their DOMAIN values to be unique. Restart the Controller or Batch, as appropriate.

EQQ3034E DOMAIN *DOM1* MUST HAVE DOMAIN MANAGER SPECIFIED

Explanation: The definition of domain *DOM1* does not have a domain manager specified, but this is required.

System action: The domains parsing process ends.

User response: In the EQQPARM member of topology information (for example, TPLGINFO), add the name of the manager in the DOMMNGR keyword. Restart the Controller or Batch, as appropriate.

EQQ3036W CPUREC DEFINES CPU *CPUI* NOT FOUND IN THE WS DATABASE.

Explanation: In the topology information member it was found a CPUREC definition for a CPU *CPUI* that does not exist in the Host Workstation database.

System action: No CPU will be added to the Symphony file for *CPUI*.

User response: Verify that the CPUNAME info *CPUI* entered in the referred CPUREC definition corresponds to a workstation that does exist in the Host Workstation database.

EQQ3037E MISSING KEYWORD *KEYWD* OR VALUE NOT SPECIFIED IN STATEMENT *STMT*.

Explanation: The required keyword is missing or incorrectly specified in the related statement.

System action: The initialization of the server started task fails.

User response: Check the statement and correct any syntax error.

EQQ3038E A NEW SYMPHONY FILE ALREADY EXISTS

Explanation: A previous batch job has created the Symphony successfully but NMM has not yet processed it.

System action: The symphony creation fails.

User response:

Wait for the message EQQW090I in the controller log file. After that, you can run the batch job again. If the problem indefinitely persists, stop and restart the NMM task using the MODIFY command or restart the controller.

EQQ3039E PREVIOUS SYMPHONY CREATION STEP NOT COMPATIBLE

Explanation: The previous Symphony progress status is not compatible with the next, probably because an error has occurred in the meantime.

System action: The Symphony creation fails.

User response:

If there are some messages explaining the error occurred, fix the problem and, if a valid CP exists, run Symphony refresh from Option 3.5. Consider that some error messages should be shown also in the data set corresponding to the DD SYSPRINT specified in the DP batch job. If the problem persists contact IBM Software Support.

EQQ3040E WORKSTATION *WSNAME* NOT DEFINED IN TOPOLOGY INFORMATION MEMBER

Explanation: Current Plan has a fault-tolerant workstation whose definition is missing in the topology information member.

System action: The creation of Symphony fails.

User response: If a valid CP exists, define the CPU in the topology information member (for example, TPLGINFO) of EQQPARM, and renew the Symphony.

EQQ3041W TOPOLOGY INFORMATION MISSING: *TEXT*. THE TPLGYPRM KEYWORD IS MISSING OR INCORRECTLY SPECIFIED IN THE BATCHOPT STATEMENT.

Explanation: The TPLGYPRM keyword of the TOPOLOGY statement in the topology parameters member (for example, TPGYPARM) is missing or incorrectly specified.

TEXT can be either blank or WORKSTATION *WSNAME* REQUIRES IT.

System action: Symphony creation fails.

User response: Specify the topology information member of EQQPARM correctly and, if a valid CP exists, run Symphony Renew from Option 5.3.

EQQ3042E JOB *JOBNM* IS ON WORKSTATION *CPUNM* THAT IS NOT PRESENT IN SYMPHONY FILE

Explanation: Either:

- The *CPUNM* is not defined in the topology information member
- OR:
- The *CPUNM* is defined, but has not been flagged as a fault-tolerant workstation in the scheduler WS database so it has not be added to Symphony.

System action: Depending on where you are, Batch or Controller, the Symphony creation either fails or the occurrence operation is not added to the CP.

User response: Define the workstation correctly in both the topology information member and the workstation database, then renew Symphony.

EQQ3043E JOB *JOBNM* ON WORKSTATION *CPUNM* MUST SPECIFY ONE KEYWORD BETWEEN *JOBSCR* AND *JOBCMD*

Explanation: The job definition *JOBNM* in EQQSCLIB must specify one, and only one of either the *JOBSCR* or *JOBCMD* keywords. Either these keywords are both missing or both present.

If you are running EQQSLCHK sample JCL, workstation field is filled with N/A (Not applicable), because the CPU name is not available for the sample.

System action: Depending on where you are (Batch, controller, or EQQSLCHK):

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.
- EQQSLCHK sample JCL continues parsing process.

User response: Find the *JOBNM* definition in EQQSCLIB and correct the definition. Renew the Symphony if you were creating it, or add the occurrence again if you were using the MCP.

EQQ3044E JOB JOBNM ON A CPU CPUNM SPECIFIES USER USRNM THAT IS NOT IN SYMPHONY

Explanation: A job definition *JOBNM* specifies a WNT workstation, but the user *USRNM* for that workstation is bad defined in users information member (for example, USRINFO).

System action: The job is added in the symphony file in Fail status, while in the current plan the operation remains in Started status.

User response: Find the *JOBNM* definition in EQQSCLIB and correct the *JOBUSR* keyword value to specify an existing user. Renew the Symphony if you were creating it, or add the occurrence again if you were using the MCP. If you want to change the *USRNM* definition in users information member (for example, USRINFO), you must renew Symphony.

EQQ3045I JOB JOBNM ON WORKSTATION CPUNM HAS NO JOBUSR KEYWORD SPECIFIED, THE DEFAULT ONE SPECIFIED FOR THE WORKSTATION IS USED

Explanation: The job definition does not specify a user name. The default user specified for *CPUNM* will be used to execute the job.

If you are running EQQSLCHK sample JCL, workstation field is filled with N/A (Not applicable), because the CPU name is not available for the sample.

System action: The job is added to the symphony file under the user name specified as the default for *CPUNM*.

EQQSLCHK sample JCL continues parsing process.

User response: None.

EQQ3046I TPLGYMEM KEYWORD IS NOT PRESENT IN TOPOLOGY MEMBER

Explanation: The TOPOLOGY statement of the topology parameters member (for example, TPLGPARM) does not specify any topology information member name.

System action: The default name TPLGINFO is used.

User response: If the TPLGINFO member does not exist or does not contain valid topology information statements, some severe error will occur. If this is the situation, change the TOPOLOGY statement to specify a valid topology information name, and renew Symphony.

EQQ3047E BINDIR KEYWORD MISSING IN TOPOLOGY MEMBER

Explanation: BINDIR keyword is required.

System action: The task ends.

User response: Add the BINDIR keyword in the TOPOLOGY statement with a valid path name, then renew Symphony.

EQQ3048E WRKDIR KEYWORD MISSING IN TOPOLOGY MEMBER

Explanation: WRKDIR keyword is required.

System action: The task ends.

User response: Add the WRKDIR keyword in the TOPOLOGY statement with a valid path name, then renew Symphony.

EQQ3049I USRMEM KEYWORD IS NOT PRESENT IN TOPOLOGY MEMBER

Explanation: The USRMEM keyword is missing. This means that you are not using WNT fault-tolerant workstations.

System action: If you are not using WNT fault-tolerant workstations, the Symphony creation process and WNT occurrence adding to CP fails.

User response: If you have WNT fault-tolerant workstations:

1. Define their user names and passwords in the users information member (for example, USRINFO) of EQQPARM
2. Specify the keyword USRMEM in the TOPOLOGY statement, specifying the name of the member that contains the user information if you have not used the default member name USRINFO
3. Renew Symphony

EQQ3050E USRNAM KEYWORD IS MISSING

Explanation: The USRREC statement requires the USRNAM keyword.

System action: The task ends.

User response: Find all the USRREC statements without the USRNAM keyword in the users information member of EQQPARM. Add valid users names in these definitions, and renew Symphony.

EQQ3051W USER DEFINITION RECORD *USER* DOES NOT SPECIFY CPU OR CPU NAME *CPUNM* IS NOT CORRECT: THE USER IS NOT ADDED TO THE SYMPHONY FILE

Explanation: In a USRREC statement, the USRCPU keyword is not specified or the CPU name specified in the keyword is not an existing CPU.

System action: The task continues its processing, ignoring this record. This may impact the execution of Windows NT jobs that need the specified user.

System programmer response: Add or correct the CPU *CPUNM* specified for the user *USER*.

Problem determination: Check the USRREC statements in the scheduler parameters to make sure that the CPU specified for the Windows users is correct.

EQQ3052E INVALID C/PLX INTERFACE AREA

Explanation: An incorrect memory area is passed by the PLX code to the C code.

System action: The batch job does not produce the Symphony file.

System programmer response: Save the batch job message log and contact IBM Software Support.

User response: Contact your system programmer.

EQQ3053E *FNMI*: EFFECTIVE USERID NOT GOTTEN

Explanation: The task is unable to get the UNIX System Services user ID for the user that has executed the planning batch job.

System action: The batch job does not produce the Symphony file.

System programmer response: Define a UNIX System Services user ID for the user.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the user that executed the batch job has a user ID defined for UNIX System Services.

EQQ3054E *FNMI*: ALLOCATION OF HEADER RECORD FOR FILE *SUF1* FAILED

Explanation: The task is unable to allocate memory for the header record of Symphony file.

System action: The batch job does not produce a Symphony file.

System programmer response: Increase the memory for the batch job, or correct any other discovered problem.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: The error is due to insufficient memory available to the task. Check what is preventing the task from obtaining memory.

EQQ3055E *FNMI*: BUILDING OF HEADER RECORD FOR FILE *SUF1* FAILED

Explanation: The task is unable to build the symphony file.

System action: The batch job does not produce a Symphony file.

System programmer response: Change the access mode of the work directory or provide the required rights to the user to allow them to write the new Symphony file.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check the batch job sysout and the system log to find possible system error messages referring to authorization problems. Check the access mode of the work directory (the one specified in WRKDIR keyword of the TOPOLOGY statement in the scheduler parameters) so that the user that is running the batch job is not prevented from writing in that directory.

EQQ3056E *FNMI*: ACCESS ATTRIBUTES OF FILE *SUF1* NOT CHANGED

Explanation: The task is unable to set the access mode to the *SUF1* Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Change the access mode of the work directory or provide the required rights to the user to allow them to write the new Symphony file.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check the batch job sysout and the system log to find possible system error messages referring to authorization problems. Check

the access mode of the work directory (the one specified in WRKDIR keyword of the TOPOLOGY statement in the scheduler parameters) so that the user that is running the batch job is not prevented from writing in that directory.

EQQ3057E *FNMI: OPENING OF FILE SUF1 FAILED*

Explanation: The task is unable to open the *SUF1* Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it.

EQQ3058E *FNMI: ADDING OF CPU RECORD CPU1 TO FILE SUF1 FAILED*

Explanation: The task is unable to put information for the CPU *CPU1* in the *SUF1* Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file. Alternatively, increase the free space on the file system according to the discovered problem.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it. Check that there is sufficient free space on the file system.

EQQ3059E *FNMI: ADDING OF DOMAIN RECORD CPU1 TO FILE SUF1 FAILED*

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file. Alternatively, increase the free space on the file system according to the discovered problem.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job

has the correct rights to write to it. Check that there is sufficient free space on the file system.

EQQ3060E *FNMI: READING FILE SUF1 FAILED: JOBSTREAM SCH1 NOT ADDED*

Explanation: The task is unable to read information for the *SCH1* Job Stream from the *SUF1* Symphony file as expected.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it.

EQQ3061E *FNMI: WRITING TO FILE SUF1 FAILED: JOBSTREAM SCH1 NOT ADDED*

Explanation: The task is unable to put information for the *SCH1* Job Stream in the *SUF1* Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file. Alternatively, increase the free space on the file system according to the discovered problem.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it. Check that there is sufficient free space on the file system.

EQQ3062E *FNMI: ALLOCATION OF COMMON JOBSTREAM RECORD FAILED*

Explanation: The task is unable to allocate memory for the Job Stream record of Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Increase the memory for the batch job, or correct any other discovered problem.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: The error is due to insufficient memory available to the task. Check what

is preventing the task from obtaining memory.

EQQ3063E FNMI: ALLOCATION OF COMMON JOB RECORD FAILED

Explanation: The task is unable to allocate memory for the Job record of the Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Increase the memory for the batch job, or correct any other discovered problem.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: The error is due to insufficient memory available to the task. Check what is preventing the task from obtaining memory.

EQQ3064E FNMI: WRITING OF JOB RECORD JOB1 TO FILE SUF1 FAILED

Explanation: The task is unable to put information for the *JOB1* job in the *SUF1* Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file. Alternatively, increase the free space on the file system according to the discovered problem.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it. Check that there is sufficient free space on the file system.

EQQ3065E FNMI: READING JOB RECORD JOB1 OF FILE SUF1 FAILED

Explanation: The task is unable to read information for the *JOB1* Job from the *SUF1* Symphony file as expected.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it.

EQQ3066E FNMI: UPDATING JOB RECORD JOB1 OF FILE SUF1 FAILED

Explanation: The task is unable to update information for the *JOB1* job in the *SUF1* Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it.

EQQ3067E FNMI: UPDATING JOBSTREAM RECORD SCH1 OF FILE SUF1 FAILED

Explanation: The task is unable to update information for the *SCH1* job Stream in the *SUF1* Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it.

EQQ3068E FNMI: JOBSTREAM RECORD SCH1 NOT FOUND IN FILE SUF1

Explanation: The task is unable to found information for the *SCH1* job Stream in the *SUF1* Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it.

EQQ3069E FNMI: JOB RECORD JOB1 NOT FOUND IN FILE SUF1

Explanation: The task is unable to find information for the *JOB1* job in the *SUF1* Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it.

EQQ3070E FNMI: USER RECORD USR1 NOT ADDED TO FILE SUF1

Explanation: The task is unable to put information for the *USR1* NT user in the *SUF1* Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file. Alternatively, increase the free space on the file system according to the discovered problem.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it. Check that there is sufficient free space on the file system.

EQQ3071E FNMI: FILE SUF1 NOT CLOSED OR COMMON AREA NOT RELEASED

Explanation: The task is unable to update the last information in the *SUF1* Symphony file.

System action: The batch job does not produce Symphony file.

System programmer response: Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file. Alternatively, increase the free space on the file system according to the discovered problem.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it. Check that there is sufficient free space on the file system.

EQQ3072E FNMI: FILE SUF1 NOT RENAMED AS SNF1

Explanation: The task is unable to rename the *SUF1* Symphony file as *SNF1*.

System action: The batch job does not produce Symphony file.

System programmer response: Change the access mode to the work directory or provide the required rights to the user to allow them to set the access mode of the new Symphony file. If *SNF1* is already, present remove it.

User response: Contact the system programmer to fix the problem and run Symphony Renew.

Problem determination: Check the access mode of the work directory (the one specified in the *WRKDIR* keyword of the *TOPOLOGY* statement in the scheduler parameters) to ensure that the user that is running batch job can rename files in that directory. Check that *SNF1* does not already exist.

EQQ3073E INVALID FUNCTION REQUEST PASSED TO EQQZCEE

Explanation: An incorrect function has been called by the *PLX* code to the *C* code.

System action: The batch job does not produce Symphony file.

System programmer response: Save the batch job message log and contact IBM Software Support.

User response: Contact your system programmer.

EQQ3075E EQQSCLIB OPENING FAILED

Explanation: The task is unable to open the PDS specified by *EQQSCLIB DDNAME*.

System action: The batch job does not produce Symphony file.

System programmer response: Check that *DDNAME EQQSCLIB* is correctly defined and that the user that is executing the batch job can read the specified data set.

User response: Contact your system programmer.

EQQ3076E EQQSCLIB INVALID RECORD LENGTH

Explanation: The task is unable to use the PDS specified by *EQQSCLIB DDNAME* because of an incorrect record length.

System action: The batch job does not produce Symphony file.

System programmer response: Check that *DDNAME EQQSCLIB* is correctly defined and the specified data set is allocated. For details, refer to the *Installation Guide*.

User response: Contact your system programmer to fix the problem and run Symphony Renew.

**EQQ3077E NO VALID JOB DEFINITION FOUND
IN EQQSCLIB FOR JOB *JB1NAM***

Explanation: The task finds a wrong job definition in EQQSCLIB for the indicated *JB1NAM* job.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues, but the job is added to the Symphony file in Fail status. In the CP file, at job run time, the status of the job will be Started, with extended status Waiting for submission.
- The addition of the operation fails.

User response: Check for other messages explaining the error. Correct the *JB1NAM* member of EQQSCLIB definition. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

**EQQ3078E OCCURENCE *OCC1* NOT FOUND IN
EQQSCPDS**

Explanation: The task is unable to find the specified occurrence in the Current Plan.

System action: The batch job does not produce a Symphony file.

System programmer response: Save the batch job message log and contact Customer Support.

User response: Contact your system programmer.

**EQQ3079W NO OCCURENCES FOUND IN
EQQSCPDS**

Explanation: The task is unable to find any occurrences in the Current Plan.

System action: The batch job produces a Symphony file without jobs.

User response: None.

**EQQ3080I PROCESS OF ADDING TOPOLOGY
INFORMATION TO SYMPHONY HAS
FAILED**

Explanation: A previous error prevents the task from producing the Symphony.

System action: The batch job does not produce a Symphony file.

User response: Examine previous errors.

EQQ3081E EQQSCLIB CLOSING FAILED

Explanation: An error has occurred closing the data set associated with the EQQSCLIB DDNAME.

System action: The batch job continues its own processing.

User response: None.

**EQQ3082E SYMPHONY JOB *OPINUM OF
JOBSTREAM APP1TOK* WITH NO
CORRESPONDING RECORD IN
EQQSCPDS**

Explanation: The task is unable to find the specified job in the Current Plan.

System action: The batch job does not produce a Symphony file.

System programmer response: Save the batch job message log and VSAM data set associated with EQQSCPDS and contact IBM Software Support.

User response: Contact your system programmer.

**EQQ3083I LOGLINES KEYWORD IS NOT
PRESENT IN TOPOLOGY MEMBER
THE DEFAULT VALUE IS USED**

Explanation: The keyword LOGLINES has been not specified in the TOPOLOGY statement.

System action: The task continues its own processing using the default value for the parameter.

User response: If a value different from the default is preferred, add the keyword to the statement.

**EQQ3084W LOGLINES KEYWORD IN TOPOLOGY
MEMBER HAS AN IVALID VALUE
SPECIFIED THE DEFAULT VALUE IS
USED**

Explanation: The LOGLINES keyword in the TOPOLOGY statement has an incorrect value specified.

System action: The task continues its own processing using the default value for the parameter.

User response: Correct the value and rerun the task to use the selected value.

**EQQ3085I TRCDAYS KEYWORD IS NOT
PRESENT IN TOPOLOGY MEMBER
THE DEFAULT VALUE IS USED**

Explanation: The TRCDAYS keyword has been not specified in the TOPOLOGY statement.

System action: The task continues its own processing using the default value for the parameter.

User response: If a value different from the default is preferred, add the keyword to the statement.

**EQQ3086W TRCDAYS KEYWORD IN TOPOLOGY
MEMBER HAS AN IVALID VALUE
SPECIFIED THE DEFAULT VALUE IS
USED**

Explanation: The TRCDAYS keyword in the

TOPOLOGY statement has an incorrect value specified.

System action: The task continues its own processing using the default value for the parameter.

User response: Correct the value and rerun the task to use the selected value.

EQQ3087I SYMNEW FILE HAS BEEN CREATED

Explanation: The batch job has successfully created the Symphony file.

System action: The task continues its own processing.

User response: None.

EQQ3088E THE SYMPHONY FILE HAS NOT BEEN CREATED

Explanation: The batch job was unable to produce the Symphony file.

System action: The task continues its own processing.

User response: Check the daily plan batch mlog and controller mlog for other messages explaining the cause of the error and correct it. If a valid CP exists renew the symphony or run the batch again.

EQQ3089W PORTNUMBER KEYWORD IN TOPOLOGY MEMBER HAS AN INVALID VALUE SPECIFIED THE DEFAULT VALUE IS USED

Explanation: The PORTNUMBER keyword in the TOPOLOGY statement has an incorrect value specified.

System action: The task continues its own processing using the default value for the parameter.

User response: Correct the value and rerun the task to use the selected value.

EQQ3090I PORTNUMBER KEYWORD IS NOT PRESENT IN TOPOLOGY MEMBER THE DEFAULT VALUE IS USED

Explanation: The PORTNUMBER keyword has not been specified in the TOPOLOGY statement.

System action: The task continues its own processing using the default value for the parameter.

User response: If a value different from the default is preferred, add the keyword to the statement.

EQQ3091E FAILED SYNCHRONIZATION WITH THE END-TO-END DISTRIBUTED ENVIRONMENT

Explanation: The NMM task was not able to synchronize with the TWS distributed environment. There might be a communication problem between the controller and the server.

System action: The NMM continues its processing and the Symphony creation will fail.

System programmer response: Verify that the Enabler tasks and the Server are active. If necessary restart either the Enabler or the Server and then try to recreate the Symphony file running a Daily Plan or a Symphony Renew batch job. If the Enabler and the Server are active, save the message log data set containing this error message and contact the IBM Software Support.

EQQ3092I CPUTYPE NOT SPECIFIED FOR CPUNAME CPU1 CPUTYPE CPUT IS USED

Explanation: The CPUTYPE parameter was not specified in the topology definitions for the CPU identified in the message text. The CPUTYPE is set to the value displayed in the message text.

System action: The CPU parsing process continues.

User response: None.

EQQ3093W JOB JOBNM ON WORKSTATION CPUNM MUST SPECIFY ONE JOBREC STATEMENT ONLY. THE FIRST DEFINITION WILL BE USED.

Explanation: The script definition of FTW job JOBNM contains more than one JOBREC statement. Only one JOBREC statement for member is allowed.

System action: The Batch job continues processing using the definition contained in the first JOBREC statement in the member.

System programmer response: Correct the script definition using only one JOBREC statement. The script definition is contained in the JOBNM member of the PDS related to EQQ3093W.

EQQ3094I CPULIMIT NOT SPECIFIED FOR CPUNAME CPU1 . THE DEFAULT VALUE IS USED

Explanation: The keyword CPULIMIT was not used in the CPUREC statement for the fault-tolerant workstation CPU1.

System action: The task continues processing using the default value for CPU limit.

System programmer response: If you want to limit the maximum jobs running simultaneously, add the CPULIMIT keyword in the CPUREC statement.

EQQ3095W CPULIMIT KEYWORD FOR CPUNAME CPU1 HAS AN INVALID VALUE SPECIFIED THE DEFAULT VALUE IS USED

Explanation: An invalid value has been specified in

the CPULIMIT keyword in the CPUREC statement for fault-tolerant workstation CPU1

System action: The task continue processing using the default value for CPU limit.

System programmer response: Correct the value specified in the CPULIMIT keyword. If the error has been detected in a batch job launched to extend or replan the Current Plan or to refresh Symphony file, run a new refresh Symphony batch job to create a new Symphony containing the specified value.

EQQ3096E THE EQQSCPDS DATA SET PROVIDED BY CONTROLLER IS NOT VALID

Explanation: The Controller has provided a data set, defined by the EQQSCPDS DD-statement, not valid as input to Symphony creation. The possible reason could be:

- Problems in data set defined by the EQQSCPDS DD-statement.
- Controller and server failed to synchronize.

System action: The Symphony creation fails and the daily plan batch program ends in error.

User response: Check the Controller message log to understand why the EQQSCPDS data set is not valid, in particular check for previous EQQN064E messages. Fix the problem and recreate the Symphony. If the cause of failure is a synchronization problem it could be better to wait a while before recreating the Symphony Renew to allow Translator to process all the events in data set specified by the EQQTWSOU DD-statement.

EQQ3097E SOME DOMAINS SPECIFIED BUT NO WORKSTATIONS IN SYMPHONY FILE

Explanation: No workstations have been added to the symphony file but some domain definitions (DOMREC) are present in the topology member (ex.: tplginfo) of EQQPARM.

System action: The symphony file is not produced.

User response: You must add the needed CPUREC definitions (CPUREC) in the topology member (ex: tplginfo) of EQQPARM, define the workstations in the workstation database, and renew the symphony.

EQQ3098W THE TOPOLOGY IS IN USE: THE BATCH PROCESSING CANNOT BE PERFORMED IF THE CONTROLLER IS NOT AVAILABLE

Explanation: The batch job detected that the controller is not active and the Topology member is specified in the batch options.

System action: The batch job fails and no new CP plan nor Symphony file are created.

User response: Restart the controller and re-submit the batch job.

EQQ3099E THE REASON OF THE PREVIOUS ERROR IS: TXT

Explanation: This error provides more detail on what caused the previous error and is issued when a system call failed for some reason.

System action: Depends on the previous error.

User response: Depends on the previous error.

EQQ3100I CODEPAGE KEYWORD IS NOT PRESENT IN TOPOLOGY STATEMENT THE DEFAULT VALUE IS USED

Explanation: The keyword CODEPAGE has not been specified in the Topology statement.

System action: The task will continue its own processing using the default value for the parameter.

User response: If you prefer a value different from the default, add the keyword to the statement.

EQQ3101I NUMJOB JOBS ADDED TO THE SYMPHONY FILE FROM THE CURRENT PLAN

Explanation: During the processing of the daily plan NUMJOB jobs were added to the file.

System action: The batch job continues its normal processing.

User response: None.

EQQ3102I CPUTZ NOT SPECIFIED FOR CPUNAME CPU1. THE DEFAULT VALUE IS USED

Explanation: The keyword CPUTZ was not used in the CPUREC statement for the fault-tolerant workstation CPU1.

System action: The task continues processing using the default value for the CPU timezone.

System programmer response: If you want to specify a timezone different from the default one, specify the CPUTZ keyword in the CPUREC statement.

EQQ3103E FNMI: UNABLE TO LOAD TIMEZONE INFORMATION FOR TZ TIMEZONE UTC WILL BE USED FOR CPU CPU1

Explanation: The batch program that is creating the Symphony file is not able to load the information about the timezone TZ specified for workstation CPU1. The reasons for this error can be one of the following:

- An unsupported timezone has been specified.

EQQ3104I • EQQ3111E

- The BINDIR has been incorrectly specified.
- The file containing the timezone information cannot be accessed.

System action: The batch program continues processing using UTC timezone for the workstation CPU1.

System programmer response: Check that the specified timezone is supported and that the BINDIR keyword of the TOPOLOGY statement specifies the correct directory.

EQQ3104I E2E HOSTNAME NOT SPECIFIED, THE IP ADDRESS VALUE IS TAKEN FROM TCP/IP CONFIGURATION

Explanation: The keyword HOSTNAME was not used in the Topology statement.

System action: The task continues processing using the hostname that the operating system returns for the local machine.

System programmer response: If you want to specify an hostname different from the default one or you are experiencing problems connecting distributed agents to the controller, specify the keyword with the required value.

EQQ3105I A NEW NCP WAS CREATED

Explanation: A new current plan (NCP) was created during the creation, extension, or replanning of the daily plan.

System action: The process continues.

User response: None.

EQQ3106I WAITING FOR SCP

Explanation: During DP extent, DP replan or symphony Renew, the batch is waiting for SCP to start the Symphony file creation.

System action: The process continues.

User response: None.

EQQ3107I SCP IS READY: START JOB ADDITION TO SYMPHONY FILE

Explanation: During DP extend, DP replan or symphony Renew, the batch has been notified that the SCP VSAM data set is available so the addition of the jobs to the symphony file can start.

System action: The process continues.

User response: None.

EQQ3108I JOBS ADDITION TO SYMPHONY FILE COMPLETED

Explanation: During DP extend, DP replan or Symphony Renew, the batch has added all the jobs to the symphony file. The Symphony creation process can continue adding other definitions, for example the job dependencies or the user's definitions.

System action: The process continues.

User response: None.

EQQ3109E MEMBER MEMBER NOT FOUND IN EQQSCLIB LIBRARY

Explanation: There is no member named *MEMBER* in the EQQSCLIB library. This may not necessarily be an error: if the operation is defined as centralized, the EQQSCLIB member containing the job definition is optional.

System action: If the script is not centralized, depending on where you are, Batch or controller:

- The creation of Symphony continues, but the job is added to the Symphony file in Fail status. In the CP file, at job run time, the status of the job will be Started, with extended status Waiting for submission.
- The addition of the operation fails.

User response: Correct the problem in EQQSCLIB, then run Symphony Renew to create and distribute a correct Symphony file.

EQQ3110E EQQSCLIB LIBRARY MEMBER MEMBER IS EMPTY

Explanation: The member named *MEMBER* in EQQSCLIB does not contain any statements.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the EQQSCLIB definition. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ3111E I/O ERROR READING EQQSCLIB LIBRARY MEMBER MEMBER

Explanation: An I/O error has prevented the task from parsing member *MEMBER* of EQQSCLIB.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the EQQSCLIB definition.

Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ3112E INVALID STATEMENT *STMT* IN
EQQSCLIB LIBRARY MEMBER
MEMBER

Explanation: Member *MEMBER* in EQQSCLIB contains one of the following:

- A non-valid *STMT* statement.
- A non-valid *STMT* keyword in one of its statements.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the EQQSCLIB definition. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ3113E NO *STMT* STATEMENT IS PRESENT
IN EQQSCLIB LIBRARY MEMBER
MEMBER

Explanation: Member *MEMBER* in EQQSCLIB does not contain the required *STMT* statement.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the EQQSCLIB definition. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ3114E IN STATEMENT *STMT* THE VALUE
VALUE SPECIFIED FOR KEYWORD
KEYWORD IS INVALID

Explanation: An incorrect value for keyword *KEYWORD* in statement *STMT* was found while parsing a job definition.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the EQQSCLIB definition. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ3115E IN STATEMENT *STMT* RIGHT
PARENTHESIS IS MISSING FOR
KEYWORD *KEYWORD*

Explanation: A syntax error for keyword *KEYWORD* in statement *STMT* was found while parsing a job definition. The left parenthesis that is before the keyword is not matched with a right parenthesis.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the EQQSCLIB definition. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ3116E IN STATEMENT *STMT* THE VALUE
SPECIFIED FOR KEYWORD *KEYWORD*
IS TOO LONG, MAX LENGTH IS *LEN*

Explanation: An incorrect value for keyword *KEYWORD* in statement *STMT* was found while parsing a job definition. The value specified is too long, it cannot exceed *LEN* characters.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the EQQSCLIB definition. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ3117E IN STATEMENT *STMT* THE
KEYWORD *KEYWORD* IS SPECIFIED
TWICE

Explanation: An error was found while parsing a job definition. Keyword *KEYWORD* in statement *STMT* was specified twice. A keyword can only be used once in a statement.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the EQQSCLIB definition. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ3118E THE STATEMENT *STMT* IS SPECIFIED TWICE

Explanation: An error was found while parsing a job definition. Statement *STMT* was specified twice. A statement can only be used once in a job definition.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the EQQSCLIB definition. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ3119I CPUUSER NOT SPECIFIED FOR CPUNAME *CPUI*. THE DEFAULT VALUE IS USED

Explanation: The CPUREC statement that defines the configuration of workstation *CPUI* does not contain the CPUUSER keyword.

System action: IBM Tivoli Workload Scheduler for z/OS will use tws as the default user for the jobs scheduled on workstation *CPUI*. This value is used for operations that do not specify the user name in the job definition and, if they are centralized, do not use user exit 01 to set the user name.

User response: If tws is not correct as the default user, specify the CPUUSER keyword in the CPUREC statement for workstation *CPUI*.

EQQ3120E END-TO-END TRANSLATOR SERVER PROCESS NOT AVAILABLE

Explanation: The end-to-end server is down or it is not running correctly; the Translator process might be ended unexpectedly and the communication with the distributed environment is not possible. This message might be issued in the DP batch MLOG or in the controller MLOG. To perform DPextend, DP replan or Symphony Renew, the Translator process must be running. On the controller side the Receiver task periodically checks for the End-to-End Translator server process availability. Note that:

- The message can be issued during controller initialization if the server has not already started. In this case it is not an error.
- If the Event Manager is not active the Receiver starts waiting for it to become active - EQQW099I message with action = 'STARTED' is issued in the controller MLOG and the Receiver stops checking for the server availability. When the Event manager becomes active again - EQQW099I message with action = 'STOPPED' is issued in the controller MLOG - and the Receiver restarts checking for the server availability.

System action: Depending on where you are:

- The daily plan batch programs are interrupted.
- The controller keeps running.

User response: If the message appears in the controller MLOG while the server is still initializing, wait a while for EQQZ193I message before checking for errors. Otherwise check for errors in the topology server, correct them and restart the server. Check in the controller MLOG for EQQZ193I message. If you receive the message EQQ3120E during a DP batch, after the EQQZ193I message is issued in the controller MLOG you can run the batch program again.

EQQ3121W KEYWD KEYWORD IN *STMT* STATEMENT HAS AN INVALID VALUE SPECIFIED. THE DEFAULT VALUE IS USED

Explanation: The value specified for keyword *KEYWD* in statement *STMT* is not correct.

System action: The program will use the default value for keyword *KEYWD*.

User response: Correct the value specified in statement *STMT* for keyword *KEYWD* to avoid receiving this warning message or if you want to use a different value than the default.

EQQ3122I KEYWD KEYWORD IS NOT PRESENT IN *STMT* STATEMENT THE DEFAULT VALUE IS USED

Explanation: Keyword *KEYWD* has not been specified in statement *STMT*.

System action: The program will use the default value for keyword *KEYWD*.

User response: Specify a value for keyword *KEYWD* in statement *STMT* if you do not want to use the default.

EQQ3123W KEYWD KEYWORD FOR CPUNAME *CPUI* HAS AN INVALID SPECIFIED VALUE. THE DEFAULT VALUE IS USED

Explanation: The value specified for keyword *KEYWD* in the CPUREC statement for workstation *CPUI* is not correct.

System action: The program will use the default value for keyword *KEYWD*.

User response: Correct in the CPUREC statement of *CPUI* the value specified for keyword *KEYWD* to avoid receiving this warning message or if you want to use a different value than the default.

EQQ3124E *FNMI: INTERNAL ERROR WRITING SYMPHONY FILE*

Explanation: There was an internal error during the execution of the *FNMI* routine called to build the symphony file. The next EQQ3099E message will display the reason of this error.

System action: The batch job is interrupted.

User response: Contact IBM support.

EQQ3125W *RECOVERY STATEMENT IGNORED FOR CENTRALIZED SCRIPT JOBNM*

Explanation: The recovery statement in member *JOBNM* in *EQQSCLIB* will be ignored because job *JOBNM* is centralized.

System action: The recovery statement is ignored.

User response: Correct member *JOBNM* in *EQQSCLIB* to avoid the warning message.

EQQ3126W *KEYWORD JOBCMD/JOBSR IGNORED FOR CENTRALIZED SCRIPT JOBNM*

Explanation: The *JOBCMD* and *JOBSR* keywords in statement *JOBREC* of member *JOBNM* in *EQQSCLIB* will be ignored because job *JOBNM* is centralized.

System action: Keywords *JOBCMD* and *JOBSR* are ignored.

User response: To avoid the warning message, correct the *JOBREC* definition in member *JOBNM* of *EQQSCLIB*.

EQQ3127E *DEPNR DEPENDENCIES DEFINED FOR OPERATION OPERNR IN APPLICATION APPL, IADATE, IATIME. THE INTERNAL, EXTERNAL AND PENDING PREDECESSORS NUMBER IS IPREDNR, EPREDNR AND PPREDNR RESPECTIVELY. SPECIAL RESOURCES SRYN.*

Explanation: The job failed because the daily planning process detected more than 40 dependencies defined for the operation. A dependency can be:

- A predecessor operation.
- One or more special resources required by the operation. In this case, one dependency has to be considered regardless the number of required resources.

System action: The daily planning batch process terminates. Neither the current plan nor the Symphony file are updated.

User response: Decrease the number of dependencies specified for the operation in the AD file. Update the LTP accordingly and resubmit the daily planning job.

EQQ3128E *FNMI: UNABLE TO LOAD TIMEZONE INFORMATION FOR CONTROLLER. TIMEZONE UTC WILL BE USED FOR MASTER.*

Explanation: The value of *TIMEZONE* parameter is incorrect.

System action: The scheduler uses the UTC value as default.

User response: Correct the specified *TIMEZONE* value.

EQQ3129E *FNMI PUTENV ENVVAR FAILED*

Explanation: While running the call *PUTENV* in module *FNMI*, an error occurred when a new environment variable *ENVVAR* was being added or the value of an existing environment variable was being changed. The environment variable contains the string used in the *PUTENV* call.

System action: The program runs without this environment setting.

User response: None.

EQQ3131I *WAITING FOR A CP BACKUP*

Explanation: The batch job is waiting for the backup of the current plan to complete.

System action: Processing continues.

User response: None.

EQQ3132I *CREATING A NEW CP*

Explanation: The daily planning job is creating a new current plan (NCP). The normal mode manager (NMM) controller subtask is waiting for the process to complete.

System action: Processing continues.

User response: None.

EQQ3133I *INITIALIZING A NEW SYMPHONY FILE (RUN NUMBER = RUNNO)*

Explanation: The daily planning job is creating and initializing the new Symphony file, based on the new current plan (NCP). The *RUNNO* value is the run number of this Symphony file.

System action: The batch job updates the Symphony file with the records contained in the event files.

User response: None.

EQQ3134E AT LEAST ONE USER DEFINITION RECORD MUST BE SPECIFIED FOR WORKSTATION CPU

Explanation: Workstation CPU is a WNT workstation, but not even a USRREC definition was specified for it.

System action: The Symphony file is not created.

User response: Create at least a USRREC definition for the workstation.

EQQ3135I LIST OF OBJECTS

Explanation: Loop analysis message, issued in the EQQLOOP data set together with message EQQ3136I or EQQ3137I. Possible values for *objects* are OCCURRENCES and OPERATIONS.

System action: None.

User response: None.

EQQ3136I OCC ID: OCCURRENCE

Explanation: Loop analysis message, issued in the EQQLOOP data set. It identifies the occurrence of the network when a loop type NO ENTRY POINT or NO EXIT POINT, or both, are detected and the loop analysis fails.

For each occurrence involved in the loop, one message EQQ3136I is issued.

System action: EQQBATCH module terminates.

User response: Examine the EQQLOOP data set and your network to identify bad dependencies.

Problem determination: The network might be corrupted.

EQQ3137I OPER ID: OPERATION

Explanation: Loop analysis message, issued in the EQQLOOP data set. It identifies the operation that was not checked in the network when a loop type SOME NODES COULD NOT BE CHECKED is detected and the loop analysis fails.

For each operation involved in the loop, one message EQQ3137I is issued.

System action: EQQBATCH module terminates.

User response: Examine the EQQLOOP data set and your network to identify bad dependencies.

Problem determination: The network might be corrupted.

EQQ3139I TIMEZONE KEYWORD IS NOT PRESENT IN TOPOLOGY STATEMENT

Explanation: TIMEZONE parameter is missing in the TOPOLOGY statement.

System action: The scheduler uses the UTC value as default.

User response: Add the TIMEZONE parameter to avoid the informational message.

EQQ3140E THE CPUHOST NAME IS NOT VALID. IT CAN BE EITHER 'OPCMaster' OR HAVE A MAXIMUM LENGTH OF 4 CHARACTERS.

Explanation: You entered a name that is longer than four characters in the CPUHOST parameter of the CPUREC statement. OPCMASTER is the only name that can exceed this limit. OPCMASTER can be used only for standard or fault-tolerant agents that are directly attached to the end-to-end server and belong to the MASTERDM domain.

System action: The daily planning batch ends with RC=16.

User response: Correct the name in the CPUHOST parameter.

EQQ3141I WORKSTATION CPU IS IN MASTERDM DOMAIN AND CANNOT RESOLVE DEPENDENCIES. THE CPURESDEP PARAMETER WILL BE FORCED TO OFF.

Explanation: In the CPUREC statement you specified a fault-tolerant agent in the MASTERDM domain with the CPURESDEP parameter set to ON. Fault-tolerant agents in domain MASTERDM must have CPURESDEP set to OFF.

System action: The value of the CPURESDEP parameter is forced to OFF.

User response: Set CPURESDEP to OFF.

EQQ3142I WORKSTATION CPU IS IN MASTERDM DOMAIN AND CANNOT BE FULLSTATUS. THE FULLSTATUS PARAMETER WILL BE FORCED TO OFF.

Explanation: In the CPUREC statement you specified a fault-tolerant agent in the MASTERDM domain with the FULLSTATUS parameter set to ON. Fault-tolerant agents in domain MASTERDM must have FULLSTATUS set to OFF.

System action: The value of the FULLSTATUS parameter is forced to OFF.

User response: Set FULLSTATUS to OFF.

EQQ3143W IN CPUREC DEFINITION OF WORKSTATION *WSNAME* THE CPULIMIT VALUE IS IGNORED BECAUSE IT DIFFERS FROM THE VALUE STORED IN THE CURRENT PLAN

Explanation: The CPULIMIT keyword in the CPUREC statement for workstation *WSNAME* has a value different from the value stored in the current plan. The value in the current plan cannot be updated by simply running the Symphony Renew option, therefore the CPULIMIT is ignored and the value in the current plan is used to create the Symphony file.

System action: None.

User response: Extend or replan the current planning period to have the CPULIMIT value applied, or use `conman lc` to dynamically change the value in the current plan.

EQQ3144E THE CPUHOST FOR AN EXTENDED AGENT MUST BE AN EXISTING FAULT TOLERANT OR STANDARD AGENT

Explanation: The CPUREC for an extended agent does not refer to an existing CPUHOST. No default values exist as host.

System action: The processing is stopped. No symphony file is produced.

User response: Correct the CPUREC definition for the extended agent and ensure that a workstation is defined to be used as default host (it must be either a standard agent, fault-tolerant agent, or domain manager).

EQQ3145E WORKSTATION *CPU1* BECOMES HOST FOR *CPU2*

Explanation: An error in the CPUREC for workstation *CPU2* was found. The CPUHOST value is reset to the default value *CPU1*.

System action: The processing continues with the new CPUHOST value.

User response: Correct the CPUREC definition for the workstation.

EQQ3146E EXTENDED AGENT *CPU1* HAS AN INCORRECT CPUHOST DEFINITION: *CPUM*

Explanation: The CPUHOST for the extended agent was incorrectly specified. It was set either to OPCMASTER, a non-existent CPU, or another extended agent. An extended agent cannot use OPCMASTER or another extended agent as a host.

System action: If an extended agent was specified as

the host, this message is followed by message EQQ3148W. A default value is forced, if possible, to the first of the following conditions that is found as true:

- The default first level domain manager and its domain exist
- The default fault tolerant agent and its domain exist
- The default standard agent and its domain exist

User response: Correct the CPUREC definition for the workstation.

EQQ3147E EXTENDED AGENT *CPU1* HAS AN INCORRECT DOMAIN DEFINITION: *DOM1*

Explanation: The CPUDOMAIN parameter for the extended agent either does not exist or does not coincide with the domain of the CPUHOST workstation.

System action: Both the domain of the extended agent and the CPUHOST are forced to the first of the following conditions that is found as true:

- The defined CPUHOST and its domain, if it exists
- The default first level domain manager and its domain, if they exist
- The default fault tolerant agent and its domain, if they exist
- The default standard agent and its domain, if they exist

User response: Correct the CPUREC definition for the extended agent.

EQQ3148I CPUHOST *CPU2* IS AN EXTENDED AGENT

Explanation: This message is issued after message EQQ3146W, if an extended agent was specified as CPUHOST.

System action: None.

User response: None.

EQQ3149W CPUHOST *CPU1* HAS AN INCORRECT DOMAIN DEFINITION: *DOM1*

Explanation: An extended agent did not specify the CPUDOMAIN parameter, but its CPUHOST has an incorrect value for it.

System action: A default value is forced, if possible, as CPUDOMAIN, to the first of the following conditions that is found as true:

- The default first level domain manager and its domain exist
- The default fault tolerant agent and its domain exist
- The default standard agent and its domain exist

User response: Correct the CPUREC definition for the workstation.

EQQ3150E LOOP FOUND IN AN APPLICATION NETWORK:

Explanation: A loop was found in a network during the daily planning activity. This message is issued in both EQQMLOG and EQQLOOP data sets. It provides the following information:

- Loop type (no entry and/or exit point, some nodes could not be checked)
- Network ID
- Total number of operations in the network
- Total number of dependencies in the network
- Number of first operations (FOPs), that is operations with no predecessors
- Number of last operations (LOPs), that is operations with no successors
- Number of unchecked operations
- The first occurrence of the network (provided for debug reasons)

System action: The current plan is not created or extended and the loop analysis is started.

User response: Examine the EQQLOOP data set to discover the reasons of the loop and see the suggestions on how to resolve it.

EQQ3151I LOOP REDUCTION ITERATION NN REDUCED LOOP TO MM OPERATIONS

Explanation: Loop analysis message, issued in the EQQLOOP data set. The reduction process was iteratively performed by the loop analysis function and only the operations directly involved in the loop were left in the matrix representing the network. For details, refer to *Managing the Workload*.

System action: The loop analysis function identifies the operations involved in the loop.

User response: Examine the EQQLOOP data set.

EQQ3152I ADID IADATE IATIME WSD OPNO JOBNM

Explanation: Loop analysis message, issued in the EQQLOOP data set. This is the header for message EQQ3153I and indicates:

- Application definition ID
- Input arrival date
- Input arrival time
- Workstation definition ID
- Operation number
- Job name

System action: None.

User response: None.

EQQ3153I LOOP OPERATION: (ADID) IADATE IATIME WSD OPNO JOBNM

Explanation: Loop analysis message, issued in the EQQLOOP data set (message EQQ3152I contains the header for this message). It identifies the operation involved in the loop, providing the following information:

- Application definition ID
- Input arrival date
- Input arrival time
- Workstation definition ID
- Operation number
- Job name

For each operation involved in the loop, one message EQQ3153I is issued.

System action: Details about the operation involved in the loop are provided.

User response: Examine the EQQLOOP data set.

EQQ3154I PREDECESSOR OF: (ADID) IADATE IATIME WSD OPNO JOBNM

Explanation: Loop analysis message, issued in the EQQLOOP data set. It identifies a successor of the operation specified in message EQQ3153I.

System action: Details about the operation involved in the loop are provided.

User response: Examine the EQQLOOP data set.

EQQ3155I SUCCESSOR OF: (ADID) IADATE IATIME WSD OPNO JOBNM

Explanation: Loop analysis message, issued in the EQQLOOP data set. It identifies a predecessor of the operation specified in message EQQ3153I.

System action: Details about the operation involved in the loop are provided.

User response: Examine the EQQLOOP data set.

EQQ3156I REMOVED DEPENDENCY: (ADID) WSD OPNO JOBNM IADATE IATIME PREDECESSOR OF: (ADID) WSD OPNO JOBNM IADATE IATIME REASON FOR REMOVAL: REASON

Explanation: Loop analysis message, issued in the EQQLOOP data set. It indicates the dependency that was identified as being removed from the matrix representing the network, to resolve the loop. It also explains the reason for the removal according to the loop analysis that was done.

Possible values for the reason are: IA TIME CHECK, CLOSEST TO LOOP ENTRY, and MINIMAL NET DISTORTION. For details about the meaning of these

values, refer to *Managing the Workload*.

System action: The system tries to resolve the loop.

User response: According to the information provided in this message, consider if you can actually remove the indicated dependency from your network and resolve the loop.

**EQQ3157I LIST OF INVOLVED APPLICATIONS
SORTED BY LAST UPDATE IN AD
ADID VALIDTO LASTUPD USER**

Explanation: Loop analysis message, issued in the EQQLOOP data set. This is the header for message EQQ3158I and indicates:

- Application definition ID
- VALID TO date of the application definition
- Date and time of the last update made to the application definition
- The user who made the last update

System action: None.

User response: None.

**EQQ3158I LOOP ADID: ADID VALIDTODATE
LASTUPDDATE LASTUPD TIME USR**

Explanation: Loop analysis message, issued in the EQQLOOP data set (message EQQ3157I contains the header for this message). It identifies the application involved in the loop, providing the following information:

- Application definition ID
- VALID TO date
- The date of the last update
- The time of the last update
- The user who made the last update

For each application involved in the loop, one message EQQ3158I is issued, in descending order according to the last update made to the application definitions.

System action: Lists the applications involved in the loop, ordered by the last update date and time.

User response: In the EQQLOOP data set, examine the applications that were listed, starting from the one that was modified most recently. The loop can be caused by recent changes made to the application definitions.

**EQQ3159E LOOP ANALYSIS FAILED: THE LIST
OF OBJECTS IS AVAILABLE IN
EQQLOOP**

Explanation: Loop analysis failed. Possible values for *objects* are OCCURRENCES and OPERATIONS. This message is issued in the EQQMLOG data set.

System action: EQQBATCH module terminates.

User response: Examine the EQQLOOP data set and

your network to identify bad dependencies.

Problem determination: The network might be corrupted. Check the EQQLOOP data set to find detailed messages about the network.

**EQQ3160E EVENT DATASET WITH DDNAME =
DDNAME CANNOT BE ACTION**

Explanation: The specified action could not be performed on the specified event data set. Possible values for *ACTION* are OPENED and READ. This message is issued in the EQQMLOG data set.

System action: This action is skipped on the specified data set and job processing continues

User response: Correct the error and restart the job.

Problem determination: Examine the EQQMLOG for other specific messages that indicate the cause of the problem

**EQQ3161I STATUS OF EVENT DATASET:
DDNAME = DDNAME NUMBER OF
RECORDS = RECNUM STATUS IS =
STATUS UNPROCESSED EVENTS =
RECNOT UNPROCESSED EVENTS % =
PERCENT**

Explanation: The message shows the following status information related to the event data set with DDNAME *DDNAME*:

- Number of records (excluding the header): *RECNUM*
- Status: *STATUS*
- Number of unprocessed event records: *RECNOT*
- Percentage of unprocessed events over total: *PERCENT*

System action: None.

User response: None.

**EQQ3162E WRONG HEADER FOR EVENT
DATASET WITH DDNAME =
DDNAME**

Explanation: The header of the event data set with DDNAME *DDNAME* has inconsistent or unrecognized data. The data set cannot be used.

System action: Job processing is interrupted.

User response: Check that the event data set used is a valid TWSIN or TWSOU event data set. Correct the error and restart the job.

**EQQ3163E NETWORK LOOP DETECTED
DURING BATCH DAILY PLAN**

Explanation: A loop was found in a network during the daily planning activity. This message is issued in the system log.

System action: The current plan is not created or extended and the loop analysis is started.

User response: Examine the EQQLOOP data set to find the reasons for the loop and suggestions on how to resolve it.

EQQ3164E AN ERROR OCCURRED DURING NETWORK CONDITIONS VALIDATION PROCESS

Explanation: A loop was found in a network during the daily planning activity. The inconsistent definition includes condition dependencies. This message is issued in the system log.

System action: The current plan is not created or extended and the loop analysis is started.

User response: Examine the EQQLOOP data set to find the reasons for the loop and suggestions on how to resolve it.

EQQ3166E NO WS OPEN TIMES FOR PERIOD PER1 - PER2.

Explanation: All workstations are closed during the period of time extending from *PER1* to *PER2*. The format of *PER1* and *PER2* is YMMDD HHHH.

System action: The daily planning program is terminated.

User response: Use the Workstation Description panel or the Calendar panel to update the workstation open intervals.

EQQ3167E BLANK INPUT ARRIVAL IN OCCURRENCE INDEX BLOCK.

Explanation: While processing the index blocks for occurrences belonging to the old current plan, the daily plan batch detected a blank value in the IA time.

System action: The daily planning program ends in error.

User response: Contact IBM Support.

EQQ4010E RECOVERY JOB OF JOB *JOBNM* IS ON WORKSTATION *CPURE* THAT IS NOT PRESENT ON SYMPHONY FILE

Explanation: The recovery statement (JOBREC) in member *JOBNM* in EQQSCLIB specifies a workstation *CPURE* that is not defined in the symphony file. The problem is one of the following:

- The workstation is not defined in the topology information member.
- The workstation is defined, but has not been flagged as a fault-tolerant workstation in the scheduler database.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues but the job is added in *fail* status.
- The addition of the operation fails.

User response: Correct the EQQSCLIB definition. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ4011I RECOVERY JOB OF *JOBNM* CANNOT USE KEYWORD MESSAGE IF RECOVERY OPTION IS STOP

Explanation: The recovery statement (JOBREC) in member *JOBNM* in EQQSCLIB cannot specify the keyword MESSAGE if the recovery option is STOP. It is not possible to use recovery option STOP with recovery action prompt reply.

System action: The MESSAGE keyword is ignored.

User response: To avoid the warning message, correct the JOBREC definition in member *JOBNM* in EQQSCLIB.

EQQ4012E RECOVERY JOB OF *JOBNM* SPECIFIES USER *USRRE* THAT IS NOT IN SYMPHONY

Explanation: The recovery statement (JOBREC) in member *JOBNM* in EQQSCLIB specifies a non-valid user name *USRRE* for the recovery job. The user name must be defined on the in the PARMLIB in the users information member (for example, USRINFO)..

System action: Depending on where you are, Batch or controller, you can have one of the following situations:

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the JOBREC definition in member *JOBNM* in EQQSCLIB. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ4013E RECOVERY JOB OF *JOBNM* MUST SPECIFY ONE KEYWORD BETWEEN JOBSCR AND JOBCMD

Explanation: The recovery statement (JOBREC) in member *JOBNM* in EQQSCLIB must specify one of either the JOBSCR or JOBCMD keywords. The two keywords are both either missing or present.

System action: Depending on where you are, Batch or controller, you can have one of the following situations:

- The creation of Symphony continues but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the JOBREC definition in member *JOBNM* in EQQSLIB. Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ4014I RECOVERY JOB OF *JOBNM* HAS NO JOBUSR KEYWORD SPECIFIED, THE DEFAULT ONE SPECIFIED FOR CPU CPURE IS USED

Explanation: The *JOBUSR* keyword is missing from the recovery statement (JOBREC) in member *JOBNM* in EQQSLIB. The default one specified for CPU *CPURE* in the CPUREC statement will be used in its place.

System action: Depending on where you are, Batch or controller, the creation of Symphony or the addition of the operation continues by automatically setting the user with the default value.

User response: If you want to use a different value, you must add the *JOBUSR* keyword in script *JOBNM* and renew the Symphony.

EQQ4015I RECOVERY JOB OF *JOBNM* HAS NO JOBWS KEYWORD SPECIFIED, THE WORKSTATION CPUNM OF JOB *JOBNM* IS USED

Explanation: The *JOBWS* keyword is missing from the recovery statement (JOBREC) in member *JOBNM* in EQQSLIB. The workstation defined for job *JOBNM* will be used in its place.

If you are running EQQSLCHK sample JCL, workstation field is filled with N/A (Not applicable), because the CPU name is not available for the sample.

System action: Depending on where you are (Batch, controller, or EQQSLCHK):

- The creation of Symphony or the addition of the operation continues by automatically setting the workstation to *CPUNM*.
- EQQSLCHK sample JCL continues parsing processing.

User response: If you want to specify a different recovery job workstation than the workstation of the job to recover, you must add the *JOBWS* keyword in script *JOBNM* and renew the Symphony.

EQQ4016W JOB *JOBNM* HAS NO RECOVERY JOB: JOBUSR, JOBWS, INTERACTV, RCONDSUC, RECOVERY STATEMENT KEYWORDS WILL BE IGNORED

Explanation: In RECOVERY statement in member *JOBNM* in EQQSLIB, there are no JOBCMD or JOBSCR keywords: *JOBNM* has no recovery job then *JOBUSR*, *JOBWS*, *INTERACTV*, and *RCONDSUC* recovery statement keywords will be ignored.

System action: Depending on where you are, Batch or

controller, the creation of Symphony or the addition of the operation continues.

User response: If you want to define a recovery job for *JOBNM*, add JOBCMD or JOBSCR to the recovery statement and renew the Symphony.

EQQ4017E FNMI: WRITING OF PROMPT RECORD FOR JOB *JOB1* TO FILE *SUF1* FAILED

Explanation: The task is unable to put information for the prompt record of *JOB1* job in the *SUF1* Symphony file.

System action: The creation of the Symphony fails.

System programmer response: Depending on the user problem do one or more of the following operations:

- Set the access mode of the work directory or provide the required rights to the user to allow the user to write to the file.
- Increase the free space on the file system.

User response: Check that the *SUF1* file exists and that the user that is running the batch job has the correct rights to write to it. Check that there is sufficient free space on the file system. Contact the system programmer and renew the Symphony.

EQQ4018E JOB *JOBNM*: RCONDSUC VALUE LENGTH NOT ALLOWED REC

Explanation: In member *JOBNM* in EQQSLIB, in *JOBREC/RECOVERY* statement the length of *RCONDSUC* value is not allowed because the length of *RCONDSUC* plus the length of *JOBSCR/JOBCMD* is greater than 4095.

System action: Depending on where you are, Batch or Controller:

- The Symphony creation continues but job is added in fail status
- Operation adding fails.

User response: Correct *JOBREC/RECOVERY* definition in member *JOBNM* in EQQSLIB: you can change *RCONDSUC* or *JOBSCR/JOBCMD* value. Renew Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ4019E JOB *JOBNM* RCONDSUC VALUE NOT VALID. RSN: REASON

Explanation: In member *JOBNM* in EQQSLIB, in *JOBREC/RECOVERY* statement the *RCONDSUC* keyword value is not correct. The *REASON* explains the cause of the error:

- Unbalanced parenthesis
- Invalid operation
- Invalid expression
- Invalid operand

System action: Depending on where you are, Batch or controller:

- The symphony creation continues but job is added in fail status
- Operation adding fail

User response: Correct the RCONDSUC value.

Depending on where you are, Batch or controller:

- Renew Symphony
- Add the operation again

EQQ4020E MISPLACED VARSUB STATEMENT IN JOB *JOBNM* ON WORKSTATION CPNUM

Explanation: The VARSUB statement was inserted incorrectly in the member *JOBNM* of the SCRIPTLIB. The VARSUB statement must always be in the first position.

System action: The creation of Symphony continues, but the job is added in fail status.

User response: Check and correct the position of the VARSUB statement in the *JOBNM* member of SCRIPTLIB.

Renew the Symphony if you were creating it, or add the occurrence again if you were modifying the CP.

EQQ4021E UNDEFINED VARIABLE *VAR* IN *SCTN* SCRIPT

Explanation: The *SCTN* definition of the EQQSCLIB library specifies the *VAR* variable which is neither predefined by the scheduler nor appears in a JCL variable table of the scheduler database.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues, but the job is added in fail status.
- The addition of the operation fails.

User response: Correct the *SCTN* definition or define the *VAR* variable in a JCL variable table of the scheduler database. Renew the Symphony or request to add the occurrence using the panel interface again.

EQQ4022E VALIDATION ERROR IN SCRIPT *SCTN*. VALUE IS REQUIRED FOR THE VARIABLE *VAR* BUT IS DEFINED AS BLANK

Explanation: The variable substitution exit setting of the *VAR* variable might be set to blank.

System action: The creation of Symphony or the addition of the operation fails.

User response: Change the Exit process or use the panel interface to modify the variable specification. Renew the Symphony or request to add the occurrence

using the panel interface again.

EQQ4024E INVALID VARIABLE *VAR* IN SCRIPT *SCTN*

Explanation: The name of a variable can contain from one to eight alphanumeric characters. The first character must be alphabetic.

System action: The creation of Symphony or the addition of the operation fails.

User response: Correct the script. Renew the Symphony or request to add the occurrence using the panel interface again.

EQQ4025E RECURSIVE SUBSTITUTION IN SCRIPT *SCTN*

Explanation: The value of a variable depends on the values of other variables, which in turn depend on its value. No value can be determined for this variable

System action: If the job is an end-to-end job with fault-tolerant capabilities, then the creation of Symphony or the addition of the operation fails. If the job is a job with advanced options, the current operation status is set to ended-in-error with error code OJCV.

User response: Examine the tables and variable definitions. Correct them to eliminate the closed translation loop. If the job is an end-to-end job with fault-tolerant capabilities, renew the Symphony or request to add the occurrence using the panel interface again. If the job is a job with advanced options, resubmit the job.

EQQ4026I INTRACTV KEYWORD IGNORED FOR JOB *JOBNM* ON WORKSTATION *CPNM*

Explanation: The *JOBNM* definition of EQQSCLIB library specifies the INTRACTV keyword in the JOBREC or RECOVERY statements. This keyword is ignored because it is supported on Windows workstations only.

System action: None.

User response: None.

EQQ4027E UNDEFINED VALUE FOR DEPENDENT VARIABLE *VAR* IN SCRIPT *SCTN*

Explanation: The independent variable is currently set to a value that is not included in the dependency value list of the dependent variable.

System action: Depending on where you are, Batch or controller:

- The creation of Symphony continues, but the job is added in fail status.

- The addition of the operation fails.

User response: Check and correct the variable definitions. Renew the Symphony or request to add the occurrence using the panel interface again.

EQQ4028W BLANK VALUE FOR VARIABLE VAR IN SCRIPT SCTN

Explanation: Data not found in the Extended Info field in the Current Plan operation record.

System action: Processing continues.

User response: Before resubmitting the operation, check the current value of the operation Extended Info field in the Current Plan.

EQQ4029E TRUNCATION OCCURRED DURING VARSUB IN SYSTEM AUTOMATION COMMAND FOR APPLICATION ADID WITH INPUT ARRIVAL IADATE, IATIME AND OPERATION NUMBER OPNO

Explanation: The variable substitution caused the system automation command text to exceed its maximum length (255 bytes). The operation is identified by the owning application ID, operation input arrival date and time, and operation number.

System action: The variable substitution in the system automation command fails. If the SAVARFAIL parameter is set, the system automation operation ends in error with code OJCV.

User response: Check the command text and the variables used. Change the variables to correct the error or make the variable definition available. Request to add the occurrence using the dialog interface again.

EQQ4031W EQQSCLIB IS EMPTY

Explanation: All data sets associated with the EQQSCLIB ddname are empty.

System action: None.

User response: None.

EQQ4032E RECOVERY JOB OF JOB JOBNM IS ON WORKSTATION CPURE THAT IS NOT PRESENT IN FAULT TOLERANT WORKSTATION DEFINITIONS

Explanation: The recovery statement in member *JOBNM* in EQQSCLIB specifies a workstation CPURE that is not defined in the topology information member (for example, TPLGINFO).

System action: None.

User response: Define either the workstation CPURE in the topology information member (for example, TPLGINFO) of EQQPARM, or the correct workstation

in the *JOBWS* parameter for member *JOBNM* in SCRIPTLIB.

EQQ4033I PROCESSED JOB JOBNM IN CONCNUM CONCATENATED SCRIPT LIBRARY

Explanation: Job *JOBNM* processed from EQQSLCHK sample JCL is defined in the script library *CONCNUM* of the EQQSCLIB DDNAME.

System action: None.

User response: None.

EQQ4034E RECURSIVE SUBSTITUTION IN SYSTEM AUTOMATION COMMAND TEXT FOR APPLICATION ADID WITH INPUT ARRIVAL IADATE, IATIME AND OPERATION NUMBER OPNO

Explanation: The value of a variable depends on the values of other variables, which in turn depend on its value. No value can be determined for this variable. The operation is identified by the owning application ID, operation input arrival date and time, and operation number.

System action: The variable substitution in the system automation command fails. If the SAVARFAIL parameter is set, the system automation operation ends in error with code OJCV.

User response: Examine the tables and variable definitions. Correct them to eliminate the closed translation loop and submit the command again.

EQQ4035E UNDEFINED VALUE FOR DEPENDENT VARIABLE VAR IN SA COMMAND FOR APPLICATION ADID WITH INPUT ARRIVAL IADATE, IATIME AND OPERATION NUMBER OPNO

Explanation: The independent variable is currently set to a value that is not included in the list of dependency values related to the dependent variable. The operation is identified by the owning application ID, operation input arrival date and time, and operation number.

System action: The variable substitution in the system automation command fails. If the SAVARFAIL parameter is set, the system automation operation ends in error with code OJCV.

User response: Check the contents of the variable definitions. Correct them and request to add the occurrence again.

EQQ4036E VARIABLE *VAR* NOT VALID IN SYSTEM AUTOMATION COMMAND TEXT FOR APPLICATION *ADID* WITH INPUT ARRIVAL *IADATE*, *IATIME* AND OPERATION NUMBER *OPNO*

Explanation: The variable used in the command text is not valid. The name of a variable can contain from 1 to 8 alphanumeric characters, and the first character must be alphabetic. The operation is identified by the owning application ID, operation input arrival date and time, and operation number. The variable in error is shown.

System action: The variable substitution in the system automation command fails. If the SAVARFAIL parameter is set, the system automation operation ends in error with code OJCV.

User response: Check the contents of the variable definitions. Correct them and request to add the occurrence again.

EQQ4037E BLANK VALUE FOR VARIABLE *VAR* IN SA COMMAND TEXT FOR APPLICATION *ADID* WITH INPUT ARRIVAL *IADATE*, *IATIME* AND OPERATION NUMBER *OPNO*

Explanation: Data not found for the variable *VAR*. The operation is identified by the owning application ID, operation input arrival date and time, and operation number.

System action: The variable substitution in the system automation command fails. If the SAVARFAIL parameter is set, the system automation operation ends in error with code OJCV.

User response: Before resubmitting the operation, check the current value for the variable of the operation.

EQQ4038E VALIDATION ERROR FOR REQUIRED VARIABLE *VAR* IN SA COMMAND FOR APPLICATION *ADID* WITH INPUT ARRIVAL *IADATE*, *IATIME* AND OPERATION NUMBER *OPNO*

Explanation: The variable substitution exit could set the variable *VAR* to blank.

System action: The variable substitution in the system automation command fails. If the SAVARFAIL parameter is set, the system automation operation ends in error with code OJCV.

User response: Change the exit process or use the dialog interface to modify the variable specification of the operation. Request to add the occurrence again.

EQQ4039E UNDEFINED VARIABLE *VAR* IN SYSTEM AUTOMATION COMMAND TEXT FOR APPLICATION *ADID* WITH INPUT ARRIVAL *IADATE*, *IATIME* AND OPERATION NUMBER *OPNO*

Explanation: The variable used in the system automation command text was not found. The operation is identified by the owning application ID, operation input arrival date and time, and operation number.

System action: The variable substitution in the system automation command fails. If the SAVARFAIL parameter is set, the system automation operation ends in error with code OJCV.

User response: Check the command text and the variables used. Change the variables to correct the error or make the variable definition available. Request to add the occurrence using the dialog interface again.

EQQ4040E INCOHERENT DATA IN EQQWSDS. SOME DESTINATIONS RESULT DEFINED WITHOUT A VIRTUAL WORKSTATION. *WSNAME*: *WSNAME*.

Explanation: An internal error occurred in the workstation definition. Some records result as being defined for destinations but no virtual workstation record with that name are defined in the data base.

System action: DP batch ends in error with return code 12.

User response: Contact IBM Software Support.

EQQ9973E THE MAXHISTORYROWS KEYWORD SPECIFIES A VALUE THAT IS NOT IN THE RANGE 0 – 999999

Explanation: The value set for MAXHISTORYROWS in the OPCOPTS statement to define the maximum number of rows to be returned by the HIST command is outside of the allowed range.

System action: The parsing of the initialization parameters stops.

Programmer response: Modify the MAXHISTORYROWS setting. Valid values are in the range 0-999999.

When setting this value, consider that during the HIST command processing the GENERAL SERVICE task locks the CP, preventing other panel requests from accessing it.

EQQ9974E INVALID OPTION VALUE FOR OCCURRENCE NUMBER LIMIT

Explanation: The value of the occurrence number limit is invalid.

System action: The job is terminated.

User response: Check the input parameters and resubmit the job.

EQQ9975E INVALID OPTION VALUE FOR PAGE SIZE

Explanation: The value of the PAGESIZE keyword in the BATCHOPT parameter must be a number from 30 through 500. The default value is 55.

System action: The job is terminated.

User response: Specify a valid option value.

EQQ9979E INVALID OPTION VALUE FOR PLANNING PERIOD

Explanation: The value of the PLANHOUR keyword in the BATCHOPT parameter is invalid.

System action: The job is terminated.

User response: Specify a valid option value. Refer to *Customization and Tuning* for more information.

EQQ9980E OPEN FAILED FOR PARMLIB DATA SET

Explanation: The batch program could not open the parameter library (EQQPARM) data set.

System action: The job is terminated.

User response: Check and correct the EQQPARM DD statement in the JCL and resubmit the job.

EQQ9981E BATCHOPT PARAMETER NOT FOUND

Explanation: The batch program could not find the BATCHOPT initialization statement in the data set specified in the EQQPARM DD statement.

System action: The job is terminated.

User response: Check and correct the EQQPARM DD statement in the JCL and resubmit the job.

EQQ9983E BATCH PARAMETER OPERHISTORY IS EQUAL TO YES, BUT BIND IS NOT AUTHORIZED

Explanation: IBM Tivoli Workload Scheduler for z/OS received an error during an Open DB2 function, because the ID is not authorized to the plan.

System action: The daily planning process is terminated.

User response: Verify that EQQINIDB was correctly run.

EQQ9984E DBSAVAIL KEYWORD REQUIRES DAILY PLANNING PROCESS TO BE STOPPED

Explanation: The DB2 system specified in the DB2 system keyword of the BATCHOPT statement is not running or no DB2 history database has been actually created and initialized. So, since DB2AVAIL keyword has been set equal to stop, the daily planning process is terminated.

System action: The daily planning process is terminated.

User response: Check the reason for the failure and fix the problem.

EQQ9985E INVALID OPTION VALUE FOR DP ALGORITHM

Explanation: The value of the DP algorithm (DPALG) option in the BATCHOPT parameter is invalid.

System action: The job is terminated.

User response: Specify a valid option value. Refer to *Customization and Tuning* for more information.

EQQ9986E DB2SYSTEM KEYWORD NOT SPECIFIED

Explanation: You have specified OPERHISTORY(YES) without specifying a value for the DB2SYSTEM keyword.

System action: The daily planning program is terminated

System programmer response: Edit the BATCHOPT or OPCOPTS statement and either remove the OPERHISTORY keyword or specify the name of a DB2 system in the DB2SYSTEM keyword.

EQQ9987W OPERHISTORY IS NO BUT RELATED PARAMETERS ARE SPECIFIED: IGNORED

Explanation: The BATCHOPT statement specifies the DB2SYSTEM, CONTROLLERTOKEN, DB2AVAIL, or RETAINOPER parameters, either without specifying the OPERHISTORY keyword or with OPERHISTORY set to NO.

System action: The daily planning program continues.

System programmer response: Check whether the history function is intentionally disabled or whether the OPERHISTORY keyword was omitted. If the OPERHISTORY keyword was omitted, add it, setting the value to YES.

EQQ9988I • EQQ9989E

EQQ9988I **DB2SYSTEM DB2SYS IS NOT AVAILABLE**

Explanation: The DB2 system specified in the DB2SYSTEM keyword of the BATCHOPT statement is not started, has been stopped, or has abended, or the specified name is incorrect.

System action: The daily planning program continues processing, but no operations are inserted into the history database.

System programmer response: Check the reason for the failure and correct the problem.

EQQ9989E **DB2 MODULE DB2MOD LOAD FAILED**

Explanation: DB2 module *DB2MOD* failed to load during the daily planning batch run.

System action: The daily planning batch job is terminated.

System programmer response: Check the reason for the failure and correct the problem.

Chapter 195. EQQAnnn messages

EQQA000 - EQQA609

EQQA000E YOU ARE NOT AUTHORIZED TO ACCESS THE AD DATABASE

Explanation: You have attempted to access the application description (AD) database, but you are not authorized to access it. Or, you do not have access authority to a minimum of one of the following IBM Tivoli Workload Scheduler for z/OS resources that are used together with the AD database: the calendar database, the workstation description database, or in some cases, the long-term plan data set.

System action: The request is rejected.

User response: If you require access, contact your security administrator.

EQQA002E THIS VERSION OF THE APPLICATION ALREADY EXISTS

Explanation: The application already exists with the valid-from date that you specified.

System action: The system waits for you to respond.

User response: Specify another valid-from date.

EQQA003E SELECTED PREDECESSOR IS NOT EXTERNAL

Explanation: The predecessor you selected is not external. When defining an external dependency, you must specify the application ID of the external predecessor before selecting to describe it.

System action: The system waits for you to respond.

User response: Specify the application ID of the external predecessor.

EQQA004E NO MATCHING APPLICATION DESCRIPTION(S) FOUND

Explanation: No application description matched the generic or nongeneric search criteria you specified to generate a list of applications.

System action: The system waits for you to respond.

User response: Retry using new selection criteria.

EQQA005E NO MATCHING APPLICATION DESCRIPTION FOUND

Explanation: You selected an application that does not have a matching application description. In a list of

applications, in either the browse or list function, the application you selected was not found. The application may have been deleted or modified after the list of application entries was generated.

System action: The request is rejected.

User response: Return to the application selection criteria panel and press ENTER to generate a fresh list of applications.

EQQA006I NO RUNCYCLES FOUND FOR THIS APPLICATION

Explanation: You have attempted to display the run cycles of an application for which no run cycles have been specified.

System action: The request is rejected.

User response: None.

EQQA009I NO PREDECESSORS FOUND FOR THIS OPERATION

Explanation: You have attempted to display the predecessors of an operation for which no predecessors have been specified.

System action: The request is rejected.

User response: None.

| EQQA010E INVALID PARAMETER INPUT TO | MODULE MOD

| **Explanation:** This message indicates a programming error.

| **System action:** The system waits for you to respond.

| **System programmer response:** To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems", sub-section, "Information to collect for application description problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

EQQA011I THE APPLICATION IS CREATED

Explanation: The application has been created and

EQQA012I • EQQA024E

saved in the application description database.

System action: None.

User response: None.

EQQA012I THE SELECTED APPLICATION IS MODIFIED

Explanation: The selected application has been modified and saved in the application description database.

System action: None.

User response: None.

EQQA013I THE SELECTED APPLICATION IS COPIED

Explanation: The selected application has been copied and the copy has been saved in the application description database.

System action: None.

User response: None.

EQQA014I THE SELECTED APPLICATION IS DELETED

Explanation: The selected application has been deleted from the application description database.

System action: None.

User response: None.

EQQA015E THE NUMBER OF INTERNAL PREDECESSORS IS TOO LARGE

Explanation: You specified too many internal predecessors.

System action: The system waits for you to respond.

User response: Delete one or more internal predecessors.

EQQA016E THE NUMBER OF EXTERNAL PREDECESSORS IS TOO LARGE

Explanation: You specified too many external predecessors.

System action: The system waits for you to respond.

User response: Delete one or more external predecessors.

EQQA017E THE NUMBER OF SPECIAL RESOURCES IS TOO LARGE

Explanation: You specified too many special resources.

System action: The system waits for you to respond.

User response: Delete one or more special resources.

EQQA018E OP OP HAS AN EXTERNAL PRED WS EWS, WHICH IS NOT FOUND

Explanation: Operation *OP* has an external predecessor workstation (*EWS*) that does not exist in the workstation description database.

System action: The system waits for you to respond.

User response: Enter correct data.

EQQA019E THE NUMBER OF CONDITIONAL DEPENDENCIES IS TOO LARGE

Explanation: You specified too many conditional dependencies.

System action: The system waits for you to respond.

User response: Delete one or more conditional dependencies.

EQQA021I NO SPECIAL RESOURCES FOUND FOR THIS OPERATION

Explanation: You have attempted to display the special resources of an operation for which no special resources have been defined.

System action: None.

User response: None.

EQQA022E THE APPLICATION STATUS SPECIFIED IS NOT VALID

Explanation: Valid application statuses you can specify as selection criteria are:

A For active

P For pending

blank For both active and pending

System action: None.

User response: Specify a correct value and press Enter.

EQQA023E PRIORITY MUST BE A NUMBER FROM 1 - 9

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA024E STATUS MUST BE OCHCACT OR OCHCPEND

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA025E INPUT DATA IN FIELD IS REQUIRED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA026E AUTOMATION NOT VALID

Explanation: The Automation option can be Y (yes), N (no), or blank.

EQQA027I NO CONDITION FOUND FOR THIS OPERATION

Explanation: The selected operation has no conditional dependency, therefore the condition list is empty.

EQQA028E CONDITION RULE MUST BE SELECTED AS OCHCYES OR OCHCNO

Explanation: The condition rule option can be Y (yes) or N (no).

EQQA029E ONE AND ONLY ONE CONDITION RULE MUST BE SELECTED

Explanation: You entered the same option in both the condition rule fields.

System action: The system waits for you to respond.

User response: According to the boolean logic, the first field corresponds to the OR operator, the second one to the AND operator. Decide which criteria you want to apply and deselect the other one.

EQQA101E THE VARIABLE TABLE NAME CONTAINS AN INVALID CHARACTER

Explanation: The name of a variable table contains 1 to 16 alphanumeric characters, where the first character is alphabetic.

System action: None.

User response: Specify a correct value and press Enter.

EQQA102E AN APPLICATION WITH THIS ID ALREADY EXISTS

Explanation: You have attempted to create an application, but the application ID that you specified already exists in the application description database.

System action: The system waits for you to respond.

User response: Enter a unique application ID. If you want to create versions of an already existing

application, you should use the copy function.

EQQA103E THE APPLICATION IS BEING UPDATED BY USER *USR* TRY LATER

Explanation: Another user is currently updating the application you want to update.

System action: The system waits for you to respond.

User response: Try to update the application later.

EQQA104E THE PERIOD NAME DOES NOT EXIST IN THE CALENDAR

Explanation: The period name that you specified is not defined in the calendar database.

System action: The system waits for you to respond.

User response: Enter an existing period name, or use the Calendar dialog to define the period name.

EQQA105E YOU ARE NOT AUTHORIZED TO READ THE JCL VARIABLE TABLE DATA BASE

Explanation: You have attempted to refer to a JCL variable table. To do this, you need read authority to the JCL variable table database.

System action: The system waits for you to respond.

User response: If you need to refer to JCL variable table names, contact your security administrator.

EQQA106E DEADLINE PRECEDES INPUT ARRIVAL TIME

Explanation: The deadline must be later than the input arrival time.

System action: None.

User response: Specify a correct value and press Enter.

EQQA107E WORKSTATION DOES NOT EXIST IN WS DESCRIPTION DATA BASE

Explanation: The workstation name that you specified is not defined in the workstation description database.

System action: The system waits for you to respond.

User response: Enter an existing workstation name or use the Work Station Description dialog to define the workstation name.

EQQA108W WHEN UPDATING WS NAME, OPR, EXT, INT, CND ITEMS MUST ALL BE SELECTED

Explanation: To obtain a correct result, you must select all of:

CND Conditional predecessor ws name

EQQA109I • EQQA121E

OPR Workstation name
INT Predecessor ws name
EXT Predecessor ws name

This does not prevent you from updating only one of the items.

System action: The system waits for you to continue.

User response: Select all three items.

EQQA109I NO USER FIELDS ARE FOUND FOR THE OPERATION

Explanation: You have attempted to display the user fields of an operation for which no predecessors have been specified.

System action: The request is rejected.

User response: None.

EQQA110E JOBNAME REQUIRED FOR JOB SETUP, PRINT, OR COMPUTER WS

Explanation: A job name is required for an operation at a job setup, print, or computer workstation.

System action: None.

User response: Specify a correct value and press Enter.

EQQA111E YOU HAVE ENTERED AN INVALID VALUE IN ONE OF THE WLM FIELDS

Explanation: In the WLM POLICY field, the only valid values are:

- L Long Duration. The job is assisted if it runs beyond its estimated duration.
- D Deadline. The job is assisted if it has not finished when its deadline time is reached.
- S Latest Start Time. The job is assisted if it is submitted after its latest start time.
- C Conditional. An algorithm calculates whether to apply the Deadline policy or the Latest Start Time policy.

If you do not specify any value for the WLM POLICY field, the value specified in the WLM parameter of the OPCOPTS statement will be used.

User response: Enter a valid value in the WLM POLICY field.

EQQA116E DURATION TIME IS NOT SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA117E 24.00 IS NOT ALLOWED AS INPUT ARRIVAL TIME

Explanation: Valid input arrival times are 00.00 through 23.59.

System action: None.

User response: Specify a correct value and press Enter.

EQQA118E 00.00 IS NOT ALLOWED AS DEADLINE TIME

Explanation: Valid deadline times are 00.01 through 24.00.

System action: None.

User response: Specify a correct value and press Enter.

EQQA119W SPECIFIED OPERATION DEADLINE EARLIER THAN APPLICATION INPUT ARRIVAL

Explanation: The operation deadline that you specified is earlier than the application input arrival time for the application. This does not prevent you from saving the application description as it is.

System action: The operation deadline is accepted and the system waits for you to respond.

User response: Enter END to save the application description or make the deadline and the input arrival time consistent.

EQQA120I SPECIFIED OPERATION INPUT ARRIVAL LATER THAN APPLICATION DEADLINE

Explanation: The operation input arrival time that you specified is later than the deadline time for the application. This does not prevent you from saving the application description as it is.

System action: The input arrival time for the operation is accepted and the system waits for you to respond.

User response: Enter END to save the application description or make the operation input arrival and the application deadline consistent.

EQQA121E SPECIFIED OPERATION DEADLINE EARLIER THAN OP INPUT ARRIVAL

Explanation: The deadline time must be later than the input arrival time.

System action: None.

User response: Specify a correct value and press Enter.

EQQA122I SPECIFIED APPLICATION INPUT ARRIVAL LATER THAN AN OP INPUT ARRIVAL

Explanation: The application input arrival time that you specified is later than an operation input arrival time defined in the OPER table. This does not prevent you from saving the application description as it is.

System action: The input arrival time for the application is accepted and the system waits for you to respond.

User response: Enter END to save the application description or make the input arrival times consistent.

EQQA123I SPECIFIED OP INPUT ARRIVAL EARLIER THAN APPLICATION INPUT ARRIVAL

Explanation: The operation input arrival time that you specified is earlier than the input arrival time for the application. This does not prevent you from saving the application description as it is.

System action: The input arrival time for the operation is accepted and the system waits for you to respond.

User response: Enter END to save the application description or make the input arrival times consistent.

EQQA124I SPECIFIED OP DEADLINE LATER THAN APPLICATION DEADLINE

Explanation: The operation deadline time that you specified is later than the deadline time for the application. This does not prevent you from saving the application description as it is.

System action: The deadline time for the operation is accepted. The system waits for you to respond.

User response: Enter END to save the application description or make the deadline times consistent.

EQQA125I NO APPLICATION INPUT ARRIVAL TIME SPECIFIED YET

Explanation: No application input arrival time is specified for this application. This does not prevent you from saving the application description as it is.

System action: The times specified for the operation are accepted. The system waits for you to respond.

User response: Enter END to save the application description, or make the deadline times consistent.

EQQA126E SPECIFY AT LEAST ONE RUNDAY

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA127E OUT-OF-EFFECT-FROM DATE PRECEDES IN-EFFECT-FROM DATE

Explanation: The out-of-effect-from date for a run cycle must be later than the in-effect-from date.

System action: None.

User response: Specify a correct value and press Enter.

EQQA128W MULTIPLE INSTANCES DETECTED, BUT IA WAS SPECIFIED AND ITS VALUE WILL BE USED TO GENERATE ONLY ONE OCCURRENCE PER DATE

Explanation: The rule includes run cycle groups that generate more than one instance per day due to the definition of several IA times. But an Input Arrival time value is specified for the run cycle in the AD panels. This value overruns the IA times defined in the run cycle group and is used to define a single occurrence for each day while the multiple daily instances are ignored.

System action: Generates one occurrence per day with the IA time defined in the AD.

User response: If this is not the expected result, consider revising the run cycle group definition. For run cycle groups of type N, you must delete the IA time to keep the multiple instances.

EQQA129E THE REFERENCED RUN CYCLE GROUP IS NOT VALID

Explanation: A problem has been detected in the referenced run cycle group.

System action: None.

User response: Verify the run cycle group or specify a different one.

EQQA132I IA 2400 IS NOT SUPPORTED, CHANGED TO 0000 THE DAY AFTER

Explanation: The occurrence input arrival time specified is out of the prearranged range. Valid input arrival times are 00.00 through 23.59. The inout has therefore been converted to 00.00 the day after.

System action: None.

User response: None.

EQQA133I DEADLINE 0000 IS NOT SUPPORTED,CHANGED TO 2400 THE DAY BEFORE

Explanation: The occurrence deadline specified is out of the prearranged range. Valid deadline times are 00.01 through 24.00. The deadline has therefore been converted to 24.00 the day before.

System action: None.

User response: None.

EQQA134E SUPPRESS IF LATE = YES ALLOWED ONLY WHEN TIME DEPENDENT = YES

Explanation: The SUPPRESS IF LATE option can be YES only when the TIME DEPENDENT option is specified as YES.

System action: None.

User response: Specify a correct value and press Enter.

EQQA135E THE SMOOTHING FACTOR MUST BE A NUMBER 0 - 999

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA136E THE FEEDBACK LIMIT MUST BE A NUMBER 100 - 999

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA137E DEADLINE WTO IS NOT DEFINED OR INVALID

Explanation: Valid deadline WTO options are Y for Yes, and N for No.

System action: None.

User response: Specify a correct value and press Enter.

EQQA138W OPERATION IA OPIA LESS THAN OCCURRENCE IA OCCIA

Explanation: The operation arrival date is earlier than the occurrence. This is accepted, but might not be what you intend.

System action: None.

User response: None.

EQQA139E VALID VALUES: P, W, OR N

Explanation: In the CRITICAL field, the only valid values are:

P Critical path target

W Eligible for WLM assistance

N Not eligible for WLM assistance

User response: Enter a valid value in the CRITICAL field.

EQQA140E REPEAT EVERY CAN BE A VALUE FROM 00.01 TO 23.59

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA141E EVERY OPTION NOT CONSISTENT WITH INPUT ARRIVAL AND WORK DAY END TIME

Explanation: The REPEAT END TIME must be a value between the input arrival time of the run cycle and the calendar work day end time of the application.

System action: The panel is redisplayed with this error message.

User response: If you are in the EVERY Options panel, specify a valid value for the REPEAT END TIME. If you are in the Modifying a Rule panel, go to the EVERY Options panel and set a valid value for the REPEAT END TIME.

EQQA142E REPEAT END TIME CAN BE A VALUE FROM 00.00 TO 23.59

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA143E REPEAT EVERY CANNOT BE BLANK, IF REPEAT END TIME IS SET

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA144E REPEAT END TIME CANNOT BE BLANK, IF REPEAT EVERY IS SET

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA145E THE DEADLINE SMOOTHING FACTOR MUST BE A NUMBER 0 - 999

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA146E THE DEADLINE FEEDBACK LIMIT MUST BE A NUMBER 100 - 999

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA200E OPERATION NUMBER MUST BE 1 - 255

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA201E THE VARIABLE TABLE IS NOT DEFINED

Explanation: You have tried to define a variable table ID that does not exist in IBM Tivoli Workload Scheduler for z/OS's database.

System action: None.

User response: Specify a correct value and press Enter.

EQQA202E THE RUN CYCLE TYPE IS INVALID, ENTER EITHER N, X, R OR E

Explanation: Valid run cycle types are:

N Normal offset-based run cycles.
X Negative offset-based run cycles.
R Regular rule-based run cycles.
E Exception rule-based run cycles.

System action: The request is rejected.

User response: Change the run cycle type to one of the supported values.

EQQA203E THE FREE DAY RULE SPECIFICATION IS INVALID

Explanation: A valid free day rule specification is any of the following:

E Free days excluded.
1 Run on the closest workday before the free day.
2 Run on the closest workday after the free day.
3 Run on the free day.
4 Do not run at all.

EQQA204E CONDITION RULE SUBSET VALUE MUST BE 0-999

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA205E THE RUN CYCLE TYPE MUST BE SPECIFIED

Explanation: Valid run cycle types are:

N Normal offset-based run cycles.
X Negative offset-based run cycles.
R Regular rule-based run cycles.
E Exception rule-based run cycles.

System action: The request is rejected.

User response: Change the run cycle type to one of the supported values.

EQQA206E THE FREE DAY RULE MUST BE SPECIFIED

Explanation: A valid free day rule specification is any of the following:

E Free days excluded.
1 Run on the closest workday before the free day.
2 Run on the closest workday after the free day.
3 Run on the free day.
4 Do not run at all.

System action: None.

User response: Specify a correct value and press Enter.

EQQA207E AN IN-EFFECT-FROM DATE MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA208E AN OUT-OF-EFFECT-FROM DATE MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA209E THE RUN DAY OFFSET MUST BE A NUMBER FROM -999 TO -1 OR 1 TO 999

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA210E THE PRINT OPTION MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify the print option and press Enter.

EQQA211E THE PRINT OPTION CHARACTER IS INVALID

Explanation: Valid print option characters are A for always and C for conditionally.

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA212E WHEN TIME DEPENDENT = YES, SUPPRESS IF LATE MUST BE SPECIFIED

Explanation: The **SUPPRESS IF LATE** option must be specified when the **TIME DEPENDENT** option is specified as YES.

System action: None.

User response: Specify a correct value and press Enter.

EQQA213E THE WS RESOURCE AMOUNT SPECIFIED MUST BE A NUMBER 0 - 99

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA214E THE JOB OPTION CHARACTER SPECIFIED IS INVALID

Explanation: Valid job option characters are Y for yes and N for no.

System action: None.

User response: Specify a correct value and press Enter.

EQQA215E THE NUMBER OF PARALLEL SERVERS MUST BE 1 - 99

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA216E THE INPUT ARRIVAL DAY MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA217E THE INPUT ARRIVAL DAY MUST BE A NUMBER 0 - 99

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA218E THE INPUT ARRIVAL TIME MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA219E THE NUMBER OF PARALLEL SERVERS MUST BE 1 FOR CPU OPERATIONS

Explanation: Operations on a computer workstation can use only one parallel server.

System action: The panel is redisplayed and the dialog waits for you to change the number of parallel servers.

User response: Change the number of parallel servers to one.

EQQA220E THE DEADLINE DAY MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA221E THE DEADLINE DAY OFFSET SPECIFIED MUST BE A NUMBER 0 - 99

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA222E THE DEADLINE TIME MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA223E THE JCL EDIT/BROWSE FUNCTION NEEDS A JOBNAME

Explanation: The JCL edit/browse option can be called only if a jobname has been specified.

System action: The panel is displayed again with this error message.

User response: Specify a jobname.

EQQA224E AD CAPPL OP COP IS JUST A NORMAL PREDECESSOR

Explanation: You cannot define the same job as both conditional and normal predecessor.

System action: The request is rejected.

User response: Remove the inconsistency.

EQQA225E AD PAPPL OP POP IS JUST A CONDITIONAL DEPENDENCY OPERATION

Explanation: You cannot define the same job as both conditional and normal predecessor.

System action: The request is rejected.

User response: Remove the inconsistency.

EQQA226E THE OPERATION NUMBER MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA227E CONDITION DEPENDENCY CANNOT REFER ITSELF AS INTERNAL PRED.

Explanation: The operation number specified for the conditional predecessor is equal to the owning operation number.

System action: The request is rejected.

User response: Correct the operation number.

EQQA228E THE SPECIFIED SPECIAL RESOURCE HELD OPTION IS INVALID

Explanation: Valid special resource held options are S for shared and X for exclusive.

System action: None.

User response: Specify a correct value and press Enter.

EQQA229W OFFSET WRKOFF IS GREATER THAN PERIOD INTERVAL WRKINT

Explanation: The number that you specified for a positive or negative run day offset is greater than the period interval value. If the period is type A, no occurrences are created in the long term plan (LTP) for this offset. If the period type is W, the message is issued as a warning but occurrences can still be created in the LTP.

System action: The system waits for you to respond.

User response: Check if the offset value provides the desired run dates. Correct the value if required. If LTP occurrences should be created, and the period type is A, you must change either the period interval value or the run cycle offset value. Press the END key to save the offset values.

EQQA230E THE VALID RESPONSE IS Y OR N FOLLOWED BY ENTER KEY

Explanation: Y deletes the application and N cancels the deletion of the application.

System action: None.

User response: Specify a correct value and press Enter.

EQQA231E A PERIOD NAME MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA232E UP TO 24 (12 POSITIVE AND 12 NEGATIVE) RUNDAY OFFSETS ARE ALLOWED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA233E THE SPECIFIED HIGHEST RETURN CODE MUST BE A NUMBER 0 - 4095

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA234E THE APPLICATION ID IS NOT SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA235E THE FIRST CHARACTER IN APPLICATION ID MUST BE ALPHABETIC

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA236E THERE IS AN INVALID CHARACTER IN THE APPLICATION ID

Explanation: An application ID can be made up of the following valid characters: A through Z, 0 through 9, and national characters (that is, #, \$, and @).

System action: None.

User response: Specify a correct value and press Enter.

EQQA237E ENTER THE OWNER ID

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA238E THE PRIORITY MUST BE A NUMBER FROM 1 TO 9

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA239E ENTER THE STATUS, A OR P

Explanation: A stands for active and P for pending.

System action: None.

User response: Specify a correct value and press Enter.

EQQA240E SPECIFY A VALID-FROM DATE

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA241E THE MAXIMUM 4 ACTIVE VERSIONS ALREADY EXIST

Explanation: You have attempted to enter an active version of an application description but the maximum four active versions of the application description already exist in the application description database.

System action: The system waits for you to respond.

User response: Reenter with a new application ID, valid-from data, or status; or delete one of the four active versions.

EQQA242E THE MAXIMUM 4 PENDING VERSIONS ALREADY EXIST

Explanation: You have attempted to enter a pending version of an application description but the maximum four pending versions of the application description already exist in the application description database.

System action: The system waits for you to respond.

User response: Reenter with a new application ID, valid-from data, or status; or delete one of the four pending versions.

EQQA243E A PENDING VERSION CANNOT BE COPIED

Explanation: You have attempted to copy a pending version of the application description but only an active version can be copied.

System action: The request is rejected and the system waits for you to respond.

User response: Select an active version to copy.

EQQA244E APPLICATION ID, STATUS, OR VALID-FROM MUST BE CHANGED

Explanation: In the copy function, one of the three key fields (application ID, status, or valid-from key fields) must be changed to create a new version of an existing application description, or a new application description.

System action: The system waits for you to respond.

User response: Change one of the three key fields.

EQQA245E THE RUN DAY OFFSET TABLE CONTAINS DUPLICATES

Explanation: The list of run days cannot contain duplicate offsets.

System action: The system waits for you to respond.

User response: Use the row command D to delete the duplicate run day offsets or change the duplicates.

EQQA246E SPECIFY A WORK STATION NAME

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA247E THE OPERATION TABLE CONTAINS DUPLICATE OPERATION NUMBERS

Explanation: The list of operations cannot contain duplicate operation numbers.

System action: The system waits for you to respond.

User response: Use the row command D to delete the duplicate operation numbers or change the duplicates.

**EQQA248E THE PREDECESSOR TABLE
CONTAINS DUPLICATE
PREDECESSORS**

Explanation: The list of predecessors cannot contain duplicate predecessors.

System action: The system waits for you to respond.

User response: Use the row command D to delete the duplicate predecessors or change the duplicates.

**EQQA249E THE SPECIAL RESOURCE TABLE
CONTAINS DUPLICATE RESOURCES**

Explanation: The list of special resources cannot contain duplicate resources.

System action: The system waits for you to respond.

User response: Use the row command D to delete the duplicate resources or change the duplicates.

EQQA250I AD DOES NOT EXIST IN DATA BASE

Explanation: The specified external predecessor application does not exist in the application description database. This does not prevent you from saving the application as it is.

System action: The system waits for you to respond.

User response: Either enter END to save the external predecessor application or change the external predecessor application.

**EQQA251E AD DOES NOT EXIST IN DATA BASE,
ENTER WS NAME**

Explanation: The specified external predecessor application does not exist in the application description database, so the predecessor workstation name cannot be picked up. Therefore, you must specify the predecessor workstation name.

System action: The system waits for you to respond.

User response: Enter the workstation name of the external predecessor.

**EQQA252I PRED OP DOES NOT EXIST IN
PREDECESSOR APPLICATION**

Explanation: The specified external predecessor operation does not exist in the external predecessor application. This does not prevent you from saving the application as it is.

System action: The system waits for you to respond.

User response: Either enter END to save the external

predecessor operation or change the external predecessor operation.

**EQQA253E PRED OP DOES NOT EXIST IN
PREDECESSOR APPLICATION, ENTER
WS NAME**

Explanation: The specified external predecessor operation does not exist in the external predecessor application, so the predecessor workstation name cannot be picked up. Therefore, you must specify the predecessor workstation name.

System action: The system waits for you to respond.

User response: Enter the predecessor workstation name.

**EQQA254E PRINT OPERATION *OP* MAY HAVE
ONLY ONE CPU PREDECESSOR**

Explanation: The print operation number (*OP*) can have only one CPU internal predecessor.

System action: The system waits for you to respond.

User response: Delete all except one of the internal predecessors.

**EQQA255E JOB SETUP *OP* MUST HAVE THE
SAME JOBNAME AS A CPU
SUCCESSOR**

Explanation: The job setup operation number (*OP*) must have the same job name as any of its CPU successors.

System action: The system waits for you to respond.

User response: Enter a valid CPU successor job name.

**EQQA256E PRINT *OP* MUST HAVE THE
SAME JOBNAME AS THE CPU
PREDECESSOR**

Explanation: The print operation number (*OP*) must have the same job name as its CPU predecessor.

System action: The system waits for you to respond.

User response: Enter a valid CPU predecessor job name.

**EQQA257E THIS VERSIONS VALID-FROM DATE
CAN NOT PRECEDE *MSGVALF***

Explanation: The application valid-from date for a previously defined application description version has been modified. The valid-from date now falls within the validity period of another version of this application description.

System action: The system waits for you to respond.

User response: Change the valid-from date so that it

EQQA258I • EQQA269E

is later than the date specified in *MSGVALF*. Review the validity periods for versions of this application. If a new version is required for the date that you specified, you can copy a version of the application description and specify the required valid-from date.

EQQA258I AD HAS PENDING STATUS

Explanation: The specified external predecessor application has pending status. This does not prevent you from saving the application as it is.

System action: The system waits for you to respond.

User response: Enter END to save the external predecessor application as it is, or change it.

EQQA259E DUPLICATE CONDITIONAL DEPENDENCY

Explanation: You specified the same conditions details in more than one condition definition.

System action: None.

User response: Specify different conditions and press Enter.

EQQA260E SAME DATE SPECIFIED FOR IN-EFFECT-FROM AND OUT-OF-EFFECT-FROM

Explanation: The out-of-effect-from date must be later than the in-effect-from date.

EQQA261E NO MORE THAN 12 ITEMS CAN BE SPECIFIED

Explanation: The print function can handle up to 12 print items at a time.

System action: The system waits for you to respond.

User response: Delete print items so that the total does not exceed 12.

EQQA262E NO MORE THAN 5 ITEMS CAN BE SELECTED

Explanation: No more than five sort items can be selected to be part of the cross reference list.

System action: The system waits for you to respond.

User response: Delete sort items so that the total is not greater than five.

EQQA263E THE SORT ORDER SPECIFIED IS NOT A NUMBER 1 - 5

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA264E THE SPECIFIED SORT ORDER CONTAINS DUPLICATE DIGITS

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA265E THE SPECIFIED SORT ORDER SEQUENCE IS INVALID

Explanation: The digits representing the sort order must be continuous and start with the digit 1.

System action: None.

User response: Specify a correct value and press Enter.

EQQA266E YOU ARE NOT AUTHORIZED TO READ THE OI DATA BASE

Explanation: You have attempted to read the operator instruction (OI) database, but you are not authorized to read it.

System action: The system waits for you to respond.

User response: If you require access to the OI database, contact your security administrator

EQQA267E YOU ARE NOT AUTHORIZED TO UPDATE THE OI DATA BASE

Explanation: You have attempted to update the operator instruction (OI) database, but you are not authorized to update it.

System action: The system waits for you to respond.

User response: If you require update authority to the OI database, contact your security administrator.

EQQA268E CONDITION NUMBER VALUE MUST BE 1-999

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA269E CONDITION TYPE MUST BE RC OR ST

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA271E THERE IS AN INVALID CHARACTER
IN JOBNAME

Explanation: A job name can be made up of the following valid characters: A through Z, 0 through 9, and national characters (that is, #, \$, and @). The first character must be alphabetic or national, the remaining characters can be alphabetic, numeric, and national characters.

System action: None.

User response: Correct the value and press Enter.

EQQA272E THE FIRST CHARACTER IN GROUP
ID MUST BE ALPHABETIC

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA273E THERE IS AN INVALID CHARACTER
IN GROUP ID

Explanation: A group ID can be made up of the following valid characters: A through Z, 0 through 9, and national characters (that is, #, \$, and @).

System action: None.

User response: Specify a correct value and press Enter.

EQQA274E THE FIRST CHARACTER IN
JOBNAME MUST BE ALPHABETIC

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA275E THE WS RESOURCE AMOUNT MUST
BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify the workstation resource and press Enter.

EQQA276E THE NUMBER OF PARALLEL
SERVERS MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify the number of parallel servers and press Enter.

EQQA277E THE FILTER NUMBER *FNR* IS NOT
SUPPORTED

Explanation: This message indicates a programming error.

System action: The system waits for you to respond.

System programmer response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQA278E THE VERIFICATION NUMBER *VNR* IS
NOT SUPPORTED

Explanation: This message indicates a programming error.

System action: The system waits for you to respond.

System programmer response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQA279E THE TABLE OF UPDATES CONTAINS
DUPLICATE UPDATES

Explanation: The table of pending updates cannot contain duplicate updates.

System action: The system waits for you to respond.

User response: Use the row command D to delete the duplicate updates or change the duplicates.

EQQA280E THE TABLE CONTAINS DUPLICATE
ROWS

Explanation: The table cannot contain duplicate rows.

System action: The system waits for you to respond.

User response: Use the row command D to delete the duplicate row items or change the duplicates.

EQQA281E NO MORE THAN 25 PENDING
UPDATES CAN BE SPECIFIED IN
THIS SESSION

Explanation: It is not allowed to specify more than 25 pending updates in this session.

System action: The system waits for you to respond.

User response: Use the row command D to delete pending updates or cancel the latest pending updates.

EQQA282E THE SPECIFIED BATCH JOB TYPE OPTION IS INVALID

Explanation: A valid batch job type is T for trial run or U for updating run.

System action: None.

User response: Specify a correct value and press Enter.

EQQA283E NO UPDATE AUTHORITY TO APPLICATION DESCRIPTION DATA BASE

Explanation: You have attempted to update the application description database, but you are not authorized to update it.

System action: The system waits for you to respond.

User response: If you need to update the application description database, contact your security administrator

EQQA284E YOU ARE NOT AUTHORIZED TO READ THE CALENDAR DATA BASE

Explanation: You have attempted to read the calendar database, but you are not authorized to read it.

System action: The system waits for you to respond.

User response: If you need access to the calendar database, contact your security administrator

EQQA285E YOU ARE NOT AUTHORIZED TO READ THE WS DESCRIPTION DATA BASE

Explanation: You have attempted to read the workstation (WS) description database, but you are not authorized to read it.

System action: The system waits for you to respond.

User response: If you need to access the WS description database, contact your security administrator.

EQQA286E THE DATA SPECIFIED IS TOO LONG

Explanation: The data that you have specified for mass updating is longer than the maximum length allowed for the data item.

System action: The system waits for you to respond.

User response: Check the maximum data length allowed and enter the correct data.

EQQA287E THE CONVERSION NUMBER CNR IS NOT SUPPORTED

Explanation: This message indicates a programming error.

System action: The system waits for you to respond.

System programmer response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQA288E THE RESCALE FACTOR IS NOT SPECIFIED

Explanation: See text.

System action: None.

User response: Specify the rescale factor and press Enter.

EQQA289E THE RESCALE FACTOR MUST BE A NUMBER 0 - 999

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA290E VALID DATA IS A NUMBER 1 - 99

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA291E VALID DATA IS A NUMBER 0 - 99

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA292E VALID DATA IS A NUMBER 100 - 999

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA293E VALID DATA IS A NUMBER 0 - 999

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA294E PERIOD/RULE NAME FILTER IS NOT RELEVANT FOR CURRENT DATA ITEM

Explanation: See text.

System action: None.

User response: Remove the incorrect filter and press Enter.

EQQA295E JOBNAME FILTER IS NOT RELEVANT FOR CURRENT DATA ITEM

Explanation: See text.

System action: None.

User response: Remove the incorrect filter and press Enter.

EQQA296E WS NAME FILTER IS NOT RELEVANT FOR CURRENT DATA ITEM

Explanation: See text.

System action: None.

User response: Remove the incorrect filter and press Enter.

EQQA297E NEITHER JOBNAME NOR WS NAME IS RELEVANT FOR CURRENT DATA ITEM

Explanation: See text.

System action: None.

User response: Remove the incorrect filter and press Enter.

EQQA298E FILTER CRITERIA ARE NOT RELEVANT FOR OWNER ID

Explanation: See text.

System action: None.

User response: Remove the incorrect filter and press Enter.

EQQA299I DATA SET NAME GIVEN; SPECIFIED APPLICATION ID(S) IGNORED

Explanation: When the name of the data set is specified, it is not necessary to specify the application IDs.

System action: None.

User response: None.

EQQA300E VALID DATA IS A NUMBER 1 - 255

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA301E THERE MUST BE AT LEAST ONE OPERATION IN AN APPLICATION

Explanation: The application has no operations. You must specify at least one operation.

System action: The system waits for you to respond.

User response: Specify one or more operations for the application.

EQQA302E PREDECESSOR OPERATION *PO* IS NOT FOUND FOR OPERATION *OP*

Explanation: The predecessor operation (predecessor operation number *PO*) was not found for the operation (operation number *OP*). An internal predecessor operation must exist within the application.

System action: The system waits for you to respond.

User response: Enter an existing operation number.

EQQA303E OPERATION *OP* IS NOT CONNECTED TO APPLICATION

Explanation: The operation (operation number *OP*) has no predecessor or successor connections to the application.

System action: The system waits for you to respond.

User response: Enter or change an internal predecessor to establish a correct application link.

EQQA304E OPERATION *OP* SPECIFIES WORKSTATION *OPWS*, WHICH IS NOT FOUND

Explanation: The operation (operation number *OP*) of this application specifies a workstation (workstation name *OPWS*), which was not found in the workstation description database.

System action: The system waits for you to respond.

User response: Enter an existing workstation name or use the Workstation Description dialog to define the workstation name.

EQQA305E DEPENDENCIES INCLUDING OPERATION *OP* FORM A LOOP

Explanation: A loop was detected in the operation (operation number *OP*) dependency network which must be corrected. For example, operation 10 has operation 5 as its predecessor, and operation 5 has operation 10 as its predecessor.

System action: The system waits for you to respond.

User response: Correct the found loop with these internal predecessors.

EQQA306E VALID-FROM DATE LATER THAN VALID-TO DATE

Explanation: When modifying an application, the valid-from date cannot be changed to a date later than the valid-to date.

System action: None.

User response: Correct the value and press Enter.

EQQA307E OPERATION INPUT ARRIVAL TIME MUST BE SPECIFIED FOR A TIME JOB

Explanation: If the time-dependent job option is specified as YES, an operation input arrival time must be specified.

System action: None.

User response: Set the operation input arrival time and press Enter.

EQQA308E JOB SETUP OPERATION *OP* MUST HAVE A CPU SUCCESSOR

Explanation: The job setup operation (operation number *OP*) must have a CPU successor operation.

System action: The system waits for you to respond.

User response: Enter the job setup operation number as a CPU predecessor number.

EQQA309E PRINT OPERATION *OP* MUST HAVE A CPU PREDECESSOR

Explanation: The print operation (operation number *OP*) must have a CPU predecessor operation.

System action: The system waits for you to respond.

User response: Enter a CPU operation number as the predecessor number.

EQQA310E FIELD FORMAT SPECIFIED AS DBCS BUT INPUT NOT BRACKETED DBCS

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA311E DBCS PART OF BRACKETED FIELD IS BLANK

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA312E COND OP DOES NOT EXIST, ENTER WS NAME

Explanation: While specifying an external conditional predecessor, you entered no workstation name and a number that does not correspond to any operation defined for the external application.

System action: The system waits for you to respond.

User response: Enter a valid workstation name to get a list of jobs available as conditional predecessors.

EQQA313E COND OP DOES NOT EXIST IN THE AD APPLICATION

Explanation: While specifying an external conditional predecessor, you entered a number that does not correspond to any operation defined for the external application.

System action: The system waits for you to respond.

User response: Enter a valid number. To get a list of jobs available as conditional predecessors, enter a valid workstation name and do not enter any data as operation number.

EQQA314E THE OWNER ID IS NOT SPECIFIED

Explanation: See text.

System action: None.

User response: Specify the owner ID and press Enter.

EQQA315E FORMAT OF OWNER ID SPECIFIED AS DBCS BUT INPUT NOT BRACKETED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA316E DBCS PART OF BRACKETED OWNER ID FIELD IS INVALID

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA317E DBCS FIELD CONTAINS UNPAIRED SHIFT-OUT / SHIFT-IN CHARACTER

Explanation: The field indicated by the cursor contains one or more superfluous shift-out or shift-in characters.

System action: The data is rejected.

User response: Correct data and reenter.

EQQA318E DBCS PART CONTAINS INVALID DBCS-CHARACTER

Explanation: The field indicated by the cursor contains out-of-range DBCS characters. With the exception of DBCS blank, X'4040', each byte must be within the range X'41' - X'FE'.

System action: The data is rejected.

User response: Correct data and reenter.

EQQA319E DBCS PART CONTAINS AN ODD NUMBER OF BYTES

Explanation: The field indicated by the cursor is specified as a DBCS field, and requires two bytes per character.

System action: The data is rejected.

User response: Correct data and reenter.

EQQA321E THE SPECIFIED DATA EXCEEDS THE ALLOWED LENGTH

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA322E CONDITION OPERATOR MUST BE CLOG.

Explanation: See text.

System action: None.

User response: Specify CLOG and press Enter.

EQQA323E CONDITION CHECK VALUE MUST BE CVAL.

Explanation: See text.

System action: None.

User response: Specify CVAL and press Enter.

EQQA324E CONDITION MUST HAVE AT LEAST ONE CONDITION DEPENDENCY.

Explanation: The condition has no dependencies defined. You must specify at least one condition dependency.

System action: The request is rejected.

User response: Specify one or more condition dependencies.

EQQA325E CONDITIONS CANNOT BE DEFINED ON A NOT CENTRALIZED OPERATION

Explanation: The COND command is not supported on an end-to-end operation that is not centralized.

System action: The COND command is not run. Remove the conditions and try the operation again.

User response: Remove the conditions and rerun the operation again.

EQQA326E YOU MUST DELETE ALL CONDITIONS BEFORE SETTING CENTRALIZED OPTION TO NO.

Explanation: You are trying to set the centralized option to NO for an end-to-end operation that has conditions defined.

System action: None

User response: First remove the conditions defined on the end-to-end operation and then try again to set the centralized option to NO in the EQQAMJBP panel.

EQQA327E VALUE2 FIELD MUST BE GREATER OF VALUE1 FIELD.

Explanation: You entered an upper boundary greater than the lower one as range values.

System action: The data is rejected.

User response: Enter consistent boundaries for the RG operator.

EQQA329E CONDITIONAL INTERNAL PREDECESSOR NOT FOUND.

Explanation: The specified predecessor does not exist in the database.

System action: The request is rejected.

EQQA330E • EQQA341E

User response: Correct the input and reenter.

EQQA330E CONDITION CHECK VALUE MUST BE 000-FFF (IF UXXX, SXXX) OR 0-9999.

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA331E CONDITION CHECK VALUE CANNOT BE UFFF, SFFF, OR 9999 IF CondOP=GT.

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA332E CONDITION CHECK VALUE CANNOT BE U000, S000, OR 0 IF CondOP=LT.

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA333E CONDITION CAN BE ADDED ONLY ON WAITING OR READY OPERATIONS

Explanation: You requested to create a new condition for an operation that is not in ready or waiting status.

System action: The request is rejected.

User response: Check the operation status before repeating the request.

EQQA334E CONDITIONAL PREDECESSOR CANNOT BE ADDED IF REMOVED FROM PLAN

Explanation: You requested to create a condition dependency specifying a predecessor that was removed by daily planning.

System action: The request is rejected.

User response: Consider specifying a different conditional predecessor.

EQQA335E CONDITION CHECK VALUE1 CANNOT BE UFFF, SFFF OR 9999 IF CONDOP=RG

Explanation: You specified the maximum allowed value as first boundary of a range.

System action: The request is rejected.

User response: Enter a correct value, lower than the maximum allowed.

EQQA336E THERE IS AN INCORRECT CHARACTER IN STEPNAME

Explanation: STEPNAME can be made up of the following valid characters: A through Z, 0 through 9, and national characters (that is, #, \$, and @). The first character must be alphabetic or national, the remaining characters can be alphabetic, numeric, and national characters.

System action: None.

User response: Specify a correct value and press Enter.

EQQA337E THE FIRST CHARACTER IN STEPNAME MUST BE ALPHABETIC

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA338E THERE IS AN INCORRECT CHARACTER IN PROCSTEP

Explanation: PROCSTEP can be made up of the following valid characters: A through Z, 0 through 9, and national characters (that is, #, \$, and @). The first character must be alphabetic or national, the remaining characters can be alphabetic, numeric, and national characters.

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA339E THE FIRST CHARACTER IN PROCSTEP MUST BE ALPHABETIC

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA340E JOB STREAM WORKSTATION MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a workstation and press Enter.

EQQA341E JOB STREAM NAME MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a job stream and press Enter.

EQQA342E JOB NAME MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a job name and press Enter.

EQQA343E INVALID SELECTION FOR REMOTE ENGINE WORKSTATIONS

Explanation: The selected information cannot be specified for remote engine workstations.

System action: None

User response: Specify valid information for remote engine workstations and try the operation again. See *Managing the Workload* for details.

EQQA344E SELECTION IS ALLOWED ONLY FOR REMOTE ENGINE WORKSTATIONS

Explanation: Remote job information is not available for non-remote engine workstations.

System action: None

User response: Remove all the remote job information and try the operation again. See the *Managing the Workload* for details.

EQQA345E DATA SPECIFIED CONTAINS INVALID CHARACTERS

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA346E REMOTE JOB INFORMATION MUST BE SPECIFIED

Explanation: Remote job information must be specified if the operation is defined to run on a remote engine workstation.

System action: None

User response: Specify the remote job information and try the operation again. See *Managing the Workload* for details.

EQQA347E INCONSISTENT OPTION FOR AN OPERATION ON A REMOTE ENGINE WORKSTATION

Explanation: The operation option specified is not supported on operations defined on remote engine workstations.

System action: None

User response: Specify a valid option and try the operation again. See *Managing the Workload* for details.

EQQA348E COND CANNOT BE SPECIFIED ON AN OPERATION DEFINED ON A REMOTE ENGINE WORKSTATION

Explanation: The COND command is not supported on an operation defined on a remote engine workstation.

System action: The COND command is not run.

User response: Remove the COND command and try the operation again. See *Managing the Workload* for details.

EQQA350E THE RUN DAY SHIFT MUST BE A NUMBER FROM -999 TO -1 OR 1 TO 999.

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA351E RUN CYCLE SHIFT TYPE MUST BE INSERTED IF SHIFT IS SPECIFIED.

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA352E THE RUN CYCLE SHIFT TYPE IS INVALID, ENTER EITHER W OR F.

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA400E NO MATCHING JOB DESCRIPTION(S) FOUND

Explanation: No job descriptions were found matching the generic or non-generic search criteria that you specified to generate a list of jobs.

System action: The system waits for you to respond.

User response: Try again, with different selection criteria.

EQQA401E NO MATCHING JOB DESCRIPTION FOUND

Explanation: The job that you selected from a list does not have a matching job description. The job may have been deleted or modified after the list of job entries was generated.

System action: The request is rejected.

User response: Return to the Job Selection Criteria panel and press Enter to generate a fresh list of jobs.

EQQA402I NO RUNCYCLES FOUND FOR THIS JOB

Explanation: You tried to display the run cycles for a job for which no run cycles have been specified.

System action: The request is rejected.

User response: None.

EQQA403I THE JOB IS CREATED

Explanation: The job has been created and saved as a job description.

System action: None.

User response: None.

EQQA404I THE SELECTED JOB IS MODIFIED

Explanation: The job has been modified and saved as a job description.

System action: None.

User response: None.

EQQA405E THE WS SPECIFIED IS NOT A CPU WS OR A GENERAL WS WITH WTO SET

Explanation: See text.

System action: None.

User response: Specify a valid workstation and press Enter.

EQQA406E A JOB WITH THIS ID ALREADY EXISTS

Explanation: You tried to create a job with an ID that already exists in the application description database.

System action: The system waits for you to respond.

User response: Enter a unique job ID. If you want to create a new version of an existing job, use the copy function.

EQQA407E THE JOB IS BEING UPDATED BY ANOTHER USER

Explanation: Another user is currently updating the job that you want to update.

System action: The system waits for you to respond.

User response: Try again later.

EQQA408E THE JOBNAME HAS NOT BEEN SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a job name and press Enter.

EQQA409I THE SELECTED JOB IS DELETED

Explanation: The selected job has been deleted from the job description database.

System action: None.

User response: None.

EQQA410E THE JOB DIALOG CANNOT BE USED WHEN DBCS IS DEFINED FOR APPLID

Explanation: You have tried to enter the job description dialog but DBCS bracketed input has been defined for application IDs in your installation. The application ID of job descriptions must be the same as the job name. Job names cannot be entered in DBCS bracketed format.

System action: The panel is redisplayed with this error message.

User response: Use the Application Description dialog instead.

EQQA411E WORK STATION MUST BE SPECIFIED

Explanation: The workstation pointed to by the cursor must be entered.

System action: None.

User response: Specify a workstation name and press Enter.

EQQA412E WORK STATION SPECIFIED IS NOT A VALID JCL PREPARATION WORK STATION

Explanation: The workstation must be a workstation with the JCL preparation indicator set to Y.

System action: None.

User response: Specify a correct workstation and press Enter.

EQQA413E WORK STATION SPECIFIED IS NOT A VALID MANUAL WORK STATION

Explanation: The workstation must be a MANUAL workstation.

System action: None.

User response: Specify a correct workstation and press Enter.

EQQA414E 24.00 NOT ALLOWED AS A FROM-RUN TIME

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA415E NO PREDECESSORS FOUND THAT MATCH SELECTION CRITERIA

Explanation: You tried to select predecessors for a job. No predecessors were found with the specified selection criteria.

System action: The request is rejected.

User response: Specify a different selection criteria and resubmit the request. See *Managing the Workload* for details.

EQQA416E 00.00 NOT ALLOWED AS A TO-RUN TIME

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQA418E FROM-RUN TIME MUST BE SPECIFIED

Explanation: Either a run time has been entered or run cycles are missing.

System action: None.

User response: Specify a from-run time.

EQQA419E INTERNAL PREDECESSORS ARE NOT ALLOWED FOR JDS

Explanation: If you are currently defining a job, the application ID must be completed for a predecessor.

System action: None.

User response: Complete the application ID and press Enter.

EQQA500E GROUP DEFINITION CANNOT HAVE OPERATIONS

Explanation: A group definition cannot contain operations.

System action: The system waits for you to respond.

User response: If operations are to be defined in this application, change the application type to A.

EQQA501W GROUP DEFINITION *APPLGRID* COULD NOT BE FOUND IN AD FILE

Explanation: The current application description (AD) references an application group definition that cannot be found in the AD database. Either you entered the wrong name, or the application group has not yet been created, or the application group has a pending status (not selectable for processing), or you are not authorized to reference it. If you want to, and if you are authorized, you can save the current application description while it references an application group that does not exist. Such an application description is not used to create occurrences in the long term plan (LTP).

System action: The system waits for you to respond.

User response: If you want the application description to be selected by LTP programs, enter the correct group definition ID, or create the referenced group definition with the application status field set to A.

EQQA502E GROUP DEFINITION ID FIELD CAN BE FILLED IN ONLY WHEN NO RUN CYCLES

Explanation: You cannot specify a group definition ID when run cycles already exist.

System action: The system waits for you to respond.

User response: Either erase the data in the group definition ID field or delete the run cycles for the application.

EQQA503E GROUP DEFINITION CANNOT BELONG TO ANOTHER GROUP

Explanation: You can specify a group definition ID only when the application type is A.

System action: The system waits for you to respond.

User response: Change the application type to A or erase the group definition ID field.

EQQA504E APPLICATION TYPE MUST BE *OHCSTN*, *OHCGRP* OR BLANK

Explanation: The selection criteria that you have specified contains an invalid application type. *OHCSTN* and *OHCGRP* are the national language characters for 'A' (applications) and 'G' (group definitions).

System action: The system waits for you to respond.

User response: Enter the correct characters for applications or group definitions, or blank to select both applications and group definitions.

EQQA505E TYPE MUST BE OCHCSTN OR OCHCGRP

Explanation: You have specified an invalid application type. *OCHCSTN* and *OCHCGRP* are the national language characters for 'A' (applications) and 'G' (group definitions).

System action: The system waits for you to respond.

User response: Enter one of the supported application types.

EQQA506I RUN COMMAND NOT ALLOWED. APPLICATION IN A GROUP CONTAINS NO RUN CYCLE

Explanation: An application that references a group definition for run cycle information does not itself contain run cycles.

System action: The request is rejected.

User response: None.

EQQA507I OPER COMMAND NOT ALLOWED. A GROUP DEFINITION DOES NOT HAVE OPERATIONS

Explanation: A group definition (application type=G) does not contain operations.

System action: The request is rejected.

User response: None.

EQQA508E RUN CYCLES ARE NOT ALLOWED FOR A JOB DESCRIPTION IN A GROUP

Explanation: A job description that references a group definition for run cycle information cannot itself contain run cycles.

System action: The system waits for you to respond.

User response: Either erase the data in the group definition ID field or delete the run cycles for this job description.

EQQA509I NO RUN CYCLES FOR A JOB DESCRIPTION IN A GROUP

Explanation: A job description that references a group definition for run cycle information cannot itself contain run cycles.

System action: The request is rejected.

User response: None.

EQQA510E PRIORITY CANNOT BE SPECIFIED FOR A GROUP DEFINITION

Explanation: You cannot specify priority for a group definition.

System action: The system waits for you to respond.

User response: Erase the data in the priority field.

EQQA511E CALENDAR CANNOT BE SPECIFIED FOR AN APPLICATION IN A GROUP

Explanation: A calendar ID cannot be specified for an application that references a group definition for run cycle information.

System action: The system waits for you to respond.

User response: Either erase the data in the calendar ID field or erase the data in the group definition ID field.

EQQA512E GROUP DEFINITION CANNOT BELONG TO ANOTHER GROUP

Explanation: Group definitions can be specified only when the application type is A (application) or blank (both application and group definition).

System action: The system waits for you to respond.

User response: Change the application type to A or blank, or erase the data in the group definition ID field.

EQQA513I COMMAND NOT VALID FOR A GROUP DEFINITION

Explanation: Calculate and print runday, or Modify long term plan (LTP) can be requested only for applications.

System action: The request is rejected.

User response: None.

EQQA514W GROUP DEFINITION HAS NO RUN CYCLES

Explanation: The group definition contains no run cycle information. Applications that reference this group definition are automatically included in the long term plan.

System action: The system waits for you to respond.

User response: If you want to use this group definition to schedule applications, specify run cycle information.

EQQA515E CALENDAR CANNOT BE SPECIFIED FOR A JOB IN A GROUP

Explanation: A calendar ID cannot be specified for a job that references a group definition for run cycle information.

System action: The system waits for you to respond.

User response: Either erase the data in the calendar ID field or erase the data in the group definition ID field.

EQQA516E NO RUN CYCLES FOR AN APPLICATION IN A GROUP

Explanation: An application that references a group definition for run cycle information cannot itself contain run cycles.

System action: The request is rejected.

User response: Remove the run cycles from the application that belongs to a group.

EQQA517E USER FIELD TABLE CONTAINS DUPLICATED RESOURCES

Explanation: In the user field table, the same user field name was specified in more than one line.

System action: None.

User response: Correct the user field table and press Enter.

EQQA518E THE NUMBER OF USER FIELDS EXCEEDS THE MAXIMUM LIMIT

Explanation: Too many user fields were specified; the maximum allowed is 120.

System action: The system waits for you to respond.

User response: To correct the error, delete one or more user fields.

EQQA520E THE RULE ON WHICH THE RUN CYCLE IS BASED MUST BE DEFINED

Explanation: A rule-based run cycle (type R or E) was inserted or replicated in the run cycle table, but no rule definition was specified.

System action: The request is rejected.

User response: Use the S row command to select the Rule Modification panel and define the rule.

EQQA521E A VALID RULE NAME MUST BE SPECIFIED

Explanation: You have not entered a valid rule name. A valid rule name has a maximum of 8 characters, where the first character is alphabetical and the

remaining characters are alphanumeric or national.

System action: The request is rejected.

User response: Specify a valid rule name.

EQQA522E THE RULE NAME MUST BE UNIQUE WITHIN AN AD

Explanation: You have specified a rule name that has already been defined for a rule-based run cycle for this application description.

System action: The request is rejected.

User response: Specify a unique rule name.

EQQA523E THE RUN CYCLE TYPE HAS BEEN INCORRECTLY MODIFIED

Explanation: You have modified the type from an offset-based run cycle to a rule-based run cycle, or vice versa. You can only change type within the run cycle subtype; that is, N and X for offset-based run cycles, or R and E for rule-based run cycles.

System action: The request is rejected.

User response: Specify one of the required types or create a new run cycle.

EQQA524E CONDITION RULE SUBSET VALUE MUST BE FROM 1 UP TO ROW NUMBER

Explanation: The specified value cannot exceed the number of specified condition dependencies.

EQQA525E CONDITION CHECK VALUE MUST BE SET

Explanation: See text.

System action: None.

User response: Set the value and press Enter.

EQQA526E CONDITION CHECK VALUE MUST BE COMPATIBLE

Explanation: You specified a value not compatible with condition check type or operator.

System action: The request is rejected.

User response: If you specified abend codes as return code range, they must be both in the form Sxxx or Uxxx.

EQQA527E CONDITION STATUS T OR F CANNOT BE CHANGED

Explanation: The condition status does not allow the requested change.

System action: The request is rejected.

User response: Remove the changes in the condition status.

EQQA528E **CONDITION NUMBER CANNOT BE CHANGED**

Explanation: You cannot change the condition identifier.

System action: The request is rejected.

User response: Remove the change in the condition number and try the operation again.

EQQA530E **INVALID SELECTION WHEN FT WORKSTATION**

Explanation: This value is wrong for a fault-tolerant workstation. The fault-tolerant workstation requires a default value.

System action: The request is rejected.

User response: Enter one of the permitted values and try the operation again. See *Managing the Workload* for details.

EQQA531E **INCONSISTENT OPTION WHEN FT WORKSTATION**

Explanation: This option is wrong for a fault-tolerance workstation. The fault-tolerant workstation requires a default value.

System action: Request is rejected.

User response: Enter one of the permitted values and try the operation again. See *Managing the Workload* for details.

EQQA532E **FTW CANNOT HAVE A JOB SETUP AS IMMEDIATE PREDECESSOR**

Explanation: The fault-tolerant workstation does not accept a general workstation as a predecessor.

System action: The request is rejected.

User response: Enter the correct value.

EQQA533E **FTW CANNOT HAVE A PRINT OPERATION AS IMMEDIATELY SUCCESSOR**

Explanation: The fault-tolerance workstation does not accept a printer workstation as a predecessor.

System action: Request is rejected.

User response: Enter the correct value.

EQQA534E **JOB SETUP NOT AVAILABLE FOR NOT CENTRALIZED FTW OPERATIONS**

Explanation: A job setup requires, among its successors, an operation with the following features:

- The operation must run on a CPU.
- The CPU must not be a fault-tolerant workstation or the operation must use centralized script support.
- The operation's jobname must be equal to the job setup name.

In this case, the only operation running on a CPU and having the same jobname is a FTW operation that does not use the centralized script support.

System action: The request is rejected.

User response: Enter the correct value.

EQQA535E **AUTOMATION INFO AVAILABLE FOR A NOT-AUTOMATION WORKSTATION**

Explanation: System automation information is available for a workstation that is not-Automation.

System action: The request is rejected.

User response: Specify a valid value. Ensure that the workstation has the Automation option set to Yes. If you changed the workstation from Automation to not-Automation, change it back or use a workstation that is Automation. If you no longer need the System Automation operation, you cannot change it to be a not-Automation one; you must delete it and create a new one. If you cannot delete the operation for any reason, you can leave a System Automation workstation and define a dummy System Automation command for it in the command text.

EQQA536E **AUTOMATION INFO NOT DEFINED FOR AN AUTOMATION WORKSTATION**

Explanation: System automation information was not defined, but at least the command text is required for an Automation workstation.

System action: The request is rejected.

User response: Specify the requested value.

EQQA537E **AUTOMATION INFO SELECTED FOR OP OP, WORKSTATION NOT FOR AUTOMATION**

Explanation: Automation information were specified for a not Automation workstation.

System action: The request is rejected.

User response: Enter a valid value. Automation

information can be specified only for automation workstations.

EQQA538E AUTOMATION INFO NOT AVAILABLE FOR OP OP, WORKSTATION IS FOR AUTOMATION

Explanation: Automation information is not available for an Automation workstation.

System action: The request is rejected.

User response: Enter a valid value. Automation information (the command text, at least) must be provided for automation workstations.

EQQA539E INCONSISTENT OPTION WHEN SA WORKSTATION

Explanation: This option is wrong for a System Automation workstation. The System Automation workstation requires the default value.

System action: The request is rejected.

User response: Enter a valid option.

EQQA600E THE FUNCTION REQUESTED IS UNKNOWN.

Explanation: An incorrect request was received from the Dynamic Workload Console.

System action: The request is rejected.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems", sub-section, "Information to collect for JCL editing problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA601E THE JOB LIBRARY DYNAMIC ALLOCATION FAILED.

Explanation: The job library dynamic allocation failed.

System action: The request is rejected.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA602E THE OPEN OF THE JOB LIBRARY FAILED.

Explanation: The program cannot open the job library.

System action: The request is rejected.

User response: Search the IBM Software database for

a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA603E THE RECORD LENGTH OF THE JOB LIBRARY IS INVALID.

Explanation: The record length of the job library is incorrect.

System action: The request is rejected.

User response: Check that the job library data set was correctly created.

EQQA604E THE FIND OF A JCL MEMBER IN THE JOB LIBRARY FAILED.

Explanation: The program cannot find the JCL member in the job library.

System action: The request is rejected.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA605E THE READ OF A JCL MEMBER IN THE JOB LIBRARY FAILED.

Explanation: The program cannot read the JCL member in the job library.

System action: The request is rejected.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA606E THE CLOSE OF THE JOB LIBRARY FAILED.

Explanation: The program cannot close the JCL member in the job library.

System action: The request is rejected.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA607E THE JCL MEMBER SPECIFIED IS EMPTY.

Explanation: The operation cannot be performed because JCL member specified is empty.

System action: The request is rejected.

User response: Correct the JCL member and retry the operation.

EQQA608E THE JOB LIBRARY DYNAMIC DEALLOCATION FAILED.

Explanation: The job library dynamic deallocation failed.

System action: The request is rejected.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA609E THE STORAGE NEEDED TO PROCESS THE REQUEST WAS NOT AVAILABLE.

Explanation: The operation cannot be performed because of a memory problem

System action: The request is rejected.

User response: Check the memory allocation in the controller.

EQQA610 - EQQA709

EQQA610E AN ERROR OCCURRED WHILE TRANSFERRING DATA WITH CROSS MEMORY.

Explanation: An error occurred while transferring data with cross memory.

System action: The system rejects the action.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Explanation: The request failed because the JCL has invalid record length.

System action: None.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA611E THE STOW OF A JCL MEMBER IN A JOB LIBRARY FAILED.

Explanation: The STOW of a JCL member in a job library failed.

System action: The system rejects the action.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA615E THE INSERT OF A JCL FAILED BECAUSE THE MEMBER ALREADY EXISTS.

Explanation: The INSERT of a JCL failed because the member already exists.

System action: None.

User response: You cannot have more than one JCL with the same name.

EQQA612E THE WRITE OF A JCL MEMBER IN A JOB LIBRARY FAILED.

Explanation: The WRITE of a JCL member in a job library failed.

System action: The system rejects the action.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA616E THE DELETE OF A JCL FAILED BECAUSE THE MEMBER WAS NOT FOUND.

Explanation: The DELETE of a JCL failed because the member was not found.

System action: None.

User response: Verify the name of the JCL that you want to delete and enter the name of an existing JCL.

EQQA613E THE REQUEST FAILED BECAUSE THE JCL PROVIDED IS EMPTY.

Explanation: The request failed because the JCL provided is empty.

System action: None.

User response: Ensure that the JCL has content.

EQQA617E THE JFCB MACRO FAILED TO RETRIEVE THE JOBLIB DATASET LIST.

Explanation: The JFCB macro failed to retrieve the JOBLIB dataset list.

System action: None.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA614E THE REQUEST FAILED BECAUSE THE JCL HAS INVALID RECORD LENGTH.

EQQA618E THE DESERV MACRO FAILED TO RETRIEVE THE JOBLIB MEMBER LIST.

Explanation: The DESERV macro failed to retrieve the JOBLIB member list.

System action: None.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA619E THE LIST FILTER PROVIDED IS NOT VALID.

Explanation: The list filter provided is not valid.

System action: The request is rejected.

User response: Enter a valid filter.

EQQA620E AN UNKNOWN ERROR OCCURRED WHILE EXECUTING AN HTTP REQUEST.

Explanation: An unknown error occurred while executing an HTTP request.

System action: The request is rejected.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA621E AN HTTP SELECT REQUEST WAS RECEIVED WITH NO INPUT DATA.

Explanation: An HTTP SELECT request was received with no input data.

System action: The request is rejected.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA622E THE RETRIEVE OF THE HTTP SELECT INPUT SEGMENT FAILED.

Explanation: The retrieve of the HTTP SELECT input segment failed. A possible cause for this failure is that the input segment version is old.

System action: The request is rejected.

User response: Check that the z/OS connector is at the proper level. If you recently upgraded z/OS connector, run Settings->Manage Engines->Test Connection in the Dynamic Workload console, to refresh its cached settings, and retry your request.

If this is not the problem, search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA623E THE HTTP SELECT REQUEST DESTINATION HAS AN INVALID METHOD.

Explanation: The HTTP SELECT request destination has an invalid method.

System action: The request is rejected.

User response: Specify a valid workstation (either HTTP or HTTPS).

EQQA624E THE HTTP SELECT REQUEST DESTINATION WAS NOT FOUND.

Explanation: The HTTP SELECT request destination was not found.

System action: The request is rejected.

User response: Specify an existing destination.

EQQA625E THE HTTP SELECT REQUEST HAS AN INVALID HTTP DESTINATION TYPE.

Explanation: The HTTP SELECT request has an invalid HTTP destination type.

System action: The request is rejected.

User response: Specify a destination with a valid HTTP destination type (either broker or agent).

EQQA626E THE ATTACH OF THE C PROCESS FAILED.

Explanation: The ATTACH of the C process failed.

System action: The system rejects the action.

User response: Search the IBM Software database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA627E THE REQUEST TO THE DYNAMIC DOMAIN MANAGER FAILED WITH REASON CODE XSSRC.

Explanation: The request to the Dynamic Domain Manager failed with reason code XSSRC. See Chapter 234, "Reason codes," on page 1417 for a description of the reason code.

System action: The request is rejected.

User response: Correct the error and retry the operation.

EQQA628E THE HTTP REQUEST FAILED WITH REASON CODE XSSRC.

Explanation: The HTTP request failed with reason code XSSRC. See Chapter 234, "Reason codes," on page 1417 for a description of the reason code.

System action: The request is rejected.

User response: Correct the error and retry the operation.

EQQA629E THE C PROCESS FAILED WITH REASON CODE XSSRC.

Explanation: The C process failed with reason code XSSRC. See Chapter 234, "Reason codes," on page 1417 for a description of the reason code.

System action: The action is rejected.

User response: Correct the error and retry the operation.

EQQA630E AN ERROR OCCURRED WHILE TRANSFERRING DATA WITH CROSS MEMORY.

Explanation: An error occurred while transferring data with cross memory.

System action: The system rejects the action.

User response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA631E THE STORAGE NEEDED TO PROCESS THE REQUEST WAS NOT AVAILABLE.

Explanation: The storage needed to process the request was not available.

System action: The action is rejected.

User response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA632E THE TEMPLATE YOU HAVE ENTERED IS NOT CORRECT.

Explanation: The template you have entered is not correct.

System action: The request is rejected.

User response: Specify a valid template.

EQQA634E THE FUNCTION REQUESTED IS UNKNOWN.

Explanation: The function requested is unknown.

System action: The request is rejected.

User response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA635E AN UNKNOWN ERROR OCCURRED WHILE EXECUTING A DEST REQUEST.

Explanation: An unknown error occurred while executing a DEST request.

System action: The system rejects the request.

User response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQA636E THE NAME OF THE MEMBER CONTAINS AN INVALID CHARACTER.

Explanation: The name of the member contains an invalid character.

System action: The system rejects the request.

User response: Specify an existing member name.

EQQA637E THE NAME OF THE DATA SET IS INVALID.

Explanation: The name of the data set is invalid.

System action: The system rejects the request.

User response: Specify an existing data set name.

EQQA638E THE DELETE POOL HTTP REQUEST FAILED WITH REASON CODE XSSRC.

Explanation: The delete pool HTTP request failed with reason code XSSRC. See Chapter 234, "Reason codes," on page 1417 for a description of the reason code.

System action: The request is rejected.

User response: Correct the error and retry the operation.

EQQA639E THE DELETE POOL HTTP REQUEST FAILED WITH REASON CODE &XSSRC

Explanation: The HTTP request has failed. See Chapter 234, "Reason codes," on page 1417 for a description of the reason code.

System action: The request is rejected.

User response: Correct the error and retry the operation.

EQQA640E THE REQUEST CANNOT BE EXECUTED ON A BROKER DYNAMIC WORKSTATION.

Explanation: The operation type you requested is not supported on broker workstations. You can perform this operation on the following workstation types:

- Pool

- Dynamic pool
- Tivoli Workload Scheduler for z/OS agent

System action: The request is rejected.

User response: Specify one of the workstation types where you can perform the operation. See *Managing the Workload* or the *Dynamic Workload Console User's Guide* for details.

EQQA641E THE POOL CREATION FAILED. THE NAME CONTAINS UNSUPPORTED SPECIAL CHARACTERS.

Explanation: The pool creation failed. The name contains unsupported special characters.

System action: The request is rejected.

User response: Correct the error and retry the operation.

EQQA642E THE HTTP REQUEST FAILED. THE SPECIFIED WORKSTATION WAS NOT FOUND.

Explanation: The HTTP request failed. The specified workstation was not found.

System action: The request is rejected.

User response: Correct the error and retry the operation.

EQQA643E THE HTTP REQUEST CANNOT BE EXECUTED. THE JOB WAS NOT FOUND.

Explanation: The HTTP request cannot be executed. The job was not found.

System action: The request is rejected.

User response: Correct the error and retry the operation.

EQQA644E THE JOB CANNOT BE RESTARTED BECAUSE OF A DEPENDENCY WITH ANOTHER JOB.

Explanation: The job cannot be rerun, restarted, or refreshed because it is a predecessor job to another external job or because a conditional dependency is defined.

System action: The request is rejected.

User response: Submit another occurrence of the predecessor job without the dependency.

EQQA645E HTTP REQUEST COULD NOT BE FULFILLED.

Explanation: An HTTP request was made by the controller to the agent or broker, but the request could not be fulfilled. A possible cause for this problem is that the version of the agent or dynamic workload broker might not be compatible with the request.

System action: The request is rejected.

User response: Verify the version of the agent or dynamic workload broker to ensure it is compatible with the request and then submit the request again.

EQQA700E Is mandatory must be C, P or N.

Explanation: In the Application Description ISPF dialogue the user entered a wrong value in the Is mandatory field. This field specifies if an external dependency must be resolved immediately (at plan level), later (after waiting for a subsequent predecessor add) or if it can be left unresolved. Allowed values are C (control), P (plan), or N (no).

System action: The ISPF panel is displayed again.

User response: Enter a valid value in the field.

EQQA701E Criteria must be C, S, R or A.

Explanation: In the Application Description ISPF dialogue the user entered a wrong value in the Criteria field. This field specifies how to resolve a dependency. Allowed values are C (Closest Preceding criteria), S (Same Day criteria), R (Relative Interval criteria), or A (Absolute interval criteria).

System action: The ISPF panel is displayed again.

User response: Enter a valid value in the field.

EQQA702E From hours must be blank or numeric: range is 0-167.

Explanation: In the Application Description ISPF dialogue the user entered a wrong value in the From hours field. This field is related to the resolution criteria used to resolve the dependency: it specifies the number of hours before or after the Input Arrival time (as specified in the when field) at which the interval must start.

System action: The ISPF panel is displayed again.

User response: Enter a valid value in the field.

EQQA703E From minutes must be blank or numeric: range is 0-59.

Explanation: In the Application Description ISPF dialogue the user entered a wrong value in the From minutes field. This field is related to the resolution criteria used to resolve the dependency: it specifies the

| number of minutes before of after the Input Arrival
| time (as specified in the when field) at which the
| interval must start

| **System action:** The ISPF panel is displayed again.

| **User response:** Enter a valid value in the field.

| **EQQA704E For days must be numeric: range is 0-7**

| **Explanation:** In the Application Description ISPF
| dialogue the user entered a wrong value in the For
| days field. This field is related to the resolution criteria
| used to resolve the dependency: it specifies the number
| of days one can move back or forward to solve the
| dependency.

| **System action:** The ISPF panel is displayed again.

| **User response:** Enter a valid value in the field.

| **EQQA705E To hours must be numeric: range is
| 0-167**

| **Explanation:** In the Application Description ISPF
| dialogue the user entered a wrong value in the To
| hours field. This field is related to the resolution criteria
| used to resolve the dependency: it specifies the number
| of hours before of after the Input Arrival time (as
| specified in the when field) at which the interval must
| end.

| **System action:** The ISPF panel is displayed again.

| **User response:** Enter a valid value in the field.

| **EQQA706E To minutes must be numeric: range is
| 0-59**

| **Explanation:** In the Application Description ISPF
| dialogue the user entered a wrong value in the To
| minutes field. This field is related to the resolution
| criteria used to resolve the dependency: it specifies the
| number of minutes before or after the Input Arrival
| time (as specified in the when field) at which the
| interval must end.

| **System action:** The ISPF panel is displayed again.

| **User response:** Enter a valid value in the field.

| **EQQA707E Time format must be HH.MM**

| **Explanation:** In the Application Description ISPF
| dialogue the user entered a wrong value in the Time
| field. This field is related to the resolution criteria used
| to resolve the dependency: it specifies the time before
| of after the Input Arrival time (as specified in the when
| field) at which the interval must end/start.

| **System action:** The ISPF panel is displayed again.

| **User response:** Enter a valid value in the field.

| **EQQA708E when must be B or A.**

| **Explanation:** In the Application Description ISPF
| dialogue the user entered a wrong value in the when
| field. This field is related to the resolution criteria used
| to resolve the dependency: it can refer to the start or
| end of the interval where the dependency must be
| solved and specify if one must search before (B) of after
| (A) the IA of the occurrence to be added.

| **System action:** The ISPF panel is displayed again.

| **User response:** Enter a valid value in the field.

| **EQQA709E from fields must be all blank or all
| filled up.**

| **Explanation:** In the Application Description ISPF
| dialogue the user entered values in only a few of the
| required From fields. These fields are related to the
| resolution criteria used to resolve the dependency and
| can be all left blank to indicate that there is no limit in
| searching a match in the past before the IA of the
| occurrence to be added. But it is not allowed to enter
| values in some of these fields while leaving others
| blank.

| **System action:** The ISPF panel is displayed again.

| **User response:** Either enter a valid value in every
| From field of the panel or leave them all blank.

Chapter 196. EQQCnnn messages

EQQC001 - EQQC501

**EQQC001I THE AUTOMATIC RECOVERY
SUBTASK HAS STARTED**

Explanation: The automatic job recovery subtask has been successfully initialized.

System action: Automatic job recovery processing is started.

User response: None.

**EQQC002E THE AUTOMATIC RECOVERY
INITIALIZATION FAILED**

Explanation: The automatic job recovery subtask was not initialized because there is an error in the AROPTS initialization statement.

System action: Automatic job recovery initialization is terminated.

System programmer response: Correct the error in the AROPTS initialization statement and restart IBM Tivoli Workload Scheduler for z/OS.

User response: Contact your system programmer.

Problem determination: This message is preceded by a message in the IBM Tivoli Workload Scheduler for z/OS message log giving the reason for this error message.

**EQQC003I THE AUTOMATIC RECOVERY
SUBTASK HAS ENDED NORMALLY**

Explanation: This message is issued when the IBM Tivoli Workload Scheduler for z/OS subsystem is being stopped by an operator command.

System action: The IBM Tivoli Workload Scheduler for z/OS termination processing continues.

User response: None.

**EQQC004E STARTTIME OR ENDTIME OPTION
TIME IN AROPTS STATEMENT IS
NOT VALID**

Explanation: The STARTTIME or ENDTIME option in the AROPTS initialization statement is not specified in a valid IBM Tivoli Workload Scheduler for z/OS time format. The option *TIME* must be a 4-digit decimal number in the format HHMM, where HH is from 00 through 23, and MM is from 00 through 59.

System action: Automatic job recovery initialization is terminated.

User response: Correct the STARTTIME or ENDTIME value in the AROPTS initialization statement. Stop IBM Tivoli Workload Scheduler for z/OS and restart it.

**EQQC005E THE AUTOMATIC RECOVERY
INITIALIZATION FAILED, MODULE
EQQCASEM NOT FOUND**

Explanation: The initialization of the automatic job recovery subtask failed because the load module EQQCASEM could not be found in a library that can be accessed by IBM Tivoli Workload Scheduler for z/OS.

System action: Automatic job recovery initialization is terminated.

System programmer response: Make sure that the load module EQQCASEM is present in a library that can be accessed by IBM Tivoli Workload Scheduler for z/OS. Stop the IBM Tivoli Workload Scheduler for z/OS started task and restart it.

User response: Contact your system programmer.

**EQQC006E HOUR AND MINUTE MUST BOTH BE
TWO-DIGIT NUMBERS**

Explanation: A nonnumeric time value has been specified.

System action: Processing continues.

System programmer response: Reenter a numeric time value.

**EQQC007E AN ABEND OCCURRED IN THE
AUTOMATIC RECOVERY SUBTASK,
IT IS RESTARTED**

Explanation: An error has caused the automatic job recovery subtask to end abnormally, but it has been able to restart.

System action: Automatic job recovery resumes normal processing, but one or more requests for service may have been rejected.

System programmer response: Collect relevant information about the sequence of events leading to this error. Make sure that the dump data set and the IBM Tivoli Workload Scheduler for z/OS message log are available for inspection. Contact your system administrator.

User response: Inform your system programmer about

EQQC008E • EQQC014W

the error and, if the error can be reproduced, of the sequence of dialog requests leading to the error.

Problem determination: At abend, a dump is written to the SYSxDUMP data set.

EQQC008E HOUR MUST BE IN THE RANGE 0 TO 23

Explanation: A time value has been specified where the hour number is not valid.

System action: Processing continues.

System programmer response: Reenter the time value and specify an hour number in the range 0 through 23.

EQQC009E MINUTE MUST BE IN THE RANGE 0 TO 59

Explanation: A time value has been specified where the minute number is not valid.

System action: Processing continues.

System programmer response: Reenter the time value and specify a minute number in the range 0 through 59.

EQQC011W AUTOMATIC RECOVERY REQUEST FAILED, SERVICE INACTIVE

Explanation: Automatic job recovery requires service from other IBM Tivoli Workload Scheduler for z/OS subtasks. When automatic job recovery was initiated to determine whether or not recovery should be performed for the job that ended in error, the service *SERVICE* was down (not available).

System action: No recovery attempt is made and the job remains ended in error.

System programmer response: Check why the service *SERVICE* was down.

User response: Use the ended-in-error list of the Modify Current Plan dialog to decide whether or not a new automatic job recovery attempt should be made for the job that ended in error.

Problem determination: To determine why the service is not available, review the earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log. For job tracking, consider the messages that mention the normal mode manager.

EQQC012W AUTOMATIC RECOVERY REQUEST FAILED, CANNOT OPEN FILE FILE

Explanation: Automatic job recovery requires access to IBM Tivoli Workload Scheduler for z/OS VSAM files. Failure to open one of these files prevented automatic job recovery from checking whether or not recovery should be performed for the job that ended in error.

FILE is the name of the VSAM file that could not be opened.

System action: No recovery attempt is made and the job remains ended in error.

System programmer response: Check with your system programmer why the file *FILE* could not be opened.

User response: Use the ended-in-error list of the Modify Current Plan dialog to decide whether or not a new automatic job recovery attempt should be made for the job that ended in error.

Problem determination: To determine why the file cannot be opened, review the earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log.

EQQC013W AUTOMATIC RECOVERY REQUEST FAILED, CANNOT ALLOCATE BUFFERS

Explanation: A storage allocation error prevented automatic job recovery from checking whether or not recovery should be performed for the job that ended in error. This message may be followed by message EQQC045I with reason code 50, which identifies the job checked by automatic job recovery.

System action: No recovery attempt is made and the job remains ended in error.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS and restart it in a larger region.

User response: Use the ended-in-error list of the Modify Current Plan dialog to decide whether or not a new automatic job recovery attempt should be made for the job that ended in error.

EQQC014W AUTOMATIC RECOVERY REQUEST FAILED DUE TO I/O ERROR

Explanation: An I/O error prevented automatic job recovery from determining whether or not recovery should be performed for the job that has ended in error. This message may be followed by message EQQC045I with reason code 50, which identifies the job checked by automatic job recovery.

System action: No recovery attempt is made and the job remains ended in error.

System programmer response: Refer to the associated I/O error message for guidance.

User response: Use the ended-in-error list of the Modify Current Plan dialog to decide whether or not a new automatic job recovery attempt should be made for the job that ended in error.

Problem determination: Review the earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log for a message issued for the I/O error.

**EQQC020E NO AUTOMATIC RECOVERY
BECAUSE INVALID CLEAN UP TYPE:
CLNTYP FOR OPERATION OPNO IN
APPLICATION ADID**

Explanation: An automatic recovery task was executed that has the cleanup type set to the value specified by *CLNTYP*. However, the only allowed values are None or Immediate.

System action: The automatic recovery is not processed and the cleanup actions are not started

System programmer response: Check if the cleanup type can be changed to Immediate.

**EQQC021W NO AUTOMATIC RECOVERY TEST
BECAUSE NO ERROR INFORMATION
IN JNT RECORD**

Explanation: When a job fails, error information about the failing operation is saved in the job name table (JNT) record. Automatic job recovery was initiated but could not determine if recovery should be performed for the failed job because no error information was available in the JNT record. This message is followed by message EQQC045I with reason code 50, which identifies the job checked by automatic job recovery.

System action: No recovery attempt is made and the job remains ended in error.

System programmer response: Check the IBM Tivoli Workload Scheduler for z/OS message log for any messages issued at the time that the job ended in error to determine why no JNT record exists.

User response: If any recovery actions by automatic job recovery were required for the job that failed, the actions must be initiated manually. Use the Modify Current Plan dialog to initiate the actions.

If you use automatic job recovery together with the restart and cleanup functions and have defined the *RESSTEP* parameter of the *RECOVER* statement, specify *STEPEVENTS(ALL)* on the *EWTROPTS* statement. Otherwise automatic job recovery and restart and cleanup are not invoked.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log for inconsistencies at the time that the job ended in error. Also review the event data set for the completion of the job. Refer to *Diagnosis Guide and Reference* for the layout of the record in the event data set.

**EQQC022I AUTOMATIC RECOVERY ACTION
POSTPONED FOR OPERATION OPNO
IN APPLICATION ADID. CLEANUP
ACTIONS PENDING. CLEANUP TYPE
IS TYPE**

Explanation: When the automatic recovery for this operation was about to start, the scheduler found that

cleanup actions were in progress (for a cleanup type set to Immediate) or waiting to be started (for a cleanup type set to Manual).

System action: The automatic recovery is postponed until the cleanup actions are complete. If the cleanup type is Immediate, the cleanup actions are started automatically by the scheduler. If the cleanup type is Manual, the cleanup actions must be requested in a dialog.

User response: None.

**EQQC023W NO AUTOMATIC RECOVERY TEST
BECAUSE NO JCL RECORD FOR THE
OPERATION**

Explanation: The JCL record could not be read. This prevented automatic job recovery from determining whether or not recovery should be performed for the job that ended in error. This message is followed by message EQQC045I with reason code 50, which identifies the job checked by automatic job recovery.

System action: No recovery attempt is made and the job remains ended in error.

System programmer response: Check the IBM Tivoli Workload Scheduler for z/OS message log for any messages issued at the time that the job ended in error to determine why the JCL record could not be read.

User response: If any recovery actions by automatic job recovery were required for the job that failed, the actions must be initiated manually. Use the Modify Current Plan dialog to initiate the actions.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log for inconsistencies at the time that the job ended in error.

**EQQC024W NO AUTOMATIC RECOVERY TEST
BECAUSE OPERATION RECORD
MODIFIED**

Explanation: Automatic job recovery could not determine whether or not recovery should be performed for the job that ended in error because the operation record indicates that the operation no longer has the error status.

System action: No recovery attempt is made for the job that ended in error.

User response: None.

**EQQC025W CLEAN UP ACTION NOT STARTED
BECAUSE CP14 RECORD COULD NOT
BE READ**

Explanation: An automatic recovery task was executed. The cleanup type was set to Immediate, so it tried to read the job log record in the current plan to

start the cleanup actions. However, the record was not found

System action: The recovery attempt stops.

System programmer response: Current plan job log information records (CP14) are created by the Controller or by non z/OS trackers when a job execution is completed. Check the EQQMLOG of the Controller to diagnose the problem.

**EQQC026W NO AUTOMATIC RECOVERY TEST
BECAUSE JCL MEMBER IS BEING
USED**

Explanation: Automatic job recovery could not determine whether or not recovery should be performed for the job that ended in error, because the member on the JCL repository file (ddname EQQJ1SDS and EQQJS2DS) was being used by another IBM Tivoli Workload Scheduler for z/OS subtask. This message is followed by message EQQC045I with reason code 50, which identifies the job checked by automatic job recovery.

System action: No recovery attempt is made and the job remains ended in error.

User response: When the EQQJSxDS JCL member is free, you can initiate a new automatic job recovery attempt for the job that ended in error by using the ended-in-error list of the Modify Current Plan dialog.

**EQQC027W NO AUTOMATIC RECOVERY
BECAUSE PROCLIB MEMBER NOT
FOUND**

Explanation: No automatic job recovery could be performed for the job that ended in error because the RECOVER statement that matched the error specifies a procedure library member that could not be found. This message is followed by message EQQC045I with reason code 50, which identifies the job checked by automatic job recovery.

System action: No recovery attempt is made and the job remains ended in error.

User response: Check that the member name is correctly spelled and that it is available in the EQQPRLIB file. When you have found and corrected the error, edit the JCL and insert a % sign in column 4 of the RECOVER line so as to reconvert the line into a RECOVER statement. You can initiate a new automatic job recovery attempt for the job that ended in error by using the ended-in-error list of the Modify Current Plan dialog.

Problem determination: Review the JCL to determine the procedure library member name. The selected RECOVER statement is followed by a comment line that gives the member name.

**EQQC028W NO AUTOMATIC RECOVERY TEST
BECAUSE ERROR IN RECOVER
STATEMENT**

Explanation: While automatic job recovery was checking whether or not recovery should be performed for a job that ended in error, a RECOVER statement with a syntactical error was found. This message is followed by message EQQC045I with reason code 50, which identifies the job checked by automatic job recovery.

System action: No recovery attempt is made and the job remains ended in error.

User response: Check the RECOVER statements for syntactical errors. Make sure that the operation is separated from the operands by one or more blanks, and that the operands are separated by a comma. When you have found and corrected the error, you can initiate a new automatic job recovery attempt for the job that ended in error by using the ended-in-error list of the Modify Current Plan dialog.

Problem determination: Review the JCL of the identified operation.

**EQQC029I NO AUTOMATIC RECOVERY
BECAUSE RECOVER STATEMENT
DOES NOT MATCH THIS ERROR**

Explanation: While automatic job recovery was checking whether or not recovery should be performed for a job that ended in error, one or more RECOVER statements were found but none matched the current error. This message is followed by message EQQC045I with reason code 50, which identifies the job checked by automatic job recovery.

System action: No recovery attempt is made and the job remains ended in error.

User response: Consider if the error should be covered in the recovery scheme.

**EQQC041W JOBLOG INFORMATION COULD
NOT BE RETRIEVED BECAUSE CP14
RECORD COULD NOT BE READ FOR
APPL: ADIDDATE HH.MM, OP WSNOP**

Explanation: An automatic recovery task was executed and an attempt was made to read the job log record in the current plan to start the automatic recovery task actions, however, the record was not. The automatic recovery task was unable to locate the CP14 record in the current plan for the operation that ended in error and that is identified by application *ADID DATE HH. MM*, operation *WSN OP*, where *DATE HH. MM* is the occurrence input arrival time.

System action: The specified automatic recovery actions are not carried out.

User response: Save the message log (EQQMLOG)

and contact IBM Software Support.

EQQC044I AUTO RECOVERY OF APPL
ADIDDATE HH.MM, OP WSNOPJNJID

Explanation: Automatic job recovery actions have been taken for the specified occurrence (application *ADID DATE HH. MM*, operation *WSN OP*, where *DATE HH. MM* is the occurrence input arrival time). The specified JCL rebuild is made. Restart, application addition, and release of successors are in process as specified in the RECOVER statement.

System action: The specified automatic recovery actions are started up.

User response: None.

EQQC045I AUTO RECOVERY INFO RS, APPL
ADIDDATE HH.MM, OP WSNOPJNJID

Explanation: Automatic job recovery is being performed for the job identified as application *ADID DATE HH. MM*, operation *WSN OP*, where *DATE HH. MM* is the occurrence input arrival time). This message is issued to keep track of a particular action taken during the recovery processing.

RS is a reason code that stands for a certain error or action, or both, related to automatic job recovery. Message EQQC047E has a list of the reason codes and their meanings.

System action: The specified automatic recovery actions are started up.

User response: Look up the meaning of reason code *RS* in the list given in message EQQC047E. Review the action taken and see if it matches the action requested. If necessary, take the appropriate action.

Problem determination: Review the JCL of the identified operation. Identify the recovery actions described in the RECOVER statement of the JCL.

EQQC046W AUTO RECOVERY WARNING RS,
APPL ADID DATEHH.MM, OP
WSNOPJNJID

Explanation: Automatic job recovery was attempted for the job identified as application *ADID DATE HH. MM*, operation *WSN OP*, where *DATE HH. MM* is the occurrence input arrival time. A problem was encountered that inhibited automatic job recovery.

RS is a reason code that stands for a certain error or action, or both, related to automatic job recovery. Message EQQC047E has a list of the reason codes and their meanings.

System action: The operation is left unchanged by automatic job recovery.

User response: Look up the meaning of reason code *RS* in the list given in message EQQC047E. Review

what recovery actions are taken and see if they match the actions requested in the RECOVER statement. If necessary, use the Modify Current Plan dialog to perform the rest of the recovery actions.

Problem determination: Review the JCL of the identified operation. Identify the recovery actions described in the RECOVER statement of the JCL.

EQQC047E AUTO RECOVERY ERROR RS, APPL
ADIDDATE HH.MM, OP WSNOPJNJID

Explanation: Automatic job recovery was attempted for the job identified as application *ADID DATE HH. MM*, operation *WSN OP*, where *DATE HH. MM* is the occurrence input arrival time. An error was encountered that inhibited the recovery actions.

RS is a reason code that stands for a certain error or action, or both, related to automatic job recovery (see Problem determination).

System action: The job remains ended in error and the extended status of the operation is set to E. The JCL record on the JCL repository data set might have been updated with information about the error.

User response: Check the RECOVER statements. Comment lines that describe the error in detail are added to the JCL. When you have found and corrected the error, you can use the ended-in-error list of the Modify Current Plan dialog to initiate a new automatic job recovery attempt.

Problem determination:

The following reason codes (*RS*) indicate the errors or actions, or both, related to automatic job recovery:

- 1 Misplaced IBM Tivoli Workload Scheduler for z/OS recover statement.
- 2 Incorrect parameter.
- 3 Unbalanced parentheses.
- 4 Invalid continuation line.
- 5 Invalid length of parameter value.
- 6 A parameter appears twice in same recover statement.
- 7 Invalid return code from exit.
- 8 Terminate return code from exit.
- 9 Abandon return code from exit.
- 10 Invalid restart parameter value. Set Y, YES, N, or NO.
- 11 Procedure library member not found.
- 12 I/O error.
- 13 Unable to load exit routine.
- 14 No job statement found.
- 15 Incorrect job statement. Cannot add restart parameter.
- 16 Invalid specification of generic code.
- 17 Loop in the case code lists.
- 18 Checkpoint name contains special characters.
- 19 Missing stepname.
- 20 Too many values specified in parameter.
- 21 Failing OP is outside rerun or successor tree.

- 22 External successor in rerun tree is not in the failing tree.
- 23 Inconsistency with AD of failing occurrence (for example, AD no longer exists or is not active).
- 24 AD of application to add could not be found.
- 25 Error while using MCP (additional message by MCP).
- 26 Unable to allocate virtual storage.
- 27 Error detected and handled by other subtask.
- 28 Improper naming of steps, give all unique names.
- 29 Cannot add restart param. because no delimiter last job line.
- 30 No information about error in job name table (JNT).
- 31 Failing operation record could not be read.
- 32 Invalid stepname or no step with that name.
- 33 More than one step in JS record with the given name.
- 34 JS data set in use. Recovery test canceled.
- 35 JS data set member in use. Recovery test canceled.
- 36 OP record has been changed. Recovery test canceled.
- 37 Invalid range.
- 38 No occurrence exists for the specified application.
- 39 Recovery actions taken.
- 40 No JS record.
- 41 Restart step not present in the JCL.
- 42 Step end entries missing in JNT record (CPLREC04). The error can relate to:
 - Nested procedures
 - JCL INCLUDE statements
 - JCL IF/THEN/ELSE/ENDIF statement constructs.

These JCL statements are restricted by automatic job recovery when used in conjunction with the ERRSTEP, RESSTEP, or STEPCODE parameters of the RECOVER statement.
- 43 Parameter not supported when STEPEVENTS(ABEND) specified.
- 44 RESSTEP=% specified but error not related to a step.
- 45 A required service function (NMM) has terminated.
- 46 No free input arrival time for the application to add.
- 47 Missing value for parameter.
- 48 Authorization check requires user ID.
- 50 Adding operation identifiers to message text in EQQMLOG file.
- 51 Error in ALTWS parameter.
- 52 Error in ALTJOB parameter.

EQQC048W AUTO RECOVERY WARNING RS

Explanation: Automatic job recovery was attempted for the job that ended in error, but was inhibited because of a problem with reason code RS. This message differs from EQQC046W in that automatic job recovery was not able to identify the application to be handled.

System action: No recovery is made and the job remains ended in error.

User response: Look up the meaning of reason code RS in the list given in message EQQC047E. Review what recovery actions are taken and see if they match the actions requested in the RECOVER statement. If necessary, use the Modify Current Plan dialog to perform the rest of the recovery actions.

Problem determination: Message EQQC047E has a list of the reason codes and their meanings. Review the JCL of the identified operation. Identify the recovery actions described in the RECOVER statement of the JCL.

EQQC049E AUTO RECOVERY ERROR RS

Explanation: Automatic job recovery was attempted for the job that ended in error, but was inhibited because of an error with reason code RS. This message differs from EQQC047E in that automatic job recovery was not able to identify the application to be handled.

System action: No recovery is made and the job remains ended in error. The extended status of the operation is set to E.

User response: Look up the meaning of reason code RS in the list given in message EQQC047E. Review what recovery actions are taken and see if they match the actions requested in the RECOVER statement. If necessary, use the Modify Current Plan dialog to perform the rest of the recovery actions.

Problem determination: Message EQQC047E has a list of the reason codes and their meanings. The JS record may have been updated with information about the error. Review the JCL of the identified operation. Identify the recovery actions described in the RECOVER statement of the JCL.

EQQC061E AUTOMATIC RECOVERY FAILED, I/O ERROR

Explanation: Automatic job recovery failed for the job that ended in error because an I/O error occurred. The I/O error occurred while the automatic job recovery subtask was determining whether recovery should be performed, or while the recovery actions were being activated or implemented.

This message is preceded by a message that describes the I/O error in more detail, and is followed by message EQQC045I with reason code 50, which

identifies the job handled by automatic job recovery.

System action: The job remains ended in error. Some of the intended recovery actions may have been started up or completed.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log for I/O errors that immediately precede this message.

User response: When you have found and corrected the error, you can initiate a new automatic job recovery attempt for the job that ended in error by using the ended-in-error list of the Modify Current Plan dialog. You may have to initiate the recovery actions manually, or you may have to change the RECOVER statement to encompass only the remaining recovery actions.

Problem determination: Review the JCL of the identified operation. Identify the recovery actions described in the RECOVER statement of the JCL.

EQQC062E AUTOMATIC RECOVERY FAILED, NOT ENOUGH VIRTUAL STORAGE - SIZE

Explanation: Automatic job recovery failed for the job that ended in error because of insufficient virtual storage. The failure occurred while the automatic job recovery subtask was determining whether recovery should be performed, or while the recovery actions were being activated or implemented. *SIZE* is the amount of virtual storage requested.

This message is followed by message EQQC045I with reason code 50, which identifies the job checked by automatic job recovery.

System action: The job remains ended in error. Some of the intended recovery actions may have been started up or completed.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS and restart it in a larger region.

User response: When you have found and corrected the error, you can initiate a new automatic job recovery attempt for the job that ended in error by using the ended-in-error list of the Modify Current Plan dialog. You may have to initiate the recovery actions manually, or you may have to change the RECOVER statement to encompass only the remaining recovery actions.

Problem determination: Review the JCL of the identified operation. Identify the recovery actions described in the RECOVER statement.

EQQC500E THE JCL LIBRARY, DDNAME EQQPRLIB, COULD NOT BE OPENED

Explanation: Automatic job recovery could not open the JCL procedure library (ddname EQQPRLIB) to read a procedure specified in the ADDPROC parameter of the RECOVER statement. This message is followed by

message EQQC045I with reason code 50, which identifies the job checked by automatic job recovery.

System action: No recovery attempt is made and the job remains ended in error.

System programmer response: Check that the ddname EQQPRLIB is correctly specified and that the task started by IBM Tivoli Workload Scheduler for z/OS is authorized to open the data set for input. When the error is corrected, stop IBM Tivoli Workload Scheduler for z/OS and restart it.

User response: Contact your system programmer. When your system programmer has fixed the problem, you can initiate a new automatic job recovery attempt for the job that ended in error by using the ended-in-error list of the Modify Current Plan dialog.

Problem determination: Review the earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log for a message describing an I/O error on the EQQPRLIB file.

EQQC501E LOGICAL RECORD LENGTH FOR THE JCL LIBRARY, DDNAME EQQPRLIB, IS NOT VALID

Explanation: Automatic job recovery could not read a procedure specified in the ADDPROC parameter of the RECOVER statement because the logical record length is not 80 bytes. This message is followed by message EQQC045I with reason code 50, which identifies the job checked by automatic job recovery.

System action: No recovery attempt is made and the job remains ended in error.

System programmer response: Check that the ddname EQQPRLIB is correctly defined. When the error is corrected, stop IBM Tivoli Workload Scheduler for z/OS and restart it.

User response: Contact your system programmer. When your system programmer has fixed the problem, you can initiate a new automatic job recovery attempt for the job that ended in error by using the ended-in-error list of the Modify Current Plan dialog.

Problem determination: Check the definition of the ddname EQQPRLIB.

Chapter 197. EQQCLnnn messages

EQQCL00 - EQQCLZ6

EQQCL00I PROCESSING: *INSTRUCTION*

Explanation: OCL is processing the *INSTRUCTION* instruction

System action: Processing continues.

User response: None.

EQQCL02X *INSTR INSTRUCTION EXECUTED:* *RC=RETURN_CODE*

Explanation: This message reports the return code (*RETURN_CODE*) of the instruction. *X* can be one of the following:

I Information (RC=0)

W Warning (RC=4)

E Error (RC=8)

System action: The scheduler's processing continues.

User response: None.

EQQCL03I TRUE CONDITION: IF *EXPRESSION*

Explanation: An IF instruction was specified. OCL processed the instruction specified in the THEN clause.

System action: The scheduler's processing continues.

User response: None.

EQQCL04I TRUE CONDITION: ELSE *EXPRESSION*

Explanation: An IF instruction was specified. OCL processed the instruction specified in the ELSE clause.

System action: The scheduler's processing continues.

User response: None.

EQQCL05I FALSE CONDITION: IF *EXPRESSION*

Explanation: The condition specified in the IF instruction is false.

System action: The scheduler's processing continues.

User response: Verify that the specified keywords are correct.

EQQCL06I THE DEFAULT VALUE OF VARIABLE *VARNAME* WAS UPDATED

Explanation: An UPD or SETUPD instruction was specified. The default value of the variable *VARNAME* was updated in the scheduler's variable table specified by the INIT instruction.

System action: The scheduler's processing continues.

User response: None.

EQQCL08I OCCURRENCE *APPL* WAS COMPLETED

Explanation: OCL processed a COMPL instruction that completed the occurrence *APPL*.

System action: The scheduler's processing continues.

User response: None.

EQQCL09I THE OPERATION WAS COMPLETED: *OPNO(OPNUM) APPL(APPL) IA(IADT)*

Explanation: OCL completed the operation *OPNUM* within the occurrence *APPL* with the input arrival date and time *IADT*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0AI THE OCCURRENCE WAS ADDED: *APPL(APPL) IA(IADT)*

Explanation: OCL added a new occurrence in the scheduler's current plan or long term plan. *APPL* is the occurrence ID and *IADT* is the input arrival date and time.

System action: The scheduler's processing continues.

User response: None.

EQQCL0BI A DELETE REQUEST WAS EXECUTED FOR APPLICATION *APPL*

Explanation: OCL tried to add a new occurrence in the scheduler's plan, but a problem occurred, so it issued a DELETE request for the application *APPL*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0CI DEFAULT PREDECESSOR OPERATION IS USED: *DEFPREOPNO*

Explanation: OCL defined *DEFPREOPNO* as an

EQQCL0DI • EQQCL0OI

external predecessor of the operation to be modified.

System action: The scheduler's processing continues.

User response: None.

EQQCL0DI INTERNAL PREDECESSOR PREOPNUM DEFINED TO OPERATION OPNUM

Explanation: A new internal predecessor was defined for operation *OPNUM*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0EI APPL BELONGS TO GROUP APPLGRP

Explanation: Application *APPL* is associated to the application group *APPLGRP*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0FI THE OCCURRENCE WAS DELETED: APPL(APPL) IA(IADT)

Explanation: The occurrence *APPL* was deleted from the scheduler's current plan.

System action: The scheduler's processing continues.

User response: None.

EQQCL0GI THE OPERATION WAS DELETED: OPNO(OPNUM) APPL(APPL) IA(IADT)

Explanation: The operation *OPNUM* was deleted from the occurrence *APPL* with the input arrival date and time *IADT*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0HI OCCURRENCE FOUND IN LTP: APPL(APPL) IA(IADT)

Explanation: OCL found an occurrence in the long term plan (LTP) that matches with the specified selection parameters.

System action: The scheduler's processing continues.

User response: None.

EQQCL0II DATE IS VALID

Explanation: The input date is valid.

System action: OCL calculates about 210 variables, based on the input date.

User response: None.

EQQCL0JI SEARCHING FOR OCCURRENCE APPL IN CP

Explanation: OCL is searching the occurrence *APPL* in the scheduler's current plan (CP).

System action: The scheduler's processing continues.

User response: None.

EQQCL0KI TOTAL NUMBER OF MATCHING OCCURRENCES: N_OCC

Explanation: OCL found *N_OCC* occurrences in the scheduler's current plan that match the specified selection parameters.

System action: The scheduler's processing continues.

User response: None.

EQQCL0LI OPER. IN ERROR: OPNUM APPL(APPL) IA(IADT) WS(WSNAME) ERR(ERR_CODE)

Explanation: OCL found an ended-in-error operation with error code *ERR_CODE*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0MI ERROR CODE ERR_CODE MATCHES ERR() FOR OPERATION OPNUM

Explanation: This "output" message reports all the operations whose error code matches the value that the user specified in the *ERR()* parameter.

System action: The scheduler's processing continues.

User response: None.

EQQCL0NI REPLY TO WTOR WAS ISSUED

Explanation: An operator replied to the WTO issued by OCL.

System action: The scheduler's processing continues.

User response: None.

EQQCL0OI OCCURRENCE FOUND: APPL(APPL) IA(IADT) STATUS(STATUS)

Explanation: OCL found an occurrence in the current plan that matches the selection parameters.

System action: The scheduler's processing continues.

User response: None.

EQQCL0PI CMD COMMAND WAS ISSUED

Explanation: OCL issued command *CMD*, which can be SRSTAT, OPSTAT, or WSSTAT.

System action: The scheduler's processing continues.

User response: None.

EQQCL0QI OPERATION *OPNUM* WAS SUCCESSFULLY MODIFIED

Explanation: OCL modified the operation *OPNUM*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0RI DELETING THE SPECIAL RESOURCE FROM OPERATION *OPNUM*

Explanation: OCL is deleting the special resource definition from operation *OPNUM*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0SI DELETING THE EXTERNAL PREDECESSOR(S) FROM OPERATION *OPNUM*

Explanation: OCL is deleting the external predecessors from operation *OPNUM*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0TI OPERATION STATUS WAS CHANGED TO 'R': *OPNO(opnum)*

Explanation: OCL modified the status of operation *OPNUM*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0UI EXTERNAL PREDECESSOR(S) WILL BE DELETED FROM OPERATION *opnum*

Explanation: OCL deletes all the external predecessors from operation *OPNUM*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0VI OCCURRENCE *APPL* IS NOW STARTED

Explanation: OCL forced the occurrence *appl* to start.

System action: The scheduler's processing continues.

User response: None.

EQQCL0WI JOBNAME WAS CHANGED FOR OPERATION *OPNUM*

Explanation: OCL changed the jobname for operation *OPNUM*.

System action: The scheduler's processing continues.

User response: None.

EQQCL0XI DEFAULT OPERATION NUMBER IS USED: *DEFOPNO*

Explanation: OCL uses *DEFOPNO* as the default operation number.

System action: The scheduler's processing continues.

User response: None.

EQQCL0YI PREDECESSOR ADDED TO OPERATION *OPNUM*:
PREOPNO(*PREOPNUM*)
PREAPPL(*PREAPPL*)

Explanation: OCL added a new predecessor to operation *OPNUM*. *PREOPNUM* is the predecessor operation, and *PREAPPL* is the predecessor application ID.

System action: The scheduler's processing continues.

User response: None.

EQQCL0ZI NEW DEPENDENCY CREATED FOR OCCURRENCE *APPL*:
PREAPPL(*PREAPPL*)

Explanation: OCL added a new predecessor to operation *OPNUM*. *PREAPPL* is the predecessor application ID.

System action: The scheduler's processing continues.

User response: None.

EQQCL8EI DUBPROC VALUE MUST BE Y OR N. VALUE N HAS BEEN ASSIGNED AS DEFAULT.

Explanation: The value set for the DUBPROC keyword was not valid.

System action: The DUBPROC keyword is assigned the default value N. OCL processing continues.

User response: None.

EQQCL10I PREDECESSOR DELETED:
 PREOPNO(PREOPNUM)
 PREAPPL(PREAPPL) PREIA(IADT)

Explanation: OCL deleted a predecessor definition. *PREOPNUM* is the predecessor operation number, *PREAPPL* is the occurrence ID, and *IADT* is the input arrival date and time.

System action: The scheduler's processing continues.

User response: None.

EQQCL11I SPECIAL RESOURCE ADDED TO
 OPERATION OPNUM: RES_NAME

Explanation: OCL added a new special resource definition to operation *OPNUM*. *RES_NAME* is the name of the special resource.

System action: The scheduler's processing continues.

User response: None.

EQQCL12I SPECIAL RESOURCE DELETED FROM
 OPERATION OPNUM: RES_NAME

Explanation: OCL deleted a special resource definition from operation *OPNUM*. *RES_NAME* is the name of the special resource.

System action: The scheduler's processing continues.

User response: None.

EQQCL13I SUCCESSOR RELEASED FROM
 OPERATION OPNUM:
 OPNO(S_OPNUM) APPL(APPL)

Explanation: OCL deleted a successor dependency definition from operation *OPNUM*. *S_OPNUM* is the successor operation number, and *APPL* is the successor application ID.

System action: The scheduler's processing continues.

User response: None.

EQQCL14I OPERATION P_OPNUM WAS
 DEFINED AS AN INTERNAL
 PREDECESSOR OF OPERATION
 OPNUM

Explanation: OCL added a new predecessor to operation *OPNUM*. *P_OPNUM* is the predecessor operation number.

System action: The scheduler's processing continues.

User response: None.

EQQCL15I INTERNAL SUCCESSOR RELEASED:
 OPNO(S_OPNUM) APPL(APPL)

Explanation: OCL released the internal successor operation number *S_OPNUM* in the occurrence *APPL*.

System action: The scheduler's processing continues.

User response: None.

EQQCL16I EXTERNAL SUCCESSOR FOUND FOR
 OPERATION OPNUM:
 OPNO(S_OPNUM) APPL(APPL)

Explanation: OCL found an external successor for operation *OPNUM*. *S_OPNUM* is the successor operation number; *APPL* is the successor occurrence ID.

System action: The scheduler's processing continues.

User response: None.

EQQCL17I INTERNAL SUCCESSOR FOUND FOR
 OPERATION OPNUM:
 OPNO(S_OPNUM)

Explanation: OCL found an internal successor for operation *OPNUM*. *S_OPNUM* is the successor operation number.

System action: The scheduler's processing continues.

User response: None.

EQQCL18I EXTERNAL PREDECESSOR FOUND:
 PREAPPL(APPL) PREIA(IADT)

Explanation: OCL found an external predecessor. *APPL* is the predecessor occurrence ID, and *IADT* is its input arrival date and time.

System action: The scheduler's processing continues.

User response: None.

EQQCL19I EXTERNAL PREDECESSOR FOUND:
 PREOPNO(OPNUM) PREAPPL(APPL)
 PREIA(IADT)

Explanation: OCL found an external predecessor. *OPNUM* is the predecessor operation number, *APPL* is the predecessor occurrence ID and *IADT* is its input arrival date and time.

System action: The scheduler's processing continues.

User response: None.

EQQCL1AI N_OCC OCCURRENCES FOUND FOR
 APPLICATION APPL

Explanation: OCL found *N_OCC* occurrences of application *APPL* in the current plan.

System action: The scheduler's processing continues.

User response: None.

EQQCL1BI OPERATION *OPNUM* WAS ADDED TO OCCURRENCE *APPL* WITH IA *IADT*

Explanation: OCL added operation *OPNUM* to occurrence *APPL*.

System action: The scheduler's processing continues.

User response: None.

EQQCL1CI NUMBER OF NOT COMPLETED OCCURRENCES: *N_OCC*

Explanation: OCL found *N_OCC* occurrences that are not in Complete status.

System action: The scheduler's processing continues.

User response: None.

EQQCL1DI EXTERNAL PREDECESSOR DELETED: *PREAPPL(PREAPPL) PREIA(IADT)*

Explanation: OCL deleted an external predecessor definition. *PREAPPL* is the predecessor occurrence ID, and *IADT* its input arrival date and time.

System action: The scheduler's processing continues.

User response: None.

EQQCL1EI SPECIAL RESOURCE FOUND FOR OPERATION *OPNUM*: *RES_NAME*

Explanation: OCL found a special resource defined to operation *OPNUM*. *RES_NAME* is the name of the special resource.

System action: The scheduler's processing continues.

User response: None.

EQQCL3EI EXTNAME ADDED TO OP *OPNUM* OF OCC *APPL* WITH IA *IADT*

Explanation: OCL added extended name to operation *OPNUM* of occurrence *APPL* with input arrival time *IADT*.

System action: The scheduler processing continues.

User response: None.

EQQCL3LI EXTNAME ADDED TO OP *OPNUM* OF OCC *APPL* WITH IA *IADT*

Explanation: OCL added extended name to operation *OPNUM* of occurrence *APPL* with input arrival *IADT*.

System action: The scheduler processing continues.

User response: None.

EQQCL3MI SA INFO UPDATED FOR OP *OPNUM* OF OCC *APPL* WITH IA *IADATE IATIME*

Explanation: OCL updated the system automation information for operation *OPNUM* of occurrence *APPL* with input arrival *IADATE IATIME* with the new values specified.

System action: The scheduler processing continues.

User response: None.

EQQCL3NI DEFAULT CONDITION ID IS USED: *DEFCONDID*

Explanation: OCL uses *DEFCONDID* as the default condition ID.

System action: The scheduler processing continues.

User response: None.

EQQCL3OI CONDITION *XC* ADDED TO OPERATION *XO*

Explanation: OCL added a new condition to operation *XO*. *XC* is the condition ID.

System action: The scheduler processing continues.

User response: None.

EQQCL3PI DEP. ADDED TO COND *XC* IN OP *XO*: *PREOPNO(XPO) PREAPPL(XPA)*

Explanation: OCL added a condition dependency to condition *XC* in operation *XO*. *XPO* is the predecessor operation, and *XPA* is the predecessor application ID.

System action: The scheduler processing continues.

User response: None.

EQQCL3QI CONDITION *XC* IN OPERATION *XO* WAS SUCCESSFULLY MODIFIED

Explanation: OCL modified condition *XC* in operation *XO*.

System action: The scheduler processing continues.

User response: None.

EQQCL3RI CONDITION *XC* IN OPERATION *XO* WAS SUCCESSFULLY DELETED

Explanation: OCL deleted condition *XC* from operation *XO*.

System action: The scheduler processing continues.

User response: None.

EQQCL3SI DEP. DELETED IN COND *XC*, OP *XO* :
PREOPNO(*XPO*) PREAPPL(*XPA*)

Explanation: OCL deleted a condition dependency from condition *XC* in operation *XO*. *XPO* is the predecessor operation, and *XPA* is the predecessor application ID.

System action: The scheduler processing continues.

User response: None.

EQQCL40W THE ROUTINE RETURNED *RESULT*
RETURN CODE

Explanation: The value of *RESULT* is the return code of the routine. This message is issued when the return code is not zero.

System action: If the return code issued by the called routine is higher than the highest return code of the other processed OCL instructions, it is assumed as the highest return code.

OCL processing continues.

User response: None.

EQQCL41W PROCESS TERMINATED DUE TO A
LABEL INSTRUCTION - HIGHEST
RC=*LASTRC*

Explanation: OCL processed a LABEL instruction.

System action: OCL processing is terminated with the highest return code of the processed OCL instructions.

User response: None.

EQQCL42W VARIABLE *VARNAME* WILL BE
ADDED TO THE VARIABLE TABLE
VARTAB

Explanation: OCL processed an UPD or SETUPD instruction to modify the value of a variable that does not exist in the scheduler's variable table.

System action: OCL adds the variable *VARNAME* to the variable table *VARTAB*. OCL processing continues.

User response: Verify that the variable name specified in the UPD or SETUPD instruction is correct.

EQQCL43W NO OCCURRENCE TO COMPLETE:
APPL

Explanation: OCL processed a COMPL instruction for an application occurrence, but no occurrence in a noncomplete status was found in the current plan.

System action: OCL processing continues.

User response: Verify that the selection parameters for the application occurrence are correct.

EQQCL44W OCCURRENCE NOT FOUND IN THE
CURRENT PLAN: APPL(*APPL*)
IA(*IADT*)

Explanation: OCL attempted to modify or list the application occurrence *APPL*, which does not exist in the current plan. *IADT* is the input arrival date and time used to search for the occurrence.

System action: OCL processing continues.

User response: Verify that the selection parameters are correct.

EQQCL45W OCCURRENCE NOT FOUND IN THE
LTP: APPL(*APPL*) IA(*IADT*)

Explanation: OCL attempted to modify or list the application occurrence *APPL*, which does not exist in the long term plan (LTP). *IADT* is the input arrival date and time used to search for the occurrence.

System action: OCL processing continues.

User response: Verify that the selection parameters are correct.

EQQCL46W ONLY OCL INSTRUCTIONS ARE
ACCEPTED: *SYSIN_LINE*

Explanation: A non-OCL instructions was specified and the initialization parameter TSOCMD is set to NO.

System action: OCL processing continues.

User response: If you want to be able to specify TSO commands or REXX instructions other than those of OCL, set the TSOCMD parameter to YES.

EQQCL47W OPER. NOT FOUND OR NOT IN
ERROR: *OPNUM* APPL(*APPL*) IA(*IADT*)

Explanation: The application occurrences *APPL* with input arrival date and time *IADT* does not contain the selected operation or the selected operation is not in error status.

System action: OCL processing continues.

User response: Verify that the selected operation really exists in the application occurrence.

EQQCL48W ERROR CODE *ERRCODE* DOES NOT
MATCH *ERRCODE()* FOR OPERATION
OPNUM

Explanation: *ERRCODE* is the error code specified in the CHKAPPL instruction for operation *OPNUM*. OCL found the operation *OPNUM* in error status, but its error code does not match *ERRCODE*.

System action: OCL processing continues.

User response: None.

EQQCL49W OPERATION *OPNUM* IS NOT IN HOLD STATUS

Explanation: OCL tried to release an operation that was not manually held.

System action: OCL processing continues.

User response: None.

EQQCL4AW OPERATION *OPNUM* IS ALREADY IN HOLD STATUS

Explanation: OCL tried to hold an operation that was already in HOLD status.

System action: OCL processing continues.

User response: None.

EQQCL4BW OPERATION *OPNUM* IS NOT IN NOP STATUS

Explanation: OCL issued an UNNOP command against an operation that was not in NOP status.

System action: OCL processing continues.

User response: None.

EQQCL4CW OPERATION *OPNUM* IS ALREADY IN NOP STATUS

Explanation: OCL issued a NOP command against an operation that was already in NOP status.

System action: OCL processing continues.

User response: None.

EQQCL4DW EXTERNAL PREDECESSOR(S) FOUND, STATUS CANNOT BE CHANGED

Explanation: OCL tried to set an operation to Ready status, but external predecessors are defined. OCL deletes the dependency definitions and tries to set the operation Ready again.

System action: OCL processing continues.

User response: None.

EQQCL4EW OCCURRENCE *APPL* IS STILL IN WAITING STATUS

Explanation: OCL tried to force the application occurrence to start, but it is still in Waiting status.

System action: OCL processing continues.

User response: Verify the conditions that cause the occurrence to wait. Check the current operation status and extended status, using the scheduler's dialogs, to determine more precisely why the application occurrence failed to start.

EQQCL4FW NO OPERATION FOUND TO BE CHANGED

Explanation: OCL tried to change the jobname associated with an operation in the current plan, but the operation was not found.

System action: OCL processing continues.

User response: Verify that the selection parameters are correct.

EQQCL4GW PREDECESSOR APPLICATION NOT FOUND IN CP: *PREAPPL(PREAPPL)* *PREIA(PREIADT)*

Explanation: *PREAPPL* is the predecessor application ID and *PREIADT* is the input arrival date and time of the predecessor application. OCL tried to define *PREAPPL* as a predecessor of the application occurrence specified in the *APPL()* keyword, but *PREAPPL* is not present in the current plan.

System action: OCL processing continues.

User response: Verify that the selection parameters are correct.

EQQCL4HW OPERATION *OPNUM* DOESN'T EXIST

Explanation: OCL tried to change or delete an operation that does not exist in the current plan.

System action: OCL processing continues.

User response: Verify that the specified keywords are correct.

EQQCL4IW ALREADY PREDECESSOR: *PREOPNUM*

Explanation: OCL tried to define a predecessor that is already defined.

System action: OCL processing continues.

User response: Verify that the specified keywords are correct.

EQQCL4JW PREDECESSOR NOT FOUND IN THE LTP: *PREAPPL(PREAPPL)* *PREIA(PREIADT)*

Explanation: OCL tried to define *PREAPPL* as a predecessor of the application occurrence specified in the *APPL()* keyword, but *PREAPPL* is not present in the long term plan (LTP).

System action: OCL processing continues.

User response: Verify the selection parameters.

EQQCL4KW NO EXTERNAL SUCCESSOR FOUND FOR THE OCCURRENCE *APPL*

Explanation: OCL tried to release the external successors of the occurrence *APPL*, but no successor was found for the occurrence.

System action: OCL processing continues.

User response: None.

EQQCL4LW OPERATION *OPNUM* NOT FOUND: *APPL(APPL) IA(IADT)*

Explanation: OCL tried to change operation *OPNUM*, which does not exist in the current plan.

System action: OCL processing continues.

User response: Verify the selection parameters.

EQQCL4MW NO INTERNAL SUCCESSOR FOUND FOR OPERATION *OPNUM* OF THE OCCURRENCE *APPL*

Explanation: OCL tried to release the internal successors of operation *OPNUM*, but no successor was found.

System action: OCL processing continues.

User response: Verify the selection parameters.

EQQCL4NW NO EXTERNAL PREDECESSOR FOUND FOR THE OCCURRENCE *APPL*

Explanation: OCL tried to release the external predecessors of occurrence *APPL*, but no predecessor is present in the current plan.

System action: OCL processing continues.

User response: Verify the selection parameters.

EQQCL4OW NO SPECIAL RESOURCE FOUND

Explanation: OCL tried to delete a special resource definition, but no special resource is defined to the operation.

System action: OCL processing continues.

User response: Verify the selection parameters.

EQQCL4PW NO OPERATION WAS MODIFIED

Explanation: OCL did not modify any operation in the occurrence.

System action: OCL processing continues.

User response: Verify the selection parameters.

EQQCL4QW OPERATION *OPNUM* ALREADY EXISTS

Explanation: OCL tried to add an operation that already exists in the occurrence.

System action: OCL processing continues.

User response: Verify the selection parameters.

EQQCL4RW OPERATION DEADLINE LATER THAN OCCURRENCE DEADLINE - ACCEPTED: *DEADLINE*

Explanation: The specified operation deadline is later than the occurrence deadline, but is accepted.

System action: OCL processing continues.

User response: Verify that the specified keywords are correct.

EQQCL4SW OPERATION DEADLINE PRECEDES OPERATION INPUT ARRIVAL - ACCEPTED: *DEADLINE*

Explanation: The operation deadline precedes the operation input arrival, but is accepted.

System action: OCL processing continues.

User response: Verify that the specified keywords are correct.

EQQCL4TW OPERATION INPUT ARRIVAL PRECEDES OCCURRENCE - ACCEPTED: *IADT*

Explanation: The operation input arrival precedes the occurrence input arrival, but is accepted.

System action: OCL processing continues.

User response: Verify that the specified keywords are correct.

EQQCL4UW DEPENDENCY ALREADY DEFINED

Explanation: OCL tried to define a predecessor that is already defined.

System action: OCL processing continues.

User response: Verify that the specified keywords are correct.

EQQCL4VW NO PARAMETER WAS SPECIFIED

Explanation: No parameter was specified for the MODOP instruction. No change is required for the operation.

System action: OCL processing continues.

User response: Verify the selection parameters.

EQQCL4WW OCCURRENCE ALREADY IN COMPLETE STATUS: APPL WITH IA IADT

Explanation: OCL tried to complete an occurrence that was already completed.

System action: OCL processing continues.

User response: Verify the selection parameters.

EQQCL4XW OCCURRENCE NOT FOUND IN THE CURRENT PLAN: APPL(APPL)

Explanation: No occurrence exists in the current plan for application *APPL*.

System action: OCL processing continues.

User response: Verify the selection parameters.

EQQCL4ZW UNRESOLVED DEPENDENCY

Explanation: OCL tried to resolve a dependency for an occurrence being added to the Long Term Plan (LTP). However, a predecessor could not be resolved because the predecessor application does not have an occurrence with an earlier start time or the same start time.

System action: OCL processing continues.

User response: Check the dependencies of the added occurrences.

EQQCL50E NOT POSSIBLE TO READ THE OCL MLIB

Explanation: OCL was not able to read the data set referenced by the OCLMLIB DD-card.

System action: OCL processing is terminated.

User response: Verify the data set name specified in the OCLMLIB DD-card.

EQQCL51E NOT POSSIBLE TO READ THE OCL PARMLIB

Explanation: OCL was not able to read the EQQYRPRM member in the OCL library.

System action: OCL processing is terminated.

User response: Verify the data set name specified in the OCLPARM ddname.

EQQCL52E NOT POSSIBLE TO READ THE SYSIN CARD

Explanation: OCL was not able to read the SYSIN DD-card.

System action: OCL processing is terminated.

User response: Verify the data set specified in the EQQOCL.SYSIN DD-card.

EQQCL53E INVALID SYNTAX: INSTRUCTION

Explanation: An invalid instruction was specified in the OCL SYSIN.

System action: OCL terminates

User response: Correct the instruction and resubmit the job.

EQQCL54E NOT POSSIBLE TO WRITE THE CONTROL CARDS FOR EQQPIFT PROGRAM

Explanation: OCL was not able to write the input control cards for the EQQPIFT program.

System action: OCL terminates

User response: Verify that the **CARDIN** card is correctly defined in the EQQYRPRC procedure. See the *Developer's Guide* for more information.

EQQCL55E ERROR DURING THE GETMAIN REQUEST

Explanation: OCL was not able to get the storage for the PIF session.

System action: OCL processing is terminated.

User response: Resubmit the job. If the problem persists, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section.

EQQCL56E PIF INITIALIZATION FAILED FOR SUBSYSTEM SUBSYS

Explanation: OCL was not able to initialize the scheduler's PIF session.

System action: OCL processing is terminated.

User response: Check the scheduler's subsystem name specified in the PARMLIB SUBSYS() parameter or in the INIT instruction. If the subsystem name is correct and if the subsystem is active, contact IBM Software Support.

EQQCL57E VARIABLE NAME IS MISSING

Explanation: The variable name was not specified in the UPD or SETUPD instruction.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL58E PIF TERM REQUEST FAILED

Explanation: OCL was not able to terminate the scheduler's PIF session.

System action: OCL processing is terminated.

User response: If the problem persists, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section.

EQQCL59E PIF TERM REQUEST FAILED: ERROR DURING FREEMAIN

Explanation: OCL was not able to terminate the scheduler's PIF session.

System action: OCL processing is terminated.

User response: If the problem persists, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section.

EQQCL5AE PREDECESSOR CAN'T BE EQUAL TO THE OPERATION TO BE ADDED

Explanation: OCL was requested to add a new operation in an application occurrence, but the operation number is equal to its internal predecessor operation number.

System action: OCL processing is terminated.

User response: If you have specified the DEFOPNO initialization parameter, OCL uses it as a default predecessor operation number. You cannot add an operation with a number equal to DEFOPNO.

EQQCL5BE NO CURRENT PLAN EXISTS

Explanation: OCL cannot add or modify occurrences because the current plan does not exist.

System action: OCL processing is terminated.

User response: Extend the current plan and resubmit the job.

EQQCL5CE NO DEFAULT VALUE FOR VARIABLE VARNAME

Explanation: OCL did not find a value for variable *VARNAME*.

System action: OCL processing is terminated.

User response: Verify that a SET or SETUPD instruction was specified to set the variable value.

EQQCL5DE INVALID OPERAND FOR THE PIF REQUEST: OPERAND

Explanation: A PIF request contained an invalid operand.

System action: OCL processing is terminated.

User response: Verify that the length of operand is specified in the SETSTEMS subroutine in the OCL program.

EQQCL5EE NOT POSSIBLE TO COMPLETE THE OCCURRENCE APPL WITH IA IADT

Explanation: OCL was not able to complete the occurrence *APPL*.

System action: OCL processing is terminated.

User response: Verify that the specified occurrence Application Identifier, the Input Arrival Date and Time, and the occurrence status are correct and uniquely identify the occurrence. If not correct it and resubmit the job.

EQQCL5FE NOT POSSIBLE TO MODIFY THE OCCURRENCE APPL WITH IA IADT

Explanation: OCL was not able to modify the occurrence *APPL* in the current plan.

System action: OCL processing is terminated.

User response: Verify that the resource is not locked from another user and resubmit the job.

EQQCL5GE CANNOT COMPLETE OPERATION OPNUM of occurrence appl with IA IADT

Explanation: OCL was not able to complete the operation *OPNUM* in the occurrence *APPL* with input arrival time *IADT*.

System action: OCL processing is terminated.

User response: Verify if the operation has external predecessors.

EQQCL5HE REQUIRED KEYWORD(S) MISSING

Explanation: A required keyword was not specified in the instruction.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL5IE APPL AND GROUP ARE MUTUALLY EXCLUSIVE KEYWORDS

Explanation: *APPL* and *GROUP* keywords were specified in the same *ADD* instruction.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL5JE SUBSYSTEM ID MUST BE SUPPLIED

Explanation: The scheduler's subsystem ID was not specified.

System action: OCL processing is terminated.

User response: Specify the subsystem ID in the SUBSYS initialization parameter (EQQYRPRM member in the OCL library) or in the INIT instruction.

EQQCL5KE NO APPLICATION FOUND FOR THE GROUP *APPLGRP*

Explanation: OCL tried to add the application group *APPLGRP*, but no application was defined to the group.

System action: OCL processing is terminated.

User response: Verify the application group ID.

EQQCL5LE NOT POSSIBLE TO ADD THE OCCURRENCE *APPL*

Explanation: OCL was not able to add the occurrence *APPL*.

System action: OCL processing is terminated.

User response: Verify that the specified occurrence Application Identifier, the Input Arrival Date and Time, and the occurrence status are correct and uniquely identify the occurrence. If not correct it and resubmit the job.

EQQCL5ME NOT POSSIBLE TO USE AN IA DATE OTHER THAN THE ACTUAL DATE

Explanation: OCL tried to add an occurrence in the current or long term plan. An occurrence with the same input arrival (IA) already existed, so OCL tried to increment the input arrival time by 1 minute. An error occurs if the occurrence input arrival time is 23:59.

System action: OCL processing is terminated.

User response: Specify an input arrival time other than 23:59 for the occurrence to be added.

EQQCL5NE NOT POSSIBLE TO ADD THE OCCURRENCE WITH IA *IADT*

Explanation: OCL was not able to add the occurrence with IA *IADT*.

System action: OCL processing is terminated.

User response: Verify if the occurrence input arrival date and time is later than the long term plan end time.

EQQCL5OE OPERATION NUMBER MUST BE SPECIFIED

Explanation: The operation number is a required keyword for the instruction.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL5PE WORKSTATION ID MUST BE SPECIFIED

Explanation: Workstation ID is a required keyword for the instruction.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL5QE WORKSTATION *WSNAME* NOT FOUND IN THE DATABASE

Explanation: Workstation *WSNAME* is not defined in the scheduler's Workstation database.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL5RE JOBNAME MUST BE SPECIFIED FOR WORKSTATION *WSNAME*

Explanation: Workstation *WSNAME* requires the jobname (job-setup, computer, or printer)

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL5SE DATE1 AND DATE2 ARE MUTUALLY EXCLUSIVE KEYWORDS

Explanation: You cannot use DATE1 and DATE2 keywords in the same CHKDATE instruction.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL5TE INTERNAL PREDECESSOR DOESN'T EXIST: *PREOPNUM*

Explanation: OCL tried to add an internal predecessor that does not exist.

System action: OCL processing is terminated.

User response: Check that the PREOPNUM() keyword refers to an existing operation number. If it does not, correct the instruction and resubmit the job. If the

EQQCL5UE • EQQCL62E

PREOPNUM() keyword is not specified, OCL uses the default operation number (initialization parameter DEFOPNO) as the internal predecessor operation. Verify that the application contains an operation with the number equal to the number specified in the DEFOPNO parameter.

EQQCL5UE INCVALUE VALUE CAN'T BE GREATER THAN 30

Explanation: The value of INCVALUE must be in the range 1–30.

System action: OCL processing is terminated.

User response: Specify a correct INCVALUE and resubmit the job.

EQQCL5VE THE OPERATION INPUT ARRIVAL MUST BE IN THE YYMMDDHHMM FORMAT

Explanation: OCL found an invalid operation input arrival date and time.

System action: OCL processing is terminated.

User response: Specify the operation arrival date and time in the YYMMDDHHMM format, correct the instruction and resubmit the job.

EQQCL5WE THE OPERATION DEADLINE MUST BE IN THE YYMMDDHHMM FORMAT

Explanation: OCL found an invalid operation deadline date and time.

System action: OCL processing is terminated.

User response: Specify the operation deadline date and time in the YYMMDDHHMM format, correct the instruction and resubmit the job.

EQQCL5XE NOT POSSIBLE TO ADD THE OPERATION OPNUM IN OCCURRENCE APPL

Explanation: OCL tried to insert a new operation in the application occurrence *APPL*, but a problem occurred.

System action: OCL processing is terminated.

User response: Verify if the operation *OPNUM* already existed in the occurrence. Refer to the error messages in the scheduler's message log.

EQQCL5YE NOT POSSIBLE TO DEFINE INTERNAL PRED. PREOPNUM TO OPERATION OPNUM

Explanation: OCL tried to define an internal

predecessor to operation *OPNUM*, but a problem occurred.

System action: OCL processing is terminated.

User response: Verify that you provided all the provided OCL parameters necessary to uniquely identify the Application Operation (ADID, IA, and eventually OSTATUS) and the predecessor (PREADID, PREIA and eventually PREOSTAT). Then correct and resubmit the job.

EQQCL5ZE NOT POSSIBLE TO REMOVE THE OCCURRENCE FROM THE APPLICATION GROUP

Explanation: OCL tried to remove an occurrence from the application group before deleting it from the current plan or from the long term plan, but a problem occurred.

System action: OCL processing is terminated.

User response: Verify that you specified the correct occurrence application ID and input arrival date and time to uniquely identify the application in the group. Then correct and resubmit the job.

EQQCL60E NOT POSSIBLE TO DELETE OCCURRENCE APPL WITH IA IADT

Explanation: OCL tried to delete the occurrence *APPL*, but a problem occurred.

System action: OCL processing is terminated.

User response: Verify that you specified the correct occurrence application ID and input arrival date and time to uniquely identify the application in the group. Correct them and resubmit the job.

EQQCL61E NOT POSSIBLE TO DELETE OPERATION OPNUM OF OCCURRENCE APPL

Explanation: OCL tried to delete operation *OPNUM* from the occurrence *APPL*, but a problem occurred.

System action: OCL processing is terminated.

User response: Verify that the operation number is correctly specified for the selected occurrence Application ID. Then correct and resubmit the job.

EQQCL62E DATE MUST BE SUPPLIED

Explanation: A date must be supplied in the *CHKDATE* instruction.

System action: OCL processing is terminated.

User response: Use the *DATE1* or *DATE2* keyword according with the format of the date and resubmit the job.

EQQCL63E DATE NOT VALID: DATE LENGTH CANNOT BE > 10

Explanation: An invalid date was specified in the CHKDATE instruction. Valid date formats are YYMMDD, YY/MM/DD, YYYYMMDD, YYYY/MM/DD, DDMMYY, DD/MM/YY, DDMMYYYY, and DD/MM/YYYY.

System action: OCL processing is terminated.

User response: Correct the date and resubmit the job.

EQQCL64E DATE NOT VALID: DATE LENGTH CANNOT BE < 6

Explanation: An invalid date was specified in the CHKDATE instruction. Valid date formats are YYMMDD, YY/MM/DD, YYYYMMDD, YYYY/MM/DD, DDMMYY, DD/MM/YY, DDMMYYYY, and DD/MM/YYYY.

System action: OCL processing is terminated.

User response: Correct the date and resubmit the job.

EQQCL65E DATE NOT VALID: FORMAT NOT RECOGNIZED

Explanation: An invalid date was specified in the CHKDATE instruction. Valid date formats are YYMMDD, YY/MM/DD, YYYYMMDD, YYYY/MM/DD, DDMMYY, DD/MM/YY, DDMMYYYY, and DD/MM/YYYY.

System action: OCL processing is terminated.

User response: Correct the date and resubmit the job.

EQQCL66E DATE NOT VALID: IT'S NOT IN THE YYYYMMDD FORMAT

Explanation: The date supplied is not in the YYYYMMDD format.

System action: OCL processing is terminated.

User response: Correct the date and resubmit the job.

EQQCL67E YEAR YEAR MUST BE INCLUDED BETWEEN 1996 AND 2999

Explanation: The date specified in the CHKDATE instruction is outside the valid range 1996–2999.

System action: OCL processing is terminated.

User response: Correct the date and resubmit the job.

EQQCL68E MONTH MONTH MUST BE INCLUDED BETWEEN 01 AND 12

Explanation: The date specified in the CHKDATE instruction is invalid; it is not in the range 01–12.

System action: OCL processing is terminated.

User response: Correct the date and resubmit the job.

EQQCL6AE STATUS INVALID: IT CAN BE: C, E, D, P, S, U OR W

Explanation: An invalid occurrence status was specified in the CHKAPPL instruction.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL69E DAY DAY MUST BE INCLUDED BETWEEN 01 AND LAST_DAY

Explanation: The date specified in the CHKDATE instruction is invalid. The value of day *DAY* must be in the range 01–*LAST_DAY*. *LAST_DAY* is the last day of the month specified in the input date.

System action: OCL processing is terminated.

User response: Correct the date and resubmit the job.

EQQCL6BE OCCURRENCE NAME CAN'T BE '*'

Explanation: An invalid occurrence ID was specified.

System action: OCL processing is terminated.

User response: Correct the APPL keyword and resubmit the job.

EQQCL6CE ALERT PARAMETER CAN BE YES OR NO

Explanation: An invalid ALERT keyword was specified.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL6DE USER ID MUST BE SPECIFIED FOR ALERTING

Explanation: The USER keyword is required with ALERT(YES).

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL6EE NOT POSSIBLE TO ISSUE THE WTO

Explanation: OCL tried to invoke the IPOWTO program, but a problem occurred.

System action: OCL processing is terminated.

User response: Make sure that the IPOWTO program is available to OCL and resubmit the job.

EQQCL6FE INVALID CMD COMMAND

Explanation: *CMD* can be only SRSTAT, OPSTAT, or WSSTAT.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL6GE VARIABLE TABLE NOT FOUND IN DATABASE

Explanation: The variable table specified in the INIT instruction does not exist in the scheduler's database.

System action: OCL processing is terminated.

User response: Specify a valid variable table in the INIT instruction and resubmit the job.

EQQCL6HE INTERNAL SUCCESSOR OPERATION NOT FOUND: S_OPNUM

Explanation: OCL tried to release an internal successor, but a problem occurred. *S_OPNUM* is the successor operation number.

System action: OCL processing is terminated.

User response: If the problem persists, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section.

EQQCL6IE NOT POSSIBLE TO EXECUTE EQQPIFT PROGRAM

Explanation: OCL could not run the EQQPIFT program.

System action: OCL processing is terminated.

User response: Make sure that the EQQPIFT load module is available to OCL and resubmit the job.

EQQCL6JE NEW JOBNAME INVALID OR MISSING

Explanation: A valid NEWJOB keyword must be specified in the CHGJOB instruction.

System action: OCL processing is terminated.

User response: Specify a valid NEWJOB keyword and resubmit the job.

EQQCL6KE CANNOT LIST THE WORKSTATIONS

Explanation: OCL tried to list the workstations defined in the scheduler's Workstation database, but a problem occurred.

System action: OCL processing is terminated.

User response: If the problem persists, for the information to collect, see the *Diagnosis Guide and*

Reference, "Problem analysis procedures" section.

EQQCL6LE NOT POSSIBLE TO MODIFY OPERATION OPNUM OF OCCURRENCE APPL

Explanation: OCL tried to modify operation *OPNUM* in the occurrence *APPL*, but a problem occurred.

System action: OCL processing is terminated.

User response: Refer to the messages in the scheduler's message log and contact IBM Software Support.

EQQCL6ME SPECIFY THE OPNO() KEYWORD OR SPECIFY THE DEFAULT OPERATION NUMBER

Explanation: The OPNO keyword is not specified. OCL tried to use the default operation number, which is not specified in the initialization parameter DEFOPNO.

System action: OCL processing is terminated.

User response: Specify the OPNO keyword or the default operation number in the initialization parameter DEFOPNO.

EQQCL6NE NOT POSSIBLE TO MODIFY THE OPERATION STATUS: OPNO(OPNUM)

Explanation: OCL tried to modify the status of operation *OPNUM*, but a problem occurred.

System action: OCL processing is terminated.

User response: If the problem persists, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section.

EQQCL6OE NEW JOBNAME IS BLANK

Explanation: The NEWJOB keyword was not specified in the CHGJOB instruction.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL6PE NOT POSSIBLE TO CHANGE THE JOBNAME

Explanation: OCL tried to change the jobname of an operation, but a problem occurred.

System action: OCL processing is terminated.

User response: If the problem persists, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section.

EQQCL6QE PREDECESSOR OPERATION NOT FOUND: PREOPNUM

Explanation: OCL tried to add a predecessor that does not exist

System action: OCL processing is terminated.

User response: Verify the PREOPNO keyword or the initialization parameter DEFPREOPNO. Correct the instruction and resubmit the job.

EQQCL6RE NOT POSSIBLE TO MODIFY THE OPERATION OPNUM

Explanation: OCL tried to modify operation *OPNUM*, but a problem occurred.

System action: OCL processing is terminated.

User response: Verify that you specified the correct *OPNUM*. Correct the instruction and resubmit the job.

EQQCL6SE CAN'T DEFINE THE PRED. FOR OPERATION OPNUM: PREOPNO(P_OPNUM) APPL(P_APPL)

Explanation: OCL tried to add a new predecessor to operation *OPNUM*.

P_OPNUM

The predecessor operation number

P_APPL

The predecessor occurrence ID.

System action: OCL processing is terminated.

User response: Verify the correctness of the values of the predecessor keywords used in the *ADDPRED* instruction, correct them and resubmit the job.

EQQCL6TE CAN'T HAVE A DEPENDENCY ON ITSELF: PREAPPL(P_APPL) PREIA(IADT)

Explanation: In the long term plan, an occurrence cannot have a predecessor with the same occurrence ID and input arrival date and time.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL6UE NOT POSSIBLE TO CREATE A NEW DEPENDENCY: PREAPPL(PREAPPL)

Explanation: OCL tried to define a new dependency in an application occurrence in the long term plan, but a problem occurred.

System action: OCL processing is terminated.

User response: Verify the correctness of the values of the predecessor keywords used in the *ADDPRED* instruction, correct them and resubmit the job.

EQQCL6VE OPERATION NOT FOUND: OPNUM

Explanation: Operation *OPNUM* does not exist in the occurrence to be modified.

System action: OCL processing is terminated.

User response: Verify the *OPNO* keyword or the default operation number in the initialization parameter *DEFOPNO*. Correct the instruction and resubmit the job.

EQQCL6WE NOT POSSIBLE TO DELETE THE DEPENDENCY DEFINITION

Explanation: OCL tried to delete a predecessor, but a problem occurred.

System action: OCL processing is terminated.

User response: Verify the correctness of the keyword values of the *FORCE* instruction, correct them and resubmit the job.

EQQCL6XE SPECIAL RESOURCE NAME MUST BE SUPPLIED

Explanation: *RESNAME* is a required keyword.

System action: OCL processing is terminated.

User response: Specify the *RESNAME* keyword and resubmit the job.

EQQCL6YE SPECIAL RESOURCE USAGE MUST BE SUPPLIED

Explanation: *RESUSAGE* is a required keyword.

System action: OCL processing is terminated.

User response: Specify the *RESUSAGE* keyword and resubmit the job.

EQQCL6ZE ONERROR ACTION CAN BE Y OR N OR BLANK

Explanation: An invalid *ONERROR* keyword was specified.

System action: OCL processing is terminated.

User response: Correct the instruction specifying one of the possible values and resubmit the job.

EQQCL70E NOT POSSIBLE TO MODIFY EXTENDED INFO

Explanation: OCL was unable to add or modify the extended information in the current plan.

System action: The extended information is unchanged.

User response: Verify the correctness of the values of the predecessor keywords used in the *ADDPRED*

EQQCL71E • EQQCL7AE

instruction, correct them and resubmit the job.

EQQCL71E OPNO() AND EXCLOP() ARE MUTUALLY EXCLUSIVE KEYWORDS

Explanation: OPNO and EXCLOP are mutually exclusive keywords.

System action: OCL processing is terminated.

User response: Specify the OPNO or the EXCLOP keyword, correct the instruction and resubmit the job.

EQQCL72E CAN'T RELEASE THE SUCCESSOR OF OPERATION *OPNUM*: APPL(*S_APPL*) OPNO(*S_OPNUM*)

Explanation: OCL tried to release an external successor of operation *OPNUM*, but a problem occurred.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL73E YOU CAN SPECIFY ONLY ONE OPERATION NUMBER

Explanation: Only one operation number is accepted in the OPNO keyword.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL74E DEFAULT OPERATION NUMBER IS NOT SPECIFIED (DEFOPNO PARAMETER)

Explanation: OCL is trying to release an internal successor. OCL would use the default operation number as an internal predecessor of this operation, but the default operation number was not specified in the DEFOPNO parameter of the OCL PARMLIB.

System action: OCL processing is terminated.

User response: Specify the DEFOPNO parameter in the OCL PARMLIB.

EQQCL75E OPNO() CANNOT BE EQUAL TO DEFOPNO INITIALIZATION PARAMETER: *OPNUM*

Explanation: OCL is trying to release an internal successor of operation *OPNUM*. It would use the default operation number as an internal predecessor of this operation, but the value of OPNO must not be the same as the default operation number.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL76E REQUIRED KEYWORD(S) MISSING. SPECIFY THE INIT INSTRUCTION

Explanation: The variable table or the scheduler's subsystem name was not supplied.

System action: OCL processing is terminated.

User response: Specify the INIT instruction before the UPD or SETUPD instructions and resubmit the job.

EQQCL77E CAN'T DEFINE THE DEFAULT OPERATION NUMBER *OPNUM* AS A PREDECESSOR OF *S_OPNUM*

Explanation: OCL tried to add the default operation number *OPNUM* as a predecessor of *S_OPNUM*. *S_OPNUM* is the internal successor to be released by the RELOP instruction.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL78E CAN'T RELEASE THE SUCCESSOR OPERATION: *S_OPNUM*

Explanation: OCL tried to release an internal successor, but a problem occurred.

System action: OCL processing is terminated.

User response: Verify the correctness of the keyword values of the RELOP instruction, correct them and resubmit the job.

EQQCL79E CAN'T DELETE THE SPECIAL RESOURCE: *RES_NAME* OPNO(*OPNUM*)

Explanation: OCL tried to delete the special resource *RES_NAME* from the operation *OPNUM*.

System action: OCL processing is terminated.

User response: Verify the correctness of the keyword values of the FORCE instruction, correct them and resubmit the job.

EQQCL7AE OCCURRENCE ID MUST BE SUPPLIED

Explanation: APPL is a required keyword.

System action: OCL processing is terminated.

User response: Specify the APPL keyword and resubmit the job.

EQQCL7BE CALENDAR NOT FOUND: CAL

Explanation: The calendar *CAL* was not found in the scheduler's Calendar database.

System action: OCL processing is terminated.

User response: Specify the calendar *CAL* and resubmit the job.

EQQCL7CE SPECIFY THE PREOPNO() KEYWORD OR THE DEFAULT OPERATION NUMBER

Explanation: OCL is adding a new operation in an application occurrence. It tried to define the internal predecessor of this operation, but either the PREOPNO keyword or the default operation number was not specified.

System action: OCL processing is terminated.

User response: Specify the PREOPNO keyword or the default operation number in the OCL PARMLIB.

EQQCL7DE DATE IS BLANK

Explanation: OCL tried to determine whether an input date corresponds to a free day, but the date is blank.

System action: OCL processing is terminated.

User response: Provide the date and resubmit the job.

EQQCL7EE VALID VALUES FOR OPCVER ARE 1 AND 2

Explanation: The initialization parameter OPCVER is not either 1 or 2.

System action: OCL processing is terminated.

User response: Correct the parameter and resubmit the job.

EQQCL7FE NOT POSSIBLE TO ALLOCATE DATASET: DSNNAME(WTOIN)

Explanation: OCL tried to allocate the member WTOIN in the data set *DSNAME*, but a problem occurred.

System action: OCL processing is terminated.

User response: Verify that you allocated correctly the WTOIN data set and resubmit the job.

EQQCL7GE VALID VALUES FOR TSOCMD PARAMETER ARE YES AND NO

Explanation: The initialization parameter TSOCMD is not either YES or NO.

System action: OCL processing is terminated.

User response: Correct the parameter and resubmit the job.

EQQCL7HE NOT POSSIBLE TO WRITE THE MESSAGE ON DATASET: DSNNAME(WTOIN)

Explanation: OCL tried to write the message text of the WTOR in the member WTOIN of data set *DSNAME*, but a problem occurred.

System action: OCL processing is terminated.

User response: Verify that you allocated correctly the WTOIN data set and resubmit the job.

EQQCL7IE INVALID PARAMETER OR INVALID VALUE FOR PARAMETER: INVPARM

Explanation: The message variable shows the incorrect parameter.

System action: OCL processing is terminated.

User response: Specify a valid value for PARAMETER: *INVPARM* and resubmit the job.

EQQCL7JE NOT POSSIBLE TO MODIFY THE OCCURRENCE APPL

Explanation: OCL tried to modify the occurrence *APPL*, but a problem occurred.

System action: OCL processing is terminated.

User response: Either another user is editing the occurrence or you do not have permission to modify it. Verify if the occurrence is locked by another user or that you have permission to submit the OCL job. Try to rerun the command.

EQQCL7KE CANNOT UPDATE THE LOG DATASET

Explanation: OCL tried to write a new record in the log data set, but a problem occurred.

System action: OCL processing is terminated.

User response: The data set pointed by the OCLLOG DD card cannot be updated. Check the other messages reported in the SYSTSPRT log, correct the problem and submit again the OCL JCL.

EQQCL7LE NOT POSSIBLE TO RESOLVE DEPENDENCIES

Explanation: OCL can not handle versioning and dependencies resolution at the same time.

System action: OCL processing is terminated.

User response: The applications group you want to add contains more versions of the same application, for reason it is not possible to resolve the external

EQQCL7NE • EQQCL7YE

dependencies. Correct the application group and rerun the OCL JCL.

EQQCL7NE EXTENDED JOB NAME LENGTH INVALID

Explanation: The Extended Job Name length must be maximum of 54 characters.

System action: OCL processing is terminated .

User response: Correct the Extended Job Name length and resubmit the job.

EQQCL7OE NOT POSSIBLE TO MODIFY EXTENDED JOB NAME EXTNAM

Explanation: OCL was not able to add or modify the Extended Job Name in the current plan .

System action: OCL processing is terminated.

User response: Analyze the messages reported in the SYSTSPRT and in the EQQMLOG logs, correct the problem and submit the OCL JCL again.

EQQCL7PE SPECIFY EXTNAM OR EXTSE OR BOTH

Explanation: OCL needs either the extended name, the scheduling environment name, or both, to modify the extended information.

System action: The extended information is unchanged.

User response: Specify at least either the extended name or the scheduling environment name.

EQQCL7SE SCHEDULING ENVIRONMENT NAME LENGTH INVALID

Explanation: The scheduling environment name is too long. The maximum length allowed is 16 characters.

System action: OCL processing is terminated.

User response: Specify a name of acceptable length and submit the job again.

EQQCL7TE COMMAND TEXT LENGTH NOT VALID

Explanation: The length of the command text specified in COMMTEXT is longer than the maximum 255 characters allowed.

System action: OCL processing is terminated.

User response: Correct the command text and submit the job again.

EQQCL7UE AUTOMATED FUNCTION LENGTH NOT VALID

Explanation: The length of the automated function specified in AUTFUNC is longer than the maximum 8 characters allowed.

System action: OCL processing is terminated.

User response: Correct the automated function and submit the job again.

EQQCL7VE SECURITY ELEMENT LENGTH NOT VALID

Explanation: The length of the security element specified in SECELEM is longer than the maximum 8 characters allowed.

System action: OCL processing is terminated.

User response: Correct the security element length and submit the job again.

EQQCL7WE COMPLETION INFO LENGTH NOT VALID

Explanation: The length of the completion information specified in COMPINFO is longer than the maximum 64 characters allowed.

System action: OCL processing is terminated.

User response: Correct the completion info length and submit the job again.

EQQCL7XE SPECIFY AT LEAST COMMTEXT, AUTFUNC, SECELEM, OR COMPINFO

Explanation: The OCL instruction CHGOPSAI requires at least one of the keywords COMMTEXT, AUTFUNC, SECELEM, and COMPINFO. If COMMTEXT is specified, its value cannot be blank or empty.

System action: OCL processing is terminated.

User response: Correct the instruction and submit the job again.

EQQCL7YE NOT POSSIBLE TO MODIFY SA INFO

Explanation: An error occurred that prevented system automation information from being updated.

System action: OCL processing is terminated.

User response: Check for the return code and error messages from PIF. Correct the instruction and submit the job again.

EQQCL7ZE THE BRACKET CHARACTER IS MISSING IN THE COMMTEXT FIELD

Explanation: The COMMTEXT argument requires a bracket or a continuation character.

System action: OCL processing is terminated.

User response: Correct the instruction and submit the job again.

EQQCL80E ONCOMPL ACTION CAN BE Y, N, R, OR BLANK

Explanation: The ONCOMPL keyword specified is not valid.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL81E WLM SERVICE CLASS LENGTH INVALID

Explanation: The length of the WLM service class can be up to 8 characters.

System action: OCL processing is terminated.

User response: Correct the value for the WLM service class and resubmit the job.

EQQCL82E LUNAME AND REMHOST PARAMETERS ARE MUTUALLY EXCLUSIVE.

Explanation: LUNAME parameter cannot be specified together REMHOST parameter, because they correspond to different communication protocols.

System action: OCL processing is terminated.

User response: Correct the instruction and rerun.

EQQCL83E REMPORT VALUE MUST BE USED IN CONJUNCTION WITH REMHOST.

Explanation: If you specify REMPORT, you must specify also REMHOST.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL84E REMPORT MUST BE A POSITIVE NUMBER: VALID VALUES ARE FROM 0 TO 65535.

Explanation: The specified REMPORT is not in the range 0-65535.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL85E REMHOST VALUE LENGTH IS NOT VALID: 52 CHARACTERS AT MAX.

Explanation: The specified REMHOST exceeds the allow length.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCL86E CAN'T ADD DEP. TO COND XC OP XO: PREOPNO(XPO) PREAPPL(XPA)

Explanation: OCL failed to add a condition dependency to condition XC in operation XO. XPO is the predecessor operation, and XPA is the predecessor application ID. Possible reasons for the error are:

- Condition XC does not exist.
- The scheduler already evaluated the status of condition XC.

System action: OCL processing ends.

User response: Correct the instruction and resubmit the job.

EQQCL87E CAN'T DEFINE THE CONDITION XC FOR OPERATION XO

Explanation: OCL failed to define a condition XC in operation XO. Possible reasons for the error are:

- Condition XC already exists.
- Operation XO does not exist.
- Operation XO had a status different from waiting or ready at the time of the request.

System action: OCL processing ends.

User response: Correct the instruction and resubmit the job.

EQQCL88E CONDITION NOT FOUND: XO

Explanation: OCL did not find condition XC.

System action: OCL processing ends.

User response: Consider changing the condition ID and resubmit the job.

EQQCL89E CAN'T MODIFY THE CONDITION XC FOR OPERATION XO

Explanation: OCL failed to modify condition XC in operation XO. Possible reasons for the error are:

- Condition XC does not exist.
- Operation XO does not exist.

EQQCL8AE • EQQCLZ6E

- Operation *XO* had a status different from waiting or ready at the time of the request.

System action: OCL processing ends.

User response: Correct the instruction and resubmit the job.

EQQCL8AE CAN'T DELETE THE CONDITION XC FOR OPERATION XO

Explanation: OCL failed to delete condition *XC* from operation *XO*. Possible reasons for the error are:

- Condition *XC* does not exist.
- Operation *XO* does not exist.
- Operation *XO* had a status different from waiting or ready at the time of the request.

System action: OCL processing ends.

User response: Correct the instruction and resubmit the job.

EQQCL8BE DEP. NOT DELETED IN COND XC OP XO: PREOPNO(XPO) PREAPPL(XPA)

Explanation: OCL failed to delete a condition dependency from condition *XC* in operation *XO*. *XPO* is the predecessor operation, and *XPA* is the predecessor application ID. Possible reasons for the error are:

- Condition *XC* does not exist.
- The scheduler already evaluated the status of condition *XC*.

System action: OCL processing ends.

User response: Correct the instruction and resubmit the job.

EQQCL8CE MISSING PARAMETER: INVPARM

Explanation: The message variable shows a required parameter that is missing.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

EQQCLNLE EXTENDED JOB NAME LENGTH INVALID

Explanation: The Extended Job Name length must be maximum of 54 characters.

System action: OCL processing is terminated.

User response: Correct the Extended Job Name length and resubmit the job.

EQQCLZ6E ONERROR ACTION CAN BE Y, N, OR BLANK

Explanation: The ONERROR keyword specified is not valid.

System action: OCL processing is terminated.

User response: Correct the instruction and resubmit the job.

Chapter 198. EQQCNnnn messages

EQQCN00 - EQQCN99

EQQCN00I START CLEANUP AND, OR
RET-CODE SIMULATION
PROCESS(ES)

Explanation: EQQCLEAN stand-alone data set cleanup and return code simulation process has been started

System action: Cleanup and return code simulation process continues.

User response: None.

EQQCN01E NO MATCH FOUND FOR SYSIN
RECORD: *STRING*

Explanation: The EQQCLEAN stand-alone data set cleanup and return code simulation process detected a mismatch between the JCL executed and the step list specified in EQQSIMDD DD. *STRING* identifies the step number, return code, step name, and procedure name.

System action: Cleanup and return code simulation process ends in error.

System programmer response: Save the JCL and the message log, then contact IBM Software Support.

User response: The content of the EQQSIMRC DD or some JCL lines might have been modified manually after the restart and cleanup process analyzed and created the submitted JCL. If nobody modified the JCL, contact your System Programmer.

EQQCN02I *PROGR STEPNAME PROCNAME RC*

Explanation: EQQCLEAN stand-alone data set cleanup and return code simulation process simulated *RC* return code for stepname *STEPNAME* procstepname *PROCNAME* step number *PROGR*.

System action: Cleanup and return code simulation process continues.

User response: None.

EQQCN03I *PROGR STEPNAME PROCNAME
ABEND*

Explanation: EQQCLEAN stand-alone data set cleanup and return code simulation process simulated *ABEND* ABEND code for stepname *STEPNAME* procstepname *PROCNAME* step number *PROGR*.

System action: Cleanup and return code simulation process continues.

User response: None.

EQQCN04I *PROGR STEPNAME PROCNAME
USERCODE*

Explanation: EQQCLEAN stand-alone data set cleanup and return code simulation process simulated *USERCODE* user code for stepname *STEPNAME* procstepname *PROCNAME* step number *PROGR*.

System action: Cleanup and return code simulation process continues.

User response: None.

EQQCN05I *PROGR STEPNAME PROCNAME
FLUSH*

Explanation: EQQCLEAN stand-alone data set cleanup and return code simulation process simulated a *FLUSH* for stepname *STEPNAME* procstepname *PROCNAME* step number *PROGR*.

System action: Cleanup and return code simulation process continues.

User response: None.

EQQCN06E INVALID PARAMETER IN SYSIN,
PROCESS TERMINATED

Explanation: EQQCLEAN stand-alone data set cleanup and return code simulation process received an invalid parameter.

System action: Cleanup and return code simulation process ends in error.

System programmer response: Save the JCL and the message log, then contact IBM Software Support.

User response: The content of the EQQCLEAN step might have been modified manually after the restart and cleanup process analyzed and created the submitted JCL. If nobody modified the JCL, contact your System Programmer

EQQCN10I *DLTD DEVTYPE VIA RMM DSNNAME*

Explanation: The EQQCLEAN stand-alone data set cleanup and return code simulation process deletes data set *DSNAME* stored on device type *DEVTYPE* using HSM services.

EQQC�11I • EQQC�18I

System action: Cleanup and return code simulation process continues

User response: None.

EQQC�11I TSO/E MESSAGE: MSGCODE IN ACTION PROCESS

Explanation: The EQQCLEAN stand-alone data set cleanup and return code simulation process kept a return code RC performing ACTION using IDCAMS services

System action: Cleanup and return code simulation process ends in error.

User response: Contact your system programmer.

Problem determination: Review the JCL message log data set to determine the cause of the problem.

EQQC�12I ACTION DEVTYPE DSNAME

Explanation: The EQQCLEAN stand-alone data set cleanup and return code simulation process did the ACTION action on data set DSNAME stored in a DEVTYPE device type.

System action: Cleanup and return code simulation process continues.

User response: None.

EQQC�13I DLTĐ DEVTYPE VIA RMM DSNAME

Explanation: The EQQCLEAN stand-alone data set cleanup and return code simulation process deletes data set DSNAME stored on device type DEVTYPE using RMM services.

System action: Cleanup and return code simulation process continues.

User response: None.

EQQC�14E ERROR IN DATA SET CLEANUP: JOB STOPPED

Explanation: The EQQCLEAN stand-alone data set cleanup and return code simulation process was not able to perform one or more cleanup actions.

System action: Cleanup and return code simulation process ends in error.

User response: If the problem persists, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section.

Problem determination: Review the JCL message log data set to determine the cause of the problem.

EQQC�15W RMM MACRO CMD CMDTYPE: RMM_COMMAND RMM MACRO RC: RC RSC: RSC

Explanation: An error occurred during an RMM macro processing. RMM processing can be started both by EQQCLEAN and EQQDELDS. The RMM EDGXCI macro operation type, indicated by the the "CMDTYPE" value, can be:

- BEGIN
- CONTINUE
- RELEASE

The RMM command is indicated by the "RMM_COMMAND" value.

The RMM macro return code and reason code are indicated by the "RC" and "RSC" values. See "Using the DFSMSRMM Application Programming Interface - Chapter 1 - EDGXCI Return and Reason Codes" and "DFSMSRMM Guide and Reference - Chapter 11 - DFSMSRMM Return Codes and Reason Codes" for details.

System action: EQQCLEAN or EQQDELDS is stopped and ends in error.

User response: Contact your system programmer.

EQQC�16I ALREADY DELETED DSNAME

Explanation: The EQQCLEAN stand-alone data set cleanup and return code simulation process tried to delete the DSNAME data set but it does not exist. The data set was probably deleted manually.

System action: Cleanup and return code simulation process continues.

User response:

EQQC�17I VOLSER

Explanation: The EQQCLEAN process sends this message that follows EQQC�12I. It contains the volser name involved in the cleanup operation.

System action: Cleanup and return code simulation process continues.

User response: None.

EQQC�18I SNUM STEPNAME PROCNAME RC

Explanation: This message is followed by EQQC�02I messages and is a header message used as a layout.

SNUM indicates the step number.

STEPNAME is the step name

PROCNAME is the procedure step name

RC is the return code.

System action: None.

User response: None.

EQQCN19E INVALID SYSIN INPUT: *SYSINREC*

Explanation: EQQCLEAN program (used for cleanup and/or return code simulation) has invalid sysin input data: *SYSINREC*.

System action: Cleanup and return code simulation process ends in error and job fails.

System programmer response: Save the JCL and message log, and contact IBM Software Support.

User response: The content of EQQSIMDD, EQQGDGDD, or EQQROOTD, DD was incorrectly built by the scheduler. Contact your system administrator.

EQQCN20I EQQUXCAT EXIT IGNORED DATA SET: *dsname*

Explanation: The EQQCLEAN program invoked the user exit EQQUXCAT before executing the cleanup action for the data set specified by *dsname*. EQQUXCAT checked the data set and decided that no action should be done.

System action: No cleanup action is taken for the specified data set.

User response: None.

EQQCN21I CLEAN UP DETAILS FOLLOW: *details*

Explanation: EQQCLEAN program was used by scheduler to execute clean up and /or restart action. The variable *details* will contain all the IDCAMS messages related to this action. This message can also be issued by the EQQDELDS sample program if RMM is involved.

System action: If an error is detected clean up action fails otherwise the process continues.

System programmer response: Check the IDCAMS messages to understand if there was a problem.

User response: None.

EQQCN22I START GDG NAME SIMULATION PROCESS

Explanation: The EQQCLEAN pre-step is going to simulate GDG names in order to enable Step Restart. (This process consists in overwriting the GDGs in the submitted JCL appropriately, in order to correctly execute a Step Restart).

System action: None.

User response: None.

EQQCN23I GDG NAME SIMULATION PROCESS ENDED

Explanation: The EQQCLEAN pre-step has finished simulating GDG names in order to enable Step Restart (this process consists in overwriting the GDGs in the submitted JCL appropriately, in order to correctly execute a Step Restart).

System action: None.

User response: None.

EQQCN24I NOT SIMULATED GDG DATA SETS: *SNUM GDGDSNAME GDGRELNUM*

Explanation: EQQCN24I is shown as follows:

EQQCN24I – NOT SIMULATED GDG DATA SETS:

EQQCN26I – SNUM DSNAME RELNUM

EQQCN24I – *snum gdgdsnam gdgrelnum*

EQQCN24I – *snum gdgdsnam gdgrelnum*

.....

The GDG data sets identified by SNUM GDGDSNAME GDGRELNUM have not been simulated; in fact, they were found within non-simulated steps, but the corresponding GDG information was not available. This is usually not a problem. In fact, information about GDG data sets belonging to previously unexecuted steps is normally not provided when you run a step restart: however, EQQCLEAN acknowledges that these data sets are in the JCL and issues message EQQCN24I to inform you about this.

System action: Processing continues.

User response: None.

EQQCN25I *SNUM GDGDSNAME GDGRELNUM*

Explanation: The GDG data set identified by *SNUM GDGDSNAME GDGRELNUM* has been successfully simulated.

System action: Processing continues.

User response: None.

EQQCN26I SNUM DSNAME RELNUM

Explanation: This message is followed by a list of EQQCN24I, EQQCN25I, or EQQCN28I messages. It provides a header for these messages, where:

SNUM: is the step number

DSNAME: is the GDG simulated data set name

RELNUM: is the relative GDG number

System action: Processing continues.

User response: None.

EQQC27W *STEPNAME PROCNAME STEPNUM
MISMATCH: SYSINSNUM/ SNUM*

Explanation: EQQCLEAN tried to simulate the step identified by *STEPNAME*, *PROCNAME* and *SYSINSNUM*, but no exact match was found in the JES SCT control blocks. A match was found for *STEPNAME PROCNAME*, but the step number in SCT was *SNUM*

System action: EQQCLEAN simulates the step in the SCT found with the partial match, without considering the step number.

User response: None.

EQQC28I *EQQUXGDG EXIT EXCLUDED FROM
SIMULATION FOLLOWING GDG:
SNUM GDGDSNAME GDGRELNUM*

Explanation: EQQC28I is displayed as follows:

EQQC28I – EQQUXGDG EXIT EXCLUDED FROM
SIMULATION FOLLOWING GDG:

EQQC26I – SNUM DSNAME RELNUM

EQQC28I – snum gdgdsnam gdgrelnum

EQQC28I – snum gdgdsnam gdgrelnum

.....

The EQQUXGDG exit, called before executing the simulation, asked to exclude this GDG from simulation.

System action: EQQCLEAN does not simulate the indicated GDG.

User response: None.

EQQC29E *ERROR IN RMM PROCESS. RC: RC
REASON: RSC DSN: DSNAME*

Explanation:

An error occurred during the RMM process while handling the data set indicated by *DSNAME*. RC and RSC could directly contain the RMM macro return and reason codes or could also have the following values:

- RC=2 Error in IDCAMS command
- RC=3 Data Set not found

For details about RMM failure, the Tivoli Workload Scheduler z/OS internal RMM trace can be seen in the SYSPRINT data set.

If the failure occurred in the RMM API, the macro message EQQC15W will display more details about this.

System action: EQQCLEAN or EQQDELDS process is stopped and ends in error.

User response: If the problem persists, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section.

EQQC90E *UNABLE TO LOAD BEX: EQQCLEAN
PROGRAM NOT EXECUTED.*

Explanation: The EQQCLEAN program could not load a BEX environment.

System action: Processing ends in error and job fails.

User response: Check that the data set referred to by the STEPLIB in the EQQCLEAN sample procedure contains the whole Tivoli Workload Scheduler load library.

EQQC99I *CEANUP AND, OR RET-CODE
SIMULATION PROCESS(ES) ENDED*

Explanation: The EQQCLEAN stand-alone data set cleanup and return code simulation process ends.

System action: None.

User response: None.

Chapter 199. EQQCPnnn messages

EQQCP00 - EQQCP27

EQQCP00I CRITICAL JOB TABLE DATA SPACE HAS BEEN CREATED. *SIZE* PAGES ARE USED FOR *NUM* JOB ENTRIES RECORDS.

Explanation: The scheduler successfully created a data space for a critical job table. *SIZE* shows the number of pages (each 4096 bytes) used to create the data space. *NUM* shows the maximum number of job entries that the data space can contain. The scheduler uses a minimum of 20 pages.

System action: Normal processing continues. The scheduler uses the data space when accessing the critical job table.

System programmer response: None.

EQQCP01E CRITICAL JOB TABLE DATA SPACE CREATION FAILED. REASON CODE IS *RSN*. *SIZE* PAGES WERE REQUESTED FOR *NUM* JOB ENTRIES RECORDS.

Explanation: The scheduler could not create a data space for critical job table storage. Reason code *RSN* is set by the DSPSERV service. *SIZE* shows the number of pages (each 4096 bytes) that the scheduler needed. *NUM* shows the number of job entries that the scheduler requested to store in the data space.

System action: The normal mode manager (NMM) ends.

System programmer response: Correct the error and restart the NMM subtask.

Problem determination: Use the reason code *RSN* from DSPSERV to determine the cause of the error. Refer to the z/OS documentation that describes DSPSERV reason codes.

EQQCP02E CRITICAL JOB TABLE DATA SPACE DELETED FAILED. REASON CODE IS *RSN*

Explanation: The scheduler could not delete the data space. reason code *RSN* is set by the DSPSERV service.

System action: Normal process continues.

System programmer response: Correct the error and, if necessary restart the subtask that encountered the error.

Problem determination: Use the reason code *RSN*

| from DSPSERV to determine the cause of the error.
| Refer to the z/OS documentation that describes
| DSPSERV reason codes.

EQQCP03I CRITICAL JOB TABLE DATA SPACE HAS BEEN SUCCESSFULLY DELETED.

Explanation: The scheduler successfully deleted a data space for a critical job table.

System action: Normal processing continues.

User response: None.

EQQCP04E CRITICAL JOB TABLE DATA SPACE EXTENSION FAILED. REASON CODE IS *RSN*

| **Explanation:** The scheduler could not extend the data
| space. reason code *RSN* is set by the DSPSERV service.

| **System action:** Normal process continues.

| **System programmer response:** Correct the error and,
| if necessary restart the subtask that encountered the
| error.

| **Problem determination:** Use the reason code *RSN*
| from DSPSERV to determine the cause of the error.
| Refer to the z/OS documentation that describes
| DSPSERV reason codes.

EQQCP05I CRITICAL JOB TABLE DATA SPACE HAS BEEN EXTENDED. *SIZE* ARE USED FOR *NUM* JOB ENTRY RECORDS.

Explanation: The scheduler successfully extended a data space for a critical job table. *SIZE* shows the number of pages (each 4096 bytes) to which the data space was extended. *NUM* shows the maximum number of job entries that the data space can contain.

System action: Normal processing continues. The scheduler uses the data space when accessing the critical job table.

User response: None.

EQQCP06E UNSUCCESSFUL DATA SPACE ACCESS REQUEST, INFORMATION FOLLOWS: ACCESS REQUEST IS FROM *MODID* , REASON CODE IS *RSN* , REQUESTED FUNCTION IS *FUNC* , INDEX NUMBER IS *INDEX*.

Explanation: A scheduler subtask encountered an unexpected error when accessing the critical job table data space.

System action: The messages that follow this message in the scheduler message log indicate the action taken by the scheduler subtask.

System programmer response: Correct the error and, if necessary, restart the subtask that encountered the error.

EQQCP10I THE CRITICAL PATH HANDLER TASK HAS STARTED.

Explanation: The critical path handler successfully completed the initialization phase.

System action: The critical path handler processing starts.

User response: None.

EQQCP11I THE CRITICAL PATH HANDLER TASK HAS ENDED.

Explanation: The critical path handler ended processing normally.

System action: The critical path handler processing ends.

User response: None.

EQQCP12E THE CRITICAL PATH HANDLER TASK HAS ENDED DUE TO PROCESSING ERRORS.

Explanation: The critical path handler cannot continue processing because of a severe error.

System action: The critical path handler processing ends.

User response: Correct the errors and restart the critical path handler. If the problem persists, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section.

Problem determination: Review previous messages in the scheduler message log.

EQQCP13E THE CRITICAL PATH HANDLER TASK HAS IGNORED THE FOLLOWING QUEUE ELEMENT REQUEST

Explanation: The critical path handler cannot continue processing because of a severe error.

System action: The critical path handler processing ends.

User response: Collect the documentation listed in *Diagnosis Guide and Reference*, "Problem analysis procedures" section. Restart the critical path handler.

Problem determination: Review previous messages in the scheduler message log.

EQQCP14E A SEVERE ERROR IN THE CRITICAL PATH HANDLER TASK HAS CAUSED ONE OR MORE DQES TO BE LOST

Explanation: The critical path handler lost some requests.

System action: The critical path handler will try to continue the process.

User response: Collect the documentation listed in *Diagnosis Guide and Reference*, "Problem analysis procedures" section. Restart the critical path handler.

Problem determination: Review previous messages in the scheduler message log.

EQQCP15E THE CRITICAL PATH HANDLER TASK ABENDED WHILE PROCESSING THE FOLLOWING DQE REQUEST

Explanation: The critical path handler stopped with abnormal termination.

System action: No retry is possible, the critical path handler ends.

User response: Collect the documentation listed in *Diagnosis Guide and Reference*, "Problem analysis procedures" section. Restart the critical path handler.

EQQCP16E THE CRITICAL PATH HANDLER TASK DETECTED AN ERROR WHILE PROCESSING THE FOLLOWING DQE: DQE

Explanation: The critical path handler lost a request.

System action: The critical path handler processing ends.

User response: Collect the documentation listed in *Diagnosis Guide and Reference*, "Problem analysis procedures" section. Restart the critical path handler.

EQQCP17E THE CRITICAL PATH HANDLER TASK INITIALIZATION FAILED: CANNOT OPEN CP FILE

Explanation: The critical path handler cannot open the CP.

System action: The critical path handler processing ends.

User response: Collect the documentation listed in *Diagnosis Guide and Reference*, "Problem analysis procedures" section. Restart the critical path handler.

EQQCP18E THE CRITICAL PATH HANDLER TASK INITIALIZATION FAILED: AN ERROR OCCURRED WHILE PROCESSING THE CPHQ QUEUE

Explanation: The critical path handler cannot continue processing because of a severe error.

System action: The critical path handler processing ends.

User response: Collect the documentation listed in *Diagnosis Guide and Reference*, "Problem analysis procedures" section. Restart the critical path handler.

Problem determination: Review previous messages in the scheduler message log.

EQQCP19I CRITICAL PATH RECALCULATED FOR OPERATION OPNUM IN APPLICATION ADID WITH IA: IA FOR JOB JOBNAME. THE TRIGGER WAS: TRIGGER.

Explanation: The scheduler updated the critical path for the job indicated in the message text. *TRIGGER* message variable shows the type of the update trigger, that can be one of the following:

- C** Job on critical path, completed or removed from the hot list
- D** Dynamic updates to the plan
- L** Late job
- P** Daily planning

If the network of your jobs contains either more than one job originating the same critical path, or a critical path nested in this one, the message is issued once.

System action: The critical path handler processing continues.

User response: None.

EQQCP20I THE RISK LEVEL FOR CRITICAL JOB OPNUM IN APPLICATION ADID WITH IA: IA FOR JOB JOBNAME HAS BECOME POTENTIAL.

Explanation: The critical path handler changed to potential the risk level for the job identified by the message variables.

System action: Normal processing continues.

User response: None.

EQQCP21I THE RISK LEVEL FOR CRITICAL JOB OPNUM IN APPLICATION ADID WITH IA: IA FOR JOB JOBNAME HAS BECOME HIGH.

Explanation: The critical path handler changed to high the risk level for the job identified by the message variables.

System action: Normal processing continues.

User response: None.

EQQCP22I THE RISK LEVEL FOR CRITICAL JOB OPNUM IN APPLICATION ADID WITH IA: IA FOR JOB JOBNAME WAS RESET TO POTENTIAL.

Explanation: The critical path handler reset to potential the risk level for the job identified by the message variables.

System action: Normal processing continues.

User response: None.

EQQCP23I THE RISK LEVEL FOR CRITICAL JOB OPNUM IN APPLICATION ADID WITH IA: IA FOR JOB JOBNAME WAS RESET TO NONE.

Explanation: The critical path handler reset to none the risk level for the job identified by the message variables.

System action: Normal processing continues.

User response: None.

EQQCP24E THE CRITICAL JOB WITH OPERATION NUMBER OPNUM IN APPLICATION ADID WITH IA: IA FOR JOB JOBNAME HAS A LOOP IN ITS NETWORK AND HAS BEEN TEMPORARILY DISABLED.

Explanation: The critical path handler task detected a loop in the network of this critical job, while recalculating its critical path. The critical job is temporarily disabled and will not be listed in the critical job list until the critical dataspace is rebuilt, after a controller restart or a batch plan turnover.

System action: Normal processing continues.

User response: Correct the loop and restart the critical path handler. If the problem persists, for the information to collect, see the *Diagnosis Guide and Reference*, Chapter 3, "Problem analysis procedures", section "Information needed for all problems", sub-section "Information to collect for daily planning problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQCP25I THE CRITICAL PATH HANDLER TASK SYNCHRONIZATION PHASE HAS STARTED.

Explanation: The critical path handler has started its resynchronization phase after a controller restart or a batch plan job termination.

EQQCP26I • EQQCP27I

System action: The schedulers processing continues.

User response: None.

**EQQCP26I THE CRITICAL PATH HANDLER
TASK SYNCHRONIZATION PHASE
HAS ENDED.**

Explanation: The critical path handler has ended its resynchronization phase after a controller restart or a batch plan job termination.

System action: The schedulers processing continues.

User response: None.

| **EQQCP27I THE CRITICAL JOB WITH
| OPERATION NUMBER *OPNUM* WITH
| RL RISKL IN APPLICATION *ADID*
| WITH IA: *IA* FOR JOB *JOBNAME* HAS
| BEEN COMPLETED.**

| **Explanation:** The critical job completed.

| **System action:** The schedulers processing continues.

| **User response:** None.

Chapter 200. EQQDnnn messages

EQQD000 - EQQD159

EQQD000E YOU DO NOT HAVE AUTHORITY TO
ACCESS THE CURRENT PLAN DATA
SET

Explanation: None.

EQQD001E INVALID VALUE SPECIFIED FOR
REPORT SELECTION

Explanation: If you want a report, you must specify a Y. If you do not want a report, you must specify an N.

System action: None.

User response: Specify a correct value and press Enter.

EQQD002E START AND END DATES MUST NOT
BE THE SAME

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQD003I ENTER END AGAIN TO EXIT, OR
PRESS ENTER TO PRINT

Explanation: You can either cancel the print request and leave this panel by entering END again or print the specified reports by pressing ENTER.

System action: The system waits for you to respond.

User response: Enter END or press ENTER.

EQQD004E END TIME MUST BE LATER THAN
START TIME

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQD005E END DATE MUST BE LATER THAN
START DATE

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQD006E THE END TIME MUST BE A VALUE
00.01 TO 24.00

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQD007E SPECIFY A (ALL DAYS) OR W
(WORKDAYS ONLY)

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQD008E THE EXTENSION TIME SPECIFIED
MAY NOT BE > 21 DAYS OR 504
HOURS

Explanation: The extension time that you specified is greater than 21 days (504 hours), the maximum allowed extension time.

System action: The system waits for you to respond.

User response: Enter a valid extension time.

EQQD009E A MINUTE VALUE GREATER THAN
59 IS NOT ALLOWED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQD010E EXTENSION TIME MUST BE IN THE
FORM HHHMM

Explanation: The valid extension time format is HHHMM, where HHH is 000 through 504 and MM is 00 through 59.

System action: None.

User response: Specify a correct value and press Enter.

EQQD011E SPECIFY EITHER EXTENSION OR
END DATE AND TIME

Explanation: To extend a plan period, you must specify either an extension length or an end date and time, but not both.

System action: None.

User response: Specify a correct value and press Enter.

EQQD012E END DATE OR EXTENSION LENGTH MUST BE FILLED IN

Explanation: To extend a plan period, you must specify either an end date and time or an extension length.

System action: None.

User response: Specify a correct value and press Enter.

EQQD013E A START DATE MUST BE SPECIFIED

Explanation: You must specify a start date because no current plan exists.

System action: None.

User response: Specify a correct value and press Enter.

EQQD014E A CURRENT PLAN ALREADY EXISTS FOR THE SPECIFIED PERIOD

Explanation: You specified a start date and time for a current plan when a current plan already exists.

System action: The system waits for you to respond.

User response: Blank out the start date and time and enter a valid extension length.

EQQD015E NO CURRENT PLAN EXISTS, SPECIFY START DATE AND TIME

Explanation: To create a current plan, you must specify a start date and time.

System action: None.

User response: Specify a correct value and press Enter.

EQQD016E NO CURRENT PLAN EXISTS, FUNCTION CANNOT BE USED

Explanation: You have attempted to use a function that requires the existence of a current plan.

System action: The system waits for you to respond.

User response: Check why a current plan does not exist.

EQQD017E SPECIFIED PERIOD MUST BE WITHIN CURRENT PLAN PERIOD

Explanation: The start and end times must be within the current plan start and end times.

System action: None.

User response: Specify a correct value and press Enter.

EQQD018E PLAN START MUST BE EQUAL TO OR GREATER THAN CURRENT PLAN END

Explanation: The start of the future trial plan cannot be before the end of the current plan.

System action: The system waits for you to respond.

User response: Enter a valid start date and time.

EQQD019E INVALID VALUE SPECIFIED FOR COPY VSAM USAGE SELECTION

Explanation: See text.

System action: None.

User response: To copy VSAM usage data, specify Y. Otherwise, specify N.

EQQD020E END DATE AND TIME MUST BE LATER THAN CURRENT PLAN END

Explanation: When extending the current plan, the end date and time must be later than the end of the current plan.

System action: The system waits for you to respond.

User response: Enter an end date and time that is later than the current plan end.

EQQD141E THE SCHEDULER COULD NOT RETRIEVE REQUIRED HISTORY DATABASE DATA.

Explanation: The scheduler tried to access operation data in the DB2[®] history database but failed. The reason is described in message EQQD142, which follows this message.

System action: Processing continues, but the required data is not passed to the caller.

System programmer response: Check message EQQD142.

User response: Contact your system programmer.

EQQD142I DB2TXT

Explanation: This message describes why IBM Tivoli Workload Scheduler for z/OS could not access the DB2 history database. It contains messages issued by the DB2 system.

System action: Processing continues.

System programmer response: Review the messages issued by DB2 and take the action described in the DB2 documentation.

User response: Contact your system programmer.

EQQD143I DB2 SYSTEM DB2 HAS STOPPED. THE HISTORY FUNCTION IS NOT AVAILABLE

Explanation: The scheduler has discovered that the DB2 system has either stopped or abended. It cannot support requests for data from the history database.

System action: Processing continues but the history function is not available.

System programmer response: Restart the DB2 system that stopped or abended.

User response: Contact your system programmer.

EQQD144I DB2 SYSTEM DB2 IS AVAILABLE

Explanation: The DB2 system containing the scheduler history data is available.

System action: Processing continues.

System programmer response: None.

User response: None.

EQQD145E OBJECT OBJ COULD NOT BE CREATED. REASON FOLLOWS:

Explanation: The initialization program tried to create a table, index or an alias in the history database but failed. The reason is described in message EQQD142, which follows this message.

System action: Processing is terminated.

System programmer response: Check message EQQD142.

User response: Contact your system programmer.

EQQD146I OBJECT OBJ HAS BEEN CREATED IN THE HISTORY DATABASE

Explanation: The initialization program has successfully created this object in the history database.

System action: Processing continues.

User response: None.

EQQD147E THE SYSIN FILE CONTAINS BAD OR MISSING PARAMETERS

Explanation: The initialization program was unable to create the history database because some SYSIN parameters are missing or specified incorrectly. The following parameters are required to create the history database:

DBNAME
The database name

MAIN The name of the scheduler history database main table

MAINX

The main table index name

OCC The name of the scheduler table that stores occurrence data

OCCX1
Occurrence data index 1

OCCX2
Occurrence data index 2

OCCX3
Occurrence data index 3

OPR The name of the scheduler table that stores operation data

OPRX1 Operation data index 1

OPRX2 Operation data index 2

OPRX3 Operation data index 3

DS The name of the scheduler table that stores operation data set information

DSX1 Data Set information index 1

DSX2 Data Set information index 2

DSX3 Data Set information index 3

JL The name of the scheduler table that stores joblog status information

JLX1 Joblog status information index 1

JLX2 Joblog status information index 2

JLX3 Joblog status information index 3

System action: Processing is terminated.

User response: Contact your system programmer.

EQQD148E AN IDENTIFY REQUEST FOR CONNECTION TO DB2 WAS REJECTED. DB2 HAS BEEN STARTED IN RESTRICTED ACCESS MODE.

Explanation: IBM Tivoli Workload Scheduler for z/OS loses the connection to DB2 because DB2 was started in restricted access mode, using ACCESS(MAINT).

System action: Processing continues

System programmer response: Stop DB2 and restart it without the ACCESS keyword. To connect IBM Tivoli Workload Scheduler for z/OS to DB2, as soon as DB2 is up again, enter the following operator command: /F subsystemname, DB2RETRY

User response: Contact your system programmer.

EQQD149E THE CAF INTERFACE FAILED WITH RC

Explanation: This message explains why IBM Tivoli Workload Scheduler for z/OS cannot connect with DB2.

EQQD150I • EQQD159I

It includes the error code issued by the DB2 system.

System action: Processing continues.

System programmer response: Review the return code issued by DB2 and follow the actions described in the DB2 documentation.

User response: Contact your system programmer.

EQQD150I A HIST COMMAND WAS ISSUED ON DATE AT TIME BY USER USER OF SUBSYSTEM SUBSYS

Explanation: The *user* entered a HIST command to retrieve data from the IBM Tivoli Workload Scheduler for z/OS history database, from the *subsystem* indicated. Retrieving data was started on *date* and *time*, as indicated.

System action: Processing continues.

Operator response: Wait for the operation result. For the command execution status, refer to messages EQQD151I, EQQD152I, and EQQD153I.

EQQD151I DATA RETRIEVAL FROM THE HISTORY DATABASE HAS STARTED

Explanation: Based on a HIST command issued, the data retrieval has started. To identify the HIST command that was entered, refer to message EQQD150I.

System action: Processing continues.

Operator response: Wait for the operation result. For the command execution status, refer to messages EQQD152I, and EQQD153I.

EQQD152I DATA RETRIEVAL FROM THE HISTORY DATABASE HAS COMPLETED

Explanation: Based on a HIST command issued, the data retrieval has completed. To identify the HIST command that was entered, refer to message EQQD150I.

System action: Processing continues. Data is forwarded to the requesting panel user.

Operator response: Wait for data to be displayed in the panel.

EQQD153I REQUIRED DATA NOT RETRIEVED FROM THE HISTORY DATABASE. REASON: THE LIMIT SET BY MAXHISTORYROWS WAS REACHED.

Explanation: You issued a HIST command to retrieve data from the IBM Tivoli Workload Scheduler for z/OS history database. The number of rows retrieved from the database exceeds the maximum allowed by the MAXHISTORYROWS keyword.

System action: The request is cancelled. No data is returned from the history database.

Operator response: Set some filtering criteria to reduce the amount of data retrieved from the history database or ask the system administrator to increase the value set in the MAXHISTORYROWS keyword.

Programmer response: If needed, increase the value set in the MAXHISTORYROWS keyword.

EQQD159I RETRIEVED JOBLOG (JOBID JNUM) for APPLICATION APPL IA OPERATION OPER WAS NOT STORED BECAUSE A NEW JOB RUN OCCURRED.

Explanation: A new job run occurred before a joblog retrieval request for a previous run was able to complete. The requested joblog is now obsolete. The joblog (identified by jobname *JOBID*, JobId *JNUM*, Application Name *APPL*, input arrival time *IA* and operation number *OPER*) will not be stored in JS VSAM.

System action: The joblog is not stored in JS VSAM.

Operator response: None.

Chapter 201. EQQEnnn messages

EQQE000 - EQQE309

EQQE000I TOTAL NUMBER OF EVENTS PROCESSED BY THE EVENT MANAGER TASK IS: *NUMEV* NUMBER OF EVENTS SINCE THE PREVIOUS MESSAGE IS: *NEWEV* EVENT MANAGER QUEUE LENGTH STATISTICS FOLLOW: TOTAL Q1 Q2 Q5 Q10 Q20 Q50 Q100 >100 *CALLSQ1Q2Q3Q4 Q5Q6Q7Q8*

Explanation: This message is issued if the EVENTS statistics are made active, either by specifying the STATMSG(EVENTS) keyword in the JTOPTS initialization statement or by issuing the modify command, /F subsystem,EVESTA=ON.

Once activated, this message is regularly issued by the event manager subtask, until it is deactivated. The interval between two messages is calculated as follows:

- If STATIM is nonzero (in the initial parm or by modify command) the message is issued approximately every *n* minutes (where *n* is the STATIM value). If no events have been processed in an interval, then no messages will be issued for that interval.
- Otherwise, if EVELIM is nonzero (in the initial parm or by modify command), the message is issued approximately every *n* events (where *n* is the EVELIM value).
- Otherwise, the message is issued approximately every *n* events, where *n* is half the JTOPTS BACKUP keyword value (default BACKUP is 400).

This message shows the total number of events processed and how many events have been processed since the message was last issued or, if it is the first time it is issued, since the last time the event manager processed the events queue.

The message also contains information about how many events were waiting to be processed each time the queue processing routine was called. The value below the TOTAL heading gives the total number of times that the event queue was emptied. The values below the Qx headings give the number of times that the length of the queue was in a particular interval. For example, Q50 gives the number of times that the queue was between 21 and 50 events.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQE001E ETT FAILED TO ADD *ADID* FOR TRIGGERING EVENT *TRIG I/O* ERROR READING AD DATA BASE

Explanation: Event-triggered tracking (ETT) was triggered by an event, but could not add the associated application due to an I/O-error on the application description database.

System action: The associated application was not added by ETT, but ETT processing continues normally.

System programmer response: Analyze the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error, correct the error and retry. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section, sub-section "Information needed for all problems".

User response: Contact your system programmer.

Problem determination: Review previous messages in the IBM Tivoli Workload Scheduler for z/OS message log data set to determine the cause of the error.

EQQE002E ETT FAILED TO ADD *ADID* FOR TRIGGERING EVENT *TRIG FIRST* OPERATION NOT ON MVS CPU WS, JOBNAME CANNOT BE REPLACED

Explanation: Event-triggered tracking (ETT) was triggered by an event, but could not add the associated application since the first operation (that is, the operation with the lowest operation number) was not a CPU-operation or a non-z/OS CPU operation and ETT's Job Name Replace option was specified.

System action: The associated application was not added by ETT, but ETT processing continues normally.

User response: Correct the ETT criteria table or the AD database, or both, or get the CPU workstation for z/OS systems into the control plan. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section, sub-section "Information needed for all problems".

Problem determination: If the Job Name Replace option is used, check the application description (AD)

database to make sure that the first operation in the application to be added is a z/OS CPU-operation. Or, check the ETT criteria table to make sure that the correct Job Name Replace option was specified. Or, check that the CPU workstation for z/OS systems is part of the control plan since it might have been added to the workstation database after a new control plan was created.

EQQE003E ETT FAILED TO ADD ADID FOR TRIGGERING EVENT TRIG FIRST OPERATION HAS PREDECESSORS, JOBNAME CANNOT BE REPLACED

Explanation: Event-triggered tracking (ETT) was triggered by an event, but could not add the associated application since the first operation (that is, the operation with the lowest operation number) had internal predecessor operations, and ETT's Job Name Replace option was specified.

System action: The associated application was not added by ETT, but ETT processing continues normally.

User response: Correct the ETT criteria table or the AD database, or both or get the CPU workstation for z/OS systems into the control plan. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section, sub-section "Information needed for all problems".

Problem determination: Check the application description (AD) database to make sure that the first operation in the application to be added does not have any internal predecessor operations. Or, check the ETT criteria table to make sure that the correct Job Name Replace option was specified.

EQQE004I CP ENQ LOCK STATISTICS SINCE PREVIOUS MESSAGE FOLLOW: NAME NEXCL NSHRD THELD TWAIT AHELD AWAIT

Explanation: This message is issued if the CP ENQ LOCK statistics are active. This can be done either by specifying the STATMSG(CPLOCK) keyword in the JTOPTS initialization statement or by using the modify command, /F subsystem,CPQSTA=ON.

Once activated, this messages is regularly issued by the event manager subtask, until it is deactivated. The interval between two messages is calculated as follows:

- If STATIM is nonzero (in the initial parm or by modify command) the message is issued approximately every *n* minutes (where *n* is the STATIM value), if any events have been processed.

- Otherwise, if EVELIM is nonzero (in the initial parm or by modify command), the message is issued approximately every *n* events (where *n* is the EVELIM value).
- Otherwise, the message is issued approximately every *n* events, where *n* is half the JTOPTS BACKUP keyword value (default BACKUP is 400).

This message shows that IBM Tivoli Workload Scheduler for z/OS tasks have referred to the current plan data since the last message was issued, or if it is the first time it is issued, since the last time the event manager processed the events queue.

The message consists of column headers that describe data indicating how often and in what way the current plan data set has been referenced. The data values are displayed in the message EQQE005I. The values for each heading are:

NAME The name of the IBM Tivoli Workload Scheduler for z/OS task for which data was gathered.

NEXCL The number of times that the task acquired exclusive use of the current plan.

NSHRD The number of times that the task acquired shared use of the current plan.

THELD The total amount of time, in seconds, that the task was using the current plan.

TWAIT The total amount of time, in seconds, that the task was waiting to use the current plan.

AHELD The average amount of time, in seconds, that the task was using the current plan.

AWAIT The average amount of time, in seconds, that the task was waiting to use the current plan.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQE005I NAMENEXCLNSHRDTHELD TWAITAHELDAWAIT

Explanation: This message is issued together with the message EQQE004I. See the explanation for EQQE004I for details about when it is issued.

The message contains information about the use of the current plan data set by one IBM Tivoli Workload Scheduler for z/OS subtask. The descriptions of the column headings in the previous message, EQQE004I, also describe the variables in this message.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQE006I **EVENT MANAGER EVENT TYPE
STATISTICS FOLLOW: TYPE NTOT
NNEW TTOT TNEW TAVG NAVG
NSUS**

Explanation: This message is issued if the EVENTS statistics are active. This can be done either by specifying the STATMSG(EVENTS) keyword in the JTOPTS initialization statement, or by using the modify command, /F *subsys*,EVESTA=ON.

Once activated, this message is regularly issued by the event manager subtask, until it is deactivated. The interval between two messages is calculated as follows:

- If STATIM is nonzero (in the initial parm or by modify command) the message is issued approximately every *n* minutes (where *n* is the STATIM value), if any events have been processed.
- Otherwise, if EVELIM is nonzero (in the initial parm or by modify command), the message is issued approximately every *n* events (where *n* is the EVELIM value).
- Otherwise, the message is issued approximately every *n* events, where *n* is half the JTOPTS BACKUP keyword value (default BACKUP is 400).

This message consists of column headers that describe measured values that are displayed in the message EQQE007I that follows. The measured values contain information about the total number of events processed, how many have been processed since the message was last issued, or, if it is the first time it is issued, since the last time the event manager processed the events queue, and the elapsed time that the event manager needed to process the events.

The values for each heading are:

TYPE The event type for which data was gathered.
TTOT The total number of events of this type.
NNEW The number of events of this type since the last message.
TTOT The total time, in seconds, used to process this event type.
TNEW The total time, in seconds, used to process this event type since the last message.
TAVG The average time, in seconds, used to process an event of this type.
NAVG The average time, in seconds, used to process an event of this type since the last message.
NSUS The number of times that the event manager could not immediately process an event of this type.

Valid values in the TYPE column are:

ALL This line is a total line for all event types.
1 Reader events.
2 Job start events.
3S Step end events.
3J Job end events.
3P Job on output queue events.

4 Data Set print events.
5 Job purge events.
USER User generated event, EQQUSINT program or the OPSTAT command.
OTHR Other events.
FT Events related to scheduling end-to-end with fault tolerance capabilities.
ZCEN Events related to scheduling end-to-end with z-centric capabilities.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQE007I *TYPENTOTNNEWTTOT
TNEWTAVGNAVGNSUS*

Explanation: This message is issued if STATMSG(EVENTS) has been specified in the JTOPTS initialization statement. The message contains information about how the event manager subtask processed one type of event. The descriptions of the column headings in the previous message, EQQE006I, also describe the variables in this message.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQE008I *TYPE08
Q10Q100Q1000Q5000Q10000>10000
R1R2R3R4R5R6*

Explanation: This message is issued if the WSA statistics are active. This can be done either by specifying the STATMSG(WSTATASK) keyword in the JTOPTS initialization statement, or by using the modify command, /F *subsys*,WSASTA=ON.

Once activated, this message is regularly issued by the event manager subtask, until it is deactivated. The interval between two messages is calculated as follows:

- If STATIM is nonzero (in the initial parm or by modify command) the message is issued approximately every *n* minutes (where *n* is the STATIM value), if any events have been processed.
- Otherwise, if EVELIM is nonzero (in the initial parm or by modify command), the message is issued approximately every *n* events (where *n* is the EVELIM value).
- Otherwise, the message is issued approximately every *n* events, where *n* is half the JTOPTS BACKUP keyword value (default BACKUP is 400).

This message shows some statistic information about the operations ready queue list and its handling by the WSA task since it was last issued, or, if it is the first time it is issued, since the last time the event manager processed the events queue.

EQQE009I • EQQE014E

The set of variables (R1-R6) gives the number of times that the ready list was found to be within a specific range, each time the WSA task processed it to select a “winner” operation (one to be submitted). For example, R1=10 means that the ready queue list was found 10 times to contain n operations, where $n < 10$.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQE009I TYPE09VALUE09

Explanation: This message is issued together with message EQQE008I. See the explanation for EQQE008I for details about when it is used.

The meanings of *VALUE09* are as follows:

- V1 Size of the ready list queue when the message is issued
- V2 Number of operations whose status changed to ready (R, *, or A) since the last message
- V3 Number of operations whose status changed to started since the last message
- V4 Number of operations whose status changed to completed since the last message
- V5 Number of times the WSA task was called to select a winner operation since the last message
- V6 Number of times the JS VSAM was accessed to read JCL since the last message
- V7 Number of times the JOBLIB PDS was accessed to read JCL since the last message
- V8 Number of times the User Exit 001 was called since the last message
- V9 Number of times the User Exit 002 was called since the last message

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQE011E ETT FAILED TO ADD ADID FOR TRIGGERING EVENT TRIG NO ACTIVE APPLICATION DESCRIPTION IN AD DATABASE

Explanation: Event-triggered tracking (ETT) was triggered by an event but could not add the associated application because there was no active application description (AD) in the AD database.

System action: The associated application was not added by ETT, but ETT processing continues normally.

User response: Correct the ETT criteria table or the AD database.

Problem determination: Check the ETT criteria to make sure that the triggering event identifies an active application description.

EQQE012E ETT FAILED TO ADD ADID FOR TRIGGERING EVENT TRIG UNABLE TO ALLOCATE NECESSARY STORAGE

Explanation: IBM Tivoli Workload Scheduler for z/OS was unable to allocate storage needed to build the tables required when adding an application (occurrence) to the current plan.

System action: The associated application was not added by event-triggered tracking (ETT), but ETT processing continues normally.

System programmer response: Increase the region for the IBM Tivoli Workload Scheduler for z/OS started task.

User response: Contact your system programmer.

Problem determination: Check the region size allocated to the IBM Tivoli Workload Scheduler for z/OS started task.

EQQE013E ETT FAILED TO ADD ADID FOR TRIGGERING EVENT TRIG ERROR DETECTED BY MODIFY CURRENT PLAN INTERFACE

Explanation: IBM Tivoli Workload Scheduler for z/OS was unable to add the application because the modify current plan interface detected an error.

System action: The associated application was not added by event-triggered tracking (ETT), but ETT processing continues normally.

System programmer response: Save the message log data set containing these error messages and contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Check the IBM Tivoli Workload Scheduler for z/OS message log data for *EQQMxxx* messages (that is, the Modify Current Plan messages) preceding this message. These messages give the exact reason why the application could not be added.

EQQE014E ETT FAILED TO ADD ADID FOR TRIGGERING EVENT TRIG AD DATABASE NOT OPEN

Explanation: Event-triggered tracking (ETT) was triggered by an event but could not add the associated application since the application description database was not open.

System action: The associated application was not added by ETT, but ETT processing continues normally.

System programmer response: Save the message log data set containing these error messages and contact IBM Software Support. Analyze the IBM Tivoli

| Workload Scheduler for z/OS message log data set
 | containing these error messages to determine the cause
 | of the error, correct the error and retry. If the problem
 | persists, search the IBM Support database for a solution
 | at <http://www.ibm.com/software/sysmgmt/products/>
 | support. If you do not find any information, for the
 | information to collect, see the *Diagnosis Guide and*
 | *Reference*, "Problem analysis procedures" section.

| **Problem determination:** This is a IBM Tivoli
 | Workload Scheduler for z/OS internal error.

**EQQE015W ETT CANNOT TRACK JOB *JOB* EVEN
 THOUGH APPLICATION *APPL* HAS
 BEEN ADDED**

Explanation: Event-triggered tracking (ETT) was unable to track the specified job, even though the specified associated application was successfully added.

System action: The job that triggered the addition of application *APPL* is not tracked by IBM Tivoli Workload Scheduler for z/OS. ETT processing continues.

User response: Review the tracking options and correct if in error.

Problem determination: The track keyword of the job tracking option statement has most likely been defined so that no tracking should occur.

**EQQE016I ETT HAS SUCCESSFULLY ADDED
 ADID FOR TRIGGERING EVENT *TRIG***

Explanation: Event-triggered tracking (ETT) has detected a triggering event (*TRIG*) and has added the associated application (*ADID*) to the current plan.

System action: Processing continues.

User response: None.

EQQE017I THE ETT FUNCTION IS ACTIVATED

Explanation: The event-triggered tracking (ETT) function has been activated from the dialog or has been started during the controller start up process because ETT(YES) is specified on the JTOPTS initialization statement.

System action: Processing continues.

User response: None.

**EQQE018I THE ETT FUNCTION IS
 DEACTIVATED**

Explanation: The event-triggered tracking (ETT) function has been deactivated due to a dialog request or because the event manager subtask has been requested to terminate.

System action: Processing continues.

User response: None.

**EQQE019I *JOBNAME(JOBNUM)* WAS SUBMITTED
 OUTSIDE THE PRODUCT AND
 TRACK(OPCASUB) OR
 TRACK(JOBOPT) IS ACTIVE, BUT
 THE JOB WILL BE TRACKED
 ANYWAY BECAUSE IT BELONGS TO
 AN APPLICATION THAT WAS
 ADDED BY ETT**

Explanation: Event-triggered tracking (ETT) has a job on its list of jobs to be tracked, but the specified job has not been submitted by IBM Tivoli Workload Scheduler for z/OS.

System action: IBM Tivoli Workload Scheduler for z/OS tracks the job because it belongs to an application that was added by ETT.

User response: None.

**EQQE020W EXPANDED JCL USED IN LAST RUN
 BUT NO STEP NAME CHANGE
 TABLE FOUND FOR *JOBNUM* .**

Explanation: IBM Tivoli Workload Scheduler for z/OS Controller was checking the NOERROR table for an operation having the expanded jcl used for the last run: in this case a step name table (DCLCPR44) should exist to map the original step names and the new step names, but no table was found.

System action: Processing continues without using the step name table information.

System programmer response: Check EQQMLOG to see if some error occurred causing missing step name table for that operation..

**EQQE021E THE EVENT MANAGER WAS
 UNABLE TO SET STATUS *STATUS*
 FOR *JOBNAME(JOBNUM)***

Explanation: The event manager was unable to change the status of an operation in the current plan.

System action: The status of the current operation remains unchanged. The event manager continues normally by processing the next event.

System programmer response: Correct all errors and, if necessary, restart IBM Tivoli Workload Scheduler for z/OS.

User response: If the current operation can be determined, set the correct status for this operation.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine which operation is involved. The most likely cause of this error is an unsuccessful I/O operation against the current plan data set.

EQQE022E EVENT MANAGER INITIALIZATION FAILED

Explanation: The event manager could not acquire all resources required for normal operation. The most likely cause of this error is that the subsystem is being stopped but the normal mode manager subtask has not started. It is also possible that the JCL repository data set could not be opened.

System action: If this message is issued while the IBM Tivoli Workload Scheduler for z/OS subsystem is being stopped, subsystem termination continues normally. Otherwise, message EQQZ045W is issued.

System programmer response: Review previous messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQE023I THE EVENT MANAGER ENDED NORMALLY

Explanation: This message is issued if the IBM Tivoli Workload Scheduler for z/OS subsystem is being stopped and Event Manager initialization has completed successfully. The message is also issued if the Event Manager has been requested to stop by an operator modify command.

System action: Termination processing continues.

User response: None.

EQQE024E THE EVENT MANAGER TERMINATED BECAUSE OF UNRECOVERABLE ERRORS

Explanation: This message is issued if a serious error that prevents normal operation by the Event Manager has been encountered after Event Manager initialization has completed.

System action: Message EQQZ045W is issued.

Operator response: If the Event Manager should be activated, issue an operator modify command to start the Event Manager again.

System programmer response: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQE025I THE EVENT MANAGER HAS STARTED

Explanation: Event Manager initialization has completed successfully and the Event Manager is about to start processing.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQE026I APPLICATION APPL ENDED IN ERROR EC. OPER = OPERNUM, PRTY = PRI, IA = IA

Explanation: This message is issued when an operation on a general type workstation has ended in error and the ALERTS initialization statement specifies TYPE(ERROROPER).

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: Perform error recovery actions for the specified operation.

EQQE027I OPERATION OPERNUM, IN APPLICATION APPL, IA = ARRTIME IS LATE

Explanation: This message is issued when a ready operation on a general type workstation has reached its latest start time but has not yet started.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: Investigate what is keeping the operation from starting and take appropriate actions to enable it to start.

EQQE028I LONG DURATION FOR OPERATION OPERNUM, IN APPLICATION APPL, IA = ARRTIME, FOR JOB JOBNAME, WORK STATION WSID

Explanation: This message is issued when a started operation on a general type workstation has been active longer than its estimated duration multiplied by the feedback limit, divided by 100. For example, if the feedback limit is 200 and the estimated duration is ten minutes, the message is issued if the operation has been active longer than twenty minutes.

The values indicated in this message help you determine the late operation. If you did not specify a job name, a blank value is displayed.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: Investigate why the operation has been active so long. If possible, take corrective action to speed up operation processing.

This message can help determine which operation is late. If the operation name (an optional field) was not specified, a blank value is displayed.

EQQE029E TRACK (OPCASUB/JOBOPT) IS SPECIFIED, AND AS USER SUBMITTED JOBNAME(JOBNUM) OUTSIDE THE PRODUCT, IT WILL NOT BE TRACKED

Explanation: The job is not one that IBM Tivoli Workload Scheduler for z/OS has submitted although it is known to IBM Tivoli Workload Scheduler for z/OS as one that should be tracked. However, because someone submitted the job outside of IBM Tivoli Workload Scheduler for z/OS's control, the job is not tracked.

System action: None.

User response: Determine if the job was submitted outside of IBM Tivoli Workload Scheduler for z/OS. See *Customization and Tuning* to set the parameters to track external jobs through the JTOPTS statement. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section, sub-section "Information needed for all problems".

EQQE030I USER USER CAUSED A NEW SPECIAL RESOURCE TO BE DEFINED. NAME OF NEW RESOURCE IS: RESOURCE

Explanation: The request to create the new resource came from: an SRSTAT command, EQQEVPGM using SRSTAT as input, the EQQUSINS subroutine, the EQQUSIN subroutine, or from the data set triggering function.

System action: Processing continues.

User response: None.

EQQE031I THE JOBNAME(JOBNUM) MATCHED THE NOERROR STATEMENT: VALUE

Explanation: The job error code matched the NOERROR definition indicated in the message.

System action: Processing continues.

User response: None.

EQQE032I ALL DEP INFO USER USR ISSUED QUERY ALL DEPS TYP NES LVL

Explanation: A ALL DEP request was performed from EQQSOPGD panel, the message shows the user ID that originated the request, the TYPE OF SELECTION, the NUMBER OF NESTINGS and the NESTING DETAILS.

System action: The request is processed.

User response: None.

EQQE036I JOB JOBNAME(JNUM), OPERATION(OPERNUM), OPERATION TEXT(OPTEXT) ENDED IN ERROR EC. PRTY=PRI, APPL = APPL, WORK STATION = WSID, IA = IA, NRC

Explanation: This message is issued when an operation on a computer or printer workstation has ended in error and the ALERTS initialization statement specifies TYPE(ERROROPER). The variable NRC indicates the numeric return code for an end-to-end job. In case the job ends in error, the variable NRC is set to E2E RC = xxxxxxxxxxxx. In case the job fails, or the message concerns an MVS job, the variable NRC is set to NO E2E RC.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: Perform error recovery actions for the current job.

EQQE037I JOB JOBNAME(JNUM), OPERATION (OPERNUM) IN APPLICATION APPL, IS LATE, WORK STATION = WSID, IA = ARRTIME

Explanation: This message is issued when a job has reached its latest start time but has not yet started.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: Investigate what is keeping the job from starting and take appropriate actions to enable it to start.

EQQE038I LONG DURATION FOR JOB JOBNAME(JNUM), OPERATION (OPERNUM) IN APPLICATION APPL, WORK STATION = WSID, IA = ARRTIME

Explanation: This message is issued when a job has been active longer than its estimated duration multiplied by the feedback limit, divided by 100. For example, if the feedback limit is 200 and the estimated duration is ten minutes, the message is issued if the job has been active longer than twenty minutes. The feedback limit specified on the JTOPTS initialization statement is used in the calculation.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: Investigate why the job has been active so long. If possible, take corrective action to speed up the processing of the job.

EQQE039I LONG TIME ON INPUT QUEUE FOR JOB JOBNAME (JNUM), OPERATION (OPERNUM), APPL = APPL, WORK STATION = WSID, IA = ARRTIME

Explanation: If the ALERTS initialization statement specifies DURATION, this message is issued when a job or started task has been started by the controller but after 10 minutes has not started to operate yet (for MVS jobs no A2/B2 event has been processed), for FT-jobs the extended status is waiting for submission

EQQE040W • EQQE043E

i.e. no event signaling that the job is started on the agent has been processed.)

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

System programmer response: For MVS jobs if the operation status is successful, verify in the message log that the link to the DESTINATION is active, the associated submit task is active, events are available on the associated EQQEVDS data set, and that an event reader function is active. In a shared DASD environment, also verify that no hardware reserves, or other contention are locking access to the data set.

User response: Investigate what is keeping the job from starting and take appropriate actions to enable it to start. For FT-jobs it could be possible that the job is started on the agent but the workstation is unlinked.

EQQE040W JOB JOBNAME(JOBNUM) CANNOT BE HANDLED. THE JOB MAY HAVE TO BE CANCELED

Explanation: IBM Tivoli Workload Scheduler for z/OS job tracking has encountered an “add job to JES queue” event for a job whose job name matches job names defined in the current plan. However, none of the operations with this job name has a status that is consistent with an “add job to JES queue” event. This message indicates that jobs with IBM Tivoli Workload Scheduler for z/OS job names are being submitted by non-IBM Tivoli Workload Scheduler for z/OS functions.

System action: IBM Tivoli Workload Scheduler for z/OS assumes that the job is not a IBM Tivoli Workload Scheduler for z/OS job and does not track the job. If the job was held by a IBM Tivoli Workload Scheduler for z/OS job tracking exit it is released.

Note: Since this job is not handled by IBM Tivoli Workload Scheduler for z/OS, any dependencies this job may have must be manually implemented.

System programmer response: Determine if IBM Tivoli Workload Scheduler for z/OS and non-IBM Tivoli Workload Scheduler for z/OS jobs are using the same job names. Check that all jobs belonging to IBM Tivoli Workload Scheduler for z/OS defined applications are defined in the current plan.

EQQE041W THE EVENT MANAGER HAS IGNORED THE FOLLOWING USER DEFINED EVENT RECORD BECAUSE THE NEW STATUS IS NOT VALID FOR A FTW OPERATION: EXITREC

Explanation: An invalid user-defined event record has been found in the event manager work queue. The operation specified in the event is a fault-tolerant workstation operation and the new specified status is not valid. As a rule, only C and S are accepted. The S value is not allowed if the operation is running or if it

has a recovery job that is running.

System action: The incorrect event record is returned to the free queue of the event manager without any further processing.

System programmer response: Determine if any user program generates events that change the status of an FTW operation.

EQQE042I JOBNAME(JOBNUM) SUBMITTED OUTSIDE THE PRODUCT BUT WILL BE TRACKED ANYWAY

Explanation: The Event Manager has encountered an event for a job whose job name matches an operation defined in the current plan. However, IBM Tivoli Workload Scheduler for z/OS did not submit this job. This message indicates that jobs with IBM Tivoli Workload Scheduler for z/OS job names are being submitted by non-IBM Tivoli Workload Scheduler for z/OS functions.

System action: IBM Tivoli Workload Scheduler for z/OS accepts current job as a IBM Tivoli Workload Scheduler for z/OS job and continues to track events for this job.

System programmer response: Determine if IBM Tivoli Workload Scheduler for z/OS and non-IBM Tivoli Workload Scheduler for z/OS jobs are using the same job names. If IBM Tivoli Workload Scheduler for z/OS and non-IBM Tivoli Workload Scheduler for z/OS jobs are using the same job names, take appropriate action to minimize such name conflicts. Inform IBM Tivoli Workload Scheduler for z/OS application owners that rerunning applications or adding additional work to the job queue should be done using the IBM Tivoli Workload Scheduler for z/OS Modify Current Plan dialog.

EQQE043E JOB EVENT EVENT RECEIVED FOR JOBNAME(JOBNUM) IS NOT CONSISTENT WITH CURRENT OPC STATUS OF THIS JOB: STATUS

Explanation: The Event Manager has received an event for a job on an automatically reporting computer workstation that conflicts with the information already collected for this operation. For example, a job complete event can only occur for a job that has started to execute.

System action: The status of the operation is not changed. The Event Manager continues normal operation with the next queued event.

System programmer response: Use console messages in the z/OS SYSLOG data set, or records in an SMF log data set to determine what has happened to this job. If possible, try to locate the SYSMSG data set for this job.

EQQE044W *JOBNAME(JOBNUM) MAY HAVE BEEN STARTED OUT-OF-ORDER. IF REQUIRED, SET CORRECT STATUS MANUALLY*

Explanation: The Event Manager has received a job start event for an operation on an automatically reporting computer workstation. However, this operation has predecessor operations that have not yet been reported complete.

System action: The status of the operation is not changed. The Event Manager continues normal operation with the next queued event.

Operator response: Determine if predecessors to the current operation have completed. If they have, change their status to complete, and change the status of the current operation to started. If they have not, the current job should be entered into hold status, and the job should be restarted. After predecessors have completed, the job should be released from hold.

System programmer response: Determine if the job was submitted outside of IBM Tivoli Workload Scheduler for z/OS or if it was held and released manually. Inform all people concerned about the reason for this message and take appropriate action to make sure that operations are started only after all predecessors are complete.

EQQE045E *ERRORS OCCURRED READYING SUCCESSOR TO THE FOLLOWING OPERATION: APPLICATION = APPL, INPUT ARRIVAL = ARRTIME, OPERATION NUMBER = OPNUM THE FAILURE REASON WAS REASON. THE PROBLEM SUCCESSOR OPERATION: APPLICATION = SAPPL, INPUT ARRIVAL = SARRTIME, OPERATION NUMBER = SOPNUM*

Explanation: The scheduler changed the status of an operation to Complete but encountered errors when attempting to set the status to Ready for a successor of the complete operation.

System action: The status is not changed for any of the successor operations. Processing continues.

Operator response: Check each successor operation to see if all its predecessors are complete. If they are complete, change the status of the operation to ready using the MCP dialog.

System programmer response: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message. Some possible values for reason are:

R A VSAM I/O error was encountered when reading the successor operation. See the message reporting the I/O error for more details.

N The successor operation does not list the predecessor as a dependency.

W The workstation name for the successor operation is not defined in the current plan.

C The status of the successor operation is already complete.

M Setting the status of the successor operation to Ready failed. Check the message log for further messages describing the error.

All of the reasons above indicate an internal product error. Save a copy of the active current plan, the job-tracking archive, and the active job-tracking log. Contact IBM Software Support.

EQQE046W *THE EVENT MANAGER WAS UNABLE TO RELEASE JOBNAME(JOBNUM) FROM HOLD*

Explanation: The Event Manager was unable to communicate successfully with JES while trying to release a job from hold.

System action: The hold status of the current job is not changed. The Event Manager continues normal operation with the next queued event.

Operator response: Check that the job is still held by JES. If it is, enter an appropriate operator command to release the job from hold.

System programmer response: Check that JES is executing normally.

EQQE047W *JOBNAME(JOBNUM) COULD NOT BE RELEASED FROM HOLD BECAUSE THE SUBMIT/RELEASE DDNAME DDNAME COULD NOT BE LOCATED*

Explanation: A job that was held by a IBM Tivoli Workload Scheduler for z/OS job tracking exit could not be released from hold because the "add job to JES queue" event was read by an event reader where the RELDDNAME keyword on the ERDROPTS statement defines a ddname that is not defined as a submit/release ddname for any workstation defined in the current plan.

System action: The hold status of the current job is not changed. The Event Manager continues normal operation with the next queued event.

Operator response: Check that the job is still held by JES on the system where it is executing. If it is, enter an appropriate operator command to release the job from hold.

System programmer response: Determine if the EWTROPTS statement is in error and should be corrected or if a new current plan containing an additional workstation must be created.

EQQE048W *JOBNAME(JOBNUM)* COULD NOT BE RELEASED FROM HOLD BECAUSE OF ERRORS ON THE SUBMIT/RELEASE FILE WITH DDNAME *DDNAME*

Explanation: A job that was held by a IBM Tivoli Workload Scheduler for z/OS job tracking exit could not be released from hold because an error occurred while writing the release command to a submit/release data set.

System action: The hold status of the current job is not changed. The Event Manager continues normal operation with the next queued event.

Operator response: Check that the job is still held by JES on the system where it is executing. If it is, enter an appropriate operator command to release the job from hold.

System programmer response: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQE049W THE EVENT MANAGER HAS IGNORED THE FOLLOWING USER DEFINED EVENT RECORD BECAUSE NO MATCHING OPERATION COULD BE FOUND IN CURRENT PLAN: *EXITREC*

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. No operation in the current plan data set could be found that matches the operation defined by the event record.

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing.

System programmer response: Determine if any user program generates events for an undefined application or for an undefined operation in a known application.

EQQE051W THE EVENT MANAGER HAS IGNORED THE FOLLOWING USER DEFINED EVENT RECORD BECAUSE THE JOBNAME *JOBNAME* IS NOT RECOGNIZED: *EXITREC*

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. No job name has been given, but it is required.

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing.

System programmer response: Determine if any user program generates events for an application or for an operation without specifying a job name.

EQQE050W THE MANDATORY ACT OPERAND HAS NOT BEEN SPECIFIED IN THE JSUACT COMMAND

Explanation: There is no default for the ACT operand, which therefore must be specified (to be sure that a so important function as the job submission is not activated or deactivated incidentally).

System action: The request is rejected.

User response: Add the ACT operand with the desired value to the command.

EQQE052E THE ISSUER OF THE JSUACT COMMAND HAS NOT THE REQUIRED UPDATE ACCESS AUTHORIZATION TO THE JSUB FIXED RESOURCE

Explanation: It is required that the person who issues the JSUACT command has the proper RACF® authorization.

System action: The request is rejected

User response: Enhance the RACF authorization of the user or ensure that the JSUACT command be issued by another user having the correct authorization.

EQQE053E THE EVENT MANAGER HAS IGNORED THE FOLLOWING FTW EVENT RECORD BECAUSE NO MATCHING OCCURRENCE WAS FOUND IN THE CURRENT PLAN: *EXITREC*

Explanation: An invalid event record originated from a fault-tolerant workstation has been found on the Event Manager work queue. No occurrence in the current plan data set could be found that matches the occurrence token defined by the event record.

System action: The incorrect event is returned to the Event Manager free queue without any further processing. This error might be a symptom that the Tivoli Workload Scheduler Symphony file and the Tivoli Workload Scheduler for z/OS Current Plan VSAM data sets are out of sync.

User response: Check if in the Symphony file any occurrence is present that is not present in the Current Plan. Run Symphony Renew to produce a new Symphony file synchronized with the Current Plan.

EQQE054E THE EVENT MANAGER HAS IGNORED THE FOLLOWING FTW EVENT RECORD BECAUSE IS NOT CONSISTENT WITH CURRENT STATUS OF THIS JOB: *EXITREC*

Explanation: An invalid event record originated from a fault-tolerant workstation has been found on the Event Manager work queue. The operation that the

event record refers to is in a status that is not compatible with the event record.

System action: The incorrect event is returned to the Event Manager free queue without any further processing. This error might be a symptom that the Symphony file and the scheduler Current Plan VSAM data sets are out of sync.

User response: Check that no unsupported manual action has been performed directly from the IBM Tivoli Workload Scheduler for z/OS agent. Run Symphony Renew to produce a new Symphony file synchronized with the Current Plan

EQQE055W THE EVENT MANAGER HAS IGNORED THE FOLLOWING SUBMIT EVENT RECORD BECAUSE NO MATCHING OPERATION WAS FOUND IN THE CURRENT PLAN: EXITREC

Explanation: The Event Manager's work queue contains an incorrect submit event. No operation in the current plan data set matches the operation defined by the event record. This submit event record is created for work being scheduled on one of the systems in this controller product configuration by another controller having the same name.

System action: The Event Manager continues normal processing.

System programmer response: If you cannot determine the reason for this message, contact IBM Software Support.

Problem determination: Check if the current plan has changed significantly since the job defined in the event record was submitted. Check if the submit event is old, and was sent by a IBM Tivoli Workload Scheduler for z/OS subsystem that has been inactive a long time.

EQQE056W THE EVENT MANAGER HAS IGNORED THE FOLLOWING INVALID EVENT RECORD: EXITREC

Explanation: An invalid event record has been found on the Event Manager's work queue. The most likely error is that the last 4 bytes of the record do not contain the IBM Tivoli Workload Scheduler for z/OS character string EQQF. It is also possible that the first 3 characters of the job number field do not contain the character string JOB.

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing.

System programmer response: Save the IBM Tivoli Workload Scheduler for z/OS message log data set (EQQMLOG) containing this message and contact IBM Software Support.

Programmer response: Note the job name and job

number in the exit record. If necessary, set the correct status for this job manually.

EQQE057W A NOT VALID QUEUE ENTRY HAS CAUSED THE SCHEDULER TO IGNORE THIS EVENT: EVENT HEADER: EVNTHDR EVENT RECORD: EXITREC

Explanation: An invalid event queue entry has been found on the Event Manager's work queue. The Event Manager could not determine the origin of the event. Each event must come from one of sixteen possible event data sets on each IBM Tivoli Workload Scheduler for z/OS node. In the current event queue entry, either the event data set number or the IBM Tivoli Workload Scheduler for z/OS node number is not valid.

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing.

System programmer response: Save the IBM Tivoli Workload Scheduler for z/OS message log data set containing this message and contact IBM Software Support.

EQQE058W THE EVENT MANAGER HAS IGNORED THE FOLLOWING USER DEFINED EVENT RECORD BECAUSE THE WORK STATION NAME WSNAME IS NOT RECOGNIZED: EXITREC

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. The workstation name in the current event record does not match any workstation definition in the current plan data set.

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing.

System programmer response: Determine if any user program generates events for an undefined workstation or if a new current plan containing an additional workstation must be created.

EQQE059W THE FOLLOWING USER DEFINED EVENT RECORD CANNOT BE USED BECAUSE WORK STATION WSNAME IS NOT AN AUTOMATICALLY REPORTING WORK STATION: EXITREC

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. Workstations referenced by user-defined event records must be automatically reporting workstations. The current workstation does not have this attribute.

System action: The incorrect event record is returned

to the Event Manager's free queue without any further processing.

System programmer response: Determine if the user program generating the event should reference some other workstation or if the attributes of the current workstation should be changed.

EQQE061E THE INPUT DATA SET, DDNAME = SYSIN, COULD NOT BE OPENED

Explanation: The EQQEVPGM program could not open the data set referenced by the SYSIN DD statement, the statement was not defined correctly, or no SYSIN DD statement was present.

System action: The EQQEVPGM program ends.

User response: Check that the SYSIN DD statement is present and that it is correctly coded. After making corrections, resubmit the EQQEVPGM batch job.

EQQE062E EQQEVPGM INITIALIZATION FAILED

Explanation: The EQQEVPGM program found one or more errors during initialization.

System action: The EQQEVPGM program ends.

User response: Review the message log data set for error messages. Remove the cause of each error and resubmit the EQQEVPGM batch job.

EQQE063I EQQEVPGM ENDED NORMALLY

Explanation: The EQQEVPGM program has finished processing. No errors were found during execution.

System action: The EQQEVPGM program ends.

User response: None.

EQQE064E EQQEVPGM TERMINATED BECAUSE OF UNRECOVERABLE ERRORS

Explanation: A severe error occurred during execution of the EQQEVPGM program.

System action: The EQQEVPGM program ends.

User response: Review the message log data set and the SYSUDUMP data set to determine the cause of the error. After making corrections, resubmit the EQQEVPGM batch job. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference*, Chapter 3 "Problem analysis procedures".

EQQE065I THE EQQEVPGM PROGRAM HAS STARTED

Explanation: The EQQEVPGM program has been correctly initialized and is about to start generating events.

System action: EQQEVPGM processing continues normally.

User response: None.

EQQE066E SUBSYS IS NOT A VALID SUBSYSTEM NAME. NO EVENT IS CREATED

Explanation: The SUBSYS keyword contains an invalid subsystem name.

System action: The event is not created. The EQQEVPGM program continues processing the next event creation statement.

User response: If the event should be created, make the necessary corrections and resubmit the EQQEVPGM batch job.

EQQE067E A SUBSYSTEM REQUEST ERROR (R15 = R15) OCCURRED. NO EVENT IS CREATED

Explanation: An error occurred when attempting to send an event to a IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The event is not created. The EQQEVPGM program continues processing the next event creation statement.

User response: If R15 is 4, the SUBSYS keyword does not define a IBM Tivoli Workload Scheduler for z/OS subsystem. If R15 is 8, the SUBSYS keyword either does not define a IBM Tivoli Workload Scheduler for z/OS subsystem or it defines a IBM Tivoli Workload Scheduler for z/OS subsystem that has not been properly installed. Make the necessary corrections and resubmit the EQQEVPGM batch job. If R15 is 12, 16 or 20, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQE068E A SUBSYSTEM ERROR (SSOBRETN = RETN) OCCURRED. NO EVENT IS CREATED

Explanation: An error occurred when attempting to send an event to a IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The event is not created. The EQQEVPGM program continues processing the next event creation statement.

User response: If the problem persists, search the IBM Support database for a solution at <http://>

www.ibm.com/software/sysmgmt/products/support.
If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference*, Chapter 3, "Problem analysis procedures".

EQQE069E ERRORS ENCOUNTERED IN EVENT DEFINITION STATEMENTS. ONE OR MORE EVENTS HAVE NOT BEEN CREATED

Explanation: The EQQEVPGM program found one or more incorrectly coded event definition statements.

System action: The EQQEVPGM program ends.

User response: If the events should be created, make the necessary corrections and resubmit the EQQEVPGM batch job.

EQQE070E THE SPECIAL RESOURCE NAME GIVEN IS TOO LONG. MAXIMUM SIZE IS 44 CHARACTERS

Explanation: The special resource name defined by the SRSTAT event definition statement is too long.

System action: The event is not created. The EQQEVPGM program continues processing the next event creation statement.

User response: If the event should be created, make the necessary corrections and resubmit the EQQEVPGM batch job.

EQQE071E A SPECIAL RESOURCE NAME IS REQUIRED ON THE SRSTAT STATEMENT

Explanation: The current SRSTAT event definition statement does not define any special resource name. This name is required.

System action: The event is not created. The EQQEVPGM program continues processing the next event creation statement.

User response: If the event should be created, make the necessary corrections and resubmit the EQQEVPGM batch job.

EQQE072E YOU ARE NOT AUTHORIZED TO UPDATE SPECIAL RESOURCES FOR SUBSYSTEM SUBSYS

Explanation: In order to change a special resource for a IBM Tivoli Workload Scheduler for z/OS subsystem, update authority to the SR resource is necessary. You do not have this authority.

System action: If you specified SUBSYSTEM(MSTR) in the command, no event is created for this subsystem. However, EQQEVPGM tries to create an event for the next active IBM Tivoli Workload Scheduler for z/OS subsystem in this z/OS system. If you are authorized

to update one or more of the IBM Tivoli Workload Scheduler for z/OS subsystems, the statement return code is set to 4. Otherwise, it is set to 8. After scanning all active IBM Tivoli Workload Scheduler for z/OS subsystems, EQQEVPGM continues processing the next event creation statement.

If you specified a unique IBM Tivoli Workload Scheduler for z/OS subsystem name instead of MSTR, no event is created for the subsystem specified. The statement return code is set to 8. The EQQEVPGM program continues processing the next event creation statement.

User response: Contact your security administrator.

EQQE073E YOU ARE NOT AUTHORIZED TO UPDATE THE CURRENT PLAN FOR SUBSYSTEM SUBSYS

Explanation: In order to create an operation or workstation event for a IBM Tivoli Workload Scheduler for z/OS subsystem, update authority to the RL resource is necessary. You do not have this authority.

System action: If you specified SUBSYSTEM(MSTR) in the command, no event is created for this subsystem. However, EQQEVPGM tries to create an event for the next active IBM Tivoli Workload Scheduler for z/OS subsystem in this z/OS system. If you are authorized to update one or more of the IBM Tivoli Workload Scheduler for z/OS subsystems, the statement return code is set to 4. Otherwise, it is set to 8. After scanning all active IBM Tivoli Workload Scheduler for z/OS subsystems, EQQEVPGM continues processing the next event creation statement.

If you specified a unique IBM Tivoli Workload Scheduler for z/OS subsystem name instead of MSTR, no event is created for the subsystem specified. The statement return code is set to 8. The EQQEVPGM program continues processing the next event creation statement.

User response: Contact your security administrator.

EQQE074E THE EVENT CREATION DATE SPECIFIED BY THE EVDATE KEYWORD IS NOT VALID

Explanation: The EVDATE keyword contains an invalid date. The date must be specified in the format YYMMDD where:

YY Is year and must specified as 72 to 99 for years 1972 to 1999 or 00 to 71 for years 2000 to 2071.
MM Is the month number and must be in the range 01 to 12.
DD Is the day number and must be in the range 01 to 31.

System action: The event is not created. The EQQEVPGM program continues processing the next statement.

User response: If the event should be created, correct the EVDATA keyword and resubmit the EQQEVPGM batch job.

EQQE075E THE EVENT CREATION TIME SPECIFIED BY THE EVTIME KEYWORD IS NOT VALID

Explanation: The EVTIME keyword contains an invalid time-of-day value. The time must be specified in the format HHMMSS, where:

- HH** Is a two-digit hour number. It must be in the range 00–23.
- MM** Is a two-digit minute number. It must be in the range 00–59.
- SS** Is a two-digit second number. It must be in the range 00–59.

System action: The event is not created. The EQQEVPGM program continues processing the next statement.

User response: If the event should be created, make the necessary corrections and resubmit the EQQEVPGM batch job.

EQQE076E THE INPUT ARRIVAL TIME SPECIFIED BY THE IA KEYWORD IS NOT VALID

Explanation: The IA keyword contains an invalid input arrival value. The value must be specified in the format YYMMDDHHMM where:

YYMMDD

Is the input arrival date:

- YY** Is the year. It must be in the range 72–99 for years 1972 through 1999 or 00–71 for years 2000 through 2071.
- MM** Is the month number. It must be in the range 01–12.
- DD** Is the day number. It must be in the range 01–31.

HHMM

Is the input arrival time:

- HH** Is the hour. It must be in the range 00–23.
- MM** Is the minute. It must be in the range 00–59.

System action: The event is not created. The EQQEVPGM program continues processing the next statement.

User response: If the event should be created, correct the IA keyword and resubmit the EQQEVPGM batch job.

EQQE077E WORK STATION NAME, APPLICATION DESCRIPTION OR JOB NAME MUST BE SPECIFIED

Explanation: The current OPSTAT or WSSTAT event definition statement does not define any workstation

name, application description, or job name. These items are required.

System action: The event is not created. Processing ends if it was invoked by a current TSO command. If the command was invoked by the EQQEVPGM program, processing continues with the next statement.

User response: If the event should be created, make the necessary corrections and issue the command again.

EQQE078E THE EVENT DURATION TIME SPECIFIED BY THE DURATION KEYWORD IS NOT VALID

Explanation: The DURATION keyword contains an invalid duration value. Event duration must be specified in the format HHMM, where:

- HH** Is a two-digit hour number. It must be in the range 00–99.
- MM** Is a two-digit minute number. It must be in the range 00–59.

System action: The event is not created. The EQQEVPGM program continues processing the next statement.

User response: If the event should be created, make the necessary corrections and resubmit the EQQEVPGM batch job.

EQQE079E KEYWORD KEY HAS AN INVALID VALUE

Explanation: The only valid values for CREATE, AVAIL, and the new availability value of LIFESPAN are either YES, NO, and RESET or abbreviations of YES, NO, and RESET.

System action: The event is not created. Processing ends for current SRSTAT command. If SRSTAT is invoked by the EQQEVPGM program, processing continues with the next statement.

User response: If the event must be created, make the necessary corrections and reissue the SRSTAT command.

EQQE080E THE EQQMinox PROGRAM ABENDED WITH ABEND CODE ABEND

Explanation: This message is issued when a IBM Tivoli Workload Scheduler for z/OS TSO command has failed due to an error when communicating with the IBM Tivoli Workload Scheduler for z/OS subsystem.

System programmer response: Check the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If the failing command contains an error, correct it and retry. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference*, "Problem analysis procedures" section, sub-section "Information needed

for all problems". If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your systems programmer.

Problem determination: If necessary, generate a dump by allocating a SYSxDUMP data set to the TSO user's address space, or by defining a slip trap, and reissue the failing command.

EQQE081E R15 RETURN CODE R15 WAS RETURNED BY THE TSO SERVICE FACILITY. RETURN CODE RC, REASON CODE RSN WERE ALSO RETURNED

Explanation: This message is issued when a IBM Tivoli Workload Scheduler for z/OS TSO command has failed due to an error when communicating with the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The IBM Tivoli Workload Scheduler for z/OS service requested has not been executed.

System programmer response: If the failing command contains an error, correct it and retry. If the error cannot be corrected, see the z/OS TSO manuals and look for the return code and the reason code to identify the cause of the error.

User response: Contact your systems programmer.

EQQE082E THE SUBSYSTEM SUBSYS IS NOT INITIALIZED. NO EVENT IS CREATED

Explanation: A IBM Tivoli Workload Scheduler for z/OS TSO command or EQQEVPGM has failed because the IBM Tivoli Workload Scheduler for z/OS subsystem *SUBSYS* has not been initialized. IBM Tivoli Workload Scheduler for z/OS subsystems are initialized during a z/OS IPL.

System action: No event is created.

System programmer response: If the IBM Tivoli Workload Scheduler for z/OS subsystem should be initialized the EQQINITD program must be executed successfully. Ensure EQQINITD is located in a library in the LNKLST nn concatenation and IPL the z/OS system.

User response: If the command referred to the wrong subsystem correct the input, and retry the command.

Problem determination: Check the system log for error messages issued during IPL that identify why the IBM Tivoli Workload Scheduler for z/OS subsystem was not initialized.

EQQE083E SUBSYSTEM SUBSYS IS NOT A PRODUCT SYSTEM. NO EVENT IS CREATED

Explanation: This message is issued when a IBM Tivoli Workload Scheduler for z/OS TSO command has failed because the subsystem that was referenced is not a IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: None.

User response: Correct the command and retry.

EQQE084E YOU ARE NOT AUTHORIZED TO UPDATE THE SPECIAL RESOURCE SPECIFIED FOR SUBSYSTEM SUBSYS

Explanation: An SRSTAT request to update a special resource specified for subsystem *SUBSYS* failed because the user making the request was not authorized to update the resource.

System action: The request is rejected.

User response: Contact your security administrator if access is required.

EQQE085E RESDS IS NOT A VALID RESOURCE DATASET NAME, NO EVENT IS CREATED

Explanation: The value specified for the resource data set keyword—RESDS was not valid. The keyword value must be specified as CP or JS.

System action: The request is ignored.

User response: Correct the input and resubmit the request.

EQQE086E THE RESDS KEYWORD MUST BE SPECIFIED

Explanation: The resource data set keyword—RESDS was not specified.

System action: The request is ignored.

User response: Supply the RESDS keyword and a valid value and resubmit the request.

EQQE087E YOU ARE NOT AUTHORIZED TO REQUEST A BACKUP OF THE RESDS RESOURCE DATASET SPECIFIED FOR SUBSYSTEM SUBSYS

Explanation: In order to request a backup of a IBM Tivoli Workload Scheduler for z/OS resource data set, update authority to the BKP fixed resource is required. You do not have this authority.

System action: The request is ignored.

User response: If authority is required contact your security administrator.

EQQE088E YOU ARE NOT AUTHORIZED TO UPDATE THE OPERATION, *SUBRES* CHECK FAILED AT SUBSYSTEM *SUBSYS*

Explanation: An OPSTAT requests to update an operation in subsystem *SUBSYS* failed because the user making the request was not authorized to update the *SUBRES* subresource.

System action: The request is rejected.

User response: If authority is required contact your security administrator.

EQQE089E YOU ARE NOT AUTHORIZED TO UPDATE STATUS OF WORKSTATION *WSNAME* FOR SUBSYSTEM *SUBSYS*

Explanation: A WSSTAT request to update the status of workstation *WSNAME* in subsystem *SUBSYS* failed because the user making the request was not authorized to update the RL.WSSTAT subresource.

System action: The request is rejected.

User response: If authority is required contact your security administrator.

EQQE090E EITHER WORKSTATION NAME OR DESTINATION MUST BE SPECIFIED

Explanation: The current WSSTAT statement does not define a workstation name (*WSNAME*) or a destination ID (*DESTINATION*). At least one of *WSNAME* or *DESTINATION* must be specified. Both can be specified.

System action: The event is not created. The EQQEVPGM program continues processing any further event creation statements.

User response: If the event should be created, make the necessary corrections and issue the command again or resubmit the EQQEVPGM batch job.

EQQE091E THE FOLLOWING USER DEFINED EVENT RECORD CANNOT BE USED BECAUSE THE OPCTOKEN VALUE IS NOT CONSISTENT WITH THE VALUE(S) SPECIFIED IN THE ADID, IA, JOBNAME AND/OR OPNUM
KEYWORDS: *EXITREC*

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. An OPSTAT event definition statement defined an OPCTOKEN value that is not consistent with some or all of the values specified in the ADID, IA, JOBNAME, AND OPNUM keywords. The operation cannot be identified by the scheduler.

System action: The incorrect event record is returned

to the Event Manager's free queue without any further processing.

User response: If a new event should be created, make the necessary corrections and issue the command again or resubmit the EQQEVPGM batch job.

EQQE092E THE FOLLOWING USER DEFINED EVENT RECORD CANNOT BE USED BECAUSE THE CURRENT OPERATION STATUS IS NOT STARTED, READY OR ARRIVING:
EXITREC

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. An OPSTAT event definition statement specified a new status of SQ or SS, but the current operation status is not started (S), ready (R), or arriving (A).

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing. The operation status is not changed.

User response: If a new event should be created, make the necessary corrections and issue the command again or resubmit the EQQEVPGM batch job.

EQQE093E THE FOLLOWING USER DEFINED EVENT RECORD CANNOT BE USED BECAUSE THE WORKSTATION *WSNAME* IS NOT A COMPUTER OR WTO WORKSTATION: *EXITREC*

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. An event generated by WSSTAT or EQQUSINW specified a workstation that is not a computer, or WTO workstation.

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing. The workstation status is not changed.

User response: If a new event should be created, make the necessary corrections and issue the command again or resubmit the EQQEVPGM batch job.

EQQE094E THE FOLLOWING USER DEFINED EVENT RECORD CANNOT BE USED BECAUSE THE WORKSTATION *WSNAME* DOES NOT MATCH THE DESTINATION *DEST*: *EXITREC*

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. An WSSTAT event definition statement specified a workstation that did not match the destination specified in the event.

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing. The workstation status is not changed.

User response: If a new event should be created, make the necessary corrections and issue the command again or resubmit the EQQEVPGM batch job.

EQQE095E THE FOLLOWING USER DEFINED EVENT RECORD CANNOT BE USED BECAUSE THE DESTINATION DEST IS NOT SPECIFIED IN THE ROUTOPTS INITIALIZATION STATEMENT: EXITREC

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. An WSSTAT event definition statement specified a destination which was not specified in the ROUTOPTS initialization statement.

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing. The workstation status is not changed.

User response: If a new event should be created, make the necessary corrections and issue the command again or resubmit the EQQEVPGM batch job.

EQQE096E THE STATUS KEYWORD MUST BE SPECIFIED

Explanation: The current WSSTAT event definition statement does not define any status. This keyword is required.

System action: The event is not created. The EQQEVPGM program continues processing the next event creation statement.

User response: If the event should be created, make the necessary corrections and resubmit the EQQEVPGM batch job.

EQQE097E THE FOLLOWING USER DEFINED EVENT RECORD CANNOT BE USED BECAUSE THE SPECIFIED TOKEN VALUE DOES NOT MATCH ANY OPERATION IN THE CURRENT PLAN: EXITREC

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. An OPSTAT event definition statement defined a TOKEN value that does not match any operation in the current plan. The operation cannot be identified by the scheduler.

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing.

User response: If a new event should be created, make the necessary corrections and issue the command again or resubmit the EQQEVPGM batch job.

EQQE098E THE FOLLOWING USER DEFINED EVENT RECORD CANNOT BE USED BECAUSE THE CURRENT OPERATION STATUS IS SS: EXITREC

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. An OPSTAT event definition statement specifies a new status Q for an operation which has a current status SS. This is not allowed.

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing. The workstation status is not changed.

User response: If a new event should be created, make the necessary corrections and issue the command again or resubmit the EQQEVPGM batch job.

EQQE099E THE FOLLOWING USER DEFINED EVENT RECORD CANNOT BE USED BECAUSE THE ALTERNATE WORKSTATION WSNAME DOES NOT EXIST: EXITREC

Explanation: An invalid user-defined event record has been found on the Event Manager's work queue. A WSSTAT event definition statement specified an alternative workstation that did not exist.

System action: The incorrect event record is returned to the Event Manager's free queue without any further processing. The workstation status is not changed.

User response: If a new event should be created, make the necessary corrections and issue the command again or resubmit the EQQEVPGM batch job.

EQQE100E THE CURRENT WORKSTATION WSNAME CANNOT BE USED AS ALTERNATE TO ITSELF. REROUTE IS NOT IN EFFECT FOR THE WORKSTATION

Explanation: A WSSTAT event definition statement specified an alternative workstation that was the same as the current workstation.

System action: Reroute is not in effect for the actual workstation. The workstation status is changed.

User response: Insert the correct value in the WSNAME field of the WSSTAT command. See *Managing the Workload*.

EQQE101E KEYWORD KEY HAS AN INVALID VALUE

Explanation: The only valid values for the QUANTITY and DEVIATION keywords are KEEP, RESET or a numeric value.

System action: The event is not created. Processing ends for current SRSTAT command. If SRSTAT is

EQQE102W • EQQE107I

invoked by the EQQEVPGM program, processing continues with the next event creation statement.

User response: If the event should be created, make the necessary corrections and issue the SRSTAT command again.

EQQE102W PULSE LOST FROM TRACKER *SUBS* AT DESTINATION *DEST*

Explanation: This message indicates that handshake processing, the frequency for which is determined by the PULSE keyword of the ROUTOPTS statement, has terminated for the indicated Tracker system. When handshake processing is in use, each connected Tracker system sends an identification (ID) event to the controller at the specified interval. If the controller detects that a Tracker system has missed two consecutive PULSE intervals, this message is issued. *SUBS* is the name of the Tracker (the subsystem name for z/OS trackers). *DEST* is the destination for this system, as defined in the ROUTOPTS statement.

System action: If the destination *DEST* is defined using shared DASD (submit/release) data set communication, this destination is forced Offline by the controller. For other communication methods, no action is taken.

System programmer response: Check that the destination is active. If it is, check that the event writer at the destination is active.

EQQE103W TRACKER *SUBS* AT DESTINATION *DEST* LOST THE *FUNC*

Explanation: This message is issued for reporting purposes on the controller message log, EQQMLOG, when the ROUTOPTS PULSE processing is active for Tracker systems on IBM Tivoli Workload Scheduler for z/OS release 3 level or higher. The message indicates that the *FUNC* subtask in the *SUBS* subsystem on the z/OS system represented in IBM Tivoli Workload Scheduler for z/OS by the *DEST* destination has abnormally terminated.

System action: No action is taken by the controller.

System programmer response: Check the message log for the indicated Tracker address space and take appropriate actions to restart the failed subtask.

EQQE104E KEYWORD *KEYW* MISSING. IT IS REQUIRED FOR SUBRESOURCE *SUBRES* CHECKING AT SUBSYSTEM *SUBSYS*

Explanation: Authority checking for subresource *SUBRES* is specified in the AUTHDEF statement for subsystem *SUBSYS*. A valid subresource name cannot be built for protection of the operation when keyword *KEYW* is omitted. When EQQEVPGM processes a TSO command, for example, OPINFO, OPSTAT, JSUACT or

WSSTAT, it checks the authority of the requestor analyzing the contents of AUTHDEF statements of the scheduler. To do this check it also necessary that a certain keyword *KEYW* should be specified in the previous TSO statement.

System action: No event is created for the subsystem identified in the message text. If SUBSYSTEM(MSTR) was specified in the input, the request is directed to the next scheduler subsystem. If event creation failed for one or more subsystems, return code 4 is set. If it failed for all subsystems or for a subsystem specifically identified in the input, return code 8 is set.

System programmer response: Add the keyword and resubmit the EQQEVPGM job for the failing subsystem.

EQQE105W DATA STORE FUNCTIONALITY IS ACTIVE ON CONTROLLER BUT NOT ON TRACKER

Explanation: The controller is running with DSTTASK(YES), that is, SYSOUT retrieval is done via the Data Store, but a minimum of one tracker is running in an environment where the Data Store is not active.

System action: None

System programmer response: Check that the EQQSSCMx level of code is correct.

User response: Contact your system programmer.

EQQE107I SUCCESSFUL TWS-WLM PROMOTION FOR *ADID* *WSID* *OPNUM* **IA: IA JOB:** *JOBNAME*(*JOBNUM*) **IN SERVICE** **CLASS** *WLMCLASS*

Explanation: The job identified by:

Application name

ADID

Workstation

WSID

Operation number

OPNUM

Job name

JOBNAME

Job number

JOBNUM

Input arrival

IA

was successfully promoted to the WLM service class *WLMCLASS*.

System action: The job was successfully promoted and its processing continues.

User response: None.

EQQE108E THE EVENT MANAGER HAS IGNORED THE FOLLOWING FTW EVENT RECORD BECAUSE NO MATCHING OPERATION COULD BE FOUND IN CURRENT PLAN: EXITREC

Explanation: An invalid event record originated from a fault-tolerant workstation has been found on the Event Manager work queue. No operation in the current plan data set could be found that matches the operation defined by the event record.

System action: The incorrect event is returned to the Event Manager free queue without any further processing. This error might be a symptom that the Symphony file and the scheduler Current Plan VSAM data sets are out of sync.

User response: Check if in the Symphony file any operation is present that is not present in the Current Plan. Run Symphony Renew to produce a new Symphony File synchronized with the Current Plan.

EQQE109E THE EVENT MANAGER HAS IGNORED THE FOLLOWING FTW EVENT RECORD BECAUSE THE WORK STATION NAME WSNNAME IS NOT RECOGNIZED: EXITREC

Explanation: An invalid event record originated from a fault-tolerant workstation has been found on the Event Manager work queue. No workstation in the current plan data set could be found that matches the workstation defined by the event record.

System action: The incorrect event is returned to the Event Manager free queue without any further processing. This error might be a symptom that the Symphony file and the scheduler Current Plan VSAM data sets are out of sync.

User response: Check if in the Symphony file any operation is present that is not present in the Current Plan. Run Symphony Renew to produce a new Symphony File synchronized with the Current Plan.

EQQE110W THE EVENT MANAGER WAS UNABLE TO SET STATUS STATUS FOR OPERATION OPERNUM, IN APPLICATION APPL, IA=ARRTIME. THE OPERATION IS SET INTO OUT OF SEQUENCE STATUS

Explanation: An event record, originating from a fault-tolerant workstation, indicates that an operation started before predecessors are completed or resources allocated. This error is probably produced by dependencies added after the job was started on the agent.

System action: The operation is set in Error status with error code OSEQ (Out Of Sequence).

User response: Check the status of the job on the

agent and, when the predecessors are completed, manually set the operation to the correct status.

EQQE111W THE EVENT MANAGER WAS UNABLE TO SET STATUS STATUS FOR OPERATION OPERNUM, IN APPLICATION APPL, IA=ARRTIME. THE EVENT IS DISCARDED

Explanation: An event record, originating from a fault-tolerant workstation, reports a status transition that is not compatible with the actual operation status. This error is probably produced by setting the status of running jobs manually or by operations already set out of sequence.

System action: The event is discarded and the operation status is left as it is before.

User response: Check the status of the job on the agent and, when the predecessors are completed, manually set the operation to the correct status.

EQQE112E THE EVENT MANAGER WAS UNABLE TO SET STATUS STATUS FOR THE FAULT-TOLERANT WORKSTATION WSNNAME

Explanation: An event record, originating from a WSSTAT command, tried to set a status of a fault-tolerant workstation to Failed, which is not compatible with the actual workstation type.

System action: The event is discarded and the workstation status is left as it was before.

User response: Insert the correct value in the WSNNAME field of the WSSTAT command. See *Managing the Workload*.

EQQE113W AN ERROR HAS OCCURRED SENDING THE SCRIPT TO THE DISTRIBUTED AGENT FOR OPERATION OPERATION, IN APPLICATION APPL, IA=ARRTIME. THE OPERATION STATUS IS RESET TO READY

Explanation: The submission of operation OPERATION in occurrence APPL with Input Arrival ARRTIME failed while the engine was sending the script for the operation to the distributed agent.

System action: The Workstation Analyzer task retries the job submission for a maximum of 10 times over a 5 minute period.

System programmer response: Check the controller and the server MLOG for the error causing the failure.

User response: If the error persists, contact your system programmer.

EQQE114E THE EVENT MANAGER WAS UNABLE TO SET AN ALTERNATE WORKSTATION FOR THE FAULT-TOLERANT WORKSTATION *WSNAME*.

Explanation: An event record, originating from a **WSSTAT** command, tried to set alternate workstation for a fault-tolerant workstation. This is not compatible with the actual workstation type.

System action: The request is discarded.

User response: Insert the correct value in the **WSNAME** field of the **WSSTAT** command. See *Managing the Workload*.

EQQE115E KEYWORDS STATUS, CMD AND MANAGES MUST BE MUTUALLY EXCLUSIVE

Explanation: An event record, originating from a **WSSTAT** command, tried to concurrently use the STATUS, CMD and MANAGES keywords. This is not possible. You can only use one of the three.

System action: The request is discarded.

User response: Rerun the **WSSTAT** command specifying the correct keywords. Refer to *Managing the workload*.

EQQE116E *WSNAME* IS NOT A FAULT-TOLERANT WORKSTATION. THE COMMAND KEYWORD IS INCORRECT

Explanation: An event record, originating from a **WSSTAT** command, used keyword CMD (command) to set STATUS or LINK, when the workstation is not a fault-tolerant workstation.

System action: The request is rejected.

User response: Rerun the **WSSTAT** command specifying the correct keywords. Refer to *Managing the workload*.

EQQE117E *WSNAME* IS NOT A FAULT-TOLERANT WORKSTATION. THE MANAGES KEYWORD IS INCORRECT

Explanation: An event record, originating from a **WSSTAT** command, used the MANAGES keyword to change the domain, when the workstation is not a fault-tolerant workstation.

System action: The request is rejected.

User response: Rerun the **WSSTAT** command specifying the correct keywords. Refer to *Managing the workload*.

EQQE118E THE EVENT MANAGER HAS IGNORED THE FOLLOWING FTW EVENT RECORD BECAUSE IT WAS UNABLE TO RETRIEVE RECOVERY INFORMATION: *EXITREC*

Explanation: An invalid event record coming from a fault-tolerant workstation was found in the work queue of the Event Manager. No recovery information could be found in the current plan record 24 that matches the operation defined by the event record.

System action: The incorrect event is returned to the Event Manager free queue without any further processing. This error may be a symptom that the Symphony file and the scheduler Current Plan VSAM data sets are out of sync.

User response: Check the Symphony file for an operation that is not present in the current plan. Run Symphony Renew to produce a new Symphony File and to synchronize it with the current plan.

EQQE119E THE FOLLOWING USER DEFINED EVENT RECORD CANNOT BE USED BECAUSE THE ALTERNATE WORKSTATION *WSNAME* IS A FAULT-TOLERANT WORKSTATION.

Explanation: An event record for changing the workstation status, tried to assign a fault-tolerant workstation as alternate workstation and to reroute operations with the REROUTE value.

System action: The request is discarded.

User response: Rerun the **WSSTAT** command specifying the correct keywords. Refer to *Managing the workload*.

EQQE120W WRONG TYPE OPERAND WAS SPECIFIED IN THE JSUACT COMMAND POSSIBLE VALUES ARE H=HOST/F=FTW/B=BOTH

Explanation: The keyword TYPE on command JSUACT contains a wrong value. The possible values are H for Host, F for FTW and B for both environments.

System action: The request is rejected.

User response: Insert the right value.

EQQE122E UNSUPPORTED STATUS CHANGE OF OSEQ OPERATION WITH UNCOMPLETED PREDECESSOR(S)

Explanation: The request requires an operation in error status with error code OSEQ to change status. There are restrictions as to how this can be done when the operation has uncompleted predecessors.

System action: The request is rejected.

User response: The OSEQ operation can be reset to the proper status, waiting, by using the operation restart request from the ended-in-error list panel. The modify occurrence request can also be used. The operation can be deleted or the occurrence can be deleted or set to waiting. An occurrence rerun or a change of the operation status is not accepted until all predecessors have been completed or the dependencies have been deleted.

EQQE123I A SYSTEM AUTOMATION MESSAGE WILL FOLLOW RELATED TO OPERATION: APPL: APPLID IA: IA OPERATION: OPNO

Explanation: IBM Tivoli Workload Scheduler for z/OS submitted an operation with a system automation command and received a message back from system automation. The operation is identified by the owning application ID, operation input arrival date and time, and operation number.

System action: The message received from System Automation follows in the log only if MLOG is one of the destinations specified in the AUTOMATIONMSG parameter of the OPCOPTS statement.

User response: Check the message content and correct the reason of the error. Issue a system automation operation again.

EQQE124W THE MONITORING TASK IS NOT RUNNING: THE BULKDISC USER EVENT RECORD IS IGNORED

Explanation: The user has requested a bulk discovery when the monitoring task is not active.

System action: The user request is ignored.

User response: Start the monitoring task. To initiate the bulk discovery run the TSO BULKDISC command again.

EQQE125W A BULK DISCOVERY IS ALREADY RUNNING. THE BULKDISC USER EVENT RECORD IS IGNORED

Explanation: The user has requested a new bulk discovery while a bulk discovery is currently running.

System action: The user request is ignored.

User response: Wait for the previous bulk discovery to end. Submit the bulk discovery again

EQQE126W THE BULKDISC USER EVENT RECORD IS IGNORED. PLANNING ACTIVITY IS IN PROGRESS.

Explanation: The user has requested a bulk discovery but a planning activity is currently in progress.

System action: The user request is ignored.

User response: Wait for the planning activity to end. Submit the bulk discovery again.

EQQE127W MISSING STEP END EVENT FOR OPERATION APPLID1 IA1 OPNO1 JOB NAME JOBN1. CONDITION DEPENDENCY SIMP IN CONDITION COND DEFINED ON OPERATION APPLID2 IA2 OPNO2 WILL REMAIN UNDEFINED.

Explanation: At job-end time, the indicated step dependency is not evaluated yet, because the event writer did not receive the step-end event.

System action: The scheduler cannot evaluate the indicated condition.

User response: Possible causes are:

- The EWTROPTS initialization statement, for the tracker event-writer task, does not specify either the SDEPFILTER or STEPEVENTS(ALL) parameter. One of them is necessary to activate the step-end event generation.
- The SDEPFILTER string value does not match the JOB card programmer name value or a subset of it, according to the specified start position.
- The step name specified in the dependency definition does not correspond to a step in the JCL that actually run.

EQQE128E WSSTAT COULD NOT SET AN ALTERNATE WORK STATION FOR WSNAME. THE ALTERNATE WORK STATION MUST BE OF THE SAME TYPE.

Explanation: A WSSTAT command was issued to set a workstation as offline, but the alternate workstation specified is not a Tivoli Workload Scheduler for z/OS Agent workstation.

System action: The command is ignored.

User response: Issue the command again by specifying a Tivoli Workload Scheduler for z/OS Agent agent as the alternate workstation.

EQQE130I OPERATION ADID WSID OPNUM JOBNAME IA: IA LATEST START TIME: LOUT IS A CRITICAL JOB AND NEXT TO BE LATE: MOVED TO READY URGENT QUEUE

Explanation: The operation identified by:

Application name
ADID
Workstation
WSID
Operation number
OPNUM

EQQE131I • EQQE133E

Job name (if applicable)

JOBNAME

Input arrival

IA

is reaching its latest start time *LOUT* in about 2 minutes, but has not started yet.

System action: IBM Tivoli Workload Scheduler for z/OS moves the operation to the queue used for operations with priority 9, to speed up its starting.

User response: Check if there is any reason that prevents the operation from starting, for example the availability of a special resource.

EQQE131I OPERATION ADID WSID OPNUM
JOBNAME IA: IA LATEST START TIME:
LOUT IS A CRITICAL JOB NO MORE
LATE: REMOVED FROM READY
URGENT QUEUE

Explanation: The operation identified by:

Application name

ADID

Workstation

WSID

Operation number

OPNUM

Job name (if applicable)

JOBNAME

Input arrival

IA

was previously promoted to the ready urgent queue, but its starting is no longer late. The operation is therefore moved back to the ordinary queue.

This situation occurs only when the latest start time is postponed by a DP batch extend or replan.

System action: IBM Tivoli Workload Scheduler for z/OS moves the operation to the ordinary queue.

User response: Check if the latest start time modified by the DP batch is really what you want.

EQQE132E UNSUCCESSFUL TWS-WLM
PROMOTION FOR ADID WSID
OPNUM IA: IA JOB:
JOBNAME(JOBNUM) IN SERVICE
CLASS WLMCLASS. SERVICE CLASS
WLMCLASS IS NOT DEFINED IN THE
ACTIVE WORKLOAD MANAGER
POLICY

Explanation: The job identified by:

Application name

ADID

Workstation

WSID

Operation number

OPNUM

Job name

JOBNAME

Job number

JOBNUM

Input arrival

IA

cannot be promoted to the WLM service class *WLMCLASS*, because the class is not defined in the active workload manager policy.

System action: The job is not promoted to the specified WLM service class.

User response: Correct the service class definition or modify the current plan to specify for the operation a WLM service class that is defined in the workload manager policy.

EQQE133E UNSUCCESSFUL TWS-WLM
PROMOTION FOR ADID WSID
OPNUM IA: IA JOB:
JOBNAME(JOBNUM) IN SERVICE
CLASS WLMCLASS. WLM MACRO
INVOKED: WLMMACRO. RETURN
CODE: WLMRC REASON CODE:
WLMRSN

Explanation: The job identified by:

Application name

ADID

Workstation

WSID

Operation number

OPNUM

Job name

JOBNAME

Job number

JOBNUM

Input arrival

IA

cannot be promoted to the WLM service class *WLMCLASS*. The following information is provided to find the reason for the unsuccessful promotion:

WLM macro invoked
WLMMACRO

Return code
WLMRC

Reason code
WLMRSN

System action: The job is not promoted to the specified WLM service class.

User response: Based on the information provided by this message, refer to the WLM documentation to find the reason for the unsuccessful promotion of the job.

EQQE136W THE EVENT MANAGER HAS IGNORED THE FOLLOWING EVENT BECAUSE THE WORKSTATION *WSID* IS VIRTUAL AND TRACKER DOES NOT SUPPORT IT: *EXITREC*

Explanation: The Controller (Event Manager task) ignored the event identified by *EXITREC* because it was related to a virtual workstation, but the tracker that originated the event does not support virtual workstations, so that not all the needed information were provided. The event *EXITREC* is an *IJO* event sent by tracker to controller after a workstation synchronize request or submission request found out of sequence. When the workstation is virtual the name of the workstation is insufficient, because the event must also contain the tracker destination. This kind of information is provided by trackers running a product level corresponding to Version 8.3 with APAR PK46296 or higher

System action: The virtual workstation *WSID* will have the destination associated to the tracker that generated the event not synchronized. That destination will not be available for submissions.

System programmer response: Check that all the destinations belonging to the virtual workstation *WSID* are associated to trackers running a product level corresponding to Version 8.3 with APAR PK46296 or higher

User response: None.

EQQE137I STATUS OF OPERATION *ADID OPNUM IA IA* HAS BEEN SET TO INTERRUPTED DUE TO OFFLINE WORKSTATION.

Explanation: The scheduler changed from started to interrupted the status of the indicated operation. The reason is that this operation has conditional successors already completed, started, ended in error, or suppressed by condition.

System action: Processing continues.

User response: None.

EQQE138I STATUS OF OPERATION *ADID OPNUM IA IA* HAS NOT BEEN RESET BY ERRRES DUE TO CONDITIONAL SUCCESSORS IN STATUS *C,S,E,X*.

Explanation: The scheduler did not reset to arriving the indicated operation, even if the related error code matches a value specified through the *ERRRES* parameter in the *JTOPTS* statement. The reason is that this operation has conditional successors already completed, started, ended in error, or suppressed by condition.

System action: Processing continues.

User response: None.

EQQE139W THE EVENT MANAGER WAS UNABLE TO PROCESS THE FOLLOWING BIND REQUEST: *EXITREC*. REASON: *REASON*.

Explanation: The Event Manager was unable to process a bind request. The reason indicates the cause of the problem:

- 1 Error adding a data queue element to an internal queue.
- 2 Error accessing VSAM data set.

System action: The event record is returned to the Event Manager's free queue without any further processing.

System programmer response: For problems related to data queue elements or accessing VSAM data set, refer to the specific messages in the log.

EQQE141W UNEXPECTED RC OCCURRED FOR OPERATION: *ADID APPL, IA ARRTIME, OPNO OPNUM, WS WSN, JOBNAME JOBNM, JOBID JOBID, DEST DEST* WHEN SET TO STATUS *ST*.

Explanation: The operation specified in the message was marked with the *Unexpected RC* flag because its status *ST* does not match any of those specified in the conditions of its conditional successors. This means that no possible path for progression exists. The status settings that can cause this message are *E* (Error) and *C* (Complete).

System action: The operation is flagged as *Unexpected RC* and the status of the conditions of its conditional successors is set to *Undefined*.

User response: Verify the following:

- Make sure you correctly typed condition definitions.
- If the operation result was expected, make sure that a successor is defined for that result.
- If the operation result was not expected, fix the error that caused that result.

Then rerun the occurrence or manually operate appropriately to let the successors start.

EQQE142W UNEXPECTED RC OCCURRED FOR OPERATION: *ADIDAPPL, IA ARRTIME, OPNO OPNUM, WS WSN, JOBNAME JOBNM, JOBID JOBID, DEST DEST* WHEN CHECKING END OF STEP: *SNAM PNAM*.

Explanation: The operation specified in the message was marked with the *Unexpected RC* flag because its return code or status *ST* does not match those specified

in step level conditional dependency associated to the indicated operation's step. This means that no possible path for progression can exist.

System action: The operation is flagged as Unexpected RC and the status of the conditions of its conditional successors is set to Undefined.

User response: Verify the following:

- Make sure you correctly typed condition definitions.
- If the operation result was expected, make sure that a successor is defined for that result.
- If the operation result was not expected, fix the error that caused that result.

Then rerun the occurrence or manually operate appropriately to let the successors start.

EQQE143E THE EVENT MANAGER WAS UNABLE TO OPEN THE DDNAME DATA SET. THE HTTPPTS OUTPUTCOLLECTOR VALUE IS FORCED TO NO.

Explanation: You set the HTTPPTS OUTPUTCOLLECTOR keyword to YES to collect the joblog for jobs that run on z-centric and dynamic agents and write it to JES. When this feature is active, the event manager writes in the DDNAME data set an event for each joblog that must be collected by the output collector. An error occurred opening the data set so the event manager cannot use the data set to communicate with the output collector.

System action: The communication with the output collector is interrupted. Joblogs for jobs that run on z-centric and dynamic agents are not collected or written to JES by the output collector.

User response: Check the controller MLOG and analyze the previous messages that explains why the data set cannot be opened. Solve the problem and restart the controller.

EQQE144E ERROR OCCURRED WHILE NOTIFYING THE OUTPUT COLLECTOR TO GET THE JOBLOG FOR OPERATION OPERNUM, IN APPLICATION APPL, IA=ARRTIME. THE FAILURE REASON IS: REASON.

Explanation: An error occurred while notifying the output collector to get the joblog for the operation. REASON indicates the failure type; possible reasons are:

- The EQQOUCV event data set is full.
- An error occurred while enqueueing or dequeueing a logical resource
- An error occurred while reading or updating the EQQOUCV event data set header.

- An error occurred while reading or updating the EQQOUCV event data set record.

System action: The event manager task continues its processing without notifying the output collector about this operation.

User response: Check the system log for messages indicating more details about the cause of the problem.

EQQE145W THE DDNAME EVENT DATA SET USE HAS EXCEEDED THE THRESHOLD VALUE. PERCENT % OF THE DATA SET IN USE.

Explanation: The DDNAME data set use has reached the percentage indicated by the value of PERCENT. Some events might be lost.

System action: The event manager task continues its processing.

User response: Check the system log and the output collector EQQMLOG for any messages identifying the problem. If there are no message, this means that the data set is too small, allocate a larger data set. Stop and restart the controller and the output collector.

Problem determination: The DDNAME data set is too small or the output collector cannot process events for a problem.

EQQE146W THE DDNAME EVENT DATA SET IS FULL.

Explanation: The DDNAME data set is full. Some events might be lost.

System action: The event manager continues processing but any events sent to the output collector from now on might be lost.

User response: Check the system log and output collector EQQMLOG for any messages identifying the problem. If there are no message, this means that the data set is too small, allocate a larger data set. Stop and restart the controller and the output collector.

Problem determination: The DDNAME data set is too small or the output collector cannot process events for a problem.

EQQE200W JSUACT REQUEST IGNORED. SUBTASK HAS TERMINATED.

Explanation: The job submit activate/deactivate command has been ignored because the controller normal mode manager (NMM) task has terminated.

System action: The request is rejected.

User response: Review the message log for messages that could explain why NMM is unavailable.

EQQE201W SUBMIT FUNCTION ALREADY ACTIVE FOR ENV

Explanation: The job submit activate command has been ignored because the job submit function is already active and enabled for service.

System action: The request is ignored.

User response: None.

EQQE202W SUBMIT FUNCTION ALREADY INACTIVE FOR ENV

Explanation: The job submit deactivate command has been ignored because the job submit function is already inactive and disabled for service.

System action: The request is rejected.

User response: None.

EQQE203I SUBMIT FUNCTION ACTIVATED FOR HOST, Z-CENTRIC, DYNAMIC AND REMOTE ENGINE WORKSTATIONS

Explanation: The job submit activate command has been accepted and executed.

System action: None.

User response: None.

EQQE204I SUBMIT FUNCTION INACTIVATED FOR HOST, Z-CENTRIC, DYNAMIC AND REMOTE ENGINE WORKSTATIONS

Explanation: The job submit deactivate command has been accepted and executed.

System action: None.

User response: None.

EQQE205E ENV JOB SUBMISSION REQUEST REJECTED, E2E FEATURE NOT ACTIVE

Explanation: You tried to submit an activate or deactivate job submission on FTW with TSO command JSUACT when end-to-end feature is not active.

System action: The request is ignored.

User response: Start the end-to-end feature before running the command

EQQE206W TIME DISCREPANCY (DISCR HUNDREDTHS OF A SECOND) IN EVENTS FOR APPLID IA OPNUM JOBNAME (JOBID)

Explanation: A time discrepancy equal to or less than a minute has been detected in the reader queue time

(JMRENTY) stored in JMR block, therefore the events for the job do not match.

System action: Processing of the job terminates with error code CCUN.

User response: Because the error is caused by a discrepancy in JMRENTY but all the events are present for the job, you can manually complete the operation.

EQQE210I TIVOLI WORKLOAD SCHEDULER FOR z/OS HAS UPDATED THE GMT OFFSET ON SYSTEM SYSID

Explanation: On the indicated system, the system time was changed. IBM Tivoli Workload Scheduler for z/OS generated an event to change its GMT offset through the tracker.

System action: The tracker generates the event and modifies the GMT offset, if the difference in the GMT offset is at least of 1 minute. The controller, if the event was created in its own system, updates its GMT offset and issues message EQQE210I into its MLOG. If the event was created in a system different from the system where the controller runs, the controller issues message EQQE210I but does not update its GMT offset.

User response: None.

EQQE300E FOLLOWING EVENT HAS BEEN IGNORED BECAUSE REQUEST TOKEN DID NOT MATCH EXITRC

Explanation: The Event Manager has received an event for a restart and cleanup process that does not match the token used in the original dialog request.

System action: The Event Manager continues normal operation with the next queued event.

System programmer response: Save the message log containing this message and the JT files with the event, then contact IBM Software Support. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQE301E FOLLOWING EVENT HAS BEEN IGNORED BECAUSE DOA OPERATION BLOCK WAS NOT FOUND EXITREC

Explanation: The Event Manager has received an event for a restart and cleanup process for which no matching DOA can be found.

System action: The Event Manager continues normal operation with the next queued event.

User response: Save the message log containing this message and the JT files with the event. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQE302I APPL: APPLID IA: IA WS: CPU
 OPNUM: OPNO JOB: JOBNAME IS
 WAITING FOR SCHEDULING
 ENVIRONMENT: SCHED NOT
 AVAILABLE IN ENV SID=SYSPLEXID

Explanation: The job identified by:

Application name

APPLID

Input arrival

IA time

Workstation

CPU

Operation number

OPNUM

Job name

JOBNAME

could not be submitted because the associated scheduling environment *SCHED* is not available.

The *ENV* parameter specifies if the scheduling environment is unavailable at the JESplex level only or throughout the entire sysplex. SID reports the sysplex identification number where this event occurred.

System action: The job is now in the READY status and in the WAITING FOR SE extended status. It remains ineligible for submission until the scheduling environment is again available.

User response: Make the scheduling environment available so that the job can be submitted again.

EQQE303W APPL: APPLID IA: IA WS: CPU
 OPNUM: OPNO JOB: JOBNAME SET
 TO ERROR: SCHEDULING
 ENVIRONMENT SCHED NOT
 AVAILABLE IN ENV SID=SYSPLEXID
 AND OPERATION COMES FROM RC
 PATH.

Explanation: The job identified by:

Application name

APPLID

Input arrival

IA time

Workstation

CPU

Operation number

OPNUM

Job name

JOBNAME

could not be submitted because the associated scheduling environment *SCHED* is not available. The job is now in error with error code SERC.

The *ENV* parameter specifies if the scheduling environment is unavailable at the JESplex level only or throughout the entire sysplex. SID reports the sysplex identification number where this event occurred.

System action: The job is set to Error with code SERC. It was not set to the READY status because it comes from Restart and Clean Up paths and the original customized JCL is no longer available.

User response: Make the scheduling environment available so that the job can be submitted again.

EQQE304W APPL: APPLID IA: IA WS: CPU
 OPNUM: OPNO JOB: JOBNAME SET
 TO ERROR: SCHEDULING
 ENVIRONMENT SCHED IS NOT
 DEFINED IN ENV SID=SYSPLEXID

Explanation: The job identified by:

Application name

APPLID

Input arrival

IA time

Workstation

CPU

Operation number

OPNUM

Job name

JOBNAME

could not be submitted because the associated scheduling environment *SCHED* was not defined to WLM.

The *ENV* parameter specifies if the scheduling environment is unavailable at the JESplex level only or throughout the entire Sysplex. SID reports the Sysplex identification number where this event occurred.

System action: The job is set to Error with code SEUN.

User response: Check whether the scheduling environment is defined incorrectly in the JCL or in the CP operation record, or if the WLM definition is missing. Fix the error so that the job can be submitted.

EQQE305I WLM SERVICE DEFINITION WAS
 SUCCESSFULLY INSTALLED IN
 SYSPLEX SID

Explanation: A WLM Service Definition has been successfully installed on the Sysplex identified by *SID* (it is the value specified in OPCOPTS SYSPLEXID tracker parameter).

System action: None.

User response: None.

EQQE306I WLM VARY POLICY WAS
 SUCCESSFULLY EXECUTED IN
 SYSPLEX SID

Explanation: A WLM VARY POLICY command has been successfully completed on the sysplex identified by *SID* (it is the value specified in OPCOPTS

SYSPLEXID tracker parameter).

System action: All operations in waiting status, but waiting for a Scheduling Environment belonging to the specified sysplex, are resubmitted.

User response: None.

EQQE307W APPL: *APPLID* IA: *IA* WS: *WSID*
OPNUM: *OPNUM* JOB: *JOBNAME* HAS AT LEAST ONE SPECIAL RESOURCE WITH MAXLIMIT GREATER THAN 0 THIS IS NOT COMPATIBLE WITH WAITING FOR SE STATUS.

Explanation: This message is preceded by message EQQE302I. It is issued when the operation identified by:

Application name

APPLID

Input arrival

IA time

Workstation

WSID

Operation number

OPNUM

Job name

JOBNAME

is set to Ready, waiting for scheduling environment, and at least one special resource with maximum limit greater than 0 is associated with it.

Avoid using special resources with the maximum limit function active and scheduling environment, because retrying an operation waiting for the scheduling environment increases the usage counter each time the operation becomes Ready again. The scheduling environment availability check is done by the tracker, so the operation changes status from Ready to Started and from Started to Ready again if the scheduling environment is not available.

System action: Processing continues.

User response: Identify the special resources associated with the operation that have the maximum limit function active. For these special resources, ensure that the global availability status is the one you want (the maximum limit might have been reached before the expected time).

| **User response:** None.

| **EQQE309I** A PARTIAL DEADLINE UPDATE HAS OCCURRED IN AD DATABASE FOR *APPLID OPNUM*.

| **Explanation:** The Event Manager has partially updated the deadline. A complete update was not possible, because the value would have been 00.00 in the same day as IA, while allowed values for deadline are 00.01-24.00. The value has been set to 00.01.

| **System action:** The Event Manager continues normal processing with the next event in queue.

| **User response:** None.

| **EQQE308I** THE FOLLOWING EVENT HAS BEEN IGNORED BECAUSE OPERATION IS COMPLETED: *EXITREC*.

| **Explanation:** The Event Manager has received an event for a restart and cleanup process, but no matching DOA can be found because the operation results completed.

| **System action:** The Event Manager continues normal processing with the next event in queue.

Chapter 202. EQQEXnn messages

EQQEX01 - EQQEX08

EQQEX01I THE EXTERNAL ROUTER TASK HAS STARTED

Explanation: The external router task has successfully completed initialization. The external router task handles the interface to the operation-initiation exit, EQQUX009, which is used to start operations at user-defined destinations.

System action: The external router task processing continues.

User response: None.

EQQEX02I THE EXTERNAL ROUTER TASK HAS ENDED

Explanation: The external router task has ended either because the controller is in the process of shutting down or as a result of an operator modify command to terminate this task or a related task.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQEX03E THE EXTERNAL ROUTER TASK HAS ENDED DUE TO PROCESSING ERRORS

Explanation: The external router task has terminated due to processing errors.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

System programmer response: If the cause of the error is due to a problem in the operation-initiation exit, EQQUX009, correct the error and restart the controller. If the cause of the error cannot be determined, take a dump of the IBM Tivoli Workload Scheduler for z/OS address space, retain a copy of the message log and the job tracking data sets and contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Check the IBM Tivoli Workload Scheduler for z/OS message log and the dump data sets for additional information that describes the problem.

EQQEX04W NO ROUTING FOR USER DESTINATIONS IS IN EFFECT

Explanation: The external router task has not been able to load the operation-initiation exit, EQQUX009.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues. Operations at user-defined workstations are not started.

System programmer response: Determine why IBM Tivoli Workload Scheduler for z/OS was unable to find or load the operation-initiation exit, EQQUX009. When the problem has been corrected restart the controller.

User response: If the controller includes workstations with user-defined destinations, contact your system programmer.

EQQEX05E THE EXTERNAL ROUTER HAS TERMINATED DUE TO AN INITIALIZATION FAILURE

Explanation: The external router task could not acquire the resources required for normal operation.

System action: External router processing is terminated.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

User response: Contact your system programmer.

Problem determination: Review previous messages in the IBM Tivoli Workload Scheduler for z/OS message log.

EQQEX06E A SEVERE ERROR IN THE EXTERNAL ROUTER TASK HAS CAUSED ONE OR MORE REQUESTS TO BE LOST

Explanation: The external router task encountered an error processing elements on the EXAQ. As a result, at least one queue element has been lost.

System action: z/OS recovery/termination is requested to generate a dump. The external router task attempts to continue normal processing.

Programmer response: Save the message log, diagnostic and dump data sets, and contact IBM Software Support.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log data set, the EQQDUMP diagnostic data set, and the dump data set to determine the cause of the problem.

**EQQEX07E THE EXTERNAL ROUTER TASK
ABENDED WHILE PROCESSING THE
FOLLOWING REQUEST** *REQUEST*

Explanation: An abend prevented the external router task from processing a queue element.

System action: z/OS recovery/termination is requested to generate a dump. The external router task attempts to continue normal processing.

System programmer response: Save the message log, diagnostic and dump data sets, and contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log data set, the EQQDUMP diagnostic data set, and the dump data set to determine the cause of the problem.

**EQQEX08E THE EXTERNAL ROUTER TASK HAS
IGNORED THE FOLLOWING QUEUE
ELEMENT:** *REQUEST*

Explanation: The external router task has detected an invalid queue element on its queue.

System action: The element is discarded from the external router queue. The task continues normal processing.

System programmer response: Save the message log (EQQMLOG) and the current plan (EQQCPxDS) and contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log data set.

Chapter 203. EQQFnnn messages

EQQF000 - EQQF018

EQQF000E DATA ROUTER TASK HAS IGNORED AN INVALID QUEUE ELEMENT: *DQE*.

Explanation: A queue element did not contain the correct eye catcher or version number.

System action: The data router task does not process the invalid element, but continues normal processing.

System programmer response: Save the IBM Tivoli Workload Scheduler for z/OS message log and contact IBM Software Support.

User response: Contact your system programmer.

EQQF001I DATA ROUTER TASK INITIALIZATION IS COMPLETE.

Explanation: The data router task has successfully completed initialization.

System action: Data router task processing starts.

User response: None.

EQQF002E DATA ROUTER TASK INITIALIZATION FAILED.

Explanation: The data router task could not acquire the resources required for normal operation.

System action: Data router task processing is terminated.

System programmer response: Correct all errors and restart the data router task.

User response: Contact your system programmer.

Problem determination: Review previous messages in the IBM Tivoli Workload Scheduler for z/OS message log.

EQQF003E MEMBER *MEMBER* IS DEFINED AS A DESTINATION IN ROUTOPTS BUT IS STARTED AS A STANDBY SYSTEM.

Explanation: An XCF member has joined the same XCF group as the controller. This member was defined as a tracker in the ROUTOPTS but has been started as a IBM Tivoli Workload Scheduler for z/OS standby subsystem.

System action: IBM Tivoli Workload Scheduler for z/OS does not recognize the joined standby member as a destination. No communication takes place between the controller and the standby member.

System programmer response: Restart the standby system as a tracker or update the controller ROUTOPTS statement.

User response: Contact your system programmer.

Problem determination: Check the ROUTOPTS initialization statement and the initialization statement defined for the member.

EQQF004E DATA ROUTER TASK ABENDED WHEN PROCESSING THE FOLLOWING QUEUE ELEMENT *DQE*.

Explanation: An abend prevented the data router task from processing a queue element.

System action: z/OS recovery/termination is requested to generate a dump. The data router task attempts to continue normal processing.

System programmer response: Save the message log and dump data sets and contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log data set, the EQQDUMP data set, and the SYSMDUMP data set to determine the cause of the problem.

EQQF005E DATA ROUTER TASK QUEUE POINTERS ARE DESTROYED, RTRQ IS LOST.

Explanation: The data router task abended while processing elements on RTRQ because the queue chaining is invalid.

System action: z/OS recovery/termination is requested to generate a dump. All elements on RTRQ are skipped, but the data router task attempts to continue normal processing.

Programmer response: Save the message log and dump data sets and contact IBM Software Support.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log data set, the EQQDUMP data set, and the SYSMDUMP data set to determine the cause of the problem.

EQQF006I UNKNOWN XCF MEMBER *MEMBER* HAS JOINED THE GROUP. IT IS IGNORED.

Explanation: A member that is not defined in

ROUTOPTS has joined the XCF group.

System action: The controller ignores the joined member. No workload or event communication between the controller and the tracker takes place.

Programmer response: Verify that the tracker system has been defined with an XCF member name that corresponds to the definition in ROUTOPTS. Add the member name to ROUTOPTS and restart the controller.

Problem determination: Check the XCFOPTS initialization statement of the IBM Tivoli Workload Scheduler for z/OS tracker system and check the ROUTOPTS initialization statement of the controller.

EQQF007I XCF MEMBER MEMBER HAS JOINED THE GROUP. THE DESTINATION WILL BE REPORTED ACTIVE.

Explanation: A IBM Tivoli Workload Scheduler for z/OS tracker system has joined the same XCF group as the controller. The member is defined as an XCF destination in the ROUTOPTS initialization statement.

System action: The controller reports the destination as active. Work can be scheduled at workstations defining this destination.

User response: None

EQQF008I XCF MEMBER MEMBER HAS JOINED THE GROUP AS STANDBY FOR THE CONTROLLER.

Explanation: A IBM Tivoli Workload Scheduler for z/OS standby subsystem has joined the same group as the controller.

System action: Controller processing continues as normal.

User response: None

EQQF009I ADAPTIVE PACING ON EVENT INFLOW MODE.

Explanation: The *MODE* can be ACTIVATED or DEACTIVATED.

ACTIVATED

The data router has detected that the maximum number of queue elements on the event manager queue (MGRQ) were already in use when the data router task attempted to add incoming events to the MGRQ. The data router task has posted each locally attached event reader task and event writer task (when EWSEQNO(*n*)), to stop reading from the event data sets or adding to the DRTQ. The data router task has also built and sent a DQE request (type RTQ) to each remote (NCF or XCF) linked tracker, where the remote data router task posts each attached event reader

task and event writer task (when EWSEQNO(*n*)), to stop reading from the event data sets or adding to the DRTQ.

DEACTIVATED

The data router task has detected that the event manager has processed all events on the event manager queue (MGRQ), so the data router task has posted each locally attached event reader task and event writer task (when EWSEQNO(*n*)), to start reading from the event data sets or adding to the DRTQ. The data router task has also built and sent a DQE request (type RTQ) to each remote (NCF and/or XCF) linked tracker, where the remote data router task posts each attached event reader task and event writer task (when EWSEQNO(*n*)), to start reading from the event data sets or adding to the DRTQ.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None. This message is for information only.

EQQF010I INVALID RETURN CODE RETC FROM EQQUX009 IS IGNORED.

Explanation: User exit EQQUX009 passed an invalid return code back to the data router task. The return code is ignored.

System action: Normal processing continues. The return code is treated as return code 0.

System programmer response: Investigate why EQQUX009 returned an invalid return code.

User response: Inform your system programmer.

EQQF011E THE OPERATION INITIALIZATION EXIT USRX HAS ABENDED WHILE PROCESSING OPERATION OPN IN APPLICATION APPL WITH IA IA SCHEDULED ON WORKSTATION WSNAME. THE EXIT IS MARKED AS NOT USABLE.

Explanation: The exit abended while processing. IBM Tivoli Workload Scheduler for z/OS does not try to call it again unless the data router task is restarted. The exit is flagged as not executable.

System action: The current operation status is set according to what is specified in the SUBFAILACTION JTOPTS parameter.

System programmer response: Correct all errors in the exit and restart the data router task.

EQQF012I PROCESSING RETURN CODE RETC FROM EQQUX009.

Explanation: User exit EQQUX009 passed a return code, *RETC*, that is not 0. The data router task processes the return codes and continues normal processing.

System action: The return code is processed as follows:

- 4 The current operation status is set according to the value set in the SUBFAILACTION keyword of the JTOPTS initialization statement.
- 8 The operation status is set according to the value set in the SUBFAILACTION keyword of the JTOPTS initialization statement. All workstations specifying the destination are set to offline status.

System programmer response: Investigate why EQQUX009 returned the return code.

User response: Inform your system programmer.

EQQF013I EXIT EQQUX009 IS NOT LOADED OR HAS BEEN DISABLED.

Explanation: User exit EQQUX009 has not been loaded or has abended previously. The operations scheduled to run on a workstation that specifies a user-defined destination are routed.

System action: The operation status is set according to the value specified in the SUBFAILACTION keyword of the JTOPTS initialization parameter.

System programmer response: Investigate why EQQUX009 is not loaded. If a previous abend caused the exit to be disabled, correct the error and stop/start the IBM Tivoli Workload Scheduler for z/OS subsystem to get the exit reloaded.

User response: Issue a WSSTAT command, or use the workstation dialog, to vary the destination workstations offline.

EQQF014E THE EXTERNAL ROUTER QUEUE IS FULL. USER DESTINATION WILL BE SET TO OFFLINE STATUS.

Explanation: The external router queue is full. IBM Tivoli Workload Scheduler for z/OS sets the destination to offline status and sets the corresponding operation to the status specified in the SUBFAILACTION keyword of the JTOPTS initialization statement.

System action: The current operation status is set according to what is specified in the SUBFAILACTION JTOPTS parameter.

System programmer response: Investigate why the EQQUX009 exit is not processing.

EQQF015I XCF TYPE MEMBER MEMBER HAS LEFT THE GROUP. REASON: REASON.

Explanation: The XCF link to *TYPE* with member name *MEMBER* has been disconnected. The *REASON* is either that the linked IBM Tivoli Workload Scheduler for z/OS address space terminated or the entire scheduler system terminated.

System action: The transmission of data (such as event records) through the XCF link is postponed. The transmission of data resumes when the XCF member rejoins the group.

System programmer response: This is a IBM Tivoli Workload Scheduler for z/OS informational message.

If this message was expected and:

- The *TYPE* indicated *CONTROLLER* and message EQQW070I was also issued when the controller was restarted, you should consider increasing the size of the tracker's event data set.
- The *TYPE* indicated *TRACKER* and message EQQZ035I was also issued when the tracker was restarted, you should consider increasing the size of the ECSA buffer (SYS1.PARMLIB(IEFSSNxx)).

User response: Contact your system programmer.

Problem determination: If this message is not expected, review the message log (EQQMLOG) and the SYSLOG of the linked IBM Tivoli Workload Scheduler for z/OS *MEMBER* to determine the cause of the outage.

EQQF016E THE TCP/IP TASK QUEUE IS FULL. THE DESTINATION WILL BE SET TO OFFLINE STATUS.

Explanation: The TCP/IP queue is full.

System action: The scheduler sets the corresponding operation to the status specified in the SUBFAILACTION keyword of the JTOPTS initialization statement.

System programmer response: Try to find out why the TCP/IP task is not processing.

EQQF017E THE HTTP CLIENT TASK QUEUE IS FULL. THE DESTINATION WILL BE SET TO OFFLINE STATUS.

Explanation: The HTTP client task is full.

System action: The scheduler sets the corresponding operation to the status specified in the SUBFAILACTION keyword of the JTOPTS initialization statement.

System programmer response: Try to find out why the HTTP client task is not processing.

EQQF018E

EQQF018E DATA ROUTER TASK HAS IGNORED
THE FOLLOWING DQE ELEMENT
BECAUSE IT CONTAINS THE
INVALID DESTINATION *DEST: DQE*.

Explanation: A queue element contained a destination not present in the destination table.

System action: The data router task does not process the invalid element, but continues normal processing.

System programmer response: Save the IBM Tivoli Workload Scheduler for z/OS message log and contact IBM Customer Support.

User response: Check your ROUTOPTS statements for the missing destination.

Chapter 204. EQQFxxx messages

EQQFA00 - EQQFV43

EQQFA00E VSAM ERROR FUNC: *FUNC RC: RC*
REASON: *REASON*

Explanation: A VSAM operation failed. *FUNC* specifies which kind of operation, for example, OPEN, CLOSE, and so on. *RC* and *REASON* are the VSAM return and reason codes.

System action: If the VSAM error could not be bypassed the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information. This file contains a copy of the control block.

EQQFA01E BAD CONTROL BLOCK REASON: -
REASON: *REASON*

Explanation: This message describes an internal error of the Data Store and is addressed to IBM Software Support. The first field of the specified control block is invalid. It does not contain the name of the control block.

System action: The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a

solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information. This file contains a copy of the control block.

EQQFA02E BAD INSTANCE - REASON: *REASON*

Explanation: This message describes an internal error of the Data Store and is addressed to IBM Software Support. The specified instance address for the called service is invalid.

System action: The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information.

EQQFA03E BAD PARAMETER - REASON:
REASON

Explanation: This message describes an internal error of the Data Store and is addressed to IBM Software Support. One or more parameters passed to a called service are invalid.

System action: The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/>

support. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information. This file contains a copy of the value of the invalid parameter.

EQQFA04E BAD REQUEST - REASON: REASON

Explanation: This message describes an internal error of the Data Store and is addressed to IBM Software Support. The specified address for the control block is invalid.

System action: The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information. This file contains the value of the invalid request field.

EQQFA05E BAD SYSOUT DATABASE - REASON: REASON

Explanation: Generally there is a mismatch between the primary keys data set and data files, for example, the Data Store was started without all the previously-used data files and containing the sysout listed by the primary key file.

System action: The Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: Check that, when the Data Store was started, it was pointing to the correct primary key and data files. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the

information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information.

EQQFA06E IS EMPTY - REASON: REASON

Explanation: This message describes an internal error of the Data Store and is addressed to IBM Software Support. An internal objects list was found to be empty.

System action: The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information.

EQQFA07E NOT FOUND - REASON: REASON

Explanation: This message describes an internal error of the Data Store and is addressed to IBM Software Support. An internal object was not found by a search operation.

System action: The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a

| solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Refer to the dump data set (ddname EQQDUMP) for further information.

| **EQQFA08E NOT INITIALIZED - REASON:**
| *REASON*

| **Explanation:** This message describes an internal error of the Data Store and is addressed to IBM Software Support. A data file was not found in an initialized state.

| **System action:** The Data Store is terminated See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

| **System programmer response:** If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Refer to the dump data set (ddname EQQDUMP) for further information.

| **EQQFA10E DETACH ERROR - REASON:** *REASON*

| **Explanation:** This message describes an internal error of the Data Store and is addressed to IBM Software Support. An error occurred when the Data Store attempted to detach a subtask.

| **System action:** The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

| **System programmer response:** If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Review earlier messages in

| the Data Store message log and SYSLOG data sets to determine the cause of the error.

| **EQQFA11E NOT ACTIVE - REASON:** *REASON*

| **Explanation:** This message describes an internal error of the Data Store and is addressed to IBM Software Support. A component that should be active was found in an inactive state.

| **System action:** The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

| **System programmer response:** If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Refer to the dump data set (ddname EQQDUMP) for further information.

| **EQQFA12E NOT READY - REASON:** *REASON*

| **Explanation:** This message describes an internal error of the Data Store and is addressed to IBM Software Support. A data file or primary index was found not ready to be used, for example, not logically open.

| **System action:** The Data Store is terminated

| **System programmer response:** If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Refer to the dump data set (ddname EQQDUMP) for further information.

| **EQQFA13E INTERNAL ERROR - REASON:**
| *REASON*

| **Explanation:** This message describes an internal error of the Data Store and is addressed to IBM Software

| Support. This is a generic internal failure of the
| Database task. It can occur during the shutdown of the
| Data Store and indicates an internal mismatch. No data
| is lost, but its handling can be deferred to the next
| startup of the Data Store.

| **System action:** The Data Store is terminated. See
| Chapter 234, "Reason codes," on page 1417 for a list of
| the *REASON* codes.

| **System programmer response:** If the problem persists,
| search the IBM Support database for a solution at
| [http://www.ibm.com/software/sysmgmt/products/](http://www.ibm.com/software/sysmgmt/products/support)
| support. If you do not find any information, for the
| information to collect, see the *Diagnosis Guide and*
| *Reference* manual, Chapter 3. Problem analysis
| procedures, section "Information needed for all
| problems, sub-section "Information to collect for data
| store problems". Search the IBM Support database for a
| solution at [http://www.ibm.com/software/sysmgmt/](http://www.ibm.com/software/sysmgmt/products/support)
| products/support.

| **Problem determination:** Refer to the dump data set
| (ddname EQQDUMP) for further information.

| **EQQFA14E BAD DATA - REASON: REASON**

| **Explanation:** This message describes an internal error
| of the Data Store and is addressed to IBM Software
| Support. A data file or a storage area was found in a
| corrupted state.

| **System action:** The involved Data Store task is closed.
| If the involved task is either the JES Queue or the
| Database task, the Data Store is terminated. See
| Chapter 234, "Reason codes," on page 1417 for a list of
| the *REASON* codes.

| **System programmer response:** Use the Recover utility
| to recover the corrupted data file or use the Export
| utility to make a copy of the previous backup copy.
| After the recovery operation, if the problem persists,
| search the IBM Support database for a solution at
| [http://www.ibm.com/software/sysmgmt/products/](http://www.ibm.com/software/sysmgmt/products/support)
| support. If you do not find any information, for the
| information to collect, see the *Diagnosis Guide and*
| *Reference* manual, Chapter 3. Problem analysis
| procedures, section "Information needed for all
| problems, sub-section "Information to collect for data
| store problems". Search the IBM Support database for a
| solution at [http://www.ibm.com/software/sysmgmt/](http://www.ibm.com/software/sysmgmt/products/support)
| products/support.

| **User response:** Contact your system programmer.

| **Problem determination:** Refer to the dump data set
| (ddname EQQDUMP) for further information.

EQQFA17E COMMAND ERROR

Explanation: This message describes an internal error
of the Data Store and is addressed to IBM Software
Support. An internal error was detected while
analyzing a modify comamnd.

System action: The modify command is ignored.

User response: Resubmit the modify command with
the correct syntax.

EQQFA18E STOP IN PROGRESS

Explanation: The Data Store has received a command
while closing all the subtasks.

System action: The stop command is ignored.

EQQFA19E COMMAND SYNTAX ERROR

Explanation: The modify command is syntactically
incorrect.

System action: The modify command is ignored.

User response: Resubmit the modify command with
the correct syntax.

| **EQQFA20E NOT OPEN - REASON: REASON**

| **Explanation:** This message describes an internal error
| of the Data Store and is addressed to IBM Software
| Support. A read or write operation was attempted on a
| data file or index that was not previously opened.

| **System action:** The Data Store is terminated. See
| Chapter 234, "Reason codes," on page 1417 for a list of
| the *REASON* codes.

| **System programmer response:** If the problem persists,
| search the IBM Support database for a solution at
| [http://www.ibm.com/software/sysmgmt/products/](http://www.ibm.com/software/sysmgmt/products/support)
| support. If you do not find any information, for the
| information to collect, see the *Diagnosis Guide and*
| *Reference* manual, Chapter 3. Problem analysis
| procedures, section "Information needed for all
| problems, sub-section "Information to collect for data
| store problems". Search the IBM Support database for a
| solution at [http://www.ibm.com/software/sysmgmt/](http://www.ibm.com/software/sysmgmt/products/support)
| products/support.

| **User response:** Contact your system programmer.

| **Problem determination:** Refer to the dump data set
| (with ddname EQQDUMP) for further information.

| **EQQFA21E ERROR IN RPL GENERATION FOR
| VSAM ACCESS - REASON: REASON**

| **Explanation:** During an RPL generation, the DIV
| macro returns an error.

| **System action:** The Data Store is terminated. See
| Chapter 234, "Reason codes," on page 1417 for a list of
| the *REASON* codes.

| **System programmer response:** If possible correct all
| errors and restart the Data Store. If the problem
| persists, search the IBM Support database for a solution
| at [http://www.ibm.com/software/sysmgmt/products/](http://www.ibm.com/software/sysmgmt/products/support)
| support. If you do not find any information, for the

information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Review earlier messages in the Data Store message log and SYSLOG data sets to determine the cause of the error. One possibility is that there is a DFP error in the Data Store data files or indexes.

EQQFA22E ERROR IN POINT OPERATION ON VSAM FILE - REASON: REASON

Explanation: During a Point operation, the DIV macro returns an error.

System action: The Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If possible correct all errors and restart the Data Store. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Review earlier messages in the Data Store message log and SYSLOG data sets to determine the cause of the error. One possibility is that there is a DFP error in the Data Store data files or indexes.

EQQFA24E VSAM LOGICAL ERROR IN GET - REASON: REASON

Explanation: During a Get operation, the DIV macro returns an error.

System action: The Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If possible correct all errors and restart the Data Store. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all

problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Review earlier messages in the Data Store message log and SYSLOG data sets to determine the cause of the error. One possibility is that there is a DFP error in the Data Store data files or indexes.

EQQFA25E VSAM PHYSICAL ERROR IN GET - REASON: REASON

Explanation: During a Get operation, the DIV macro returns an error.

System action: The Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If possible correct all errors and restart the Data Store. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Review earlier messages in the Data Store message log and SYSLOG data sets to determine the cause of the error. One possibility is that there is a DFP error in the Data Store data files or indexes.

EQQFA26E NO PARAMETER PASSED - REASON: REASON

Explanation: This message describes an internal error of the Data Store and is addressed to IBM Software Support. A calling function did not pass all the required parameters to the called function.

System action: The Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a

| solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Refer to the dump data set (ddname EQQDUMP) for further information.

EQQFA27E INCORRECT PARAMETER IN MODIFY COMMAND

Explanation: The command could not be processed because one or more parameters on that command could not be recognized or are out of range.

System action: The command is ignored.

User response: Change the Modify command and resubmit the command.

| **EQQFA28E TRANSMISSION ERROR FROM COMMUNICATION - REASON: REASON**

| **Explanation:** This message describes an internal error of the Data Store and is addressed to IBM Software Support. There was a generic transmission error in the communication subtask.

| **System action:** The requested data cannot be transmitted. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

| **System programmer response:** If possible correct all the errors and restart the Data Store. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Review earlier messages in the Data Store message log and SYSLOG data sets to determine the cause of the error. One possible reason is a communication failure in the SNA or the XCF communication task due to system resource definition or an unavailable resource.

EQQFA30E BAD STATUS - REASON: REASON

Explanation: This message describes an internal error of the Data Store and is addressed to IBM Software Support. An internal object was found in a corrupted state.

System action: The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See

Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: Contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information.

| **EQQFA32E BAD PAGE - REASON: REASON**

| **Explanation:** This message describes an internal error of the Data Store and is addressed to IBM Software Support. The database component detected a data page in a corrupted state.

| **System action:** The Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

| **System programmer response:** Use the Recover utility to recover the corrupted data file or use the Export utility to make a copy of the previous backup copy. After the recovery operation, if the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Refer to the dump data set (ddname EQQDUMP) for further information.

EQQFA34E NO SPACE AVAILABLE - REASON: REASON

Explanation: There is no more space available in a data file or an index file.

System action: The involved Database data file subtask is closed. Data Store processing continues using the other data files. If this was the last available data file, the Data Store is terminated.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information. The data files or the index files, or both, should be reallocated with more space and the old data files should be copied using the IDCAMS Repro utility or the Data Store Export/Import utility.

EQQFA36E ERROR DURING ENQUEUE - REASON: REASON

Explanation: This message describes an internal error of the Data Store and is addressed to IBM Software Support. An enqueue operation failed.

System action: The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information.

EQQFA37E ALREADY RESERVED - REASON: REASON

Explanation: This message describes an internal error of the Data Store and is addressed to IBM Software Support. The Data Store attempted to reserve a message that was already reserved for processing.

System action: The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information.

EQQFA39E ERROR IN ACB GENERATION FOR VSAM ACCESS - REASON: REASON

Explanation: During an ACB generation, the macro returns an error.

System action: The Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If possible correct all errors and restart the Data Store. If the error persists, contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Review earlier messages in the Data Store message log and SYSLOG data sets to determine the cause of the error. One possibility is that there is a DFP error in the Data Store data files or indexes.

EQQFA42E NO DD FOUND - REASON: REASON

Explanation: In the Data Store startup procedure, all the ddnames and the files that are necessary for Data Store life were not specified.

System action: The Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

User response: Check the Data Store start up procedure.

Problem determination: Refer to the *Planning and Installation Guide* for correct definitions of files.

EQQFA43E VSAM OPEN ERROR - REASON: REASON

Explanation: During an Open operation, the macro returns an error.

System action: The Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If possible correct all errors and restart the Data Store. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Review earlier messages in the Data Store message log and SYSLOG data sets to determine the cause of the error. One possibility is that

| there is a DFP error in the Data Store data files or
| indexes.

| **EQQFA44E** **GENERIC I/O ERROR - REASON:**
| *REASON*

| **Explanation:** During an I/O operation, an error was
| detected.

| **System action:** The involved Data Store task is closed.
| If the involved task is either the JES Queue or the
| Database task, the Data Store is terminated. See
| Chapter 234, "Reason codes," on page 1417 for a list of
| the *REASON* codes.

| **System programmer response:** If possible correct all
| errors and restart the Data Store. If the problem
| persists, search the IBM Support database for a solution
| at [http://www.ibm.com/software/sysmgmt/products/](http://www.ibm.com/software/sysmgmt/products/support)
| support. If you do not find any information, for the
| information to collect, see the *Diagnosis Guide and*
| *Reference* manual, Chapter 3. Problem analysis
| procedures, section "Information needed for all
| problems, sub-section "Information to collect for data
| store problems". Search the IBM Support database for a
| solution at [http://www.ibm.com/software/sysmgmt/](http://www.ibm.com/software/sysmgmt/products/support)
| products/support.

| **User response:** Contact your system programmer.

| **Problem determination:** Review earlier messages in
| the Data Store message log and SYSLOG data sets to
| determine the cause of the error. One possibility is that
| there is a DFP error in the Data Store data files or
| indexes.

| **EQQFA45E** **ATTACH ERROR - REASON:** *REASON*

| **Explanation:** This message describes an internal error
| of the Data Store and is addressed to IBM Software
| Support. An error occurred when the Data Store
| attempted to attach a subtask.

| **System action:** The involved Data Store task is closed.
| If the involved task is either the JES Queue or the
| Database task, the Data Store is terminated. See
| Chapter 234, "Reason codes," on page 1417 for a list of
| the *REASON* codes.

| **System programmer response:** If possible correct all
| errors and restart the Data Store. If the problem
| persists, search the IBM Support database for a solution
| at [http://www.ibm.com/software/sysmgmt/products/](http://www.ibm.com/software/sysmgmt/products/support)
| support. If you do not find any information, for the
| information to collect, see the *Diagnosis Guide and*
| *Reference* manual, Chapter 3. Problem analysis
| procedures, section "Information needed for all
| problems, sub-section "Information to collect for data
| store problems". Search the IBM Support database for a
| solution at [http://www.ibm.com/software/sysmgmt/](http://www.ibm.com/software/sysmgmt/products/support)
| products/support.

| **User response:** Contact your system programmer.

| **Problem determination:** Review earlier messages in

| the Data Store message log and SYSLOG data sets to
| determine the cause of the error. One possibility is that
| the Data Store is being started in a region that is too
| small.

| **EQQFA46E** **UNEXPECTED TASK END - REASON:**
| *REASON*

| **Explanation:** A Data Store subtask ended
| unexpectedly.

| **System action:** The involved Data Store task is closed.
| If the involved task is either the JES Queue or the
| Database task, the Data Store is terminated. See
| Chapter 234, "Reason codes," on page 1417 for a list of
| the *REASON* codes.

| **System programmer response:** If the problem persists,
| search the IBM Support database for a solution at
| [http://www.ibm.com/software/sysmgmt/products/](http://www.ibm.com/software/sysmgmt/products/support)
| support. If you do not find any information, for the
| information to collect, see the *Diagnosis Guide and*
| *Reference* manual, Chapter 3. Problem analysis
| procedures, section "Information needed for all
| problems, sub-section "Information to collect for data
| store problems". Search the IBM Support database for a
| solution at [http://www.ibm.com/software/sysmgmt/](http://www.ibm.com/software/sysmgmt/products/support)
| products/support.

| **User response:** Contact your system programmer.

| **Problem determination:** Refer to the dump data set
| (ddname EQQDUMP) for further information.

| **EQQFA47E** **ERROR DURING DYNALLOC**
| **(ALLOCATION) - REASON:** *REASON*

| **Explanation:** There was an error during a Dynalloc
| operation.

| **System action:** The involved Data Store task is closed.
| If the involved task is either the JES Queue or the
| Database task, the Data Store is terminated. See
| Chapter 234, "Reason codes," on page 1417 for a list of
| the *REASON* codes.

| **System programmer response:** If the problem persists,
| search the IBM Support database for a solution at
| [http://www.ibm.com/software/sysmgmt/products/](http://www.ibm.com/software/sysmgmt/products/support)
| support. If you do not find any information, for the
| information to collect, see the *Diagnosis Guide and*
| *Reference* manual, Chapter 3. Problem analysis
| procedures, section "Information needed for all
| problems, sub-section "Information to collect for data
| store problems". Search the IBM Support database for a
| solution at [http://www.ibm.com/software/sysmgmt/](http://www.ibm.com/software/sysmgmt/products/support)
| products/support.

| **User response:** Contact your system programmer.

| **Problem determination:** Refer to the dump data set
| (ddname EQQDUMP) for further information.

EQQFA48E ERROR DURING SSI REQUEST - REASON: REASON

Explanation: There was an error during a Dynalloc operation.

System action: The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information.

EQQFA49E ERROR DURING DYNALLOC (UNALLOCATION) - REASON: REASON

Explanation: This message describes an internal error of the Data Store and is addressed to IBM Software Support. An error was detected when a Subsystem Interface function was invoked.

System action: The Data Store is terminated. See Chapter 234, "Reason codes," on page 1417 for a list of the *REASON* codes.

System programmer response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Refer to the dump data set (ddname EQQDUMP) for further information.

EQQFA70E NO VALUE ASSIGNED TO SYSDEST PARAMETER

Explanation: You must specify a valid output destination value in the SYSDEST parameter of DSTOPTS because there is no default value..

System action: Data store does not start.

User response: Check the command. Correct the error and resubmit the request.

EQQFA71E SYSDEST IS MANDATORY IN DSTOPTS OPTIONS

Explanation: You must specify the SYSDEST (sysout destination reserved for data store) parameter in DSTOPTS.

System action: Data store does not start.

User response: Check the command. Correct the error and resubmit the request.

EQQFA72W HDRJOBNAME PARAMETER NOT SPECIFIED DEFAULTED TO "JOBNAME"

Explanation: You did not specify the HDRJOBNAME parameter in DSTOPTS. It has been defaulted to "JOBNAME"

System action: Data store continues processing.

User response: None.

EQQFA73W HDRSTEPNAME PARAMETER NOT SPECIFIED DEFAULTED TO "STEPNAME"

Explanation: You did not specify the HDRSTEPNAME parameter in DSTOPTS. It has been defaulted to "STEPNAME".

System action: Data store continues processing.

User response: None.

EQQFA74W HDRPROCNAME PARAMETER NOT SPECIFIED DEFAULTED TO "PROCSTEP"

Explanation: You did not specify the HDRPROCNAME parameter in DSTOPTS. It has been defaulted to "PROCSTEP".

System action: Data store continues processing.

User response: None.

EQQFA75W HDRJOBLENGTH PARAMETER NOT SPECIFIED DEFAULTED TO 21

Explanation: You did not specify the HDRJOBLENGTH parameter in DSTOPTS. It has been defaulted to 21.

System action: Data store continues processing.

User response: None.

EQQFA76W HDRSTEPLength PARAMETER NOT SPECIFIED DEFAULTED TO 30

Explanation: You did not specify the HDRSTEPLength parameter in DSTOPTS. It has been defaulted to 30.

System action: Data store continues processing.

User response: None.

EQQFA77W HDRPROCLength PARAMETER NOT SPECIFIED DEFAULTED TO 39

Explanation: You did not specify the HDRPROCLength parameter in DSTOPTS. It has been defaulted to 39.

System action: Data store continues processing.

User response: None.

EQQFA78E AN INVALID VALUE WAS ASSIGNED TO SYSDEST PARAMETER

Explanation: You have specified an invalid value for the SYSDEST parameter of the DSTOPTS option. It must be a valid z/OS name.

System action: Data store does not start.

User response: Check the command. Correct the error and resubmit the request.

EQQFA7AW MAXUNPAGES PARM NOT SPECIFIED OR OUT OF RANGE DEFAULTED TO 4096

Explanation: The MAXUNPAGES parameter was not specified in DSTOPTS, or its value is out of range. It has been defaulted to 4096.

System action: Data store continues processing.

User response: None.

EQQFA7BW SMSMODDELETE PARAM NOT SPECIFIED DEFAULTED TO NO

Explanation: The SMSMODDELETE parameter was not specified in DSTOPTS. It was defaulted to NO.

System action: Data store continues processing.

User response: None.

EQQFA81I THE DSTHIGHJOBID VALUE USED NEEDS MVS 64K JOBID SUPPORT

Explanation: The DSTHIGHJOBID value is greater than 65534. The MVS system must support >64K Jobid values.

System action: Data store continues processing.

EQQFA82E CTLHOSTNAME IS MANDATORY WHEN HOSTCON(TCP) IS SPECIFIED.

Explanation: If you select the TCP/IP connection type, you must specify the CTLHOSTNAME parameter.

System action: The Data Store does not start.

User response: Correct the DSTOPTS initialization statement and restart the Data Store.

EQQFA83W CTLPORTNUMBER NOT SPECIFIED OR OUT OF RANGE (0:65535) DEFAULTED TO 423.

Explanation: The CTLPORTNUMBER parameter is invalid or missing.

System action: The Data Store processing continues using the default value for CTLPORTNUMBER parameter.

EQQFAR1I WAITING FOR SUBTASK COMPLETION TASKNAME

Explanation: The Data Store is waiting for a subtask completion. This message can occur during the Data Store shut down.

System action: None.

User response: None.

EQQFAR2E TASKNAME TASK ABENDED - RETURN: REASON

Explanation: The task specified *TASKNAME* has abended with reason *REASON* or is terminated unexpectedly.

System action: The involved Data Store task is closed. If the involved task is either the JES Queue or the Database task, the Data Store is terminated. If the involved task is WRITER and the RETURN value is 00001000, see message EQQFJKME.

System programmer response: If possible correct all errors and restart the Data Store. If the error persists, contact IBM Software Support.

User response: If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Review earlier messages in the Data Store message log and SYSLOG data sets to determine the cause of the error. One possibility is that

| the Data Store is being started in a region that is too
| small.

EQQFAR3I ALL WRITER SUBTASKS ARE CLOSED

Explanation: All active writer subtasks are now closed.

System action: The Data Store is not able to store sysout until a minimum of one writer is restarted. To start some of them, issue the ARMDWR modify command.

EQQFAR4I DATA STORE ENDED

Explanation: All Data Store subtasks have terminated. The Data Store subsystem is starting its own termination process.

System action: The Data Store subsystem frees all acquired resources and is terminated.

EQQFAR5W RETRYCOUNTER PARM INVALID OR NOT SPECIFIED: DEFAULTED TO 1

Explanation: The RETRYCOUNTER value is invalid or missing. A default value of 1 will be used.

System action: Data store continues processing.

EQQFAR6E INVALID COMBINATION OF COMMUNICATION PARAMETERS

Explanation: The combination of communication parameters is invalid, for example, you have specified both HOSTCON(SNA) and CTLMEM.

System action: The Data Store does not start.

EQQFAR7W FAILDEST PARM NOT SPECIFIED: DEFAULTED TO FAILDEST

Explanation: The FAILDEST parameter was not specified. Default value *FAILDEST* will be used.

System action: Data store continues processing.

EQQFAR8I DATA STORE STATISTICS

Explanation: A modify command, /F procname,ARSTGN or /F procname,ARSTKW 0=[owner],K=[keyword], has been issued and the data store shows internal statistics values. This message is followed by one or more EQQFAR9I messages.

System action: Data store statistics are displayed

User response: None

EQQFAR9I DATA STORE STATISTICS NOT EVALUATED YET

Explanation: A modify command, /F procname,ARSTGN or /F procname,ARSTKW 0=[owner],K=[keyword], has been issued but the data store does not have any statistic value to display.

System action: Data store continues processing.

User response: None.

EQQFARAI DATA STORE TASKNAME TASK ACTIVE

Explanation: The task indicated by *TASKNAME* has been successfully started and is active.

System action: The Data Store continues processing.

EQQFARBE A COMMUNICATION METHOD MUST BE SPECIFIED (SNA / XCF)

Explanation: You must specify one of the two methods for communication in DSTOPTS via the HOSTCON keyword.

System action: The Data Store does not start.

EQQFARCE DSTLUNAM / CTLLUNAM ARE MANDATORY WHEN HOSTCON(SNA) IS SPECIFIED

Explanation: If HOSTCON(SNA) is required, you must specify both DSTLUNAM and CTLLUNAM.

System action: The Data Store does not start.

EQQFARDE DSTGROUP / DSTMEM / CTLMEM ARE MANDATORY WHEN HOSTCON(XCF) IS SPECIFIED

Explanation: If HOSTCON(XCF) is required, you must specify all the three parameters.

System action: The Data Store does not start.

EQQFAREE SYSCON IS MANDATORY IN DSTOPTS OPTIONS

Explanation: You must specify the SYSCON (sysout class reserved for Data Store) parameter in DSTOPTS.

System action: The Data Store does not start.

EQQFARFW NWRITER PARM NOT SPECIFIED OR OUT OF RANGE (1:16): DEFAULTED TO 1

Explanation: The NWRITER (number of writer tasks) parameter was invalid or not specified. The number of writers was defaulted to 1.

System action: The Data Store continues processing.

EQQFARGW • EQQFARQE

EQQFARGW MAXSTOL PARM NOT SPECIFIED
OR OUT OF RANGE (0:10000):
DEFAULTED TO 0

Explanation: The MAXSTOL (maximum number of sysout lines stored in SysDb) parameter was invalid or not specified. The maximum number of stored lines was defaulted to 0.

System action: The Data Store continues processing.

EQQFARHW MAXSYSL PARM NOT SPECIFIED
OR OUT OF RANGE (0:10000):
DEFAULTED TO 0

Explanation: The MAXSYSL (maximum number of sysout lines returned to the Controller) parameter was invalid or not specified. The maximum number of sysout lines was defaulted to 0.

System action: The Data Store continues processing.

EQQFARIW QTIMEOUT PARM NOT SPECIFIED
OR OUT OF RANGE (0:10000):
DEFAULTED TO 15

Explanation: The QTIMEOUT (timeout system reader) parameter was invalid or not specified. The timeout system reader was defaulted to 15.

System action: The Data Store continues processing.

EQQFARJE DSTHIGHJOBID PARM MUST BE
GREATER THAN DSTLOWJOBID
PARM.

Explanation: You have specified a value for the DSTHIGHJOBID parameter that is lower than the value of the DSTLOWJOBID parameter.

System action: The Data Store does not start.

EQQFARKI DATA STORE STATISTICS NOT
EVALUATED YET

Explanation: A modify command, /F procname,ARSTGN or /F procname,ARSTKW 0=[owner],K=[keyword], has been issued but the Data Store doesn't have any statistic value to display.

System action: Data Store continues processing.

User response: None

EQQFARKW RETRYCOUNTER PARM INVALID
OR NOT SPECIFIED: DEFAULTED TO
1

Explanation: The RETRYCOUNTER value is invalid or missing. Default value 1 will be used.

System action: Data Store continues processing.

EQQFARLW CINTERVAL PARM NOT SPECIFIED
OR OUT OF RANGE (0:1440):
DEFAULTED TO 0

Explanation: The CINTERVAL (interval time in minutes for cleanup) parameter was invalid or not specified. The interval time for cleanup was defaulted to 0.

System action: The Data Store continues processing.

EQQFARMW WINTERVAL PARM NOT SPECIFIED
OR OUT OF RANGE (0:3600):
DEFAULTED TO 30

Explanation: The WINTERVAL (interval time in seconds for writer) parameter was invalid or not specified. The interval time for writer was defaulted to 30.

System action: The Data Store continues processing.

EQQFARNW DELAYTIME PARM NOT SPECIFIED
OR OUT OF RANGE (0:1440):
DEFAULTED TO 1

Explanation: The DELAYTIME (maximum delay for job permanence in JES queue) parameter was invalid or not specified. The parameter was defaulted to 1.

System action: The Data Store continues processing.

EQQFAROE REQDEFCLASS MUST BE DIFFERENT
FROM SYSCCLASS

Explanation: The REQDEFCLASS (default class for queue) parameter must be different from the SYSCCLASS (sysout class reserved for Data Store) parameter.

System action: The Data Store does not start.

EQQFARPE UNABLE TO START TASK BECAUSE
IT IS ALREADY ACTIVE

Explanation: An operator START command has been entered for a Data Store task that is already active.

System action: The second attempt is terminated.

System programmer response: If you want to restart the task, first stop it, and then issue the START command.

EQQFARQE SYSDDEST SPECIFIES A DESTINATION
ALREADY IN USE BY ANOTHER
DATA STORE

Explanation: A Data Store has been started with a destination that is assigned to another active Data Store.

System action: The second Data Store is terminated.

System programmer response: If you want to restart the second Data Store, first change the SYSDEST in the initialization parameters.

EQQFARRI SUBTASK *TASKNAME* DIAGNOSE HAS BEEN ACTIVATED

Explanation: The diagnose trace for subtask *TASKNAME* has been activated

System action: The activities of subtask *TASKNAME* are now traced.

EQQFARSI SUBTASK *TASKNAME* DIAGNOSE HAS BEEN DE-ACTIVATED

Explanation: The diagnose trace for subtask *TASKNAME* has been deactivated.

System action: The activities of subtask *TASKNAME* are now traced.

EQQFARTW CLNPARM PARM NOT SPECIFIED DEFAULTED TO EQQCLNPA

Explanation: The CLNPARM (cleanup options member name) parameter was not specified. The cleanup options member name was defaulted to EQQCLNPA.

System action: The Data Store continues processing.

EQQFARUW STORESTRUCMETHOD PARM NOT SPECIFIED DEFAULTED TO IMMEDIATE.

Explanation: You did not specify a value for storestrucmethod parameter. The allowed values are :

Delayed- Structured information will be archived only on demand, that is when requested by controller.

Immediate- Structured information will be archived as soon as possible, when a writer task will be available.

System action: Value is defaulted to immediate. Processing continues.

User response: None

EQQFARVW DSTREQUEUEDEF PARM NOT SPECIFIED DEFAULTED TO ASIS

Explanation: The DSTREQUEUEDEF parameter was not specified. The parameter was defaulted to ASIS.

System action: The Data Store continues processing.

EQQFARWE STORESTRUCMETHOD (DELAYED) NEEDS STOUNSD (YES)

Explanation: If you specify storestrucmethod as delayed you must set *STOUNSD* to yes, because delayed method needs to find the *JOBLOG* into the

UDF files in order to extract the structured data.

System action: Processing is terminated.

User response: Set *STOUNSD* to yes and check that the UDFXX files are allocated and specified into the data store start JCL.

EQQFARXE INVALID VALUE SPECIFIED FOR STORESTRUCMETHOD PARAMETER.

Explanation: If you specify an invalid value for parameter storestrucmethod. The allowed values are:

Delayed- Structured information will be archived only on demand, that is when requested by controller.

Immediate- Structured information will be archived as soon as possible, when a writer task will be available.

System action: Processing is terminated.

User response: Set a valid value.

EQQFARYI DSTLOWJOBID PARM NOT SPECIFIED, DEFAULTED TO 1

Explanation: The DSTLOWJOBID parameter was invalid or not specified. The parameter was defaulted to 1.

System action: The Data Store continues processing.

EQQFARZI DSTHIGHJOBID PARM NOT SPECIFIED, OR INVALID DEFAULTED TO *hjobid*

Explanation: The DSTHIGHJOBID parameter was not valid or not specified. The parameter was defaulted to the *hjobid* value, where *hjobid* is one of the following:

- 65534, if the value of DSTHIGHJOBID is greater than 65534
- 9999 otherwise

System action: Data store continues processing

EQQFCC0E DATA STORE COMMUNICATION TASK INITIALIZATION FAILED

Explanation: The Communication task could not acquire all the resources needed for normal operation.

System action: The Communication task is not started.

System programmer response: Correct the errors and restart the communication task.

Problem determination: Review earlier messages in the Data Store message log to determine the cause of the error.

EQQFCC1I DATA STORE COMMUNICATION TASK INITIALIZATION ENDED

Explanation: The Communication task has successfully completed its initialization.

System action: Communication processing starts.

EQQFCC2I DATA STORE COMMUNICATION TASK ENDED

Explanation: The Communication processing has been completed and control is returned to the Data Store subsystem.

System action: The Communication task is terminated.

EQQFCC3I STARTING FN APPLICATION

Explanation: The Data Store FN task has received control from the Data Store communication subtask and is soon to start initialization processing.

System action: Data Store FN processing continues.

EQQFCC4I CLOSING FN APPLICATION

Explanation: The Data Store FN processing has been completed and control is returned to the Data Store communication task.

System action: Data Store FN processing is terminated.

EQQFCC5E FN APPLICATION DOES NOT RESPOND

Explanation: After a close request issued by the Data Store communication task, the Data Store FN subtask does not respond.

System action: The system waits until the subtask is closed.

User response: Correct the errors shown in the message and restart the **std** task.

Problem determination: Check for problems in the communication VTAM or TCP/IP settings of the system where the data store runs. C

EQQFCC6I XCF COMMUNICATION WITH CONTROLLER MEMBER MEMBER IS OFFLINE

Explanation: The member *MEMBER* of the XCF communication with the Controller is offline.

System action: The Data Store cannot communicate with the Controller.

User response: Check if the Controller is active or if there are some problems in the XCF connections. One possibility is that either CTLMEM or DSTGROUP is

incorrectly specified in the DSTOPTS initialization statement.

EQQFCC7I UNABLE TO SEND MESSAGE: CONTROLLER XCF MEMBER MEMBER IS OFFLINE

Explanation: The XCF Controller member *MEMBER* is offline.

System action: The Data Store cannot communicate with the Controller: sysout cannot be sent back to it.

User response: Check if the Controller is active or if there are some problems in the XCF connections. One possibility is that CTLMEM is incorrectly specified in the DSTOPTS initialization statement.

EQQFCC9I XCF MEMBER MEMBER HAS JOINED THE GROUP GROUP

Explanation: A data store or controller FL subtask has joined the XCF group as defined in the DSTOPTS or FLOPTS statements.

System action: None

User response: None.

EQQFCCA I STARTING XCF JOIN

Explanation: The join process between the Data Store and XCF has been started.

System action: Normal processing continues.

EQQFCCBI UNABLE TO RETRIEVE JOB JOBNAME: READER TASK INACTIVE

Explanation: The Controller requested the retrieval of the JOB *JOBNAME* to the Data Store, but the Data Store Reader subtask is not active. The retrieval cannot be performed.

System action: The request is rejected. Data Store normal processing continues.

User response: Start the reader task and resubmit the request.

EQQFCCCI STARTING TCP/IP COMMUNICATION TASK FOR DATA STORE (ID TASK).

Explanation: The ID task started the initialization process.

System action: The processing continues.

EQQFCCDE TCP/IP COMMUNICATION TASK FOR DATA STORE DOES NOT RESPOND (ID TASK).

Explanation: After a close request issued by the Data

Store communication task, the ID task does not respond.

System action: The system waits until the subtask is closed.

User response: Correct the errors shown by the earlier messages and restart the **std** task.

Problem determination: Check for problems in the TCP/IP settings of the system where the data store runs.

EQQFCCEI CLOSING TCP/IP COMMUNICATION TASK FOR DATA STORE (ID TASK).

Explanation: The TCP/IP communication processing has been completed and control is returned to the Data Store subsystem.

System action: The TCP/IP communication task (ID task) ends.

EQQFCM1I STOP IN PROGRESS

Explanation: The Data Store command task is terminating after a stop request.

System action: The Data Store waits until the command task is closed.

EQQFCM2I DATA STORE COMMAND TASK IS BEING STARTED

Explanation: The command task has been successfully attached.

System action: The Data Store continues processing. If the startup process is successful, the Command task issues its own start message.

EQQFCM3I DATA STORE COMMAND TASK ENDED

Explanation: The command task has been requested to stop and is ending normally.

System action: The command task is terminated and all other active tasks are closed.

EQQFCMAI NUMBER OF ACTIVE WRITERS: VALUE

Explanation: This message indicates (by *VALUE*) the number of writers that are currently running.

System action: The Data Store continues processing.

EQQFCMBI WINTERVAL TIME FOR SYSDB WRITERS : VALUE

Explanation: This message indicates (by *VALUE*) the current value of the WINTERVAL (interval time in minutes for writer) parameter.

System action: The Data Store continues processing.

EQQFCMCI MAXSYSL RETURNED SYSOUT LINES: VALUE

Explanation: This message indicates (by *VALUE*) the current value of the MAXSYSL (maximum number of sysout lines returned to the Controller) parameter.

System action: The Data Store continues processing.

EQQFCMDI MAXSTOL STORED SYSOUT LINES: VALUE

Explanation: This message indicates (by *VALUE*) the current value of the MAXSTOL (maximum number of sysout lines stored in SysDb) parameter.

System action: The Data Store continues processing.

EQQFCMFI CLEAN UP INTERVAL TIME: VALUE

Explanation: This message indicates (by *VALUE*) the current value of the CINTERVAL (interval time in minutes for cleanup) parameter.

System action: The Data Store continues processing.

EQQFCMGE AN INCORRECT MODIFY COMMAND HAS BEEN IGNORED

Explanation: The Data Store has detected an invalid modify command.

System action: The modify command is not processed.

User response: Enter a valid command.

EQQFCMHE MODIFY COMMAND SYNTAX ERROR

Explanation: The modify command is syntactically incorrect.

System action: The modify command is not processed.

User response: Enter a valid command.

EQQFCMIE INVALID MODIFY COMMAND PARAMETER VALUE

Explanation: The parameter value specified for the modify command is incorrect or out of range.

System action: This command is not processed. The Data Store continues processing.

User response: Enter a valid command.

EQQFCU1I CLEAN UP TASK STARTED

Explanation: The cleanup data store task has been successfully started. This does not always mean that a cleanup policy is running (see message EQQFCU3I).

System action: The Data Store continues processing.

EQQFCU2I CLEAN UP TASK ENDED

Explanation: The cleanup data store task has been requested to stop and is terminating normally.

System action: The cleanup task is terminated. Data Store normal processing continues.

EQQFCU3I CLEAN UP TASK RUNNING

Explanation: The cleanup data store task is running. A value other than 0 (zero) was specified for CINTERVAL. The cleanup policy specified in the CLNPARM member is active.

System action: The Data Store and cleanup task continue processing.

EQQFCU4I CLEAN UP TASK IN QUIESCE STATUS

Explanation: The cleanup task is in a quiescent status and is waiting until the cleanup interval time has elapsed.

System action: At the end of the cleanup interval time, the cleanup task is reactivated.

EQQFCU5E PARAMETER NOT ALLOWED IN DATA STORE CLEAN UP TASK

Explanation: A statement (or statements) in CLNPARM is invalid because it is applicable only to batch cleanup.

System action: The cleanup task is terminated. Data store normal processing continues.

User response: Check the CLNPARM statement (or statements). Correct the error and restart the cleanup task.

EQQFCU6I BATCH UTILITY PROCESSING STARTED

Explanation: The batch program that executes the batch utilities has been successfully started.

System action: None

EQQFCU7E PARAMETER PARM NOT ALLOWED IN BATCH CLEAN UP

Explanation: A statement (or statements) in CLNPARM is invalid because it is applicable only to the data store cleanup task.

System action: Batch utility processing is terminated.

User response: Check the CLNPARM statement (or statements). Correct the error and resubmit the utility.

EQQFCU8I BATCH UTILITY PROCESSING ENDED

Explanation: The program that executes the batch utilities is terminating normally.

System action: The batch utility processing is terminated. Data Store normal processing continues.

EQQFCU9E STRUCTURED DATA NOT AVAILABLE

Explanation: One of the following events has happened:

- A batch utility is processing one of the following commands:
 - DELBOTH
 - DELSTRUC
 - EXPBOTH
 - EXPSTRUC

but the structured data files are not available (perhaps because they were not specified in the JCL procedure).

- A batch utility is processing an IMPORT command by using an export file that contains structured data but the structured data files are not available (perhaps because they were not specified in the JCL procedure).

System action: The current command is ignored and the following command is processed.

User response: Check the command and the batch utility start JCL. Correct the error and resubmit the request.

Problem determination: Refer to the diagnostics file (ddname EQQDUMP) for further information

EQQFCUAE CMDPAR: PARM-MEMBER IS EMPTY

Explanation: No operand is specified in the CMDPAR member.

System action: The batch utility is not started.

User response: Check the member. Correct the error and resubmit the request.

EQQFCUBE IMPORT / EXPORT COMMAND WITHOUT DDNAME PARAMETER

Explanation: The DDNAME parameter was not specified in an Import or Export statement.

System action: The request is rejected.

User response: Check the DDNAME parameter. Correct the error and resubmit the utility.

EQQFCUCE PARAMETER CMDPAR NOT ALLOWED

Explanation: The *CMDPAR* parameter is not allowed for this statement.

System action: The request is rejected.

User response: Check the parameter. Correct the error and resubmit the utility.

EQQFCUEE ERROR ON PARAMETER LIBRARY MEMBER CMDPAR

Explanation: An error was found in the *CMDPAR* initial parameter member.

System action: The batch utility is terminated. Previous error messages help you to understand the problem.

User response: Check the statement. Correct the error and resubmit the utility.

EQQFCUFE SYNTAX ERROR IN SEARCH CRITERIA CMDPAR

Explanation: The search condition specified for the *CMDPAR* statement contains a syntax error (or errors).

System action: The batch utility is terminated.

User response: Check the statement. Correct the error and resubmit the utility.

EQQFCUGW NAME EXCEEDS 8 CHARACTERS

Explanation: In the search criteria, you specified a Job name or Job ID that is greater than eight characters. This is not allowed.

System action: The name or ID is truncated to eight characters.

User response: To use the correct criteria, change the statement and resubmit the utility.

Problem determination: None.

EQQFCUHW THE IMPORT FILE IS EMPTY

Explanation: The import batch utility found an empty import file.

System action: The batch utility is terminated.

User response: Check the import file and, if necessary, resubmit the utility.

EQQFCUJI NUMBER OF SYSOUTS/RECORDS EXPORTED: *nnn*/*mmm* NUMBER OF SYSOUTS IGNORED: *xxx*

Explanation: This message is issued by the data store batch utility to indicate:

- The total number of SYSOUTS that were selected from the SYSOUT database and stored in the export file (*nnn*)
- The total number of records that were selected from the SYSOUT database and stored in the export file (*mmm*)
- The total number of SYSOUTS that were not selected from the SYSOUT database according to the specified filter criteria (*xxx*)

System action: The system informs you that the export utility has terminated processing of a single export command. Normal batch utilities processing continues.

EQQFCUKI NUMBER OF SYSOUTS IMPORTED: *nnn* NUMBER OF SYSOUTS IGNORED: *mmm*

Explanation: This message is issued by the Data store batch utility to indicate:

- The total number of SYSOUTS that were selected from the import file and stored in the SYSOUT database (*nnn*)
- The total number of SYSOUTS that were not selected from the import file according to the specified filter criteria (*mmm*)

System action: None.

EQQFCUMW BAD SYSOUT: SYSOUT KEY IMPORTED

Explanation: During a batch import utility, a mismatch was detected between the number of records written in the import file, for a specific sysout, and the total number of pages stored in the page prefix. The incorrect *SYSOUT KEY* is shown.

System action: The batch utility does not import the incorrect sysout and continues its normal processing.

EQQFCUNI NUMBER OF KEYS EXTRACTED: *nnn*

Explanation: This message indicates the total number of keys selected from the sysout database and written into an output file by a single batch recover primary index utility.

System action: The system informs you that the recover utility has terminated Normal batch utilities processing continues.

EQQFCUOW THE HEADER RECORD DOESN'T CONTAIN A VALID IDENTIFIER

Explanation: The first record of an input file found by the import batch utility is not an header record.

System action: The import utility is terminated.

User response: Check the import file and, if necessary, resubmit the utility.

EQQFCUPI CLEAN UP ISSUED DELETE REQUEST FOR NNN SYSOUTS STRUCTURED: STR UNSTRUCTURED: UNS

Explanation: The cleanup task has completed the deletion of the specified sysouts (*NNN*) in accordance with the current cleanup policy. *STR* identifies the number of deleted structured sysout (joblogs structured info) and *UNS* identifies the number of deleted unstructured sysout (joblogs).

System action: None

EQQFCUQI EQQCLNPA MEMBER NOT FOUND

Explanation: This message is issued when the CLNPARM option is not specified in the DSTOPTS statement. Default member EQQCLNPA is used, but is not found in the parameter library.

System action: The cleanup task is started, but there is no active policy.

User response: Specify the CLNPARM option or add the member EQQCLNPA into the parameter library and restart the cleanup task with the appropriate command.

EQQFCUSE UNSTRUCTURED DATA NOT AVAILABLE

Explanation: One of the following events has happened:

- An online cleanup was processing a DELUNSTR or DELBOTH command, but STOUNSD(N) was codified in Data Store (Data Store does not manage unstructured data).
- A batch utility was processing the DELBOTH, DELUNSTR, EXPBOTH, or EXPUNSTR command but the unstructured data files are not available (perhaps they were not specified in the JCL procedure).
- A batch utility was processing an IMPORT command by using an export file that contains unstructured data, but the unstructured data files are not available (perhaps they were not specified in the JCL procedure).

System action: If the message is issued during the online cleanup, the execution of the command is terminated. The cleanup task waits for another request and Data Store normal processing continues. If the message is issued while the batch utility program is running, the current command is discarded and the next command is processed.

User response: Check the command and the batch utility start JCL. Correct the error and resubmit the request.

Problem determination: Refer to the diagnostics file (with ddname EQQDUMP) for further information.

EQQFCUTE A SINGLE COMMAND MUST BE SPECIFIED IN ON LINE DATA STORE CLEAN UP

Explanation: During the online cleanup, more than one command DSTUTIL has been specified, but this isn't supported in on line mode.

System action: No command DSTUTIL is performed and the data store is terminated with return code 8.

System programmer response: Correct the error specifying only one DSTUTIL command in the cleanup parameters member. Then restart data store.

User response: Contact your system programmer.

Problem determination: No further information is needed to identify this problem.

EQQFJK1I UNABLE TO WRITE ALL DSID IN SYSDB FOR JOB: JOBNMID

Explanation: After several retries, a writer task was unable to store all the sysouts in the database for the specified job.

System action: The sysouts are not requeued to their original class. They are kept in the Data Store reserved class for a next retry until they are correctly processed or removed manually from the reserved class.

System programmer response: If the error persists, remove the job manually from the reserved class and contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Review earlier messages in the Data Store message log and SYSLOG data sets to determine the cause of the error.

EQQFJK2E DATA STORE JESQUEUE TASK INITIALIZATION FAILED

Explanation: The JES queue task could not acquire all the resources needed for normal operation.

System action: The JES queue task is not started and all other active tasks are closed. Data Store is terminated.

System programmer response: Correct the errors and restart the data store.

Problem determination: Review earlier messages in the data store message log to determine the cause of the error.

EQQFJK3I DATA STORE JESQUEUE TASK INITIALIZATION COMPLETED

Explanation: The JES queue task has successfully completed its initialization.

System action: JES queue processing starts.

EQQFJK4I DATA STORE JESQUEUE TASK ENDED

Explanation: The JES queue task has been requested to stop and is terminating normally.

System action: The JES queue task is terminated.

EQQFJK5E DATA STORE JESQUEUE TASK ENDED DUE TO AN ERROR

Explanation: The JES queue task has been abnormally stopped.

System action: The JES queue task is terminated and all other active tasks are closed. The data store is terminated.

System programmer response: Correct the errors shown by the earlier messages and restart the Data Store. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the errors shown by the data store message log and restart the data store. If the problem occur again refer to the *Diagnosis Guide and Reference*.

Problem determination: Review earlier messages in the data store message log to determine the cause of the error.

EQQFJK6I DATA STORE JESQUEUE TASK WAITING FOR DATABASE TASK END.

Explanation: The JES queue has received a stop command, but it has some jobs in its queue and the database task has to complete the pending requests.

System action: The JES queue task waits until the database task is terminated.

EQQFJK7I DATA STORE JESQUEUE TASK CLOSE IN PROGRESS : ANALYSING QUEUE

Explanation: Before closing, the JES queue task examines its internal queue for the last time to close all pending situations.

System action: None.

EQQFJK9I JOBNMID CANNOT BE REQUEUED TO ORIGINAL CLASS: DEFAULT CLASS IS USED.

Explanation: The original class specified for the requeue operation is reserved. The requeue operation for the *JOBNMID* job is forced in the default class.

System action: JES queue processing continues.

EQQFJKAI ORIGINAL CLASS NOT FOUND: JOBNMID REQUEUED TO DEFAULT CLASS

Explanation: The original class specified for the requeue operation was not found. The requeue operation for the *JOBNMID* job is forced in the default class.

System action: JES queue processing continues.

EQQFJKBE SSI CALL ENDED IN ERROR:FUNCTION: SAPIFUNC RETURN CODE: SRC SSOBRETN: SRETN SSS2REAS: SREAS JOBNAME: SAPIJOBN JOBID: SAPIJBID

Explanation: Data Store invoked the SSI interface to execute a SAPI function for handling the sysout from its reserved destination queue, but this call failed. The message displays the following detailed information:

SAPIFUNC

The SAPI function that failed. Possible values are:

SAPI 79 — PUT/GET

Used to put/get sysouts from spool.

SAPI 79 — PUT/GET LAST CALL

Used to close a put/get function.

SAPI 79 — COUNT

Used to count sysout elements.

SAPI 79 — COUNT LAST CALL

Used to close a count function.

SAPI 79 — BULK MODIFY

Used to requeue or purge sysouts.

SAPI 79 — BULK MODIFY LAST CALL

Used to close a Bulk modify function.

SRC The return code from the SSI call. To learn its meaning, refer to the MVS publication that describes the specified SAPI function (*OS/390 MVS Using the Subsystem Interface — Return Code Information*).

SRETN The value returned by SAPI in the *ssobretn* field of the SSOB control block. To learn its meaning, refer to the MVS publication that describes the specified SAPI function.(*OS/390*

MVS Using the Subsystem Interface — Output Parameters — SSOBRETN Contents).

SREAS The value returned by SAPI in the sss2reas field of the SSS2 control block. To learn its meaning, refer to the MVS publication that describes the specified SAPI function (*OS/390 MVS Using the Subsystem Interface — Output Parameters — SSS2 Contents*).

SAPIJOB

The jobname filter criteria used to execute the specified SAPI function. It can be blank or it can contain a jobname value. The jobname value indicates which is the job that causes problems to the SAPI function. A blank indicates that Data Store issued a SAPI function to get all the jobs on its reserved queue: in this case, it is not easy to identify the job that causes problems (if it is a job and not another kind of error). One of the possible reasons is a job that lacks the JCT; this can be verified by looking for the \$HASP364 message on the data store log.

SAPIJBID

The jobid range used as filter criteria for the specified SAPI function. It has the form lowjobid/highjobid. If lowjobid and highjobid are equal, they identify the single job that causes trouble. If lowjobid and highjobid are different, this means that Data Store issued a SAPI function to get all the jobs on its reserved queue. The SAPIJBID is the used range.

System action: Data store stops processing the problem job. If the error occurred in the JES queue task, data store stops processing completely. If the error occurred in the Writer task, Writer stops processing and the job is retried later.

System programmer response: See the MVS publication for the explanation of the SAPI function, the return code, the SSOB reason code, and the SSS2 reason code. If a specific jobname jobid is shown in the message, remove it from the reserved class queue. If no specific jobname appears, look into the reserved class queue which contains the jobs currently handled by data store: a generic SAPI get function was issued with only reserved class as the filter criteria. One of the possible reasons is that a job has no JCT and this can be verified by looking for the \$HASP364 message in the data store log.

User response: Contact your system programmer to analyze where the problem originated.

**EQQFJKDI ARCHIVING IN PROGRESS FOR:
JOBNMID (REASON=RETRY)**

Explanation: The archiving process is not completed yet, but there is no real error: data is still being sent and a retry will be performed.

System action: The data store continues the archiving process.

User response: None.

**EQQFJKEI ARCHIVING IN PROGRESS FOR:
JOBNMID (REASON=DELAY)**

Explanation: The archiving process is not completed yet, but there is no real error: delay time has been reached (data retry will be performed).

System action: The data store continues the archiving process.

User response: None.

**EQQFJKFI ARCHIVING COMPLETED FOR:
JOBNMID**

Explanation: The archiving process, delayed for 'retry' or 'delay' reason, is finally completed.

System action: None.

User response: None.

**EQQFJKGW ARCHIVING FAILED FOR: JOBNMID.
JOB REQUEUED TO FAILD**

Explanation: The job identified by *JOBNMID* exceeded the maximum number of archiving attempts specified by the RETRYCOUNTER keyword. For this reason, the job is requeued to the destination *FAILD*.

System action: Data store removes the job from the reserved destination queue and requeues it to the failure destination: the one specified in *FAILDEST* keyword.

System programmer response: Check the data stores *EQQMLOG* and *EQQDUMP* for messages about the problem job. Check if the delay value specified in the initial parameters is too low for the data store to complete the archiving.

User response: Contact your system programmer to analyze the origin of the problem.

**EQQFJKHI EQQFJKHI PARSER ONLY IN
PROGRESS FOR: JOBNMID**

Explanation:

This message occurs immediately after message *EQQFJKLI* or *EQQFJKEI*. Refer to these two messages for details. This message indicates that data store handled the operinfo retrieval request associated with the specified *JOBNMID* (job name - job ID) by starting only the parser processing. This can occur only if *STORESTRUCMETHOD(Delayed)* is set on.

System action: Data store continues its processing. The parser process of *JOBNMID* is stopped and not

started again until a new operinfo retrieval request is received from controller.

User response: None.

**EQQFJKIW STOP COMMAND IN PROGRESS:
VSAM FILE CHECK NOT POSSIBLE**

Explanation:

This message occurs during the data store shutdown when the database and the *JESQUEUE* tasks end.

System action: Data store continues processing. The *JESQUEUE* task ends with no error.

User response: None.

**EQQFJKLW JOB: JOBNMID TOO LARGE - R&C IS
ALLOWED BUT JOBLOG IS NOT
STORED. JOBLOG WILL BE
REQUEUED TO FAILD.**

Explanation: The job identified by *JOBNMID* is not archived because too large. For this reason, the job is requeued to the destination indicated by the *FAILD* variable.

System action: Data store removes the job from the reserved destination queue and requeues it to the failure destination specified in the *FAILDEST* keyword.

User response: None.

**EQQFJKME ARCHIVING FAILED FOR: JOBNMID.
JOBLOG DELETED.**

Explanation: A writer task was unable to store the joblog for the specified job.

System action: The joblog was deleted from the Data Store destination because unusable.

User response: If this message is preceded by message *EQQFAR2E* and the *REASON* value is 00001000, a *S001*abend has been recovered and no other action is needed. However it is not possible to restart the job mentioned in the *EQQFAR2E* message. Contact your system programmer to determine the *QSAM* abend cause. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Review earlier messages in the Data Store message log and *SYSLOG* data sets to determine the cause of the error. The cause of the problem might be a *QSAM* abend.

**EQQFJKNE JOB: JOBNMID MVS JOB LOG TOO
LARGE. JOB LOG IS NOT STORED,
NOT PARSED AND REQUEUED TO
FAILD.**

Explanation: The job identified by *JOBNMID* was not archived because too large. It is the *MVS* part of the job log to be too large, therefore parsing is not possible. The job is queued again to the destination *FAILD*.

System action: Data store removes the job from the reserved destination queue and queues it again to the failure destination specified by the *FAILDEST* keyword.

User response: None. Restart and clean up cannot be performed on this job. To prevent this problem from occurring again, consider setting the *MAXMVSPAGES* keyword in the *DSTOPTS* statement.

**EQQFJKWW ARCHIVING FAILED FOR: JOBNMID.
JOB REQUEUED TO FAILD.**

Explanation: The job identified by *JOBNMID* exceeded the maximum number of archiving attempts (as specified by the *RETRYCOUNTER* keyword). For this reason, the job is requeued to the *FAILD* destination.

System action: Data store removes the job from the reserved destination queue and requeues it to the failure destination specified in the *FAILDEST* keyword..

**EQQFL00E JOB LOG FETCH TASK HAS
IGNORED AN INVALID QUEUE
ELEMENT: DQE**

Explanation: A queue element did not contain the correct eye catcher or version number.

System action: The job log fetch task does not process the invalid element, but continues normal processing.

System programmer response: Save the Data Store job log task message log. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

**EQQFL01I JOB LOG FETCH TASK
INITIALIZATION COMPLETE**

Explanation: The job log fetch task has successfully completed its initialization.

System action: Job log fetch processing is available.

**EQQFL02E JOB LOG FETCH TASK
INITIALIZATION FAILED**

Explanation: The job log fetch task could not acquire all the resources needed for normal operation.

System action: The job log fetch task is not started and all other active tasks are closed.

System programmer response: Correct the errors and restart the submit task.

Problem determination: Review earlier messages in the data store message log to determine the cause of the error.

**EQQFL04E JOB LOG FETCH ABENDED WHEN
PROCESSING THE FOLLOWING
QUEUE ELEMENT DQE**

Explanation: An abend prevented the job log fetch task from processing a queue element.

System action: z/OS recovery/termination is requested to generate a dump. The job log fetch task attempts to continue normal processing.

System programmer response: Save the message log and dump data sets. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Review the Data Store message log data set, the EQQDUMP data set, and the SYSDUMP data set to determine the cause of the error.

**EQQFL05E JOB LOG FETCH QUEUE POINTER IS
DESTROYED. ARCQ IS LOST**

Explanation: The job log fetch task abended while processing elements on the DSCQ because queue chaining is invalid.

System action: z/OS recovery/termination is requested to generate a dump. The job log fetch task attempts to continue normal processing.

System programmer response: Save the message log, BEX and dump data sets. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all

problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your systems programmer.

Problem determination: Review the Data Store message log data set, the BEX diagnostic data set, and the dump data set to determine the cause of the problem.

**EQQFL10E IN XCF ENVIRONMENT BOTH
DSTGROUP AND CTLMEM ARE
MANDATORY**

Explanation: DSTGROUP and CTLMEM are not specified in the FLOPTS statement of the controller initial parameter statement. If you specify the XCFDEST parameter, they are both mandatory.

System action: The Data Store does not start.

System programmer response: Correct the error and restart the Data Store.

**EQQFL11E CTLLUNAM AND DSTGROUP/
CTLMEM ARE MUTUALLY
EXCLUSIVE**

Explanation: CTLLUNAM and DSTGROUP or CTLMEM parameters are specified together in the FLOPTS statement of the controller initial parameter statement. They are mutually exclusive.

System action: The FL task does not start.

System programmer response: Correct the error and restart the FL task

**EQQFL12E SPECIFY AT LEAST ONE
DESTINATION.**

Explanation: Specify at least one of the following parameters: SNADEST, XCFDEST, or TCPDEST.

System action: The FL task does not start.

System programmer response: Correct the error and restart the FL task

**EQQFL13E CONFLICT DETECTED BETWEEN
CTLLUNAM AND SNADEST VALUES**

Explanation: The same name is specified in the FLOPTS statement for the CTLLUNAM and SNADEST parameters or for the CTLMEM and XCFDEST parameters. Home and destination must have different names.

System action: The FL task does not start.

System programmer response: Correct the error and restart the FL task

EQQFL14E SNADEST SPECIFIED IN XCF ENVIRONMENT

Explanation: SNADEST and DSTGROUP or CTLEM are specified together in the FLOPTS statement of the controller initial parameter statement. They are mutually exclusive.

System action: The FL task does not start.

System programmer response: Correct the error and restart the FL task

EQQFL15E XCFDEST SPECIFIED IN SNA ENVIRONMENT

Explanation: XCFDEST and CTLLUNAM are specified together in the FLOPTS statement of the controller initial parameter statement. They are mutually exclusive.

System action: The FL task does not start.

System programmer response: Correct the error and restart the FL task

EQQFL16E MORE THAN ONE DOT FOUND IN DESTINATION PARM

Explanation: The value of the XCFDEST, SNADEST, or TCPDEST parameter in the FLOPTS statement is not valid because it contains more than one dot (period). The period divides the Tracker by Data Store destination names and there must be only one.

System action: The FL task does not start.

System programmer response: Correct the error and restart the FL task

EQQFL17E AT LEAST ONE DOT MUST BE SPECIFIED IN DESTINATION PARM

Explanation: The value of the XCFDEST, SNADEST, or TCPDEST parameter in the FLOPTS statement is not valid because it does not contain a dot (period). The period divides the Tracker by Data Store destination names and there must be a minimum of one.

System action: The FL task does not start.

System programmer response: Correct the error and restart the FL task

EQQFL18E NO DESTINATION NAME FOUND FOR TRACKER TRACKER

Explanation: The Controller has requested a job log from the Data Store, but the Tracker destination name is not specified in the XCFDEST, SNADEST, or TCPDEST parameter of the FLOPTS statement.

System action: The request fails.

System programmer response: Correct the XCFDEST

or SNADEST parameter and restart the Data Store.

If you changed the data store destination name, specify both the old and new destination names in the FLOPTS statement. For further information, refer to the tracker and data store considerations in the **Migrating** section of the *Installation Guide*.

EQQFL19I DATA STORE DST IS INACTIVE

Explanation: The Controller has requested a job log, but the Data Store destination specified in the XCFDEST, SNADEST, or TCPDEST parameter of the FLOPTS statement is currently inactive.

System action: The request fails.

System programmer response: Start the appropriate Data Store and resubmit the request.

EQQFL21E ERROR CREATING DB END WRITE QUEUE

Explanation: An internal Joblog Fetch task error occurred when constructing an internal queue.

System action: The Joblog Fetch task ends abnormally.

System programmer response: Save the scheduler Pre Submitter task message log. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQFL22E ERROR CREATING DB DELETE EVENTS QUEUE

Explanation: An internal Joblog Fetch task error occurred when constructing an internal queue.

System action: The Joblog Fetch task ends abnormally.

System programmer response: Save the scheduler Pre Submitter task message log. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

**EQQFL23E UNEXPECTED LOCAL DATASTORE
SUBTASK END**

Explanation: The Joblog Fetch task detected a failure in the local data store.

System action: The Joblog Fetch task ends abnormally.

System programmer response: If the problem persists, save the message log and dump data sets. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Review the message log data set and the EQQDUMP data set to determine the cause of the problem.

**EQQFL24E ERROR CREATING CP16 QUEUE FOR
FL SUBTASK**

Explanation: An internal Joblog Fetch task error occurred during construction of an internal queue.

System action: The Joblog Fetch task ends abnormally.

System programmer response: Save the scheduler Pre Submitter task message log. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

**EQQFL25E ERROR ADDING OPERATION
TOKEN TO BE DELETED**

Explanation: An internal Joblog Fetch task error occurred during an operation on an internal queue.

System action: The Joblog Fetch task ends abnormally.

System programmer response: Save the scheduler Pre Submitter task message log. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis

procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

**EQQFL26E ERROR DURING OPERINFO CHECK
FOR OP TOKEN:OPTOK**

Explanation: The Joblog Fetch task detected a failure while trying to delete a sysout in the local data store. The sysout belongs to the occurrence identified by the token *OPTOK*. The *RC* return code indicates the kind of error:

- * = 4 → the sysout was not found
- * > 4 → an internal error occurred

The cleanup of a local data store is the consequence of a current plan extend or a current plan replan and its start and end is identified by the messages EQQFL28 and EQQFL29. The sysout to be deleted are the ones associated to the occurrences removed by the current plan batch run.

System action: The Joblog Fetch task continues processing.

System programmer response: If *RC* > 4 are detected, save EQQDUMP and EQQMLOG. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer if *RC* > 4 are detected .

Problem determination: If *RC* > 4 are detected, check EQQMLOG and EQQDUMP to find further error messages.

**EQQFL27E ERROR DURING OPERINFO CHECK
FOR OP TOKEN OPTOK**

Explanation: An internal Joblog Fetch task error occurred while an internal queue was being processed.

System action: The Joblog Fetch task ends abnormally.

System programmer response: Save the scheduler message log. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section

| "Information needed for all problems, sub-section
 | "Information to collect for data store problems". Search
 | the IBM Support database for a solution at
 | [http://www.ibm.com/software/sysmgmt/products/
 | support.](http://www.ibm.com/software/sysmgmt/products/support/)
 | **User response:** Contact your system programmer.

**EQQFL28I LOCAL DATA STORE CLEANUP
 STARTED**

Explanation: The Joblog Fetch task started the local data store cleanup process. The cleanup of local data store is the consequence of a current plan extend or current plan replan and its start and end is identified by the messages EQQFL28 and EQQFL29. The sysout to be deleted are the ones associated to the occurrences removed by the current plan batch run (the completed ones).

System action: The Joblog Fetch task continues the processing.

System programmer response: None.

User response: None.

**EQQFL29I LOCAL DATA STORE CLEANUP
 ENDED. NUMBER OF OCCURENCE
 SUCCESSFULLY PROCESSED: SYS**

Explanation: The Joblog Fetch task ended the local data store cleanup process. The number of occurrence whose sysout were successfully deleted is indicated by the SYS value. The cleanup of local data store is the consequence of a current plan extend or current plan replan and its start and end is identified by the messages EQQFL28 and EQQFL29. The sysout to be deleted are the ones associated to the occurrences removed by the current plan batch run (the completed ones).

System action: The Joblog Fetch task continues the processing.

System programmer response: None.

User response: None.

EQQFL30E UNEXPECTED ID SUBTASK END.

| **Explanation:** The ID task detected a failure in the local
 | data store.

| **System action:** The ID task ends abnormally.

| **System programmer response:** If the problem persists,
 | save the message log and dump data sets. If the
 | problem persists, search the IBM Support database for
 | a solution at [http://www.ibm.com/software/
 | sysmgmt/products/support.](http://www.ibm.com/software/sysmgmt/products/support/) If you do not find any
 | information, for the information to collect, see the
 | *Diagnosis Guide and Reference* manual, Chapter 3.
 | Problem analysis procedures, section "Information
 | needed for all problems, sub-section "Information to

| collect for data store problems". Search the IBM
 | Support database for a solution at [http://
 | www.ibm.com/software/sysmgmt/products/support.](http://www.ibm.com/software/sysmgmt/products/support/)

| **User response:** Contact your system programmer.

| **Problem determination:** Review the message log data
 | set and the EQQDUMP data set to determine the cause
 | of the problem.

**EQQFL31E AT LEAST ONE TCPDEST KEYWORD
 VALUE IS INCORRECT.**

Explanation: The TCPDEST keyword of the FLOPTS statement contains one or more incorrectly defined TCP/IP destinations.

System action: The processing of the current FLOPTS statement terminates with a nonzero return code. This causes the controller initialization to fail.

User response: Review the syntax of the TCP/IP destinations specified. Remove or correct the incorrect destination, and then restart the controller.

**EQQFL32E A TRACKER DESTINATION ENTRY IS
 TOO LONG IN STATEMENT FLOPTS.**

Explanation: The tracker destination name must be not greater than 8 characters.

System action: Processing of the TCPDEST keyword continues. Message EQQFL31E is issued when all destinations have been processed.

User response: Either remove or correct the invalid destination and restart the subsystem.

EQQFL1AE UNEXPECTED FN SUBTASK END

Explanation: The FL task has detected an unexpected end of FN subtask.

System action: The FL task ends in error.

System programmer response: If the error persists, save the message log and dump data sets and contact IBM Software Support.

User response: Contact your system programmer

Problem determination: Review the Data Store message log data set, the EQQDUMP data set, and the SYSDUMP data set to determine the cause of the problem

**EQQFSD0E SYSOUT DATABASE INITIALIZATION
 FAILED**

Explanation: The initialization of the sysout data base task failed.

System action: If the task is started by data store, data store ends. If the task is started by the controller, FL task is ended.

User response: Check the previous messages in the EQQMLOG to get more information (for example the message EQQFSF0E).

EQQFSD1I SYSOUT DATABASE ERROR HANDLER TASK STARTED

Explanation: The sysout database error handler task is being started.

System action: The Data Store initialization process continues.

EQQFSD2I SYSOUT DATABASE ERROR HANDLER TASK ENDED

Explanation: The sysout database error handler task has been requested to stop and it has terminated normally.

System action: The sysout database error handler task is terminated.

EQQFSD3E DATABASE ERROR HANDLER DETECTED SUBTASK FAILURE

Explanation: The error handler task that coordinates data file activities has detected a subtask failure.

System programmer response: If possible correct all errors and restart the Data Store. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for data store problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Review earlier messages in the Data Store message log and SYSLOG data sets to determine the cause of the error.

EQQFSD4I SYSOUT DATABASE STARTING

Explanation: The sysout database is being started.

System action: The Data Store initialization process continues.

EQQFSD5I SYSOUT DATABASE INITIALIZATION COMPLETE

Explanation: The sysout database has successfully completed its initialization.

System action: The sysout database is now active.

EQQFSD6I SYSOUT DATABASE TERMINATING

Explanation: A stop request was issued to close the sysout database.

System action: The sysout database is shut down.

EQQFSD7I SYSOUT DATABASE STOPPED

Explanation: A stop request was accepted and completed by the sysout database.

System action: The sysout database is now stopped.

EQQFSD8W WARNING MESSAGES WERE ISSUED DURING OPERATION ON DATA FILE DATAFILE

Explanation: This message is displayed during the close process of the Data Store and indicates that an error was found during an operation on the *DATAFILE* data file.

Problem determination: Review earlier messages in the Data Store message log and SYSLOG data sets to determine which operation failed or the cause of the error.

EQQFSD9E DATAFILE NUMBER MISMATCH: DATFILE NUM:DNUMDATAFILE MAX NUM:MNUM

Explanation: Data store detected a datafile number mismatch during initialization phase. The primary key information(*MNUM*) does not match with the number of data files (*DNUM*)

System action: Data Store stops the processing and terminates.

System programmer response: Check if the JCL used to start data store has the correct number of data file specified: if it doesn't, change the JCL and restart.

User response: Contact system programmer to find the origin of mismatch.

EQQFSDAE UNSTRUCTURED DATA REQUIRED BUT NO UDFxx VSAM FILE HAS BEEN SPECIFIED

Explanation: Data store initialization failed because STOUNSD(Y) was specified (for joblog retrieval) but the started task JCL did not include any unstructured vsam file (identified by ddname UDFxxx).

System action: Data store stops processing.

User response: Allocate and add the UDFxx VSAM files, then restart data store.

EQQFSDBE STRUCTURED DATA REQUIRED BUT NO SDFxx VSAM FILE HAS BEEN SPECIFIED

Explanation: Data store initialization failed because no structured VSAM file was specified in the started task JCL. Structured VSAM files (identified by ddname SDFxx) are always required.

System action: Data store stops processing.

User response: Allocate and add the SDFxx VSAM files, then restart data store.

EQQFSF0E OPEN FAILED FOR DDN FUNCTION: FUNC REASON: SS

Explanation: A Data store SYSOUT database task tried to open the data file identified by the ddname *DDN* but detected an error: the specific macro used is explained by *FUNC* while the reason code returned by the macro is specified in *SS*.

System action: If the task is started by data store, data store ends. If the task is started by the controller, the FL task is ended.

User response: Check the meaning of the macro reason code. For example, the specified data file could be already used by another data store or the started task JCL could contain a duplicate ddname.

EQQFSF1I DATA FILE DATAFILE INITIALIZATION COMPLETED

Explanation: The initialization process of the *DATAFILE* data file task was completed successfully.

System action: The *DATAFILE* data file can be used to store sysout data.

EQQFSF2I DATA FILE DATAFILE TERMINATION COMPLETED

Explanation: The *DATAFILE* data file task termination process has been completed.

System action: The *DATAFILE* data file is closed.

EQQFSF3E UNABLE TO ALLOCATE AND FORMAT SPACE MAP

Explanation: An error occurred when allocating storage to build and format the space map.

System action: Data Store initialization is stopped.

System programmer response: The allocation in the data file is too small (a minimum of two tracks is needed). Correct the values in the allocation JCL, reallocate the data file and restart the Data Store.

EQQFSF4W INVALID PAGE - FILENUMRBN

Explanation: During cleanup an invalid page was detected for one of the following reasons:

- the RBN is out of range
- the page status is deleted, but the corresponding bit of the space map is on.

The message shows the data file number *FILENUM* and the *RBN* stored in the page prefix.

System action: The cleanup resets the corresponding bit of the space map.

EQQFSF5W UNABLE TO EXTEND DATA FILE DATAFILE- DATA FILE DISABLED

Explanation: An error occurred when trying to extend the data file number *DATAFILE*.

System action: The data file was flagged as disabled and cannot be used to store sysout data. The store operations continue on the next available data file. If no more data files are available, no more sysout could be stored.

System programmer response: Perform one of the following actions:

- To make more space available, shorten the cleanup task interval (*CINTERVAL*)
- Stop the data store, increase the size of the current data store files, and restart the data store.
- Allocate additional data files and restart the data store.

EQQFSF6I UNABLE TO COMPLETE SAVE OPERATION - DATA FILE DISABLED SAVE WILL BE RETRIED

Explanation: This message is issued by the sysout DB task, which is a data store task started also by the controller when the restart and cleanup function is activated. It occurs when the storing in the data file of the *JOBLOG* or structured info failed due to problems occurred during the I/O phase (for example when the data file is full).

System action: The archiving will be retried later.

System programmer response: Check the *EQQMLOG* to find messages that may explain the origin of the problem.

EQQFSF7W NO MORE DATAFILE AVAILABLE TO STORE JOBLOG

Explanation: An error occurred when trying to extend the data file. This message is sent when the datafile is the last one.

System action: No more datafile available.

System programmer response: Allocate additional datafile and restart the Data Store.

**EQQFSF8E DATA FILE *DDNAME* HEADER PAGE
FILE NUMBER *FILNUM* MISMATCH**

Explanation: This message is issued when, at start time, the data store database subtask finds incongruent information in the header page of the data file identified by the *ddname* specified by *DDNAME*. The incorrect information is the data file identifier number *FILNUM*.

System action: Data store stops processing and terminates.

Problem determination: Check the data store started procedure JCL to see which is the data file associated with the specified *DDNAME*. Check which are the data files that have the same *FILNUM* printing the header page of all used data files. Check if among these data files there are data files used by another data store: This cannot be done.

**EQQFSF9W UNABLE TO STORE *DATATYPE* DATA,
FILES ARE FULL**

Explanation: Sysout data was to be stored on the data store data files but there was not enough free space. *DATATYPE* is SDF for structured, UDF for unstructured data.

System action: Data store continues its processing.

System programmer response: Check the MAXSTOL parameter of the DSTOPTS data store initialization statement giving the number of user SYSOUT files that can be stored. If correctly specified, allocate more space to the EQQUDFnn files or the EQQSDFnn files, or specify a cleanup policy that prevents the files from filling up.

Problem determination: Messages EQQFJK1I or EQQFJKGW following message EQQFSF9 in the data store message log give the jobname and jobid of the job for which sysout data failed to be stored.

**EQQFSI1I SECONDARY KEY FILE
INITIALIZATION COMPLETED**

Explanation: The initialization process of secondary key file task completed successfully.

System action: The secondary key file can now be used to store sysout data.

User response: None.

**EQQFSI2I SECONDARY KEY FILE
TERMINATION COMPLETED**

Explanation: The secondary key file task termination process has completed.

System action: The secondary key file is now closed.

User response: None.

**EQQFSI3I GENERIC I/O ERROR DURING OPEN
VSAM FILE**

Explanation: The macro returns an error during an OPEN operation.

System action: The data store closes.

System programmer response: If possible, correct all errors, then restart data store. If the error persists, contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Review earlier messages in the data store message log and the SYSLOG data sets to determine the exact reason for this message. One possibility is that the user has an insufficient authorization to the VSAM file.

**EQQFSK1I PRIMARY KEY FILE INITIALIZATION
COMPLETED**

Explanation: The initialization process of the primary key file task was completed successfully.

System action: The primary key file can be used to store sysout data.

**EQQFSK2I PRIMARY KEY FILE TERMINATION
COMPLETED**

Explanation: The primary key file task termination process has been completed.

System action: The primary key file is closed.

**EQQFSK3I GENERIC I/O ERROR DURING OPEN
VSAM FILE**

Explanation: A VSAM Open operation failed.

System action: The Data Store is terminated.

System programmer response: If possible correct all errors and restart the Data Store. If the error persists, contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Review earlier messages in the Data Store message log and SYSLOG data sets to determine the cause of the error. One possibility is that you have insufficient authorization on that VSAM file.

**EQQFSR0E DATA STORE READER TASK
INITIALIZATION FAILED**

Explanation: The reader task could not acquire all the resources needed for normal operation.

System action: The reader task is not started.

System programmer response: Correct the errors and restart the submit task.

Problem determination: Review earlier messages in

the Data Store message log to determine the cause of the error.

EQQFSR1I DATA STORE READER TASK INITIALIZATION COMPLETED

Explanation: The reader task has successfully completed its initialization.

System action: Reader processing starts.

User response: None.

EQQFSR2I DATA STORE READER TASK ENDED

Explanation: The reader task has been requested to stop and is terminating normally.

System action: The reader task is terminated.

System programmer response: None.

EQQFSR3I DATA STORE IS ATTEMPTING TO COMMUNICATE WITH CONTROLLER

Explanation: During a retrieval request processing, communication was lost between the Controller and the Data Store. The Data Store retries three times, at 5-second intervals, to retransmit the joblog.

System action: None

System programmer response: If the error persist, check the reason for the communication failure.

EQQFSR4I JOB *JOBNMID* NOT FOUND NEITHER IN DATA STORE NOR IN JES QUEUE

Explanation: The Reader Task has received a request for a job that is not stored either on Data Store or on the JES queue. It may happen if the job log has not been copied into the scheduler destination (see value specified both in DSTDEST parameter of RCLOPTS controller initialization statement and SYSDEST parameter of DSTOPTS data store initialization statement). Possible reasons of the failure:

- a JCL error produces a log which cannot be copied in the scheduler destination (e.g. incomplete job log)
- a job is tracked by scheduler but submitted outside, for example Event-Triggered Tracking (ETT with "job-name replace" option set to Y). In any case the Reader Task is unable to return the requested job.

System action: The job log retrieval request fails.

System programmer response: Correct the JCL to avoid the error. In case of ETT, you can manually route the job log from the local to the scheduler destination.

EQQFSR5I TIMEOUT REACHED DURING SEARCH OF JOB: *JOBNMID*

Explanation: The job log retrieval request reached the maximum allowed time (see QTIMEOUT statement). The reader is unable to return the requested job.

System action: The job log retrieval request fails.

EQQFSR6I SOME PROBLEMS OCCURED IN WRITE PHASE FOR JOB: *JOBNMID*, RETRY LATER

Explanation: An internal error was detected during database write phase. Data store was unable to return the job log identified by JOGNMID.

System action: The job log retrieval request fails.

System programmer response: Check the writer failure reason.

EQQFSR7I UNSTR DATA FOR JOB *JOBNMID* REQUEST BUT NOT ON DB DUE TO INIT PARAM

Explanation: The data store reader task is unable to retrieve requested unstructured data because it can not be stored in the data store database. This because the DSTOPST STOUNSTR(N) option is not specified.

System action: The reader task is unable to retrieve JOBLOG but continues processing.

User response: If you want to retrieve JOBLOG, you must specify the DSTOPTS STOUNSTR(Y) option in your data store initialization parameters

EQQFSR8I UNABLE TO RETRIEVE JOB *JOBNMID*

Explanation: Data store reader task is unable to retrieve requested joblog.

System action: The reader task is unable to retrieve JOBLOG but continues processing.

System programmer response: If the problem persists, save the message log and dump data sets, then contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Review the data store message log data set and the EQQDUMP data set to determine the cause of the problem.

EQQFSW1I DATA STORE WRITER TASK INITIALIZATION COMPLETED

Explanation: The writer task has successfully completed its initialization.

System action: Writer processing starts.

User response: None.

EQQFSW2I DATA STORE WRITER TASK ENDED

Explanation: The writer task has been requested to stop and is terminating normally.

System action: The writer task is terminated.

System programmer response: None.

EQQFSW3I DATA STORE WRITER TASK ENDED DUE TO AN ERROR

Explanation: The writer task has been abnormally stopped.

System action: The writer task is terminated.

System programmer response: Correct the errors shown by the earlier messages and restart the indicated task.

Problem determination: Review earlier messages in the Data Store message log to determine the cause of the error.

EQQFSW4I JOB: JOBNAME- JOBNAME(DDN) INVALID SYSOUT

Explanation: The writer has received an empty data set (dynamically allocated). *DDN* is returned to JES, but is always equal to JESMSGLG for the three DSIDs of the job log. This message is displayed once for each DSID found for the job.

System action: The writer task skips to another job log that is to be stored.

System programmer response: None.

EQQFSW5W JOB: JOBNMID INCOMPLETE JOBLOG: OPERINFO NOT GENERATED

Explanation: Data store handled an incomplete MVS joblog: not all of the 3 MVS sysouts (JESMSGLG, JESJCL and JESYSMSG) were received. Data store needs all the 3 MVS sysouts to build the structured information (operinfo): it will not be built.

System action: Only unstructured information is stored.

System programmer response: None.

EQQFSW6W JOB: JOBNMID JOBLOG PARSING ERROR: OPERINFO NOT GENERATED. REASON: STRURSN

Explanation: This message is issued by the Writer task of Data store when the joblog parsing fails and structured info cannot be built. The related job is identified by *JOBNMID* and the reason for failing is explained by *STRURSN*.

System action: The structured information is not produced. If requested to do so, the unstructured joblog

is archived. The job is deleted from the destination queue.

User response: Check *STRURSN* to understand the cause of the error.

EQQFV00E DUPLICATE NAMES IN THE DSTOPTS SNA DESTINATIONS

Explanation: A minimum of one name in the SNA keyword destination list of the DSTOPTS initialization statement is a duplicate of a previously-specified name. These names are the application names of potential session partners and must be unique.

System action: FN processing is terminated.

System programmer response: Correct the name (or names) in error and restart the subsystem.

EQQFV01I FN APPLICATION STARTED

Explanation: The FN task has received control from the Data Store subsystem and is soon to start initialization processing.

System action: FN processing continues.

User response: None.

EQQFV02E FN APPLICATION TERMINATED - SETLOGON EXECUTION FAILURE

Explanation: A VTAM® SETLOGON macro used for enabling FN logon processing has failed. The reason for this error is defined in detail by message EQQFV15E that precedes this message in the message log.

System action: FN processing is terminated.

System programmer response: Correct the error (or errors) and restart the subsystem.

Problem determination: Review message EQQFV15E to determine the cause of the error.

EQQFV05E FN APPLICATION TERMINATED - INITIALIZATION PROCESSING FAILURE

Explanation: FN initialization processing failed. Messages that are issued preceding this message define the cause of the error.

System action: FN processing is terminated.

System programmer response: Correct all errors and restart the subsystem.

Problem determination: Review earlier messages in the message log to determine the cause of the error.

EQQFV06I FN APPLICATION ENDED

Explanation: FN processing has completed and control is returned to the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: FN processing is terminated.

User response: None.

EQQFV07E INITIALIZATION FAILED - SNA DESTINATION NOT SPECIFIED IN FLOPTS

Explanation: In a Controller system, FN initialization processing failed because no partner application IDs were specified in the SNA keyword of the FLOPTS statement.

System action: FN processing is terminated.

System programmer response: Add the missing information and restart the subsystem.

EQQFV08I INITIALIZATION FAILED - SUBSYSTEM STOP REQUESTED

Explanation: FN received a subsystem stop request while in the initialization phase. FN was most likely waiting for some other IBM Tivoli Workload Scheduler for z/OS resource to become active.

System action: FN processing is terminated.

User response: None.

EQQFV09E INITIALIZATION FAILED - CTLLNAM KEYWORD NOT SPECIFIED OR INVALID

Explanation: FN initialization processing failed because the CTLLUNAM keyword was not specified or was invalid.

System action: FN initialization processing is terminated.

System programmer response: Add the missing information and restart the subsystem.

EQQFV10E NIB BUILD PROCESSING FAILED - R15 = R15 R00 = R00

Explanation: The GENCB macro request that was issued to generate a NIB block did not complete normally.

System action: FN processing is terminated.

System programmer response: If insufficient main storage was the cause of the error, increase the region size and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. For any other cause of the error, contact IBM Software Support.

Problem determination: Use the R15 and R00 return

codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this system.

EQQFV11E RPL BUILD PROCESSING FAILED - R15 = R15 R00 = R00

Explanation: The GENCB macro request that was issued to generate an RPL block did not complete normally.

System action: FN processing is terminated.

System programmer response: If insufficient main storage was the cause of the error, increase the region size and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. For any other cause of the error, contact IBM Software Support.

Problem determination: Use the R15 and R00 return codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this system.

EQQFV12E NIB EXSLT BUILD PROCESSING FAILED - R15 = R15 R00 = R00

Explanation: The GENCB macro request that was issued to generate a NIB EXLST block did not complete normally.

System action: FN processing is terminated.

System programmer response: If insufficient main storage was the cause of the error, increase the region size and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. For any other cause of the error, contact IBM Software Support.

Problem determination: Use the R15 and R00 return codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this system.

EQQFV13E ACB EXSLT BUILD PROCESSING FAILED - R15 = R15 R00 = R00

Explanation: The GENCB macro request that was issued to generate an ACB EXLST block did not complete normally.

System action: FN processing is terminated.

System programmer response: If insufficient main storage was the cause of the error, increase the region size and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. For any other cause of the error, contact IBM Software Support.

Problem determination: Use the R15 and R00 return codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this system.

**EQQFV14E ACB BUILD PROCESSING FAILED -
R15 = R15 R00 = R00**

Explanation: The GENCB macro request that was issued to generate the FN ACB did not complete normally.

System action: FN processing is terminated.

System programmer response: If insufficient main storage was the cause of the error, increase the region size and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. For any other cause of the error, contact IBM Software Support.

Problem determination: Use the R15 and R00 return codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this system.

**EQQFV15E VTAM MACRO REQUEST FAILURE -
DIAGNOSTIC INFORMATION:
NODE= NODE, REQUEST= X'REQ'
(NAMEREQ), RTNCD= X'RC' (DECRC)
FDBK2= X'FDBK2' (DFDBK2),
SSEMI= SMI, USENSEI= USEI,
SSENSEI=SSEI R00= X'R00', R15=
X'R15'**

Explanation: An error occurred when a VTAM request was executed or scheduled. The variable items in the message provide diagnostic information and have the following meanings:

NODE FN application LU-name

REQ VTAM request code in hexadecimal

NAMEREQ
VTAM request name

RC RTNCD feedback field value from RPL in hexadecimal

DECRC
RTNCD feedback field value from RPL in decimal

FDBK2 FDBK2 feedback field value from RPL in hexadecimal

DFDBK2
FDBK2 feedback field value from RPL in decimal

SMI System sense modifier information from RPL

USEI User sense information from RPL

SSEI System sense information from RPL

R00 Register 0 return code after a VTAM macro request

R15 Register 15 return code after a VTAM macro request.

System action: The action taken depends on the severity of the error situation. If at all possible, FN tries to continue processing. For the most serious errors, for example, undefined feedback code, FN abends with a dump and user code.

System programmer response: Analyze the diagnostic information and the dump (if produced) to determine

the cause of the error. If this was not a user error, contact IBM Software Support.

Problem determination: Use the diagnostic information in the message to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on the system.

**EQQFV16E NAMEREQ REQUEST FAILURE -
LU/APPLICATION NODE NOT FOUND**

Explanation: The VTAM *NAMEREQ* request failed to complete successfully because the LU-name *NODE* could not be found. The most likely reasons for the failure is:

- A LU-name is specified incorrectly in the CTLLUNAME keyword of the DSTOPTS initialization statement
- the name *NODE* has not been properly defined to VTAM.

System action: The FN processing is terminated.

System programmer response: Review the name specified in the CTLLUNAME keyword. Make sure that it is correct and that a counterpart exists in the VTAM definition statements. Correct the items in error and restart FN.

**EQQFV17E NAMEREQ REQUEST FAILURE -
LU/APPLICATION NODE NOT
ACTIVE**

Explanation: The VTAM *NAMEREQ* request failed to complete successfully because the LU-name *NODE* was not active.

System action: The FN processing is terminated.

System programmer response: Investigate why *NODE* is inactive. Restart FN when *NODE* is active again.

**EQQFV18E NAMEREQ REQUEST FAILURE -
VTAM ERROR, OR NCP/VTAM
INCOMPATIBILITY**

Explanation: The VTAM *NAMEREQ* request failed to complete successfully because there was an error in VTAM or an NCP/VTAM incompatibility. This message is preceded by message EQQFV15E in the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The FN processing is terminated.

System programmer response: Restart FN when the VTAM errors have been corrected.

Problem determination: Refer to message EQQFV15E to determine the cause of the failure.

EQQFV19E SESSION SETUP FAILED - PLU=LU NOT AVAILABLE

Explanation: The FN has not been able to establish a session for one of the following reasons:

- The controller is not started.
- The FN task in the controller is not available.
- The LU specified in the CTLLUNAME keyword of the DSTOPTS initialization is not active or is not defined.

The FN retries every 10 seconds until it is successful, until the subsystem is stopped, or until the FN is deactivated.

System action: The FN continues to attempt to establish the LU-LU session.

System programmer response: Review the name specified in the CTLLUNAME keyword of the DSTOPTS initialization statement and make sure that it is the correct one. If it is correct, ask the system operator at the controller system to activate the required resource.

EQQFV20I ACB SUCCESSFULLY CLOSED

Explanation: The FN has been successfully disconnected from VTAM.

System action: The FN termination processing continues.

User response: None.

EQQFV21W UNABLE TO CLOSE ACB

Explanation: The FN is unable to successfully disconnect from VTAM.

System action: The FN termination processing continues even though the ACB could not be closed.

System programmer response: Contact your VTAM administrator.

Problem determination: It is most likely that a VTAM error has caused this error. Check the system log for VTAM error messages that can be related to this failure.

EQQFV22E LOGON ATTEMPTED BY UNDEFINED LU/APPLICATION LU- CLSDST ISSUED

Explanation: A session establishment attempt was made by a remote FN application unknown to this host IBM Tivoli Workload Scheduler for z/OS subsystem. This message is issued only for a FN application at a IBM Tivoli Workload Scheduler for z/OS host.

System action: The FN task turns down the request for the session by issuing a CLSDST macro. Processing continues for the IBM Tivoli Workload Scheduler for z/OS host FN application.

System programmer response: Stop the FN task for which erroneous specifications have been given. Correct the specifications in the DSTOPTS statement and restart the FN.

Problem determination: It is most likely that a name in the DSTOPTS SNA keyword list of names has been misspelled or left out entirely.

EQQFV23E LOGON REQUEST FOR LU/APPLICATION LU THAT IS ACTIVE - CLSDST ISSUED

Explanation: Data store/FN task connection was attempted, but the session is already active.

System action: The request for a session is turned down and FN task process continues.

System programmer response: Stop the controller, data stores, and trackers that have incorrect definitions. Correct them, specifying a different LU-name and restart them.

Problem determination: The most likely reason for this error is that more the same LU-name was used to define more data stores or SNA connected trackers. Check both the controller FLOPTS definitions (CTLLUNAM, SNADEST), the data store DSTOPTS definitions (DSTLUNAM, CTLLUNAM) and the tracker OPCOPTS definitions (NCFAPPL).

EQQFV24I ACB SUCCESSFULLY OPENED

Explanation: The FN has successfully established contact with VTAM and is ready for further VTAM processing.

System action: The FN processing continues.

User response: None.

EQQFV25I ACB OPEN FAILURE (RC=X'RC') - VTAM SHUTTING DOWN

Explanation: The FN was unable to establish contact with VTAM because of an OPEN ACB failure. RC is the ACB error flag value in hexadecimal.

System action: The FN continues processing.

User response: None.

EQQFV26E ACB OPEN FAILURE (RC=X'RC') - FN IMPROPERLY DEFINED

Explanation: The FN task was unable to establish contact with VTAM because of an OPEN ACB failure. RC is the ACB error flag value in hexadecimal.

System action: The FN processing is terminated.

System programmer response: Correct the problem and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Use the return code to

EQQFV27E • EQQFV36I

determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this z/OS system.

EQQFV27E ACB OPEN FAILURE (RC=X'RC') - ABEND 1104 DUE TO SERIOUS ERROR

Explanation: The FN was unable to establish contact with VTAM because of an OPEN ACB failure. RC is the ACB error flag value in hexadecimal.

System action: The FN processing is abnormally terminated with a dump (abend code 1104).

System programmer response: Analyze the 1104 abend dump. If this was not a user error, contact IBM Software Support.

Problem determination: Use the R15 and R00 return codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this z/OS system.

EQQFV28W ACB OPEN FAILED FOR THE LAST 2 MINUTES - VTAM NOT ACTIVE

Explanation: The FN failed to establish contact with VTAM during the last two minutes because VTAM was not active. This message is issued every two minutes until contact is made.

System action: The FN continues to attempt to establish contact with VTAM until contact is made or until the IBM Tivoli Workload Scheduler for z/OS subsystem is stopped.

System programmer response: Ask your network operator to activate VTAM.

EQQFV29I VTAM TERMINATION, OR FN DEACTIVATION, STOPPED SESSION SETUP ATTEMPTS

Explanation: Session initiation attempts were stopped because VTAM is terminating or the FN task was deactivated.

System action: The FN termination processing continues.

User response: None.

EQQFV31I SUBSYSTEM STOP REQUEST TERMINATED SESSION SETUP ATTEMPTS

Explanation: A remote FN application was in the process of initiating a session when the subsystem was stopped.

System action: The FN termination processing continues.

User response: None.

EQQFV32I SUBSYSTEM STOP REQUEST TERMINATED ACB OPEN ATTEMPTS

Explanation: The FN was in the process of establishing contact with VTAM when the subsystem was stopped.

System action: The FN termination processing continues.

User response: None.

EQQFV33E ACB OPEN FAILED FOR THE LAST 2 MINUTES - FN APPLICATION NOT ACTIVE

Explanation: The FN failed to establish contact with VTAM during the last two minutes because the FN application was not activated. The FN attempts to establish contact every 10 seconds until contact is made. This message is issued every two minutes until contact is established.

System action: The FN continues to attempt to establish contact with VTAM until contact is made or until the scheduler subsystem is stopped.

System programmer response: Ask the network operator to activate the VTAM LUs.

EQQFV34E NAMEREQ REQUEST FAILURE - LU/APPLICATION NODE INHIBITED

Explanation: The VTAM *NAMEREQ* request failed to complete successfully because the LU-name *NODE* was inhibited. The most likely reason for the failure is that either the cross-domain FN partner *NODE* has been deactivated or the partner VTAM system has been taken down.

System action: If *NAMEREQ* is the *REQSESS* request, the FN continues processing with session establishment attempts every 10 seconds. For other VTAM requests, FN processing is terminated.

System programmer response: Ask the network operator to activate the VTAM or FN application, or both applications, on the cross-domain partner system.

EQQFV36I SESSION HOME-DEST ESTABLISHED

Explanation: A session has been established between the home application *HOME* and the destination application *DEST*.

System action: The FN continues processing.

User response: None.

EQQFV37I SESSION HOME-DEST ENDED

Explanation: The session between the home application *HOME* and the destination application *DEST* has ended.

System action: The FN continues processing.

User response: None.

EQQFV41E THE FN TASK IGNORED THE FOLLOWING ELEMENT ON THE FN QUEUE *DQE*

Explanation: An invalid element has been found by the FN task. Possibly, the first four bytes of the element do not match the IBM Tivoli Workload Scheduler for z/OS character string 'DQE'. (The fourth byte is a blank space.)

System action: The FN task no longer processes the element, but continues normal processing.

System programmer response: Save the Tivoli Workload Scheduler for z/OS message log data set containing this error message and contact IBM Software Support.

EQQFV42E THE FN TASK IGNORED THE FOLLOWING DATA, RECEIVED FROM '*NODE*' *DQE*

Explanation: The FN task did not recognize the type of data received from the application. This message is issued once for every invalid receive operation.

System action: The FN task continues processing

System programmer response: Verify that the session parameters specified in the VTAM LOGMODE table are valid. Especially check that the ru-sizes are not zero.

If this message occurs during normal execution and the VTAM LOGMODE definitions are correctly specified, contact IBM Software Support.

EQQFV43E INVALID RU-SIZE SPECIFIED IN '*LU*' SESSION PARAMETERS

Explanation: The ru-sizes specified in the session parameters are not valid.

System action: The FN continues processing, but the specified session is not established.

System programmer response: Verify that the ru-sizes specified are valid. If necessary, specify different ru-sizes, and stop and restart the FN task.

Chapter 205. EQQGnnn messages

EQQG001 - EQQG109

EQQG001I SUBTASK *SUBTASK* HAS STARTED

Explanation: The subtask *SUBTASK* has been successfully initialized.

System action: Processing for the indicated subtask is started.

User response: None.

EQQG002E INITIALIZATION OF SUBTASK *SUBTASK* FAILED. REASON CODE: *RS*

Explanation: The indicated subtask could not acquire all the resources needed for normal operation.

System action: Processing continues but no requests from the dialog or the program interface for IBM Tivoli Workload Scheduler for z/OS can be served.

System programmer response: Correct errors shown by the earlier messages and restart the subtask indicated.

User response: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error.

Problem determination: The message variable *RS* can have the following values:

- 02 The main task, the normal mode manager, is unavailable.
- 11 The application description file is unavailable.
- 12 The workstation description file is unavailable.
- 13 The calendar file is unavailable.
- 14 The period file is unavailable.
- 15 The all workstations closed record is unavailable.
- 16 The operator instruction file is unavailable.
- 17 The JCL variables file is unavailable.
- 18 The resource description file is unavailable.
- 19 The ETT criteria file is unavailable.
- 21 End-to-end input/output queue file is unavailable.
- 22 End-to-end input/output queue file initialization failed.

EQQG003I SUBTASK *SUBTASK* HAS ENDED

Explanation: This message is issued when the IBM Tivoli Workload Scheduler for z/OS subsystem is being stopped by an operator command.

System action: IBM Tivoli Workload Scheduler for z/OS termination processing continues.

User response: None.

EQQG004E SUBTASK *SUBTASK* ABENDED, IT IS RESTARTED AT *RETRYAT*

Explanation: A serious error caused the *SUBTASK* subtask to end abnormally. *SUBTASK* has been able to restart, at *RETRYAT*.

System action: *SUBTASK* resumes normal processing, but one or more requests for service may have been rejected. The dialog user requesting service may or may not be informed about the completion or termination of the requests. A dump is created. Message EQQX271E, when issued, informs the dialog user that the request has failed due to a serious error in *SUBTASK*. If the subtask is GENERAL SERVICE, the dialog user must press "attention" to break the request.

System programmer response: Collect relevant information about the sequence of events leading to this error, make the dump data set and the message log available for inspection. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for general service problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Inform the system programmer about the error and, (if the error can be reproduced), of the sequence of dialog requests leading to the error.

Problem determination: Review the dump data set to determine what caused the problem.

EQQG005E VALIDATION FAILED FOR FILE: *FILE*, REASON: *REASON*, OFFSET: *POS*

Explanation: The record that was to be written to the IBM Tivoli Workload Scheduler for z/OS database was rejected because it was incorrect.

System action: No update to the database is made.

System programmer response: If you cannot find a valid reason for the error, make the dump data set (ddname EQQDUMP) and the message log available for inspection. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems, sub-section "Information to collect for general service problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Look in the dump data set (ddname EQQDUMP) for further information about the error. This data set contains the record and the position of the error. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: *FILE* gives the database on which the update was attempted, *REASON* indicates the reason for the failure, and *POS* indicates the failing position in hexadecimal form within the record.

See Chapter 234, "Reason codes," on page 1417 for a list of the reason codes and their meanings.

EQQG006I THE FUNC FUNCTION IS ACTION BY USER

Explanation: This message confirms and logs some action taken to a IBM Tivoli Workload Scheduler for z/OS function. *FUNC* is either AUTOMATIC JOB RECOVERY or JOB SUBMISSION. *ACTION* is either ACTIVATED or DEACTIVATED. *USER* is the user ID of the user who requested the function. The message confirms that the dialog request has been successfully accomplished.

System action: Processing continues.

User response: None.

EQQG007E THE LEVEL OF EQQMINOx IS NOT THE SAME AS THE LEVEL OF GENERAL SERVICE

Explanation: The version of the module EQQMINOx is not the correct version to handle the data communication between the Controller and user address space.

System action: The system proceeds with the next request.

System programmer response: Ensure that the EQQMINOx program is of the same level as the EQQGSBEX module. EQQMINOx is accessed by the dialog user and Program Interface programs. EQQGSBEX is accessed by the Controller.

User response: None.

EQQG008W THE REQUEST FAILED, GENERAL SERVICE QUEUING PROBLEM, REASON: XSSRS

Explanation: The request was rejected because of an

interface problem in the General Service function.

System action: The system waits for you to respond.

System programmer response: Correct the General Service error given in the IBM Tivoli Workload Scheduler for z/OS message log.

User response: Try again. If the error persists, contact your system programmer.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log for errors related to General Service to determine the cause of the error.

EQQG009W INSUFFICIENT VIRTUAL STORAGE FOR THE COMPLETE LIST, REASON: XSSRS

Explanation: The requested list could not be displayed because the amount of virtual storage in the dialog address space was not sufficient. There is a limit of 16MB on all data transfers.

System action: A partial list is displayed, or no list at all.

User response: If this is a request from a dialog function in which a selection criterion can be specified, change the selection criterion to select fewer items. Increase the region size at TSO logon.

EQQG010I GENERAL SERVICE REQUEST STATISTICS FOLLOW: TYPE TOTAL NEWRQS TOTTIME NEWTIME TOTAVG NEWAVG

Explanation: This message is issued if the GENERAL SERVICE task statistics are active. Do this either by specifying the STATMSG(GENSERV) keyword in the JTOPTS initialization statement or with the modify command, /F *subsys*,GENSTA=ON.

If any requests have been processed, this message is issued every *n* minutes, where *n* is either the value specified in the JTOPTS keyword STATIM, if it has a nonzero value, or the default of 30.

It consists of column headers defining the values of the EQQG011I message following.

The following column headers are defined:

TYPE The request for which data was gathered.

TOTAL

The total number of requests of this type.

NEWRQS

The number of requests of this type since the last message.

TOTTIME

The total time, in seconds, used to process this request.

NEWTIME

The total time, in seconds, used to process this request since the last message.

TOTAVG

The average time, in seconds, used to process a request of this type.

NEWAVG

The average time, in seconds, used to process a request of this type since the last message.

The value in the TYPE column is one of the following resources:

ALL	Total line for all resources
AD	Application description
AR	Automatic recovery
PERI	Calendar periods
CALE	Calendar
CRIJ	Critical job
CRDP	Dependency job on a critical path
WSCL	All workstations closed
WSD	Workstation description
LTPS	Long-term plan
PLAN	Long-term plan status
WS	Current plan workstation status
WSRL	Current plan workstation status requested from the ready list
RL	Current plan ready list
OPER	Current plan operation
OPRL	Current plan operation requested from the ready list
PREP	Preparation CPU operations
DEPC	Dependency operation
R3P	Current plan operation record
C3C	Current plan occurrences
C3CR	Current plan occurrences requested from the ready list
CP_G	Current plan general
JCL	JCL Repository record
JSUB	Job submission
JCLA	Automatic JCL preparation
JCLP	Promptable JCL variables
JCLT	JCL tailoring
JVAR	Tailoring session
JV	JCL variable table
RACF	Refresh RACF resources
SRES	Special resources
ETT	Event-triggered tracking
OI	Operator instruction
STAT	IBM Tivoli Workload Scheduler for z/OS status record
MCP	Modify current plan
DEP	Successor candidates
CATM	Restart and cleanup
OTHR	All other resources

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQG011I TYPENUMRQNEWRQTOT
TNEWTAVGNAVG

Explanation: This message is issued if the GENERAL SERVICE task statistics are active. This can be done either by specifying the STATMSG(GENSERV) keyword in the JTOPTS initialization statement or with the modify command, /F *subsys*,GENSTA=ON.

If any requests have been processed, this message is issued every *n* minutes, where *n* is either the value specified in the JTOPTS keyword STATIM, if it has a nonzero value, or the default of 30.

In the message text shown above:

nnnnn A 5-digit number.

secs The number of seconds.

The message contains data about how the general service subtask processed requests for one resource. See the description of message EQQG010I for an explanation of what the data values mean.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQG012I GENERAL SERVICE QUEUE
STATISTICS FOLLOW: TYPE TOTAL
Q1 Q2 Q5 Q10 Q20 Q50 Q100 >100

Explanation: This message is issued if the GENERAL SERVICE task statistics are active. This can be done either by specifying the STATMSG(GENSERV) keyword in the JTOPTS initialization statement or with the modify command, /F *subsys*,GENSTA=ON.

If any requests have been processed, this message is issued every *n* minutes, where *n* is either the value specified in the JTOPTS keyword STATIM, if it has a nonzero value, or the default of 30.

The message shows the size and delay of the General Service queue since the message was last issued.

The value below the TYPE heading can be either QUEUE SIZE or QUEUE DELAY. The value below the TOTAL heading gives the total number of times that the General Service queue was emptied. The values below the Qx headings give the number of times that either the length of the queue or the time spent waiting for General Service processing, was in a particular interval. For example, Q20 on the queue size line gives the number of times that the queue size was between 11 and 20 requests.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQG013I TYPETOTSZQ1Q2Q3 Q4Q5Q6Q7Q8

Explanation: This message is issued if the GENERAL SERVICE task statistics are active. This can be done either by specifying the STATMSG(GENSERV) keyword in the JTOPTS initialization statement or with the modify command, /F *subsys*,GENSTA=ON.

If any requests have been processed, this message is issued every *n* minutes, where *n* is either the value specified in the JTOPTS keyword STATIM, if it has a nonzero value, or the default of 30.

In the message text shown above:
nnnnn A 5-digit number.

This message contains data about the General Service queue size. See the description of message EQQG012I for an explanation of what the data values mean.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQG014W REQUEST TERMINATED BECAUSE TIME LIMIT IS EXCEEDED

Explanation: A general service request has terminated because the requesting process: a program interface (PIF) program or a dialog user, did not respond within 10 minutes.

System action: Processing continues.

User response: None.

EQQG015W REQUEST TERMINATED - REQUESTOR NO LONGER CONNECTED

Explanation: A general service request was terminated because the requesting process: a program interface (PIF) program or a dialog user, is no longer connected to the general service subtask. The connection can be lost if the requestor is canceled, or if a dialog user presses the ATTN (attention) key, after a request for service has been sent to the controller and before a response has been received.

System action: Processing continues.

User response: None.

EQQG016E MORE THAN 40 DEPENDENCIES DEFINED FOR OPERATION *OPN* IN APPLICATION *APPL*. THE IA IS *IA*

Explanation:

The request to update the current plan failed because the general service task detected more than 40 dependencies defined for the operation. A dependency can be:

- A predecessor operation

- One or more special resources required by the operation. In this case, one dependency has to be considered regardless of the number of required resources

System action: The request is rejected and no update is made.

User response: Decrease the number of dependencies specified for the reported operation and repeat the request.

EQQG017W THE FOLLOWING DEPENDENCIES WERE REMOVED AND AFFECTED CRITICAL PATHS MUST BE RECALCULATED:ADID IADATE IATM WSD OPNO JOBNM

Explanation: Modifying the current plan has caused the deletion of one or more dependencies belonging to critical paths. As a consequence, all the involved critical paths need to be recalculated. IBM Tivoli Workload Scheduler for z/OS does not update critical paths during plan execution.

This message is stored in the controller EQQMLOG data set. It is the header for message EQQG018 and indicates:

- Application definition ID
- Input arrival date
- Input arrival time
- Workstation definition ID
- Operation number
- Job name

System action: None.

User response: Recalculate the critical paths by running a batch daily planning replan.

EQQG018W FIELD CRITICAL HAS BEEN SET TO NEWCRT FOR OPERATION ADID IA WSID OPNUM JOBNAME BUT NO JOB TABLE DATA SPACE HAS BEEN ALLOCATED.

Explanation: You changed to P the CRITICAL field for the operation indicated by the message variables, but the critical job table does not exist. The reason is that the last daily planning produced a plan containing no critical jobs. Therefore, the critical path handler task did not allocate the job table data space.

System action: None.

User response: Run a batch daily planning replan.

EQQG019I THE FIELD CRITICAL WAS SET TONEWCRT FOR OPERATION ADID IA WSID OPNUM JOBNAME. AFFECTED CRITICAL PATHS WILL BE RECALCULATED.

Explanation: Modifying the current plan has changed

the value in the CRITICAL field for the job (either from P to another value or from another value to P). As a consequence, the scheduler automatically recalculates all the affected critical paths.

System action: None.

User response: None.

EQQG100E GDDM COULD NOT BE LOADED

Explanation: When requesting a graph, IBM Tivoli Workload Scheduler for z/OS could not load GDDM*.

System action: The graph request is ignored. Processing continues.

System programmer response: Make sure that the GDDM load library is part of ISPLLIB.

User response: Contact your system programmer.

EQQG101E CPATH DS NOT AVAIL

Explanation: The data space for the critical path is not available. This occurred for either of the following reasons:

- At the startup of the controller or extension of the current plan, there were no critical jobs.
- The controller started with the CRITJOBS parameter in the OPCOPTS initialization statement set to No.

System action: The request for the critical path is not satisfied because the critical path data space does not exist. The request is ignored.

User response: Do one of the following:

- Ensure the CRITJOBS parameter in the OPCOPTS initialization statement is set to Yes and restart the controller.
- Run the daily plan batch using REPLAN or EXTEND to build the critical path data space.

EQQG101W THE MAXIMUM NUMBER OF ROWS THAT CAN BE DISPLAYED HAS BEEN REACHED

Explanation: The requested list cannot be displayed, because the ISPF TBADD function supports only 32767 rows.

System action: A partial list of rows is displayed.

User response: If you requested the list from a dialog where you can set a selection criterion, specify a selection criterion to select fewer items.

EQQG102E CPATH DS NOT AVAIL

Explanation: The data space for the critical path is not available. This occurs for either of the following reasons:

- At the startup of the controller or extension of the current plan, there are no critical jobs.
- The controller started with the CRITJOBS parameter, in the OPCOPTS initialization statement, set to No.

System action: The request for the critical path is not satisfied because the critical path data space does not exist. The request is ignored.

User response: Do one of the following:

- Ensure the CRITJOBS parameter in the OPCOPTS initialization statement is set to Yes and restart the controller.
- Run the daily plan batch using REPLAN or EXTEND to build the critical path data space.

EQQG104W POSITION THE CURSOR ON AN ELEMENT IN THE GRAPHICAL AREA

Explanation: A graph selection command has been given, but the cursor was not located in the graphical area.

System action: The command is ignored. Processing continues.

User response: Position the cursor in the graphical area at or close to the element to be selected and reissue the command.

EQQG105E DUMMY NODES ARE NOT VALID, REPOSITION CURSOR

Explanation: This node is a dummy node and as such has no data related to it.

System action: The system waits for you to respond.

User response: Specify another node for processing.

EQQG106I THE SPECIFIED ATTRIBUTE MUST BE NUMERIC. SEE GDDM MANUALS

Explanation: An invalid graphical attribute has been given.

System action: The attribute panel is redisplayed and prompts you for a correct attribute value.

User response: Correct the invalid attribute.

EQQG107I THE GDDM IS NOT ALLOWED IN SPLIT SCREEN MODE

Explanation: The GDDM is not allowed in split-screen mode.

System action: The call to GDDM is disabled.

User response: Set the screen in single-screen mode and repeat the command.

EQQG109E

**EQQG109E NET LOADER MODULE COULD NOT
BE LOADED**

Explanation: When requesting a graph, IBM Tivoli Workload Scheduler for z/OS could not load the net building routine.

System action: The graph request is ignored. Processing continues.

System programmer response: Make sure that the ISPLLIB libraries are updated to contain the graph net building routines. The name of the routine can be seen in the ISPF log. See message EQQX009.

User response: Contact your system programmer.

Chapter 206. EQQHnnn messages

EQQH001 - EQQH712

EQQH001E THE NETVIEW INTERFACE MODULE CNMNETV COULD NOT BE LOADED

Explanation: CNMNETV was not found in the library search path.

System action: IBM Tivoli Workload Scheduler for z/OS continues, but the generic alert functions as requested in the GENALERT keyword of the ALERT initialization statement are disabled. Instead, IBM Tivoli Workload Scheduler for z/OS generates WTO messages for the error conditions specified in the GENALERT keyword.

System programmer response: Ensure that the CNMNETV module is accessible and restart IBM Tivoli Workload Scheduler for z/OS.

EQQH003E SEND GENERIC ALERT TO NETVIEW FAILED WITH RC=RC

Explanation: Request type 12 sent to the NetView[®]* PPI failed.

System action: A WTO is issued instead of the generic alert.

System programmer response: Check NetView documentation for further information.

EQQH201W AN INCORRECTLY PLACED COMMA AT H20101 IS IGNORED

Explanation: You have coded a comma that is not required at *H20101*.

System action: The statement is accepted. The extraneous comma is ignored. Tivoli Workload Scheduler for z/OS continues verifying the statements.

User response: If you rerun the job, remove the extra comma.

EQQH202W AN INCORRECTLY PLACED COMMA IN THE PARMSTRING IS IGNORED

Explanation: An unnecessary comma is coded in the parameter.

System action: The parameter is accepted and the extraneous comma is ignored. The IBM Tivoli Workload Scheduler for z/OS continues verifying the commands

User response: Remove the extra comma and rerun.

EQQH203E THE KEYWORD H20301 APPEARS

TOO MANY TIMES

Explanation: A statement is specified with two or more identical keywords.

System action: IBM Tivoli Workload Scheduler for z/OS continues to verify the statement, but the database is not updated.

User response: Remove the duplicate keyword and rerun.

EQQH204E THE STATEMENT H20401 IS UNDEFINED

Explanation: The statement *H20401* is not recognized.

System action: Processing of the statement is terminated.

User response: Correct the invalid statement and rerun.

EQQH205E THE COMMAND IS MISSING OR THE FORMAT IS INVALID

Explanation: The statement does not start with a valid command.

System action: Processing of the statement is terminated.

User response: Add a valid command or correct the invalid command and rerun.

EQQH206E AN END OF COMMENT IS MISSING AT THE END OF THE STATEMENT

Explanation: A start of comment delimiter (*/**) has been detected, without a corresponding end of comment (**/*).

System action: Processing of the statement is terminated

User response: Add an end of comment (**/*) and rerun.

EQQH207W A MISSING END QUOTE IS ASSUMED AT THE END OF THE STATEMENT

Explanation: The quote for this character string is not closed.

System action: IBM Tivoli Workload Scheduler for

EQQH208E • EQQH219E

z/OS assumes the quote ends after the control statement.

User response: Add a quote and rerun if required.

EQQH208E THE KEYWORDS *H20801* AND *H20802* ARE EXCLUSIVE

Explanation: Two mutually exclusive keywords are entered on the same statement.

System action: Processing of the statement is terminated.

User response: Remove one of the keywords and rerun.

EQQH209E AN INVALID RIGHT PARENTHESIS WAS FOUND AT *H20901*

Explanation: More right parentheses than left parentheses are coded.

System action: Processing of the statement is terminated.

User response: Correct the number of parentheses and rerun.

EQQH210E TOO MANY VALUES ARE CODED IN THE KEYWORD *H21001*

Explanation: The keyword *H21001* has too many coded values.

System action: Processing of the statement is terminated.

User response: Correct the keyword values and rerun.

EQQH211E AN INVALID VALUE *H21101* SPECIFIED OR A KEYWORD IS MISSPELLED

Explanation: Either the value *H21101* is not valid for the keyword or the keyword is misspelled.

System action: Processing of the statement is terminated.

User response: Correct the statement and rerun.

EQQH213E A VALUE IS MISSING AFTER *H21301*

Explanation: Not enough keyword values are specified for *H21301*.

System action: Processing of the statement is terminated.

User response: Add the missing keyword value (or values) and rerun.

EQQH214E TOO MANY LEFT PARENTHESSES OR AN INVALID VALUE FOUND AT *H21401*

Explanation: Too many parentheses are provided at *H21401* or you have provided an invalid value for a keyword.

System action: Processing of the statement is terminated.

User response: Correct the statement and rerun.

EQQH215E TOO MANY LEFT PARENTHESSES ARE INSERTED IN THE PARMSTRING

Explanation: Too many left parentheses are provided.

System action: Processing of the statement is terminated.

User response: Remove the extra left parentheses and rerun.

EQQH216E A LEFT PARENTHESIS IS MISSING BEFORE *H21601*

Explanation: A left parenthesis is missing.

System action: Processing of the statement is terminated.

User response: Add the missing left parenthesis and rerun.

EQQH217E AN INVALID COMMA IS INSERTED IN *H21701*

Explanation: A keyword and its values are separated by an invalid comma.

System action: Processing of the statement is terminated.

User response: Remove the comma and rerun.

EQQH218W A MISSING RIGHT PARENTHESIS IS ASSUMED AT THE END OF THE STATEMENT

Explanation: The right parenthesis, which should delimit the end of statement, is missing. Too many items might be specified.

System action: The processing continues.

User response: Specify the keyword and its value in the correct format and rerun.

EQQH219E THE REQUIRED KEYWORD *H21901* IS MISSING

Explanation: The keyword *H21901* is missing from the statement.

System action: Processing of the statement is terminated.

User response: Specify the missing keyword and rerun.

EQQH220E A REQUIRED KEYWORD IS MISSING. SPECIFY EITHER H22001 OR H22002

Explanation: You must specify either *H22001* or *H22002*.

System action: Processing of the statement is terminated.

User response: Specify one of the keywords and rerun.

EQQH221E AN INVALID H22101H22102 WAS FOUND IN THE KEYWORD H22103

Explanation: The value type *H22101* in field *H22102* for keyword *H22103* is invalid.

System action: Processing of the statement is terminated.

User response: Specify a valid value and rerun.

EQQH222E AT LEAST ONE KEYWORD MUST BE SPECIFIED FOR STATEMENT H22201

Explanation: You must specify at least one keyword for *H22201*.

System action: Processing of the statement is terminated.

User response: Correct the command and rerun.

EQQH223E THE EMPTY QUOTED STRING IS INVALID FOR THE KEYWORD H22301

Explanation: No values are specified for keyword *H22301*.

System action: Processing of the statement is terminated.

User response: Correct the string and rerun.

EQQH224E REQUIRED KEYWORD(S) MISSING IN COMMAND H22401

Explanation: One or more required keywords were not found in the statement *H22401*.

System action: Processing of the statement is terminated.

User response: Correct the statement and rerun.

EQQH301E NUMERIC FACTOR H30101 EXCEEDS CYCLE H30102 LENGTH

Explanation: A numeric factor is out of range.

System action: The rule is invalid and is not saved.

User response: Correct the numeric factor or cycle specification and rerun.

EQQH302E NUMERIC FACTOR H30201 AND WEEKDAY > CYCLE H30202 LENGTH

Explanation: A numeric factor combined with a week day exceeds the period length. The name of a predefined cycle is preceded by two unprintable characters (..).

System action: The rule is invalid and is not saved.

User response: Correct the numeric factor or cycle specification and rerun.

| **EQQH303E THE USER PERIOD H30301 DOES NOT EXIST**

| **Explanation:** The specified user period or period automatically generated from a run cycle group is invalid. The name of the scheduler predefined cycles is preceded by two unprintable characters (..).

| **System action:** The rule is invalid and is not saved.

| **User response:** Correct the period specification and rerun.

EQQH304E THE CALENDAR H30401 DOES NOT EXIST

Explanation: The specified calendar *H30401* is invalid.

System action: The rule is invalid and is not saved.

User response: Correct the calendar specification and rerun.

EQQH305E ORIGIN SHIFT H30501 IS TOO LARGE FOR THE PERIOD H30502.

| **Explanation:** The number specified for origin shift is out of range for period *H30501* (either a user period or a period automatically generated from a run cycle group). The name of the scheduler predefined cycles is preceded by two unprintable characters (..).

| **System action:** The rule is invalid and is not saved.

| **User response:** Correct the origin shift or period specification and rerun.

EQQH306W SELECTION OF EVERY AND FIRST/LAST - INTERPRETED AS EVERY

Explanation: You have selected both EVERY and FIRST (or numeric 1) or EVERY and LAST during the definition of a rule. The rule is interpreted as EVERY without any numeric factor. This may not be what you intended.

System action: The system waits for you to respond.

User response: Decide whether the rule should be defined using EVERY or ONLY. Change the selected fields if required. If you are unsure of the affect of EVERY and ONLY use the GENDAYS command.

EQQH308W DUPLICATE VALUE(S) H30801 IGNORED.

Explanation: You have specified duplicate values. Only one of the values is used.

System action: The duplicate value is removed.

User response: Check the specified values and correct them if necessary.

EQQH309E THE SAVED RULE VALUE HAS BEEN DESTROYED, PLEASE REENTER THE INFO

Explanation: The rule value saved on the application description database is invalid and cannot be used.

System action: The rule is invalid and must be reentered before use.

User response: Reenter the rule and rerun.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the rule value.

EQQH310E UNEXPECTED ERROR IN THE CALENDAR ROUTINE

Explanation: The calendar routine used in the rule interpretation or date generation has returned an unexpected reason code.

System action: Processing of this specific rule cannot continue.

User response: This is likely to be an internal error. If possible, rerun the request.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks.

EQQH401I NO DATE GENERATED BY THIS RULE

Explanation: No date is generated by this rule.

System action: No dates are generated.

User response: Check the rule and the validity period.

EQQH402W THE PERIOD H40201 HAS NO ORIGIN WITHIN RULE VALIDITY.

| **Explanation:** The period H40201 (either a user period
| or a period automatically generated from a run cycle
| group) has no origin within rule validity period.

System action: No dates are generated.

User response: Correct the period specification or validity period and rerun.

EQQH501W NUMERIC FACTOR H50101 EXCEEDS CYCLE H50102 LENGTH

Explanation: A numeric factor is out of range.

System action: The rule is invalid and is not saved.

User response: Correct the numeric factor or cycle specification and rerun.

EQQH502W NUMERIC FACTOR H50201 TOGETHER WITH WEEKDAY EXCEEDS CYCLE H50202 LENGTH

Explanation: A numeric factor combined with a week day exceeds the period length. The name of a predefined cycle is preceded by two unprintable characters (..).

System action: The rule is invalid and is not saved.

User response: Correct the numeric factor or cycle specification and rerun.

| **EQQH503W THE PERIOD H50301 DOES NOT EXIST**

| **Explanation:** The specified user period or period
| automatically generated from a run cycle group is
| invalid. The name of the scheduler predefined cycles
| does not exist.

| **System action:** The rule is invalid and is not saved.

| **User response:** Correct the period specification and
| rerun.

EQQH504W THE CALENDAR H50401 DOES NOT EXIST

Explanation: The specified calendar H50401 is invalid.

System action: The rule is invalid and is not saved.

User response: Correct the calendar specification and rerun.

EQQH505W ORIGIN SHIFT H30501 IS TOO LARGE FOR THE PERIOD H30502.

Explanation: The number specified for origin shift is out of range for period H30501 (either a user period or a period automatically generated from a run cycle group). The name of a predefined cycle is preceded by two unprintable characters (..).

System action: The rule is invalid and is not saved.

User response: Correct the origin shift or period specification and rerun.

EQQH509W THE SAVED RULE VALUE HAS BEEN DESTROYED, PLEASE REENTER THE INFORMATION

Explanation: The rule value saved on the application description database is invalid and cannot be used.

System action: The rule is invalid and must be reentered before use.

User response: Reenter the rule and rerun.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the rule value.

EQQH511E CALENDARS DATASPACE CREATION FAILED

Explanation: An error occurred while the batch program or the normal mode manager subtask was trying to create the calendar dataspace.

System action: The job or the normal mode manager is terminated.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause and if the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>. If you do not find any information, for the information to collect, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQH700I HIGHEST RETURN CODE FROM PARSER IS H70001

Explanation: This information message is displayed after parsing a date generating rule. The short message is set to 'VALID RULE' if the parser returns 04 or lower, 'INVALID RULE' for all other return codes. The return code value is shown in H70001. This message is followed by one or more information or warning messages for a valid rule, and by up to five error

messages for an invalid rule.

System action: If 'VALID RULE' is returned, the date generating rule definition is accepted. If 'INVALID RULE' is returned, the rule is rejected.

User response: If the rule is rejected, correct the rule definition according to the diagnostics provided by the messages.

EQQH701E EITHER ONLY OR EVERY MUST BE SELECTED

Explanation: ONLY and EVERY are mutually exclusive and one of them has to be selected for a valid rule definition.

System action: The request is rejected.

User response: Select one of ONLY and EVERY.

EQQH702E MAKE AT LEAST ONE SELECTION/SPECIFICATION FROM EACH RULE SECTION

Explanation: You have failed to make at least one selection/specification from each rule section.

System action: The request is rejected.

User response: Select at least one from each section.

EQQH703E THE ENTRY IS INVALID, ENTER XRSEL OR LEAVE BLANK

Explanation: You have entered an invalid value in the selection field.

System action: The request is rejected.

User response: Change the field to a valid value.

EQQH704E THE ENTRY IS INVALID, ENTER A DAY IN THE RANGE 1 TO 999

Explanation: You have entered an invalid day in the field. It must be in the range 1 to 999.

System action: The request is rejected.

User response: Change the day to a valid value.

EQQH705E A PERIOD NAME BEGINS ALPHABETICALLY, REMAINDER IS ALPHANUMERIC

Explanation: You have not entered a valid period name. A valid period name must be maximum of eight characters, where the first character must be alphabetical and the remaining characters must be alphanumeric or national.

System action: The request is rejected.

User response: Specify a valid period name.

EQQH706E THE ENTRY IS INVALID, ENTER A VALUE IN THE RANGE 1 TO 53

Explanation: You have entered an invalid week number in the field. It must be in the range 1 to 53.

System action: The request is rejected.

User response: Change the week number to a valid value.

EQQH707E THE ENTRY IS INVALID, ENTER A NUMBER IN THE RANGE 0 TO 999

Explanation: You have entered an invalid number in the field. It must be in the range 0 to 999.

System action: The request is rejected.

User response: Change the number to a valid value.

EQQH708E H70801 TOGETHER WITH SPECIFIC H70801 SELECTION(S) IS AMBIGUOUS

Explanation: Message variable *H70801* is DAY, WEEK or MONTH. You have selected one of the following combinations:

- DAY together with specific days, for example, WORKDAY, MONDAY, FRIDAY
- WEEK together with specific week numbers, for example, WEEK 26 and WEEK 34
- MONTH together with specific months, for example, APRIL, AUGUST and DECEMBER.

These specifications are redundant and make the rule ambiguous.

System action: The request is rejected.

User response: Remove the redundancies to make the selection unambiguous.

EQQH709E RULE DEFINITION CANNOT BE MAPPED, THE RULE MUST BE REDEFINED

Explanation: The internal representation of a rule cannot be interpreted and the corresponding rule command cannot be derived from it. This is most likely caused by an internal error of the product.

System action: The rule command is not mapped and rule selections are not shown.

User response: Copy the application description (AD) temporarily to another AD identification. Update the original AD by redefining the erroneous rule so as to be able to continue using the original rule or rules. Contact your local system administrator to pursue the error analysis using the copied version.

EQQH710I NO DATES GENERATED FOR THE INTERVAL *IVL*FROM*IVL*TO

Explanation: GENDAYS is unable to generate dates for the rule and interval specified.

System action: No dates are generated.

User response: Check the rule definitions and other factors that have an impact on date generation, for example, interval, calendar, user periods, and free day rule.

EQQH711E INTERVAL START *IVL*FROM IS LATER THAN INTERVAL END *IVL*TO

Explanation: The start date of the generating interval is later than the end date.

The start date of the interval is the latest of these dates:

- Run cycle in-effect date
- Application description (AD) valid-from date
- 1 January of the current year.

The end date of the interval is the earliest of these dates:

- Run cycle out-of-effect date
- AD valid-to date
- 31 December of the current year plus three years.

A maximum of four years can be displayed.

System action: The request is rejected.

User response: Check the dates, correct any inconsistency, and reenter the GENDAYS command.

EQQH712E UNABLE TO GENERATE DATES FOR THE INTERVAL *IVL*FROM*IVL*TO

Explanation: GENDAYS is not able to generate dates for the rule because the entire requested interval is outside the limits of the internal calendar

When the interval is calculated:

- The start date of the interval is the later of the run cycle in-effect date and the application description (AD) valid-from date.
- The end date of the interval is the earlier of the run cycle out-of-effect date and the AD valid-to date.

GENDAYS can generate a maximum of four years starting at 1 January of the current year and ending on 31 December of the current year plus three.

System action: The request is rejected.

User response: Check the dates for the interval, correct any inconsistency, and reenter the GENDAYS command.

Chapter 207. EQQHMnn messages

EQQHM01 - EQQHM24

EQQHM01I THE JOB STREAM INSTANCE WAS FOUND IN THE LONG-TERM PLAN ON THE REMOTE ENGINE.

Explanation: After processing a bind request, a job stream instance was bound in the long-term plan, but the instance is not included in the current plan yet. The bind request will be completed when the current plan is extended.

System action: None.

User response: None.

EQQHM02I THE JOB WAS FOUND IN THE CURRENT PLAN ON THE REMOTE ENGINE.

Explanation: After processing a bind request, a job that matches the requested criteria was found in the current plan.

System action: None.

User response: None.

EQQHM03E NO JOB MATCHES THE CRITERIA ON THE REMOTE ENGINE.

Explanation: After processing a bind request, no jobs that match the requested criteria were found in the current plan or in the long-term plan.

System action: None.

User response: None.

EQQHM04I THE REMOTE JOB IS RUNNING.

Explanation: See message text.

System action: None.

User response: None.

EQQHM05I THE SUBMISSION OF THE REMOTE JOB FAILED.

Explanation: See message text.

System action: None.

User response: None.

EQQHM06I A RECOVERY IS IN PROGRESS.

Explanation: The remote job is an end-to-end job for

which recovery options were set. The remote job ended in error, and the recovery action is in progress.

System action: None.

User response: None.

EQQHM07I THE EXECUTION OF THE REMOTE JOB FAILED.

Explanation: See message text.

System action: None.

User response: None.

EQQHM08I THE REMOTE JOB HAS BEEN SUBMITTED.

Explanation: See message text.

System action: None.

User response: None.

EQQHM09I THE REMOTE JOB COMPLETED SUCCESSFULLY OR WAS DELETED.

Explanation: See message text.

System action: None.

User response: None.

EQQHM10I THE MONITORING OF THE REMOTE JOB WAS STOPPED BY A USER REQUEST.

Explanation: A kill command was issued for the shadow job.

System action: None.

User response: None.

EQQHM20E UNKNOWN CLIENT NOTIFICATION URI.

Explanation: Tivoli Workload Scheduler for z/OS received a bind request from another engine. The request specifies a client notification URI that does not match any HTTP destination of type remote engine, defined in ROUTOPTS.

System action: The bind request is rejected.

User response: If you want to accept the request, add an HTTP destination of the appropriate remote engine

EQQHM21E • EQQHM24E

type to the ROUTOPTS statement.

EQQHM21E APPLICATION TYPE NOT VALID.

Explanation: Tivoli Workload Scheduler for z/OS received a bind request from another engine. The request specifies an application type incompatible with a bind request.

System action: The bind request is rejected.

User response: None.

EQQHM22E MISSING PARAMETER.

Explanation: Tivoli Workload Scheduler for z/OS received an HTTP request from another engine. The request does not include a mandatory parameter.

System action: The request is rejected.

User response: None.

EQQHM23E INCORRECT PARAMETER.

Explanation: Tivoli Workload Scheduler for z/OS received an HTTP request from another engine. The request contains a parameter with an incorrect value.

System action: The request is rejected.

User response: None.

EQQHM24E GENERIC ERROR.

Explanation: Tivoli Workload Scheduler for z/OS received an HTTP request from another engine. An error occurred while managing the request.

System action: The request is rejected.

User response: None.

Chapter 208. EQQHTnn messages

EQQHT01 - EQQHT74

EQQHT01I THE HTTP CLIENT
COMMUNICATION TASK HAS
STARTED.

Explanation: The HTTP client communication task has successfully completed initialization.

System action: The HTTP client communication task processing continues.

User response: None.

EQQHT02I THE HTTP CLIENT
COMMUNICATION TASK HAS
ENDED.

Explanation: The HTTP client communication task has ended either because the controller is in the process of shutting down or as a result of an operator modify command to terminate this task or a related task.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQHT03E THE HTTP CLIENT
COMMUNICATION TASK FAILED TO
INITIALIZE THE C PROCESS.

Explanation: An error occurred while attaching a task to run the C code as an MVS executable program: an invocation to the BPXIATM callable service failed.

System action: The HTTP client task initialization fails.

User response: Try to restart the HTTP client task with the modify command. If the problem persists, contact IBM Software Support.

EQQHT04E THE HTTP CLIENT
COMMUNICATION TASK HAS
ENDED BECAUSE NO HTTP OR
HTTPS DESTINATIONS ARE
DEFINED.

Explanation: No HTTP or HTTPS destinations were defined in the ROUTOPTS statement.

System action: The HTTP client task initialization fails.

User response: None.

EQQHT05E THE HTTP CLIENT
COMMUNICATION TASK HAS
IGNORED THE FOLLOWING QUEUE
ELEMENT: *DQE*.

Explanation: The HTTP Client task received an invalid queue element. A queue element did not contain the correct eye catcher or version number.

System action: The HTTP client task does not process the invalid element, but continues normal processing.

System programmer response: Save the IBM Tivoli Workload Scheduler for z/OS message log and contact IBM Software Support.

User response: Contact your system programmer.

EQQHT06E A SEVERE ERROR IN THE HTTP
CLIENT COMMUNICATION TASK
HAS CAUSED ONE OR MORE
REQUESTS TO BE LOST.

Explanation: The HTTP client task abended while processing elements on HTTPQ because the queue chaining is invalid.

System action: z/OS recovery/termination is requested to generate a dump. All elements on HTTPQ are lost and the HTTP Client task terminates.

Programmer response: Save the message log and dump data set, and contact IBM Software Support.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log data set and the SYSMDUMP data set, to determine the cause of the problem.

EQQHT07E THE HTTP CLIENT
COMMUNICATION TASK ABENDED
WHILE PROCESSING THE
FOLLOWING REQUEST: *DQE*.

Explanation: An abend prevented the HTTP client task from processing a queue element.

System action: z/OS recovery/termination is requested to generate a dump. The HTTP client task attempts to continue normal processing.

User response: Contact your system programmer.

Programmer response: Save the message log and dump data set, and contact IBM Software Support.

Problem determination: Review the IBM Tivoli

EQQHT08I • EQQHT17W

Workload Scheduler for z/OS message log data set and the SYSMDUMP data set, to determine the cause of the problem.

EQQHT08I THE MODIFY COMMAND *CMD*
CANNOT BE PROCESSED BECAUSE
THE HTTP COMMUNICATION TASK
IS NOT RUNNING.

Explanation: See message text.

System action: None.

User response: Enter the command again when the HTTP communication task is running.

EQQHT09E ERROR PARSING JOB *JOB_NAME*.
THE KEYWORDS IN THE JOBRE
STATEMENTS ARE NOT SUPPORTED
BY THE AGENT LEVEL OF
WORKSTATION
WORKSTATION_NAME.

Explanation: See message.

System action: The job ends in error.

User response: To run job *job_name*, update the agent to the latest fix pack level.

EQQHT11I THE HTTP SERVER
COMMUNICATION TASK HAS
STARTED.

Explanation: The HTTP server communication task has successfully completed initialization.

System action: The HTTP server communication task processing continues.

User response: None.

EQQHT12I THE HTTP SERVER
COMMUNICATION TASK HAS
ENDED.

Explanation: The HTTP server communication task has ended either because the controller is in the process of shutting down or as a result of an operator modify command to terminate this task or a related task.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQHT13E THE HTTP SERVER
COMMUNICATION TASK FAILED TO
INITIALIZE THE C PROCESS.

Explanation: An error occurred while attaching a task to run the C code as an MVS executable program: an invocation to the BPX1ATM callable service failed.

System action: The HTTP server task initialization fails.

User response: Try to restart the HTTP server task with the modify command. If the problem persists, contact IBM Software Support.

EQQHT14E THE HTTP SERVER
COMMUNICATION TASK HAS
ENDED BECAUSE NO HTTP OR
HTTPS DESTINATIONS ARE
DEFINED.

Explanation: No HTTP or HTTPS destinations were defined in the ROUTOPTS statement.

System action: The HTTP server task initialization fails.

User response: None.

EQQHT15E THE HTTP CLIENT FAILED TO
PROCESS A REQUEST FOR
DESTINATION *DEST*.

Explanation: An error occurred while communicating through HTTP with the *DEST* destination. This message is followed by message EQQHT43I, which indicates the details of the error.

System action: The request fails. If the error is related to the TCP/IP connection, the destination is set to OFFLINE.

User response: Look at the error detail and try to fix the problem.

EQQHT16W THE HTTP CLIENT FAILED TO SET
THE TCP/IP JOB NAME TO *TCPNAME*.
THE DEFAULT TCPIP HAS BEEN
USED.

Explanation: An error occurred while trying to communicate with a TCP/IP stack with TCPIPJOBNAME *TCPNAME*.

System action: The HTTP client task uses the default name TCPIP.

User response: Verify your TCP/IP stack configuration and make sure that the TCPIPJOBNAME parameter in the TCPOPTS or HTTPOPTS statement is correct.

EQQHT17W THE HTTP SERVER FAILED TO SET
THE TCP/IP JOB NAME TO *TCPNAME*.
THE DEFAULT TCPIP HAS BEEN
USED.

Explanation: An error occurred while trying to communicate with a TCP/IP stack with TCPIPJOBNAME *TCPNAME*.

System action: The HTTP server task uses the default name TCPIP.

User response: Verify your TCP/IP stack configuration and make sure that the TCPIPJOBNAME parameter in the TCPOPTS or HTTPOPTS statement is correct.

EQQHT18I THE HTTP SERVER IS LISTENING FOR HTTPS REQUESTS ON LOCAL HOST NAME *HOSTNAME* WITH PORT NUMBER *SSL_PORT*.

Explanation: See message text.

System action: None.

User response: None.

EQQHT19I THE HTTP SERVER IS LISTENING FOR HTTP REQUESTS ON LOCAL HOST NAME *HOSTNAME* WITH PORT NUMBER *PORT*.

Explanation: See message text.

System action: None.

User response: None.

EQQHT20E THE HTTP SERVER WAS UNABLE TO OPEN THE EVENT DATA SET WITH DDNAME EQQHTTP0.

Explanation: The HTTP server could not open its output event data set, ddname EQQHTTP0.

System action: The HTTP server issues message EQQHT11E and is terminated.

User response: If necessary, restart the HTTP server.

Problem determination: Ensure that the ddname EQQHTTP0 is correctly specified and that the IBM Tivoli Workload Scheduler for z/OS started task is authorized to open the data set for update.

EQQHT21E THE HTTP SERVER OUTPUT DATA SET IS TOO SMALL.

Explanation: The HTTP server requires that the event data set is large enough to contain a minimum of 100 events. The data set defined by the ddname EQQHTTP0 does not fulfill this requirement.

System action: The HTTP server processing is terminated. Message EQQHT40E is issued.

System programmer response: Allocate a larger event data set. If necessary, restart IBM Tivoli Workload Scheduler for z/OS to pick up the new event data set.

EQQHT22I THE HTTP SERVER CANNOT REPOSITION AT RESTART POSITION: *CYC REC*.

Explanation: The HTTP server cannot position on the event data set with the event data set position that it has received. The restart position was probably overwritten when the event data set wrapped around.

System action: The HTTP server continues normal processing.

Programmer response: The event data set may be too small. Reallocate the data set with a larger size.

EQQHT23E UNABLE TO KILL JOB *JOBNAME* ON WORKSTATION *WSNAME*.

Explanation: The HTTP client task cannot send the KILL command for the job *JOBNAME*. For details about the reason why the operation has failed, see messages EQQHT15E and EQQHT43I. The most common reason is that the workstation is offline.

System action: The HTTP client continues normal processing.

User response: Verify the reasons why the operation has failed, and retry to issue the command after the error has been resolved.

EQQHT24E JOB *JOBNAME* ON WORKSTATION *WSNAME* WAS NOT KILLED. THE REASON IS: *RSNCODE* ON

Explanation: An error occurred while an agent was running a KILL command for the job *JOBNAME* on workstation *WSNAME*. The reason code is *RSNCODE*.

System action: None.

User response: Check the reason code to verify why the command failed.

EQQHT25E THE HTTP SERVER FAILED TO BIND ON PORT *PORT*. ERROR: *ERRNO*.

Explanation: An error was encountered when the HTTP server attempted a bind request. *ERRNO* shows the TCP/IP error number. The most common decimal values for *ERRNO* are:

- 121** The socket is already bound to an address or the socket was shut down.
- 139** The user is not authorized to bind to the port specified.

System action: The system tries to bind on port *PORT* every minute, until it is successful. If you specified a port for the SSL communication and a port for non-SSL communication, the HTTP server tries to bind also to the other port and, if successful, remains active and listens on that port while it continues to try to bind port *PORT*.

EQQHT26E • EQQHT33E

User response: Correct the problem, basing on the *ERRNO* description. If you change the initialization statement parameters, restart the subsystem, otherwise wait for the next attempt to establish the connection.

EQQHT26E THE HTTP SERVER IS NOT LISTENING ON SSL PORT *PORT* BECAUSE IT FAILED TO INITIALIZE THE SSL CONTEXT. ERROR: *SSL_ERR*.

Explanation: An error was encountered when the HTTP server attempted to initialize the SSL context. *SSL_ERR* shows the numeric error returned by the SSL API or a text explaining the error.

System action: The HTTP server cannot receive SSL requests. The system tries to bind on port *PORT* every minute, until it is successful. If you specified a port for the SSL communication and a port for non-SSL communication, the HTTP server tries to bind also to the other port and, if successful, remains active and listens on that port while it continues to try to bind to port *PORT*.

User response: Correct the problem, basing on the *SSL_ERR* description. If you change the initialization statement parameters, restart the subsystem, otherwise wait for the next attempt to establish the connection.

EQQHT27E THE HTTP SERVER FAILED TO ACCEPT A NEW CONNECTION. ERROR: *ERRNO*.

Explanation: An error was encountered when the HTTP server attempted to accept a new connection request. *ERRNO* shows the TCP/IP error.

System action: The HTTP server closes the connection and retries to listen on the specified ports.

User response: Correct the problem, basing on the *ERRNO*.

| **EQQHT28E THE AGENT FAILED TO SUBMIT THE**
| **JOB WITH OPERATION NUMBER:**
| ***OPNUM* OCCURRENCE TOKEN:**
| ***OCCTOKEN*.**

| **Explanation:** The agent failed to submit a job on a
| z/OS remote engine. Message EQQHT43I follows this
| message and provides the details of the error.

| **System action:** Processing continues.

| **User response:** See the information provided by
| message EQQHT43I.

EQQHT29E THE HTTP SERVER FAILED TO INITIALIZE THE SSL CONTEXT FOR A NEW CONNECTION. ERROR: *SSL_ERR*.

Explanation: An error was encountered when the

HTTP server attempted to initialize the SSL context for a new connection request. *SSL_ERR* shows the numeric error returned by the SSL API or a text explaining the error.

System action: The new connection request is rejected. The HTTP server continues its processing.

User response: Correct the problem, basing on the *SSL_ERR* description.

EQQHT30E THE HTTP SERVER FAILED TO RECEIVE DATA ON A SOCKET. ERROR: *ERRNO*.

Explanation: An error was encountered when the HTTP server attempted to receive data on a socket. *ERRNO* shows the numeric error returned by the SSL API or a text explaining the error.

System action: The connection is closed and the HTTP server continues its processing.

User response: Correct the problem, basing on the *ERRNO* description.

EQQHT31E THE HTTP SERVER FAILED TO MANAGE A REQUEST.

Explanation: The HTTP server failed to manage an HTTP request. The request can be either a status change notification or a bind request.

System action: The request is rejected. The HTTP server continues its processing.

User response: None.

EQQHT32E THE HTTP SERVER FAILED TO SEND DATA ON A SOCKET. ERROR: *ERRNO*.

Explanation: The HTTP server failed to send the HTTP response for a status change notification.

System action: The HTTP server continues its processing. This could cause the event manager to discard some events.

User response: None.

EQQHT33E THE HTTP SERVER RECEIVED THE UNSUPPORTED REQUEST *REQUEST*.

Explanation: The HTTP server received from an external client an unsupported request.

System action: The unsupported request is discarded. The HTTP server continues processing.

User response: None.

EQQHT34E ERROR RESERVING A BLOCK OF STORAGE OF *N* BYTES. MODULE: *MODULE* - LINE: *LINE*.

Explanation: The HTTP client or server received an error while reserving a block of storage of *n* bytes length.

System action: The action requesting the storage fails.

User response: Collect the appropriate documentation and contact the Customer Support. A minimum set of documentation is a console dump of the controller address space, the message log, and, if present, the trace log. A possible recovery action is to restart the controller.

EQQHT35E ERROR PARSING JOB *JOBNAME*. PASSWORD NOT FOUND FOR USER *USER* ON WORK STATION *WSNAME*.

Explanation: In job *JOBNAME* the *JOBPWD* keyword is set to *YES*, meaning that the password of user *USER* on workstation *WSNAME* is specified in the *USRREC* statement. The parse has failed because the password is not present.

System action: Parsing fails and the job is set in Error status.

User response: Correct the problem by editing the JCL for the job and setting *JOBPWD* to *NO*, or add the *USRREC* statement for the user *USER* on workstation *WSNAME*. Then rerun the job.

EQQHT36E ERROR PARSING JOB *JOBNAME*. LINE *LINE*.

Explanation: The HTTP client is parsing job *JOBNAME* before submitting it, and an error has occurred while parsing line *LINE*.

System action: Parsing fails and the job is set in Error status.

User response: Correct the problem by editing the JCL for the job. Run the job again.

EQQHT37E ERROR PARSING JOB *JOBNAME*. INCORRECT VALUE FOR KEYWORD *KEYW*.

Explanation: The HTTP client is parsing job *JOBNAME* before submitting it, and an error has occurred during parsing. The value specified for the keyword *KEYW* is incorrect.

System action: Parsing fails and the job is set in Error status.

User response: Correct the problem by editing the JCL for the job. Run the job again.

EQQHT38E ERROR PARSING JOB *JOBNAME*. UNBALANCED *JOBREC* STATEMENT.

Explanation: The HTTP client is parsing job *JOBNAME* before submitting it and an error has occurred during parsing. Typical errors that can cause this message to be issued are:

- *//JOBREC* line is present but *//END JOBREC* line is missing
- *//END JOBREC* line is present but *//JOBREC* line is missing
- *//JOBREC* line is duplicated

System action: Parsing fails and the job is set in Error status.

User response: Correct the problem by editing the JCL for the job. Run the job again.

EQQHT39E ERROR CONVERTING CHARACTERS. MODULE *MODULE* - LINE: *LINE*. *ERR_STRING*

Explanation: The HTTP client received an error while converting a series of characters from an encoded character set. *ERR_STR* shows the reason of the failure.

System action: The request for the conversion fails.

User response: Contact the Customer Support.

EQQHT40E EVENT DATASET ERROR: HTTP SERVER COMMUNICATION TASK HAS ENDED.

Explanation: The HTTP server subtask closes because an error occurred while reading an event from *EQQHTTP0*.

System action: The HTTP server task initialization fails.

User response: None.

EQQHT43I MSG_TEXT

Explanation: This message contains additional details for other messages (*EQQHT15E*, *EQQHT28E*, *EQQHT44E*, *EQQHT70W* and *EQQOC24W*).

System action: Processing continues.

User response: Integrate this information with the related message information.

EQQHT44E THE AGENT FAILED TO SUBMIT THE JOB *JOBNAME* ON WORKSTATION *WSNAME*. OPERATION NUMBER: *OPNUM* OCCURRENCE TOKEN: *TOKEN*.

Explanation: The agent failed to submit the job. Message *EQQHT43I* follows this message and indicates the details of the error.

EQQHT45E • EQQHT53W

System action: Processing continues.

User response: Integrate this information with the related EQQHT43I message information.

EQQHT45E THE HTTP SERVER RECEIVED A REQUEST WITH AN INCORRECT VALUE FOR THE *PARM* PARAMETER.

Explanation: The HTTP server received an incorrect HTTP request. The request can be either a status change notification or a bind request. The error concerns the internal parameter *PARM*, which has an incorrect value.

System action: The request is rejected.

User response: Check if the HTTP server is incorrectly contacted by an extraneous client. If this is not the case, this is an internal error. Contact IBM Software Support for assistance.

EQQHT46E THE HTTP SERVER RECEIVED A REQUEST WITH NO VALUE SPECIFIED FOR THE *PARM* PARAMETER.

Explanation: The HTTP server received an incorrect HTTP request. The request can be either a status change notification or a bind request. The error concerns the internal parameter *PARM*, which is missing.

System action: The request is rejected.

User response: Check if the HTTP server is incorrectly contacted by an extraneous client. If this is not the case, this is an internal error. Contact IBM Software Support for assistance.

EQQHT47E NOR THE SCRIPT NEITHER THE COMMAND WAS SET FOR THE JOB *JOBNAME* .

Explanation: The HTTP server has tried to submit the job *JOBNAME*, which had nor a script neither a command set.

System action: No job is submitted.

User response: Ensure that the definition of the job is correct.

EQQHT48E ERROR PARSING JOB *JOBNAME*. KEYWORD *KEYW* NOT FOUND.

Explanation: The HTTP client is parsing job *JOBNAME* before submitting it, and an error has occurred during parsing. The required keyword *KEYW* is not specified.

System action: Parsing fails and the job is set in Error status.

User response: Correct the problem by editing the JCL

for the job. Run the job again.

EQQHT49I THE HTTP CLIENT HAS COMPLETED THE REFRESH OF THE HTTP DESTINATION LIST.

Explanation: See message text.

System action: None.

User response: None.

EQQHT50W THE HTTP DESTINATION LIST IS BEING REFRESHED. WAIT FOR IT TO COMPLETE AND ENTER THE COMMAND AGAIN.

Explanation: The command to refresh the destinations or display the list of destinations in use cannot be run, because another command to refresh the destinations is being processed.

System action: The latest command you entered to refresh the destinations or display the list of destinations in use is not processed.

User response: Wait for the refresh command to complete, then enter the command again.

EQQHT51I THE HTTP DESTINATION LIST HAS CHANGED.

Explanation: See message text.

System action: None.

User response: None.

EQQHT52I THE DESTINATION *DEST* WAS ADDED.

Explanation: See message text.

System action: None.

User response: None.

EQQHT53W TOO MANY DESTINATIONS WERE ADDED. SOME DESTINATIONS WILL BE IGNORED.

Explanation: The destinations that were totally added are more than 100, which is the maximum allowed. Some destinations are not added.

System action: Some destinations are not added, because they exceed the maximum allowed.

User response: Stop and restart the controller, to have the MODIFY command manage other 100 new destinations.

EQQHT54I THE DESTINATION *DEST* WAS DELETED.

Explanation: See message text.

System action: None.

User response: None.

EQQHT55I NO CHANGE WAS MADE TO THE DESTINATION LIST. THE REFRESH COMMAND HAS NO EFFECT.

Explanation: See message text.

System action: None.

User response: None.

EQQHT56I THE DESTINATION *DEST* WAS CHANGED.

Explanation: See message text.

System action: None.

User response: None.

EQQHT57I START OF HTTP DESTINATION LIST.

Explanation: See message text.

System action: None.

User response: None.

EQQHT58I END OF HTTP DESTINATION LIST.

Explanation: See message text.

System action: None.

User response: None.

EQQHT59I *PROT*OC DESTINATION *DEST*,
HOST:PORT[*REMENGTYPE*].

Explanation: This message shows the current HTTP or HTTPS destinations in use, identified by:
*PROT*OC

The type of communication protocol used, either HTTP or HTTPS.

DEST The destination name, as defined in the *ROUTOPTS* statement.

HOST The fully qualified host name or IP address used to communicate with the agent.

PORT The port number used to communicate with the agent.

REMENGTYPE

The type of remote engine, either D for a distributed remote engine, or Z for a z/OS remote engine. This value is shown only if the destination is used to communicate with a remote engine workstation.

System action: None.

User response: None.

EQQHT60I THE HTTP SERVER HAS COMPLETED THE REFRESH OF THE HTTP DESTINATION LIST.

Explanation: See message text.

System action: None.

User response: None.

EQQHT62E A BIND REQUEST WITHOUT ANY KNOWN NOTIFICATION ADDRESS WAS RECEIVED. THE REQUEST WAS DISCARDED.

Explanation: The controller has received a bind request, but the notification addresses are not defined as HTTP destinations in the *EQQPARM* library. See previous *EQQHT66* messages for details about the unknown notification addresses.

System action: The bind request is discarded.

User response: If you want the request to be received, add the destination to the *ROUTOPTS* statement.

EQQHT63W A REFRESH COMMAND FOR DESTINATION *DEST* CHANGED THE DESTINATION TYPE.

Explanation: See message text.

System action: None.

User response: None.

EQQHT64W A REQUEST WITH A NOT SUPPORTED APPLICATION NAME WAS RECEIVED. THE REQUEST IS DISCARDED.

Explanation: The request received has a not supported value in the application name field. The correct value to specify for a z/OS shadow job is *zShadowJob*.

System action: The request is ignored.

User response: Inform the remote engine Tivoli Workload Scheduler administrator.

EQQHT65E DESTINATION *DESTNAME* REJECTED A BIND REQUEST BECAUSE THE *PROT*OC NOTIFICATION ADDRESS *LHOSTN:SPORT* IS UNKNOWN.

Explanation: The controller has sent a bind request to a remote engine with destination *DESTNAME*, but in the *EQQPARM* library of the remote engine there is not any *PROT*OC destination that defines the controller notification address *LHOSTN:SPORT*. For this reason, the remote controller rejected the bind request.

EQQHT66W • EQQHT71E

System action: The shadow job is put in error with SHPF error code.

User response: Contact the remote engine administrator to add to the ROUTOPTS statement a z/OS remote engine *PROTOD* destination with the specified address.

EQQHT66W THE PROTOD NOTIFICATION ADDRESS HOSTN:PORT IS UNKNOWN.

Explanation: The controller has received a bind request, but the notification address is not defined as an HTTP destination in the EQQPARM library.

System action: If all the notification addresses are unknown, the request is discarded and message EQQHT62 is logged. The message is issued for all the unknown notification addresses of the request.

If only some of the notification addresses are unknown, the system processes the request by using the notification addresses that are defined as HTTP destinations in the EQQPARM library. The message EQQHT66W is issued only once; so, if the controller receives another request with the same unknown notification addresses, the message is not issued again. This condition is reset with the refresh destination command.

User response: If you do not want the notification address to be ignored, add the destination to the ROUTOPTS statement.

EQQHT67E ERROR OPENING DDNAME DATASET: ERRNO =ERRNUM, ERRMSG, REASON=REASON.

Explanation: An error has occurred while opening the *DDNAME* data set. The *fopen()* function error is indicated by *ERRNUM* (described by *ERRMSG*) with reason code *REASON*.

System action: If the error cannot be bypassed, the output collector or the controller ends with errors.

User response: Verify and solve the error that is preventing the output collector or the controller from opening the data set, then restart it.

EQQHT68E ERROR READING DDNAME DATASET: ERRNO =ERRNUM, ERRMSG, REASON=REASON.

Explanation: An error has occurred while reading the *DDNAME* data set. The *fread()* function error is indicated by *ERRNUM* (described by *ERRMSG*) with reason code *REASON*.

System action: If the error cannot be bypassed, the output collector or the controller ends with errors.

User response: Verify and solve the error that is

preventing the output collector or the controller from reading the data set, then restart it.

EQQHT69E ERROR ALLOCATING DDNAME DATASET: ERROR CODE=ERRNUM, INFORMATION CODE=REASON.

Explanation: An error has occurred while allocating the *DDNAME* data set dynamically. *ERRNUM* and *REASON* are the error code and information code returned by the *dynalloc()* dynamic allocation function.

System action: If the error cannot be bypassed, the output collector or the controller ends with errors.

User response: Verify and solve the error that is preventing the output collector or the controller from allocating the data set, then restart it.

EQQHT70W ERROR PROCESSING JOB LOG HEADER (OCCURRENCE TOKEN: OCCTOKEN, OPNO: OPNUM).

Explanation: The controller cannot substitute the variables specified in the job log header for the job with occurrence token *OCCTOKEN* and operation number *OPNUM*. This message is followed by message EQQHT43I, which provide details for this error.

System action: The controller does not add the header to the job log.

User response: Review the output collector message log to determine the cause of the problem. Check that the level of the agent and, if appropriate, of the dynamic domain manager associated to the job log request is 8.6.0.1 or higher. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQHT71E UNABLE TO USE THE JOB LOG HEADER.

Explanation: The controller cannot use the job log header in the parameter library that you specified in the HTTPOPTS *JLOGHDRTEMPL* parameter.

System action: The controller continues processing but it does not add the header to the job log when requested from one of the product interfaces.

User response: Review the message log of the controller to determine the cause of the problem. After you solve the problem, restart the controller. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQHT72I THE HTTP DESTINATIONS LIST IS
EMPTY.

Explanation: ROUTOPTS does not contain any HTTP destinations at this moment.

System action: Processing continues.

User response: None.

EQQHT74E ERROR: FAILED TO OPEN TICKET
FOR JOB *JOBNAME(JOBNUM)*

Explanation: The Controller failed to open an incident report for job *JOBNAME JOBNUM*.

System action: Processing continues.

User response: Verify if the URI specified in the *TKTURI* keyword of the *OSLCOPTS* statement is available.

Chapter 209. EQQICnn messages

EQQIC00 - EQQIC65

EQQIC00I FILE *FILE* HAS BEEN CONVERTED
NCOPIY RECORDS COPIED, NUPD
RECORDS UPDATED, NSKIP
RECORDS SKIPPED

Explanation: A VSAM file has been successfully built from the corresponding file in a different release of IBM Tivoli Workload Scheduler for z/OS. This message documents the number of records copied without change, the number of modified records, and the number of records in the input file that were not used.

System action: The migration program continues processing by reading the next CONVERT statement from the input file.

System programmer response: None.

Problem determination: If there is a problem using the output file, verify that the statistical information in this message is correct.

EQQIC01E THE INPUT DATA SET,
DDNAME=SYSIN, COULD NOT BE
OPENED

Explanation: The program could not open its input data set.

System action: The program is terminated.

System programmer response: Check that the SYSIN DD statement exists and is correctly coded. Correct the errors and resubmit the JCL.

EQQIC02E UNABLE TO CONVERT FILE *FILE*

Explanation: The file migration program could not execute the requested file conversion. This message is preceded by one or more error messages that describe the problem.

System action: The migration program continues processing by reading the next CONVERT statement from the input file.

System programmer response: Correct the errors and resubmit the file migration batch job.

Problem determination: Check the previous messages to determine the cause of the problem.

Verify that:

- The output data sets are empty VSAM data sets.
- The output data sets are correctly allocated.
- The job executing the migration program is authorized to update the output data sets.

- The input data sets do not contain errors.
- The input data sets are VSAM data sets at the level specified.
- The migration program is authorized to read the input data sets.

EQQIC03E LOGICAL RECORD SIZE FOR THE
INPUT DATA SET, DDNAME SYSIN,
IS NOT VALID

Explanation: The program could not use the input data set, SYSIN, because its logical record length is not 80 bytes.

System action: The program is terminated.

System programmer response: Correct the errors and resubmit the file migration batch job. If necessary, copy SYSIN statements to a file that has record size 80 bytes.

Problem determination: Check that the SYSIN DD statement exists and is correctly coded.

EQQIC04E EQQICTOP TERMINATED BECAUSE
OF UNRECOVERABLE ERRORS

| **Explanation:** A severe error occurred during the
| execution of the file migration program.

| **System action:** The migration program is terminated.

| **System programmer response:** Save the IBM Tivoli
| Workload Scheduler for z/OS message log and dump
| data sets. To collect appropriate documentation for
| problem determination, see the *Diagnosis Guide and*
| *Reference* manual, Chapter 3. Problem analysis
| procedures, sub-section "Information to collect for
| migration problems". Search the IBM Support database
| for a solution at [http://www.ibm.com/software/](http://www.ibm.com/software/sysmgmt/products/support)
| [sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

| **Problem determination:** Review the message log and
| the dump data set.

EQQIC05E WRITE OF NEW RECORD FAILED,
RECORD WITH SAME KEY IS
ALREADY PRESENT

Explanation: A VSAM error occurred when writing a new record to the output data set. Error codes indicate that the output data set contains a record with the same key as the new record.

System action: The migration program continues processing with the next CONVERT statement, if one is defined.

System programmer response: Make sure that the output data set is empty when the migration starts.

EQQIC06W THE OUTPUT DATA SET DOES NOT CONTAIN ANY TYPE RECORDS

Explanation: The Logical part of the output AD data set represented by "type" (which can be "application" or "JCL variable table") or "all WS closed" is empty: this can be because also the corresponding input is empty or because all the input records could not be converted.

System action: The migration program continues processing by reading the next CONVERT statement from the SYSIN file. The return code for the current CONVERT statement is set to 4.

System programmer response: None. If the input was also empty, otherwise perform the action described for the messages issued by the migration program before this one.

Problem determination: Problem determination: check if the warning message can be ignored (because also the input logical part is empty) or determine from the previous message why the input records could not be converted.

EQQIC07E APPLICATION AD WITH INPUT ARRIVAL IA AND OPERNUM OP# THE FOLLOWING SPECIAL RESOURCES CAUSE EXCEED OF THE OUTPUT RECORD SIZE:

Explanation: During conversion of the current plan operation record identified in the message text, the migrated output record would be too large to store without modification. At least one special resource referenced by the operation cannot be included. The subsequent message EQQIC08I identifies the special resources that cannot fit.

System action: The migration program is terminated. No valid current plan is created.

System programmer response: Start up the previous release of IBM Tivoli Workload Scheduler for z/OS and delete any special resource entries from the operation that are unnecessary. The entries you delete do not have to be those identified in EQQIC08I.

Problem determination: As each special resource entry is expanded by 8 bytes, while the maximum record size remains the same, it is possible to encounter this problem.

EQQIC08I SR

Explanation: This message is associated with EQQIC07E. It lists those special resources that could not fit into the output current plan record.

System action: The migration program is terminated.

System programmer response: See the description for message EQQIC07E.

EQQIC09E APPLICATION INDEX RECORD FOR AD HAS AN INVALID INPUT ARRIVAL IA FOR AN OCCURRENCE IN STATUS ST

Explanation: A current plan application index record CPLREC05, identified in the message text, contains an invalid input arrival date in one of its occurrence data.

System action: The migration program continues processing by reading the next CONVERT statement from the input file. No valid current plan is created.

System programmer response: Do one of the following:

- Update the occurrence with a valid I/A date.
- If the occurrence status is complete, run two or more CP EXTENDS to delete it from the current plan, before rerunning the conversion.

EQQIC10E THE FILE KEYWORD IS MISSING

Explanation: The current CONVERT statement does not contain the FILE keyword.

System action: The migration program continues processing by reading the next CONVERT statement from the input file.

System programmer response: Add the FILE keyword to the current CONVERT statement and resubmit the file migration batch job.

EQQIC11E A PARAMETER IS REQUIRED FOR THE FILE KEYWORD

Explanation: The FILE keyword in the current CONVERT statement does not specify a value.

System action: The migration program continues processing by reading the next CONVERT statement from the input file.

System programmer response: Add a file name value to the FILE keyword of the current CONVERT statement, and resubmit the file migration batch job.

EQQIC12E THE FROMREL KEYWORD IS MISSING

Explanation: The current CONVERT statement does not contain the FROMREL keyword.

System action: The migration program continues processing by reading the next CONVERT statement from the input file.

System programmer response: Add the FROMREL keyword to the current CONVERT statement and resubmit the file migration batch job.

EQQIC13E AN INCORRECT PARAMETER WAS SPECIFIED FOR THE FROMREL KEYWORD

Explanation: The FROMREL keyword in the current CONVERT statement does not specify a supported value.

System action: The migration program continues processing by reading the next CONVERT statement from the input file.

System programmer response: Add a supported file name value to the FROMREL keyword of the current CONVERT statement and resubmit the file migration batch job.

EQQIC14E THE TOREL KEYWORD IS MISSING

Explanation: The current CONVERT statement does not contain the TOREL keyword.

System action: The migration program continues processing by reading the next CONVERT statement from the input file.

System programmer response: Add the TOREL keyword to the current CONVERT statement and resubmit the file migration batch job.

EQQIC15E AN INCORRECT PARAMETER WAS SPECIFIED FOR THE TOREL KEYWORD

Explanation: The TOREL keyword in the current CONVERT statement does not specify a supported value.

System action: The migration program continues processing by reading the next CONVERT statement from the input file.

System programmer response: Add a supported file name value to the TOREL keyword of the current CONVERT statement and resubmit the file migration batch job.

EQQIC16W INPUT APPLICATION APPL IS TOO LARGE TO BE WRITTEN TO THE OUTPUT FILE

Explanation: An application description (AD) in the input AD file defined to the migration program is too large to be written to the output data set. The most likely reason for this message is that the maximum record size is larger for the input AD file than for the output AD file.

System action: The current input AD record is skipped. The migration program continues normal processing by reading the next record on the input file. The return code for the current CONVERT command is 4 or higher.

System programmer response: Determine if the maximum record size defined for the output AD file is too small. If it is, reallocate the output AD file and reexecute the migration program.

EQQIC17E INPUT LTP OCCURRENCE APPLIA IS TOO LARGE TO BE WRITTEN TO THE OUTPUT FILE

Explanation: A long-term plan (LTP) occurrence in the input LTP file defined to the migration program is too large to be written to the output data set. The most likely reason for this message is that the maximum record size is larger for the input LTP file than for the output LTP file.

System action: The current input LTP record cannot be converted to the format of the output file. The migration program continues processing by reading the next record on the input file, but no more records are written to the output file. The return code for the current CONVERT command is 8 or higher.

System programmer response: Determine if the maximum record size defined for the output LTP file is too small. If it is, reallocate the output LTP file and reexecute the migration program.

EQQIC18E FROMREL AND TOREL COMBINATION NOT SUPPORTED FOR FILE FILE

Explanation: The file *FILE* specified in the current CONVERT statement is not supported by the release defined for the FROMREL or TOREL keyword.

System action: The migration program continues processing with the next CONVERT statement, if one is defined.

System programmer response: Refer to *Planning and Installation* for information about the valid combinations. Correct the value in the FILE, FROMREL, or TOREL keyword of the current CONVERT statement and resubmit the job.

EQQIC36E CURRENT PLAN RECORD OF TYPE RECID FOR APPLICATION AD WITH INPUT ARRIVAL IA AND OPERATION NUMBER OPNUM IS NOT VALID, TOO HIGH OPERATION NUMBER, CANNOT BE CONVERTED

Explanation: The operation number in one of the records in the input file is higher than the range supported by the IBM Tivoli Workload Scheduler for z/OS release to which you are reoccurring to. RECID is the current plan record type:

03 An operation record
09 A rerun record
14 A joblog record.

System action: The migration fails without producing

EQQIC37E • EQQIC41E

a migrated current plan file.

System programmer response: None.

User response: Use the scheduler dialog or the program interface to update the current plan file being migrated, making sure that all the operation numbers are in the range supported by the release to which you are reoccurring to.

EQQIC37E CURRENT PLAN RECORD OF TYPE
RECID FOR APPLICATION AD WITH
INPUT ARRIVAL IA IS NOT VALID,
TOO HIGH OCCURRENCE NUMBER,
CANNOT BE CONVERTED

Explanation: The occurrence number in one of the records in the input file is higher than the range supported by the IBM Tivoli Workload Scheduler for z/OS release to which you are reoccurring to. RECID is the current plan record type:

03 An operation record
09 A rerun record
14 A joblog record.

System action: The migration fails without producing a migrated current plan file.

System programmer response: None.

User response: Perform daily planning to reduce the number of occurrences in the current plan being migrated. Set the BATCHOPT parameter PREVRES to NO at the replan. If the current plan still has too many occurrences, do either of the following:

- Run IBM Tivoli Workload Scheduler for z/OS until enough occurrences have been completed.
- Delete occurrences, using the scheduler dialog or the program interface.

Repeat the plan.

EQQIC38W RECTYP RECORD FOR OCCURRENCE
AD AI, OPERATION OPNUM IS TOO
LARGE TO BE WRITTEN TO THE
OUTPUT FILE

Explanation: A record in the input JS file defined to the migration program is too large to be written to the output file. The most likely reason is that the maximum record size is larger for the input JS file than for the output JS file.

System action: The record that is too large is ignored. The migration program continues to process normally. The return code for the current CONVERT run is 4 or higher.

System programmer response: Determine whether the maximum record size defined for the JS file is too small, reallocate the file, and rerun the migration job.

EQQIC39E AD RECORD FOR APPLICATION AD
WITH OPERATION NUMBER OPNUM
IS NOT VALID, TOO HIGH
OPERATION NUMBER, CANNOT BE
CONVERTED PREOP PREAD

Explanation: The operation number *OPNUM* is higher than the maximum value supported by the release of IBM Tivoli Workload Scheduler for z/OS to which you are performing the fallback (values higher than 99 were introduced in Version 2.2.0.). The *PREOP* and *PREAD* variables might be displayed unresolved in the normal case. Alternatively, if the error has been discovered checking the corresponding section of the input operation, the variables might contain the operation number and the application ID of an external predecessor .

System action: The fallback fails without producing the output AD file.

System programmer response: None.

User response: Use the scheduler dialog or the programming interface to update the AD file input to the fallback. Ensure that all the operation numbers are in the range supported by the release to which the output refers.

EQQIC40E INVALID BLKSIZE — THE OUTPUT JS
FILE MUST BE ALLOCATED WITH
THE SIZE INCREASED BY 4 BYTES

Explanation: In OPC Version 2.3.0 the record size of the JS files was increased by 4 bytes more than in previous versions. Check the cluster definition of the VSAM JS file and increase the minimum and maximum record size with the same length.

System action: The conversion fails without producing a converted JS file.

User response: For conversion from OPC Version 2.2.0 to later versions:

- Define the cluster for the output JS file with increased record size
- Submit the conversion job again

EQQIC41E CALENDAR CAL HAS ALL DAYS
FREE. AT LEAST ONE WORKDAY IS
REQUIRED

Explanation: Calendar *CAL* is rejected because it has no work days. It has not been migrated.

System action: Application descriptions referencing Calendar *CAL* are migrated referencing an unexisting calendar.

User response: Define a consistent Calendar with at least a work day.

EQQIC42E THE NAME OF THE SUBSYSTEM CONVERTING FROM IS MISSING, KEYWORD FROMSUBSYSTEM

Explanation: The name of the subsystem converting from is required when converting history data.

System action: The migration program terminates.

User response: Add the FROMSUBSYSTEM keyword to the CONVERT statement and resubmit the migration job.

EQQIC43W THERE IS NO FROMREL/ FROMSUBSYSTEM OPERATIONS HISTORY DATA

Explanation: The input file to the conversion program contains no records of the specified release, FROMREL, and subsystem, FROMSUBSYSTEM.

The problem occurred because there is no input data or because you defined the wrong Tivoli Workload Scheduler for z/OS subsystem, the wrong version, or both.

System action: The migration program terminates.

User response: Check the input file to the EQQICTOP conversion program.

EQQIC44E OPER OF FILE DDNM FAILED

Explanation: A sequential I/O request failed.

OPER is the operation requested

DDNM is the ddname of a file to be allocated to the migration program EQQICTOP

System action: The migration program terminates.

User response: Check the file allocations to the migration program. This message can be preceded by message EQQ0959 with more information about the error.

EQQIC45W INPUT JCL VARIABLE TABLE JVT IS TOO LARGE TO BE WRITTEN TO THE OUTPUT FILE

Explanation: A JCL variable table in the input AD file defined to the migration program is too large to be written to the output data set. The most likely reason for this message is that the maximum record size is larger for the input AD file than for the output AD file.

System action: The current input AD record is skipped. The migration program continues normal processing by reading the next record on the input file. The return code for the current CONVERT command is 4 or higher.

System programmer response: Determine if the maximum record size defined for the output AD file is too small. If it is, reallocate the output AD file and reexecute the migration program.

EQQIC46W THE WORKSTATION WSNAM WAS DEFINED AS VIRTUAL WS. AFTER MIGRATION IT BECOMES A NORMAL WORKSTATION, PLEASE REVIEW YOUR PLAN ACCORDINGLY

Explanation: You requested a fallback to a version that does not support virtual workstations.

System action: The program converts WSNAM to a standard computer workstation.

System programmer response: Verify the resulting destination field for WSNAM in the workstation description. Consider defining a computer workstation for each item in the destination list of the original workstation.

EQQIC47W THE WORKSTATION WSNAM WAS DEFINED AS Z-CENTRIC. AFTER MIGRATION IT BECOMES A NORMAL WORKSTATION, PLEASE REVIEW YOUR PLAN ACCORDINGLY.

Explanation: You requested a fallback to a version that does not support z-centric workstations.

System action: The program converts WSNAM to a standard computer workstation.

System programmer response: Verify the resulting destination field for WSNAM in the workstation description.

EQQIC48E ROLL-BACK AD MIGRATION NOT POSSIBLE. STEP DEPENDENCIES MUST BE REMOVED. CHECK FOLLOWING CONDITION: ADID OPNO CONDID.

Explanation: You requested a fallback to a version that does not support step-level dependencies. This message is not issued if you are requesting a fallback to a version earlier than 8.5.

System action: The migration ends in error without producing a migrated AD file.

System programmer response: Remove the step dependency definitions from the indicated conditions identified by the application name *ADID*, operation number *OPNO*, and condition ID *CONDID*.

EQQIC49E ROLL-BACK CP MIGRATION NOT POSSIBLE. STEP DEPENDENCIES MUST BE REMOVED. CHECK FOLLOWING CONDITION: ADID IA OPNO CONDID.

Explanation: You requested a fallback to a version that does not support step-level dependencies. This message is not issued if you are requesting a fallback to a version earlier than 8.5.

EQQIC50E • EQQIC56E

System action: The migration ends in error without producing a migrated CP file.

System programmer response: Remove the step dependency definitions from the indicated operations.

EQQIC50E ROLL-BACK MIGRATION NOT POSSIBLE. MULTIPLE CP AD INDEX RECORDS FOUND FOR APPLICATION *APPL*

Explanation: The number of CP AD index records for the specified application in the input file is greater than one. This happens when more than 877 occurrences are defined in the CP for the application.

System action: The migration ends in error without producing a migrated CP file.

User response: Remove all occurrences exceeding the limit of 877 from the specified application. Do a REPLAN for the current plan and rerun the migration job

EQQIC51E ROLL-BACK MIGRATION NOT POSSIBLE. OPERATIONS IN X STATUS FOUND IN THE CURRENT PLAN.

Explanation: Operations in suppressed by condition status (X status) were found during a migration process from version 8.6 or 8.5.1 to version 8.5 or earlier, or from version 8.5 to version 8.5.1 or 8.6.

System action: The migration operation is interrupted and the conversation fails without producing the output current plan.

User response: Consider identifying the operations in X status by using the dialog operation list, filtering by status. Then you can:

- Delete the operations in X status from the CP.
- Set to complete the occurrences that are not in C status and contain operations in X status. Then run a replan, to remove the previous occurrences from the plan.

For more detailed information, see the section on the handling of operations in X status in a plan in the *Tivoli Workload Scheduler for z/OS: Planning and Installation Guide*.

EQQIC52I STATUS CHANGED FROM W TO ST FOR OPERATION *AD IA OPER*.

Explanation: The current operation has condition dependencies defined in the input current plan, with undefined overall condition status.

System action: The migration program continues.

User response: Consider starting the operation by using a manual action.

EQQIC53E ROLL-BACK MIGRATION NOT POSSIBLE. Z-CENTRIC STARTED OPERATIONS STILL IN PLAN.

Explanation: You requested to perform a fallback to a previous version, but the process has found started operations running on z-centric agent workstations.

System action: The fallback migration stops.

User response: Manually complete the started operations that are running on the z-centric agent workstation, then retry the migration.

EQQIC54W A FALLBACK CANNOT BE PERFORMED ON THE REMOTE WORKSTATION *WSNAM*. THIS TYPE OF WORKSTATION IS NOT SUPPORTED IN EARLIER VERSIONS OF THE PRODUCT. THE RECORD IS SKIPPED.

Explanation: The process detected a workstation defined as a remote workstation. You cannot perform a fallback on this type of workstation because it is not supported in earlier versions of the product.

System action: The fallback continues, skipping the remote workstation.

User response: You must manually remove all applications that refer to this workstation from the Application Description database and the Current Plan.

EQQIC55W A FALLBACK CANNOT BE PERFORMED ON THE DYNAMIC WORKSTATION *WSNAM*. THIS TYPE OF WORKSTATION IS NOT SUPPORTED IN EARLIER VERSIONS OF THE PRODUCT. THE RECORD IS SKIPPED.

Explanation: The process detected a workstation defined as a dynamic workstation. You cannot perform a fallback on this type of workstation because it is not supported in earlier versions of the product.

System action: The fallback continues, skipping the dynamic workstation.

User response: You must manually remove all applications that refer to this workstation from the Application Description database and the Current Plan.

EQQIC56E ROLLBACK MIGRATION NOT POSSIBLE. REMOTE ENGINE INFO MUST BE REMOVED. CHECK FOLLOWING OPERATION:*ADID OPER*.

Explanation: The remote job information is specified for the application operation identified by application name *ADID* and operation number *OPER*, which means the operation is a shadow job defined to

implement cross dependencies. Cross dependencies are supported only from Tivoli Workload Scheduler for z/OS Version 8.6 and later. For this reason, the fallback migration is not possible.

System action: After scanning the Application Description database to detect all possible migrations problems, the migration ends in error without producing a migrated AD database.

User response: Remove or modify all of the operations containing the remote job information, and then retry the migration.

EQQIC57E ROLLBACK MIGRATION NOT POSSIBLE. REMOTE ENGINE INFO MUST BE REMOVED. CHECK FOLLOWING OPERATION: *ADID IA OPER*.

Explanation: Remote job information is specified for the operation identified by application name *ADID*, input arrival time *IA*, and operation number *OPER* which means the operation is a shadow job defined to implement cross dependencies. This type of job is supported only from Tivoli Workload Scheduler for z/OS Version 8.6 and later. For this reason, the operation will not be migrated.

System action: The migration fails.

User response: You must manually remove the shadow jobs from the plan, run a replan, and then retry the migration.

EQQIC58E ROLLBACK MIGRATION NOT POSSIBLE. JOBS ON DYNAMIC WORKSTATIONS MUST BE REMOVED. CHECK FOLLOWING OPERATION: *ADID IA OPER*.

Explanation: The operation identified by application name *ADID*, input arrival time *IA*, and operation number *OPER* is a job defined on a dynamic workstation. This type of job is supported only from Tivoli Workload Scheduler for z/OS Version 8.6 and later. For this reason, the operation will not be migrated.

System action: The migration fails.

User response: You must manually remove the dynamic jobs from the plan, run a replan, and then retry the migration.

EQQIC59W A FALLBACK CANNOT BE PERFORMED ON RUN CYCLE GROUP *RGNAM*. IT IS NOT SUPPORTED IN EARLIER VERSIONS OF THE PRODUCT. THE RECORD IS SKIPPED.

Explanation: The process detected a run cycle group definition. You cannot perform a fallback on this type

of resource because it is not supported in earlier versions of the product.

System action: The fallback process continues, but the run cycle group definition is skipped.

User response: Remove or modify all the applications that refer to this type of resource.

EQQIC60W INPUT LTP OCCURRENCE *APPL & IA* HAS HAS A BLANK DEADLINE. IT IS SET TO A DEFAULT VALUE (2071-12-31 24.00).

Explanation: The occurrence contains a blank deadline date/time. To proceed with the fallback to a previous release it is automatically set to a default value (2071-12-31 24.00).

System action: The migration program continues.

System programmer response: Make sure that the occurrence migrated and that the default deadline date/time is valid for it.

EQQIC61W INPUT CURRENT PLAN OCCURRENCE *AD IA* HAS A MANDATORY PENDING STATUS. IT IS NOT SUPPORTED IN EARLIER VERSION. THIS OCCURRENCE IS SKIPPED.

Explanation: The occurrence indicates that it is in the Mandatory Pending status. This is not supported when performing a fallback to a previous release.

System action: The occurrence is skipped (it is not migrated) and the migration program continues.

System programmer response: None.

EQQIC62E ROLL-BACK MIGRATION NOT POSSIBLE. JOBS IN MANDATORY PENDING STATUS MUST BE REMOVED. CHECK FOLLOWING OPERATION: *ADID IA OPER*.

Explanation: During the migration of a CP or XD data set the process found that the operation identified by application name *ADID*, input arrival time *IA*, and operation number *OPER* is in the mandatory pending status. An operation in this status is supported only in IBM Tivoli Workload Scheduler for z/OS Version 9.1 or later. For this reason, the operation will not be migrated.

System action: The migration of the CP or XD data set fails.

System programmer response: Manually remove the operation from the plan, run a replan, and then retry the migration. Note that to successfully remove all the data related to mandatory pending predecessors, you must run a DP batch replan. If the replan is not run,

EQQIC63W • EQQIC65W

| the fall back conversion is successfully completed but
| the number of skipped records is greater than 0 as all
| the dummy occurrence records representing mandatory
| pending predecessors are not ported back.

| **EQQIC63W** APPLICATION AD HAS EXTERNAL
| OR CONDITIONAL PREDECESSORS
| USING RESOLUTION OPTIONS THAT
| CANNOT BE ROLLED BACK: THEY
| WILL BE CONVERTED TO OLD
| CRITERIA (CLOSEST PRECEDING,
| NO MANDATORY).

| **Explanation:** See message text.

| **System action:** Converts the matching criteria for
| predecessor to closest preceding and not mandatory.

| **System programmer response:** None

| **EQQIC64W** APPLICATION AD HAS A RUN CYCLE
| WITH INPUT BLANK ARRIVAL TIME
| AND CANNOT BE ROLLED BACK:
| APPLICATION WILL BE SKIPPED.

| **Explanation:** See message text.

| **System action:** The application is not rolled back.

| **System programmer response:** None.

| **EQQIC65W** APPLICATION AD HAS A RUN CYCLE
| WITH BLANK DEADLINE THAT
| CANNOT BE ROLLED BACK:
| DEADLINE WILL BE SET TO 002400.

| **Explanation:** See message text.

| **System action:** The deadline for the application is set
| to 2400 hours.

| **System programmer response:** None.

Chapter 210. EQQIPnn messages

EQQIP00 - EQQIP20

EQQIP00E THE FOLLOWING QUEUE ELEMENT TO OR FROM THE AGENT IS NOT VALID: *REQUEST*.

Explanation: The TCP/IP communication task detected an incorrect queue element on its queue.

System action: The element is discarded from the TCP/IP communication task queue. Normal processing continues.

System programmer response: Save the message log (EQQMLOG) and the current plan (EQQCPxDS), and contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Review the scheduler message log data set, EQQMLOG.

EQQIP01I THE COMMUNICATION WITH THE *RAGENTS THROUGH TCP/IP ENDED*.

Explanation: The TCP/IP communication task ended either because the scheduler started task is shutting down or as a result of an operator modify command to terminate this task or a related task.

System action: The scheduler processing continues.

User response: None.

EQQIP02E THE COMMUNICATION WITH THE *RAGENTS THROUGH TCP/IP ENDED DUE TO PROCESSING ERRORS*.

Explanation: The TCP/IP communication task terminated because of processing errors.

System action: The scheduler processing continues.

System programmer response: If you cannot determine the cause of the error, save a storage dump of the scheduler address space, retain a copy of the message log and the job-tracking data sets, and contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Check the scheduler message log and the dump data sets for additional information.

EQQIP03E THE COMMUNICATION WITH THE *RAGENTS THROUGH TCP/IP TERMINATED DUE TO A PROCESSING FAILURE. THE TASK WILL BE RESTARTED LATER*.

Explanation: An error occurred either when processing the initialization statements or in the communication with the TCP/IP address space.

System action: The TCP/IP communication task ends. If the connection with the TCP/IP address space is lost, the TCP/IP communication task is restarted automatically.

System programmer response: Correct the ROUTOPTS initialization statements and restart the product.

User response: Contact your system programmer.

Problem determination: Review previous messages in the scheduler message log.

EQQIP04E THE COMMUNICATION WITH THE *RAGENTS THROUGH TCP/IP ABENDED WHILE PROCESSING THE FOLLOWING REQUEST: REQUEST*.

Explanation: The error could be due to any of the following:

- The TCP/IP started task is not started.
- The TCPIPJOBNAME keyword in the TCPOPTS statement does not define a correct TCP/IP started task name.

System action: If the request type is any of INIT, BIND, GHID, or LSTN, the TCP/IP communication task is terminated. For any other request type, the TCP/IP communication task closes the session with the corresponding started task. The session is reestablished.

User response: Correct the error and restart the TCP/IP task. If the error recurs, save the message log (EQQMLOG) and contact IBM Software Support.

EQQIP05I THE CONTROLLER HAS ACCEPTED A CONNECTION REQUEST FROM *AGENT, WITH ADDRESS AND PORT IPADDR PORT AND HOST NAME HOSTNAME*.

Explanation: The TCP/IP communication task successfully connected to the remote agent identified by the message variables.

System action: None.

User response: None.

EQQIP06E AN UNDEFINED AGENT WITH ADDRESS AND PORT *IPADDR PORT* AND HOST NAME *HOSTNAME* ATTEMPTED TO CONNECT TO THE CONTROLLER. THE REQUEST IS NOT ACCEPTED.

Explanation: An external agent, identified by the message variables, attempted to connect to the local TCP/IP communication task. The TCPIP keyword of the controller ROUTOPTS statement does not identify the remote partner correctly.

System action: Normal processing continues.

System programmer response: Correct any inconsistency in the initialization statements and restart the involved started task.

User response: Contact your system programmer.

EQQIP07W REJECTED REQUEST FROM AGENT AT ADDRESS AND PORT *IPADDR PORT* AND HOST NAME *HOSTNAME* BECAUSE THE CONTROLLER STILL CONSIDERS IT CONNECTED.

Explanation: The TCP/IP communication task rejected a connection attempt from an external agent because another connection, with a destination having the same IP address, is already active. The new connection is rejected and the old one is reset.

System action: The local TCP/IP communication task is ready to accept a new connection from the external agent involved.

User response: Check that the next connection attempt from the external agent is established successfully. If the error recurs, save the message log (EQQMLOG) and contact IBM Software Support.

EQQIP08E RAGENTS COMMUNICATION ERROR ERRNO RECEIVED BY TCP/IP.

Explanation: The local TCP/IP experienced the error indicated by *ERRNO*. The error occurred during the communication handling with *RAGENTS*. The most common decimal values for *ERRNO* are:

1115 After the local communication task closure, you restarted the local communication task before TCP/IP completed the resource release process. This error number might also indicate a local address used by another application.

1128 The local communication task failed to connect with a remote communication task that detected EQQIP08E message with *ERRNO* = 1115.

A blank value in *ERRNO* might indicate an SSL error during the access to the key or password databases. In

this case, EQQIP08E message is followed by EQQIP16I message indicating SSL error on context initialization.

System action: The TCP/IP communication task attempts to recover the error. The system waits approximately for 1 minute before attempting an automatic restart. In case of *ERRNO* = 1128 received by the tracker, it retries every minute to reestablish the connection with the controller, until the controller is up and running.

User response: For *ERRNO* = 1128 in the tracker EQQMLOG, check the controller EQQMLOG for an EQQIP08E message with *ERRNO* = 1115: if you find it, wait for the controller communication task restart. Otherwise, try to identify the origin of the problem using further messages in the EQQMLOG. In case of SSL error on context initialization, possible causes are:

- The file system, containing the key or password databases, is not mounted.
- Either the key or password databases, or both, do not exist.
- The TCPOPTS statement contains an error in either the SSLKEYSTORE or SSLKEYSTOREPSW keywords, or both.
- The product components that are to communicate with each other do not specify the same SSLEVEL value.

If you correct an error, and the correction requires a change in any initialization statement used by the scheduler, restart the involved started task.

Problem determination: Look for EQQIP16I in the message log (EQQMLOG) for additional information. Use *ERRNO* and the additional information to identify the error type. For details about network configuration or TCP/IP customization errors, refer to the *z/OS Communications Server* publications. For the complete list of the *ERRNO* values, refer to the *z/OS Communication Server IP and SNA Codes* and *z/OS UNIX System Services Messages and Codes*.

EQQIP09W A BROKEN COMMUNICATION OCCURRED WITH THE AGENT IDENTIFIED BY ADDRESS AND PORT *IPADDR PORT* AND HOST NAME *HOSTNAME*.

Explanation: The TCP/IP communication task rejected a communication attempt with an external agent because the socket was closed. The connection is automatically retried.

System action: The local TCP/IP communication task is retrying to communicate with the external agent.

User response: Check that the next connection attempt to the external agent is established successfully. Look for additional information in the *AGENT* EQQMLOG. If the error recurs, save the message log (EQQMLOG) and contact IBM Software Support.

EQQIP10W THE CONNECTION TO AGENT WITH ADDRESS AND PORT IPADDR PORT WILL BE RESET.

Explanation: The TCP/IP communication task resets the connection with an external agent. It could be due to configuration changes, resulting in an error condition such as duplicated connection. The connection is automatically retried.

System action: The local TCP/IP communication task is ready to accept a new connection from the involved external agent.

User response: Verify that the next connection attempt to the external agent is established successfully. Check the message log (EQQMLOG) and look for other messages that explain the error. If the error recurs, save the message log and contact IBM Software Support.

EQQIP11I THE CONTROLLER IS WAITING FOR AGENTS REQUESTS ON PROT ADDRESS AND PORT IPADDR PORT.

Explanation: The TCP/IP communication task is ready to process network requests with the *PROT* protocol (IPv4 or IPv6), *IPADDR* IP address and *PORT* port number. The previous EQQIP16I message shows the local host name and port number.

System action: The scheduler processing continues.

User response: None.

EQQIP12II THE COMMUNICATION WITH THE CONTROLLER IS UP.

Explanation: A session was established between the local TCP/IP communication task and the controller.

System action: The TCP/IP communication task processing continues.

EQQIP13W AGENT WITH ADDRESS AND PORT IPADDR PORT SEEMS NOT ACTIVE.

Explanation: The TCP/IP communication task detected a timeout condition after a request to the remote agent identified by the message variables. The connection is automatically retried.

System action: The local TCP/IP communication task is ready to accept a new connection from the involved external agent.

User response: Verify that the next connection attempt to the external agent is established successfully. Check the message log (EQQMLOG) and look for other messages that explain the error. If the error recurs, save the message log and contact IBM Software Support.

EQQIP14W THE CONTROLLER SEEMS NOT ACTIVE.

Explanation: The TCP/IP communication task detected a timeout condition after a request to the controller. The connection is automatically retried.

System action: The local TCP/IP communication task is ready to accept a new connection from the controller.

User response: Verify that the next connection attempt to the controller is established successfully. Check the message log (EQQMLOG) and look for other messages that explain the error. If the error recurs, save the message log and contact IBM Software Support.

EQQIP15E AGENT COMMUNICATION ERROR ERRNO RECEIVED BY TCP/IP ON CONNECTION WITH ADDRESS AND PORT IPADDR PORT.

Explanation: The connection between the local TCP/IP communication task and an external agent *AGENT* experienced the error indicated by *ERRNO*. The most common decimal values for *ERRNO* are:

- 0111** A condition of denied permission occurred.
- 1115** After the local communication task closure, you restarted the local communication task before TCP/IP completed the resource release process. This error number might also indicate a local address used by another application.
- 1116** The *HOSTNAME* keyword of the *TCPOPTS* statement might contain a typing error in the IP address specification.
- 1128** The connection failed because of one of the following causes:
 - A valid current plan is not defined.
 - The controller did not start properly.
 - The controller address or port for is wrong.
 - A firewall blocks the address or port.

System action: The TCP/IP communication task attempts to recover the error. The system waits approximately for 1 minute before attempting an automatic restart.

User response: If the current plan is missing, define a valid current plan.

Try to identify the origin of the problem using further messages in the EQQMLOG. In case of *ERRNO* = 0111, the most common causes of the error are:

- Incorrect RACF definition of the OMVS segment for the user ID associated to the scheduler started task.
- The port number used by the scheduler started task is included in the port reservation list. Use the *NETSTAT PORTLIST* TSO command to verify the current port reservation list.

EQQIP16I • EQQIP20W

If you correct an error, and the correction requires a change in any initialization statement used by the scheduler, restart the involved started task.

Problem determination: Look for EQQIP16I in the message log (EQQMLOG) for additional information. Use *ERRNO* and the additional information to identify the error type. For details about network configuration or TCP/IP customization errors, refer to the *z/OS Communications Server* publications. For the complete list of the *ERRNO* values, refer to the *z/OS Communication Server IP and SNA Codes* and *z/OS UNIX System Services Messages and Codes*.

The controller might have started without a valid current plan, for example at first startup after installation or after a REFRESH function (option 9.5).

EQQIP16I TCPIPMSG

Explanation: This message contains additional information for a related EQQIP11I, EQQIP08E, EQQIP15E, or EQQIP18I message.

System action: Processing continues.

User response: Integrate this information with the related EQQIP11I, EQQIP08E, EQQIP15E, or EQQIP18I message information. In case of SSL error, the most common causes are listed in Chapter 236, "SSL errors," on page 1431.

EQQIP17I THE CONTROLLER HAS REJECTED A CONNECTION REQUEST FROM AGENT WITH ADDRESS AND PORT IPADDR PORT BECAUSE THE CONTROLLER CANNOT ACCEPT SSL REQUEST TYPES.

Explanation: The controller and a remote partner run with TCPOPTS statements specifying different values in the SSLLEVEL keyword.

System action: The scheduler processing continues.

User response: Specify the same SSLLEVEL value for the scheduler started tasks that are to communicate with each other. Restart the involved started task.

EQQIP18I TRYING TO CONNECT TO THE CONTROLLER WITH HOST NAME AND PORT HOSTNAME PORT .

Explanation: The TCP/IP communication task is opening a connection with the controller identified by *HOSTNAME PORT*. The following EQQIP16I message shows the local host name and port number.

System action: The scheduler processing continues.

User response: None.

EQQIP19W A BROKEN COMMUNICATION OCCURRED WITH THE CONTROLLER.

Explanation: The TCP/IP communication task rejected a communication attempt with the controller because the socket was closed. The connection is automatically retried.

System action: The local TCP/IP communication task is retrying to communicate with the controller.

User response: Check that the next connection attempt to the external agent is established successfully. Look for additional information in the controller EQQMLOG. If the error recurs, save the message log (EQQMLOG) and contact IBM Software Support.

EQQIP20W THE CONNECTION TO THE CONTROLLER WILL BE RESET. IT IS AUTOMATICALLY RETRIED IN APPROXIMATELY 60 SECONDS.

Explanation: The TCP/IP communication task resets the connection to the controller. It could be due to configuration changes, resulting in an error condition such as duplicated connection. The connection is automatically retried every 60 seconds.

System action: The local TCP/IP communication task is ready to accept a new connection from the controller. The system waits approximately for 1 minute before attempting an automatic restart.

User response: Verify that the next connection attempt to the controller is established successfully. Check the message log (EQQMLOG) and look for other messages that explain the error. If the error recurs, save the message log and contact IBM Software Support.

Chapter 211. EQQJnnn messages

EQQJ001 - EQQJ820

EQQJ001I ETT ACTIVATION/DEACTIVATION
REQUEST WAS NOT CONFIRMED

Explanation: You chose not to confirm the original request. So it was ignored by IBM Tivoli Workload Scheduler for z/OS.

System action: None.

User response: None.

EQQJ002W ETT ACTIVATION REQUEST
IGNORED SINCE ETT ALREADY
ACTIVE

Explanation: The event-triggered tracking (ETT) function was already active when you requested activation of the function.

System action: None.

User response: None.

EQQJ003W ETT DEACTIVATION REQUEST
IGNORED SINCE ETT NOT ACTIVE

Explanation: The event-triggered tracking (ETT) function was not active when you requested deactivation of the function.

System action: None.

User response: None.

EQQJ004I ETT FUNCTION HAS BEEN
SUCCESSFULLY ACTIVATED

Explanation: The event-triggered tracking (ETT) activation request has been successfully processed.

System action: None.

User response: None.

EQQJ005I ETT FUNCTION HAS BEEN
SUCCESSFULLY DEACTIVATED

Explanation: The event-triggered tracking (ETT) deactivation request has been successfully processed.

System action: None.

User response: None.

EQQJ006W ETT REQUEST IGNORED DUE TO
LACK OF PROPER AUTHORIZATION

Explanation: You have attempted to use the event-triggered tracking (ETT) function, but you do not have the necessary authorization.

System action: None.

User response: Contact your IBM Tivoli Workload Scheduler for z/OS security administrator.

EQQJ007E NOT AUTHORIZED TO UPDATE
ENTRY *ETTENAME*

Explanation: You have attempted to update the event-triggered tracking (ett) entry *ETTENAME*, but you do not have the necessary authorization.

System action: The request is rejected.

User response: Contact your security administrator.

EQQJ010I YOUR CHANGES HAVE
SUCCESSFULLY UPDATED THE ETT
DATABASE

Explanation: Your modifications to the event-triggered tracking (ETT) table have successfully updated the ETT database.

System action: None.

User response: None.

EQQJ011E YOUR CHANGES DID NOT UPDATE
THE ETT DATABASE DUE TO
ERRORS

Explanation: Your modifications to the event-triggered tracking (ETT) table did not update the table data set due to some error in the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: None.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log for I/O errors pertaining to the table data set. Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

User response: Exit from this panel and reenter it to determine which modifications updated the ETT database. Reenter those modifications that did not take effect. If the error persists, contact your system programmer.

EQQJ012E YOUR CHANGES TO THE ETT CRITERIA CONTAIN SYNTAX ERROR(S)

Explanation: Your changes to the event-triggered tracking (ETT) criteria contain a syntax error (or errors).

System action: None.

User response: Enter the correct data.

EQQJ013E THE ETT CRITERIA IS BEING UPDATED BY USER *USER* - TRY LATER

Explanation: Another user is currently updating the event-triggered tracking (ETT) criteria table. Only one user can access the table at a time.

System action: None.

User response: Try again later.

EQQJ014E VALID MATCHING TYPES ARE *OCHCEXA*, *OCHCPFX* AND *OCHCSFX*

Explanation: *OCHCEXA*, *OCHCPFX* and *OCHCSFX* are the national language characters for 'E' (exact), 'P' (prefix) and 'S' (suffix).

System action: None.

User response: Enter the correct matching type.

EQQJ020E AVAILABILITY STATUS CHANGE INFO MUST BE SPECIFIED FOR RESOURCE EVENTS

Explanation: You have defined a triggering event as a resource event, but failed to indicate if event-triggered tracking (ETT) triggering should occur only for an availability status switch from N (no) to Y (yes) or if ETT triggering should occur whenever the availability is set to Y.

System action: The system waits for you to respond.

User response: If you want the ETT triggered application to be added only when the resource is switched from unavailable to available, specify Y in the availability switch field. If you want the application to be added every time that the resource is set to available, regardless of the old status, specify N in the availability switch field.

EQQJ021E ETT EVENT TYPE MUST BE *OCHCJOB* OR *OCHCRES*

Explanation: *OCHCJOB* and *OCHCRES* are the national language characters for 'J' (job) and 'R' (resource).

System action: The system waits for you to respond.

User response: Enter the correct data.

EQQJ022E JOB NAME REPLACEMENT INFO MUST BE SPECIFIED FOR JOB EVENTS

Explanation: You have specified the event to be a job event, but failed to indicate whether the job name in the first operation of the added application should be replaced or not.

System action: The system waits for you to respond.

User response: Enter the correct data.

EQQJ023E JOB NAME REPLACEMENT INFO MUST BE *OCHCYES* OR *OCHCNO*

Explanation: *OCHCYES* and *OCHCNO* are the national characters for 'Y' (yes) and 'N' (no).

System action: The system waits for you to respond.

User response: Enter the correct data.

EQQJ024E JOB NAME REPLACEMENT INFO MUST BE *OCHCNO* OR BLANK FOR RESOURCE EVENT

Explanation: You have specified the event to be a resource event. You cannot replace job name information for resource events. IBM Tivoli Workload Scheduler for z/OS automatically sets this information to N (no) for resource events.

OCHCNO is the national character for 'N' (no).

System action: None.

User response: Enter the *OCHCNO* or blank for resource events and submit the operation again.

EQQJ025E A VALID NAME OF AN ASSOCIATED APPLICATION MUST BE SPECIFIED

Explanation: You must specify the name of a valid application to be added to the current plan when an event-triggered tracking (ETT) event matching this criteria entry occurs.

System action: The system waits for you to respond.

User response: Enter correct data.

EQQJ026E VALID VALUES ARE: *OCHCYES*, *OCHCNO*, *OCHPRED*, *OCHSUC* AND BLANK

Explanation: You have entered a value for the dependency resolution attribute that is not recognized by the Event-Triggered Tracking dialog. You must change the value to one of the supported values defined by this message.

System action: The system waits for you to respond.

User response: Change the dependency resolution value.

EQQJ027E **AVAILABILITY STATUS CHANGE
FIELD IS NOT OCHCNO OR BLANK**

Explanation: You have defined a triggering event as a reader event, but have specified a character other than *OCHCNO* or blank in the availability switch field. The availability status switch is relevant only when the triggering event is a resource.

System action: The system waits for you to respond.

User response: Change the availability switch indicator for the trigger to *OCHCNO* or leave the field blank.

EQQJ028E **EACH ETT CRITERIA ROW MUST
HAVE A UNIQUE EVENT NAME
WITHIN TYPE**

Explanation: You have specified duplicate event names in the event-triggered tracking (ETT) table.

System action: The system waits for you to respond.

User response: Remove the duplicate entry or make its name unique.

EQQJ029E **AVAILABILITY STATUS CHANGE
FIELD IS NOT OCHCYES OR OCHCNO**

Explanation: You have defined a triggering event as a resource event, but have specified a character other than *OCHCYES* or *OCHCNO* in the availability switch field. The availability status switch must be set when the triggering event is a resource.

System action: The system waits for you to respond.

User response: If you want the event-triggered tracking (ETT) application to be added only when the resource is switched from unavailable to available, specify Y in the availability switch field. If you want the application to be added every time the resource is set to available, regardless of the old status, specify N in the availability switch field.

EQQJ500E **INVALID STRING IN DIRECTIVE AT
LINE LINE OF SCTN**

Explanation: The predicate for any keyword other than *COMP* must:

- Consist of alphanumeric characters
- Begin with an alphabetic character.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the tailoring directive.

EQQJ501E **DUPLICATE TABLE NAME TBL AT
LINE LINE OF SCTN**

Explanation: The same table name was encountered twice in a *SEARCH* directive of the product.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the tailoring directive.

EQQJ502E **CONTRADICTIONARY USE OF
STANDARD TABLES AT LINE LINE OF
SCTN**

Explanation: A *SEARCH* directive of the product contains either both *GLOBAL* and *NOGLOBAL*, or both *APPL* and *NOAPPL*.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the tailoring directive.

EQQJ503E **ERROR ATTEMPTING TO READ JCL
MEMBER MBR**

Explanation: The member specified in a *FETCH* directive of the product could not be found. The member name is incorrect or the member cannot be accessed.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the tailoring directive or ensure that the member is available.

EQQJ504E **KEYWORD STRING TOO LONG IN
DIRECTIVE BEGINNING AT LINE
LINE OF SCTN**

Explanation: The third and final string in a directive of the product contains more than 1024 characters after substitution, including continuation lines.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the tailoring directive.

EQQJ505E **INVALID KEYWORD COMBINATION
IN DIRECTIVE BEGINNING AT LINE
LINE OF SCTN**

Explanation: A directive of the product has at one or more of these problems:

- Keywords are incompatible with each other.
- Keywords are incompatible with the type of directive.

- Mandatory keywords are missing.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the tailoring directive.

**EQQJ506E RECURSIVE SUBSTITUTION AT LINE
LINE OF SCTN**

Explanation: The value of a variable depends on the values of other variables, which in turn depend on its value. No value can be determined for this variable.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Examine the table definitions of the variables in the line and eliminate the closed translation loop.

**EQQJ507E CHANGE OF STRUCTURE CAUSED
BY SUBSTITUTION IN DIRECTIVE
BEGINNING AT LINE LINE OF SCTN**

Explanation: Variable substitution has caused one or more of these changes:

- A directive of the product has been created.
- The type of a directive of the product has changed.
- The keywords of a directive of the product have changed.
- A directive of the product has changed to another line type.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the original tailoring directive or substitution values.

**EQQJ508E RECURSIVE SUBSTITUTION OF
LENGTH LINES FROM FROM OF SCTN**

Explanation: A closed loop of dependency definitions or variable translations exists.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Examine the table definitions of the variables in this section, and eliminate the loop.

If this section contains promptable variables, the values supplied for these variables may have caused the error.

EQQJ509E TABLE TBL NOT FOUND

Explanation: If TABLE GLOBAL NOT FOUND message text appears: possible reasons are:

The user did not explicitly provide tables to be searched.

The user specified some tables to be searched but none of them are defined in the AD file.

The scheduler tried to search the variable in the global table, but the default global variable table is not defined in the AD file.

System action: If you are scheduling a JCL submission, a system automation command, or a job type with advanced options, the current operation status is set to ended-in-error with error code OJCV. If you are scheduling a not centralized job submission, the Symphony creation or the addition of the operation fails.

User response: Check the directives or the VARSUB statement or the HTTPOPTS statement to ensure that the table names are correct. Use the Variable Definition dialog to ensure that the tables exist.

**EQQJ510E UNSET VARIABLE VAR AT LINE LINE
OF SCTN**

Explanation: A non-dependent variable with no value was encountered in the submit phase or in a JCLPREPA simulation request.

In the submit phase, or at simulation, these types of variables can be encountered:

- Variables that have already been provided with values
- Variables that are dependent on other variables
- Variables that do not require a setting (which are eliminated from the job stream).

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Either change the variable definition or give the variable a value.

**EQQJ511E JOB JOBNAME IN APPLICATION APPL
CONTAINS A SCHEDULER CONTROL
STATEMENT THAT IS NOT
RECOGNIZED**

Explanation: The product was unable to submit the identified job because it contains an incorrectly coded `//*%OPC` statement and JCL variable scanning is active for this job.

System action: The current operation status is set to ended-in-error with error code OJCV.

User response: Locate the JCL for this job and correct the `//*%OPC` statement. Use the scheduler dialog to rerun the operation.

EQQJ512E RECURSIVE DEPENDENCY VARIABLE
VAR AT LINE LINE OF SCTN

Explanation: A closed loop of dependency definitions exists.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Examine the table definitions of this variable and the chain on which it is dependent, and eliminate the closed dependency loop. The loop does not necessarily include the variable listed in the message.

EQQJ513E SETUP VARIABLE CHLD DEPENDENT
ON SUBMIT VARIABLE PRNT AT
LINE LINE OF SCTN

Explanation: A prompt variable cannot be dependent on a submit variable.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the table definitions, SEARCH directives, or TABLE directives.

EQQJ514E RETURN CODE RC FROM USER EXIT
USRX. THE EXIT WAS DEFINED FOR
VARIABLE VAR IN TABLE TAB FOR
APPLICATION ADID, WITH
OCCURRENCE INPUT ARRIVAL IAD,
IAT. THE OPERATION NUMBER IS
OPNO

Explanation: IBM Tivoli Workload Scheduler for z/OS received an unexpected return code from an exit.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the user module, supply a valid return code, and restart IBM Tivoli Workload Scheduler for z/OS.

EQQJ515E RECOVERABLE ABEND IN USER EXIT
USRX THAT WAS DEFINED FOR
VARIABLE VAR IN TABLE TAB FOR
APPLICATION ADID, INPUT ARRIVAL
IS IAD, IAT, OPERATION NUMBER IS
OPNO

Explanation: The user module caused an abend from which IBM Tivoli Workload Scheduler for z/OS recovered.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the user module and restart IBM Tivoli Workload Scheduler for z/OS.

EQQJ516E UNRECOVERABLE ABEND IN USER
EXIT USRX THAT WAS DEFINED FOR
VARIABLE VAR IN TABLE TAB,
APPLICATION IS ADID, WITH
OCCURRENCE INPUT ARRIVAL IAD,
IAT, OPERATION NUMBER IS OPNO

Explanation: The user module caused an abend from which IBM Tivoli Workload Scheduler for z/OS could not recover.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the user module and restart IBM Tivoli Workload Scheduler for z/OS.

EQQJ517E INVALID VALUE VAL SUPPLIED BY
USER EXIT USRX FOR VARIABLE VAR
IN TABLE TAB FOR APPLICATION
ADID, OCCURRENCE IA IS IAD, IAT,
OPERATION NUMBER IS OPNO

Explanation: The value that you supplied for the variable violates the verification rules in the variable definition.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the user module or verification criteria. To use the corrected user module, you must restart IBM Tivoli Workload Scheduler for z/OS.

EQQJ518E THE SUBSTITUTION EXIT USRX WAS
REFERENCED BY VARIABLE VAR. THE
EXIT WILL NOT BE CALLED AS IT
HAS BEEN MARKED NOT
EXECUTABLE BY THE SCHEDULER.
APPLICATION IS ADID, INPUT
ARRIVAL IS: IAD, IAT, AND
OPERATION NUMBER IS OPNO

Explanation: IBM Tivoli Workload Scheduler for z/OS has previously discovered an abend in this exit and marked it as not executable. This exit is not called again.

System action: The current operation status is set to ended-in-error, with error code OJCV.

System programmer response: Correct the exit and restart IBM Tivoli Workload Scheduler for z/OS to reuse the exit.

EQQJ519E **INSUFFICIENT STORAGE TO BUILD JCL RECORD. APPLICATION IS: ADID, OPERATION NO IS: OPNO, INPUT ARRIVAL DATE IS: IAD AND INPUT ARRIVAL TIME IS: IAT.**

Explanation: IBM Tivoli Workload Scheduler for z/OS tried to allocate storage for a final build of the JCL record, but the request for storage failed.

System action: The operation status depends on the SUBFAILACTION keyword in the JTOPTS initialization statement. The operation can:

- Keep status R or extended status RE
- Get status C (complete)
- Get status E (ended-in-error) with error code OSUF.

System programmer response: Make sure that IBM Tivoli Workload Scheduler for z/OS is running in a large enough region and restart IBM Tivoli Workload Scheduler for z/OS.

EQQJ520E **VALUE LENGTH IS REQUIRED WHEN COMPARISON OPERATOR SPECIFIED**

Explanation: Because you entered a comparison operator, you must enter a value length.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQJ521E **COMPARISON OPERATOR REQUIRED WHEN LENGTH OPERATOR SPECIFIED**

Explanation: Because you entered a value length, you must enter a comparison operator.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQJ522E **THE DEFAULT VALUE IS INVALID FOR THE VERIFICATION TYPE**

Explanation: The default value that you entered does not match the verification rules for the variable.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQJ523E **A VALIDATION PATTERN IS REQUIRED FOR PICT VERIFICATION**

Explanation: Because you asked for PICT verification, you must enter a validation pattern.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQJ524E **Y/N MUST BE ENTERED IN NUMERIC FIELD FOR LIST/RANGE**

Explanation: Because you asked for RANGE verification, you must enter Y (yes) or N (no) in the numeric field.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQJ525E **THE JCL VARIABLE TABLE HAS BEEN DELETED**

Explanation: The current variable table has been deleted from IBM Tivoli Workload Scheduler for z/OS's database.

System action: The table is deleted.

User response: Re-define a variable table if needed, or check the current definition and specify it in any existing concatenation.

EQQJ526E **CHARACTER CHR IN POSITION PDS IS INVALID**

Explanation: The value entered as a default value does not match the validation pattern defined for the variable.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQJ527E **THE VALUES/RANGES MAY NOT CONTAIN IMBEDDED BLANKS**

Explanation: You cannot use blanks in a LIST/RANGE verification value list.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQJ528E **THE NUMBER OF VALUES MUST BE EVEN FOR RANGE VERIFICATION**

Explanation: You specified an odd number of values for a range verification.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQJ529E **THE VALUES DEFINING A RANGE ARE IN DESCENDING SEQUENCE**

Explanation: You entered a range that consists of a larger number followed by a smaller number. You must specify the smaller number (beginning of the range) before the larger number (end of the range).

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQJ530E SCANNING LENGTH EXCEEDED
LINE *LINE* OF *SCTN*

Explanation: Substitution of a JCL command has caused the command length to exceed 71 characters or substitution of an in-stream data line has caused the in-stream data line to exceed 80 characters.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

System programmer response: If the substitution is correct, split the command line over two or more lines. If the problem occurs in an in-stream data line, verify that the ISPF profile option for sequence numbering is turned off in the JCL job library.

EQQJ531E THE SCHEDULER WAS UNABLE TO
LOAD VARIABLE SUBSTITUTION
EXIT *USRX* TABLE NAME IS *TAB*,
VARIABLE NAME IS *VAR*,
APPLICATION IS *ADID*,
OCCURRENCE *IA* = *IAD*, *IAT*,
OPERATION NUMBER IS *OPNO*

Explanation: A variable substitution exit that was referred to could not be loaded by IBM Tivoli Workload Scheduler for z/OS.

System action: If you are scheduling a JCL job or a centralized script, the current operation status is set to ended-in-error with error code OJCV. If you are scheduling a not centralized job, depending on where you are, Batch or controller:

- The creation of symphony continues but the job is added in fail status.
- The addition of the operation fails.

System programmer response: Check the current load library in the started task JCL and make sure that the exit is link-edited to the correct library.

EQQJ532E INVALID EXPRESSION *EXPR*
BEGINNING AT LINE *LINE* OF *SCTN*

Explanation: The expression must consist of keyword= where keyword is one of: NAME, ACTION, PHASE, MEMBER, COMP, EXIT.

This message can also be issued if all mandatory keywords have not been specified.

System action: If the error occurs during job submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the JCL.

EQQJ533E DIRECTIVE *DIR* OUT OF POSITION
LINE *LINE* OF *SCTN*

Explanation: There are two possibilities:

- No previous */**%OPC BEGIN* directive corresponds to the current */**%OPC END* directive.
- A */**%OPC BEGIN* directive was found previously, but the current directive is not the corresponding */**%OPC END* directive.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the JCL.

EQQJ534E INVALID VARIABLE *VAR* LINE *LINE*
OF *SCTN*

Explanation: The name of a variable can contain one to eight alphanumeric characters, where the first character is alphabetic. This message can also be reported if a tabular variable, that is, a ?-variable, does not include the substitution column position and a default position is not defined in the JCL variable table.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the JCL or the JCL variable table as appropriate.

EQQJ535E UNDEFINED VARIABLE *VAR* LINE
LINE OF *SCTN*

Explanation: A variable that is not predefined by IBM Tivoli Workload Scheduler for z/OS must appear in a table that is created by the JCL variable dialog and is included in the current table concatenation.

For more information, refer to the description of the SEARCH and TABLE directives in *Managing the Workload*.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the JCL.

EQQJ536E POSITIONAL OVERLAP VARIABLE
VAR LINE *LINE* OF *SCTN*

Explanation: The tabular variable (?-variable) cannot be assigned the positions specified in the prefix or by default because part or all of the receiving string is already occupied.

For more information, refer to *Managing the Workload*.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the JCL.

EQQJ537E CALENDAR CAL CANNOT BE FOUND. SUBSTITUTION FAILED

Explanation: During variable substitution of a job, a function that requires access to a calendar, for example, a SETVAR directive asking for an expression involving arithmetics on calendar days, could not be processed. The calendar referenced by the occurrence no longer exists.

System action: If the error occurs during job submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: The calendar may have been deleted by mistake. Delete the SETVAR directive from the JCL, find out what the calendar once looked like and insert the needed date manually under JCL Edit.

EQQJ538E BEGIN ACTION NOT CLOSED LINE LINE OF SCTN

Explanation: At the end of the JCL stream, the last `/**%OPC BEGIN` command has not been closed by a `/**%OPC END` command.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the JCL.

EQQJ539E VARIABLE SUBSTITUTION WAS INTERRUPTED BY SUBSTITUTION EXIT USRX. APPLICATION IS ADID, INPUT ARRIVAL DATE AND TIME IS IAD, IAT OPERATION NUMBER IS OPNO

Explanation: A substitution exit set a return code of 8, which interrupted the JCL variable substitution. No further substitution is done for this operation.

System action: If you are scheduling a JCL submission, the current operation status is set to ended-in-error with error code OJCV. If you are scheduling a not centralized job submission, the symphony creation or the addition of the operation fails.

System programmer response: Check the current exits and determine the reason for return code 8 being passed back. If the exit is changed and you want to reuse it, restart IBM Tivoli Workload Scheduler for z/OS. If you are scheduling a system automation command, the operation status is set to ended-in-error with error code OJCV.

EQQJ540E MORE THAN 16 TABLES DECLARED IN SEARCH DIRECTIVE AT LINE LINE OF SCTN

Explanation: The number of tables requested by a SEARCH directive is greater than 16.

Unless GLOBAL and APPL are explicitly excluded (NOGLOBAL and NOAPPL), they contribute to the total even if they are not specified in the SEARCH directive.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Check if all tables are necessary and correct the JCL.

EQQJ541E ATTEMPT TO CONCATENATE MORE THAN 16 TABLES BY TABLE DIRECTIVE AT LINE LINE OF SCTN

Explanation: A TABLE directive has been encountered when 16 tables are already active.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Check if all tables are necessary and correct the JCL.

EQQJ542E COMP EXPRESSION BEGINNING AT LINE LINE OF SCTN EXCEEDS 1024 BYTES

Explanation: The total length of all fields of a COMP expression, including COMP= and all continuations of the right side of the expression on subsequent JCL lines, cannot exceed 1024 characters after substitution.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the JCL.

EQQJ543E COMP EXPRESSION BEGINNING AT LINE LINE OF SCTN IS NOT WELL FORMED: EXPR

Explanation: The syntax of the COMP keyword is not correct.

System action: The current operation status is set to ended-in-error with error code OJCV.

User response: Correct the directive of the product using the current COMP keyword.

Problem determination: This message is followed by message EQQJ544E, EQQJ545E, EQQJ546E, EQQJ572E, EQQJ573E, or EQQJ547E, which describes the exact cause of the syntax error.

EQQJ544E COMP EXPRESSION CONTAINS UNBALANCED PARENTHESIS

Explanation: Parentheses are not used correctly in the COMP keyword.

System action: The current operation status is set to ended-in-error with error code OJCV.

User response: Correct the JCL for the operation and make sure that the COMP keyword contains the correct number of parentheses.

Problem determination: This message is issued together with message EQQJ543E. For an explanation of the COMP keyword, refer to *Managing the Workload*

EQQJ545E COMP EXPRESSION MUST CONTAIN AT LEAST ONE OPERATOR

Explanation: The COMP keyword does not contain any operators.

System action: The current operation status is set to ended-in-error with error code OJCV.

User response: Correct the JCL for the operation and make sure that the COMP keyword contains at least one operator.

Problem determination: This message is issued together with message EQQJ543E. For an explanation of the COMP keyword, refer to *Managing the Workload*

EQQJ546E COMP EXPRESSION CONTAINS TOO FEW EQUATION SEPARATING COMMAS

Explanation: At least one comma is missing in the COMP keyword.

System action: The current operation status is set to ended-in-error with error code OJCV.

User response: Correct the JCL for the operation and make sure that the COMP keyword is correct.

Problem determination: This message is issued together with message EQQJ543E. For an explanation of the COMP keyword, refer to *Managing the Workload*

EQQJ547E COMP EXPRESSION CONTAINS TOO FEW OPERATORS

Explanation: At least one operator is missing in the COMP keyword.

System action: The current operation status is set to ended-in-error with error code OJCV.

User response: Correct the JCL for the operation and make sure that the COMP keyword is correct.

Problem determination: This message is issued together with message EQQJ543E. For an explanation of the COMP keyword, refer to *Managing the Workload*

EQQJ548W VARIABLE VAR IN TABLE TABLE COULD NOT BE UPDATED. REASON IS RSN

Explanation: A SAVEVAR directive with ERRORACT=CONT was found during variable substitution. IBM Tivoli Workload Scheduler for z/OS tried to update the default value as requested in the SETVAR directive, but it was not possible for one of the following reasons:

HELDLOCK

Could not get ENQ lock necessary to access the variable.

NOTFOUND

Variable/table did not exist in the table data set

BADVNAME

Variable/table is either a IBM Tivoli Workload Scheduler for z/OS-supplied variable or a temporary variable. These variables are never saved.

System action: Processing continues. The job is submitted as normal, but the next time that the default value is requested as input to variable substitution, it does not show the latest updated value.

User response: The value can be corrected by allowing a person with update access to the variable table to update the default value manually in the JCL variable dialog.

EQQJ549E A SETUP PHASE DIRECTIVE AT LINE LINE OF SCTN REFERS TO A VARIABLE DEFINED FOR USE AT SUBMIT

Explanation: The current job contains a JCL processing directive specifying PHASE=SETUP. IBM Tivoli Workload Scheduler for z/OS could not determine what action is requested by the statement because it refers to a JCL variable whose value is not determined until the submit phase.

System action: The system waits for you to respond.

User response: Enter the JCL Edit dialog and correct the incorrect statement. Reenter the Ready List dialog and retry JCL setup for this operation.

EQQJ550E CHARACTER CHR IN POSITION POS IS INVALID

Explanation: The value entered as a default value does not match the validation pattern defined for the variable.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQJ551E THE VALUE OF THE INDEPENDENT VARIABLE ALREADY EXISTS

Explanation: The same value of the independent variable is given in two different rows of the dependency table.

System action: The system waits for you to respond.

User response: Correct or delete the values that you entered.

EQQJ553E VALIDATION ERROR AT LINE *LINE* in JOB *SCTN* VALUE IS REQUIRED FOR THE VARIABLE *VAR* BUT IS DEFINED AS BLANK

Explanation: JCL tailoring is setting a temporary variable by a replacement with a source string. This string is blank, but a value is required.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCLV. Otherwise, the status is not changed.

User response: Check the SETVAR directive from JCL to find the cause of the error and use JCL Edit for manual insertion of the missing value.

EQQJ560E MORE THAN 16 VARIABLES SPECIFIED IN SAVEVAR DIRECTIVE AT LINE *LINE* OF *SCTN*

Explanation: The number of variables requested to be saved in a SAVEVAR directive is greater than 16.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Split the SAVEVAR directive into multiple directives.

EQQJ561E TEMPORARY VARIABLE NAME *VAR* ALREADY USED FOR SUBSTITUTION IN JOB *JOBNAME*

Explanation: A SETVAR directive requests creation of a temporary variable. There has been an earlier reference in the job to the same name and it has been found in the IBM Tivoli Workload Scheduler for z/OS Variable Table.

System action: If the error occurs during submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Use another name for your temporary variable.

EQQJ562E INSUFFICIENT STORAGE TO PROCESS MEMBER *MEMBER* OF *DDNAME*

Explanation: IBM Tivoli Workload Scheduler for z/OS was attempting to build a record in the VSAM data set to be inserted in the JCL repository data set, but it was unable to do so because of insufficient virtual storage.

System action: The operation remains in Ready status. IBM Tivoli Workload Scheduler for z/OS is unable to submit the job to JES.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS and restart it in a larger region.

User response: Submit the job manually.

EQQJ563E THE SCHEDULER WAS UNABLE TO FIND MEMBER *MEMBER* IN *DDNAME* LIBRARY FILE

Explanation: IBM Tivoli Workload Scheduler for z/OS was attempting to submit a job to JES for a ready operation on a computer workstation. However, no JCL for this operation is saved in the JCL repository data set and the job is not present as a member in the library defined by the EQQJBLIB DD statement.

System action: The operation remains in Ready status. IBM Tivoli Workload Scheduler for z/OS assumes that some other function submits the job to JES.

User response: If necessary, submit the job manually.

Problem determination: Check that the EQQJBLIB DD statement is correctly defined and that all required members are defined.

EQQJ564W MEMBER *MEMBER* IN *DDNAME* LIBRARY FILE IS EMPTY

Explanation: The JCL library member exists in the library defined by the EQQJBLIB DD statement, but there are no records in the member.

System action: The operation remains in Ready status. IBM Tivoli Workload Scheduler for z/OS assumes that some other function submits the job to JES.

User response: If necessary, submit the job manually.

Problem determination: Check that the EQQJBLIB DD statement is correctly defined and that all required members are defined.

EQQJ565E INVALID VARIABLE OR TABLE NAME AT LINE *LINE* OF *SCTN*

Explanation: During variable substitution of a job, a SAVEVAR directive specified the name of a variable, or a variable table, with incorrect syntax.

System action: If the error occurs during job submit,

the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the syntax of the variable or variable table.

EQQJ566E **INVALID REFERENCE TO GLOBAL TABLE AT LINE *LINE* OF *SCTN***

Explanation: During variable substitution of a job, a SAVEVAR directive was found that specified only the variable name. The implied table is then the Variable Substitution global table. However, no GTABLE keyword has been specified in OPCOPTS.

System action: If the error occurs during job submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Either add a GTABLE keyword to OPCOPTS and restart the controller or specify the variable table in the SAVEVAR statement.

EQQJ567E **THE JCL FOR APPLICATION *AD* COULD NOT BE INSERTED IN THE JS REPOSITORY PHYSICAL RECORD SIZE IS TOO SMALL**

Explanation: The physical record length specified for the JS repository is too small.

System action: The current operation remains in Ready status.

System programmer response: Increase the physical record length for EQQJS1DS and EQQJS2DS.

User response: Contact your system programmer.

Problem determination: Check the VSAM definitions for EQQJS1DS and EQQJS2DS.

EQQJ568E **VARIABLE *VAR* IN TABLE *TABLE* COULD NOT BE UPDATED. REASON: *RSN***

Explanation: A SAVEVAR directive with ERRORACT=NOCONT was found during variable substitution. IBM Tivoli Workload Scheduler for z/OS tried to update the default value as requested in the SETVAR directive, but it was not possible for one of the following reasons:

HELDLOCK

Could not get ENQ lock necessary to access the variable.

NOTFOUND

Variable/table did not exist in the variable table data set

BADVNAME

Variable/table is either a IBM Tivoli Workload

Scheduler for z/OS-supplied variable or a temporary variable. These variables are never saved.

User response: The value can be corrected by allowing a person with update access to the variable table to correct the default value manually in the JCL variable table dialog.

EQQJ569E **INVALID REFERENCE TO DYNAMIC FORMAT VARIABLE AT LINE *LINE* OF *SCTN***

Explanation: A reference to a dynamic-format variable has been found and the format of the variable has not been set in a SETFORM directive.

System action: If the error occurs during job submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Insert a SETFORM directive in the JCL earlier than the point where it is referenced.

EQQJ570E **INVALID DYNAMIC FORMAT VARIABLE NAME AT LINE *LINE* OF *SCTN***

Explanation: During variable substitution of a job, a SETFORM directive was found where the name of the dynamic-format variable is not a IBM Tivoli Workload Scheduler for z/OS-supplied dynamic format variable.

System action: If the error occurs during job submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the variable name in the SETFORM directive.

EQQJ571E **INVALID FORMAT EXPRESSION IN SETFORM DIRECTIVE AT LINE *LINE* OF *SCTN***

Explanation: During variable substitution of a job, a SETFORM directive was found where the format did not have the proper syntax. Possible errors are:

- The first characters after the left parenthesis and the last characters before the right parenthesis of the expression are not meaningful keywords for the specified dynamic format variable. (For example, CCYY, YY, MM, DD, or DDD for a date-related dynamic variable.)
- The whole format expression was searched and no meaningful keywords for the specified dynamic-format variable were found. (For example, CCYY, YY, MM, DD, or DDD was not found for a date-related dynamic variable.)

EQQJ572E • EQQJ578E

- IBM Tivoli Workload Scheduler for z/OS variable substitution characters (&, %, = or ?) are found in the expression.

System action: If the error occurs during job submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the format expression in the SETFORM directive.

EQQJ572E COMP EXPRESSION CONTAINS MULTIPLE VALUES FOR 'EXPRESSION2'

Explanation: A COMP expression with operators GT, GE, LT, or LE only allows one value for expression2.

System action: If the error occurs during job submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the JCL for the operation and make sure that the COMP keyword is correct.

EQQJ573E COMP EXPRESSION CONTAINS GENERIC SEARCH CHARACTERS

Explanation: A COMP expression with operators GT, GE, LT, or LE does not allow the generic characters * or % in expression2.

System action: If the error occurs during job submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the JCL for the operation and make sure that the COMP keyword is correct.

EQQJ575E ARITHMETIC EXPRESSION BEGINNING AT LINE LINE OF SCTN EXCEEDS LIMITS

Explanation: During variable substitution of a job, the calculation of a SETVAR arithmetic expression resulted in a date value that exceeds Tivoli Workload Scheduler for z/OS limits. IBM Tivoli Workload Scheduler for z/OS supports dates from 1 January 1984 to 31 December 2071. If the expression includes dynamic-format supplied variables containing the first or the last day in the month or in the year of the occurrence IA, the calculated date must fall within the range of four years earlier and seven years later than the current year.

System action: If the error occurs during job submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the SETVAR arithmetic expression.

EQQJ576E THE EQQUX002 EXIT COULD NOT OPEN AN INPUT DATA SET TO READ JOB MEMBER EXIT MESSAGE IS: UX002MSG

Explanation: The joblib I/O exit was called and gave a return code indicating that it could not open one of its input data sets.

System action: The job is not submitted by IBM Tivoli Workload Scheduler for z/OS as intended. The operation remains in Ready status.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

User response: If necessary, submit the job manually.

Problem determination: Check that all DD statements needed by the EQQUX002 exit have been correctly defined and that the IBM Tivoli Workload Scheduler for z/OS started task has (as a minimum) read access to all referenced data sets.

EQQJ577E INSUFFICIENT STORAGE TO PROCESS JOB MEMBER FOR EQQUX002 EXIT

Explanation: IBM Tivoli Workload Scheduler for z/OS was building a reord in the VSAM data set to be inserted in the JCL repository data set, but it was unable to do so because of insufficient virtual storage.

System action: The operation remains in Ready status. IBM Tivoli Workload Scheduler for z/OS is unable to submit the job to JES.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS and restart it in a larger region.

User response: Submit the job manually.

EQQJ578E THE EQQUX002 EXIT COULD NOT FIND JOB MEMBER IN ANY INPUT DATA SET

Explanation: IBM Tivoli Workload Scheduler for z/OS was attempting to submit a job to JES for a ready operation on a computer workstation. However, no JCL for this operation is saved in the JCL repository data set, and the joblib I/O exit could not find the job in any input data set.

System action: The operation remains in Ready status. IBM Tivoli Workload Scheduler for z/OS assumes that some other function submits the job to JES.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

User response: If necessary, submit the job manually.

Problem determination: Check that all DD statements needed by the EQQUX002 exit have been correctly defined and that all required members are defined.

EQQJ579W THE EQQUX002 EXIT DID NOT RETURN ANY DATA FOR JOB MEMBER

Explanation: The joblib I/O exit was called to retrieve a job to be submitted, but the exit did not return any data.

System action: The job is not submitted by IBM Tivoli Workload Scheduler for z/OS as intended. The operation remains in Ready status.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

User response: If necessary, submit the job manually.

Problem determination: Check that the joblib I/O exit has been correctly installed and that it works correctly.

EQQJ580E THE EQQUX002 EXIT RETURNED THE FOLLOWING I/O ERROR MESSAGE FOR JOB MEMBER: UX002MSG

Explanation: The joblib I/O exit was called to retrieve a job to be submitted, but the exit gave a return code indicating that an I/O error had occurred on an input data set.

System action: The job is not submitted by IBM Tivoli Workload Scheduler for z/OS as intended. The operation remains in Ready status.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

User response: If necessary, submit the job manually.

Problem determination: Check that the joblib I/O exit can access all required input data sets and that it works correctly.

EQQJ581E INVALID TEMPORARY VARIABLE NAME AT LINE LINE OF SCTN

Explanation: During variable substitution of a job, a SETVAR directive was found where the name of the temporary variable is incorrect. The possible errors are: termwidth=

- The variable name does not start with a T.
- The rest of the variable name contains one or more characters that are not alphanumeric.

System action: If the error occurs during job submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the name of the temporary variable.

EQQJ582E JOB MEMBER RETURNED BY THE EQQUX002 EXIT EXCEEDS MAXIMUM SUPPORTED SIZE

Explanation: The joblib I/O exit was called to retrieve a job to be submitted, but the returned job exceeds the maximum supported size, which is 608 KB (kilobytes) of data.

System action: The job is not submitted by IBM Tivoli Workload Scheduler for z/OS as intended. The operation remains in Ready status.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

User response: If necessary, submit the job manually.

Problem determination: Check that the joblib I/O exit has been correctly installed and that it works correctly.

EQQJ583E JOB MEMBER IN APPLICATION APPL IS TOO LARGE TO BE SAVED ON THE JS DATA SET

Explanation: A job that is about to be submitted to JES is too large to be saved in the JCL repository data set.

System action: The job is submitted, but the JCL repository data set is not updated.

System programmer response: If necessary, allocate a new JCL repository data set with a larger maximum record size. Use the IDCAMS REPRO function to copy the old data set into the new data set. Restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Use the IDCAMS LISTCAT function to determine the maximum size of records in the data set defined by the EQQJSDS DD statement.

EQQJ584E JOB MEMBER IN APPLICATION APPL COULD NOT BE SUBMITTED BECAUSE THE EQQUX001 EXIT RETURNED A SUBMITTING USER ID, USER, WHOSE AUTHORITY COULD NOT BE DETERMINED

Explanation: The job submit exit was called and returned the name of a TSO user on whose behalf the job submit should be done. An authority error occurred when trying to build a job submit environment for this user.

System action: The current job is not submitted. IBM Tivoli Workload Scheduler for z/OS processes the next read operation.

System programmer response: Correct all errors and, if necessary, restart IBM Tivoli Workload Scheduler for z/OS.

User response: If necessary, submit the job manually.

Problem determination: Check that the job submit

exit, EQQUX001, returns only valid TSO user names to the caller.

EQQJ585E INVALID ARITHMETIC EXPRESSION
AT LINE *LINE* OF *SCTN*

Explanation: During JCL variable substitution, incorrect syntax was found in SETVAR directive. The possible causes follow, grouped by parameter type:

- Common causes:
 - One or more parentheses missing.
 - Incorrect variable name.
- Arithmetic expression with supplied date or time variables:
 - A valid sign (+ or -) is missing.
 - Both plus and minus signs are present in the expression, but only one sign is allowed.
 - Incorrect number in the expression. The number must be in the range 1 to 999.
 - An incorrect type in the expression.
 - Erroneous non-blank characters within parentheses. Any non-blank within parentheses must be part of the arithmetic expression.
 - More than one type was specified for a date variable.
 - Incompatible multiple types found; only HH, MM, SS are allowed for multiple types.
 - The type is incompatible with the variable format.
- SUBSTR usage:
 - Incorrect number in the expression. The number must be in the range 1 to 60.
 - One or both of the two numeric values that must be specified as SUBSTR parameters (position, length) missing or not valid.
 - Incorrect SUBSTR function syntax.
 - The length of the whole statement reaches column 72.
- Numeric value usage:
 - Incorrect number. It must be in the range 0 to 99999.
- Arithmetic with temporary variables:
 - Incorrect operand. It must be in the range 0 to 99999.
 - Incorrect result. It must be in the range 0 to 99999.
 - A valid sign (+ or -) is missing.
 - Both plus and minus signs are present in the expression, but only one sign is allowed.
 - The expression contains blank characters.
- Alphanumeric value usage:
 - Incorrect syntax. Enclose the string in single quotes.
 - Incorrect syntax. The string cannot exceed 48 characters.

- Concatenation usage:
 - Incorrect result. It cannot exceed 48 characters.

System action: If the error occurs during job submit, the current operation status is set to ended-in-error with error code OJCV. Otherwise, the status is not changed.

User response: Correct the expression.

EQQJ586W TEMPORARY VARIABLE *VAR* IN
SETVAR DIRECTIVE NOT REFERRED
IN JCL. JOBNAME: *JOBNAME*

Explanation: During variable substitution of a job, a SETVAR directive was found and created a temporary variable. The temporary variable was not referred to anywhere in the JCL.

System action: This is a warning. Operation status is not changed.

User response: Either delete the SETVAR directive or make sure that you have a corresponding reference to the temporary variable in your JCL.

EQQJ587W VARIABLE *VAR* IN SAVEVAR
DIRECTIVE NOT REFERRED IN JCL
JOBNAME IS: *JNM*

Explanation: During variable substitution of a job, a SAVEVAR directive was found requesting update of the default value of a variable. This variable was not referred to anywhere in the JCL.

System action: This is a warning. Processing continues.

User response: Either delete the variable name from the SAVEVAR directive or make sure that you have a corresponding reference to the variable in the JCL.

EQQJ588E JOB MEMBER IN APPLICATION *APPL*
IS TOO LARGE TO BE SUBMITTED

Explanation: This job exceeds 65 535 records, which is the limit that IBM Tivoli Workload Scheduler for z/OS can process.

System action: The job is not submitted. The operation remains in Arriving or Ready status, with extended status Error during job submission.

User response: Submit the job outside of IBM Tivoli Workload Scheduler for z/OS.

EQQJ589E ETT VARIABLE *VAR* CANNOT BE
USED IN A JCL NOT ADDED VIA
ETT. JOBNAME: *JOBNM*,
APPLICATION: *APPL*

Explanation: The job is using an ETT occurrence-related variable, but the job was not added

through the Event-Triggering Tracking (ETT) mechanism.

System action: The job is not submitted. The current operation is set to ended-in-error with error code OCJV.

User response: Correct the JCL for the operation by removing the ETT variables.

EQQJ590E VARIABLE TABLE NAME CONTAINS AN INVALID CHARACTER

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ591E THE VARIABLE NAME CONTAINS AN INVALID CHARACTER

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ592E INVALID VALUE. MUST BE Y OR N

Explanation: You can enter only Y (for Yes) or N (for No) in this field.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ594E THE DEFAULT POSITION MUST BE IN THE RANGE 1-80

Explanation: The position that you have entered is out of the 80-column range for instream data or a JCL line.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ595E VALUE LENGTH IS REQUIRED WHEN COMP.OP IS SPECIFIED

Explanation: Because you entered a comparison operator, you must enter a value length.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ596E COMPARISON OPERATOR REQUIRED WHEN LENGTH IS SPECIFIED

Explanation: Because you entered a value length, you must enter a comparison operator.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ597E THE DEFAULT VALUE IS INVALIDATED BY THE VERIFICATION CRITERIA

Explanation: The default value that you entered does not comply with the verification rules for the variable.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ598E VALIDATION PATTERN IS REQUIRED FOR PICT VERIFICATION

Explanation: Because you asked for PICT verification, you must enter a validation pattern.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ599E NUMERIC MUST BE SPECIFIED FOR RANGE/LIST VERIFICATION

Explanation: Because you asked for RANGE or LIST verification, you must set the Numeric field to Yes.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ604I A DEPENDENCY HAS BEEN MODIFIED

Explanation: The dependency that you modified has been inserted into the database.

System action: None.

User response: None.

EQQJ606I A DEPENDENCY HAS BEEN CREATED

Explanation: The dependency that you created has been inserted into the database.

System action: None.

User response: None.

EQQJ607I A DEPENDENCY HAS BEEN DELETED

Explanation: The dependency that you deleted has been removed from the database.

System action: None.

User response: None.

EQQJ609E YOU ARE NOT AUTHORIZED TO DELETE THIS JCL VARIABLE TABLE

Explanation: You have tried to delete a JCL variable table that you are not authorized to delete.

System action: None.

System programmer response: If the user should have this authorization, update the RACF profiles.

User response: Contact your system programmer

EQQJ610E THE JCL IMBED EXIT *USRX* RETURNED RETCODE = RC WHILE PROCESSING JOB *MEMBER* IN APPLICATION *APPL*. THIS RETURN CODE IS NOT SUPPORTED, RETCODE = 4 IS ASSUMED

Explanation: A JCL imbed exit that was referenced in a FETCH directive of the current JCL returned an invalid return code.

System action: The current operation status is set to ended-in-error with error code OJCV.

Problem determination: Check the exit and correct possible errors. If you change the exit and want to reuse it, restart IBM Tivoli Workload Scheduler for z/OS.

EQQJ611E INSUFFICIENT STORAGE TO PROCESS JOB *MEMBER* IN APPLICATION *APPL* FOR THE JCL IMBED EXIT *USRX*

Explanation: IBM Tivoli Workload Scheduler for z/OS was trying to build a JCL record from the data supplied by the exit defined in a FETCH directive, but it could not do so because of insufficient virtual storage.

System action: The current operation status is set to ended-in-error with error code OJCV.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS and restart it in a larger region.

EQQJ612E THE JCL IMBED EXIT *USRX* COULD NOT FIND JOB *MEMBER* IN ANY INPUT DATA SET

Explanation: The exit gave a return code indicating that the JCL could not be found in the exit's input data sets.

System action: The current operation status is set to ended-in-error with error code OJCV.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Check that all DD statements needed by the exit have been correctly defined.

EQQJ613E THE JCL IMBED EXIT *USRX* DID NOT RETURN ANY DATA FOR JOB *MEMBER* IN APPLICATION *APPL*

Explanation: The exit was called to return JCL to IBM Tivoli Workload Scheduler for z/OS, but no data was returned.

System action: The current operation status is set to ended-in-error with error code OJCV.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Check that the exit works correctly and is correctly installed.

EQQJ614E THE AMOUNT OF DATA RETURNED BY THE JCL IMBED EXIT *USRX* FOR JOB *MEMBER* IN APPLICATION *APPL* EXCEEDS THE MAXIMUM AMOUNT SUPPORTED

Explanation: The exit was called to return JCL to IBM Tivoli Workload Scheduler for z/OS, but more than 256KB (kilobytes) of data was returned.

System action: The current operation status is set to ended-in-error with error code OJCV.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Check that the exit works correctly and is correctly installed.

EQQJ615E THE JCL IMBED EXIT *USRX* COULD NOT BE LOADED. THE EXIT WILL BE FLAGGED AS NOT USABLE

Explanation: IBM Tivoli Workload Scheduler for z/OS was unable to load the exit. IBM Tivoli Workload Scheduler for z/OS does not try to call it again. The exit is flagged as not executable.

System action: The current operation status is set to ended-in-error with error code OJCV.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Check the JCL FETCH directive referring to the exit and make sure that the exit is in the current load libraries of the started task JCL for IBM Tivoli Workload Scheduler for z/OS.

EQQJ616E THE JCL IMBED EXIT *USRX* HAS ABENDED WHILE PROCESSING JOB *MEMBER* IN APPLICATION *APPL*. SEE THE SYSUDUMP DATA SET FOR MORE INFORMATION. THE EXIT WILL BE FLAGGED AS NOT USABLE

Explanation: The exit abended while processing. IBM Tivoli Workload Scheduler for z/OS does not try to call

it again. The exit is flagged as not executable.

System action: The current operation status is set to ended-in-error with error code OJCV.

System programmer response: Identify the cause of the error in the exit analysis SYSDUMP data set. Correct all the errors in the exit and restart IBM Tivoli Workload Scheduler for z/OS.

EQQJ617E **JOB MEMBER IN APPLICATION APPL REFERS TO AN UNUSABLE JCL IMBED EXIT, USRX. NO DATA CAN BE RETRIEVED USING THIS EXIT**

Explanation: IBM Tivoli Workload Scheduler for z/OS has previously discovered an abend in this exit and marked it as not executable. This exit is not called again.

System action: The current operation status is set to ended-in-error with error code OJCV.

System programmer response: Correct the exit and restart IBM Tivoli Workload Scheduler for z/OS to reuse the exit.

EQQJ618E **INSUFFICIENT STORAGE FOR RECORD READ FROM JS DATA SET. APPLICATION IS: APPL, JOBNAME IS MEMBER**

Explanation: IBM Tivoli Workload Scheduler for z/OS tried to allocate storage for a record read from the JS data set, but the request for storage failed.

System action: The operation status depends on the SUBFAILACTION keyword in the JTOPTS initialization statement. The operation can:

- Keep status R or extended status RE
- Get status C (complete)
- Get status E (ended-in-error) with error code OSUF.

System programmer response: Make sure that IBM Tivoli Workload Scheduler for z/OS is running in a large enough region and restart IBM Tivoli Workload Scheduler for z/OS.

EQQJ702I **THE JCL VARIABLE TABLE HAS BEEN DELETED**

Explanation: The JCL variable table has been removed from the IBM Tivoli Workload Scheduler for z/OS database.

System action: The variable table is deleted.

User response: None.

EQQJ703E **THE JCL VARIABLE TABLE IS BEING UPDATED BY ANOTHER USER**

Explanation: You cannot access the variable table because it is being updated by another user.

System action: The system waits for you to respond.

User response: Try again later.

EQQJ704E **THE JCL VARIABLE TABLE TID ALREADY EXISTS**

Explanation: You have tried to create a table that already exists.

System action: The system waits for you to respond.

User response: Enter the correct data and try again.

EQQJ705I **THE JCL VARIABLE TABLE HAS BEEN REPLACED IN THE DATA BASE**

Explanation: The JCL variable table has been modified and successfully updated in the database.

System action: The system waits for you to respond.

User response: None.

EQQJ706E **JCL VARIABLE TABLE ENTRY COULD NOT BE RETRIEVED**

Explanation: You have tried to access a JCL variable table that has been deleted since the variable table list was displayed.

System action: The system waits for you to respond.

User response: Check if another user has already deleted the table.

EQQJ707I **A JCL VARIABLE DEFINITION HAS BEEN CREATED**

Explanation: A JCL variable definition has been created and inserted in the database.

System action: None.

User response: None.

EQQJ708I **THE JCL VARIABLE TABLE HAS BEEN REPLACED IN THE DATA BASE**

Explanation: The JCL variable table has been modified and successfully replaced in the database.

System action: None.

User response: None.

EQQJ712E THE VARIABLE TO BE DELETED HAS DEPENDENCIES

Explanation: Another variable is dependent on this variable.

System action: None.

User response: To delete this variable, first remove the dependency. You can reassign the dependency, delete the dependency, or delete the dependent variable.

EQQJ713E THE NUMBER OF VALUES MUST BE EVEN FOR RANGE TYPE

Explanation: You specified an odd number of values for a range verification.

System action: The system waits for you to respond.

User response: Correct the error and try again.

EQQJ714E THE LIST OF VALUES CONTAINS A BAD VALUE PAIR

Explanation: One of the pairs of values that you specified is in error.

System action: The system waits for you to respond.

User response: Correct the error and try again.

EQQJ715E THE CHARACTER *CHR* IN POSITION *POS* IS INVALID

Explanation: The value that you entered contains a character that is not numeric.

System action: The system waits for you to respond.

User response: Correct the error and try again.

EQQJ716E ONE VALID VALUE CANNOT EXCEED 44 POSITIONS

Explanation: You defined as valid a value that contains more than 44 characters. This is not allowed.

System action: The system waits for you to respond.

User response: Correct the error and try again.

EQQJ717E THE DEPENDENT VARIABLE VALUE IS INVALID FOR THE VERIFICATION TYPE

Explanation: The dependent value that you entered does not comply with the verification rules for the dependent variable.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQJ800E INVALID VALUE. MUST BE Y, N OR P

Explanation: In this field, you can enter only Y (for Yes), N (for No), or P (for Prompt).

System action: None.

User response: Specify a correct value and press Enter.

EQQJ801E VALUES/RANGE MUST BE SPECIFIED FOR RANGE/LIST

Explanation: You specified verification type RANGE or LIST, but did not specify any values.

System action: The system waits for you to respond.

User response: Correct the error and try again.

EQQJ802E NUMERIC CAN ONLY BE SPECIFIED FOR RANGE/LIST VERIFICATION

Explanation: You specified a valid numeric field type, but did not specify RANGE or LIST verification.

System action: The system waits for you to respond.

User response: Correct the error and try again.

EQQJ805E INVALID VERIFICATION TYPE

Explanation: Valid types are ALPHA, NUM, ENUM, HEX, BIT, PICT, NAME, DSNAME, RANGE and LIST.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ806E INVALID VALUE LENGTH

Explanation: The length must be in the range 1 to 44.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ807E INVALID COMPARISON OPERATOR

Explanation: Valid operators are:

EQ	LT	GT	LE	GE	NE	NG	NL
=	<	>	<=	>=	≠	≧	≦

System action: None.

User response: Specify a correct value and press Enter.

EQQJ808I THERE ARE NO DEPENDENCIES DEFINED FOR THIS VARIABLE

Explanation: There are no dependencies defined for this variable.

System action: None.

User response: None.

EQQJ809E THE INDEPENDENT VALUE DOES ALREADY EXIST

Explanation: You specified a duplicate value for the independent variable.

System action: The system waits for you to respond.

User response: Correct the error and try again.

EQQJ810I THERE ARE NO VERIFICATION CRITERIA DEFINED FOR THIS VARIABLE

Explanation: There are no verification criteria defined for this variable.

System action: None.

User response: None.

EQQJ811E THE VARIABLE ALREADY EXISTS IN THE CURRENT VARIABLE TABLE

Explanation: You have defined a variable that already exists in this table.

EQQJ812E VARIABLE NAME CONTAINS AN INVALID CHARACTER

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ813E TABLE NAME CONTAINS AN INVALID CHARACTER

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ814E OWNER ID IS MISSING

Explanation: See text.

System action: None.

User response: Specify the owner ID and press Enter.

EQQJ815E SUBSTITUTION EXIT NAME CONTAINS AN INVALID CHARACTER

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQJ816E THE MAXIMUM NUMBER OF DEPENDENCIES IS 360

Explanation: You tried to define more than 360 dependencies.

System action: The system waits for you to respond.

User response: Type over the incorrect value and press Enter.

EQQJ817E THE INDEPENDENT VARIABLE NAME IS REQUIRED

Explanation: You tried to enter a value for an independent variable without specifying an independent variable name.

System action: The system waits for you to respond.

User response: Correct the error and try again.

EQQJ818E THE VERIFICATION LENGTH DIFFERS FROM THE LENGTH OF VALID VALUES

Explanation: You have specified a verification length that is shorter than one of the values listed in the valid VALUES or RANGES.

System action: The panel is redisplayed with the cursor pointing at the field that is in error.

User response: Correct the length or values, and try again.

EQQJ819E VALUE OF DEPENDENT IS TOO LONG

Explanation: The value in the value-of-dependent field is longer than the value length specified on the Specifying Verification Criteria panel.

System action: The panel is redisplayed with the cursor pointing at the field that is in error.

User response: Either change the value-of-dependent field or the value length of the dependent variable.

EQQJ820E THE SUBSTRING START OR LENGTH IS INCORRECTLY SPECIFIED.

Explanation: You entered incorrect or inconsistent values in the SUBSTRING fields of the JCL Variable Dependency Value List panel. The message is issued in the following cases:

- The fields are not in the range 0-44.
- You specified only one field.
- You entered non numeric values.

System action: The panel is redisplayed with the cursor pointing at the field that is in error.

User response: Correct the values and try again.

Chapter 212. EQQKnnn messages

EQQK000 - EQQK457

EQQK000E VALID-TO SPECIFICATION
PRECEDES VALID-FROM
SPECIFICATION

Explanation: The valid-to date must be later than the valid-from date.

System action: None.

User response: Specify a correct value and press Enter.

EQQK001E OI ALREADY EXISTS IN OI DATA
BASE

Explanation: You have attempted to create an operator instruction (OI) that already exists in the OI database.

System action: The system waits for you to respond.

User response: Exit and use the modify function instead of the create function.

EQQK002E VALIDITY PERIODS OF TEMPORARY
OIS MUST NOT OVERLAP

Explanation: There is an existing operator instruction (OI) whose validity period overlaps with this temporary OI. The validity period of a temporary OI is defined by a valid-from and valid-to specification. The validity periods of temporary OIs must not overlap each other.

System action: The system waits for you to respond.

User response: Respecify valid-from and valid-to period limits.

EQQK003E OPERATOR INSTRUCTION NOT
FOUND IN OI DATA BASE. REFRESH
YOUR LIST

Explanation: You have attempted to browse, modify, or delete an operator instruction (OI) that no longer exists in the OI database. Most likely, the OI has been deleted by another user after your list of OIs was created.

System action: The system waits for you to respond.

User response: Return to the selection panel, create a new list of OIs, and continue your work.

EQQK004W OPERATOR INSTRUCTION IS IN USE
BY USER *USR*, TRY LATER

Explanation: Another user is currently updating the same operator instruction.

System action: The system waits for you to respond.

User response: Try again later.

EQQK007E YOU ARE NOT AUTHORIZED TO
ACCESS THE OI DATA BASE

Explanation: You have attempted to access the operator instruction (OI) database, but you are not authorized to access it.

System action: The system waits for you to respond.

User response: Contact your security administrator.

EQQK008E YOU ARE NOT AUTHORIZED TO
UPDATE THE OI DATA BASE

Explanation: You have attempted to update the operator instruction (OI) database, but you are not authorized to update it.

System action: The system waits for you to respond.

User response: Contact your security administrator.

EQQK021E BOTH DATE AND TIME MUST BE
SPECIFIED, OR BOTH BLANK

Explanation: See text.

System action: None.

User response: Specify a value both for date and time, or leave them blank and press Enter.

EQQK022E THE INPUT FIELD MUST BE ALL
NUMERIC, OR BLANK

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQK023W THE OPERATOR INSTRUCTION
CONTAINS NO TEXT

Explanation: The operator instruction (OI) that you selected does not contain any text.

System action: The system waits for you to respond.

User response: If this OI should contain text, use the Operator Instruction dialog to add the desired text.

EQQK024W IT IS NOT POSSIBLE TO SAVE AN OPERATOR INSTRUCTION WITHOUT TEXT

Explanation: An operator instruction must have a minimum of one line of text.

System action: The system waits for you to respond.

User response: Make sure that there is a minimum of one line of text or issue the CANCEL command to terminate the CREATE, COPY, or MODIFY request.

EQQK025I THE OI WAS MODIFIED IN THE OI DATA BASE

Explanation: The operator instruction (OI) record was modified and the OI database was updated.

System action: None.

User response: None.

EQQK026E INVALID PARAMETERS PASSED TO THE MODULE

Explanation: The parameters passed to the module from the ISPF panels were invalid. This is an internal IBM Tivoli Workload Scheduler for z/OS error.

System action: The system waits for you to respond.

System programmer response: Contact IBM Software Support.

User response: Contact your system programmer.

EQQK027I THE OI WAS ADDED TO THE OI DATA BASE

Explanation: The operator instruction (OI) record was added to the OI database.

System action: None.

User response: None.

EQQK028I THE OI WAS NOT MODIFIED IN THE OI DATA BASE

Explanation: The operator instruction (OI) record in the OI database was not updated, either because you canceled your modify request or because no lines existed in the OI record that you attempted to store.

System action: None.

User response: None.

EQQK029E THE UPDATE TO THE OI DATA BASE FAILED

Explanation: The operator instruction (OI) record was modified, but the OI database has not been updated due to a severe error.

System action: The OI database is not updated.

User response: Try to locate the previous error messages in the message log and contact your system programmer.

EQQK030I THE OI WAS NOT ADDED TO THE OI DATA BASE

Explanation: No operator instruction (OI) record was added to the OI database, either because you canceled your create request or because no lines existed in the OI record that you attempted to add.

System action: None.

User response: None.

EQQK031E APPLICATION IDENTIFICATION MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQK032E THE NAME DOES NOT START WITH AN ALPHABETIC CHARACTER

Explanation: See text.

System action: None.

User response: Specify a value and press Enter.

EQQK033E THE OPERATION NUMBER MUST BE IN THE RANGE 1 - 255

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQK034E THE NAME CONTAINS INVALID CHARACTER(S)

Explanation: A name can be made up of the following valid characters: A through Z, 0 through 9, and national characters (that is, #, \$, and @).

System action: None.

User response: Specify a correct value and press Enter.

EQQK035E BOTH VALID-FROM AND VALID-TO REQUIRED FOR TEMPORARY OIS

Explanation: Both a valid-from date and a valid-to date are required when creating temporary operator instructions (OIs).

System action: None.

User response: Specify a correct value and press Enter.

**EQQK036E THE OPERATION NUMBER
CONTAINS A NON-NUMERIC
CHARACTER**

Explanation: The operation number must be numeric.

System action: None.

User response: Specify a correct value and press Enter.

**EQQK037E THE OPERATION NUMBER MUST BE
SPECIFIED**

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

**EQQK038E TIME MISSING IN VALID-FROM OR
VALID-TO SPECIFICATION**

Explanation: Both date and time are required when specifying a valid-from or a valid-to date.

System action: None.

User response: Specify a correct value and press Enter.

**EQQK039E DATE MISSING IN VALID-FROM OR
VALID-TO SPECIFICATION**

Explanation: Both date and time are required when specifying a valid-from or a valid-to date.

System action: None.

User response: Specify a correct value and press Enter.

**EQQK040I OI WAS DELETED FROM OI DATA
BASE - REQUEST CONFIRMED**

Explanation: The operator instruction (OI) that you selected was deleted from the OI database, as specified.

System action: None.

User response: None.

**EQQK041I OI NOT DELETED FROM OI DATA
BASE - REQUEST NOT CONFIRMED**

Explanation: The operator instruction (OI) that you selected was not deleted from the OI database. The initial request was not confirmed.

System action: None.

User response: None.

**EQQK042E OI DELETE REQUEST FAILED DUE
TO I/O ERROR**

Explanation: The operator instruction (OI) record was deleted, but the OI database has not been updated due to a severe error.

System action: The OI database is not updated.

User response: Try to locate the previous error messages in the message log and contact your system programmer.

**EQQK043E THE WORK STATION NAME MUST
BE SPECIFIED**

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

**EQQK044I NO OPERATOR INSTRUCTION
MATCHED YOUR SELECTION
CRITERIA**

Explanation: No operator instructions matched the selection criteria that you specified.

System action: None.

User response: None.

**EQQK050E A REMOVAL DATE FOR PURGING
OLD TEMPORARY OIS MUST BE
SPECIFIED**

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

**EQQK051I PRESS ENTER TO CREATE REMOVAL
JCL, OR END TO CANCEL**

Explanation: You have requested to create JCL for a job to remove operator instructions. You must press ENTER to generate the JCL or enter the END command to cancel your request.

System action: The system waits for you to respond.

User response: Press ENTER or the End PF-key (or enter the END command).

**EQQK052E A VALID DATA SET NAME MUST BE
SPECIFIED**

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQK053E REPLY MUST BE Y OR N

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQK054I • EQQK457E

EQQK054I PRESS ENTER TO CREATE UPDATE
JCL, OR END TO CANCEL REQUEST

Explanation: You have requested to create JCL for a job to mass update operator instructions. You must press ENTER to generate the JCL or enter the END command to cancel your request.

System action: The system waits for you to respond.

User response: Press ENTER or the End PF-key (or enter the END command).

EQQK450E THE APPLICATION DESCRIPTION *AD*
DOES NOT EXIST

Explanation: When attempting to create or modify an operator instruction (OI), the OI data is checked for validity. A check is made for the corresponding operation. The validation failed because the application description *AD* does not exist.

System action: The system waits for you to respond.

User response: Correct the application ID and save the OI.

EQQK455E APPLICATION DESCRIPTION *AD*
HAS NO WORK STATION *WS*

Explanation: When attempting to create or modify an operator instruction (OI), the OI data is checked for validity. A check is made for the corresponding operation. The validation failed because the application description *AD* has no workstation *WS*.

System action: The system waits for you to respond.

User response: Correct the workstation name and save the OI.

EQQK456E APPLICATION DESCRIPTION *AD*
HAS NO OPERATION *OP*

Explanation: When attempting to create or modify an operator instruction (OI), the OI data is checked for validity. A check is made for the corresponding operation. The validation failed because the application description *AD* has no operation *OP*.

System action: The system waits for you to respond.

User response: Correct the operation number and save the OI.

EQQK457E APPLICATION DESCRIPTION *AD*
HAS NO OPERATION *WS OP*

Explanation: When attempting to create or modify an operator instruction (OI), the OI data is checked for validity. A check is made for the corresponding operation. The validation failed because the application description *AD* has no operation *WSOP*.

System action: The system waits for you to respond.

User response: Correct the operation number and save the OI.

Chapter 213. EQQLnnn messages

EQQL000 - EQQL706

EQQL000E YOU ARE NOT AUTHORIZED TO ACCESS THE LTP DATA SET

Explanation: You have attempted to access the long-term plan (LTP) data set, but you are not authorized. Or, you do not have access authority to at least one of the following IBM Tivoli Workload Scheduler for z/OS resources that are used together with the LTP data set: the application description database, the calendar database, or the workstation description database.

System action: The system waits for you to respond.

User response: If you require access to the LTP data set or to any of the related resources given, contact your security administrator.

EQQL001E YOU ARE NOT AUTHORIZED TO UPDATE THE LTP DATA SET

Explanation: You have attempted to access the long-term plan (LTP) data set for update but you are not authorized. Or, you do not have access authority to at least one of the following IBM Tivoli Workload Scheduler for z/OS resources that are used together with the LTP data set: the application description database, the calendar database, or the workstation description database.

System action: The system waits for you to respond.

User response: If you require access to the LTP data set or to any of the related resources given, contact your security administrator.

EQQL002I OCCURRENCE IS UPDATED

Explanation: The long-term plan (LTP) record for the occurrence has been updated.

System action: None.

User response: None.

EQQL003I THE OCCURRENCE IS NOT UPDATED

Explanation: The long-term plan (LTP) record for the occurrence was not updated because you canceled your modify request.

System action: None.

User response: None.

EQQL004I THE OCCURRENCE IS NOT UPDATED

Explanation: The long-term plan (LTP) record for the occurrence was not updated because its content was not changed.

System action: None.

User response: None.

EQQL005E LONG-TERM PLAN IS BEING UPDATED BY USER *USR*, TRY LATER

Explanation: You have attempted to update the long-term plan (LTP) data set, but it is being updated by another user. The LTP data set can only be updated by one user at a time.

System action: The system waits for you to respond.

User response: Try again later.

EQQL006I THE OCCURRENCE IS DELETED

Explanation: The long-term plan (LTP) record for the occurrence has been deleted from the LTP data set.

System action: None.

User response: None.

EQQL007I THE OCCURRENCE IS CREATED

Explanation: A long-term plan (LTP) record for the occurrence has been added to the LTP data set.

System action: None.

User response: None.

EQQL008E THE DEPENDENCY IS ALREADY DELETED

Explanation: You have tried to delete a dependency that has already been deleted.

System action: The request is rejected.

User response: None.

EQQL010E EITHER AN END DATE OR AN EXTENSION LENGTH MUST BE SPECIFIED

Explanation: See text.

System action: None.

EQQL011E • EQQL024E

User response: Specify a correct value and press Enter.

EQQL011E THE END DATE MUST BE LATER THAN THE CURRENT END DATE

Explanation: The end date specified must be later than the current end date.

System action: The system waits for you to respond.

User response: Display the status of the long-term plan to view the current end date and reenter a valid end date.

EQQL012E AN APPLICATION ID MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQL013E START AND END OF PRINT MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQL014E REPORT TYPE MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQL015E SORT ORDER MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQL016E REPORT TYPE SPECIFIED IS NOT VALID

Explanation: Valid report types are F for full report, and D for dependencies only.

System action: None.

User response: Specify a correct value and press Enter.

EQQL017E SORT ORDER SPECIFIED IS NOT VALID

Explanation: Valid sort orders are I for input arrival date, O for owner ID, and A for application ID.

System action: None.

User response: Specify a correct value and press Enter.

EQQL018E PRINT END DATE MUST BE LATER THAN PRINT START DATE

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQL019E THE PRINT INTERVAL MUST BE WITHIN THE RANGE OF THE LTP

Explanation: You have specified a print end date or print start date that is outside the range of the long-term plan (LTP) start and end dates.

System action: The system waits for you to respond.

User response: Check the displayed LTP start and end dates and reenter a valid print interval.

EQQL020E THE LTP CANNOT BE LONGER THAN FOUR YEARS

Explanation: The long-term plan (LTP) cannot be greater than four years in length, starting from the date of the first uncompleted occurrence.

System action: The system waits for you to respond.

User response: Enter a valid end date.

EQQL022E THE EXTENSION LENGTH SHOULD BE A NUMERIC VALUE FROM 0001 TO 1461

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQL023E EXTENSION LENGTH AND START DATE CANNOT BE ENTERED TOGETHER

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQL024E EITHER AN END DATE OR AN EXTENSION LENGTH MUST BE SPECIFIED

Explanation: See text.

System action: None.

User response: Specify a correct value and press Enter.

EQQL025E IF YOU SPECIFY A START DATE YOU MUST ALSO SPECIFY AN END DATE

Explanation: See text.

System action: None.

User response: Specify both start and end date and press Enter.

EQQL026E THE END DATE MUST BE LATER THAN THE CURRENT DATE

Explanation: The end date for creation of a long-term plan (LTP) must be later than the current date.

System action: The request is rejected.

User response: Correct the LTP end date and retry.

EQQL100E THE SPECIFIED DEPENDENCY TYPE MUST BE P OR S

Explanation: The dependency type P stands for predecessor and S stands for successor.

System action: None.

User response: Specify a correct value and press Enter.

EQQL101W THE LTP DATA SET IS EMPTY - ONLY LTP CREATE ALLOWED

Explanation: You have attempted to extend the long-term plan (LTP), but there is no LTP.

System action: The system returns you to the SELECTING LONG TERM PLAN BACKGROUND JOB menu so that you can select another function.

User response: Select option 7 to create the LTP.

EQQL102I NO LISTITEM DEFINED FOR THIS OCCURRENCE

Explanation: No items matched the selection criteria that you specified for *LISTITEM*.

System action: None.

User response: None.

EQQL310E THE LTP DATA SET IS EMPTY - NO HEADER FOUND

Explanation: You have attempted to do one of the following:

- Submit a long-term plan (LTP) batch job, but there is no header record in the LTP data set
- Make a trial plan, but no LTP exists.

System action: The system waits for you to respond.

User response: Select the background job that creates a new LTP and try again.

EQQL311E AN APPLICATION ID IS REQUIRED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQL312E AN INPUT ARRIVAL DATE IS REQUIRED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQL313E AN INPUT ARRIVAL TIME IS REQUIRED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQL314E A DEADLINE DATE IS REQUIRED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQL315E A DEADLINE TIME IS REQUIRED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQL316E A CURRENT PLAN EXISTS

Explanation: You have attempted to create a long-term plan (LTP) without first refreshing the LTP. Occurrences in the LTP have been selected by daily planning and might have been included in the current plan.

System action: The system waits for you to respond.

User response: Either select LTP EXTEND or perform a REFRESH from the Service dialog and request the LTP CREATE again.

EQQL317E A START DATE MUST BE SPECIFIED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQL318E THE END DATE MUST BE LATER THAN THE START DATE

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQL319E VALID REPLY IS Y, N, OR BLANK

Explanation: Data entry error; see "Data entry errors" on page 803.

**EQQL464E NO COMPUTER OPERATION(S)
FOUND IN APPLICATION**

Explanation: Job setup cannot be done because the application does not contain any computer operations.

System action: The system waits for you to respond.

User response: Add a computer operation to the application and try again.

EQQL465E DEPENDENCY *LTPDERR* NOT FOUND

Explanation: The specified dependency (*LTPDERR*) could not be found in the long-term plan (LTP) data set.

System action: The system waits for you to respond.

User response: Check that the specified dependency is correctly defined.

**EQQL466E OCCURRENCE HAS SUCCESSOR IN
CURRENT PLAN, CANNOT BE
MOVED**

Explanation: The run date and run time of the occurrence cannot be changed because the occurrence has a successor that is part of the current plan.

System action: The system waits for you to respond.

User response: Check that the dependency for the occurrence is correct and that you have correctly specified the occurrence.

**EQQL467E *LTPDERR* IS ALREADY IN CURRENT
PLAN**

Explanation: You have attempted to add a dependency for an occurrence that is already part of the current plan.

System action: The system waits for you to respond.

User response: Enter a valid dependency.

**EQQL468E *LTPDERR* CANNOT HAVE A
DEPENDENCY ON ITSELF**

Explanation: You specified a dependency for an occurrence, but the dependency is on the occurrence itself. This is not valid.

System action: The system waits for you to respond.

User response: Enter a valid dependency.

**EQQL469E DEPENDENCY ON *LTPDERR*
ALREADY SPECIFIED**

Explanation: You specified a dependency that already exists for this occurrence.

System action: The system waits for you to respond.

User response: Enter a valid dependency.

**EQQL471E *LTPDERR* CANNOT HAVE MORE
SUCCESSORS**

Explanation: You have specified too many successors for this predecessor operation. The maximum number of possible dependencies depends on the maximum record size in the long-term plan (LTP) VSAM file. If the default maximum record size is used, the maximum number of dependencies (predecessors and successors) is 3574.

System action: The system waits for you to respond.

User response: Review the dependencies for this predecessor.

**EQQL472E *LTPDERR* CANNOT HAVE MORE
PREDECESSORS**

Explanation: You have specified too many predecessors for this successor operation. The maximum number of possible dependencies depends on the maximum record size in the long-term plan (LTP) VSAM file. If the default maximum record size is used, the maximum number of dependencies (predecessors and successors) is 3574.

System action: The system waits for you to respond.

User response: Review the dependencies for this successor.

**EQQL473E MORE DEPENDENCIES DEFINED
FOR *LTPDERR* THAN WILL FIT IN
ONE RECORD**

Explanation: You have specified too many dependencies for the current long-term plan (LTP) occurrence. The maximum number of possible dependencies depends on the maximum record size in the LTP VSAM file. If the default maximum record size is used, the maximum number of dependencies is 3574.

System action: The Long-Term Plan dialog waits for you to respond.

User response: Enter the primary command CANCEL to return to the calling panel or enter the DELETE row command for one or more unnecessary dependencies.

**EQQL474E MORE OPERATIONS CHANGED FOR
LTPDERR THAN WILL FIT IN ONE
LTP RECORD**

Explanation: You have updated too many operations in the current long-term plan (LTP) occurrence. The maximum number of changed operations depends on the maximum record size in the LTP VSAM file and on the number of external dependencies for the current occurrence.

System action: The Long-Term Plan dialog waits for you to respond.

User response: Enter the primary command CANCEL to return to the calling panel.

**EQQL480E INPUT ARRIVAL TIME: T24.
RESPECIFY T00 ON THE FOLLOWING
DAY**

Explanation: T24 is not a valid input arrival time.

System action: The system waits for you to respond.

User response: Respecify the input arrival time as suggested (T00).

**EQQL481E DEADLINE TIME: T00. RESPECIFY T24
ON THE PREVIOUS DAY**

Explanation: T00 is not a valid deadline time.

System action: The system waits for you to respond.

User response: Respecify the deadline time as suggested (T24).

**EQQL482E PRIORITY MUST BE A NUMBER
FROM 1 - 9**

Explanation: Data entry error; see "Data entry errors" on page 803.

**EQQL487E RUN DATE IS EARLIER THAN THE
LTP START DATE LTPSDAY**

Explanation: You specified a run date that is earlier than the long-term plan (LTP) start date LTPSDAY. This is not valid.

System action: The system waits for you to respond.

User response: Enter a valid run date.

**EQQL489E NO OCCURRENCE MATCHES THE
SEARCH CRITERIA**

Explanation: No dependent occurrence matched the search criteria that you specified to generate a list of occurrences.

System action: The system waits for you to respond.

User response: Respecify your selection criteria.

**EQQL498E W._O IS FIRST OPERATION, INPUT
ARRIVAL MUST BE SPECIFIED**

Explanation: Data entry error; see "Data entry errors" on page 803.

The first operation (W._O) in an occurrence must have a specified input arrival time.

**EQQL499E W._O IS THE LAST OPERATION, A
DEADLINE MUST BE SPECIFIED**

Explanation: Data entry error; see "Data entry errors" on page 803.

The last operation (W._O) in an occurrence must have a specified deadline.

EQQL504E APPLICATION DEPAID NOT FOUND

Explanation: The application (DEPAID) specified in the long-term plan (LTP) occurrence was not found in the application description database. The application has been deleted from the application description database or you do not have read access to the application description for the dependent application.

System action: The system waits for you to respond.

User response: Check why the application description cannot be found. If the application description has been inadvertently deleted, reenter it.

EQQL505E APPLICATION APPL NOT FOUND

Explanation: The application (APPL) specified in the long-term plan (LTP) occurrence was not found in the application description database.

Possible explanations are:

- The application description has been deleted from the application description database, but the corresponding occurrences in the LTP data set have not deleted.
- You do not have read access to the application description for this application.
- The application was not active at the input arrival time of the LTP occurrence.

System action: The system waits for you to respond.

User response: Check why the application description cannot be found. If the application description has been inadvertently deleted, reenter it.

**EQQL506E DEPENDENT APPLICATION IS NOT
AVAILABLE IN AD DATA SET**

Explanation: This occurrence has one or more external dependencies that are not available to you. The dependent application has been deleted from the application description database or you do not have read access to the application description for the dependent application.

System action: The system waits for you to respond.

User response: Check why the application description cannot be found. If the application description has been inadvertently deleted, reenter it. Check operations with no workstation name and operation number 000.

EQQL507E RUN DATE SPECIFIED IS LATER THAN THE LTP END *LTPEDAY*

Explanation: You specified a run date that is later than the long-term plan (LTP) end date.

System action: The system waits for you to respond.

User response: Enter a run date within the range of the LTP.

EQQL509E THE SPECIFIED OCCURRENCE ALREADY EXISTS

Explanation: You specified an occurrence that already exists.

System action: The system waits for you to respond.

User response: Change the data to make a new entry or exit.

EQQL510E DEADLINE IS EARLIER THAN (OR EQUAL TO) THE INPUT ARRIVAL

Explanation: Data entry error; see "Data entry errors" on page 803.

The deadline date must be later than the input arrival date.

EQQL512E THE VARIABLE TABLE IS NOT DEFINED

Explanation: Data entry error; see "Data entry errors" on page 803.

You have tried to define a variable table ID that does not exist in IBM Tivoli Workload Scheduler for z/OS's database.

EQQL513E THE VARIABLE TABLE NAME CONTAINS AN INVALID CHARACTER

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQL514E YOU ARE NOT AUTHORIZED TO READ THE JCL VARIABLE TABLE DATA BASE

Explanation: You have attempted to refer to a JCL variable table. To do this, you need read authority to the JCL variable table database.

System action: The system waits for you to respond.

User response: If you need to refer to JCL variable table names, contact your security administrator.

EQQL530E I/O-ERROR READING CALENDAR. DEFAULT DAY STATUS USED

Explanation: An I/O error occurred when reading the calendar database. The default day status is used.

System action: The system waits for you to respond.

User response: If the default should not be used, enter the correct data.

EQQL540E OCCURRENCE IN A GROUP MUST BE REMOVED BEFORE IT CAN BE DELETED

Explanation: An occurrence that belongs to an occurrence group cannot be deleted.

System action: The system waits for you to respond.

User response: You must remove the occurrence from the group before you can delete it. To do this, either type the row command RG on the LONG TERM PLAN OCCURRENCES panel or erase the group definition ID field on the MODIFYING OCCURRENCE DATA panel.

EQQL541W APPLICATION IS A MEMBER OF A GROUP. CONSIDER ADDING THE OTHER MEMBERS

Explanation: The application is a member of an application group. This message is issued as a reminder in case you need also to add the other members of the same group to the long-term plan.

System action: Normal processing continues.

User response: If applicable, create occurrences in the long-term plan for the other applications in the same group.

EQQL542E OCCURRENCE IS NOT A MEMBER OF AN OCCURRENCE GROUP

Explanation: The occurrence does not belong to an occurrence group.

System action: The request is rejected.

User response: Check the occurrence definition and correct it.

EQQL566E INPUT ARRIVAL TIME SPECIFIED PRECEDES THE CP END *LTPPNEND*, *LTPPNENT*

Explanation: You cannot modify, delete, or add an occurrence to the long-term plan (LTP) that has an input arrival time within the range of the current plan.

System action: The request is rejected.

User response: Make sure that input arrival is correctly specified. If it is and you still want to process

the occurrence, use the Modify Current Plan dialog instead.

If you need to delete a dependency to an occurrence in the current plan, use the Modify Current Plan dialog to delete the predecessor specification.

EQQL567I *LTPCHIAD, LTPCHIAT* INPUT ARRIVAL OUTSIDE OCCURRENCE TIME LIMIT

Explanation: The operation input arrival date and time *LTPCHIAD, LTPCHIAT* is outside the occurrence time limit.

System action: None.

User response: None.

EQQL568I *LTPCHDD, LTPCHDT* DEADLINE PAST OCCURRENCE TIME LIMIT

Explanation: The operation deadline *LTPCHDD, LTPCHDT* is outside the occurrence time limit.

System action: None.

User response: None.

EQQL570I THE INPUT ARRIVAL SPECIFIED IS LATER THAN THE DEADLINE

Explanation: The operation input arrival date and time are later than the application deadline.

System action: The system waits for you to respond.

User response: If the input arrival date and time are not what you intended, change them.

EQQL572E DATE OR TIME IS MISSING FROM THE INPUT ARRIVAL

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQL573E DATE OR TIME IS MISSING FROM THE DEADLINE

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQL701E INVALID DATA LENGTH IN LONG TERM PLAN REQUEST: *L*

Explanation: An internal parameter list, consisting of a sequence of control blocks followed by an application description record, was validated and found to have an invalid length.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

System programmer response: If you cannot find a valid reason for the error, make the dump data set and

the message log available and contact IBM Software Support.

User response: This is likely to be an internal error. If possible, do the requests in a different order and rerun.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks.

EQQL705E THE APPLICATION DESCRIPTION *AD* COULD NOT BE FOUND REQUESTED AS PREDECESSOR TO LTP OCCURRENCE *LTOC*

Explanation: The application *AD* is specified in a program interface request to set up a dependency between two long-term plan occurrences. Its application description could not be found.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

User response: Correct the application ID and resubmit the job.

EQQL706E PREDECESSOR OPERATION *WSNOPNO* DOES NOT EXIST IN *AD* REQUESTED AS PREDECESSOR TO LTP OCCURRENCE *LTOC*

Explanation: The operation *WSNOPNO* is specified in a program interface request to set up a dependency between two long-term plan occurrences. The specified application description does not contain the operation.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

User response: Correct the application ID, workstation name, or operation number, and resubmit the job.

Chapter 214. EQQMnnn messages

EQQMH00 - EQQMH903

EQQMH001 THE BULK DISCOVERY HAS BEEN INTERRUPTED DUE TO PLANNING ACTIVITY: IT WILL BE RESTARTED

Explanation: The request to initiate a bulk discovery for an external monitor cannot be honored, because a planning activity is in progress.

System action: The bulk discovery is postponed. The request will be honored when planning activities complete.

User response: None.

EQQMH011 THE MONITORING TASK HAS ENDED

Explanation: The monitoring task has ended.

System action: None.

User response: None.

EQQMH02E THE MONITORING TASK HAS ENDED DUE TO PROCESSING ERRORS

Explanation: The monitoring task has encountered severe processing errors while sending data to the monitoring agent. The task has ended.

System action: The monitoring task is not restarted.

User response: Check in the message log of the controller (EQQMLOG) for error messages that will help you determine the cause of the error. Correct any errors and recycle the controller. If the error persists, contact IBM Software Support.

Problem determination: A severe processing error occurred and the monitoring task cannot be restarted. Additional messages in the message log provide details on the nature of the error.

EQQMH03E THE MONITORING TASK TERMINATED DUE TO A PROCESSING FAILURE. THE MONITORING TASK WILL BE RESTARTED

Explanation: The monitoring task has encountered processing errors while sending data to the monitoring agent.

System action: The system attempts to restart the monitoring task.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information to collect for monitoring problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Check the message log for other error messages that will help you determine the cause of the error.

EQQMH04E THE MONITORING TASK HAS ENDED ABNORMALLY. FOR ADDITIONAL INFORMATION SEE THE SYSLOG MESSAGES AND DUMP DATA SET

Explanation: The monitoring task has ended unexpectedly while sending data to a monitoring agent.

System action: The monitoring task ended abnormally.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information to collect for monitoring problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Check the message log (EQQMLOG), the system log, and the dump data set (EQQDUMP) for other error messages that will help you determine the cause of the error.

EQQMH05E THE MONITOR DATASET CONTAINS INCONSISTENT DATA. ALL RECORDS WILL BE DELETED

Explanation: The monitor data set identified by DDNAME EQQMONDS contains invalid data.

System action: All records in the specified data set are deleted.

User response: Check in the message log of the controller (EQQMLOG) for controller error messages that will help you determine the cause of the error. Try to solve the problem and recycle the controller. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information to collect for monitoring problems". Search the IBM Support database for a

EQQMHO6E • EQQMHO13E

| solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **Problem determination:** A controller error generated inconsistent data in the data set.

EQQMHO6E BULK DISCOVERY CANNOT BE PERFORMED. REASON IS: REASON

Explanation: The request to initiate a bulk discovery for an external monitor cannot be honored. The reason is one of the following:

- An error occurred while accessing current plan
- Cannot send events to the monitoring agent

System action: The bulk discovery is not initiated.

User response: If necessary, run the BULKDISC TSO command again.

Problem determination: A bulk discovery was not initiated due to one of the reasons indicated. If a planning activity was in progress, the bulk discovery will be initiated when the planning activity terminates.

EQQMHO7I BULK DISCOVERY IS IN PROGRESS

Explanation: A bulk discovery is already running

System action: None.

User response: None.

EQQMHO8I BULK DISCOVERY HAS ENDED

Explanation: A bulk discovery has ended.

System action: None.

User response: None.

EQQMHO9I CONTROLLER IS ATTEMPTING TO RE-ESTABLISH THE CONNECTION TO THE REMOTE MONITORING AGENT

Explanation: The controller monitoring task is trying to reconnect to the remote monitoring agent after a previous attempt to reconnect has failed.

System action: The controller attempts to re-establish a connection to the monitoring agent.

User response: If the re-connection attempt fails, check for any TCP/IP messages indicating the type of error in EQQMLOG.

Problem determination: Check for other messages in EQQMLOG and the system log that will help you determine the cause of the first connection failure.

EQQMHO10W BOTH MONOPTS AND TCPOPTS STATEMENTS ARE SPECIFIED FOR THE CONTROLLER. LOCHOSTNAME AND CONNTIMEOUT VALUES IN MONOPTS HAVE BEEN REPLACED BY HOSTNAME AND CONNTIMEOUT VALUES IN TCPOPTS.

Explanation: You specified both the MONOPTS and TCPOPTS server initialization statements. Both of them contain host name and connection timeout parameters.

System action: HOSTNAME and CONNTIMEOUT values in the TCPOPTS statement override LOCHOSTNAME and CONNTIMEOUT values in the MONOPTS statement.

User response: If the HOSTNAME and CONNTIMEOUT values in the TCPOPTS statement are the ones that you expect, no action is required; anyway you can remove the unneeded MONOPTS keywords. Otherwise, remove or correct the HOSTNAME and CONNTIMEOUT parameter in the TCPOPTS statement.

EQQMHO11E THE MONITOR DATASET , DDNAME DDNAME, LRECL BLKSZIS INVALID. DATASET CANNOT BE USED

Explanation: The data set referenced by DDNAME has been allocated with an invalid record length.

System action: The monitoring task terminates.

User response: Re-allocate the referenced data set.

Problem determination: The data set referenced by the DDNAME must have a logical record length between 160 and 32000. Check that the LRECL is within the supported range.

EQQMHO12E THE MONITOR DATASET , DDNAME DDNAME IS TOO SMALL

Explanation: The monitoring task requires that the monitor data set is large enough to contain a minimum of 100 events. The data set defined by the DDNAME does not fulfill this requirement.

System action: The monitoring task terminates.

User response: Re-allocate a larger data set. If necessary, restart IBM Tivoli Workload Scheduler for z/OS to reference the new data set.

EQQMHO13E THE MONITORING TASK WAS UNABLE TO OPEN DATASET WITH DDNAME DDNAME

Explanation: The monitoring task is unable to open the data set referenced by the DDNAME.

System action: The monitoring task terminates.

User response: Check that the data set referenced by the DDNAME is correctly defined and recycle the controller.

EQQMHI4I CONTROLLER HAS CONNECTED TO THE REMOTE MONITORING AGENT AT ADDRESS *HOSTNAME*

Explanation: The monitoring task on the controller has connected to the remote monitoring agent. *HOSTNAME* indicates the host name or IP address of the remote monitoring agent.

System action: None.

User response: None.

EQQMHI5E THE MONITORING TASK WAS UNABLE TO CLOSE DATASET WITH DDNAME *DDNAME*

Explanation: The monitoring task could not close the data set referenced by the DDNAME.

System action: None.

User response: Correct any errors and recycle the controller.

Problem determination: In the EQQMLOG data set look for messages that will help you determine the cause of the error.

EQQMHI6W THE MONITOR DATA SET UTILIZATION HAS EXCEEDED THE THRESHOLD VALUE. *PERCENT* % OF MONITOR DATA SET IN USE.

Explanation: The monitoring task data set utilization has reached the percentage indicated by the value of *PERCENT*. Some events might be lost.

System action: The monitoring task continues processing.

User response: Check the system log and EQQMLOG for messages indicating a network problem. If this is not the case, allocate a bigger monitoring task data set and recycle the controller.

Problem determination: The monitoring task data set EQQMMONDS is too small or there could be a problem in the connection with the monitoring agent.

EQQMHI7W THE MONITOR DATA SET IS FULL: LOST EVENTS OVERWRITTEN

Explanation: The monitoring task data set utilization has reached 100%. Some events might be lost.

System action: The monitoring task continues processing and deletes older data set records.

User response: Check the system log and EQQMLOG for messages indicating a network problem. If this is

not the case, allocate a bigger monitoring task data set and recycle the controller.

Problem determination: The monitoring task data set EQQMMONDS is too small or there could be a problem in the connection with the monitoring agent.

EQQMHI8E TCP/IP ERROR *ERRNO* RECEIVED BY MONITORING TASK ON CONNECTION WITH MONITORING AGENT. ERROR MESSAGE IS *TCPIPMSG*

Explanation: The TCP/IP connection between the IBM Tivoli Workload Scheduler for z/OS monitoring task and the monitoring agent has experienced an error. The error is identified by *ERRNO* and *TCPIPMSG*.

System action: The monitoring task attempts to recover the error. If this is not possible, the monitoring task will restart the connection.

User response: Correct the error. If the corrections involve a change in the monitoring task parameters, recycle the controller. If the changes involve a change in the metafile configuration recycle the Universal Agent and run a TSO BULKDISC command.

Problem determination: The *ERRNO* and *TCPIPMSG* fields provide specific information on the type of error. For an explanation of the type of error (network configuration or TCP/IP), see the z/OS Communications Server publications. If the value of *ERRNO* is *EPIPE*, verify that the host name is correctly specified in the metafile so that it is recognized by IBM Tivoli Monitoring (for details about the Tivoli Enterprise Portal Configuration options, refer to *Managing the Workload*). If the host name is not correctly specified, events might be lost.

EQQMHI9E CONTROLLER CANNOT CONNECT TO THE REMOTE MONITORING AGENT AT ADDRESS *HOSTNAME* MONITORING EVENTS WILL BE STORED LOCALLY ON MONITORING DATASET

Explanation: The controller has failed to establish a connection to the remote monitoring agent identified by the hostname or IP address.

System action: All collected events are stored locally in the monitoring data set and will be sent to the remote monitoring agent when the connection is established.

User response: Correct the error as indicated in the messages. If necessary, recycle the controller. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information to collect for monitoring problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQM000E • EQQM013I

| **Problem determination:** This message is issued in
| conjunction with other messages. Check EQQMLOG for
| additional messages that help you determine the cause
| of the error.

EQQM000E YOU DO NOT HAVE AUTHORITY TO ACCESS THE CURRENT PLAN

Explanation: To use the function you selected, you must have access authority to the current plan.

System action: The request is rejected and the system waits for you to respond.

User response: If you require access to the current plan, contact your security administrator.

EQQM001E YOU DO NOT HAVE AUTHORITY TO UPDATE THE CURRENT PLAN

Explanation: To use the function you selected, you must have update authority to the current plan.

System action: The request is rejected and the system waits for you to respond.

User response: If you need to update the current plan, contact your security administrator.

EQQM004E PRIORITY MUST BE A NUMBER FROM 1 - 9

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM005E THE MCP ADDED OPTION MUST BE Y, N, OR BLANK

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM006E THE RERUN OPTION MUST BE Y, N, OR BLANK

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM007E OPTION INVALID - THE WAITING FOR SE OPTION MUST BE Y, N, OR BLANK.

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM008E EXTERNAL DEPENDENCIES FORM A LOOP

Explanation: You specified an external dependency that generates a loop. This must be corrected.

System action: The dependency is rejected and the system waits for you to respond.

User response: Check your dependencies.

EQQM009E THE SPECIFIED APPLICATION COULD NOT BE FOUND

Explanation: You specified an application that could not be found in the application description database. The application may have been deleted after the list of applications was created.

System action: The system waits for you to respond.

System programmer response: Analyze messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If there are no messages, contact IBM Software Support.

User response: Return to the previous panel and re-create the list of applications. If the problem persists, contact your system programmer.

EQQM010I OCCURRENCE ADDED TO THE CURRENT PLAN

Explanation: You specified an occurrence that was added to the current plan.

System action: None.

User response: None.

EQQM011I OCCURRENCE MODIFIED IN THE CURRENT PLAN

Explanation: You specified an occurrence that was modified in the current plan.

System action: None.

User response: None.

EQQM012I OCCURRENCE DELETED FROM THE CURRENT PLAN

Explanation: You specified an occurrence that was deleted from the current plan.

System action: None.

User response: None.

EQQM013I THE OCCURRENCE IS SET TO RERUN

Explanation: In the current plan, the status of the specified occurrence was changed to "rerun".

System action: None.

User response: None.

EQQM014I THE OCCURRENCE IS SET TO WAITING

Explanation: In the current plan, the status of the specified occurrence was changed to “waiting”.

System action: None.

User response: None.

EQQM015I AN OCCURRENCE HAS BEEN COMPLETED

Explanation: You specified an occurrence that has been completed.

System action: None.

User response: None.

EQQM016E THE OCCURRENCE HAS BEEN UPDATED BY AN AUTOMATIC EVENT

Explanation: During the time taken to enter the modifications for the occurrence, at least one operation status has been updated because an automatic event has been processed.

System action: The request is rejected.

User response: Repeat the dialog request. The status set when the automatic event was processed is now the initial status for the dialog request.

EQQM017E OCCURRENCE BEING UPDATED BY ANOTHER USER

Explanation: You selected an occurrence that is being updated by another user.

System action: The system waits for you to respond.

User response: Try again later.

EQQM018E OCCURRENCE ALREADY EXISTS - NOT ADDED

Explanation: You attempted to add an occurrence that already exists in the current plan.

System action: The occurrence is not added to the current plan and the system waits for you to respond.

User response: Check the existing occurrence to determine whether or not the occurrence specified should be added with a new input arrival date and time.

EQQM019E APPLICATION IS BEING UPDATED BY USER *USR* TRY LATER

Explanation: You specified an application description that is currently being updated by another user.

System action: The system waits for you to respond.

User response: Try again later.

EQQM020E VALID STATUSES ARE W, S, C, E, AND U, IN ANY COMBINATION

Explanation: In the Modify Current Plan dialog, you entered an invalid status for selecting occurrences in the current plan.

System action: The panel is redisplayed and the system waits for you to respond.

User response: Correct the invalid values.

EQQM021I THE OPERATION WAS RESET TO READY

Explanation: In the current plan, the status of the specified operation was reset to “ready”.

System action: None.

User response: None.

EQQM022I THE OPERATION WAS COMPLETED

Explanation: You specified an operation that has been completed.

System action: None.

User response: None.

EQQM023E A DELETED OCCURRENCE CANNOT BE MODIFIED

Explanation: You selected a function that attempts to modify an occurrence that has been deleted from the current plan.

System action: The request is rejected.

User response: Select a new function.

EQQM024E SUBSYSTEM REQUEST FAILED DUE TO I/O ERROR

Explanation: The modify current plan request failed because of an I/O error.

System action: The modify current plan function is terminated. No updates are made.

System programmer response: Check the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error.

User response: Contact your system programmer.

EQQM025E DEPENDENT OPERATIONS HAVE BEEN CHANGED DURING SESSION. RS: XSSRS

Explanation: Operations that have external dependencies to the occurrence that you attempted to

EQQM026E • EQQM033E

modify have been changed in such a way that your modify request failed.

System action: The request is rejected. Message EQQMxssrsE is written to the message log, where xssrs is the reason code displayed by this message.

User response: See the message indicated by the reason code.

EQQM026E REQUEST FAILED BECAUSE OF SUBSYSTEM ERROR

Explanation: The modify current plan request failed because of an error in the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The modify current plan function is terminated. No updates are made.

System programmer response: Check the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error.

User response: Contact your system programmer.

EQQM027E REQUEST FAILED BECAUSE OF SUBSYSTEM ERROR. REASON: XSSRS

Explanation: The modify current plan request failed because of an error in the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The modify current plan function is terminated. No updates are made. Message EQQMxssrsE is written to the message log, where xssrs is the reason code displayed by this message.

User response: See the message indicated by the reason code.

EQQM028I DELETE OF MAAIDMAIMDMAIMT IGNORED WHILE CREATING NEW PLAN

Explanation: An attempt to delete an occurrence with status complete has been rejected because a daily planning batch program is currently creating a new current plan. Occurrences that were complete when the daily planning job started are removed, and are not available in the new plan.

System action: The request is rejected. Message EQQM937E is written to the IBM Tivoli Workload Scheduler for z/OS message log.

User response: None.

| EQQM029E REQUEST FAILED BECAUSE OF SUBSYSTEM ERROR

| **Explanation:** The modify current plan request failed because of an error in the IBM Tivoli Workload Scheduler for z/OS subsystem.

| **System action:** The modify current plan function is terminated. No updates are made.

| **System programmer response:** Check the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

EQQM030E INPUT ARRIVAL IS LATER THAN CURRENT PLAN END

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM031I THE OCCURRENCE HAS NO EXTERNAL DEPENDENCIES

Explanation: The selected occurrence has no external dependencies.

System action: None.

User response: None.

EQQM032E UNSUPPORTED STATUS CHANGE OF OSEQ OP. WITH UNCOMPLETED PREDECESSOR(S)

Explanation: The request requires an operation in error status with error code OSEQ to change status. There are restrictions as to how this can be done when the operation has uncompleted predecessors, that is, the operation is still out of sequence. This is not one of the accepted ways.

System action: The request is rejected. The system waits for you to respond.

User response: The OSEQ operation can be reset to the proper status, waiting, by using the operation restart request from the ended-in-error list panel. The modify occurrence request can also be used. The operation can be deleted or the occurrence can be deleted or set to waiting. An occurrence rerun or a change of the operation status is not accepted until all predecessors have been completed or the dependencies have been deleted.

EQQM033E CODE MUST BE ONE OF ST1E , ST1D , ST1P or ST1A

Explanation: You entered an invalid code for selecting occurrences from the current plan in the Modify Current Plan dialog.

System action: The system waits for you to respond.

User response: Enter the correct code.

EQQM034E THE JCL FOR THIS OPERATION IS BEING EDITED BY ANOTHER USER

Explanation: You tried to rerun an operation, but the JCL for this operation is being edited by another user.

System action: The system waits for you to respond.

User response: Try again later.

EQQM035E ONE OF THE WS REFERENCED BY OPERATIONS IN THIS OCC. IS NOT IN CP

Explanation: IBM Tivoli Workload Scheduler for z/OS was validating an occurrence to be added. A workstation referenced by an operation in this occurrence is not defined to the current plan.

It is possible that a new workstation has been created, but the daily plan batch program has not yet been executed.

System action: The request is rejected.

System programmer response: If necessary, run a daily plan batch program to add the workstation to the current plan.

User response: Examine the IBM Tivoli Workload Scheduler for z/OS message log. Message EQQM933E identifies the workstation and operation. Contact your system programmer.

EQQM036W INPUT ARRIVAL CANNOT BE BLANK FOR A TIME DEPENDENT OPERATION

Explanation: IBM Tivoli Workload Scheduler for z/OS submits a time dependent operation as soon as possible after its input arrival, but this time is not specified.

System action: The system waits for you to insert an Input Arrival Date and Time.

User response: Specify an input arrival for the operation or set it to be not time dependent.

EQQM037W OPERATION STATUS OR OPERATION JOB ID HAS CHANGED

Explanation: The Restart and Cleanup action for the operation might no longer be necessary, because the operation status or the job ID, or both, have changed. Before proceeding, ensure that you still want to restart this operation.

System action: This message is shown only once in the EQQRCLSE panel, at the first Restart and Cleanup action requested.

User response: Check if the Restart and Cleanup action is still required, and proceed accordingly.

EQQM038W VARY ACTIVE NOT ALLOWED. A QUERY AGENT INFO REQUEST HAS BEEN SENT TO THE AGENT.

Explanation: You tried to vary the status of a z-centric workstation to ACTIVE, but the workstation had been automatically set to OFFLINE. You cannot set to ACTIVE a z-centric agent the is not reachable.

System action: The controller tries to send a Query Agent Info request to the z-centric agent. If the request is successful, the z-centric agent workstation is automatically set to ACTIVE.

User response: None.

EQQM039W CURRENT PLAN MODIFIED. AFFECTED CRITICAL PATHS MUST BE RECALCULATED

Explanation: Modifying the current plan has caused one of the following:

- One or more dependencies for operations belonging to a critical path were deleted.
- The value in the CRITICAL field for the job was changed to P, or from P to another value.

As a consequence, all the affected critical paths must be recalculated. IBM Tivoli Workload Scheduler for z/OS does not update the critical path during the plan execution.

System action: None.

User response: Recalculate the critical paths by running a DP batch replan.

EQQM040E ERROR CODE MUST BE GIVEN FOR ERROR STATUS OPERATION

Explanation: An error code must be given for an operation in error.

System action: The panel is redisplayed.

User response: Correct the error.

EQQM041E ERROR CODE MUST BE BLANK FOR OPERATION NOT IN ERROR

Explanation: Error code only has meaning for an operation in error.

System action: The panel is redisplayed.

User response: Change the operation status or blank out the error code.

EQQM043W THE OPERATION WAS NOT FOUND, MAY HAVE BEEN ALTERED

Explanation: The automatic job recovery request could not be processed because the operation record could not be read.

System action: The automatic job recovery request is ignored. The system waits for you to respond.

System programmer response: To determine the cause of the error, check the IBM Tivoli Workload Scheduler for z/OS message log for I/O error messages issued at the time that the automatic job recovery request was made.

User response: If the error persists, contact your system programmer.

EQQM044I WORKSTATION *WSID*, *DEST* HAS BEEN SET TO *STAT* STATUS

Explanation: The status of the virtual workstation destination changed.

System action: The workstation status change might affect the ongoing work.

User response: None.

EQQM045E SYSTEM INFORMATION IS NOT POSSIBLE FOR VIRTUAL WORKSTATION

Explanation: System information is not available for a virtual workstation because the workstation is associated to a list of destinations, not to a specific one.

System action: The request is rejected.

User response: Enter the Select command to access a list of destinations. You can display system information for each destination.

EQQM046E INCORRECT SELECTION FOR NON-VIRTUAL WORKSTATIONS

Explanation: The selected workstation has the VIRTUAL option set to N. The V command is only allowed for virtual workstations.

System action: The request is rejected.

User response: Use the S command from the MODIFYING WORKSTATIONS IN THE CURRENT PLAN panel.

EQQM047E A PREDECESSOR CANNOT BE DEFINED AS CONDITIONAL PREDECESSOR

Explanation: You cannot define the same job as both conditional and normal predecessor.

System action: The request is rejected.

User response: Remove the inconsistency.

EQQM048E A CONDITIONAL PREDECESSOR CANNOT BE DEFINED AS PREDECESSOR

Explanation: You cannot define the same job as both conditional and normal predecessor.

System action: The request is rejected.

User response: Remove the inconsistency.

EQQM049E A CONDITIONAL DEPENDENCY CANNOT BE DELETED

Explanation: You requested to delete a dependency belonging to a logical condition.

System action: The request is rejected.

User response: To handle conditional dependencies enter the COND row command.

EQQM061E NEW STATUS MUST BE ONE OF THE SUPPORTED CHARACTERS

Explanation: The workstation status must be A, F, or O.

System action: The workstation status is not changed.

User response: Correct the status character or issue the CANCEL command to cancel the status change request.

EQQM062E THE FAIL/OFFLINE OPTIONS ENTERED ARE NOT VALID

Explanation: The restart option can be R (restart), E (set to error), or L (leave). The reroute option can be Y (yes, reroute operations) or N (no, do not reroute).

System action: The workstation status does not change. No fail or offline actions are performed.

User response: Correct the options and try again.

EQQM063E THE ALTERNATE WS NAME IS NOT FOUND IN THE DATA BASE

Explanation: The alternative workstation is not defined in the workstation database.

System action: The workstation status does not change. Reroute is not performed to an alternative workstation.

User response: Correct the name specified for the alternative workstation or update the workstation description database with this workstation name.

EQQM064E ALTERNATE WS IS REQUIRED TO BE CPU/WTO TYPE WS

Explanation: The alternative workstation is not defined in the workstation database as a computer type workstation.

System action: The workstation status does not change.

User response: Correct the name specified for the alternative workstation or update the workstation description database for this workstation to specify the correct attributes.

To exit the modification without saving any changes, issue the CANCEL command.

EQQM065W FAIL/OFFLINE OPTIONS NOT APPLICABLE FOR SETTING WS TO ACTIVE

Explanation: Fail/offline options do not apply to active workstations. If you change the status of a workstation to A (active), any previously defined fail/offline options are ignored.

System action: The system waits for you to respond.

User response: Confirm the request or cancel it.

EQQM066E THE WORK STATION STATUS INHIBITS ALTERNATE WS SPECIFICATION

Explanation: An active workstation cannot have an alternative workstation.

System action: The workstation status does not change.

User response: Either change the workstation status to something other than A (active) or clear the alternative workstation field in the panel.

EQQM067I WORK STATION *WSID*, HAS BEEN SET TO *STAT* STATUS

Explanation: The status of a workstation has changed, as you requested on the previous panel.

System action: The workstation status is changed. This may affect ongoing work.

User response: None.

EQQM068E THE CURRENT WS CANNOT BE ALTERNATE TO ITSELF

Explanation: The alternative workstation cannot be the current workstation.

System action: The workstation status does not change.

User response: Change the alternative workstation name.

EQQM069E INVALID ALTERNATIVE

Explanation: The alternate workstation must be of the same type.

System action: The WS status does not change.

User response: Specify an alternate workstation that is the same type as this one.

EQQM070E YOU CAN CHANGE ONLY ONE STATUS AT A TIME

Explanation: It is not possible to change the Active/Offline status of a fault-tolerant workstation and, at the same time, change the Active/Offline status link status.

System action: The request is rejected.

User response: Enter the correct value.

EQQM071E A JOB DEFINITION REFERENCED BY THIS OCCURRENCE IS WRONG

Explanation: IBM Tivoli Workload Scheduler for z/OS was validating an occurrence to be added. A Job definition referenced by an operation in this occurrence isn't correctly defined in the EQQSCLIB library.

System action: The request is rejected.

User response: Examine the message log. Message EQQ3077E identifies the EQQSCLIB member in error.

EQQM072E THE END-TO-END FEATURE IS NOT ACTIVE. CANNOT ADD OPERATIONS ON FTW

Explanation: The application that the user is trying to add to the current plan contains an operation defined on a fault-tolerant workstation. This kind of operations cannot be added to the current plan if the end-to-end feature is not active.

System action: The request is rejected and the system waits for you to respond.

System programmer response: Install and configure the end-to-end feature. Make sure that the TPLGYSRV keyword is present in the OPCOPTS statement of the controller parameters.

User response: If you need to add an operation on a fault-tolerant workstation, contact your system programmer; otherwise remove the operation defined on the fault-tolerant workstation or change its workstation before adding the occurrence to the plan.

EQQM073I COMMAND SENT TO CHANGE LINK OR STATUS FOR *WSID*

Explanation: The command to change the status or the link for workstation *WSID* has been sent as you requested in the previous panel.

System action: The status or the link of the workstation will be changed.

User response: None.

EQQM074E INVALID STATUS CHANGE FOR A FTW OPERATION. RS: *XSSRS*

Explanation: Possible reasons for the error are:

- Successor FTW operations of the operation that you attempted to modify have a status inconsistent with your modify request.
- The operation or its recovery job has not ended yet.

System action: The request is rejected. Message *EQQMxssrsE* provides additional information, where *xssrs* is the reason code displayed by this message. If this is a Modify Current Plan dialog request, message *EQQMxssrsE* is written to the message log.

User response: Depending on whether the request is from the Modify Current Plan dialog or from the Program Interface, refer to the message indicated by the reason code.

EQQM075E INVALID REQUEST FOR A FTW OPERATION. RS: *XSSRS*.

Explanation: An invalid modification request has been issued for an operation running on a Fault-tolerant workstation.

System action: The request is rejected. Message *EQQMxssrsE* is written to the message log, where *xssrs* is the reason code displayed by this message.

User response: Refer to the message indication by the reason code to establish the cause of the error.

EQQM076E REPORTING ATTRIBUTE MUST BE A FOR REMOTE ENGINE WORKSTATIONS

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM077E STARTED OPERATIONS MUST BE L FOR REMOTE ENGINE AND DYNAMIC WORKSTATIONS

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM100W DEADLINE IS EARLIER THAN INPUT ARRIVAL TIME - VALUE ACCEPTED

Explanation: You specified a deadline that is invalid because it is earlier than the input arrival time. However, the deadline value is accepted.

System action: None.

User response: None.

EQQM104E NO APPLICATIONS MET THE SELECTION CRITERIA

Explanation: No applications were found in the application description database, which met the selection criteria that you specified.

System action: The system waits for you to respond.

User response: Change the selection criteria.

EQQM106E DEP OPTIONS ARE: *OCHCYES, OCHPRED, OCHSUCC, OCHGRP OR OCHCNO*

Explanation: You entered a value for the dependency resolution attribute that is not recognized by the Modify Current Plan dialog. You must change the value to one of the supported values defined by this message.

System action: The system waits for you to respond.

User response: Change the dependency resolution value.

EQQM107E BOTH DATE AND TIME MUST BE SPECIFIED FOR INPUT ARRIVAL

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM108E BOTH DATE AND TIME MUST BE SPECIFIED FOR DEADLINE

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM109E APPLICATION VALID-FROM IS LATER THAN PLAN END *MPLENDI*

Explanation: The valid-from date and time of the occurrence that you attempted to add to the current plan lie outside the current plan end.

System action: The request is rejected. The system waits for you to respond.

User response: Use the Application Description dialog to change the valid-from date and time of the occurrence.

EQQM110E OPERATIONS WITH DUPLICATE NUMBERS ARE SPECIFIED

Explanation: Data entry error; see “Data entry errors” on page 803.

EQQM112E THE OCCURRENCE CONTAINS UNCONNECTED OPERATIONS

Explanation: In the occurrence that you are modifying, there is more than one network of dependencies. This is not allowed.

System action: The modification is rejected. The system waits for you to respond.

User response: Verify and correct the dependencies.

EQQM113E JOBNAME *MOJBN* MUST BE SAME IN JOB SETUP, PROCESS, AND PRINT

Explanation: The job name (*MOJBN*) specified for the job setup, process, and print operations must be the same.

System action: The system waits for you to respond.

User response: Verify and correct, for example, the dependencies or the job names.

EQQM115E A PROCESS OPERATION MUST PRECEDE A PRINT OPERATION

Explanation: A print operation must be preceded by a process operation.

System action: The system waits for you to respond.

User response: Verify and correct, for example, the print operation or the process operation.

EQQM117E WORK STATION *MOWSN* IS NOT FOUND IN THE CP, OR ACCESS WAS REVOKED

Explanation: The specified workstation (*MOWSN*) does not exist in the current plan or you are not authorized to access this workstation.

System action: The system waits for you to respond.

User response: Change the occurrence so that it uses only workstations that are in the current plan. If you are not authorized to access this workstation, contact your security administrator.

EQQM118E A SETUP OPERATION MUST HAVE A PROCESS SUCCESSOR

Explanation: A setup operation must be succeeded by a process operation.

System action: The system waits for you to respond.

User response: Verify and correct, for example, the

setup operation or the process operation.

EQQM119E A PREDECESSOR TO OPERATION *MONUM* IS ALSO A SUCCESSOR

Explanation: A predecessor to operation *MONUM* is also a successor. This forms a dependency loop and is not allowed.

System action: The system waits for you to respond.

User response: Verify the dependencies to the operation *MONUM*.

EQQM120E *ADID: ADID, IA: IA, OPNO: OPNO,* CAUSES A LOOP

Explanation: The specified dependencies create a loop in the operations network.

System action: The update request is rejected.

User response: Check your dependency specifications.

EQQM121W THERE IS JCL ON THE JS FILE FOR OPERATION *MONUM*

Explanation: There is a record on the JS file that matches an operation on a computer workstation in the occurrence being added. This record was not added during the current Modify Current Plan dialog session.

System action: The current panel is redisplayed.

User response: None.

EQQM122W *IAD* CANNOT BE EARLIER THAN 1984/01/01

Explanation: An invalid input arrival date was specified while adding an application to the current plan.

System action: The request is rejected.

User response: Define a new date starting from 1984/01/01.

EQQM123E CONDITION DEPENDENCY *SIMP* IN CONDITION *COND* IS NOT PRESENT OR DOES NOT HAVE THE MISSING INFO FLAG SET TO YES

Explanation: The general service task could not process a request to manually define the status of the indicated condition dependency. The request is valid only for step dependencies that are undefined because of missing step-end information.

System action: The request is rejected.

User response: Verify your selection criteria.

**EQQM124E NOT VALID STATUS SPECIFICATION FOR CONDITION DEPENDENCY
SIMP IN CONDITION COND**

Explanation: The general service task received an incorrect value when processing a request to manually define the status of the indicated condition dependency.

System action: The request is rejected.

User response: Valid value are T or F. Verify the specification criteria.

**EQQM125W UNEXPECTED RC OCCURRED FOR OPERATION: ADID APPL, IA
ARRTIME, OPNO OPNUM, WS WSN,
JOBNAME JOBNM, JOBID JOBID,
DEST DEST WHEN MODIFYING THE
CURRENT PLAN.**

Explanation: As a result of a modify current plan action, the operation specified in the message was marked with the *Unexpected RC* flag because the new operation status *ST* does not match any of those specified in the conditions of its conditional successors. This means that no possible path for progression exists.

Note: *JOBNM*, *JOBID* and *DEST* could be blank depending on specified operation status and characteristics.

System action: The operation is flagged as Unexpected RC and the status of the conditions of its conditional successors is set to Undefined.

User response: Verify the following:

- Make sure you correctly typed condition definitions.
- If the operation result was expected, make sure that a successor is defined for that result.
- If the operation result was not expected, fix the error that caused that result.

Then rerun the occurrence or manually operate appropriately to let the successors start.

EQQM126I A JCL is displayed if this member exists in the EQQJBLIB.

Explanation: In MCP you can select the JCL browse function if operation is on a fault-tolerant workstation and is a non-centralized script. This action is allowed only when the JOBLIB and the SCRPTLIB are concatenated in the EQQJBLIB. If a member with the same name is present both in the JOBLIB and in the SCRPTLIB, then the JCL in the JOBLIB is displayed when browsing the non centralized script.

System action: The JCL member of the JOBLIB is displayed when the member is present also in the SCRPTLIB. The script member is displayed when the member is present only in the SCRPTLIB.

User response: None.

EQQM127E THE OCCURRENCE CONTAINS ONLY ONE OPERATION.

Explanation: The operation is the only one of the occurrence.

System action: The operation will not be deleted.

User response: Consider to delete the entire occurrence.

EQQM130W OCCURRENCE HAS A PENDING PREDECESSOR, REQUEST IS NOT POSSIBLE

Explanation: The occurrence to be deleted or completed has a predecessor that is not yet in the current plan.

System action: The request is rejected.

User response: The function cannot be performed until the pending predecessor dependency is removed.

EQQM150E INPUT ARRIVAL IS LATER THAN CURRENT PLAN END CPEDCPET

Explanation: A request to modify or create an occurrence on the current plan specifies an input arrival time later than or equal to the current plan end time. All modifications to the current plan must be earlier than the current plan end time.

System action: If this is a request to the program interface, the request is rejected and control is returned with the return code set to error.

User response: Correct the input arrival time and resubmit the job.

EQQM151E CURRENT PLAN READ ERROR, AD NOT ADDED TO CURRENT PLAN

Explanation: A request to create an occurrence in the current plan failed due to an I/O error.

System action: If this is a request to the program interface, the request is rejected and control is returned with the return code set to error.

System programmer response: Review the message log of the IBM Tivoli Workload Scheduler for z/OS subsystem to determine the cause of the error. This message is generally preceded by a more specific I/O error message. Check the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference manual*, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Resubmit the job when the problem

causing the I/O error has been corrected.

Problem determination: The message log of the IBM Tivoli Workload Scheduler for z/OS subsystem contains the I/O error message.

EQQM152E ALL OCCURRENCES OF AD BEFORE CP END CPED CPET EXIST

Explanation: A request to create an occurrence in the current plan failed because the occurrence already exists. No input arrival time was given in the request, which implies that a default input arrival time should be used.

System action: If this is a request to the program interface, the request is rejected and control is returned with the return code set to error.

User response: If necessary, resubmit the job after either extending the current plan or deleting some existing occurrence.

Problem determination: The default input arrival time is the current time, consisting of the current date, current hour, and current minute. If an occurrence of the application with that input arrival time already exists, the next minute is used. If that occurrence also exists, the following minute is used. This search for an input arrival time continues up to the current plan end time.

EQQM153E IA NOT BEFORE CP END CPEDCPET, AD NOT ADDED

Explanation: A request to create an occurrence in the current plan failed because the current plan end time has passed. No input arrival time was given in the request, which implies that a default input arrival time should be used. The default input arrival time is the current time, consisting of the current date, current hour, and current minute. The request is rejected because the current plan ends before the current time.

System action: If this is a request to the program interface, the request is rejected and control is returned with the return code set to error.

User response: If necessary, resubmit the job after extending the current plan.

EQQM154E ALL POTENTIAL EXTERNAL SUCCESSORS COULD NOT BE RESOLVED

Explanation: A request to create an occurrence in the current plan failed because the Resolve Required option was Y (yes). There are also occurrences in the current plan that are possible successor occurrences, but the application description defines more dependencies than could be resolved using existing successor candidates.

System action: The current occurrence is not added to the current plan.

User response: If necessary, change the Resolve Required option to N (no) and retry the request to add the occurrence to the current plan.

EQQM155E OCCURRENCE WITH SAME ADID AND IA EXISTS IN LONG-TERM PLAN

Explanation: A request to create or modify an occurrence in the current plan specifies an application ID and input arrival date and time that are the same as an existing occurrence in the long-term plan.

System action: If this is a Modify Current Plan dialog request, the request is rejected. If it is a request to the program interface, the request is rejected and control is returned with the return code set to error.

User response: Change the input arrival date or time and resubmit the request.

EQQM161E MODIFY CP REQUEST FAILED, INSUFFICIENT STORAGE. REASON: RS

Explanation: A request to create or modify an occurrence in the current plan failed due to a storage allocation failure. The reason code provides debugging information for the personnel.

System action: If this is a request to the program interface, the request is rejected and control is returned with the return code set to error.

System programmer response: Allocate a larger region to the IBM Tivoli Workload Scheduler for z/OS subsystem and restart the subsystem. If the error persists, contact IBM Software Support.

User response: If necessary, resubmit the job after the IBM Tivoli Workload Scheduler for z/OS subsystem has been restarted in a larger region.

EQQM162W OPERATION MONUM DEFINES TOO MANY RESOURCES, FIRST MAXRES USED

Explanation: The application description record defines an operation that has more special resources than are supported by the Create Occurrence function in the Modify Current Plan dialog.

System action: The dialog uses the maximum resources defined by the application description to initialize special resources for this operation.

User response: Enter the OPER primary command to display operations for this occurrence. Select the operation defined by this message and review the current definition of special resources for the operation. If required, modify the currently defined resources, but note that no additional resources can be added for this operation.

**EQQM163W TWO OR MORE OPERATIONS
DEFINE TOO MANY RESOURCES,
FIRST MAXRES USED**

Explanation: The application description record defines one or more operations that have more special resources than are supported by the Create Occurrence function in the Modify Current Plan dialog.

System action: The dialog uses the maximum resources defined by the application description for each operation that have too many special resources.

User response: Enter the OPER primary command to display operations for this occurrence. Review the current definition of special resources for this occurrence. If required, modify the currently defined resources, but note that the number of resources that can be defined per operation is limited by the maximum record length of 32,768 bytes.

**EQQM164E AN OPERATION RECORD IS TOO
LARGE TO BE SAVED IN CURRENT
PLAN**

Explanation: The current occurrence contains an operation that contains too much information to be saved in the current plan data set.

System action: The occurrence has not been saved. The dialog waits for you to continue updating the current occurrence.

User response: Enter the OPER primary command to display operations for this occurrence. Review the current definition of the operations. Try to reduce the number of special resources or dependencies, or both, defined for the most complex operations. After making corrections, retry the Current Plan update request.

EQQM165E SYSTEM AUTO WS REQUIRED

Explanation: An operation with system automation information was defined for a not-Automation workstation.

System action: The action cannot be continued and the modification cannot be saved, until the workstation is appropriately defined.

User response: Ensure that the workstation has the Automation option set to Yes. If you changed the workstation from Automation to not-Automation, change it back or use a workstation that is Automation. If you no longer need the System Automation operation, you cannot change it to be a not-automation one; you must delete it and create a new one. If you cannot delete the operation for any reason, you can leave a System Automation workstation and define a dummy System Automation command for it in the command text.

EQQM166E NO SYSTEM AUTO DATA

Explanation: An operation without system automation information was defined for an Automation workstation.

System action: The action cannot be continued and the modification cannot be saved, until the workstation or operation is appropriately defined.

User response: Check that the workstation used has the Automation option set to N. If you changed the workstation from non-Automation to Automation, change it back or use a non-Automation workstation. If you need this operation to be a System Automation operation, specify the command text and security element.

EQQM167E AUTHORIZATION FAILED

Explanation: System automation information cannot be read due to a missing security authorization, because AD.SECELEM, CP.SECELEM, or both are set in the AUTHDEF initialization statement.

System action: The requested system automation information is not retrieved.

User response: Verify that you are trying to access the information for which you are granted access. If so, ask for the appropriate security authorization related to the specific SECELEM of the data.

**EQQM171E MAXIMUM NUMBER OF
OCCURRENCES OF AD EXISTS**

Explanation: No more occurrences of this application can be added. IBM Tivoli Workload Scheduler for z/OS can handle approximately 870 occurrences of each application.

System action: The create request is rejected.

User response: If possible, delete occurrences of this application that have finished processing. These occurrences are removed from the plan next time, producing a new plan. If necessary, copy the application description and add the occurrence with a new name.

**EQQM172E MAXIMUM NUMBER OF
OCCURRENCES EXISTS, FAILED TO
ADD AD**

Explanation: No more occurrences can be added to the current plan because either the maximum number of occurrences (32767) or the number specified in the MAXOCCNUM option of the JTOPTS statement has been reached.

System action: The request is rejected.

User response: Check that the current plan does not contain any occurrences that should not be in the plan.

If you find any such occurrences, complete or delete them. Replan the current plan to remove all completed and deleted occurrences and try to add the occurrence again. If your current plan regularly contains a large number of occurrences, you should consider shortening the length of the current plan in future daily planning runs.

Problem determination: If you use event-triggered tracking (ETT), program interface (PIF), or Automatic Recovery, check that these functions are working correctly. For example, make sure that you do not have an endless ETT loop where the availability of a special resource is set to YES by a job that ETT adds when it detects that this same resource is set to YES. Check the current plan for instances of an unusually high number of occurrences of a particular application. If you see such an application, look in the application description database and make sure that the run cycles for the application are correct. When you specify PREVRES(YES) on the BATCHOPT initialization statement, information about completed and deleted occurrences is carried forward, for reporting purposes, into a new current plan. If your current plan regularly contains a large number of occurrences, and you specify YES for PREVRES, you should consider changing this value to NO.

EQQM173W CHANGING INPUT ARRIVAL MAY CAUSE EDITED JCL TO BE LOST

Explanation: The JCL for an operation in this occurrence has been edited. Changing the input arrival for this occurrence may cause the edited JCL to be lost.

System action: The system waits for you to respond

User response: To keep the edited JCL, change the input arrival back to the original value and press ENTER. If you need the input arrival to change acknowledge this by pressing ENTER. This may cause the JCL that you edited to be lost.

EQQM174E INCORRECT CONDITION DEPENDENCY SPECIFIED ON OPERATION APPL IA OPER CONDITION COND: SIMP. STEP LEVEL DEPENDENCIES REQUIRE CONDITION TYPE RC.

Explanation: You specified a condition type different from RC.

System action: The request is rejected.

User response: Specify RC as condition type.

EQQM175E INCORRECT CONDITION DEPENDENCY SPECIFIED ON OPERATION APPL IA OPER CONDITION COND: SIMP. STEP NAME SPECIFICATION REQUIRES PROC STEP SPECIFICATION TOO.

Explanation: If you specify the procedure invocation step name, you must specify also the step name in the JCL procedure.

System action: The request is rejected.

User response: If the step is in a procedure specify both the parameters, otherwise specify only the name of the step that corresponds to the EXEC PGM= statement.

EQQM176E INCORRECT CONDITION DEPENDENCY SPECIFIED ON OPERATION APPL IA OPER CONDITION COND: SIMP. FIRST CHARACTER INCORRECT FOR STEP NAME.

Explanation: The first character must be one of the following: A through Z and national characters (that is, #, \$, and @).

System action: The request is rejected.

User response: Specify an alphabetic or national character as initial character in the procedure invocation step name.

EQQM177E INCORRECT CONDITION DEPENDENCY SPECIFIED ON OPERATION APPL IA OPER CONDITION COND: SIMP. FIRST CHARACTER INCORRECT FOR PROC STEP.

Explanation: The first character must be one of the following: A through Z and national characters (that is, #, \$, and @).

System action: The request is rejected.

User response: Specify an alphabetic or national character as initial character in the step name.

EQQM178E INCORRECT CONDITION DEPENDENCY SPECIFIED ON OPERATION APPL IA OPER CONDITION COND: SIMP. WRONG STRING SPECIFICATION FOR STEP NAME.

Explanation: The procedure invocation step name can be made up of the following valid characters: A through Z, 0 through 9, and national characters (that is, #, \$, and @). The first character must be alphabetic or national, the remaining characters can be alphabetic, numeric, and national characters.

System action: The request is rejected.

User response: Correct the string.

EQQM179E INCORRECT CONDITION DEPENDENCY SPECIFIED ON OPERATION APPL IA OPER CONDITION COND: SIMP. WRONG STRING SPECIFICATION FOR PROC STEP.

Explanation: The step name can be made up of the following valid characters: A through Z, 0 through 9, and national characters (that is, #, \$, and @). The first character must be alphabetic or national, the remaining characters can be alphabetic, numeric, and national characters.

System action: The request is rejected.

User response: Correct the string.

EQQM200E THE SPECIFIED WORK STATION ID DOES NOT EXIST

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM201E THE OPERATION NUMBER MUST BE BETWEEN 1 - 255

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM202E THE JOBNAME MUST BE IN THE FORMAT CAAAAAAA

Explanation: Data entry error; see "Data entry errors" on page 803.

A job name can be made up of the following valid characters: A through Z, 0 through 9, and national characters (that is, #, \$, and @). The first character must be alphabetic or national and the remaining characters can be alphabetic, numeric, and national characters.

EQQM203E JOB SETUP, COMPUTER, AND PRINT OPERATIONS REQUIRE A JOBNAME

Explanation: A jobname must be given for an operation at a general workstation with the job setup option, or at a computer or printer workstation.

System action: The panel is redisplayed.

User response: Specify a jobname for the operation.

EQQM204E A DURATION MUST BE SPECIFIED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM205E NUMBER OF SERVERS MUST BE BETWEEN 1 - 99

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM206E NUMBER OF WORK STATION RESOURCES MUST BE BETWEEN 0 - 99

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM207E THE NEW STATUS MUST BE R, S, C, E or I

Explanation:

R	Ready
S	Started
C	Completed
E	Error
I	Interrupt

Data entry error; see "Data entry errors" on page 803.

EQQM208E THE STATUS CANNOT BE CHANGED - EXT/CONDITIONAL SUCCESSOR S,C,X OR E

Explanation: You tried to change the status of an operation that has external or conditional successors already started, completed, suppressed by condition, or ended in error. This is not allowed. This situation can occur both if you try to change the status directly (for example, from the EQQMMGEP panel) and if you try to do it indirectly (for example, issuing a Step restart or Job Restart command).

System action: IBM Tivoli Workload Scheduler for z/OS does not change the status and ignores the request.

User response: When dependencies are involved, the status must be changed within the rerun occurrence path. Use option R in panel 5.2, or option RER in panel 5.4.

EQQM209E THE VARIABLE TABLE IS NOT DEFINED

Explanation: Data entry error; see "Data entry errors" on page 803.

You have tried to define a variable table ID that does not exist in IBM Tivoli Workload Scheduler for z/OS's database.

EQQM210E RESOURCES WITH DUPLICATE NAMES WERE FOUND

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM211E A RESOURCE NAME MUST BE SPECIFIED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM212E RESOURCE OPTION MUST BE S-SHARE OR X-EXCLUSIVE

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM213E OPTION FOR AUTOMATIC TRACKING MUST BE Y OR N

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM214E OPTION FOR AUTOMATIC SUBMIT MUST BE Y OR N

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM215E OPTION FOR HOLD/RELEASE MUST BE Y OR N

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM216E OPTION FOR TIME DEPENDENCY MUST BE Y OR N

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM217E OPTION FOR SUPPRESS IF LATE MUST BE Y OR N

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM218E CANNOT CHANGE STATUS: EXT PRED NOT COMPLETE OR COND NOT TRUE

Explanation: You tried to change the status of an operation with external predecessors that are not completed, or conditions that are not true. This is not allowed.

System action: IBM Tivoli Workload Scheduler for z/OS does not change the status and ignores the request.

User response: When dependencies are involved, the status change must be done within the rerun occurrence path.

EQQM219E OPERATION NUMBER MUST NOT BE CHANGED FROM MOONU

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM220E DEPENDENCY TYPE MUST BE P-PREDECESSOR OR S-SUCCESSOR

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM221E NO OPERATIONS IN CURRENT PLAN MATCH THE SEARCH ARGUMENT

Explanation: In the current plan, there are no operations that meet your selection criteria.

System action: The system waits for you to respond.

User response: Check your selection criteria.

EQQM222W UNRESOLVED EXTERNAL PREDECESSORS EXIST

Explanation: This message is issued when the Automatic Dep option is set to Y or P and the Resolve Required option is set to Y. When the message is issued on the EQQMAOCP panel, it means that the current occurrence could not be added to the current plan because one or more external predecessors defined by the application description could not be resolved. When the message is issued on the EQQMARXL panel, it means that one or more external predecessors displayed by the panel could not be resolved. The input arrival time for unresolved dependencies is blank.

System action: The Modify Current Plan dialog waits for input.

User response: If the message is issued on the EQQMAOCP panel, enter the DEP primary command to modify automatically added dependencies. If the message is issued on the EQQMARXL panel, delete all unresolved predecessor dependencies.

EQQM223W OPERATION DEADLINE PRECEDES OPERATION INPUT ARRIVAL - ACCEPTED

Explanation: The operation deadline is earlier than the operation input arrival. This is accepted, but might not be what you intend.

System action: None.

User response: None.

**EQQM224W OPERATION INPUT ARRIVAL
PRECEDES OCCURRENCE -
ACCEPTED**

Explanation: The operation input arrival date is earlier than the occurrence. This is accepted, but might not be what you intend.

System action: None.

User response: None.

**EQQM225W OPERATION DEADLINE LATER
THAN OCCURRENCE DEADLINE -
ACCEPTED**

Explanation: The specified operation deadline is later than the occurrence deadline. This is accepted, but might not be what you intend.

System action: None.

User response: None.

EQQM226E DEPENDENCY TYPE MUST BE P OR S

Explanation: Data entry error; see "Data entry errors" on page 803.

**EQQM227W A SUCCESSOR DEPENDENCY COULD
NOT BE ADDED**

Explanation: A dependency to a potential successor operation could not be added because the successor operation has already started.

System action: If this message is issued when the DEP command has been entered, unresolved successors are indicated by a missing (blank) input arrival time. If this message is issued when trying to add an occurrence to the plan and the RESOLVE REQUIRED indicator is Y, the occurrence is not added.

User response: If the occurrence should be added to the plan without the successor dependency, change the RESOLVE REQUIRED indicator to N and retry the add occurrence function.

**EQQM228E A DEPENDENCY TO THE
OPERATION IS ALREADY DEFINED**

Explanation: Data entry error; see "Data entry errors" on page 803.

**EQQM229E JCL BROWSE/EDIT CAN ONLY BE
SELECTED FOR PROCESSOR WORK
STATIONS**

Explanation: Data entry error; see "Data entry errors" on page 803. It is not allowed to browse or edit JCL for non-processor operations.

**EQQM230E HIGHEST RETURN CODE IS NOT
NUMERIC**

Explanation: Data entry error; see "Data entry errors" on page 803.

**EQQM231E SPECIFIED OPERATION IS ALREADY
A PREDECESSOR**

Explanation: Data entry error; see "Data entry errors" on page 803.

**EQQM232E SPECIFIED OPERATION IS ALREADY
A SUCCESSOR**

Explanation: Data entry error; see "Data entry errors" on page 803.

**EQQM233I THE SPECIFIED OPERATION HAS
BEEN ADDED AS A PREDECESSOR**

Explanation: The specified operation has been added as a predecessor.

System action: None.

User response: None.

**EQQM234I THE SPECIFIED OPERATION HAS
BEEN ADDED AS A SUCCESSOR**

Explanation: The specified operation has been added as successor.

System action: None.

User response: None.

**EQQM235E THE SPECIFIED OPTION MUST BE
EITHER Y, N, OR BLANK**

Explanation: Data entry error; see "Data entry errors" on page 803.

The value of this input field must be Y (for Yes), N (for No), or a blank (for no value). Read the help text for the panel, and decide which option you want.

**EQQM236E VARIABLE TABLE NAME CONTAINS
AN INVALID CHARACTER**

Explanation: Data entry error; see "Data entry errors" on page 803.

**EQQM237E OPTION FOR DEADLINE WTO MUST
BE Y OR N**

Explanation: Data entry error; see "Data entry errors" on page 803.

The option can be Y (yes) or N (no).

EQQM238E YOU ARE NOT AUTHORIZED TO READ THE JCL VARIABLE TABLE DATA BASE

Explanation: You have attempted to access a JCL variable table. To do this, you need at least read authority to the JCL variable table database.

System action: The system waits for you to respond.

User response: Contact your security administrator if you need to refer to JCL variable table names.

EQQM239E MULTIPLE RESTART POINTS ARE NOT ALLOWED, DUE TO EXTERNAL DEPENDENCIES

Explanation: You selected more than one restart point in the application occurrence being rerun. You cannot use multiple restart points because the occurrence has external dependencies that would be updated by the rerun.

If you want to use more than one restart point, the application occurrence being rerun must be the only occurrence whose status changes.

System action: The first restart point that you selected is accepted. All other restart points are cancelled.

User response: If you want to rerun the application occurrence starting from the first restart point, enter Y on the Rerun Confirmation panel. Otherwise, enter N.

EQQM240E RESTART OPERATION HAS PENDING OR MANDATORY PENDING PREDECESSORS

Explanation: The operation that you selected as a restart point has at least one pending or mandatory pending predecessor (not in the current plan).

Pending predecessors are marked with *P* in the predecessor type column at the far right of the panel. Mandatory pending predecessors are marked with *M*.

The manual HOLD command (MH) is not supported for operations with pending or mandatory pending predecessors.

System action: The occurrence status is not changed to rerun, but updates made to the JCL are saved.

User response: Select another restart point in the application occurrence, or delete the pending dependencies. Run the occurrence again.

EQQM241I THE OCCURRENCE STATUS HAS NOT BEEN CHANGED

Explanation: The occurrence status has not set to rerun because:

1. The operation that you selected as a restart point has at least one predecessor that is pending (not in

the current plan). The status cannot be set to rerun until you delete the pending dependencies.

2. You entered the cancel command on the EQQMOSTL panel.

System action: The occurrence status is not changed to rerun, but updates made to the JCL are saved.

User response: None.

EQQM242E THE NUMBER OF PARALLEL SERVERS MUST BE 1 FOR CPU OPERATIONS

Explanation: Operations on a computer workstation can only use one parallel server.

System action: The panel is redisplayed and the dialog waits for you to change the number of parallel servers.

User response: Change the number of parallel servers to 1.

EQQM245W THE CLEANUP ACTION HAS STARTED FOR THIS OPERATION

Explanation: When trying to start an auto recovery action, the scheduler found that there is a cleanup action in progress.

If the data store has been stopped, the auto recovery action cannot start unless a stop and start of the FL task is performed.

System action: The automatic recovery request is ignored.

User response: Try again later.

If the data store has been stopped, stop and start the FL task to restart the auto recovery action.

EQQM246E DEPENDENT OCC NOT FOUND

Explanation: The dependent occurrence OCC was not found in the current plan.

User response: Add new predecessor/successor occurrences to the current plan.

EQQM247E OPTION FOR EXTERNAL MONITOR MUST BE Y OR N

Explanation: Data entry error. See "Data entry errors" on page 803.

EQQM248E OPTION FOR CENTRALIZED SCRIPT MUST BE Y OR N

Explanation: Data entry error. See "Data entry errors" on page 803.

EQQM249E OPTION FOR IGNORED AT REMOVAL MUST BE Y OR N

Explanation: Data entry error. See “Data entry errors” on page 803

EQQM250E CURRENT OPERATION STATUS MUST BE A, *, R, W, C, X, OR E TO BE HELD

Explanation: Only operations in status A, W, R, *, C, X, or E can be manually held.

For operations with pending predecessors, the manual HOLD command is not supported at all.

System action: The request is ignored.

User response: None.

EQQM251I OPERATION IS ALREADY MANUALLY HELD BY DIALOG

Explanation: The operation has already been set to MANUAL HOLD by a Tivoli OPC dialog user.

System action: The request is ignored.

User response: None.

EQQM252I OPERATION IS NOT MANUALLY HELD BY DIALOG

Explanation: The operation for which the MANUAL RELEASE command was issued, is not Manually HELD by a IBM Tivoli Workload Scheduler for z/OS dialog user request.

For operations with pending predecessors, the MANUAL RELEASE command is not supported at all.

System action: The request is ignored.

User response: None.

EQQM253I OPERATION IS PUT IN MANUAL HOLD

Explanation: The operation for which the manual HOLD command was issued is now recognized to be HELD by Tivoli OPC.

System action: The operation is manually HELD.

User response: None.

EQQM254I OPERATION HAS BEEN MANUALLY RELEASED FROM MANUAL HOLD

Explanation: A previously held operation has been release from hold at a Tivoli OPC dialog user's request.

System action: The operation is released, and may be scheduled by Tivoli OPC.

User response: None.

EQQM255E CURRENT OPERATION STATUS MUST BE A, *, W, C, X, OR R TO BE NOPED

Explanation: Only operations in status A, W, R, C, X, or * can be NOPed.

For operations with pending predecessors, the NOP operation command is not supported at all.

System action: The request is ignored.

User response: None.

EQQM256I OPERATION IS ALREADY NOPED BY USER REQUEST

Explanation: The operation for which the NOP command was issued has already been NOPed by a dialog request.

System action: The request is ignored.

User response: None.

EQQM257I OPERATION IS NOT NOPED

Explanation: The operation for which the UN-NOP command was issued, is not currently NOP.

For operations with pending predecessors, the UN-NOP command is not supported at all.

System action: The request is ignored.

User response: None.

EQQM258I OPERATION HAS BEEN NOPED

Explanation: The operation has been recognized as no-oped by Tivoli OPC The operation is not executed, and dependent operations may be started as a result.

System action: The operation is indicated as no-oped.

User response: None.

EQQM259I OPERATION NOP HAS BEEN RESET

Explanation: An operation has been successfully reset from its NOP indication at a Tivoli OPC dialog user's request.

System action: The operation's NOP indication is removed.

User response: None.

EQQM260I OPERATION HAS BEEN EXECUTE INDICATED

Explanation: An operation has been marked as EXECUTE by Tivoli OPC and is started without regard to the normal job submission criteria.

System action: Processing continues.

User response: None.

EQQM261E CURRENT OPERATION STATUS MUST BE A, *, OR R TO BE EXECUTED

Explanation: Only operations in status A, R or * can be the subject of an EXECUTE request.

System action: The request is ignored.

EQQM262E YOU DO NOT HAVE AUTHORITY TO USE THE EXECUTE COMMAND

Explanation: To use the function you selected, you must have update authority to the EXECUTE resource.

System action: The request is rejected and the system waits for you to respond.

User response: Contact your security administrator if you need to use the EXECUTE command.

EQQM263E COMMAND VALID ONLY ON COMPUTER AUTOMATIC WORKSTATIONS

Explanation: The workstation on which this operation was scheduled is not a computer type workstation with the automatic reporting attribute.

System action: The request is ignored.

User response: Issue the command only on computer workstations with the automatic reporting attribute.

EQQM264E THE COMMAND THAT WAS ISSUED IS NOT SUPPORTED

Explanation: The command is not supported by Tivoli OPC.

System action: The request is ignored.

User response: Issue only valid Tivoli OPC commands.

EQQM265E COMMAND SUPPORTED ON AUTOMATIC CPU OR NONREPORTING WORKSTATIONS

Explanation: The command you issued is supported on automatic computer type workstations, or workstations with the nonreporting attribute.

System action: The request is ignored.

User response: Issue the command only on supported workstations.

EQQM266E THERE IS NO ACTIVE WORKSTATION FOR THIS OPERATION

Explanation: The operation is scheduled on a workstation that is inactive. If alternative workstations are specified, these are also inactive.

System action: The request is ignored.

User response: Issue the EXECUTE command when the workstation, or an alternative workstation, becomes active again.

EQQM267E STATUS CANNOT BE CHANGED AS THE OPERATION HAS BEEN MANUALLY HELD

Explanation: You cannot request Tivoli OPC to set the next logical status for an operation that has been manually held.

System action: The request is ignored.

User response: Either set a specific status using the N-x row command, or manually release the operation (MR) and reissue the N row command.

EQQM268E PROMPT CANNOT BE REPLIED FOR THIS OPERATION

Explanation: You have issued a request of prompt reply, but the task was unable to satisfy it, because the request is not valid for a centralized script or for an operation not scheduled on fault-tolerant workstation.

System action: The request is rejected.

User response: Verify that the operation has the prompt and that the prompt is in the required status.

EQQM269E THE STATUS CANNOT BE CHANGED FROM OR TO X

Explanation: Only an occurrence rerun request or internal scheduler actions can produce this kind of change, that might refer to the selected operation or its internal non-conditional successors.

System action: The request is rejected.

User response: Consider rerunning the occurrence.

EQQM270E THIS IS NOT AN FTW, IT CANNOT BE CHANGED TO AN FTW ONE

Explanation: It is not possible to change a non-fault-tolerant workstation with another FTW in the same operation in MCP.

System action: Request is rejected.

User response: Enter the correct value.

EQQM271E CANNOT CHANGE THE FIELD *FLD* IF OPERATION RUNS ON FTW.

Explanation: In MCP it is impossible to change field *FLD* to operation, if this operation runs on a Fault-tolerant workstation. *FLD* values:

WS = workstation

JNM = Job name

PS = Parallel servers

R1 = Resource 1

R2 = Resource 2

System action: Request is rejected.

User response: Enter the correct value.

EQQM272E OP. NUMBER *OP* ALREADY USED BY A DELETED OPERATION ON FTW

Explanation: It is impossible to insert an operation when the same number was use by a deleted operation with a fault-tolerant workstation.

System action: Request is rejected.

User response: Insert an operation with another operation number.

EQQM273E OP. NUMBER *OP* ALREADY USED BY A DELETED OPERATION ON NON-FTW

Explanation: It is impossible to change a fault-tolerant workstation with a workstation that is not fault-tolerant.

System action: Request is rejected.

User response: Enter the correct value.

EQQM274E THE ALTERNATE WORKSTATION CANNOT BE A FAULT-TOLERANT WORKSTATION

Explanation: It is impossible to assign a Fault-tolerant workstation as an alternate workstation in Modify Current Plan.

System action: Request is rejected.

User response: Enter the correct value.

EQQM275E THE NEW STATUS CANNOT BE I IF THE OPERATION IS ON FTW

Explanation: In Modify Current Plan, you cannot change the operation status to "I" on fault-tolerant workstations.

System action: The request is rejected.

User response: Enter the correct value.

EQQM276E THE STATUS CANNOT BE SET TO READY IF THE FTW OPERATION IS NOT ENDED.

Explanation: You cannot change the operation status to R for a fault-tolerant workstation in Modify Current Plan if the operation status is S or if the operation has a recovery job that is running.

System action: The request is rejected.

User response: Enter the correct value.

EQQM277E INVALID STATUS CHANGE TO WAITING REQUESTED FOR A FTW SUCCESSOR

Explanation: You cannot change the operation status to W for a fault-tolerant workstation in Modify Current Plan if the current status is S or if it is A, R, * and the operation does not use special resources or centralized script support. Moreover, you cannot re-run an operation that completed correctly if it has a fault-tolerant workstation successor in waiting status.

System action: The request is rejected.

User response: Enter the correct value.

EQQM278E INVALID VALUE FOR FIELD *FLD* IF OPERATION RUNS ON A FTW.

Explanation: You are modifying or adding an operation running on a Fault-tolerant workstation and you entered an invalid value for field *FLD*.

The following are values for *FLD*:

AEC = Automatic error completion

AJR = Automatic job hold/release

CRT = Workload monitor critical path

HRC = Highest return code

SUB = Automatic job submission

WTO = Issue deadline WTO

System action: The request is rejected.

User response: Enter the correct value, for example:

AEC = Y

AJR = Y

CRT = N

HRC = blank or 0

SUB = Y

WTO = N

EQQM279E FTW OPERATION: THE STATUS CAN BE R (FOR NON-RUNNING OPERATION) OR C

Explanation: You are changing the status of an operation running on a fault-tolerant workstation and the new status you specified is invalid. As a rule, only R for Ready or C for Completed are accepted. The R value is not allowed if the operation is running or if it has a recovery job that is running.

Error in data entry; see "Data entry errors" on page 803.

System action: Request is rejected.

User response: Enter the correct value.

EQQM280I EXTENDED INFO USED AS KEY IN SYMPHONY. ENTER AGAIN TO BROWSE IT

Explanation: When the operation that you are updating was added to the current plan, the TWSJOBNAME parameter in the JTOPTS statement was set to EXTNAME or to EXTNOCC; this choice implies that the extended name is used to generate the job name in the symphony file. Now you are modifying the operation but you cannot change the Extended Info field because it is used as a key to identify a job in the symphony file.

System action: Informs that it is possible to show the Browse panel.

User response: Re-enter the request to display the Browse panel.

EQQM281I CANNOT CHANGE EXTENDED NAME IF TWSJOBNAME VALUE IS EXTNAME/EXTNOCC

Explanation: You cannot change the Extended Name field to "operation" in the MCP, because, when the operation that you are updating was added to the current plan, the TWSJOBNAME parameter in the JTOPTS statement was set to EXTNAME or EXTNOCC; this choice implies that the extended name is used to generate the job name in the symphony file. Now you cannot change the Extended Info field because it is used as a key to identify a job in the symphony file.

System action: The request is rejected.

User response: Cancel the request.

EQQM282E CANNOT CHANGE EXTENDED NAME OR JOBNAME IF IT IS A SYMPHONY KEYWORD

Explanation: You cannot change the Extended Name or Jobname fields to "operation" in the MCP because, when the operation that you are updating was added to the current plan, the TWSJOBNAME parameter in

the JTOPTS statement was set to EXTNAME or JOBNAME; this choice implies that either name is used as a key in the symphony file.

System action: The request is rejected.

User response: Enter the correct value.

EQQM283E SELECTION NOT VALID

Explanation: System automation information is not available for a workstation that is not Automation.

EQQM284W THIS CONDITION IS EVALUATED AND CANNOT BE MODIFIED

Explanation: You can modify a condition while its status is undefined.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM285E A PREDECESSOR TO OPERATION OPNO IS ALSO A SUCCESSOR

Explanation: A predecessor to operation *OPNO* is also a successor. This forms a dependency loop and is not allowed.

System action: The request is rejected.

User response: Verify the dependencies to the operation *OPNO*.

EQQM286E CONDITION CID IN OPERATION OPNO IS NOT VALID

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM287E DEPENDENCY LOOP DETECTED IN OCCURRENCE NETWORK

Explanation: The modify current plan (MCP) service detected a loop while processing a request to modify a network with conditional dependencies defined.

System action: The request is rejected.

User response: Check the message log for any message identifying the occurrences and the affected operations.

EQQM288E SELECTION TYPE MUST BE S

Explanation: While defining a conditional dependency in the current plan, you entered an invalid row command.

System action: The request is rejected.

User response: Use S to select an operation.

EQQM289I INTERNAL CONDITIONAL
PREDECESSOR *PRED* NOT ADDED
TO OPERATION *APPL*, *OPER* IN
CONDITION *COND* DURING
AUTOMATIC CONDITIONAL
SUCCESSORS RESOLUTION AT
OCCURRENCE ADD

Explanation: The scheduler did not add the indicated condition dependency to prevent inconsistencies in the dependency network.

System action: The dependency resolution process skips the indicated condition dependency.

User response: Consider checking your dependency definition to remove inconsistencies.

EQQM290E CURRENT OPERATION IS NOT
EXECUTED. BIND PROCESS WAS
STARTED.

Explanation: The command EX was issued to execute a shadow job whose bind process was already started.

System action: The EX command is not performed.

User response: None.

EQQM291I BIND INFORMATION HAS BEEN
RESET.

Explanation: The information collected about the remote job has been reset.

System action: Processing continues.

User response: None.

EQQM301I WORK STATION UPDATED IN
CURRENT PLAN

Explanation: The workstation has been updated in the current plan.

System action: The modify workstation function is terminated.

User response: If you added or modified an open interval, ensure that the begin time was the same or later than the current time, otherwise the update is not made.

EQQM302W A WORK STATION IS CURRENTLY
BEING UPDATED, TRY LATER

Explanation: You have attempted to modify a workstation, but it is currently being updated by another user.

System action: The system waits for you to respond.

User response: Try again later.

EQQM303E THE REPORTING ATTRIBUTE
SPECIFIED MUST BE A, S, C, OR N

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM304E CONTROL ON SERVERS OR
RESOURCES MUST BE Y-YES OR
N-NO

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQM305E COMMAND VALID ONLY ON
COMPUTER WORKSTATIONS

Explanation: Selecting a history operation is allowed only for operations that are defined on computer workstations.

EQQM306E CONDITION DEPENDENCY MUST BE
UNDEFINED WITH MI SET TO Y

Explanation: The request is valid only for step dependencies that are undefined because of missing step-end information.

EQQM309I RETRIEVED JOBLOG (*JOBN JNUM*)
NOT STORED: NEW RUN OCCURRED

Explanation: A new job run occurred before a joblog retrieval request for a previous run was able to complete. The requested joblog is now obsolete. The joblog (identified by jobname *JOBN* and JobId *JNUM*) will not be stored in JS VSAM.

System action: The joblog is not stored in JS VSAM.

Operator response: None.

EQQM310E OPEN TIME INTERVALS MUST NOT
OVERLAP

Explanation: Data entry error; see "Data entry errors" on page 803.

It is not allowed to have overlapping open time intervals for the workstation.

EQQM311E INTERVAL START MUST PRECEDE
END

Explanation: Data entry error; see "Data entry errors" on page 803.

The open interval start time must be earlier than the open interval end time.

EQQM312E START TIME MUST BE SPECIFIED FOR AN INTERVAL

Explanation: Data entry error; see “Data entry errors” on page 803.

EQQM313E END TIME MUST BE SPECIFIED FOR AN INTERVAL

Explanation: Data entry error; see “Data entry errors” on page 803.

EQQM314E VALUE FOR PARALLEL SERVERS MUST BE 0 - 99

Explanation: Data entry error; see “Data entry errors” on page 803.

EQQM315I TABLE RESULT IS MERGED FROM MODIFIED AND PLANNED INTERVALS

Explanation: The table result is merged from modified and planned intervals. The table is built from the modified and planned intervals according to the workstation.

System action: Processing continues.

User response: If you want the displayed table to be used, use the END command. Press ENTER to display the table without this message.

EQQM317E VALUE FOR PARALLEL SERVERS MUST BE 0 - 65535

Explanation: Data entry error; see “Data entry errors” on page 803.

EQQM328E A VALID RESPONSE IS EITHER Y OR N

Explanation: Data entry error; see “Data entry errors” on page 803.

EQQM333W THE SCHEDULER INITIALLY FOUND INCONSISTENCIES IN THE JCL

Explanation: When IBM Tivoli Workload Scheduler for z/OS initially checked the JCL, inconsistencies were found.

System action: The system waits for you to respond

User response: Enter Yes to accept the step-level restart selected or enter No to reject the restart setting.

EQQM334I MORE THAN ONE STEP WITH SAME PROCSTEP/STEPNAME

Explanation: The selected stepname or proc stepname, or both, occurs more than once in the JCL.

System action: IBM Tivoli Workload Scheduler for z/OS chooses the first occurrence of the selected step name and uses it as the restart step.

User response: None.

EQQM335E THE SCHEDULER CAN NOT TAILOR ANY JCL BECAUSE NO RESTART STEP WAS SELECTED

Explanation: To tailor the JCL for step restart, IBM Tivoli Workload Scheduler for z/OS needs a step selection.

System action: The system waits for you to respond.

User response: Select a step or cancel the step restart.

EQQM336I THE RESTART HAS BEEN CANCELLED FOR THIS OPERATION

Explanation: If the cancel was for a step restart, the JCL for this operation has not been stored in the JS repository file, because no step selection was made.

System action: None.

User response: None.

EQQM337E NO STEPS WERE SELECTED FOR RESTART

Explanation: You have excluded all steps for the job, so the JCL cannot be created.

System action: The system waits for you to respond.

User response: Make sure that a minimum of one step is selected for the job and reissue the GO command.

EQQM339W THE OPERATION CANNOT BE RESTARTED WITHOUT CHANGING THE JCL

Explanation: IBM Tivoli Workload Scheduler for z/OS has investigated the JCL for restart and has detected inconsistencies. IBM Tivoli Workload Scheduler for z/OS detects many situations that can cause problems during the step restart, for example, missing instream data or references to a temporary data set created prior to the restart step.

System action: The JCL is displayed. ISPF message lines are inserted by IBM Tivoli Workload Scheduler for z/OS to document the detected inconsistencies.

User response: Change the JCL, or cancel the restart for this operation, or save the JCL after determining that the reported inconsistencies are not expected to

result in a problem during restart.

EQQM340E OCCURRENCE IN A GROUP MUST BE REMOVED BEFORE IT CAN BE DELETED

Explanation: An occurrence that belongs to an occurrence group cannot be deleted.

System action: The system waits for you to respond.

User response: You must remove the occurrence before you can delete it. To do this, type the row command RG on the MODIFYING OCCURRENCES IN THE CURRENT PLAN panel or the HANDLING OPERATIONS ENDED IN ERROR panel. Alternatively, erase the group definition ID field on the MODIFYING AN OCCURRENCE IN THE CURRENT PLAN panel.

EQQM341E OCCURRENCE IN A GROUP MUST BE REMOVED BEFORE IT CAN BE COMPLETED

Explanation: An occurrence that belongs to an occurrence group cannot be completed.

System action: The system waits for you to respond.

User response: You must remove the occurrence before you can complete it. To do this, type the row command RG on the MODIFYING OCCURRENCES IN THE CURRENT PLAN panel or the HANDLING OPERATIONS ENDED IN ERROR panel. Alternatively, erase the group definition ID field on the MODIFYING AN OCCURRENCE IN THE CURRENT PLAN panel.

This message can also be issued when you try to complete the last uncompleted operation of an occurrence belonging to a group. It is issued because the completion of an operation would imply the completion of the occurrence. However, IBM Tivoli Workload Scheduler for z/OS does not allow manual completion of this kind of occurrence before the occurrence has been removed from the group.

EQQM342E OCCURRENCE IS NOT A MEMBER OF AN OCCURRENCE GROUP

Explanation: The occurrence does not belong to an occurrence group.

System action: The request is rejected.

User response: Check the occurrence definition and correct it.

EQQM343E APPLICATION IS NOT A MEMBER OF AN APPLICATION GROUP

Explanation: The application does not belong to an application group.

System action: The request is rejected.

User response: Check the application definition and correct it.

EQQM344W APPLICATION IS A MEMBER OF A GROUP. CONSIDER ADDING THE OTHER MEMBERS

Explanation: The application is a member of an application group. This message is issued as a reminder in case you should also add the other members of the same group to the current plan.

System action: Normal processing continues.

User response: If applicable, create occurrences in the current plan for the other applications in the same group.

EQQM345E ONE OR MORE OCCURRENCES ARE IN USE

Explanation: One or more of the applications could not be added because another user is adding the same application to the current plan with the same input arrival date and time. *InUse* is displayed in the list to indicate the failing occurrence.

System action: The system waits for you to respond.

User response: Check that Group ID and Input arrival date and time have been specified correctly. Or, check with the other user who is creating the same occurrence to determine which of the occurrences should be added. Alternatively, use the row command D to delete the occurrence from the list.

EQQM346E ONE OR MORE OCCURRENCES ALREADY EXISTS

Explanation: One or more of the applications could not be added because an occurrence for the same application already exists in the current plan. *Exist* is displayed in the list to indicate the failing occurrence.

System action: The system waits for you to respond.

User response: Check that Group ID and Input arrival date and time have been specified correctly. Use the row command D to delete the occurrence from the list. Alternatively, use the Modify Current Plan dialog to delete the previously added occurrence from the current plan.

EQQM347E INSUFFICIENT AUTHORITY TO ADD ONE OR MORE APPLICATIONS

Explanation: One or more of the applications could not be added because you do not have current plan update authority for the application names. *NoAuth* is displayed in the list to indicate the failing occurrence.

System action: The system waits for you to respond.

User response: Verify that Group ID has been

specified correctly. Alternatively, use the row command to delete the occurrence from the list.

EQQM349E NO OCCURRENCES TO ADD, OR TERMINATING ERRORS FOUND

Explanation: Either there are no valid versions of any applications in the application description database for the date and time specified by the input arrival or IBM Tivoli Workload Scheduler for z/OS has been unable to execute the request.

System action: The system waits for you to respond.

User response: Check that Group ID and Input arrival date and time have been specified correctly.

EQQM350I ALL ADDED OCCURRENCES HAS BEEN SUCCESSFULLY RELEASED

Explanation: All occurrences in the group have been successfully released.

System action: The occurrences have been released.

User response: None.

EQQM351I ALL ADDED OCCURRENCES HAS BEEN SUCCESSFULLY DELETED

Explanation: The occurrences in the group have been successfully deleted from the current plan.

System action: The occurrences have been deleted from the current plan.

User response: None.

EQQM352E SOME ADDED OCCURRENCES COULD NOT BE RELEASED

Explanation: One or more of the applications added to the plan could not be released. *Error* is displayed in the list to indicate the failing occurrence.

System action: The system waits for you to respond.

User response: See the message log for possible error information. Use the row command D to delete the occurrence from the list.

EQQM353E SOME ADDED OCCURRENCES COULD NOT BE DELETED

Explanation: One or more of the applications added to the plan could not be deleted from the current plan. *Error* is displayed in the list to indicate the failing occurrence.

System action: The system waits for you to respond.

User response: See the message log for possible error information. Use the row command D to delete the occurrence from the list.

EQQM354I ALL SELECTED OCCURRENCES HAS BEEN SUCCESSFULLY ADDED

Explanation: All occurrences in the group have been successfully added to the current plan. The occurrences are held until you release them.

System action: Processing continues.

User response: Modify the individual occurrences as required and release the group.

EQQM355E SOME SELECTED OCCURRENCES COULD NOT BE ADDED

Explanation: One or more of the occurrences defined in the group could not be added to the current plan. This can happen because IBM Tivoli Workload Scheduler for z/OS was unable to resolve the dependencies for the application.

System action: The occurrence group is added to the current plan, but not all of the occurrences were added.

User response: Add the individual occurrences to the plan as members of the existing group. Alternatively, delete the entire occurrence group before the occurrences are released.

Problem determination: The message log contains messages that describe the reason why the individual occurrences could not be added.

EQQM356E GROUP VALID-FROM DATE IS LATER THAN PLAN END *MPLENDI*

Explanation: The valid-from date of the group that you attempted to add to the current plan lies outside the current plan end.

System action: The request is rejected.

User response: Use the Application Description dialog to change the valid-from date of the group definition.

EQQM357E NO VALID GROUP DEFINITION AVAILABLE

Explanation: You attempted to add a group of applications to the current plan, but no valid version of the corresponding group definition could be found.

Possible reasons for this error are:

- The group definition has been deleted from the application description database
- You do not have security access to read the group definition
- An active group definition is not in effect for the specified input arrival date.

System action: The system waits for you to respond.

User response: Check why the group definition could not be found, correct the error and resubmit the request.

EQQM358W DEP LOOP DETECTED, NOT ALL DEPS RESOLVED WITHIN THE GROUP

Explanation: One or more dependency loops has been found in the occurrence group.

System action: In each loop, the external dependencies for one of the operations has not fully been resolved within the group. If there are other occurrences, external to the group, in the current plan that matches these dependency definitions, the dependencies have been resolved to those occurrences. Message EQQM976W is written to the message log, once for each loop detected.

User response: Check the message log to identify the occurrences and the affected operations.

EQQM359E LIMIT FOR THE NUMBER OF CONCURRENT ENQUEUES REACHED

Explanation: The limit for the number of concurrent enqueues on a resource has been reached. This limit is defined by the GVTCREQ field in the GVT control block

System action: The request is rejected.

User response: Increase the z/OS value of the GVTCREQ field.

EQQM360W WHEN THE SCHEDULER CHECKED THE JCL IT FOUND JES3 DJC STATEMENTS

Explanation: Restarting this job may interfere with the JES3 dependent job control net.

System action: None.

User response: Verify that the restart does not affect the DJC net or change the JCL accordingly, or both.

EQQM361I STATEMENT OVERRIDDEN DUE TO CONFLICT WITH ORIGINAL JCL

Explanation: The statement in the JCL has been modified by IBM Tivoli Workload Scheduler for z/OS so that a replacement JCL statement could be inserted. The original statement is changed to a JCL comment.

System action: Processing continues.

User response: Verify that the step restart selected is correct.

EQQM362E THE SCHEDULER DIDN'T INSERT COND AS ONE IS ALREADY PRESENT

Explanation: Restarting this operation is not possible due to a previously defined COND statement.

System action: None.

User response: Verify that the existing COND statements are valid and amend the JCL accordingly.

EQQM364W A STEP LEVEL RESTART HAS ALREADY BEEN SELECTED FOR THE OPERATION

Explanation: A step-level restart has already been set for this operation and the operation has not yet been restarted.

System action: Processing continues.

User response: Verify the step-level restart that was previously selected. Change it if necessary.

EQQM365E THE STATEMENT CONTAINS REFER BACK TO STEP PRIOR TO RESTART

Explanation: Restarting this job is not possible due to a refer back specifying a step that is prior to a restart step. This would cause a JCL error.

System action: None.

User response: Verify that the step from which to restart is correct and amend the JCL accordingly.

EQQM366I STATEMENT FOLLOWS FROM STEP STEPNAME PROC STEP PROCNAME

Explanation: The inconsistency is highlighted by placing the JCL in ISPF note line s that are then preceded with the procname and stepname where the JCL statements were found.

System action: None.

User response: Verify that the highlighted data is in error and amend the JCL accordingly.

EQQM368E IF STATEMENT REFERS BACK TO STEP PRIOR TO RESTART STEP

Explanation: Restarting this job could result in unpredictable results as the IF statement refers to a step prior to a restart step. This is a JCL error.

System action: None.

User response: Verify that the step being referred to is correct and amend the JCL accordingly.

EQQM369E UNABLE TO OVERRIDE THE JCL BECAUSE IT IS INSIDE RECURSIVE CALLED PROCEDURES

Explanation: The job is not restartable because the JCL statement that contains the OVERRIDE statement is within recursive called procedures..

System action: None.

User response: Update the procedure manually for the duration of this job.

EQQM370W THE JOBLOG FOR THIS OPERATION IS NOT COMPLETE

Explanation: The JESJCL and JESYSMSG joblog files are needed to define a step-level restart. One or both of these files are missing and IBM Tivoli Workload Scheduler for z/OS cannot rebuild the JCL for step-level restart.

System action: None.

User response: Use the JOB primary command to view the part of the joblog that is present (if any) and use the J row command in the Previous Operation list panel to update the JCL accordingly.

EQQM371W THE STATEMENT CONTAINS A DATASET WITH DISPOSITION MOD

Explanation: The JCL statement contains a DISP=MOD for a data set. This restart may corrupt the contents of this data set.

System action: None.

User response: Verify if the step was executed or not. If it was not, ignore this message. If it was executed, verify that a restart is possible or change the JCL accordingly.

EQQM372E THE STATEMENT CONTAINS A REFERENCE TO A TEMPORARY DATASET

Explanation: The JCL statement contains a reference to a temporary name of a data set that was created in a previous step. Restarting this job would cause a JCL error.

System action: None.

User response: Change the JCL accordingly.

EQQM373W STEP STATUS IS FLUSH. POSSIBLE INCONSISTENCIES EXIST

Explanation: This step has a status of FLUSH due to a prior error. Restarting from this step may be possible. However, verification of the JCL for the status of data sets is recommended.

System action: None.

User response: Change the JCL if necessary.

EQQM374W STEP EXECUTION CONDITION TO A PREVIOUS STEP

Explanation: The JCL statement contains a condition statement that refers to a previous step. Restarting this job could cause steps to be executed that are not supposed to be executed.

System action: None.

User response: If necessary, change the COND/IF keyword accordingly. Change AUTOSAVED as 100003 AUTOSAVE A1

EQQM375I THE SCHEDULER WILL ATTEMPT TO DELETE THIS DATASET

Explanation: IBM Tivoli Workload Scheduler for z/OS attempts to delete this data set before this job is restarted.

System action: None.

User response: None.

EQQM376I THE SCHEDULER WILL ATTEMPT TO UNCATALOG THIS DATASET

Explanation: IBM Tivoli Workload Scheduler for z/OS attempts to uncatalog this data set before this job is restarted.

System action: None.

User response: None.

EQQM377I THE SCHEDULER WILL ATTEMPT TO CATALOG THIS DATASET

Explanation: IBM Tivoli Workload Scheduler for z/OS attempts to catalog this data set before this job is restarted.

System action: None.

User response: None.

EQQM378W VERIFY JCL: THE SCHEDULER COULD DELETE WRONG DATASET (IEF377I)

Explanation: The JCL statement contains a DCB reference to a name in a data set that has been referenced by an IEF377I message in the joblog. Restarting the job may cause problems as IBM Tivoli Workload Scheduler for z/OS deletes only the cataloged data sets and not those that have just been allocated and not cataloged.

System action: None.

User response: Change if this could lead to problems, and, if so, remove the involved data sets from the data set list suggested by IBM Tivoli Workload Scheduler for z/OS for deletion. If necessary, manually make any required changes or alter the JCL.

EQQM379W THE JCL STATEMENTS CONTAIN AUTOMATIC RECOVERY STATEMENTS

Explanation: The JCL contains automatic recovery statements. The automatic recovery subtask processes

those statements as soon as the cleanup actions are completed.

System action: The system waits for you to respond.

User response: Select the Start cleanup with AR option to show a cleanup list consistent with the RESSTEP parameter defined in the JCL.

EQQM380W JCL CONTAINS REFERENCES TO INSTREAM DATA THAT IS MISSING

Explanation: The JCL statement contains a reference to instream data that cannot be located. Possible reasons for this error are:

- An error was reported when IBM Tivoli Workload Scheduler for z/OS submitted the operation that prevented the JCL from being stored in the JCL repository.
- The JCL for this operation has been deleted from the JCL repository.
- The operation was not submitted by IBM Tivoli Workload Scheduler for z/OS and the corresponding data is not available in the JES job log.
- The data is missing from one of the following: a DD * or DD DATA reference, a JES XMIT or DATASET statement, or a PASSWORD= keyword on the job card.

System action: Processing continues.

User response: Enter any required instream data.

EQQM382W THE OPERATION CANNOT BE RESTARTED WITHOUT CHANGING THE JCL

Explanation: IBM Tivoli Workload Scheduler for z/OS has investigated the JCL for restart and has found errors. Use the JCL primary to determine whether JCL updates are required.

System action: The system waits for you to respond.

User response: Either edit and change the JCL or cancel the restart of the operation.

EQQM383E THE ABSOLUTE GDG NUMBER IS MISSING FOR THIS DATASET

Explanation: IBM Tivoli Workload Scheduler for z/OS was unable to find the absolute GDG number for the data set.

System action: None.

User response: Check to ensure that the GDG base exists and that the GDG level has not been deleted or that the data set has not been filtered out by a user exit.

EQQM384W THE RESTART STEP IS INSIDE AN IF/THEN/ELSE CLAUSE

Explanation: Unpredictable results may occur when the selected restart step is within an IF-THEN-ELSE clause.

System action: None.

User response: Check to ensure that the step selected is the correct step and that the IF-THEN-ELSE clause is understood.

EQQM385E NUMBER OF STEPS FOUND IN THE JOB LOG INCONSISTENT

Explanation: The number of steps found in the job log is not consistent with the number of steps reported by the tracker when the job ended.

System action: Processing continues.

System programmer response: Keep a copy of the event data set from the tracker where the job executed, the current plan, and the JCL repository, and contact IBM Software Support.

User response: Contact your system programmer.

EQQM386W THE GDG BASE IS MISSING FOR THIS DATASET

Explanation: IBM Tivoli Workload Scheduler for z/OS was unable to find the GDG base for the data set at job submit time.

System action: None.

User response: Check that the GDG name is specified correctly. The GDG may be created during the life time of the job so this may not be an error.

EQQM388W VERIFY JCL FOR POSSIBLE INCONSISTENCIES

Explanation: One of the following situations has occurred:

- At least one step status of FLUSH was detected. Restarting from this step may be possible. However, verification for the status of data sets used in this step is recommended.
- At least one IEF377I message was found in the job log. This means that in the previous run the job successfully allocated the data set, but did not manage to catalog it.

System action: None.

System programmer response: If necessary, change the JCL. If flushed steps have been detected, message EQQM373W indicates which ones they are. If there are catalog problems, message EQQM378W indicates which data sets are involved. See the description for EQQM378W for details on what action should be taken.

**EQQM396E EXCLUDE SELECTION COMMAND(S)
OUTSIDE RESTART SCOPE**

Explanation: You have defined one or more exclude-step row commands (X = Exclude a step from restart) and at least one of the excluded steps is either before the Start-selection or after the End-selection.

System action: The panel is redisplayed with this error message.

User response: Correct your definitions by moving the exclude commands inside the Start-End restart scope.

**EQQM397E SELECTED STEPS CHANGED -
REBUILD JCL**

Explanation: You have selected, or excluded, steps without issuing the GO command to build JCL according to the selected or excluded steps, or both.

System action: The panel is redisplayed with this error message.

User response: Change the selections, issue the GO command for the current selection, or CANCEL the step restart.

**EQQM398W NO STEPS HAVE BEEN SELECTED
FOR THIS STEP RESTART**

Explanation: You have attempted a step restart without selecting a restart step or an end step.

System action: If you confirm the restart, IBM Tivoli Workload Scheduler for z/OS performs cleanup of data sets for the entire job and the current JCL is resubmitted without modification.

User response: Either accept the restart with the current JCL or cancel the step-level restart on the Step-Restart Confirmation panel.

**EQQM400W THE OPERATION HAS NOT BEEN
SELECTED FOR RESTART**

Explanation: To use the row command just entered, the operation must have been selected previously for restart.

System action: None.

User response: Enter the S (select) row command to select the operation for restart and enter one of the other history row commands.

**EQQM401W THE DB2 HISTORY DATABASE IS
NOT AVAILABLE**

Explanation: The database that holds the operation data for old occurrences is not available. Possible reasons are:

- The database has been stopped or abended.
- The table space holding the data has been closed.

- The name specified in the DB2SYSTEM keyword in not correct.

System action: DB2 diagnostic messages are written to the IBM Tivoli Workload Scheduler for z/OS EQQMLOG data set.

System programmer response: Check the EQQMLOG data set for DB2 messages and take the actions described in the DB2 documentation.

User response: Contact your system programmer.

**EQQM402W THE SUBSYSTEM IS NOT
CONNECTED TO A DB2 HISTORY
DATABASE**

Explanation: When processing the request, IBM Tivoli Workload Scheduler for z/OS found either of the following conditions:

- The DB2 system specified in the DB2SYS keyword of the OPCOPTS initialization statement could not be connected.
- The OPERHISTORY keyword was not specified in the OPCOPTS statement.

System action: If IBM Tivoli Workload Scheduler for z/OS tried to connect to a DB2 system, DB2 diagnostic messages are written to the IBM Tivoli Workload Scheduler for z/OS EQQMLOG data set.

System programmer response: Check the EQQMLOG data set for DB2 messages and take the actions described in the DB2 documentation.

User response: Contact your system programmer.

**EQQM403E COULD NOT RETRIEVE REQUIRED
DATA. DB2 RETURN CODE IS DB2RC**

Explanation: IBM Tivoli Workload Scheduler for z/OS tried to access data in the DB2 history database, but failed to do so. The resulting DB2 messages are written to the IBM Tivoli Workload Scheduler for z/OS EQQMLOG data set. The return code is the sqlcode returned by DB2.

System action: DB2 diagnostic messages are written to the EQQMLOG data set.

System programmer response: Check the EQQMLOG data set for DB2 messages and take the action described in the DB2 documentation.

User response: Contact your system programmer.

**EQQM404I THE JCL FOR THIS OPERATION
MIGHT NOT BE THE ORIGINAL JCL**

Explanation: No job for this operation was found in the history database. This job was copied from the EQQJBLIB file.

System action: Processing continues.

User response: Verify if the job needs to be changed before it is submitted.

EQQM405W THE HISTORY FUNCTION IS NOT ACTIVE

Explanation: You tried to retrieve operations from the history database, but the history function is not active on your IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: Processing continues.

System programmer response: The OPERHISTORY and DB2SYSTEM keywords must be specified on the BATCHOPTS or OPCOPTS statement to activate the history function. Refer to the IBM Tivoli Workload Scheduler for z/OS documentation for more information.

User response: Contact your system programmer.

EQQM406W OCCURRENCE NOT FOUND (OCCNF) OR OPERATION NOT FOUND (OPRNF)

Explanation: The selected data could not be found in the DB2 history database. Either the occurrence is missing (OCCNF is set to *x*) or the operation record is missing (OPRNF is set to *x*). The data may have been deleted after the list of occurrences was created.

System action: The system waits for you to respond.

System programmer response: If the problem recurs when the list has been re-created, analyze the messages in the IBM Tivoli Workload Scheduler for z/OS message log, to determine the cause of the error. If there are no messages, contact IBM Software Support.

User response: Return to the previous panel and re-create the list of occurrences.

EQQM407E STEP RESTART REQUIRES MSGLEVEL=(1,1)

Explanation: Step restart was invoked but the MSGLEVEL value specified in the job JCL is wrong. The required value is:
MSGLEVEL=(1,1)

System action: The request is rejected.

User response: Set MSGLEVEL to (1,1) to correct the job JCL and rerun the operation.

EQQM500E RCLEANUP MUST BE SET TO YES TO ISSUE THIS REQUEST

Explanation: You issued a Restart a Cleanup request like step restart, Job rerun, Start Cleanup, or Display cleanup result, but IBM Tivoli Workload Scheduler for z/OS is not supporting this function because the initial parameter RCLEANUP is not set to YES.

System action: Request is rejected.

System programmer response: Set RCLEANUP to YES and check if the scheduler is correctly customized to support the Restart and cleanup function.

User response: Ask the system programmer to customize the scheduler to support the restart and cleanup function.

EQQM501E FL TASK MUST BE ACTIVE TO ISSUE THIS REQUEST

Explanation: You issued a Restart a Cleanup request like step restart, Job rerun, Start Cleanup, or Display cleanup result, but IBM Tivoli Workload Scheduler for z/OS is not supporting this function because the FL task (job log fetch task) is not active.

System action: Request is rejected.

System programmer response: Check the EQQMLOG file to see why the FL task is down.

User response: Ask the system programmer to check why the FL task is not active.

EQQM502E PSU TASK MUST BE ACTIVE TO ISSUE THIS REQUEST

Explanation: You issued a restart and cleanup request like Step restart, Job rerun, Start Cleanup, or Display cleanup result, but IBM Tivoli Workload Scheduler for z/OS is not supporting this function because the PSU task pre submit task is not active.

System action: Request is rejected.

System programmer response: Check the EQQMLOG file to see why the PSU task is down.

User response: Ask the system programmer to check why the PSU task is not active.

EQQM503E OPER_INFO IS REQUIRED TO ISSUE THIS REQUEST

Explanation: You issued a Restart a Cleanup request like step restart, Job rerun, Start Cleanup, or Display cleanup result but when the scheduler tried to read the OperInfo structure from the restart and cleanup data store, it was not found.

System action: Request is rejected.

System programmer response: Check the EQQMLOG file to understand what could cause the problem. This message is generally preceded by a more specific I/O error message. Check the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section "Information needed for all problems", sub-section "Information to collect for restart and

cleanup problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Ask the system programmer to check why OperInfo was not found.

EQQM504E LOCAL DATA STORE IS NEEDED TO ISSUE THIS REQUEST

Explanation: You issued a Restart a Cleanup request like step restart, Job rerun, Start Cleanup, or Display cleanup result but the scheduler has not yet completed restart and cleanup data store initialization

System action: Request is rejected.

User response: Retry later when the initialisation process is complete.

EQQM505E CLEAN UP TYPE CANNOT BE AUTOMATIC

Explanation: You issued an ARC command for an operation that has the cleanup type set to Automatic. The ARC command starts Automatic Recovery, which scans a JCL operation to process the recovery statements. However, Automatic Recovery cannot be applied the cleanup type is Automatic.

System action: Recovery statements will no longer be processed.

User response: Check if the cleanup type can be changed to None, Immediate, or Manual.

EQQM506W OPERATION CHANGE CAUSES PSU TAILORED JCL LOSS

Explanation: You changed the status of a ready operation that had a step restart or cleanup process pending (JCL was already tailored but not submitted). This caused the loss of the tailored JCL.

System action: Pending restart and cleanup process will be suppressed.

User response: None.

EQQM510E CANNOT ADD REMOTE JOB INFO TO THE FOLLOWING OPERATION: APPL IA OPER ON WORKSTATION WSNNAME. WORKSTATION IS NOT A REMOTE ENGINE OR REMOTE ENGINE TYPE IS NOT CONSISTENT.

Explanation: You are trying to add remote job information to an operation defined on a workstation which is not a remote engine workstation or it is defined with a type that is not consistent with the remote job information you are specifying.

System action: The requested change is not made.

User response: None.

EQQM511E CANNOT DELETE REMOTE JOB INFO IN THE FOLLOWING OPERATION: APPL IA OPER ON WORKSTATION WSNNAME. WORKSTATION IS A REMOTE ENGINE.

Explanation: You are trying to delete the remote job information related to an operation defined on a remote engine workstation.

System action: The requested change is not made.

User response: None.

EQQM512E CANNOT UPDATE REMOTE JOB INFO FOR THE FOLLOWING OPERATION: APPL IA OPER ON WORKSTATION WSNNAME. APPLICATION NAME IS NOT VALID.

Explanation: You are trying to modify the remote job information related to an operation defined on a z/OS remote engine workstation, but the application name is not valid.

System action: The requested change is not made.

User response: None.

EQQM513E CANNOT UPDATE REMOTE JOB INFO FOR THE FOLLOWING OPERATION: APPL IA OPER ON WORKSTATION WSNNAME. JOB STREAM NAME IS NOT VALID.

Explanation: You are trying to modify the remote job information related to an operation defined on a distributed remote engine workstation, but the job stream name is not valid.

System action: The requested change is not made.

User response: None.

EQQM514E CANNOT UPDATE REMOTE JOB INFO FOR THE FOLLOWING OPERATION: APPL IA OPER ON WORKSTATION WSNNAME. WORKSTATION NAME IS NOT VALID.

Explanation: You are trying to modify the remote job information related to an operation defined on a distributed remote engine workstation, but the workstation name is not valid.

System action: The requested change is not made.

User response: None.

EQQM515E CANNOT UPDATE REMOTE JOB INFO FOR THE FOLLOWING OPERATION: *APPL IA OPER ON WORKSTATION WSNNAME*. JOB NAME IS NOT VALID.

Explanation: You are trying to modify the remote job information related to an operation defined on a distributed remote engine workstation, but the job name is not valid.

System action: The requested change is not made.

User response: None.

EQQM516E CANNOT UPDATE REMOTE JOB INFO FOR THE FOLLOWING OPERATION: *APPL IA OPER ON WORKSTATION WSNNAME*. THE COMPLETE IF BIND FAILS OPTION IS NOT VALID.

Explanation: You are trying to modify the remote job information related to an operation defined on a remote engine workstation, but the option Complete if bind fails is set to a value that is not valid.

System action: The requested change is not made.

User response: None.

EQQM517E CANNOT UPDATE REMOTE JOB INFO FOR THE FOLLOWING OPERATION: *APPL IA OPER ON WORKSTATION WSNNAME*. OPERATION NUMBER IS NOT VALID.

Explanation: You are trying to modify the remote job information related to an operation defined on a z/OS remote engine workstation, but the operation number is not valid.

System action: The requested change is not made.

User response: None.

EQQM518E CANNOT UPDATE THE FOLLOWING OPERATION: *APPL IA OPER ON WORKSTATION WSNNAME*. WORKSTATION IS A REMOTE ENGINE BUT NO REMOTE JOB INFO IS SPECIFIED.

Explanation: You are trying to add or modify an operation that was defined on a remote engine workstation, without specifying any remote job information.

System action: The requested change is not made.

User response: None.

EQQM519E INCONSISTENCIES FOUND ON REMOTE JOB INFO OR WORKSTATION NAME

Explanation: You are trying to modify an operation that was defined on a remote engine workstation, but either of the following occurred:

- The remote job info specified are not valid or were not specified at all.
- The workstation type is not consistent with the remote job info specified.

System action: The requested change is not made.

User response: Ensure that the workstation type is correct and the remote job info are consistent with it.

EQQM520E RESOURCES AND CONDITIONS CANNOT BE SPECIFIED FOR OPERATION *APPL IA OPER ON WORKSTATION WSNNAME*.

Explanation: You are trying to specify resources, special resources, or conditions for an operation defined on a remote engine workstation.

System action: The requested change is not made.

User response: None.

EQQM521E SCHEDULING ENVIRONMENT CANNOT BE SPECIFIED FOR OPERATION *APPL IA OPER ON WORKSTATION WSNNAME*.

Explanation: You are trying to specify a scheduling environment for an operation defined on a remote engine workstation.

System action: The requested change is not made.

User response: None.

EQQM522E DEADLINE WTO MESSAGES CANNOT BE ISSUED FOR OPERATION *APPL IA OPER ON WORKSTATION WSNNAME*.

Explanation: You are trying to set to Y the deadline WTO option for an operation defined on a remote engine workstation.

System action: The requested change is not made.

User response: None.

EQQM523E OPERATION *APPL IA OPER ON WORKSTATION WSNNAME* CANNOT BE MADE ELIGIBLE FOR WLM ASSISTANCE.

Explanation: You are trying to make eligible for WLM assistance an operation defined on a remote engine workstation.

System action: The requested change is not made.

User response: None.

EQQM600E LAST RUN INFO NOT AVAILABLE

Explanation: Possible reasons for the failure are the following:

- RCLEANUP =YES was correctly specified in the OPCOPTS initial parameter statement, but a restart and cleanup request (Step restart, Job restart, Start cleanup, or Display cleanup result) was requested for an operation that did not run at least once producing a joblog.
- You issued a restart and cleanup request for an operation that run at least once producing a joblog but the last run info cannot be retrieved because RCLEANIUP=NO was specified in the OPCOPTS initial parameter statement.
- The operation did not run on a OS/390 system.

System action: Request is rejected.

System programmer response: Verify the check list in the Explanation section.

User response: Ask the system programmer to check the cause of the problem.

EQQM601I NEEDED JOBLOG INFO REQUESTED TO PROCESS THE COMMAND.

Explanation: You issued a Restart and Cleanup request such as: Step restart, Job rerun, Start Cleanup, or Display cleanup result. You need the last Joblog info and you just started the retrieval process.

System action: The dialog is displayed again.

User response: Wait for the request to complete. Enter your dialog request again.

EQQM602W JOBLOG INFO NEEDED TO PROCESS THE COMMAND. RETRIEVE IN PROGRESS

Explanation: You issued a Restart and Cleanup request like step restart, Job rerun, Start Cleanup, or Display cleanup result. You need the last Joblog info and this has already been requested but has not yet arrived.

System action: Panel is redisplayed.

User response: Wait for the request to complete. Re-enter your dialog request.

EQQM603E NEEDED OPER_INFO NOT FOUND

Explanation: You issued a Restart and Cleanup request like step restart, Job rerun, Start Cleanup, or Display cleanup result. You need the Oper_Info structure updated with the last Joblog info but the scheduler did not find it in the restart and cleanup data

store. A possible cause for this error is the FL subtask on the controller might be down. When this subtask is down, the restart and cleanup operation is not permitted.

System action: Panel is redisplayed.

System programmer response: Check the Controller and Data Store MLOG file to find error messages related to the operations.

User response: Ask the system programmer to check the cause of the problem. Verify if the FL subtask is down on the controller and restart it.

EQQM604E CLEAN UP STATUS DOES NOT ALLOW JOB RESTART

Explanation: You issued a Job Restart for an operation for which a restart and cleanup process is in progress. Restart and cleanup status is I (Initiated) or S (Started).

System action: Request is rejected.

User response: Wait for the restart and cleanup process to complete.

EQQM605E CLEAN UP STATUS DOES NOT ALLOW STEP RESTART

Explanation: You issued a Step Restart for an operation for which a restart and cleanup process is in progress. Restart and cleanup status is I (Initiated) or S (Started).

System action: Request is rejected.

User response: Wait for the restart and cleanup process to complete.

EQQM606E AN INVALID CLEAN UP STATUS WAS FOUND IN THE INPUT STRING

Explanation: You specified an invalid cleanup status.

System action: Request is rejected.

User response: Specify a valid value.

EQQM607E AN INVALID CLEAN UP TYPE WAS FOUND IN THE INPUT STRING

Explanation: You specified an invalid cleanup type.

System action: Request is rejected.

User response: Specify a valid value.

EQQM608E OPERATION STATUS DOES NOT ALLOW STEP RESTART

Explanation: You issued a Step Restart for an operation whose status does not allow it:

- If you are in a RERUN dialogue, you can only do this for the operation selected as the restart operation

EQQM609W • EQQM617E

(and therefore with status temporarily changed to READY, and all external dependencies also in READY status).

- Otherwise you can only do this for operations that are ready, in error, or complete.

System action: Request is rejected.

User response: Repeat the request according to the above explanation.

EQQM609W JOBLOG INFO NEEDED TO PROCESS THE COMMAND. RETRY IN PROGRESS

Explanation: You issued a Restart and Cleanup request like step restart, Job rerun, Start Cleanup, or Display cleanup result. You need the last Joblog info and this has already been requested but the process failed and a retry is in progress.

System action: Panel is redisplayed.

User response: Wait for the request to complete. Re-enter your dialog request.

EQQM610E STEP NOT RESTARTABLE CANNOT BE SELECTED AS START STEP

Explanation: You selected as a restart step a step marked as not restartable. This can be due to the JCL logic or the initial parameters setting (see RCLOPTS for details).

System action: Panel is redisplayed.

User response: Choose another step as the restart step.

EQQM611E STEP NOT EXECUTABLE CANNOT BE SELECTED AS START STEP

Explanation: You selected as a restart step a step marked as not executable. This can be due to the JCL logic or the initial parameters setting (see RCLOPTS for details).

System action: Panel is redisplayed.

User response: Choose another step as the restart step.

EQQM612E STEP NOT EXECUTABLE CANNOT BE SELECTED AS END STEP

Explanation: You selected as an end step a step marked as not executable. This can be due to the JCL logic or the initial parameters setting (see RCLOPTS for details).

System action: Panel is redisplayed.

User response: Choose another step as the end step.

EQQM613E STEP NOT EXECUTABLE CANNOT BE INCLUDED

Explanation: You included in the restart range a step marked as not executable. This can be due to the JCL logic or the initial parameters setting (see RCLOPTS for details).

System action: Panel is redisplayed.

User response: Exclude the step from the restart range.

EQQM614E STEP ALWAYS EXECUTABLE CANNOT BE EXCLUDED

Explanation: You excluded from the restart range a step marked as always executable. This is due to the initial parameters setting (see RCLOPTS for details).

System action: Panel is redisplayed

User response: Include the step in the restart range.

EQQM615E CLEAN UP IN PROGRESS: CANNOT BE STARTED NOW

Explanation: You issued a Start Cleanup for an operation for which a restart and cleanup process is already in progress. Restart and cleanup status is I (Initiated) or S (Started).

System action: Request is rejected.

User response: Wait for the restart and cleanup process to complete

EQQM616E VALID SELECTION ARE S, E, X OR I

Explanation: You have specified an invalid value for the step selection in the step restart panel. Allowed values are:

S	to indicate the restart step
E	to indicate the end step
X	to indicate a step that must not be executed
I	to indicate a step that must be executed if in the restart range

System action: Request is rejected.

User response: Specify a valid value.

EQQM617E ONLY ONE START STEP IS ALLOWED

Explanation: You set more than one step as the restart step.

System action: Panel is redisplayed.

User response: Specify only one start step.

EQQM618E ONLY ONE END STEP IS ALLOWED

Explanation: You set more than one step as the end step.

System action: Panel is redisplayed.

User response: Specify only one end step.

EQQM619E MUST STEPS MUST BE INCLUDED IN THE RESTART RANGE

Explanation: You did not include in the restart range steps that are marked as always executable. This is the due to the initial parameters setting (see RCLOPTS for details).

System action: Panel is redisplayed.

User response: Change the restart range.

EQQM620E NO STEPS AVAILABLE. ONLY JR IS POSSIBLE

Explanation: You issued a Step Restart for an operation for which it was not possible to retrieve information about the executed steps.

System action: Panel is redisplayed.

User response: Issue a Job restart.

EQQM622E OPERATION STATUS DOES NOT ALLOW JOB RESTART

Explanation: You issued a Job Restart for an operation whose status does not allow it:

- If you are in a RERUN dialog, you can only do this for the operation selected as the restart operation (and therefore with status temporarily changed to READY, and all external dependencies also in READY status).
- Otherwise you can only do this for operations that are ready, in error, or complete.

System action: The request is rejected.

User response: Repeat the request according to the above explanation.

EQQM623W EMPTY JCL CANNOT BE USED FOR RESTART

Explanation: You tried to use an empty JCL in a job rerun or Step or Job restart dialog. This is not allowed.

System action: The panel is displayed again.

User response: None.

EQQM624E EMPTY JCL CANNOT BE USED FOR RESTART.

Explanation: You tried to use JCL GET from JS VSAM or JOBLIB in a Step or Job Restart dialog but it was not found. This is not allowed.

System action: The panel is displayed again.

User response: None.

EQQM625I NO CLEAN UP ACTIONS ARE REQUIRED

Explanation: You issued a Restart and Cleanup command (like Step restart, Job Restart or start cleanup action) for an operation that has a cleanup type different to none but no action is really needed.

System action: Panel is redisplayed.

User response: None.

EQQM626E CLEAN UP TYPE NONE DOES NOT ALLOW TO START CLEAN UP

Explanation: You issued a Start Cleanup for an operation having cleanup type set to none.

System action: Request is rejected.

User response: Check the cleanup type value and change it in order to perform the Start Cleanup request.

EQQM627E OPERATION STATUS DOES NOT ALLOW START CLEANUP

Explanation: You issued a Start cleanup for an operation having a status that does not allow it:

- Or the operation code is Started
- Or the operation is ready and a standalone cleanup has already been executed.

System action: Request is rejected.

User response: None.

EQQM628E WHILE MODIFYING AN OCCURRENCE ONLY SC AND DC ARE ENABLED

Explanation: You issued a Step restart or a Job restart while you were modifying an occurrence. This is not allowed.

System action: Request is rejected.

User response: None.

EQQM629E WHILE MODIFYING AN OCCURRENCE ONLY SC AND DC ARE ENABLED

Explanation: You issued a Job restart or a Job restart while you were modifying an occurrence. This is not allowed.

System action: Request is rejected.

User response: None.

EQQM630I LAST CLEANUP RESULT NOT MERGED IN OPERINFO. UPDATE WAS REQUESTED

Explanation: You issued a Restart and Cleanup command and this needs Operinfo structure updated with the last joblog info. IBM Tivoli Workload Scheduler for z/OS checked that this update was not done and just restarted the process for update it.

System action: Panel is redisplayed.

User response: Wait for update process complete.

EQQM631I A RC REQUEST STILL IN PROGRESS IS UPDATING THE CLEANUP STATUS

Explanation: You issued a display cleanup result command but a restart and cleanup process is in progress.

System action: Request is rejected.

User response: Wait for restart and cleanup process to complete, then reissue the command.

EQQM632I RESTART AND CLEANUP NOT APPLICABLE FOR A DELETED OPERATION

Explanation: You issued a Restart and Cleanup command for a deleted operation. This is not allowed.

System action: Request is rejected.

User response: None.

EQQM633I THE REQUEST TO DISCARD THE CLEAN UP ACTIONS HAS BEEN CANCELLED

Explanation: You issued a Discard request from the MODIFYING CLEANUP ACTIONS panel but did not confirm it: No data sets have been excluded from the cleanup list.

System action: None.

User response: None.

EQQM634I THE CLEAN UP ACTIONS FOR THIS OPERATION ARE DISCARDED

Explanation: You issued a Discard request from the MODIFYING CLEANUP ACTIONS panel and confirmed it. All data sets have been excluded from the cleanup list. If you confirm the start cleanup or restart job selection, no data set is deleted.

System action: None.

User response: None.

EQQM635E VALID VALUES: A, I, M OR N

Explanation: You have entered an incorrect cleanup type. Allowed values are:

A Automatic
I Immediate
M Manual
N None

Explanation: The system waits for you to respond.

User response: Enter the correct value.

EQQM636E INSUFFICIENT AUTHORITY TO DO CLEAN UP ACTIONS

Explanation: It is not possible to do cleanup actions because you do not have the CMAC Update authority for performing them.

System action: The system waits for you to respond.

User response: Check if the CMAC fixed resource is defined and which type of authorization you assigned to CMAC.

EQQM637I A JOBLOG IS NEEDED TO PROCESS THE COMMAND. IT HAS BEEN REQUESTED

Explanation: You requested to browse the joblog of an operation. The joblog has not yet been requested and the scheduler starts the retrieval process just now on user demand.

System action: The panel is redisplayed with this information message.

User response: Wait for the request to complete. Check the joblog retrieval status field or wait to get a TSO-broadcast that the request has completed. Re-enter your dialog request.

EQQM638I JOBLOG IS NEEDED TO PROCESS THE COMMAND. IT IS NOT YET RETRIEVED

Explanation: You requested to browse the joblog of an operation. The joblog retrieval process is in progress.

System action: The panel is redisplayed with this information message.

User response: Wait for the request to complete. Check the joblog retrieval status field or wait to get a TSO-broadcast that the request has completed. Re-enter your dialog request.

EQQM639E A JOBLOG IS NEEDED TO PROCESS THE COMMAND. COULD NOT BE RETRIEVED

Explanation: You tried to retrieve a joblog but it could not be located for the operation. This happens when

the operation ends in error with one of the following error codes :

OSEQ OSSS
OSUF OSSS
OSUB OFSI
OSUP OFSQ
OJCV OFSS
JCLI OFSC
MCP CLNO
OSSI CLNA
OSSQ

It also happens when the operation defined in a fault-tolerant workstation ends in error.

System action: No joblog is displayed.

System programmer response: None.

User response: IBM Tivoli Workload Scheduler for z/OS cannot browse the joblog. Check the error code explanation in the manuals.

EQQM640E A JOBLOG IS NEEDED TO PROCESS THE COMMAND. LOG INFO NOT AVAILABLE

Explanation: You tried to perform one of the following actions:

- To retrieve the joblog of an operation.
- To request a restart and cleanup action (Step restart, Job restart, Start cleanup, Display cleanup result).
- To retrieve the recovery joblog for a not centralized job.

To process the command the scheduler needs to know the last job run id (jobname, jobid, start reader date, and time) but the records CP14 or CP24 that contain these data were not found.

System action: The command is not processed.

System programmer response: As described in the Explanation section of this message, the scheduler was unable to retrieve the joblog of an operation. RCLEANUP=YES in the OPCOPTS initial parameter statement is mandatory to retrieve the OS/390 job log. Before proceeding in the analysis of this problem, check the message log for any message related to this error condition. Most common causes of the missing creation of the CP14 or CP24 records are:

- The job did not actually run (for example if the operation is in waiting status)
- The operation job name is different from the job name in the job card.

User response: The scheduler cannot perform job log retrieval or restart and cleanup actions. Contact your system programmer to check why the records CP14 or CP24 were not created.

EQQM641I OPERINFO FOR JOB(N/JNUM) RETRIEVED

Explanation: Structured joblog info retrieval process has been completed and the information has been stored in Restart and Cleanup data store. At this point you can continue the restart and cleanup action selected by the dialog (Step Restart, start cleanup, Display cleanup, Job Restart).

System action: None.

User response: Re-enter the restart and cleanup selected action.

EQQM642E OPERINFO FOR JOB(N/JID) CANCELLED. REISSUE REQUEST

Explanation: Structured joblog information retrieval process was cancelled due to FL task closure. Re-issue the command after checking that the FL task has been restarted.

System action: None.

User response: Re-enter the restart and cleanup selected action.

EQQM643W OPERINFO FOR JOB(N/JNUM) NOT RETRIEVED. REASON: ERRC

Explanation: Structured joblog info retrieval process failed for the job identified by JOB(N) and JOBID. The reason for the failure is explained by the ERRC variable value:

- 000A** OPERINFO is not correctly stored on the data files.
- 0001** Job was not found nor in JES queue, neither in database. The EQQUX013 user exit might be active.
- 0002** An internal error occurred during data base write phase.
- 0003** Data Store Reader was inactive.
- 0004** Timeout was reached for the request.
- 0005** Data Store Connection is down.
- 0006** Job Log destination not found in FLOPTS.

If you changed the datastore destination name, verify that both the old and new destination names are specified in the FLOPTS statement. For further information, refer to the tracker and data store considerations in the **Migrating** section of the *Installation Guide*.

- 0007** An internal error occurred during Data Base call phase.
- 0008** An internal error occurred during Data Base request phase.
- 9999** Reason unknown.

System action: The message is displayed as a TSO broadcast message to the requesting user at the first interaction after the message is sent.

System programmer response: Check the reason of

the failure from the Data Store Log and message reason, and take the appropriate action.

User response: According to specified failure reason:

- 0001 Contact system programmer
- 0002 Retry later
- 0003 Contact system programmer to start Data Store Reader and retry
- 0004 Retry later
- 0005 Contact system programmer to activate Data Store communication and retry
- 0006 Contact system programmer to correct FLOPTS keyword and retry
- 0007 Contact system programmer
- 0008 Contact system programmer
- 9999 Contact system programmer

EQQM644I THERE ARE NO CLEANUP RESULTS TO BE DISPLAYED

Explanation: You issued the Display Cleanup command for an operation that did not require cleanup action in a previous run.

System action: The panel is redisplayed.

User response: None.

EQQM645I PROTECTED DATA SET CANNOT BE INCLUDED

Explanation: You tried to include in the cleanup actions data sets that are protected, that is, listed in the RCLOPTS statement as data sets that can not be deleted. See the *Customizing and Tuning* manual for details about RCLOPTS DDPROT, DSNPROT, DDPRMEM, and DSNPRMEM keywords.

System action: The panel is redisplayed with protected data set action set to X (excluded).

User response: None.

EQQM647I RETRIEVAL OF EQQCLEAN JOBLG IS IN PROGRESS

Explanation: You tried to start a restart and cleanup action from dialog but the last cleanup result has not been merged in the Operinfo structure and retrieval of the last cleanup result is already in progress.

System action: Restart and cleanup action is interrupted.

User response: Wait until the process is complete, then repeat the restart and cleanup action.

EQQM648W SYSIN MERGE FAILED: REAS

Explanation: While running a JR or SR command from dialog, the expanded jcl was required, but it could not be correctly restored merging the missing SYSIN DD *; statement from JS JCL. The REAS explain in detail the kind of problem occurred:

- EXPANDED JCL MISSING
- JS JCL SYSIN INFO MISSING
- EXPANDED JCL SYSIN INFO MISSING
- EXPANDED JCL AND JS SYSIN MISMATCH
- ERROR DURING MERGED JCL CREATION
- ERROR DURING MERGE SYSIN PROCESS

System action: The scheduler will use the partial expanded jcl built.

System programmer response: Except number 4 and 2, the other reasons indicate internal errors. Reason 4 indicates that a mismatch was found between the expanded JCL and the JCL got from JS VSAM: a sysin DD found empty in the expanded JCL was not found at all in the JS JCL. One possible reason is that sysin were in external procedures. Reason 2 indicates that the JS JCL was not found (maybe it has been deleted from JS). For all other reasons contact system administrator.

User response: Try to identify the origin of the problem from EQQMLOG and EQQDUMP messages. For number 2 and 4, if possible, set the sysin manually, using the edit command. For other reasons, contact IBM Software Support.

EQQM649I THE EXPANDED JCL WAS COMPLETED WITH JS JCL SYSIN DD *.

Explanation: While running a JR or SR command from dialog, the expanded jcl was required and it had empty sysin. JCL could be correctly restored merging the missing SYSIN DD * statement from JS JCL.

System action: The scheduler will use the expanded jcl built.

User response: None.

EQQM650E REQUEST REJECTED

Explanation: There is a Restart keyword in the jobcard of the JCL you are trying to submit. To continue, delete the keyword, because it is not compatible with the option you selected.

System action: The panel EQQMJCL is displayed.

User response: Delete the Restart keyword from the jobcard and enter GO to save and continue. Remove also the SYSCHK DD statement, if any.

EQQM651W THE JCL WAS BUILT USING THE JS JCL SYSIN DD*.

Explanation: While running a JR or SR command from dialog, the expanded JCL was required and it had empty sysin. It has been restored merging the missing SYSIN DD* statement from the JS JCL.

System action: The scheduler will use the JCL built using the SYSIN DD* of the JCL in the JS file.

User response: The scheduler found that the program name has been modified in a previous run. Check the SYSIN DD merge result before entering the GO command.

**EQQM655E INVALID CCODE SET NUMERIC
CCODE LENGTH IS ONLY 4 CHARS,
JUSTIFIED TO LEFT.**

Explanation: You filled the completion code field into the EQQMERSL panel with an invalid value. Numeric code must have a length of 4 chars.

System action: TWS z/OS justify to left the value.

User response: Check if the justified value is the correct one.

**EQQM656E INVALID CCODE SET ALPHA CCODE
CAN BE ONLY FLUSH OR NORUN**

Explanation: You filled the completion code field into the EQQMERSL panel with an invalid value. Not numeric code can be only Unnn or FLUSH or NORUN.

System action: Value is rejected.

User response: Correct the value.

**EQQM657I MISSING STEPINFO. STEP
INFORMATION ARE NOT
AVAILABLE.**

Explanation: You issued the STEP command from EQQMERSL panel to display the step information list (EQQMERSI) panel, but the step name table record was not found in CP.

System action: EQQMERSL is displayed.

User response: None.

**EQQM659E STEP COMMAND IS ONLY
APPLICABLE WHEN EXPANDED JCL
IS USED..**

Explanation: The STEP command, provided in the EQQMERSL panel, shows the mapping among step names used in the original JCL and step names used in the Expanded JCL. This command is meaningful only if you selected Expanded JCL= Y. Since you selected Expanded JCL= N, you are prevented from using the STEP command.

System action: The request is rejected.

User response: Repeat the request according to the above explanation.

**EQQM660E RECOVERY INFO FOR THIS
OPERATION DOES NOT EXIST.**

Explanation: The recovery info for this operation is not available. This could occur if the operation has never ended in error or if the operation has no recovery action or no recovery option defined..

System action: The request is rejected.

User response: None.

**EQQM661E ACTION NOT ALLOWED FOR
NON-FAULT-TOLERANT
WORKSTATION.**

Explanation: In MCP, you cannot select the recovery info (RI) or kill (K) command for an operation on a non-fault-tolerant workstation.

System action: The request is rejected.

User response: None.

**EQQM663E ACTION NOT ALLOWED WHEN FT
WORK STATION WITH
CENTRALIZED SCRIPT.**

Explanation: In MCP you cannot select the recovery info (RI) when the operation is on a fault-tolerant workstation with Centralized Script specified.

System action: The request is rejected.

User response: None.

**EQQM664E ACTION NOT ALLOWED WHEN
CENTRALIZED SCRIPT NOT
SPECIFIED.**

Explanation: In MCP you cannot select the JCL edit function when the operation is on a fault-tolerant workstation with unspecified Centralized Script.

System action: The request is rejected.

User response: Enter the correct value.

EQQM665E CLEANUP TYPE MUST BE MANUAL

Explanation: When the Start Cleanup with AR option is selected, the cleanup actions, whose completion is waited for by the automatic recovery processing, are started manually. The Start Cleanup with AR option is meaningful only for operations whose cleanup type is Manual.

System action: The request is rejected.

User response: Select the Start Cleanup option.

EQQM666E NO AR RESTART STEP IS AVAILABLE

Explanation: The automatic recovery function did not detect any restart steps.

System action: The request is rejected.

User response: Select the Start Cleanup option.

EQQM667E OPERATION STATUS DOES NOT ALLOW TO START CLEANUP WITH AR

Explanation: The operation status is not Error or the cleanup action was already performed.

System action: The request is rejected.

User response: Repeat your request when the operation status is compatible with the option requested.

EQQM668E EXPANDED JCL VALUE FORCED TO NO WITH AR STATEMENTS

Explanation: The expanded JCL field was automatically reset to a value that matches the requested function.

System action: The panel is displayed again.

User response: None.

EQQM669E INVALID ACTION - OPERATION STATUS DOES NOT ALLOW TO UPDATE THE SE NAME.

Explanation: You tried to change the scheduling environment name of an operation in STARTED status, but this is not allowed.

System action: None.

User response: Wait for the operation to complete, before changing the name.

EQQM670E OPERATION STATUS DOES NOT ALLOW FOR FAST STEP RESTART

Explanation: You issued a Fast Step Restart for an operation with a status that does not allow for it:

- If you are in a RERUN dialog, you can only do it for the operation selected as the restart operation (and therefore with status temporarily changed to READY).
- Alternatively, you can only do it for operations that are READY, in error, or COMPLETE.

System action: The request is rejected.

User response: Repeat the request according to the above explanation.

EQQM671E OPERATION STATUS DOES NOT ALLOW FAST JOB RESTART

Explanation: You issued a Fast Job Restart for an operation with a status that does not allow it:

- If you are in a RERUN dialog, you can only do it for the operation selected as the restart operation (and therefore with status temporarily changed to READY).
- Otherwise you can only do it for operations that are READY, in error, or COMPLETE.

System action: The request is rejected.

User response: Repeat the request according to the above explanation.

EQQM672W THE JCL WAS MODIFIED AFTER ACTUAL START OF OPERATION

Explanation: The JCL was edited after the actual start of the operation and therefore it may be different from the last submitted one.

System action: The panel is displayed again.

User response: You can ignore the message and continue by repeating the request, or return to the Editing JCL panel and verify the JCL changes.

EQQM673W MANUAL CLEANUP IS REQUIRED TO RESTART THE OPERATION

Explanation:

An SJR command has been issued against an operation with cleanup type set to Manual. Therefore, remember that a stand-alone cleanup has to be performed before having the operation actually re-run.

System action: The panel is displayed again.

User response: Issue a standalone cleanup if you confirm the SJR request.

EQQM675W THE JCL IS BEING TAKEN FROM JOBLIB SINCE IT IS NO LONGER IN JS DSN

Explanation: The JCL is no longer present in the JS VSAM data set (when an occurrence is completed, the scheduler flags for deletion all records for that occurrence and deletes all occurrences previously flagged as ready for deletion). The scheduler will get the JCL from the JOBLIB.

System action: The panel is displayed again.

User response: You can ignore the message and continue by issuing the GO command.

EQQM676I FAST STEP RESTART IS BEING PROCESSED

Explanation: The Fast step restart (FSR) row command is being correctly processed.

System action: Processing continues.

User response: None.

EQQM677I FAST JOB RESTART IS BEING PROCESSED

Explanation: The Fast job restart (FSR) row command is being correctly processed.

System action: Processing continues.

User response: None.

EQQM678W A MESSAGE FOR A DYNAMICALLY ALLOCATED GDG WAS BYPASSED

Explanation: The *jesysmsg* parser ignored a message issued for a dynamically allocated GDG having the same root as a GDG referred to in the JCLL.

System action: Panel is re-displayed.

User response: Check if your JCL needs to be modified before entering the GO command on EQQMMJCL panel to avoid wrong GDG simulation on restart.

EQQM679I OPERINFO RETRIEVAL PROCESS RESTARTED FOR JOB (JOBNAME) APPL: APPL, IA, OPER

Explanation: The scheduler restarted the OPERINFO retrieval process. OPERINFO is related to the job identified by Job Name *JOBNAME* (*JID*) and Job ID (*JID*). This job can be associated to the operation identified by Application Name *APPL*, Input arrival time *IA* and Operation number *OPER* or it can be the related standalone cleanup job. Standalone cleanup jobs are identified by means of a prefix specified in the RCLOPTS CLNJOBPX initial parameter.

This message might occur because the scheduler detected a pending OPERINFO retrieval process just after the FL task start or restart. In both cases, OPERINFO must be requested again from the data store.

Note: OPERINFO contains the job run information related to step execution and data set allocation and is retrieved from the data store. It is required to perform both a restart and cleanup of a job. OPERINFO is automatically requested for jobs that end in error if one the following is true:

- The RCLOPTS RESTARTINFORETRIEVAL(ONERROR) initial parameter is specified.
- The job has cleanup type IMMEDIATE.

System action: The OPERINFO retrieval process is restarted.

User response: Check the status of the operation in the panel identified by application name *APPL*, Input arrival *IA* and operation number *OPER*. If a Retry is in progress, wait for it to complete to see if the process recovers automatically. If it does not recover automatically, or if the operation was already set to error CLNC or CLNO, try to manually recover the situation, as follows:

- Check from Controller/Data Store EQQMLOG to determine why the retrieval process could have been failed.
 - Fix the problem if possible (for example: retrieval failed due to data store not active: restart it).
 - Run the display cleanup result to re-update OPERINFO with the latest information from the standalone cleanup.
 - Try the ARC command if applicable.
 - Run start cleanup from panel if needed.
-

EQQM680E ACTION NOT VALID

Explanation: The operation status does not allow you to update the system automation information. The operation is either started or ready to start.

System action: The request is rejected.

User response: None.

EQQM681E CANNOT KILL UNLESS STATUS IS STARTED AND EXTENDED STATUS IS EXECUTING

Explanation: The kill command for a job or recovery job running on a fault-tolerant workstation can be issued only if the job status is STARTED and the extended status is EXECUTING (for example, a job ID is available for the job).

System action: The request is rejected.

User response: None.

EQQM682E INCONSISTENT OPTION WHEN SA WORKSTATION.

Explanation: This option is wrong for a System Automation workstation. The System Automation workstation requires the default value.

System action: The request is rejected.

User response: Enter a valid option.

EQQM683E CONDITION COND ON OPERATION APPL IA OPER IS FALSE AND CANNOT BE MANUALLY DELETED.

Explanation: The status of the condition you

EQQM684E • EQQM693E

requested to delete is false. Conditions in false status cannot be deleted.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM684E OPERATION *APPL IA OPER* IS SCHEDULED ON AN FTA NOT CENTRALIZED. CONDITIONS CANNOT BE DEFINED ON IT.

Explanation: The processed operation is not centralized, it cannot depend on a conditional predecessor.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM685E STATUS CHANGE NOT ALLOWED FOR *APPL IA OPER*. A TRUE CONDITION POINTING TO IT AND DEFINED ON ONE OF ITS CONDITIONAL SUCCESSORS WOULD BECOME INCONSISTENT AS A CONSEQUENCE OF THIS STATUS CHANGE.

Explanation: The scheduler detected that the requested change is inconsistent with the status of the conditional dependency network.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM686E THERE IS A TRUE SUCCESSOR CONDITION FOR THIS OPERATION.

Explanation: The scheduler detected that the requested change is inconsistent with the status of the conditional dependency network.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM687W CONDITIONAL SUCCESSOR RESOLUTION CANNOT CREATE A NEW CONDITION ID ON OPERATION *APPL IA OPER* SINCE ALL POSSIBLE NUMBERS BETWEEN 1 AND 999 ARE USED IN AD/CP RECORDS FOR THIS OPERATION.

Explanation: During the automatic successor resolution, the processing reached the maximum allowed number of conditions.

System action: Processing continues, without resolving conditional successors that require to generate a new condition number.

User response: Consider changing the conditional dependency definition.

EQQM688E CONDITION *COND* ON OPERATION *APPL IA OPER* CANNOT BE CHANGED. IT HAS BEEN AUTOMATICALLY GENERATED

Explanation: You requested to change a condition generated during the automatic resolution of conditional successors. Only the description can be changed.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM689W THIS CONDITION HAS BEEN AUTOMATICALLY GENERATED.

Explanation: You requested to change a condition generated during the automatic resolution of conditional successors. Only the description can be changed.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM691E OPERATION STATUS DOES NOT ALLOW FAST START CLEANUP.

Explanation: You issued a Fast Start Cleanup for an operation with one of the statuses listed below that does not allow it:

- The operation status is deleted
- The operation status is started
- The operation is ready and a stand-alone cleanup has already been processed.

System action: The request is rejected.

User response: None.

EQQM692I FAST START CLEANUP IS BEING PROCESSED.

Explanation: The Fast Start Cleanup (FSC) row command is being correctly processed.

System action: Processing continues.

User response: None.

EQQM693E CLEANUP IN PROGRESS: CANNOT BE STARTED NOW.

Explanation: You issued a Fast Start Cleanup (FSC) row command for an operation for which a cleanup process is already in progress. Cleanup status is either I (Initiated) or S (Started).

System action: Request is rejected.

User response: Wait for cleanup process to complete.

EQQM694E CLEANUP TYPE *Type* DOES NOT ALLOW TO START CLEANUP.

Explanation: You issued a Fast Start Cleanup (FSC) row command for an operation having cleanup type set to "None".

System action: Request is rejected.

User response: Check the cleanup type value and change it so that a Fast Start Cleanup (FSC) request can be processed.

EQQM695E Modify CP request failed.

Explanation: A request to modify an occurrence or an operation in the current plan failed.

System action: The changes are discarded.

User response: Check the controller message log for error messages to determine the cause of the error.

EQQM900E INVALID SUBSYSTEM REQUEST. SEE EQQDUMP DATA SET.

Explanation: Validation of data has failed.

System action: The request is rejected.

System programmer response: Contact IBM Software Support. The dump data set (ddname EQQDUMP) contains a snap dump of the attempted request. This is needed for diagnostics.

User response: Contact your system programmer.

EQQM901E STATUS CHANGE NOT ALLOWED FOR OPERATION *APPL IA OPER*. SHADOW JOB CAN BE SET ONLY TO

EQQM910 - EQQM999

EQQM910E USER *USER* NOT AUTHORIZED TO ACCESS RESOURCE: *RESOURCE*

Explanation: A modify current plan request attempted to access the resource *RESOURCE*, but the user *USER* making the request was not authorized to access the resource.

System action: The request is rejected.

User response: Try to locate the error in the message log and contact your system programmer.

EQQM911E INVALID DEPENDENCY INFO FOR: *APPL, OPER, PRED: PRED*

Explanation: A modify current plan request failed because dependency data has been changed during the dialog session. The request was attempted for application *APPL* and operation number *OPER*. The number of the predecessor operation is *PRED*.

COMPLETE OR READY STATUS.

Explanation: An attempt to change the status of a shadow job in the current plan to a value different from Ready or Complete has been rejected, because this is not allowed. The application for which the request was attempted is identified by the application name *APPL*, input arrival date and time *IA* and operation number *OPER*.

System action: The request is rejected.

User response: Do not change the status of shadow jobs to values different from Ready or Complete.

EQQM902E SHADOW JOB STATUS CAN BE CHANGED ONLY TO COMPLETE OR READY.

Explanation: An attempt to change the status of a shadow job in the current plan to a value different from Ready or Complete has been rejected, because this is not allowed.

System action: The request is rejected.

User response: Do not change the status of shadow jobs to values different from Ready or Complete.

EQQM903E BIND IS ALLOWED ONLY FOR SHADOW JOB IN READY STATUS.

Explanation: An attempt to start a bind process for a shadow job with a status different from Ready has been rejected, because this is not allowed.

System action: The request is rejected.

User response: To issue this command, ensure that the shadow job is in Ready status.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. Report the error to IBM Software Support.

Problem determination: The request contained a reference to a dependency that IBM Tivoli Workload Scheduler for z/OS could not find or that was invalid. The operation and predecessor numbers are given in hexadecimal form. Use HEX ON when browsing the IBM Tivoli Workload Scheduler for z/OS message log.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM912E INVALID DEPENDENCY *PRED* TO: *APPL, OPER*

Explanation: A modify current plan request failed because dependency data has been changed during the dialog session. The application for which the request was attempted is *APPL* and the operation number is *OPER*. The number of the predecessor operation is *PRED*.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. Report the error to IBM Software Support.

Problem determination: The request contained a reference to a dependency that IBM Tivoli Workload Scheduler for z/OS could not find or that was invalid. The operation and predecessor numbers are given in hexadecimal form. Use HEX ON when browsing the IBM Tivoli Workload Scheduler for z/OS message log.

If the message is not in the controller message log, review the dump data set (ddname *EQQDUMP*) for more information.

**EQQM913E INVALID OPERATION DETAIL
REQUEST DETAILED REQUEST: *MTD*
TOTAL REQUEST: *MT0***

Explanation: A modify current plan request failed because the detailed information for an operation update was invalid.

The failing requests are printed in hexadecimal form. Use HEX ON when browsing the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The request is rejected and message EQQM027E is issued.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it.

Problem determination: If the message is not in the controller message log, review the dump data set (ddname *EQQDUMP*) for more information.

**EQQM914E REQUEST TO DELETE OPERATION
THAT DOES NOT EXIST OPERATION:
*APPL, IA, OPER***

Explanation: A modify current plan request to delete an operation failed because the requested operation did not exist in the occurrence.

The application ID, input arrival date and time, and operation number are listed.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: Check the *EQQMLOG* file to understand what could cause the problem.

If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Dependency data has probably been changed during the dialog session.

If the message is not in the controller message log, review the dump data set (ddname *EQQDUMP*) for more information.

**EQQM915E DELETION OF OPERATION *OPER* IN
APPL SPLITS NETWORK**

Explanation: A modify current plan request to delete an operation failed because the deletion would have split the occurrence network. The operation to be deleted is identified as application ID *APPL* and operation number *OPER*.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. Report the error to IBM Software Support.

Problem determination: Dependency data has probably been changed during the dialog session.

If the message is not in the controller message log, review the dump data set (ddname *EQQDUMP*) for more information.

**EQQM916E REQUEST TO ADD SPECIAL
RESOURCE THAT ALREADY EXISTS
OPERATION: *APPL, OPER* SPECIAL
RESOURCE: *SPR***

Explanation: A modify current plan request to add a special resource failed because the requested special resource already exists in the operation. The application ID and operation number are listed together with the special resource name.

System action: The request is rejected and message EQQM025E is issued.

User response: Check that the correct special resources are defined for the operation.

Problem determination: If the message is not in the controller message log, review the dump data set (ddname *EQQDUMP*) for more information.

EQQM919E PREDECESSOR IS ALSO SUCCESSOR
PREDECESSOR: *PREDA, PREDO*
SUCCESSOR : *SUCCA, SUCCO*

Explanation: A modify current plan request would have caused a loop in the network.

The application IDs and operation number are listed. The operation number is given in hexadecimal form. Use HEX ON when browsing the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. Report the error to IBM Software Support.

Problem determination: Dependency data has probably been changed during the dialog session.

EQQM920E EXTERNAL DEPENDENCY ALREADY EXISTS APPLICATION:
APPROPERATION: *OPER*
PREDECESSOR: *PREDA*
OPERATION: *PREDO*

Explanation: A modify current plan request attempted to add a dependency that already exists.

The application IDs and operation numbers are listed. The operation numbers are given in hexadecimal form. Use HEX ON when browsing the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Dependency data has probably been changed during the dialog session.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM921E DELETE OF INTERNAL PREDECESSOR CONNECTION FAILED, REASON: RS APPLICATION: *APPL, IA, OPERATION:* *OPER, DEPENDENCY:* *PREOP*

Explanation:

A request for current plan modification would result in an invalid occurrence. The following reason codes (RS) indicate why:

- 921** The last internal dependency cannot be deleted.
- 922** The delete would have resulted in a split into two networks.
- 923** The predecessor specification is not found.

System action: The request is rejected and the requestor is notified of the error with a message.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. Report the error to IBM Software Support.

Problem determination: The last line of the message identifies the occurrence and the internal dependency that was to be deleted.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM922E REQUEST TO DELETE SPECIAL RESOURCE THAT DOES NOT EXIST OPERATION: *APPL, OPER* **SPECIAL RESOURCE:** *SPR*

Explanation: A modify current plan request to delete a special resource failed because the requested special resource does not exist in the operation. The application ID and operation number are listed together with the special resource name.

System action: The request is rejected and message EQQM025E is issued.

User response: Check that the correct special resources are defined for the operation.

Problem determination: If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM923I JOBLOG FOR JOB (JOBNUM) ARRIVED FOR OPERATION: *APPL, IA, OPER*

Explanation: You have made a browse-joblog request on a IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The message is displayed as a TSO broadcast message to the requesting user at the first interaction after the message is sent.

User response: Enter the browse-joblog command.

EQQM924E INVALID REQUEST TO MCP - REQUEST FOLLOWS REQUEST

Explanation: A modify current plan request was invalid.

The request is given in hexadecimal form. Use HEX ON when browsing the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM925E PRINT OPERATION HAS NO PREDECESSOR OPERATION: APPL, IA, OPER

Explanation: A modify current plan request would have caused a print operation to have no predecessors.

The application ID, input arrival date and time, and operation number are listed. The operation number is given in hexadecimal form. Use HEX ON when browsing the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Dependency data has probably been changed during the dialog session.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM926E PRINT OPERATION HAS MORE THAN 1 PREDECESSOR OPERATION: APPL, IA, OPER

Explanation: A modify current plan request would have caused a print operation to have more than one predecessor.

The application ID, input arrival date and time, and operation number are listed. The operation number is given in hexadecimal form. Use HEX ON when browsing the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Dependency data has probably been changed during the dialog session.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM927E PRINT OPERATION HAS NO CPU PREDECESSOR OPERATION: APPL, IA, OPER

Explanation: A modify current plan request would have caused a print operation to have no computer operation predecessor.

The application ID, input arrival date and time, and operation number are listed. The operation number is given in hexadecimal form. Use HEX ON when browsing the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Dependency data has probably been changed during the dialog session.

If the message is not in the controller message log,

| review the dump data set (ddname EQQDUMP) for
| more information.

**EQQM928E SETUP OPERATION HAS INVALID
SUCCESSOR OPERATION: APPL, IA,
OPER**

| **Explanation:** A modify current plan request would
| have caused a job setup operation to have no valid
| computer operation successor.

| The application ID, input arrival date and time, and
| operation number are listed. The operation number is
| given in hexadecimal form. Use HEX ON when
| browsing the IBM Tivoli Workload Scheduler for z/OS
| message log.

| **System action:** The request is rejected and message
| EQQM025E is issued.

| **System programmer response:** If the error recurs,
| investigate the failing occurrence to see if any abnormal
| activities have been associated with it. To collect
| appropriate documentation for problem determination,
| see the *Diagnosis Guide and Reference* manual, Chapter 3.
| Problem analysis procedures, sub-section "Information
| needed for all problems". Search the IBM Support
| database for a solution at [http://www.ibm.com/
software/sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

| **Problem determination:** Dependency data has
| probably been changed during the dialog session.

| If the message is not in the controller message log,
| review the dump data set (ddname EQQDUMP) for
| more information.

**EQQM929W JOBLOG FOR JOBN (JNUM) NOT
FOUND**

| **Explanation:** You have made a browse—joblog request
| on an IBM Tivoli Workload Scheduler for z/OS
| subsystem.

| **System action:** The message is displayed as a TSO
| broadcast message to the requesting user at the first
| interaction after the message is sent.

| **User response:** If the end- to- end feature check the
| connection is present or joblog is on workstation.

**EQQM930E CP MAY BE DESTROYED DUE TO
ERRORS DURING MCP UPDATE**

| **Explanation:** An error occurred while updating the
| current plan, causing it to be partially updated.

| **System action:** Processing is terminated for the
| current request and message EQQM025E is issued.

| **System programmer response:** See message
| EQQM936E.

| **Problem determination:** Previous error messages in
| the IBM Tivoli Workload Scheduler for z/OS message

log contain additional information about this error.

EQQM931W JOBLOG FOR JOBN (JNUM) IN ERROR

| **Explanation:** You have made a browse-joblog request
| on an IBM Tivoli Workload Scheduler for z/OS
| subsystem, but there has been an error when retrieving
| the joblog.

| **System action:** The message is displayed as a TSO
| broadcast message to the requesting user at the first
| interaction after the message is sent.

| **User response:** Check the server log for additional
| messages (connection problems). Check the STDLIST
| directory on the Tivoli Workload Scheduler workstation
| where the job ran.

**EQQM932E OPERATION OPNUM IS TOO LARGE -
MCP UPDATE NOT POSSIBLE**

| **Explanation:** A modify current plan request was
| rejected because it would have caused a current plan
| record to become larger than the maximum record size
| in the current plan data set.

| **System action:** The current plan is not updated and
| message EQQM164E is issued.

| **System programmer response:** If the maximum record
| size for the current plan is too small, reallocate the
| current plan data sets with a larger record size: stop
| IBM Tivoli Workload Scheduler for z/OS, copy the
| current plan data sets, and restart with the new data
| sets.

| If the failing operation contains many special resources
| or dependencies, simplify the definition of the
| operation and retry the modify current plan request. If
| the error recurs, investigate the failing occurrence to see
| if any abnormal activities have been associated with it.
| To collect appropriate documentation for problem
| determination, see the *Diagnosis Guide and Reference*
| manual, Chapter 3. Problem analysis procedures,
| sub-section "Information needed for all problems".
| Search the IBM Support database for a solution at
| [http://www.ibm.com/software/sysmgmt/products/
support](http://www.ibm.com/software/sysmgmt/products/support).

| **Problem determination:** Determine if the maximum
| record size of the current plan is smaller than
| recommended, or if the failing operation contains too
| many special resources or too many dependencies.

**EQQM933E WORK STATION WSNNAME NOT
FOUND FOR OPERATION: APPL:
APPL, IA, OPER**

| **Explanation:** A modify current plan request specifies
| an operation on a workstation (WSNNAME) that is not
| defined to the current plan.

| The application ID, input arrival date and time, and
| operation number are listed. The operation number is

given in hexadecimal form. Use HEX ON when browsing the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Dependency data has probably been changed during the dialog session.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM934E JOBLOG FOR jobn (jid) CANCELLED. REISSUE REQUEST.

Explanation: A Joblog or operinfo retrieval request has been initiated but an error occurred (for example connection lost and then resumed among Controller and Data Store).

The request status is reset so that it can be issued again.

System action: The message is displayed as a TSO broadcast message to the requesting user at the first interaction after the message is sent.

User response: Reissue the request from the dialog.

EQQM935E WORK STATION WSNNAME NOT FOUND IN WQA

Explanation: A modify current plan request attempts to update a workstation (WSNNAME) that is not defined to the current plan in the workstation queue area.

System action: The request is rejected and message EQQM025E is issued.

System programmer response: None.

Problem determination: If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM936E NORMAL MODE MANAGER WILL RESTART FROM CHECKPOINT

Explanation: A serious error related to the current plan data set has occurred.

System action: The normal mode manager (NMM) subtask restarts and re-creates the current plan data set.

System programmer response: If the recovery procedure fails, that is, the NMM is unable to restart, IBM Tivoli Workload Scheduler for z/OS should be canceled (not stopped). If the subsystem is stopped, the error extends to the alternative current plan data set. If the recovery procedure is successful, IBM Tivoli Workload Scheduler for z/OS normal processing can continue.

Problem determination: Use the IBM Tivoli Workload Scheduler for z/OS message data set to investigate the cause of the original error.

EQQM937E TURNOVER IN PROCESS AND OCCURRENCE HAS STATUS COMPLETE APPLICATION: APPL

Explanation: An attempt to modify an occurrence with status complete during a turnover has been rejected.

System action: The request is rejected and either message EQQM027E or message EQQM028I is issued.

User response: To rerun the occurrence or any of its operations, use the Modify Current Plan dialog to add a new occurrence. This is necessary because IBM Tivoli Workload Scheduler for z/OS does not copy a completed occurrence to the new current plan. If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM938W JOBLOG JOBn (JNUM) NOT RETRIEVED. REASON: ERRC

Explanation: You have requested a Job Log (or caused a Job Log request, for example, by invoking a step restart), but the Job Log was not found. The request was addressed to Data Store and the reason of the failure for the job identified by *jobn jnum* is indicated in *errc*:

- 0001 Job was not found nor in JES queue neither in database. The EQQUX013 user exit might be active.
- 0002 An internal error occurred during database write phase.
- 0003 Data Store Reader was inactive.
- 0004 Timeout was reached for the request.
- 0005 Data Store Connection is down.
- 0006 Job Log destination not found in FLOPTS.
- 0007 An internal error occurred during database call phase.

- 0008 An internal error occurred during database request phase.
- 0009 Data store parameter STOUNSD(N) does not allow retrieval.
- 9999 Reason unknown.

System action: The message is displayed as a TSO broadcast message to the requesting user at the first interaction after the message is sent.

System programmer response: Check the reason of the failure from the Data Store Log and message reason and take the appropriate action.

User response: According to specified failure reason:

- 0001 Contact system programmer
- 0002 Retry later
- 0003 Contact system programmer to start Data Store Reader and retry
- 0004 Retry later
- 0005 Contact system programmer to activate Data Store communication and retry
- 0006 Contact system programmer to correct FLOPTS keyword and retry
- 0007 Contact system programmer
- 0008 Contact system programmer
- 0009 Change parameter STOUNSDS value to Y
- 9999 Contact system programmer

EQQM940E THE NUMBER OF USER FIELDS FOR APPL, OPNUM EXCEEDS THE MAXIMUM LIMIT. MCP UPDATE NOT POSSIBLE.

Explanation: An attempt to modify the user field for application *APPL*, operation *OPNUM* has been rejected, because the number of user fields is higher than 120, which is the maximum allowed.

System action: The request is rejected.

User response: To correct the error, delete a user field and submit the request again.

EQQM941E USER FIELD NAME IS BLANK FOR APPL, OPNUM

Explanation: A modify current plan request failed because the user field name is blank. The request was attempted for application *APPL* and operation number *OPNUM*.

System action: The request is rejected and message EQQM025E is issued.

User response: Ensure that a name is specified for each user field related to the specified application and operation.

EQQM942E MAX NUMBER OF USER FIELDS REACHED FOR APPL, OPNUM

Explanation: A modify current plan request failed because the number of user fields exceed the maximum number allowed. The request was attempted for application *APPL* and operation number *OPNUM*.

System action: The request is rejected and message EQQM025E is issued.

User response: Ensure that the user fields defined for the specified application and operation do not exceed the maximum allowed.

EQQM943E USER FIELD UFNAM ALREADY PRESENT FOR APPL, OPNUM

Explanation: A modify current plan request failed because the user field *UFNAME* already exists for application *APPL* and operation number *OPNUM*.

System action: The request is rejected and message EQQM025E is issued.

User response: Ensure that the correct user fields are defined for the specified application and operation.

EQQM944E USER FIELD UFNAM FOR APPL, OPNUM DOES NOT EXIST

Explanation: A modify current plan request failed, because the user field *UFNAME* is not defined for application *APPL* and operation number *OPNUM*.

System action: The request is rejected and message EQQM025E is issued.

User response: Specify a user field name that is defined for the specified application and operation.

EQQM945I JOBLOG RETRIEVAL PROCESS RESTARTED FOR JOBN (JID) APPL: APPL, IA, OPER

Explanation: The scheduler restarted the JOBLOG Retrieval process. This message might occur because the scheduler detected the JOBLOG retrieval process was pending at the start or restart of either an HTTP task or an FL task. In both cases, the JOBLOG must be requested again from the data store (FL task) or Agent (HTTP task).

Note: JOBLOG is automatically requested for jobs that end in error if the following is true:

- The RCLOPTS JOBLGRETREIVAL(ONERROR) initial parameter is specified.
- The HTTPPTS JOBLGRETREIVAL(ONERROR) initial parameter is specified.

System action: The JOBLOG retrieval process is restarted.

EQQM946I JOBLOG REQUEST FOR *JOBN (JNUM)*
 WAS SUSPENDED BECAUSE THE
 DESTINATION *DEST* IS OFFLINE.
APPL: APPL, IA, OPER

Explanation: The scheduler suspended the JOBLOG Retrieval process for the job identified by Job Name *JOBN* and Job ID *JNUM* because the related destination is OFFLINE. This message applies only to z-centric and dynamic workstations.

System action: The JOBLOG retrieval process is suspended.

User response: Determine why the destination is set OFFLINE and try to set it back ONLINE.

| **EQQM947E** *OPER* IS LAST OPERATION OF *APPL*

| **Explanation:** The operation is the last one of the application.

| **System action:** The operation will not be deleted.

| **User response:** Consider to delete the entire occurrence.

EQQM949I OCCURRENCE NOT ADDED: SET
 AUTOMATIC DEP TO Y

Explanation: You requested to add to the plan an application specifying AUTOMATIC DEP to No, meaning that all conditions on it had to be deleted. To confirm the request, panel EQQMCADC was displayed informing you about conditions deletion. In that confirmation panel you selected No so the application was not added to the plan and the message EQQM949I was prompted.

System action: None.

User response: If you want to add the application keeping its conditions make sure AUTOMATIC DEP is set to Y.

EQQM950E INPUT ARRIVAL NOT WITHIN
 CURRENT PLAN, ENDS *CPE REQUEST*

Explanation: A request to modify or create an occurrence on the current plan specifies an input arrival time later than or equal to the current plan end time. All modifications to the current plan must be earlier than the current plan end time. The request type is given by *REQUEST*.

System action: The request is terminated with an error return code.

User response: If necessary, extend the current plan to get the failing function to work.

Problem determination: This message should be followed by another message from the function requesting the current plan modification.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM951E FAILED TO ADD APPLICATION *ADID*
 REASON: CANNOT READ CURRENT
 PLAN RECORD

Explanation: A request to create an occurrence on the current plan failed due to an I/O error.

System action: The request is terminated and the processing continues with the next request.

System programmer response: Review the message log of the IBM Tivoli Workload Scheduler for z/OS subsystem to determine the cause of the error. If you cannot determine the cause and the error persists, contact IBM Software Support.

User response: Resubmit the job when the problem causing the I/O error has been corrected.

Problem determination: The message log contains the I/O error message.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM952E FAILED TO ADD APPLICATION *ADID*
 REASON: NO UNIQUE INPUT
 ARRIVAL TIME LEFT IN CP FOR THIS
 APPLICATION

Explanation: A request to create an occurrence on the current plan failed because the occurrence already exists- In the request, no input arrival time was given, which implies that a default input arrival time should be selected. This default is the current time, consisting of the current date, current hour, and current minute. If an occurrence of the application with that input arrival time already exists, the next minute is used. If that occurrence also exists, the following minute is used. This search for an input arrival time continues up to the current plan end time.

System action: The request is terminated and processing continues with the next request.

User response: If necessary, extend the current plan to get the failing function to work.

Problem determination: This message should be followed by another message from the function requesting the current plan modification.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

**EQQM953E FAILED TO ADD APPLICATION *ADID*
REASON: 'ADD' TIME LATER THAN
CURRENT PLAN END TIME**

Explanation: A request to create an occurrence on the current plan failed because the current plan end time has passed. In the request, no input arrival time was given, which implies that a default input arrival time should be used. This default is the current time, consisting of the current date, current hour, and current minute. The request is rejected because the current plan ends before current time.

System action: The request is terminated and processing continues with the next request.

User response: If necessary, extend the current plan to get the failing function to work.

Problem determination: This message should be followed by another message from the function requesting the current plan modification.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

**EQQM954E FAILED TO ADD APPLICATION *ADID*
NO ACTIVE VERSION OF THE
APPLICATION DESCRIPTION IN THE
DATA BASE**

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem has received a request to add an occurrence of application *ADID* to the current plan. The application description in the EQQADDS file could not be read (record not found).

System action: The request to add the current plan occurrence is rejected.

User response: Correct the errors.

Problem determination: If the attempt to add an application was caused by an event-triggered tracking (ETT) triggering event, check the ETT triggering criteria. Make sure that the triggering event points to an active application description.

If the attempt to add an application was caused by a program interface request, check the application name given in the program interface request.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

**EQQM955E FAILED TO ADD APPLICATION *ADID*
CAN NOT READ THE APPLICATION
DESCRIPTION FILE**

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem has received a request to add an occurrence of application *ADID* to the current plan. The application description file was not open.

System action: The request to add the current plan occurrence is rejected.

User response: To rerun the occurrence or any of its operations, use the Modify Current Plan dialog to add a new occurrence. This is necessary because IBM Tivoli Workload Scheduler for z/OS does not copy a completed occurrence to the new current plan. If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: The message log should contain a previous message giving the reason why the file is not open.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

**EQQM956E FAILED TO ADD/MODIFY
APPLICATION *ADID*. OCCURRENCE
WITH SAME APPLICATION ID AND
INPUT ARRIVAL EXISTS IN THE
LONG-TERM PLAN**

Explanation: A request to create or modify an occurrence in the current plan failed because the request specified an application ID and input arrival date and time that are the same as an existing occurrence in the long-term plan.

System action: The request to create or modify the occurrence in the current plan is rejected.

User response: To rerun the occurrence or any of its operations, use the Modify Current Plan dialog to add a new occurrence. This is necessary because IBM Tivoli Workload Scheduler for z/OS does not copy a completed occurrence to the new current plan. If the error recurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, sub-section "Information needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM957W JOBLOG FOR RECOVERY JOB *JNUM* NOT FOUND

Explanation: You have made a Browse Recovery Job Joblog request on an IBM Tivoli Workload Scheduler for z/OS subsystem. The message is sent if the joblog is not in the SDTLIST directory of the IBM Tivoli Workload Scheduler CPU where the recovery job ran.

System action: The message is displayed as a TSO broadcast message to the requesting user at the first interaction after the message was sent.

EQQM958I JOBLOG FOR RECOVERY JOB *JNUM* ARRIVED

Explanation: You have made a Browse Recovery Job Joblog request on an IBM Tivoli Workload Scheduler for z/OS subsystem. The message is displayed when the joblog is available for browsing.

System action: The message is displayed as a TSO broadcast message to the requesting user at the first interaction after the message was sent.

User response: Enter the Browse Joblog command.

EQQM959W JOBLOG FOR RECOVERY JOB *JNUM* IN ERROR

Explanation: You have made a Browse Recovery Job Joblog request on an IBM Tivoli Workload Scheduler for z/OS subsystem, but there has been an error in the retrieval of the job log.

System action: The message is displayed as a TSO broadcast message to the requesting user at the first interaction after the message was sent.

User response: Check the server log for additional messages (such as for connection problems). Check the SDTLIST directory of the IBM Tivoli Workload Scheduler CPU where the recovery job ran.

EQQM960E OPERATION *APPL IA OPER* IS NOT IN STATUS R/*A/W. CONDITIONS CANNOT BE ADDED ON IT.

Explanation: A request to add the indicated condition in the current plan failed because it is inconsistent with the processed operation status.

System action: The request is rejected.

User response: Check the operation status before repeating the request.

EQQM961E MODIFY CURRENT PLAN REQUEST FAILED, INSUFFICIENT STORAGE. REASON: *RS*

Explanation: A request to create or modify an occurrence on the current plan failed due to storage

allocation failure. The reason code provides debugging information.

System action: The request is terminated and processing continues with the next request.

System programmer response: Allocate a larger region to the IBM Tivoli Workload Scheduler for z/OS subsystem and restart the subsystem. If the error persists, contact IBM Software Support.

Problem determination: This message should be followed by another message from the function requesting the current plan modification.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM962E COMMAND TEXT HAS NO VALUE IN SYSTEM AUTOMATION DATA FOR APPLICATION *APPL*, INPUT ARRIVAL *IA*, OPERATION *OPER*

Explanation: Command text is required when system automation information is specified. The related operation is identified by the application ID, input arrival date and time, and operation number.

System action: IBM Tivoli Workload Scheduler for z/OS does not complete the operation.

System programmer response: Specify the command text in the system automation information for the operation.

EQQM964E AUTOMATED FUNCTION IS NOT ALPHANUMERIC IN SYSTEM AUTOMATION DATA FOR APPLICATION *APPL*, INPUT ARRIVAL *IA*, OPERATION *OPER*

Explanation: Automated function is optional when system automation information is specified. If you specify it, ensure that it is an alphanumeric value, uppercase. The related operation is identified by the application ID, input arrival date and time, and operation number.

System action: IBM Tivoli Workload Scheduler for z/OS does not complete the operation.

System programmer response: Specify a valid value for the automated function in the system automation information for the operation.

EQQM965E WORK STATION *WSNAME* DOES NOT SUPPORT SYSTEM AUTOMATION. *APPL: APPL, IA* BEING ADDED OR MODIFIED HAS SYSTEM AUTOMATION DATA DEFINED FOR OPERATION *OPER*

Explanation: A current plan operation is added or

modified and System Automation data is defined for the operation but the workstation is not for Automation.

System action: The action cannot be continued and the modification cannot be saved.

User response: Check that the workstation used has the Automation option set to Y. If you are trying to change the workstation from Automation to non Automation, change it back or use an Automation workstation. If you no longer need this operation to be a System Automation operation, you must delete it and create a new one.

EQQM966E WORK STATION *WSNAME* IS FOR SYSTEM AUTOMATION. *APPL: APPL, IA* BEING ADDED OR MODIFIED HAS NO SYSTEM AUTOMATION DATA DEFINED FOR OPERATION *OPER*

Explanation: The definition or modification of an application operation without system automation information was defined for an Automation workstation.

System action: The action cannot be continued and the modification cannot be saved, until the workstation or information is appropriately defined.

User response: Ensure that you are using the correct workstation. If you are trying to change the workstation from non Automation to Automation, change it back or specify the required system automation information (command text, at least).

EQQM967E OPERATION *PREDAD PREDIA PREDNO* CANNOT BE ADDED AS A CONDITIONAL PREDECESSOR FOR OPERATION *OPERAD OPERIA OPERNO*, SINCE IT IS ALREADY A NORMAL PREDECESSOR.

Explanation: You cannot define the same job as both conditional and normal predecessor.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM968E OPERATION *PREDAD PREDIA PREDNO* CANNOT BE ADDED AS A NORMAL PREDECESSOR FOR OPERATION *OPERAD OPERIA OPERNO*, SINCE IT IS ALREADY A CONDITIONAL PREDECESSOR.

Explanation: You cannot define the same job as both conditional and normal predecessor.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM969E CONDITION *COND* DEFINED ON OPERATION *APPL IA OPER* IS EVALUATED OR DOES NOT EXIST. CHANGES ARE NOT ALLOWED.

Explanation: A request to modify the indicated condition in the current plan failed because it is inconsistent with the condition status.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM970W THE POTENTIAL PREDECESSOR RECORD FOR APPLICATION *APPL* COULD NOT BE UPDATED THE MAXIMUM NUMBER (1000) OF POTENTIAL SUCCESSOR OPERATIONS HAS BEEN REACHED.

Explanation: The modify current plan (MCP) service processor was unable to add any more successor operation entries to a potential predecessor record. Since the record could not be updated as intended, it now does not define all potential successors for application *APPL*. If new occurrences of this application are added by program interface (PIF) programs or by the event-triggered tracking (ETT) function it is no longer possible to add all possible successor dependencies automatically.

System action: The MCP processor continues processing the current add occurrence request.

User response: Use the Modify Current Plan dialog to add new occurrences of the application defined by this message and use the DEP primary command to verify that successor dependencies have been set up correctly.

Problem determination: This message indicates that many different operations in different applications have defined operations of one application as external predecessors. If the message is unexpected, review the contents of the application description database and remove old applications that are no longer used.

EQQM971E FAILED TO ADD APPLICATION *ADID*. REQUESTING FUNCTION IS *FUNC* REASON: MAXIMUM NUMBER OF OCCURRENCES OF THIS APPLICATION REACHED

Explanation: No more occurrences of this application can be added. IBM Tivoli Workload Scheduler for z/OS can handle approximately 870 occurrences of each application.

FUNC is the function that requested the add:

E Event-triggered tracking
A Automatic recovery
D Dialog

System action: The create request is rejected.

User response: Change the criteria for event-triggered

tracking. Complete or delete occurrences of this application that are no longer needed. These occurrences are removed from the plan when a new plan is produced.

Problem determination: If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM972E MCP WAS UNABLE TO ADD APPLICATION *APPL* BECAUSE AN MCP CONTROL BLOCK (MT0) COULD NOT CONTAIN ALL SUCCESSOR DEPENDENCIES TO APPLICATION *SUCC*

Explanation: The modify current plan (MCP) service processor was unable to add any more successor dependencies to the MT0 block that is used to define MCP processing. The maximum size of an MT0 block is 32768 bytes.

System action: The MCP processor abandons the attempt to add current occurrence.

User response: Use the Modify Current Plan dialog to add new occurrences of the application defined by this message, but do not request MCP to automatically add successor dependencies. The same recommendation applies if the occurrence is being added as a result of event-triggered tracking (ETT) trigger processing or by a program interface (PIF) program. Instead, add successor dependencies to the occurrence after it has been added to the plan.

Problem determination: This message indicates that many different operations in different applications have defined operations in current application as external predecessors. If the message is unexpected, review the contents of the application description database and remove old predecessor definitions that should no longer be used.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM975E FAILED TO ADD APPLICATION *ADID* BECAUSE MAXIMUM NUMBER OF OCCURRENCES REACHED. REQUESTING FUNCTION IS *FUNC*.

Explanation: No more occurrences can be added to the current plan because the maximum number of occurrences (32767) or the number specified in the MAXOCCNUM option of the JTOPTS statement has been reached. *ADID* identifies the application that failed to be added. *FUNC* is the function that requested the add:

- A Automatic recovery
- D Dialog
- E Event-triggered tracking

P Program interface

System action: The request is rejected.

User response: Check that the current plan does not contain any occurrences that should not be in the plan. If you find any such occurrences, complete or delete them. Replan the current plan to remove all completed and deleted occurrences, and try to add the occurrence again. If your current plan regularly contains a large number of occurrences, you should consider shortening the length of the current plan in future daily planning runs.

Problem determination: If you use event-triggered tracking (ETT), program interface (PIF), or Automatic Recovery, check that these functions are working correctly. For example, make sure that you do not have an endless ETT loop, where the availability of a special resource is set to YES by a job that ETT adds, when it detects that this same resource is set to YES. Check the current plan for instances of an unusually high number of occurrences of a particular application. If you see such an application, look in the application description database and make sure that the run cycles for the application are correct. When you specify PREVRES(YES) on the BATCHOPT initialization statement, information about completed and deleted occurrences is carried forward, for reporting purposes, into a new current plan. If your current plan regularly contains a large number of occurrences, and you specify YES for PREVRES, you should consider changing this value to NO.

If the message is not in the controller message log, review the dump data set (ddname EQQDUMP) for more information.

EQQM976W ONE OR MORE OF THE EXTERNAL DEPENDENCIES OF OPER *OPER* IN APPLICATION *ADID* WERE NOT RESOLVED WITHIN THE GROUP

Explanation: Dependency loops in an occurrence group have been detected and eliminated.

System action: At least one of the external dependencies for the operation has not been resolved within the group. If there are other occurrences, external to the group, in the current plan that matches the operations dependency definitions, the dependencies have been resolved for those occurrences. Message EQQM358W is issued.

User response: Check how the dependencies have been resolved and, if appropriate, modify them. So as to avoid this situation, modify also the application descriptions for this group.

EQQM977E STATUS CHANGE FAILED FOR OPERATION *APPL, IA, OPER*. CONDITION *COND* IS NOT TRUE FOR THE OPERATION.

Explanation: The current status of the indicated operation is different from waiting. It is not consistent with the requested status change.

System action: The request is rejected.

User response: Verify the specified input.

EQQM979E STATUS CHANGE NOT ALLOWED FOR OPERATION *APPL, IA, OPER*. NEW OR OLD STATUS IS SUPPRESSED BY COND (X).

Explanation: Only an occurrence rerun request or internal scheduler actions can produce this kind of change.

System action: The request is rejected.

User response: Consider rerunning the occurrence.

EQQM980E DUPLICATE CONDITION *COND* ON OPERATION: *APPL, IA, OPER*.

Explanation: You defined the same condition twice.

System action: The request is rejected.

User response: Remove the duplicate entry.

EQQM981E DUPLICATE CONDITION DEPENDENCY: *SIMP ON CONDITION COND ON OPERATION: APPL, IA, OPER*.

Explanation: You defined the same condition dependency twice.

System action: The request is rejected.

User response: Remove the duplicate entry.

EQQM982E COND ID NOT VALID FOR CONDITION *COND* ON OPERATION *APPL, IA, OPER*.

Explanation: The processed condition number does not exist or is not valid. Valid values are in the range 1-999.

System action: The request is rejected.

User response: Check the specified value.

EQQM984E DEPENDENCY TYPE NOT VALID IN CONDITION DEPENDENCY: *SIMP ON CONDITION COND ON OPERATION: APPL, IA, OPER*.

Explanation: Condition type must be P or S.

System action: The request is rejected.

User response: Specify a valid value.

EQQM985E CHECK TYPE NOT VALID IN CONDITION DEPENDENCY: *SIMP ON CONDITION COND ON OPERATION: APPL, IA, OPER*.

Explanation: Condition type must be RC or ST.

System action: The request is rejected.

User response: Specify a valid value.

EQQM986E PREDECESSOR NOT FOUND IN CONDITION DEPENDENCY: *SIMP ON CONDITION COND ON OPERATION: APPL, IA, OPER*.

Explanation: The modify current plan failed when processing *APPL, IA, OPER* as predecessor data in the indicated condition dependency.

System action: The request is rejected.

User response: Verify the specified input.

EQQM987E OPERATOR NOT VALID IN CONDITION DEPENDENCY: *SIMP ON CONDITION COND ON OPERATION: APPL, IA, OPER*.

Explanation: The modify current plan process detected an incorrect logical operator. Valid values are GE, GT, LE, LT, EQ, NE, and RG. With condition type ST, valid values are EQ or NE only.

System action: The request is rejected.

User response: Verify the specified input.

EQQM988E STATUS VALUE NOT VALID IN CONDITION DEPENDENCY: *SIMP ON CONDITION COND ON OPERATION: APPL, IA, OPER*.

Explanation: The modify current plan process detected an incorrect value as predecessor status. Valid values are C (complete), E (ended-in-in-error), S (started), or X (suppressed by condition). If you use the NE operator, specify a final status (C, E or X).

System action: The request is rejected.

User response: Verify the specified input.

EQQM989E RC VALUES NOT VALID IN CONDITION DEPENDENCY: *SIMP ON CONDITION COND ON OPERATION: APPL, IA, OPER*.

Explanation: The modify current plan process detected that one or both the specified return codes are incorrect. They must be numeric values in the range

EQQM990E • EQQM997E

0-9999, or string values in the form Uxxx and Sxxx.

System action: The request is rejected.

User response: Verify the specified input.

EQQM990E MCP UPDATE FAILED. FAILING MTD BELOW: *MTD*

Explanation: A modify current plan request failed because of an error.

The request is given in hexadecimal form. Use HEX ON when browsing the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The request is rejected and another message explaining the error is issued.

System programmer response: Look at the other messages explanations for the cause of the error. If the error re-occurs, investigate the failing occurrence to see if any abnormal activities have been associated with it. Report the error to IBM Software Support.

EQQM991E ERROR DURING MCP UPDATE. FAILING MODULE: *MODULE*

Explanation: A modify current plan request failed. Look for further messages that describe the error message reported by the modify current plan module *MODULE*. If message EQQM028I is issued, no additional message is issued.

System action: The request is rejected and a further message is issued in the controller message log.

System programmer response: Look at the other messages explanations for the cause of the error. If you report the error message following this message to IBM Software Support, the information in this message is also required by IBM Software Support to diagnose the error.

EQQM992E WRONG JOB DEFINITION FOR THE FOLLOWING OCCURRENCE: *APPL, IA*

Explanation: The occurrence identified by application name *APPL* and input arrival time *IA* could not be added: a job definition referenced by an operation in this occurrence is not correctly defined in the *EQQSCLIB* library.

System action: The request is rejected.

User response: Check the message log. Message *EQQ3077E* identifies the *EQQSCLIB* member in error.

EQQM993E THE END-TO-END FEATURE IS NOT ACTIVE. CANNOT ADD OPERATIONS ON FTW FOR OCCURRENCE: *APPL, IA*

Explanation: The occurrence identified by application name *APPL* and input arrival time *IA* could not be

added: it contains an Operation defined on a fault-tolerant workstation. This kind of operations cannot be added to the current plan if the end-to-end feature is not active.

System action: The request is rejected.

System programmer response: Install and configure the End-to-End feature. Assure that the *TPLGYSRV* keyword is present in the *OPCOPTS* statement of the controller parameters.

User response: If you need to add an operation on a fault-tolerant workstation contact your system programmer; otherwise remove the operation defined on the fault-tolerant workstation or change its workstation before adding the occurrence to the plan.

EQQM994E OPERATION *APPL IA OPER* ALREADY HAS A CONDITION *COND* DEFINED.

Explanation: A request to add the indicated condition in the current plan failed because the condition already exists.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM995E OPERATION *APPL IA OPER* DOES NOT HAVE A CONDITION *COND*.

Explanation: A request to process the indicated condition in the current plan failed because the condition does not exist.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM996E CONDITION *COND* ON OPERATION *APPL IA OPER* DOES NOT HAVE THE CONDITION DEPENDENCY: *SIMP*.

Explanation: A request to process the indicated condition dependency in the current plan failed because the condition dependency does not exist.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM997E CONDITION *COND* ON OPERATION *APPL IA OPER* ALREADY HAS THE CONDITION DEPENDENCY: *SIMP*.

Explanation: A request to add the indicated condition dependency in the current plan failed because the condition dependency already exists.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM998E AN ATTEMPT HAS BEEN MADE TO
DEFINE OPERATION *APPL IA OPER*
AS CONDITIONAL PREDECESSOR OF
ITSELF.

Explanation: An operation cannot depend on itself.

System action: The request is rejected.

User response: Specify a valid selection.

EQQM999E INCONSISTENT DATA IN
CONDITION *COND* ON OPERATION
APPL IA OPER. NUMBER OF
CONDITION DEPENDENCIES LESS
THAN CONDITION SUBSET.

Explanation: The number specified as condition rule
exceeds the number of defined condition dependencies.

System action: The request is rejected.

User response: Specify a valid selection.

Chapter 215. EQQNnnn messages

EQQN000 - EQQN132

EQQN000I THE NORMAL MODE MANAGER TASK HAS BEEN REQUESTED TO TERMINATE

Explanation: The normal mode manager (NMM) subtask has been requested to terminate processing. This request is propagated to all active subtasks. The NMM subtask starts its own termination when all subtasks have ended.

System action: The NMM subtask waits for all subtasks to end. When there are no more active subtasks, the NMM backs up the current plan data set and terminates.

System programmer response: None.

Problem determination: If the NMM subtask has not ended within a few minutes, there may be a problem in one of the subtasks that prevents it from ending normally. If the problem cannot be resolved, cancel the subsystem started subtask and request a dump.

EQQN001I REFRESH IS COMPLETE. CURRENT PLAN IS NO LONGER AVAILABLE

Explanation: A current plan refresh request has been processed by the normal mode manager (NMM) subtask. The current plan data set has been closed and the checkpoint data set has been updated to indicate that no current plan is available. All IBM Tivoli Workload Scheduler for z/OS functions that need access to the current plan data set are inoperative.

System action: All IBM Tivoli Workload Scheduler for z/OS functions that do not need access to the current plan continue processing.

Programmer response: Schedule a batch job to create a new current plan using only long-term plan information as input.

EQQN002E THE NMM SUBTASK WAS UNABLE TO READ OR UPDATE CURRENT PLAN OPERATION RECORD WITH KEY (HEXADECIMAL): F0F3OPRINDEX

Explanation: The normal mode manager (NMM) subtask was reading the job tracking log data set during restart from checkpoint and met an error accessing a current plan operation record while processing an automatic job recovery event.

System action: The current job tracking event record is not processed. The NMM subtask continues reading the job tracking log data set.

System programmer response: Save the message log data set containing this error message and the job tracking log data set containing the incorrect record. Contact IBM Software Support.

Problem determination: Review the preceding messages in the IBM Tivoli Workload Scheduler for z/OS message log and SYSLOG data sets to determine the cause of the error.

EQQN003E VSAM ABENDED WHILE ATTEMPTING TO CLOSE DDNAME FILE. FOR ADDITIONAL INFORMATION SEE SYSLOG MESSAGES AND DUMP DATA SET

Explanation: A severe error occurred while closing a VSAM file.

System action: A dump is generated. The I/O subtask attempts to continue normal termination processing.

System programmer response: Save the IBM Tivoli Workload Scheduler for z/OS message log and dump data sets. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Describe the scenario that caused the error.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log, SYSLOG, and dump data sets to determine what caused the close abend.

EQQN004E VSAM PHYSICAL I/O ERROR. DETAILED INFORMATION FOLLOWS: ACTIVE TASK IS TASK. LOAD MODULE IS MODULE I/O REQUEST IS FROM MODID AT OFFSET +OFFSET REQUESTED FUNCTION IS FUNC ON LOGICAL FILE FILE, DDNAME DDNAME VSAM RETURN CODE IS 12, REASON CODE IS RSN, KEY IS KEY VSAM MESSAGE: SYNAD

Explanation: A IBM Tivoli Workload Scheduler for z/OS subtask or batch job encountered an I/O error when accessing a VSAM data set.

System action: The action taken by the IBM Tivoli Workload Scheduler for z/OS subtask or batch job is

given by additional messages that follow this message in the IBM Tivoli Workload Scheduler for z/OS message log. The VSAM message supplies information such as jobname, stepname, unit address, device type, ddname, RBA, error description and so on.

System programmer response: Correct the errors and, if necessary, rerun the batch job or restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

Problem determination: The MSGAREA and MSGGEN parameters of the RPL macro are used to extract the relevant information presented in the VSAM message. Use the VSAM return code, reason code, and message to determine the cause of the error. For more information, refer to the appropriate documentation for the MVS/DFP product installed on this z/OS system.

| EQQN005E THE NORMAL MODE MANAGER
| SUBTASK HAS ABENDED. FOR
| ADDITIONAL INFORMATION SEE
| SYSLOG MESSAGES AND DUMP
| DATA SET

| **Explanation:** A severe error has occurred in the
| normal mode manager (NMM) subtask.

| **System action:** NMM processing is terminated. A
| dump is created if a dump data set is defined. Message
| EQQZ045W is issued.

| **System programmer response:** Save the message log
| data set containing this error message, the dump data
| set, and the SYSLOG data set. To collect appropriate
| documentation for problem determination, see the
| *Diagnosis Guide and Reference* manual, Chapter 3.
| Problem analysis procedures. Search the IBM Support
| database for a solution at [http://www.ibm.com/
software/sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

| **User response:** Describe the scenario that caused the
| error.

| **Problem determination:** Review the preceding
| messages in the IBM Tivoli Workload Scheduler for
| z/OS message log, SYSLOG, and dump data sets to
| determine what caused the NMM subtask to abend.

EQQN006E THE NORMAL MODE MANAGER
HAS IGNORED THE FOLLOWING
INVALID EVENT RECORD WHILE
PROCESSING THE JOB TRACKING
LOG DATA SET DURING RESTART
FROM CHECKPOINT: EXITREC

Explanation: An invalid job tracking event record has been found in the job tracking log data set. The most likely cause is that the last four bytes of the record do not contain the IBM Tivoli Workload Scheduler for z/OS identifier EQQ3. It is also possible that the first three characters of the job number field do not contain the character string JOB.

System action: The incorrect job tracking event record

is not processed. The normal mode manager (NMM) subtask continues reading the job tracking log data set.

System programmer response: Save the IBM Tivoli Workload Scheduler for z/OS message log data set containing this error message and the job tracking log data set containing the incorrect record. Contact IBM Software Support.

Programmer response: Note the job name and job number in the exit record. If necessary, set the correct status for this job manually.

EQ07E THE FOLLOWING INVALID RECORD
WAS ENCOUNTERED WHEN THE
NORMAL MODE MANAGER WAS
PROCESSING THE JOB TRACKING
LOG DATA SET DURING RESTART
FROM CHECKPOINT: EVENT
HEADER: EVNTHDR EVENT RECORD:
EXITREC

Explanation: An invalid job tracking event record has been found in the job tracking log data set. The normal mode manager (NMM) subtask could not determine the origin of the event. Each event must come from one of 16 possible event data sets on each IBM Tivoli Workload Scheduler for z/OS node. In the current event record, either the event number in the data set or the IBM Tivoli Workload Scheduler for z/OS node number is invalid.

System action: The incorrect job tracking event record is not processed. The NMM subtask continues reading the job tracking log data set.

System programmer response: Save the IBM Tivoli Workload Scheduler for z/OS message log data set containing this error message and the job tracking log data set containing the incorrect record. Contact IBM Software Support.

Programmer response: Note the job name and the job number in the exit record. If necessary, set the correct status for this job manually.

EQQN008E AN ABEND OCCURRED WHILE
PROCESSING THE JOB TRACKING
LOG DATA SET DURING RESTART
FROM CHECKPOINT. THE
TRACKLOG RECORD HAS BEEN
SKIPPED

Explanation: An abend prevented the normal mode manager (NMM) subtask from finishing its processing of a job tracking event while it read the job tracking log data set.

System action: z/OS recovery/termination is requested to generate a dump. The NMM subtask attempts to continue normal operation with the next queued event.

System programmer response: Save the IBM Tivoli

Workload Scheduler for z/OS message log data set containing this error message and the job tracking log data set containing the incorrect record. Contact IBM Software Support.

Programmer response: Note the job name and the job number in the exit record. If necessary, set the correct status for this job manually.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log, SYSLOG, and dump data sets to determine the cause of the error.

EQQN009E THE CHECKPOINT DATA SET, DDNAME EQQCKPT, COULD NOT BE OPENED

Explanation: The normal mode manager (NMM) subtask could not open the checkpoint data set, which is a required data set for IBM Tivoli Workload Scheduler for z/OS when OPCHOST(YES) is specified.

System action: NMM initialization is terminated.

System programmer response: Check that ddname EQQCKPT is correctly specified and that the IBM Tivoli Workload Scheduler for z/OS started task is authorized to open the data set for update. Correct the errors and restart the NMM subtask.

Programmer response: Contact your system programmer.

EQQN010E AN I/O ERROR OCCURRED WHILE ATTEMPTING TO UPDATE THE CURRENT JOB TRACKING LOG DATA SET. SYNAD MESSAGE FOLLOWS: SYNMSG FIRST 90 BYTES OF LOG RECORD FOLLOWS: LOGREC

Explanation: An I/O error occurred when a IBM Tivoli Workload Scheduler for z/OS function tried to write a log record to the currently active job tracking log file.

System action: IBM Tivoli Workload Scheduler for z/OS attempts to switch to the next job tracking log file. If this process is successful, the log record is written to the next log instead. The normal mode manager (NMM) subtask is posted to take a backup of the current plan.

System programmer response: Scrap and reallocate the job tracking log data set at a suitable time when IBM Tivoli Workload Scheduler for z/OS is stopped.

Programmer response: Contact your system programmer.

Problem determination: The SYNAD routine collects information such as jobname, stepname, unit address, device type, ddname, operation, error description, and access method. The SYNADAF macro is used to extract this information. For a detailed description of the layout refer to the appropriate documentation for the

MVS/DFP product installed on this system.

EQQN011E A SEVERE ERROR, SYSTEM ABEND ABEND, OCCURRED WHILE ATTEMPTING TO UPDATE CURRENT JOB TRACKING LOG DATA SET

Explanation: An abend occurred when a IBM Tivoli Workload Scheduler for z/OS function attempted to write a record to the current job tracking log data set. If the abend code is SB37 or SD37, the current job tracking log data set is too small.

System action: IBM Tivoli Workload Scheduler for z/OS attempts to switch to the next job tracking log file. If this process is successful, the log record is written to the next log instead. The normal mode manager (NMM) subtask is posted to take a backup of the current plan.

System programmer response: If the current job tracking log data set is too small, scrap the current data set and allocate a larger one at a suitable time when IBM Tivoli Workload Scheduler for z/OS is stopped. Refer to *Customization and Tuning* for instructions.

Programmer response: Contact your system programmer.

EQQN012I JOB TRACKING EVENTS ARE NOW BEING LOGGED ON FILE DDNAME

Explanation: The normal mode manager (NMM) subtask has switched to the next available job tracking log data set. This is done after every current plan backup. If dual logging is requested, the dual log data set is also switched to the next available data set.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQN013I JOB TRACKING IS NOW ACTIVE AND CURRENT PLAN DD-NAME IS DDNAME

Explanation: The normal mode manager (NMM) subtask has started successfully and there is an available current plan.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQN014I THE JOB TRACKING LOG DATA SET, DDNAME JTFILE, HAS BEEN USED TO UPDATE THE CURRENT PLAN. NUMBER EVENTS HAVE BEEN APPLIED TO DD-NAME DDNAME

Explanation: The normal mode manager (NMM) subtask determined that the current plan data set could

EQQN015I • EQQN021E

not be used. A new current plan has been created by starting from the old current plan and reprocessing events logged on the job tracking log data set.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQN015I A VSAM DATA SET WAS SUCCESSFULLY COPIED: FROMDD=FROMDD, TODD=TODD

Explanation: A IBM Tivoli Workload Scheduler for z/OS subtask has finished copying a VSAM data set to a backup data set.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQN016I DDNAME OF CURRENT JCL REPOSITORY DATA SET IS DDNAME

Explanation: In the JCL repository data set, the name in use after a copy is *DDNAME*.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQN017I THE JCL REPOSITORY DATA SET WILL BE COPIED

Explanation: A IBM Tivoli Workload Scheduler for z/OS subtask has started to copy the JCL repository data set because either the current one has reached its maximum size or a backup has been requested using the BACKUP TSO command for the JS resource.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQN018I VSAM LSR BUFFERS HAVE BEEN SUCCESSFULLY ALLOCATED FOR VSAM FILE DDNAME NUMBER OF INDEX BUFFERS ARE NINDEX WITH SIZE SINDEX NUMBER OF DATA BUFFERS ARE NDATA WITH SIZE SDATA NR

Explanation: A VSAM LSR buffer pool has been successfully built for the file allocated to *DDNAME*. This message documents the size of the buffer pool and can be issued for either EQQCPxDS or EQQTbXDS.

NR is set for EQQPxDS only to store the additional text (REQUESTED *nnnnnn*); this is the number of buffers tuned on EQQCPxDS size. Depending on the available storage, the number of allocated buffers could be less than the buffers requested.

System action: IBM Tivoli Workload Scheduler for z/OS continues and uses the new buffer pool for I/O to the file.

System programmer response: None.

Problem determination: If necessary, verify that the size of the buffer pool is adequate.

EQQN019E VSAM LSR BUFFER ALLOCATION FAILED FOR VSAM FILE DDNAME RETURN CODE FROM BLDVRP WAS VRPRC REQUESTED NUMBER OF INDEX BUFFERS WAS NINDEX WITH SIZE SINDEX REQUESTED NUMBER OF DATA BUFFERS WAS NDATAWITH SIZE SDATA

Explanation: IBM Tivoli Workload Scheduler for z/OS was unable to build a VSAM LSR buffer pool for the file identified by *DDNAME*. This message documents the size of the buffer pool that IBM Tivoli Workload Scheduler for z/OS was trying to build and the return code from the build buffer pool service. The message can be issued for either EQQCPxDS or EQQTbXDS.

System action: IBM Tivoli Workload Scheduler for z/OS continues and uses normal VSAM buffering techniques for the file. The message EQQN019E is captured by the alerts OPCERROR() function and is issued to the system console and / or captured by NetView, if so specified.

System programmer response: Correct the error and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Use the VSAM return code to determine the cause of the error. For more information, refer to the appropriate documentation for the MVS/DFP product installed on this z/OS system.

EQQN021E VSAM FILE FILE COULD NOT BE COPIED BECAUSE INPUT OR OUTPUT DATA SET COULD NOT BE OPENED

Explanation: The normal mode manager (NMM) subtask could not copy the specified file because an error occurred when opening the input or output data sets.

System action: The NMM subtask is terminated.

System programmer response: Correct the errors and, if necessary, restart the NMM subtask.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQN022I A CURRPLAN(NEW) RESTART REQUEST IS BEING PROCESSED. THE SCHEDULER WILL START FROM THE NEW CURRENT PLAN DATA SET, DDNAME=EQQNCPDS, AND APPLY EVENTS FROM THE ARCHIVED JT LOG DATA SET, DDNAME=EQQJTARC

Explanation: IBM Tivoli Workload Scheduler for z/OS re-creates a current plan by copying the new current plan data set, EQQNCPDS, and updates it using events from the archived job tracking log and from the current job tracking log data set.

System action: The IBM Tivoli Workload Scheduler for z/OS restart process continues.

User response: None.

EQQN023I VSAM LSR BUFFERS HAVE BEEN SUCCESSFULLY DELETED FOR VSAM FILE DDNAME

Explanation: IBM Tivoli Workload Scheduler for z/OS successfully deleted the buffer pool for the file indicated in the message.

System action: None.

User response: None.

EQQN024W VSAM LSR BUFFER DELETE FAILED FOR VSAM FILE DDNAME RETURN CODE FROM DLVRP WAS VRPRC

Explanation: IBM Tivoli Workload Scheduler for z/OS could not delete the buffer pool for the file indicated in the message.

System action: None.

User response: Use the return code to determine the cause of the error and take appropriate action.

Problem determination: Use the VSAM return code to determine the cause of the error. For more information, refer to the appropriate documentation for the MVS/DFP product installed on this z/OS system.

EQQN025E AN ERROR OCCURRED WHILE READING THE JOB TRACKING LOG DATA SET DURING RESTART FROM CHECKPOINT. THE DATA SET HAS BEEN TRUNCATED

Explanation: The normal mode manager (NMM) subtask was reading the job tracking log data set during restart from checkpoint. An abend prevented it from processing the entire data set.

System action: z/OS recovery/termination is requested to generate a dump. The NMM subtask tries to complete the restart by treating the error as an

end-of-file on the log data set.

System programmer response: Save the message log data set containing this error message and the job tracking log data set causing the error. Contact IBM Software Support.

Programmer response: Review the status of all operations in the current plan. If necessary, set the correct statuses manually.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log., SYSLOG, and dump data sets to determine the cause of the error.

EQQN026W A NEW CURRENT PLAN (NCP) HAS BEEN REJECTED

Explanation: IBM Tivoli Workload Scheduler for z/OS has detected that a new current plan (NCP) has been created by a daily planning batch job, but because IBM Tivoli Workload Scheduler for z/OS failed to create a valid backup of the current plan (CP) to be used as input for the batch job, the NCP is considered invalid and is not used. This message is also issued when the checkpoint data set (EQQCKPT) has not been initialized.

System action: IBM Tivoli Workload Scheduler for z/OS starts up with the CP that was in use before IBM Tivoli Workload Scheduler for z/OS was terminated. If the EQQCKPT data set has been reallocated, IBM Tivoli Workload Scheduler for z/OS does not permit current plan actions as the old CP cannot accurately be identified.

System programmer response: Ensure that both the CP1 and CP2 data sets are online and available for IBM Tivoli Workload Scheduler for z/OS. Rerun the daily plan batch job, to create a new NCP. If the EQQCKPT data set has been reallocated specify the JTOPTS keyword CURRPLAN(NEW) option and restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

Problem determination: Review the message log from the previous IBM Tivoli Workload Scheduler for z/OS startup and look for error messages that could explain why the backup process failed. If the IBM Tivoli Workload Scheduler for z/OS backup process failed due to an open error, the reason could be that another job was using the file.

EQQN027E THE NORMAL MODE MANAGER IS TERMINATING UNEXPECTEDLY. NMMSTAT IS NMMSTAT

Explanation: The normal mode manager (NMM) subtask is in the processing of terminating unexpectedly. The reason for the termination is documented by NMMSTAT, which can have the following values:

- E An I/O error has occurred
- A Virtual storage is exhausted

S Termination is requested by another IBM Tivoli Workload Scheduler for z/OS function.

System action: NMM terminates all related subtasks. IBM Tivoli Workload Scheduler for z/OS continues to execute, but when the NMM subtask has terminated current plan functions are not available.

System programmer response: Analyze the preceding messages and take appropriate action to prevent the NMM subtask from terminating. To reactivate NMM, issue the command `F ssnm,S=NMM`.

User response: Contact your system programmer.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log (EQQMLOG) for preceding error messages that describe the problem.

EQQN028E CANNOT COPY VSAM FILE *INFILE* TO FILE *FILE* MAXIMUM OUTPUT RECORD SIZE IS SMALLER THAN MAXIMUM INPUT RECORD SIZE

Explanation: The normal mode manager (NMM) subtask has been requested to copy the specified file, but was unable to do so because the maximum size of records in the output data set is smaller than the maximum size of records in the input data set.

System action: The NMM subtask is terminated. Message EQQZ045W is issued.

System programmer response: Reallocate the output data set so that it has the same maximum record length as the input data set and retry.

EQQN029E CANNOT COPY VSAM FILE *FILE*. BUFFER GETMAIN FAILED

Explanation: The normal mode manager (NMM) subtask has been requested to copy the specified file, but is unable to do so because of insufficient virtual storage.

System action: The NMM subtask is terminated. Message EQQZ045W is issued.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS and restart it in a larger region.

EQQN030E ERROR COPYING VSAM FILE. DDNAME = *DDNAME*, VSAM RC = *RC*, REASON = *RSN*

Explanation: The normal mode manager (NMM) subtask has been requested to copy the VSAM data set *DDNAME*, but is unable to do so because a logical VSAM error occurred.

System action: The VSAM copy process is stopped.

System programmer response: Correct the errors and,

if necessary, restart the NMM subtask.

Problem determination: Use the VSAM return code and reason code to determine the cause of the error. For more information, refer to the appropriate documentation for the MVS/DFP product installed on this z/OS system.

EQQN031E I/O ERROR COPYING VSAM FILE. DDNAME = *DDNAME*, VSAM MSG FOLLOWS *ERRMSG*

Explanation: The normal mode manager (NMM) subtask has been requested to copy the VSAM data set *DDNAME*, but cannot do so because a VSAM I/O error occurred.

System action: The VSAM copy process is stopped.

System programmer response: Correct the errors and, if necessary, restart the NMM subtask.

Problem determination: Use the VSAM error message to determine the cause of the error. For more information, refer to the appropriate documentation for the MVS/DFP product installed on this z/OS system.

EQQN032E UNABLE TO OPEN VSAM FILE *FILE*, VSAM RC = *RC*, REASON = *RSN*

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem or a IBM Tivoli Workload Scheduler for z/OS batch job could not open a VSAM data set.

System action: The messages that follow this message in the message log identify the action taken by the subsystem or the batch job.

System programmer response: Correct the error and restart the IBM Tivoli Workload Scheduler for z/OS subsystem or batch job.

Problem determination: Use the VSAM return code and reason code to determine the cause of the error. For more information, refer to the appropriate documentation for the MVS/DFP product installed on this z/OS system.

EQQN033E VSAM FILE *FILE* IS INVALIDLY DEFINED

Explanation: After opening a VSAM data set (*FILE*), the VSAM I/O subtask determined that the data set's attributes did not agree with the I/O subtask's expectations for this *ddname*. For example, an incorrect size of the VSAM key could cause this message.

System action: The VSAM file is not opened.

System programmer response: Correct the errors and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Check that the file is correctly specified in the IBM Tivoli Workload Scheduler for z/OS started task procedure. Use the IDCAMS

LISTCAT function to determine the attributes of the file. Check that the relative key position is zero and that the key size is the same as that defined in the *Planning and Installation*

EQQN034E DAILY PLAN ENDS AFTER FAILURE TO BUILD VSAM LSR POOL, MACRO BLDVRP FAILED WITH RC=RCODE FOR DDNAME=DDNAME

Explanation: When building a VSAM LSR pool for the file *DDNAME*, the return code *RCODE* from BLDVRP macro indicated that the pool had not been built.

System action: The daily planning job is ended without creating a new current plan.

System programmer response: For return code = 0008, make sure that enough virtual storage is available. Review the REGION parameter in conjunction with the limits in the IEALIMIT/IEFUSI exit. Rerun the daily planning job.

For other return codes, save the message log containing the error and contact IBM Software Support.

Problem determination: For return code = 0008, the request could not complete due to lack of virtual storage. The daily planning job allocates 100 times 32 KB VSAM LSR buffers, for the new current plan VSAM file, above 16 MB. For other return codes this is probably a system error.

EQQN035I REFRESH REQUEST ISSUED BY TSouser

Explanation: The TSO user *TSouser* issued a long-term plan (LTP) refresh request.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

System programmer response: None.

EQQN036I THE EDP TABLE WAS INITIALIZED WITH NODES ENTRIES

Explanation: This message shows the number of entries contained in the EDP table when it is initialized from the checkpoint data set when the controller starts.

System action: IBM Tivoli Workload Scheduler for z/OS PROCESSING CONTINUES.

System programmer response: If the number is close to the maximum allowed, 1000 entries, and it is much greater than the number of remote destinations defined in the ROUTOPTS, refresh the checkpoint data set from the old entries at next CP extend or replan. To do this, specify the CKPTREFRESH keyword with value YES in the BATCHOPT.

EQQN037I THE EDP TABLE AND THE CKPT DATASET WERE REFRESHED

Explanation: The refresh of the checkpoint data set completed successfully.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

System programmer response: None.

EQQN038E INSUFFICIENT STORAGE TO BUILD THE TABLE

Explanation: IBM Tivoli Workload Scheduler for z/OS tried to allocate storage to build the specified table, but was not able to obtain sufficient storage.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Check the region size defined in the IBM Tivoli Workload Scheduler for z/OS JCL procedure. Increase the region size and restart IBM Tivoli Workload Scheduler for z/OS.

EQQN039E UNABLE TO ADD EQQTWSIN DATASET ENTRY IN EDP TABLE

Explanation: An error occurred while adding the EQQTWSIN entry in the EDP table. The controller detected that the EDP table has reached the number of 1000 entries, which is the maximum allowed.

System action: The controller initialization fails and a user abend is generated.

System programmer response: Remove the TPLGYPRM keyword in the BATCHOPT statement and the TPLGYSRV in the OPCOPTS; then refresh the checkpoint data set, running a daily plan extend or replan batch job after specifying the CKPTREFRESH keyword with value YES. When the batch job completes, restore the keywords previously removed.

EQQN040I SKIPINCL LIST HAS BEEN ACTION

Explanation: The modify command:
/F subsystem,SKIPINCL(member name)

was successfully processed. This command acts on the list of INCLUDE statements that are to be skipped in the JCL tailoring process (see the RCLOPTS SKIPINCL parameter section in the Customization and Tuning manual for details). The type of action performed by the command is specified by the value of ACTION and can be one of the following:

- Removed
- Updated

System action: The list of INCLUDE statements to be skipped is removed or updated. IBM Tivoli Workload Scheduler for z/OS processing continues.

EQQN041E • EQQN044I

User response: None.

EQQN041E SKIPINCL LIST CAN BE UPDATED ONLY IF RCLEANUP=YES

Explanation: The modify command:
/F subsys,SKIPINC(member name)

could not be processed because it has significance only when the Restart and Clean Up function is active.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: Check if RCLEANUP=NO is the intended setting. If it is not, set RCLEANUP=YES and check that all Restart and Clean Up customization is valid.

EQQN043E UNSUCCESSFUL VSAM I/O REQUEST. DETAILED INFORMATION FOLLOWS: ACTIVE TASK IS TASK. LOAD MODULE IS MODULE I/O REQUEST IS FROM MODID AT OFFSET +OFFSET REQUESTED FUNCTION IS FUNC ON LOGICAL FILE FILE, DDNAME DDNAME VSAM RETURN CODE IS 8, REASON CODE IS RSN, KEY IS KEY HEXADECIMAL ZONES HEXKEYZ HEXADECIMAL DIGITS HEXKEYD

Explanation: A IBM Tivoli Workload Scheduler for z/OS subtask encountered an unexpected error when accessing a VSAM data set. The return code, or RC, is always RC = 08 on return to IBM Tivoli Workload Scheduler for z/OS from VSAM. The reason code, or RSN, is the RPL feedback code for logical errors and the ACBERFLG for OPEN/CLOSE.

System action: The messages that follow this message in the IBM Tivoli Workload Scheduler for z/OS message log indicate the action taken by the IBM Tivoli Workload Scheduler for z/OS subtask.

System programmer response: Correct the error and, if necessary, restart the subtask that encountered the error.

Attention:

1. Specific corrective action must be taken for the following reason codes:

RSN=28

DATASET CANNOT BE EXTENDED

Make additional space available and then stop and restart the controller to force the affected data set to be closed and reopened.

RSN=40

INSUFFICIENT VIRTUAL STORAGE

Increase the region available to the IBM Tivoli Workload Scheduler for z/OS controller started task.

- | 2. This message can also be caused by a concurrent
| DELETE action on the CP that was run by a user at
| the same time of the query. If this is the case, the
| I/O Error is only a normal consequence of this.

Problem determination: Look up the reason code for the requested function in the documentation for the MVS/DFP product installed on the system (the VSAM Instruction Reference books contain a good description of the return and reason codes). If this error condition cannot be reproduced, consider activating a VSAM I/O trace to check preceding VSAM requests that led up to the error.

Note: Activating an I/O trace causes a large amount of output on the message data set.

EQQN044I A VSAM I/O REQUEST COMPLETED SUCCESSFULLY. DETAILED INFORMATION FOLLOWS: ACTIVE TASK IS TASK. LOAD MODULE IS MODULE I/O REQUEST IS FROM MODID AT OFFSET +OFFSET REQUESTED FUNCTION IS FUNC ON LOGICAL FILE FILE, DDNAME DDNAME KEY OF VSAM RECORD IS KEY HEXADECIMAL ZONES HEXKEYZ HEXADECIMAL DIGITS HEXKEYD

Explanation: This message is issued for all successful VSAM requests in the IBM Tivoli Workload Scheduler for z/OS address space when VSAM I/O tracing is active.

System action: Processing continues.

System programmer response: None.

EQQN045E INCORRECT VSAM I/O REQUEST. DETAILED INFORMATION FOLLOWS: ACTIVE TASK IS *TASK*. LOAD MODULE IS *MODULE* I/O REQUEST IS FROM *MODID* AT OFFSET *+OFFSET* REQUESTED FUNCTION IS *FUNC* ON LOGICAL FILE *FILE*, DDNAME *DDNAME* ERROR CAUSE IS: *CAUSE*

Explanation: A IBM Tivoli Workload Scheduler for z/OS subtask or batch job requested VSAM I/O services incorrectly.

System action: The messages that follow this message in the IBM Tivoli Workload Scheduler for z/OS message log indicate the action taken by the IBM Tivoli Workload Scheduler for z/OS subtask or batch job.

System programmer response: Save the message log containing this error message and the SYSLOG data set. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Describe the scenario that caused the error.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log and SYSLOG data set.

EQQN046I A LOGICAL VSAM FILE OPERATION WAS COMPLETED. DETAILED INFORMATION FOLLOWS: ACTIVE TASK IS *TASK*. LOAD MODULE IS *MODULE* REQUEST IS FROM *MODID* AT OFFSET *+OFFSET* REQUESTED FUNCTION IS *FUNC* ON LOGICAL FILE *FILE*, DDNAME *DDNAME*

Explanation: This message is issued for all logical VSAM requests in the IBM Tivoli Workload Scheduler for z/OS address space when VSAM I/O tracing is active.

System action: Processing continues.

System programmer response: None.

EQQN047W SUBTASK *TASK* HAS TERMINATED WITHOUT CLOSING LOGICAL FILE *FILE*, DDNAME *DDNAME*. VSAM MAY BE UNABLE TO CLOSE THIS FILE

Explanation: This message is issued by the VSAM I/O subtask during IBM Tivoli Workload Scheduler for z/OS termination when a IBM Tivoli Workload Scheduler for z/OS subtask ends without closing all of the logical VSAM files that it opened.

System action: The I/O subtask attempts to close the VSAM file.

System programmer response: Contact IBM Software Support.

Problem determination: This message usually indicates that the subtask has terminated abnormally.

EQQN048E IDCAMS REPRO UTILITY FAILED TO COPY FROM *FROMDD* TO *TODD*.

Explanation: An error occurred while creating, extending, or replanning a current plan. The JRUNHISTORY parameter of the BATCHOPT statement is set to (YES,STOP), therefore the batch job tries to create a backup copy of the old current plan to be used later by the archiving process. The copy is not created because of the IDCAMS utility failure.

System action: The daily planning batch job fails.

System programmer response: If the problem persists save the IBM Tivoli Workload Scheduler for z/OS message log and the DP Extend message log. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Review the message log data set for further error messages. Remove the cause of each error and submit the daily planning batch job again.

EQQN049I EXCLUSIVE CONTROL VSAM ERROR, RETCODE 8, REASON CODE 0020, WAS CAUSED BY A RESOURCE CONFLICT WITH SUBTASK *TASK*

Explanation: This message contains additional information for a preceding EQQN043E message. It identifies the IBM Tivoli Workload Scheduler for z/OS subtask that has exclusive control of a VSAM control interval that the current IBM Tivoli Workload Scheduler for z/OS subtask needs.

System action: Processing continues.

System programmer response: Save the IBM Tivoli Workload Scheduler for z/OS message log data set containing this message and contact IBM Software Support.

EQQN050E A JOB TRACKING LOG DATA SET, DDNAME *DDNAME*, COULD NOT BE OPENED

Explanation: The normal mode manager (NMM) subtask could not open the job tracking log data set *DDNAME*, which it requires.

System action: The NMM is terminated. Message EQQN107I is issued.

EQQN051I • EQQN058I

System programmer response: Correct the errors and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Check that ddname *DDNAME* is correctly specified and that the IBM Tivoli Workload Scheduler for z/OS started task is authorized to open the data set for output.

EQQN051I A CURRENT PLAN BACKUP PROCESS HAS STARTED. TRIGGER WAS: REASON

Explanation: The normal mode manager (NMM) subtask has started updating a current plan data set in preparation for the creation of a current plan image copy backup. The reason why IBM Tivoli Workload Scheduler for z/OS has initiated the backup is identified by the *REASON* defined in the message text. The possible values for *REASON* are:

BACKUP LIM

The number of events specified in the JTOPTS BACKUP keyword has been reached

BACKUP CMD

The backup was initiated as a result of the IBM Tivoli Workload Scheduler for z/OS BACKUP command

BULKDISC CMD

The IBM Tivoli Workload Scheduler for z/OS BULKDISC command initiated a bulk discovery request

CATCH UP

IBM Tivoli Workload Scheduler for z/OS has successfully recovered the current plan using job-tracking data

JT ERROR

An error on a job-tracking log has caused IBM Tivoli Workload Scheduler for z/OS to switch to the next available JT log

NMM ENDING

The controller has been requested to shutdown or the NMM subtask has been requested to stop

DP START

Daily plan turnover phase 1, a daily plan batch extend, replan, trial, or print current period results process has been started

DP END

Daily plan turnover phase 2, a daily plan extend or replan has created a new current plan that is being taken over by IBM Tivoli Workload Scheduler for z/OS

UNKNOWN

Please take a copy of the EQQJTARC and the EQQMLOG data sets and report to IBM Software Support.

System action: Backup processing continues. Current

plan activity is suspended until the backup is complete.

User response: None.

EQQN052W AN OUTSTANDING MCP MODIFY REQUEST HAS BEEN CANCELLED FOR USER USER REASON IS: REASON. LIST OF AFFECTED OCCURRENCES FOLLOW:

Explanation: A modify current plan (MCP) multiple add request did not complete normally. IBM Tivoli Workload Scheduler for z/OS has canceled the wait for the completing modify request. Operations within such added occurrences may be in held status and must be released manually.

System action: The wait for the modify request has been canceled.

EQQN053W OCCURRENCE OCCID WITH IA IADATE IATIME MAY CONTAIN HELD OPERATIONS

Explanation: A modify current plan (MCP) multiple add request did not complete normally. IBM Tivoli Workload Scheduler for z/OS has canceled the wait for the completing modify request. Operations within the reported occurrence may be in held status and must be released manually.

System action: The wait for the modify request has been canceled.

EQQN056I A CURRENT PLAN COPY PROCESS HAS STARTED

Explanation: The normal mode manager (NMM) subtask has started to copy a current plan data set because either a new current plan has become available or a current plan image copy backup is to be created.

System action: Processing continues.

System programmer response: None.

EQQN057I A CURRENT PLAN DATA SET WAS SUCCESSFULLY COPIED: FROMDD=FROMDD, TODD=TODD

Explanation: The normal mode manager (NMM) subtask has finished copying a current plan data set.

System action: Processing continues.

System programmer response: None.

EQQN058I THE SCHEDULER WILL RECOVER THE CP DATA SET FROM THE JTLOGS. PLEASE BE PATIENT. THIS WILL TAKE A WHILE.

Explanation: IBM Tivoli Workload Scheduler for z/OS determined that a CP recovery is required. While this

CP recovery is in progress, the scheduler is in a partially initialized state. Users cannot enter the dialogs and no jobs are submitted.

System action: Processing continues.

System programmer response: None.

EQQN059I JT APPLY IS IN PROGRESS. NUMBER RECORDS HAVE BEEN PROCESSED

Explanation: While the CP recovery is in progress, a lot of events are processed from the JT files to update the CP data set.

System action: Processing continues.

System programmer response: None.

EQQN060E INVALID KEYW KEYWORD VALUE POSITION IN THE WLRSTMT KEYWORD

Explanation: Keyword *WLRSTMT* on the *JTOPTS* statement contains a valid value *KEYW*, but in an incorrect position.

System action: The normal mode manager (NMM) subtask is terminated.

System programmer response: Correct the error and restart the NMM subtask or the IBM Tivoli Workload Scheduler for z/OS subsystem. Refer to *Customization and Tuning* for a description of the keyword.

EQQN061E TOO MANY KEYWORD VALUES IN THE WLRSTMT KEYWORD

Explanation: Keyword *WLRSTMT* on the *JTOPTS* statement contains too many values.

System action: The normal mode manager (NMM) subtask is terminated.

System programmer response: Correct the error and restart the NMM subtask or the IBM Tivoli Workload Scheduler for z/OS subsystem. Refer to *Customization and Tuning* for a description of the keyword.

EQQN062E The WLRSTMT KEYWORD CONTAINS UNKNOWN KEYWORD VALUE KEYW

Explanation: Keyword *WLRSTMT* on the *JTOPTS* statement contains a value *KEYW*, which is not recognized by IBM Tivoli Workload Scheduler for z/OS.

System action: The normal mode manager (NMM) subtask is terminated.

System programmer response: Correct the error and restart the NMM subtask or the IBM Tivoli Workload Scheduler for z/OS subsystem. Refer to *Customization and Tuning* for a description of the keyword.

EQQN063W A FAILURE OCCURRED DURING THE CREATION OF THE VSAM FILE EQQSCPDS

Explanation: There was an error while the NMM subtask was copying the current plan VSAM file to the EQQSCPDS VSAM file during the Symphony file creation process.

System action: The creation of the Symphony fails either during the Daily plan batch job or during the Symphony Renew batch job execution. If the Daily plan is running, it ends with return code 4, allowing the creation of the current plan. The Symphony Renew ends with return code 8.

System programmer response: Analyze the preceding messages to determine the cause of the error. Correct the problem, then run a Symphony Renew to create the Symphony file asynchronously.

EQQN064E CONTROLLER FAILED TO SYNCHRONIZE WITH END-TO-END SERVER

Explanation: The NMM subtask was unable to synchronize with the end-to-end server. Possible causes are:

- An end-to-end queue is full.
- There is a communication problem between the controller and the server.
- The server is down.

System action: The NMM subtask continues its processing and the Symphony creation fails.

System programmer response: Check for previous EQQW088W or EQQW089W messages. Verify that the Enabler tasks and the Server are active. If necessary, restart either the Enabler or the Server, then try to recreate the Symphony file running a Daily Plan or a Symphony Renew batch job. If the Enabler and the Server are active, save the message log data set containing this error message and contact IBM Software Support.

In the case where the NCP was created successfully by the DP batch run, do not stop and restart with CURRPLAN(NEW), but perform the following actions:

- Solve the problem that caused the missing synchronization if possible (for example, start the server).
- Run a DP extend (TPLGYPRM commented out in BATCHOPTS).
- Run a Symphony renew (TPLGYPRM uncommented in BATCHOPTS).

Refer to APAR PK40651 for more details.

EQQN065E THE NORMAL MODE MANAGER WAS NOT ABLE TO SEND THE EVENT EVENT TO THE ENABLER TASK: THE EVENT IS LOST

Explanation: The NMM subtask failed to send the event shown in the message text to the end-to-end task for an unknown reason.

System action: The NMM subtask continues its normal processing while the event is lost. The creation of the Symphony file fails.

System programmer response: Review earlier messages in the message log and, if it is possible to fix the problem, recreate the Symphony file running the Daily Plan or the Symphony Renew batch jobs. In any case, save the message log data set containing this error message, then contact IBM Software Support.

EQQN066W A CURRENT PLAN MUST BE PRESENT TO RUN A SYMPHONY RENEW

Explanation: The user submitted a Symphony Renew batch job but the NMM subtask found that there is no active current plan.

System action: The Symphony Renew batch job fails. No new Symphony can be created if there is no active current plan.

System programmer response: Run a Daily Plan batch job to generate the current plan. A new Symphony file is also created.

EQQN067I NOERRROW !NOERRMEM

Explanation: You issued a modify command with the LSTNOERR option, to list the NOERROR table content. The *NOERRROW* variable shows a currently active NOERROR definition; the *NOERRMEM* variable shows the name of the EQQPARM member containing that definition.

System action: The scheduler lists the NOERROR table content in the controller message log.

User response: None.

EQQN068I THE NEW NOERROR STATEMENT VALUE: TABROW1 OVERLAPS THE ALREADY DEFINED VALUE: TABROW2.

Explanation: While defining a new NOERROR entry *TABROW1*, the scheduler detected that it overlaps the already defined entry *TABROW2*.

System action: The new entry is added to the NOERROR table.

User response: Consider removing any redundant criteria. You can list the currently active NOERROR

table by using the modify command, /F *subsys,LSTNOERR*.

EQQN069W THE NEW NOERROR STATEMENT VALUE: TABROW1 IS NOT CONSISTENT WITH THE ALREADY DEFINED VALUE: TABROW2. IT CANNOT BE ADDED TO THE NOERROR TABLE.

Explanation: While defining a new NOERROR entry *TABROW1*, the scheduler detected that it is not consistent with the already defined entry *TABROW2*.

System action: The scheduler does not update the NOERROR table. Processing continues.

User response: Check the currently active NOERROR table by using the modify command, /F *subsys,LSTNOERR* and remove the inconsistency.

EQQN070E KEYVALUE IS NOT A VALID KEYWORD VALUE

Explanation: An invalid keyword value has been defined.

System action: IBM Tivoli Workload Scheduler for z/OS uses the default keyword value.

Programmer response: Correct the value for the keyword containing the error and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Contact your IBM Tivoli Workload Scheduler for z/OS administrator.

EQQN071E AN ATTEMPT TO UPDATE THE NOERROR TABLE HAS FAILED

Explanation: A modify command was entered requesting the NOERROR table to be updated. One or more errors were found while processing input NOERROR statements.

System action: The NOERROR table is not changed. IBM Tivoli Workload Scheduler for z/OS continues normal processing.

User response: Review earlier error messages in the message log that describe initialization statement processing errors. Correct all identified errors and reenter the modify command.

EQQN072I THE NOERROR TABLE HAS BEEN SUCCESSFULLY UPDATED

Explanation: A modify command has caused IBM Tivoli Workload Scheduler for z/OS to rebuild the NOERROR table from NOERROR statements in the parameter library.

System action: IBM Tivoli Workload Scheduler for

z/OS continues normal processing and is using the updated NOERROR table.

User response: None.

EQQN073E PROTECTED LIST CAN BE UPDATED ONLY IF RCLEANUP=YES

Explanation: You issued a modify command to modify the list of protected data sets but the OPCOPTS RCLEANUP option is not set to YES.

System action: The modify command is ignored.

System programmer response: Check why RCLEANUP option is not set.

EQQN074E PROTECTED LIST CAN BE UPDATED ONLY IF RCLOPTS SPECIFIED

Explanation: You issued a modify command to modify the list of protected data set but the RCLOPTS option was not specified or built with defaults.

System action: The modify command is ignored.

System programmer response: Check why RCLOPTS was not specified.

EQQN075I PROTECTED DDNAME LIST HAS BEEN REMOVED

Explanation: You issued a modify command to modify the list of protected data set via DDNAME providing a blank value for DDNAME member. For example, /F subsystem,DDPROT(). An empty member name removes the current list of protected data sets.

System action: The DDPROT list is removed.

System programmer response: None.

EQQN076I PROTECTED DSNAME LIST HAS BEEN REMOVED

Explanation: You issued a modify command to modify the list of protected data set via DSNAME providing a blank value for DSNAME member. For example, /F subsystem,DSNPROT(). An empty member name removes the current list of protected data sets.

System action: The DSNPROT list is removed.

System programmer response: None.

EQQN077I PROTECTED DDNAME LIST HAS BEEN UPDATED

Explanation: You issued a modify command to modify the list of protected data set via DDNAME providing a new value for DDNAME member. For example, /F subsystem,DDPROT(newmem). The newmem member is read and used to substitute the current list of protected data set via DDNAME.

System action: The DDPROT list is updated.

System programmer response: None.

EQQN078I PROTECTED DSNAME LIST HAS BEEN UPDATED

Explanation: You issued a modify command to modify the list of protected data sets via DSNAME providing a new value for DSNAME member. For example, /F subsystem,DSNPROT(newmem) The newmem member is read and used to substitute the current list of protected data set via DSNAME.

System action: The DSNPROT list is updated.

System programmer response: None.

EQQN079W INCORRECT VALUE SPECIFIED FOR KEYWORD KEYWORD. DEFAULT VALUE IS USED.

Explanation: At least one of the two parameters of the ALEACTION keyword is either out of range or was specified not using 3 digits. The default value is used.

System action: None.

User response: Specify a correct value and restart the controller.

EQQN080I THE LOG ARCHIVER TASK HAS STARTED

Explanation: The job-tracking log archiver task has completed initialization and is ready to perform additional work.

System action: Normal processing continues.

User response: None.

EQQN081I THE LOG ARCHIVER TASK HAS ENDED

Explanation: The job-tracking log archiver task is ending normally after having been posted to stop processing.

System action: Normal processing continues.

User response: None.

EQQN082E NEXT JOB TRACKING LOG DATA SET, DDNAME DDNAME, IS NOT OPEN

Explanation: IBM Tivoli Workload Scheduler for z/OS was unable to use the next job-tracking log in a situation where current job tracking log can no longer be used.

System action: The normal mode manager (NMM) subtask is stopped and the current plan is no longer available.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS. Ensure that IBM Tivoli Workload Scheduler for z/OS is authorized to update all job-tracking log data sets defined by currently specified (or defaulted) values of the JTLOGS and DUAL keywords of the JTOPTS initialization statement. Reallocate any job-tracking log data sets that had output errors. After making the necessary corrections, restart IBM Tivoli Workload Scheduler for z/OS.

User response: Contact your system programmer.

Problem determination: Review earlier messages in the message log data set to determine why the next job-tracking log is not open.

EQQN083E THE JTLOGS KEYWORD MUST SPECIFY A VALUE IN THE RANGE 2 TO 99

Explanation: The value specified for the JTLOGS keyword is not supported.

System action: The normal mode manager subtask is terminated.

System programmer response: Correct the JTLOGS specification and restart IBM Tivoli Workload Scheduler for z/OS.

Programmer response: Contact your system programmer.

EQQN084E DD STATEMENT IS MISSING FOR A JOB TRACKING LOG DATASET, DDNAME DDNAME

Explanation: A DD statement needed to support currently specified (or defaulted) values of the JTLOGS and DUAL keywords of the JTOPTS initialization statement is not defined.

System action: The normal mode manager subtask is terminated.

System programmer response: Either change the value defined by the JTLOGS or DUAL keyword or add the ddname defined by this message to the IBM Tivoli Workload Scheduler for z/OS started task procedure. After making the necessary corrections, restart IBM Tivoli Workload Scheduler for z/OS.

Programmer response: Contact your system programmer.

EQQN085E UNSUPPORTED ATTEMPT TO REDUCE THE NUMBER OF JOB TRACKING LOGS. JTLOGS VALUE IS MAXJT, CURRENT JOB TRACKING LOG IS CURJT

Explanation: The value specified for the JTLOGS keyword of the JTOPTS initialization statement is

smaller than the number of the current job-tracking log. This is not supported.

System action: The normal mode manager subtask is terminated.

System programmer response: Change the JTLOGS specification to a larger value. After making the necessary corrections, restart IBM Tivoli Workload Scheduler for z/OS.

Programmer response: Contact your system programmer.

EQQN086E UNSUPPORTED ATTEMPT TO REDUCE THE NUMBER OF JOB TRACKING LOGS. JTLOGS VALUE IS MAXJT, LAST ARCHIVED LOG IS ARCJT

Explanation: The value specified for the JTLOGS keyword of the JTOPTS initialization statement is smaller than the number of the first nonarchived job-tracking log. This is not supported.

System action: The normal mode manager subtask is terminated.

System programmer response: Change the JTLOGS specification to a larger value. After making the necessary corrections, restart IBM Tivoli Workload Scheduler for z/OS.

Programmer response: Contact your system programmer.

EQQN087E DUAL JOB TRACKING LOG CONTAINS MORE EVENTS THAN PRIMARY JOB TRACKING LOG. CURRENT JOB TRACKING LOG, DDNAME DDNAME MAY BE INVALID

Explanation: During IBM Tivoli Workload Scheduler for z/OS restart it was determined that the dual job-tracking log contains more events than the primary log. This could indicate that the primary log data set is invalid.

System action: The normal mode manager (NMM) subtask is terminated.

System programmer response: If the primary log data set is invalid, copy the dual log to the primary log. Otherwise, if the dual log data set is invalid, copy the primary log to the dual log. After making the necessary corrections, restart IBM Tivoli Workload Scheduler for z/OS.

Programmer response: Contact your system programmer.

EQQN088E NMM WAS UNABLE TO SWITCH TO NEXT JOB TRACKING LOG DATA SET, DDNAME *DDNAME*, BECAUSE IT HAS NOT YET BEEN ARCHIVED.

Explanation: IBM Tivoli Workload Scheduler for z/OS was unable to use the next job-tracking log in a situation where current job-tracking log can no longer be used.

System action: The normal mode manager subtask is stopped and the current plan is no longer available.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS. Ensure that IBM Tivoli Workload Scheduler for z/OS is authorized to update all job-tracking log data sets defined by currently specified (or defaulted) values of the JTLOGS and DUAL keywords of the JTOPTS initialization statement. Reallocate any job-tracking log data sets that had output errors. After making the necessary corrections, restart IBM Tivoli Workload Scheduler for z/OS.

Programmer response: Contact your system programmer.

Problem determination: Review earlier messages in the message log data set to determine why the next job-tracking log has not been archived.

EQQN089E AN ATTEMPT TO LIST THE NOERROR TABLE CONTENT HAS FAILED. THE NOERROR TABLE IS EITHER EMPTY OR NOT DEFINED.

Explanation: The scheduler did not find any NOERROR definition while processing a modify command, /F *subsys*,LSTNOERR.

System action: The modify command ends in error. Processing continues.

User response: Verify that the EQQPARM library contains NOERROR definitions. Check for previous parsing error messages in the controller message log. After the controller initialization statements have been successfully processed, submit the modify command again.

EQQN090I THE JOB TRACKING LOG DATA SET DEFINED BY DDNAME *DDNAME* HAS BEEN COPIED TO THE JOB TRACKING LOG ARCHIVE DATA SET

Explanation: The job-tracking log archiver task has successfully copied a data set to the archive data set.

System action: Normal processing continues.

User response: None.

EQQN091I THE LOG ARCHIVER TASK WAS UNABLE TO COPY THE DATA SET DEFINED BY DDNAME *DDNAME* TO THE JOB TRACKING LOG ARCHIVE DATA SET

Explanation: An error prevented the job-tracking log archiver task from copying a job-tracking log data set to the archive data set.

System action: The job-tracking log archiver task is terminated. The current plan updating tasks continue, but if the log archiver task problem is not corrected, IBM Tivoli Workload Scheduler for z/OS eventually runs out of available job *hypheng* log data sets.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS. Make sure that IBM Tivoli Workload Scheduler for z/OS is authorized to read all job-tracking log data sets defined by currently specified (or defaulted) values of the JTLOGS and DUAL keywords of the JTOPTS initialization statement. Reallocate any job-tracking log data sets that had output errors. After making the necessary corrections, restart IBM Tivoli Workload Scheduler for z/OS.

Programmer response: Contact your system programmer.

Problem determination: Review earlier messages in the message log data set to determine what prevented the log archiver task from copying the current log data set.

EQQN092E AN I/O ERROR OCCURRED WHILE ATTEMPTING TO UPDATE THE JOB TRACKING LOG ARCHIVE DATA SET. THE ARCHIVER TASK IS ENDING. SYNAD MESSAGE FOLLOWS: *SYNMSG*

Explanation: An I/O error occurred when the job-tracking log archiver task tried to write a log record to the job-tracking archive log data set.

System action: The job-tracking log archiver task ends. The current plan updating tasks continue, but if the job-tracking log archiver task problem is not corrected, IBM Tivoli Workload Scheduler for z/OS eventually runs out of available job-tracking log data sets.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS. If necessary, allocate a new job-tracking log archive data set and copy the old data set to the new data set. After making the necessary corrections, restart IBM Tivoli Workload Scheduler for z/OS.

Programmer response: Contact your system programmer.

Problem determination: The SYNAD routine collects information such as jobname, stepname, unit address, device type, ddname, operation, error description, and

access method. The SYNADAF macro is used to extract this information. For a detailed description of the layout refer to the appropriate documentation for the MVS/DFP product installed on this system.

EQQN093E AN SEVERE ERROR, SYSTEM ABEND ABEND, OCCURRED WHILE ATTEMPTING TO UPDATE THE JOB TRACKING LOG ARCHIVE DATA SET. THE ARCHIVER TASK IS ENDING.

Explanation: An abend occurred when the job-tracking log archiver task tried to write a log record to the job tracking archive log data set. If the abend code is SB37 or SD37, the archive data set is too small.

System action: The job-tracking log archiver task ends. The current plan updating tasks continue, but if the job-tracking log archiver task problem is not corrected, IBM Tivoli Workload Scheduler for z/OS eventually runs out of available job-tracking log data sets.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS. If necessary, allocate a new larger job-tracking log archive data set and copy the old data set to the new data set. After making the necessary corrections, restart IBM Tivoli Workload Scheduler for z/OS.

Programmer response: Contact your system programmer.

Problem determination: Use the abend code to determine what is wrong with the archive data set.

EQQN094E AN I/O ERROR OCCURRED WHILE ATTEMPTING TO UPDATE A DUAL JOB TRACKING LOG DATA SET. SYNAD MESSAGE FOLLOWS: SYNMSG

Explanation: An I/O error occurred when a IBM Tivoli Workload Scheduler for z/OS function tried to write a log record to the currently active dual job-tracking log file.

System action: IBM Tivoli Workload Scheduler for z/OS stops logging events to the dual job-tracking log data sets. Logging on the primary job-tracking log data sets continues normally.

System programmer response: Scrap and reallocate the failing data set at a suitable time when IBM Tivoli Workload Scheduler for z/OS is stopped.

User response: Contact your system programmer.

Problem determination: The SYNAD routine collects information such as jobname, stepname, unit address, device type, ddname, operation, error description, and access method. The SYNADAF macro is used to extract this information. For a detailed description of the layout refer to the appropriate documentation for the

MVS/DFP product installed on this system.

EQQN095E A SEVERE ERROR, SYSTEM ABEND ABEND, OCCURRED WHILE ATTEMPTING TO UPDATE CURRENT DUAL JOB TRACKING LOG DATA SET

Explanation: An abend occurred when a IBM Tivoli Workload Scheduler for z/OS function attempted to write a record to a dual job-tracking log data set. If the abend code is SB37 or SD37, the current dual job-tracking log data set is too small.

System action: IBM Tivoli Workload Scheduler for z/OS stops logging events to the dual job-tracking log data sets. Logging on the primary job-tracking log data sets continues normally.

System programmer response: If the current job-tracking log data set is too small scrap the current dual log data set and allocate a larger one at a suitable time when IBM Tivoli Workload Scheduler for z/OS is stopped.

Programmer response: Contact your system programmer.

EQQN096I THE NEW NOERROR STATEMENT VALUE: TABROW1 IS ALREADY PRESENT IN THE NOERROR TABLE: IT IS NOT STORED AGAIN.

Explanation: While defining a new NOERROR entry *TABROW1*, the scheduler detected that it duplicates already defined criteria.

System action: The new NOERROR entry is ignored. Processing continues.

User response: Check the currently active NOERROR table by using the modify command, /F *subsys*,LSTNOERR and consider removing the duplication.

EQQN097E EQQUX014 EXIT RETURNED RC RETURN CODE. EXIT HAS BEEN DEACTIVATED

Explanation: The scheduler tried to access the UX14IN data set but failed.

System action: The scheduler cannot use the exit and deactivates it.

User response: Check if the controller JCL procedure specifies the UX14IN DD statement.

EQQN098I THE NOERROR TABLE HAS BEEN UPDATED ANYWAY DUE TO NOERRCONCHECK PARAMETER SETTING.

Explanation: The NOERROR consistency check

detected some inconsistent statements.

System action: Based on the NOERRCONCHECK parameter setting MSG, the NOERROR table update has been forced.

System programmer response: If you specified NOERRCONCHECK(MSG), review the previous EQQN069W messages issued as result of the NOERROR table update. Based on your environment settings (for example naming conventions and standards), make sure that the indicated entries are not actually inconsistent.

Before attempting to update the NOERROR table, consider running the trial modify command `/F subsystem,TRYNOERR(mem_name)`, to simulate the insertion of new statements, and check the sequence of EQQN069W messages.

Problem determination: The NOERROR statements might be inconsistent and might produce unexpected results.

EQQN099I THE NOERROR STATEMENTS TRIAL COMMAND HAS ENDED

Explanation: The scheduler normally processed a modify command `/F subsystem,TRYNOERR(mem_name)`.

System action: The scheduler did not update the NOERROR table. Normal processing continues.

System programmer response: Check for previous EQQN069W messages issued after the modify command. Consider removing any inconsistency or changing the NOERRCONCHECK parameter value in the OPCOPTS statement.

EQQN101E THE MODIFY CURRENT PLAN MODULE, EQQMCTOP, COULD NOT BE LOADED

Explanation: IBM Tivoli Workload Scheduler for z/OS could not locate the modify current plan load module, EQQMCTOP.

System action: The normal mode manager (NMM) subtask initialization fails.

System programmer response: Make sure that the EQQMCTOP load module is present in a library that can be reached by IBM Tivoli Workload Scheduler for z/OS, and restart the NMM subtask.

EQQN102W AN USER EXIT LOAD MODULE, MODULE, COULD NOT BE LOADED

Explanation: IBM Tivoli Workload Scheduler for z/OS could not locate an exit load module.

System action: This exit is not used by IBM Tivoli Workload Scheduler for z/OS.

System programmer response: Correct the error and

restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

Problem determination: Check if the module named in this message should be used by IBM Tivoli Workload Scheduler for z/OS. Also check that the module exists in a library that the subsystem started task can reach.

EQQN103E THE EVENT HANDLER MODULE, EQQEMEVH, COULD NOT BE LOADED

Explanation: IBM Tivoli Workload Scheduler for z/OS could not locate the event handler load module, EQQEMEVH.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Make sure that the EQQEMEVH load module exists in a library that can be reached by IBM Tivoli Workload Scheduler for z/OS and restart the IBM Tivoli Workload Scheduler for z/OS started task.

EQQN104W PROCESSING RETURN CODE RETC from EQQUX011. THE EXIT HAS BEEN MARKED AS NOT EXECUTABLE BUT THE PROCESS CONTINUES

Explanation: IBM Tivoli Workload Scheduler for z/OS has passed job tracking log information to Exit011, but unusual conditions (including errors) have been encountered.

System action: The system writes a job tracking log record, but Exit011 is set as inactive.

System programmer response: Refer to the meaning of the RETC return code in the Exit011. The code depends on Exit011 customization.

EQQN105W NO VALID CURRENT PLAN EXISTS. CURRENT PLAN VSAM I/O IS NOT POSSIBLE

Explanation: The IBM Tivoli Workload Scheduler for z/OS checkpoint data set indicates that no valid current plan exists. All IBM Tivoli Workload Scheduler for z/OS functions that need access to the current plan data set are inoperative.

System action: The normal mode manager (NMM) subtask, which has been initialized, takes a new current plan if one is created by a daily plan create batch job executing on behalf of this subsystem.

System programmer response: Correct the errors and, if necessary, restart the NMM subtask.

Problem determination: If this message was not expected, check that the started task procedure (ddname EQQCKPT) is correctly specified. Also check that this subsystem is the only IBM Tivoli Workload

Scheduler for z/OS subsystem that references this checkpoint data set.

EQQN106E ERRORS ENCOUNTERED PROCESSING NMM INITIALIZATION STATEMENTS. THE NORMAL MODE MANAGER TASK WILL TERMINATE

Explanation: While processing initialization statements, the normal mode manager (NMM) subtask found one or more errors.

System action: The NMM subtask initialization fails.

System programmer response: Correct the error and restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

Problem determination: Review the previous messages in the message log data set to determine the cause of the problem.

EQQN107I THE NORMAL MODE MANAGER TASK HAS ENDED

Explanation: The normal mode manager (NMM) subtask is ending normally after having initialized successfully. Usually, this message is due to an operator command requesting the IBM Tivoli Workload Scheduler for z/OS subsystem to stop.

System action: Normal processing continues.

System programmer response: None.

EQQN108E THE NEW CURRENT PLAN DATA SET IS INVALID. A NEW NCP DATA SET MUST BE CREATED.

Explanation: The normal mode manager (NMM) subtask found that a new current plan (NCP) in the NCP data set did not contain any header record.

System action: The NMM subtask does not use the contents of the NCP data set.

System programmer response: If necessary, correct errors in the daily planning input data sets and rerun the daily planning batch job or correct the NCP file definition problems and restart IBM Tivoli Workload Scheduler for z/OS.

Programmer response: Contact your system programmer.

Problem determination: If a daily planing batch job has just ended, check ending conditions for the job. If the error occurs when IBM Tivoli Workload Scheduler for z/OS is starting, verify that the DD statement, EQQNCPDS, defining the NCP file, is correct.

EQQN109W EXIT11 TERMINATES ABNORMALLY. THE EXIT HAS BEEN MARKED AS NOT EXECUTABLE BUT THE PROCESS CONTINUES

Explanation: IBM Tivoli Workload Scheduler for z/OS has passed job tracking log information to Exit011, but an abnormal condition has been encountered. This condition has caused an abnormal termination for Exit011.

System action: The system writes a job tracking log record, but Exit011 is set as inactive.

System programmer response: None.

EQQN110W FL TASK IS NOT STARTED: R&C DATA STORE CLEAN UP COULD BE IGNORED

Explanation: A turnover process was just completed and a request was built to remove the completed occurrence related information from the Restart and Cleanup data store. However, the FL task that should process the request is not active.

System action: The remove request is not processed.

System programmer response: Check why the FL task is down and restart it.

EQQN111I A NEW SYMPHONY FILE HAS BEEN CREATED

Explanation: The batch job has successfully created the *symnew* file. This file is a new version of the symphony file and is created by daily planning. It becomes active when translator renames the existing symphony file to *symold* and the *symnew* file to symphony.

System action: The task sends to the Translator the command to complete the switch of the new Symphony file.

User response: None.

| EQQN112E THE NEW SYMPHONY FILE HAS NOT BEEN CREATED

| Explanation: The batch job was unable to renew the Symphony file.

| System action: The task continues its own processing. The plan is not distributed to fault-tolerant workstations.

| System programmer response: If the problem persists save the DP Extend message log. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Review the message log data set for
 | further error messages. Remove the cause of each error
 | and submit the daily planning batch job again.

**EQQN113E FT WORKSTATION *WSID* PRESENT
ON CP, BUT E2E FEATURES NOT
ACTIVE**

Explanation: Your TWS subsystem runs without the end- to- end features defined, the keyword *TPLGYSRV* on *OPCOPTS* parameter not specified, but exists a workstation on CP defined as a Fault-tolerant workstation.

System action: The inconsistency is showed on subsystem *MLOG* for every Fault-tolerant workstation.

User response: Change workstation from Fault-tolerant to None-Fault-tolerant workstation, or the keyword *TPLGYSRV* on *OPCOPTS* parameter.

**EQQN114E ONLY OCCNAME VALUE ALLOWED
FOR TWSJOBNAME PARAMETER
WHEN EQQTWSOU RECORD
LENGTH IS LESS THAN 160**

Explanation: The TWSJOBNAME parameter in the JTOPTS statement is set to EXTNAME, EXTNOCC or JOBNAME, but the record length of the EQQTWSOU data set is 120 bytes. This behaviour is not supported: in order to select a value different from the default OCCNAME for the TWSJOBNAME parameter, you have to migrate the EQQTWSOU data set using sample EQQMTWSO; this sample increase the data set record length to 160 bytes.

System action: The controller initialization fails.

User response: Migrate the EQQMTWSO data set by using the EQQMTWSO sample or set the TWSJOBNAME parameter in the JTOPTS statement to OCCNAME.

EQQN115I WAITING FOR NCP

Explanation: The daily planning job is creating a new current plan (NCP). The normal mode manager (NMM) controller subtask is waiting for the process to complete.

System action: The NMM subtask is waiting for the NCP to complete.

User response: None.

EQQN116I A NEW NCP WAS CREATED

Explanation: The daily planning job finished to create a new current plan (NCP).

System action: Processing continues.

User response: None.

**EQQN117I SYNCHRONIZATION BETWEEN
CONTROLLER AND SERVER
STARTED**

Explanation: The controller started synchronizing with the server during a daily planning activity.

System action: The normal mode manager (NMM) subtask is waiting for synchronization to complete.

User response: None.

EQQN118I NEW SCP WAS CREATED

Explanation: The current plan backup created the SCP file, which is a copy of the current CP.

System action: Processing continues.

User response: None.

**EQQN119W THE SA COMMAND VARSUB
MODULE EQQZVGSU COULD NOT
BE LOADED**

Explanation: IBM Tivoli Workload Scheduler for z/OS could not locate the load module EQQZVGSU for the variable substitution function in the system automation command.

System action: The initialization of the scheduler main task continues, but it is not possible to use the variable substitution function for system automation commands. If the SAVARFAIL parameter is not set, no variable substitution is done. If the SAVARFAIL parameter is set, the system automation operation fails with OJCV code.

System programmer response: Make sure that the EQQZVGSU load module exists in a library that can be accessed by IBM Tivoli Workload Scheduler for z/OS. Stop and restart the IBM Tivoli Workload Scheduler for z/OS started task.

**EQQN120I DP BATCH NCP CREATION PHASE
ENDED**

Explanation: The batch job completed the NCP creation phase. The NCP might have been created if the batch ended successfully. If so, the message EQQN118I follows.

System action: None.

System programmer response: None.

EQQN121I NEW SCP WAS CREATED

Explanation: The current plan backup for the creation of the Symphony file was created.

System action: Processing continues.

User response: None.

EQQN122I A SYMPHONY RENEW ACTIVITY WAS STARTED

Explanation: A Symphony renew activity was started by a batch job.

System action: Processing continues.

User response: None.

EQQN123W A NEW BULK DISCOVERY CANNOT BE STARTED. BULK DISCOVERY IS CURRENTLY IN PROGRESS.

Explanation: The controller received a request to start a new bulk discovery when a bulk discovery is already in progress.

System action: The new bulk discovery request is interrupted.

User response: None.

EQQN124W JTOPTS CURRPLAN(NEW) HAS BEEN SPECIFIED, BUT THE NCP DATA SET WAS NOT COPIED BY THE CONTROLLER

Explanation: The controller was restarted with JTOPTS CURRPLAN(NEW) specified. This means that during recovery to restore the current plan, the NCP VSAM file is used, with the job-tracking logs archived in the JTARC file. However, the controller detected that this NCP file had not been copied to the CP1 and CP2 VSAM files during the previous controller run. The checkpoint data set indicates that this NCP file was not taken by the controller: OPCTUNCP field is set to H. To prevent reapplying of old events, ensure that you have taken the manual actions described in the User response.

System action: Processing continues.

User response: Ensure that you performed the following steps; if not, stop the controller, take them, and restart the controller:

1. You must have replaced JTARC with the current JT log, that is the JT log indicated in the checkpoint data set. For details, see the DCLOPC record in the *Diagnosis Guide and Reference*.
2. The current JT log must have been emptied.

Note that this message is issued only the first time the controller is restarted after an incomplete NCP creation process.

EQQN125W FAILED TO SYNCHRONIZE SUBMISSION ON Z-CENTRIC WORKSTATIONS

Explanation: An error occurred during the submission synchronization processing for the Tivoli Workload Scheduler for z/OS Agent workstations.

System action: The normal mode manager (NMM) subtask continues its processing.

User response: Find and correct any error occurred on operations on Tivoli Workload Scheduler for z/OS Agent workstations with status Started and extended status Waiting for submission.

EQQN126E UNABLE TO ADD EQQHTTP0 DATASET ENTRY IN EDP TABLE

Explanation: An error occurred while adding the EQQHTTP0 entry in the EDP table. The controller detected that the EDP table has reached the number of 1000 entries, which is the maximum allowed.

System action: The controller initialization fails and a user abend is generated.

System programmer response: Remove the TPLGYPRM keyword in the BATCHOPT statement and the TPLGYSRV in the OPCOPTS; then refresh the checkpoint data set, running a daily plan extend or replan batch job after specifying the CKPTREFRESH keyword with value YES. When the batch job completes, restore the keywords previously removed.

EQQN127E A SEVERE ERROR OCCURRED WHILE RUNNING TIE BLOCK ADD ROUTINE

Explanation: An error occurred that caused the late tie adding routine to fail.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues and additional debugging traces are generated in message log.

System programmer response: If the problem persists save message log. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Describe the scenario that caused the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures.

EQQN128E A SEVERE ERROR OCCURRED WHILE RUNNING TIE BLOCK DELETE ROUTINE

Explanation: An error occurred that caused the late tie deletion routine to fail.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues and additional debugging traces are generated in message log.

System programmer response: If the problem persists save message log. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Describe the scenario that caused the

| error. To collect appropriate documentation for problem
| determination, see the *Diagnosis Guide and Reference*
| manual, Chapter 3. Problem analysis procedures.

| **EQQN130E AN ERROR OCCURRED WHILE**
| **SYNCHRONIZING BIND REQUESTS**

| **Explanation:** An error occurred while synchronizing
| the bind requests at controller startup. The scope of the
| synchronization is to prevent events from being lost
| while cross-dependencies are processed. The
| synchronization consists of:

- | 1. Sending again to remote engines the bind request
| for shadow jobs that are in Ready status with
| Sending bind request extended status.
- | 2. Notifying again the current status for the jobs
| associated with an active bind request.

| **System action:** The normal mode manager (NMM)
| subtask processing continues.

| **System programmer response:** If the problem persists
| save message log. Search the IBM Support database for
| a solution at [http://www.ibm.com/software/
| sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

| **User response:** Check for other messages indicating
| the cause of the error. After the problem is solved,
| restart the controller to force a new synchronization. If
| the problem persists, describe the scenario that caused
| the error. To collect appropriate documentation for
| problem determination, see the *Diagnosis Guide and*
| *Reference* manual, Chapter 3. Problem analysis
| procedures.

| **EQQN131W THE UNIT OF MEASURE FOR THE**
| **MAXJSFILE PARAMETER HAS**
| **CHANGED FROM KILOBYTES TO**
| **MEGABYTES**

| **Explanation:** With the support of extended VSAM
| files for the JS files, the unit of measure for the
| MAXJSFILE parameter has been modified from
| kilobytes to megabytes.

| **User response:** Recalculate and assign the value of the
| parameter in megabytes.

| **EQQN132E AN ERROR OCCURRED WHILE**
| **PROCESSING THE BIND REQUESTS**
| **IN PENDING STATUS**

| **Explanation:** An error occurred while the bind
| requests coming from a remote engine and in pending
| status were being processed. The bind requests are put
| in pending state when they need to wait for a current
| plan extension, a long-term plan extension, or a lock on
| long-term plan to be available. These pending requests
| are processed each time a new plan is put in
| production, that is when you replan or extend the
| current plan.

| **System action:** The normal mode manager (NMM)

| subtask processing continues.

| **System programmer response:** If the problem persists
| save message log. Search the IBM Support database for
| a solution at [http://www.ibm.com/software/
| sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

| **User response:** Check for other messages indicating
| the cause of the error. After the problem is solved, run
| a replan to process the pending bind requests again. If
| the problem persists, describe the scenario that caused
| the error. To collect appropriate documentation for
| problem determination, see the *Diagnosis Guide and*
| *Reference* manual, Chapter 3. Problem analysis
| procedures.

Chapter 216. EQQOnnn messages

EQQO001 - EQQO011

EQQO001I APPC TASK INITIALIZATION IS COMPLETE

Explanation: The APPC task has completed initialization processing.

System action: Processing continues.

Operator response: None.

EQQO002E APPC TASK ABENDED WHEN PROCESSING THE FOLLOWING QUEUE ELEMENT *DQE*

Explanation: An abend prevented the APPC task from processing a queue element.

System action: z/OS recovery/termination is requested to generate a dump. The APPC task attempts to continue normal processing.

System programmer response: Save the EQQMLOG, EQQDUMP, and system dump data sets and contact IBM Software Support.

Programmer response: Contact your system programmer.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log data set (EQQMLOG), the diagnostic data set (EQQDUMP), and the system dump data set to determine the cause of the error.

EQQO003E APPC TASK INITIALIZATION FAILED - XCF FAILURE

Explanation: The APPC task has ended due to an XCF failure or request denied by XCF.

System action: The APPC task is not started.

Operator response: None.

System programmer response: Make sure that the XCF destination names are defined correctly and restart the APPC task when XCF is available.

EQQO004E APPC TASK INITIALIZATION FAILED - APPC/MVS FAILURE

Explanation: The APPC task has ended due to APPC failure

System action: The APPC task is not started.

Operator response: Restart the APPC address space

before starting the IBM Tivoli Workload Scheduler for z/OS APPC task.

EQQO005I INITIALIZATION FAILED - SUBSYSTEM STOP REQUESTED

Explanation: A stop subsystem command was issued while the APPC task was initializing. This caused the task to end.

System action: The IBM Tivoli Workload Scheduler for z/OS subsystem continues the shutdown sequence.

Operator response: None.

EQQO006E APPC TASK TERMINATED - MVS/APPC SHUTTING DOWN

Explanation: The APPC task has ended due to APPC ending. All active conversations have been lost.

System action: The APPC task is shut down.

Operator response: When APPC is available again, restart the IBM Tivoli Workload Scheduler for z/OS APPC task.

EQQO007E THE APPC TASK IGNORED THE FOLLOWING ELEMENT ON THE APPC QUEUE *DQE*

Explanation: An invalid allocate request or outbound reply was found on the APPC queue.

System action: Processing continues.

System programmer response: If the element was an allocate request from a user written transaction program (TP), verify the code in the TP. If not, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQO008E THE APPC TASK IGNORED THE FOLLOWING INBOUND APPC BUFFER *APP*

Explanation: An invalid buffer was received.

System action: Processing continues.

System programmer response: If the element was an allocate request from a user written transaction program (TP), verify the code in the TP. If not, search the IBM Support database for a solution at

EQQO009E • EQQO011E

| [http://www.ibm.com/software/sysmgmt/products/](http://www.ibm.com/software/sysmgmt/products/support)
| support.

EQQO009E APPC TASK QUEUE POINTERS ARE DESTROYED, APPQ IS LOST

Explanation: The APPC task abended while processing elements on APPQ because the queue chaining is invalid.

System action: z/OS recovery/termination is requested to generate a dump. The APPC task attempts to continue normal processing.

System programmer response: Save the EQQMLOG, EQQDUMP, and system dump data sets and contact IBM Software Support.

Programmer response: Contact your system programmer.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log data set (EQQMLOG), the diagnostic data set (EQQDUMP), and the system dump data set to determine the cause of the error.

EQQO010E AN APPC FUNCTION HAS BEEN REQUESTED BUT THE LEVEL OF THE MVS SYSTEM IS NOT MVS/SPP4.2.2 OR HIGHER

Explanation: IBM Tivoli Workload Scheduler for z/OS attempted to initialize APPC services, but due to the wrong operating system level, the attempt failed.

System action: IBM Tivoli Workload Scheduler for z/OS continues to initialize without APPC support.

Programmer response: Remove (or set to NO) the APPCTASK initialization statement.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS initialization statement.

EQQO011E APPC/MVS INTERFACE MODULE COULD NOT BE LOADED

Explanation: An APPC interface module was not found in the library search path.

System action: IBM Tivoli Workload Scheduler for z/OS continues, but the APPC functions as requested by the APPCTASK keyword are disabled.

System programmer response: Ensure that the APPC modules are accessible and restart IBM Tivoli Workload Scheduler for z/OS.

Chapter 217. EQQOCnn messages

EQQOC02 - EQQOC31

EQQOC02E AN OUTPUT COLLECTOR WITH THIS NAME IS ALREADY ACTIVE, IT CANNOT START AGAIN.

Explanation: You submitted an operator START command for an output collector that is already active.

System action: The second attempt to invoke the output collector is terminated.

System programmer response: If you want to restart the output collector, stop it and submit the START command again.

EQQOC05E THE OUTPUT COLLECTOR CLIENT TASK FAILED TO INITIALIZE THE C PROCESS.

Explanation: An error occurred while attaching a task to run the C code as an MVS executable program: an invocation to the BPX1ATM callable service failed.

System action: The output collector client task initialization fails.

User response: Try to restart the output collector. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQOC06E THE OUTPUT COLLECTOR CLIENT TASK ENDED BECAUSE YOU DID NOT DEFINE ANY HTTP OR HTTPS DESTINATIONS.

Explanation: You did not define any HTTP or HTTPS destinations in the ROUTOPTS statement in the parameter library.

System action: The output collector client task initialization fails.

User response: Verify that the OUCOPTS CNTPARMS parameter is correctly set to the name of the parameter library member containing the ROUTOPTS statement definitions and that you defined at least one HTTP or HTTPS destination for a z-centric agent or a for a dynamic domain manager. Correct the parameters and restart the output collector.

EQQOC07W THE EQQPARM MEMBER SPECIFIED BY CNTPARMS DOES NOT INCLUDE OUTPUTCOLLECTOR(YES).

Explanation: The EQQPARM member specified in the

CNTPARMS keyword of the OUCOPTS statement points to an HTTPOPTS statement that does not include the OUTPUTCOLLECTOR(YES) keyword.

System action: Output collector continues processing.

User response: Verify that you specified a correct member in CNTPARMS, or that the controller is using a different version of HTTPOPTS with the OUTPUTCOLLECTOR keyword set to YES.

EQQOC08E OUCOPTS STATEMENT NOT FOUND IN THE EQQPARM PARAMETER LIBRARY MEMBER.

Explanation: The output collector started task could not find the OUCOPTS initialization statement in the data set specified in the EQQPARM DD statement.

System action: The output collector started task is terminated.

User response: Check and correct the EQQPARM DD statement in the JCL and restart Output collector.

EQQOC10E OUTPUT COLLECTOR FAILED SETTING TCP/IP IMAGE NAME TO TCPNAME.

Explanation: An error occurred while trying to communicate with the TCPIPJOBNAME TCPNAME TCP/IP stack.

System action: The output collector task uses the default name TCPIP.

User response: Verify your TCP/IP stack configuration and make sure that the TCPIPJOBNAME parameter in the TCPOPTS or HTTPOPTS statement is correct.

EQQOC11E THE LOG REQUEST (ADID: ADID, IA: IA, OPNO: OPNUM) IS DISCARDED BECAUSE THE DESTINATION DESTNAME DOES NOT EXIST.

Explanation: The output collector cannot get the joblog for the operation OPNUM in occurrence ADID with input arrival IA because the destination DESTNAME no longer exists.

System action: The output collector discards the request.

User response: Correct your ROUTOPTS definition. Then run a MODIFY command to refresh the

destination list or stop and restart the output collector.

EQQOC12W THE LOG REQUEST (ADID: ADID, IA: IA, OPNO: OPNUM) IS NOW IN PENDING STATUS BECAUSE THE AGENT IS UNAVAILABLE.

Explanation: Output collector cannot get the job log for operation *OPNUM* of occurrence *ADID* with input arrival *IA* because the dynamic agent that ran the job is unavailable.

System action: Output collector puts the request in pending status and repeatedly tries to get the job log for this job every 30 minutes until the agent is available or the retry period specified by the *OUCOPTS RETAINPEND* keyword expires.

User response: Check why the dynamic agent is unavailable and fix the problem. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQOC13E OUTPUT COLLECTOR IS CLOSING BECAUSE AN ERROR OCCURRED.

Explanation: The output collector is closing because an error occurred.

System action: The output collector closes.

User response: Review the output collector message log to determine the cause of the error. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQOC14E KILL ERROR KILLING MAIN PROCESS (PID=PID): ERRNO=ERRNUM, ERRMSG, REASON=REASON.

Explanation: An output collector thread failed to send a signal to shut down the main process. *PID* is the process ID of the main process. The error is *ERRNUM* (described by the *ERRMSG*) with reason code *REASON*.

System action: The thread closes but the output collector remains active.

User response: Close the output collector and review the output collector message log to determine why the thread is trying to kill the main process. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQOC15E ERROR OPENING SYSOUT DATA SET DDNAME: ERRNO=ERRNUM, ERRMSG, REASON=REASON.

Explanation: An error occurred while opening the

DDNAME sysout data set. The *fopen()* function error is indicated by *ERRNUM* (described by the *ERRMSG*) with reason code *REASON*.

System action: The output collector ends with errors.

User response: Verify and solve the error that is preventing the output collector from opening the sysout data set, then restart the output collector.

EQQOC16E DYNAMIC ALLOCATION FAILED FOR SYSOUT DATA SET DDNAME: ERROR CODE=ERRNUM, INFORMATION CODE=REASON.

Explanation: An error has occurred while allocating the *DDNAME* sysout data set dynamically. *ERRNUM* and *REASON* are the error code and information code returned by the *dynalloc()* dynamic allocation function.

System action: The output collector ends with errors.

User response: Verify and solve the error that is preventing the output collector from opening the sysout data set, then restart the output collector.

EQQOC17E DYNAMIC DEALLOCATION FAILED FOR SYSOUT DATA SET DDNAME: ERROR CODE=ERRNUM, INFORMATION CODE=REASON.

Explanation: An error has occurred while deallocating the *DDNAME* sysout data set dynamically. *ERRNUM* and *REASON* are the error code and information code returned by the *dynfree()* dynamic allocation function.

System action: The output collector ends with errors.

User response: Verify and solve the error that is preventing the output collector from closing the sysout data set, then restart the output collector.

EQQOC18E ERROR CLOSING SYSOUT DATA SET DDNAME: ERRNO=ERRNUM, ERRMSG, REASON=REASON.

Explanation: An error occurred while closing the *DDNAME* sysout data set. The *fclose()* function error is indicated by *ERRNUM* (described by the *ERRMSG*) with reason code *REASON*.

System action: The output collector discards the data in the sysout data set and it ends with errors.

User response: Verify and solve the error that is preventing the output collector from closing the sysout data set, then restart the output collector.

EQQOC19E ERROR WRITING TO SYSOUT DATA SET DDNAME: ERRNO=ERRNUM, ERRMSG, REASON=REASON.

Explanation: An error occurred while writing a joblog to a sysout data set with name *DDNAME*. The *fwrite()*

function error is indicated by *ERRNUM* (described by the *ERRMSG*) with reason code *REASON*.

System action: The output collector discards the data in the sysout data set and it ends with errors.

User response: Verify and solve the error that is preventing the output collector from closing the sysout data set, then restart the output collector.

EQQOC20E ERROR PROCESSING THE LOG REQUEST (ADID: *ADID*, IA: *IA*, OPNO: *OPNUM*).

Explanation: The output collector cannot get the joblog for the operation *OPNUM* in occurrence *ADID* with input arrival *IA* because an error occurred.

System action: The output collector discards the request.

User response: Review the output collector message log to determine the cause of the error. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQOC21W DESTINATION *DESTNAME* IS OFFLINE.

Explanation: Output collector failed to communicate with the z-centric agent or the dynamic domain >manager identified by the destination *DESTNAME*.

System action: The processing continues. The output collector tries periodically to connect to the destination.

User response: Look for the message *EQQHT15* in the message log. It provides details about the cause of the problem.

EQQOC23W THE *DDNAME* EVENT DATASET HAS NOT BEEN FORMATTED YET.

Explanation: The event dataset specified by *DDNAME* and used to exchange events between the controller and Output collector is not formatted yet.

System action: The task or process that is writing in the specified data set is held until the data set is formatted.

User response: Check that the controller is started and that it has completed its initialization without error. Verify that the *DDNAME* specified in the message refers to the same data set in both the controller and Output collector JCLs.

EQQOC24W ERROR PROCESSING JOB LOG HEADER (ADID: *ADID*, IA: *IA*, OPNO: *OPNUM*).

Explanation: Output collector cannot substitute the variables specified in the job log header for operation

OPNUM in occurrence *ADID* with input arrival *IA* because an error occurred. This message is followed by message *EQQHT43I*, which provides the details of the error.

System action: Output collector does not add the header to the job log.

User response: Review the output collector message log to determine the cause of the problem. Check that the level of the agent and, if appropriate, of the dynamic domain manager associated to the job log request is 8.6.0.1 or higher. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQOC25W ERROR GETTING THE JOB LOG HEADER FROM DESTINATION *DESTNAME*.

Explanation: Output collector cannot get the job log header from the agent because the current version of your agent or dynamic domain manager does not support this service.

System action: Output collector does not add the header to the job log of jobs that run on this destination.

User response: Upgrade the agent and/or dynamic domain manager to version 8.6.0.1 or higher. As soon as the upgraded version starts running, Output collector will automatically start adding a header to the job logs originated from this workstation.

EQQOC26W THE REQUEST CHECKPOINT DATASET *DDNAME* IS FULL. SLEEPING FOR *SECS* SECONDS.

Explanation: Output collector cannot checkpoint an incoming job log request in the *DDNAME* dataset.

System action: Output collector stops reading incoming requests from the *EQQOUCV* dataset for *SECS* seconds. After that it will retry to checkpoint the request.

User response: Check the output collector message log for messages indicating a problem in communicating with the agents or in deleting check-pointed requests from the dataset. Verify and solve the error. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQOC27E ERROR DELETING MEMBER *MEMBER* FROM THE REQUEST CHECKPOINT DATASET *DDNAME*.

Explanation: Output collector cannot delete a processed request from the *DDNAME* checkpoint dataset.

EQQOC28E • EQQOC31E

System action: Output collector continues processing without removing the request.

User response: Manually remove the member from the dataset. Verify and solve the error that is preventing Output collector from deleting the member. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQOC28E ERROR RESUMING INTERRUPTED JOB LOG REQUESTS. REASON: REASON.

Explanation: Output collector has encountered a problem during initialization. An error occurred while resuming interrupted job log requests that were checkpointed in the EQQOUCKP dataset.

System action: Output collector stops resuming job log requests and continues its initialization.

User response: Investigate the *REASON* to solve the problem that is causing the error and restart Output collector. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQOC30I THE LOG REQUEST (ADID: ADID, IA: IA, OPNO: OPNUM) IS NO LONGER IN PENDING STATUS.

EQQOC31E THE PENDING LOG REQUEST (ADID: ADID, IA: IA, OPNO: OPNUM) HAS BEEN DISCARDED BECAUSE THE RETAIN PERIOD HAS EXPIRED.

Explanation: Output collector cannot get the job log for operation *OPNUM* of occurrence *ADID* with input arrival *IA* because the dynamic agent that ran the job has been unavailable for a longer period than the retry period specified by the OUCOPTS RETAINPEND keyword.

System action: Output collector discards the request.

User response: Check why the dynamic agent is unavailable and fix the problem. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Chapter 218. EQQPnnn messages

EQQPH00 - EQQP109

EQQPH00I SERVER TASK HAS STARTED

Explanation: The server task has started successfully. This task is started by the server started task. It is started by the IBM Tivoli Workload Scheduler for z/OS subsystem if APPC(YES) is specified in the OPCOPTS initialization statement.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing.

EQQPH01I SERVER TASK ENDED

Explanation: The server task has been requested to stop and is ending normally.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing.

EQQPH02E SERVER NAME IS ALREADY ACTIVE, IT CANNOT START AGAIN

Explanation: An operator START command has been entered for a IBM Tivoli Workload Scheduler for z/OS server that is already active.

System action: The second attempt to invoke the server is terminated.

System programmer response: If you want to restart the IBM Tivoli Workload Scheduler for z/OS server, first stop it and issue the START command.

EQQPH03I AN ELEMENT ON THE APPC/MVS QUEUE IS OF UNRECOGNIZED TYPE: ELEM

Explanation: IBM Tivoli Workload Scheduler for z/OS receives APPC requests, for example, allocate requests, on the APPC queue. The queue element presented in the message is not supported by the server task.

System action: The queue element is deleted from the APPC queue. It causes no further action.

System programmer response: The message variable *ELEM* gives diagnostics, which is especially useful if there are other indications on an error in the IBM Tivoli Workload Scheduler for z/OS server APPC communication.

EQQPH05E BUFFER CONTAINS WRONG AMOUNT OF INPUT DATA, OR WRONG VALUES

Explanation: The APPC and TCP/IP communication routines of the IBM Tivoli Workload Scheduler for z/OS server receive data for processing by the server. The buffer of data is validated and does not pass the validation.

System action: The server deallocates the APPC (TCP/IP) conversation. The contact between either the IBM Tivoli Workload Scheduler for z/OS dialog or the program interface application and the IBM Tivoli Workload Scheduler for z/OS subsystem is thereby broken. The partner of the APPC (TCP/IP) conversation needs to reestablish the connection.

System programmer response: Save a slip trap on message EQQPH05E and dump the IBM Tivoli Workload Scheduler for z/OS Server task. Save the IBM Tivoli Workload Scheduler for z/OS server and controller message log and the SYSLOG portion that includes the message. If the problem persists, to collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the IBM Tivoli Workload Scheduler for z/OS Server region size to verify if this value is not enough to run the workload. Describe the scenario that caused the error.

EQQPH06E A SERVER SUBTASK ABENDED. THE SUBTASK WAS CREATED FOR PROCESSING APPC ALLOCATE DATA: FMH5 FMH52

Explanation: The IBM Tivoli Workload Scheduler for z/OS server has created a subtask for processing requests from a remote dialog user or a program interface application. The subtask has abended.

System action: The server deallocates the APPC conversation. The contact between either the IBM Tivoli Workload Scheduler for z/OS dialog or the program interface application and the IBM Tivoli Workload Scheduler for z/OS subsystem is thereby broken.

System programmer response: If the problem persists save the server and controller message log and the DUMP produced. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

- | **User response:** Check the Server region size to verify
- | if this value is not enough to run the workload.
- | Describe the scenario that caused the error.

EQQPH07E A SERVER OBJECT ABENDED. THE OBJECT WAS CREATED TO PROCESS TYPE REQUESTS.

Explanation: A IBM Tivoli Workload Scheduler for z/OS server subtask was created to process requests from a remote dialog user using a TCP/IP connection. The subtask has abended.

For the end-to-end server the problem may be that it is pointing to the wrong work directory. If this is the case, this is due to the fact that either the BINDIR or WRKDIR values in the TOPOLOGY statement may be discordant with the values created with the EQQPCS05 sample.

System action: The server closed the TCP/IP connection, so contact between the IBM Tivoli Workload Scheduler for z/OS dialog and the IBM Tivoli Workload Scheduler for z/OS subsystem has been lost.

User response: If you use end-to-end scheduling, check the BINDIR and WRKDIR values in the TOPOLOGY statement.

If the problems recurs, report the error to IBM Software Support.

EQQPH08I TCP/IP CANNOT BE INITIALIZED. CHECK THAT TCP/IP IS AVAILABLE AND THAT SSL IS PROPERLY CONFIGURED.

Explanation: A IBM Tivoli Workload Scheduler for z/OS server got an error when trying to communicate with TCP/IP.

System action: The IBM Tivoli Workload Scheduler for z/OS server stops processing.

User response: Check that TCP/IP is available.

EQQPH09I THE SERVER IS USING THE *PROT* PROTOCOL

Explanation: A IBM Tivoli Workload Scheduler for z/OS server is using the *PROT* protocol for communication.

System action: None.

EQQPH10E COMMUNICATION WITH USER *USER* AT LU *LU* FAILED, APPC/MVS SERVICE *VERB* REQUESTED IN STATE *STATE* RETURN_CODE *RC*, STATUS_RECEIVED *SR*, DATA_RECEIVED *DR*

Explanation: The APPC communication between a dialog user or program interface application and the

IBM Tivoli Workload Scheduler for z/OS server failed. An APPC service request issued by the server ended with a nonzero return code.

System action: The server deallocates the APPC conversation. The contact between either the IBM Tivoli Workload Scheduler for z/OS dialog or the program interface application and the IBM Tivoli Workload Scheduler for z/OS subsystem is thereby broken.

System programmer response: Check the meaning of the APPC return codes. If the problem recurs, report the error to IBM Software Support.

EQQPH11E COMMUNICATION WITH USER *USER* AT LU *LU* FAILED, UNEXPECTED COMBINATION OF RETURN VALUES APPC/MVS SERVICE *VERB* REQUESTED IN STATE *STATE* RETURN_CODE *RC*, STATUS_RECEIVED *SR*, DATA_RECEIVED *DR*

Explanation: The APPC communication between a dialog user or program interface application and the IBM Tivoli Workload Scheduler for z/OS server failed. An APPC service request ended with a combination of return values that is not supported by the communication routines.

System action: The server deallocates the APPC conversation. The contact between either the IBM Tivoli Workload Scheduler for z/OS dialog or the program interface application and the IBM Tivoli Workload Scheduler for z/OS subsystem is thereby broken. The partner of the APPC conversation, a dialog user, or a program interface application, is informed about the error by message EQQPH14 and an error return code. A IBM Tivoli Workload Scheduler for z/OS dialog user gets message EQQPH14 displayed at the next terminal action. A program interface application gets message EQQPH14 written to the message log of the program interface job and the EQQYCOM call ends with a return code of 8.

System programmer response: Check the meaning of the APPC return codes. If the problem recurs, report the error to IBM Software Support.

EQQPH12E COMMUNICATION WITH USER *USER* AT LU *LU* FAILED, INSUFFICIENT VIRTUAL STORAGE AVAILABLE, DIAGNOSTIC INFO *ALT*

Explanation: The APPC communication between a dialog user or program interface application and the IBM Tivoli Workload Scheduler for z/OS server failed because of insufficient storage for the server task.

System action: The server deallocates the APPC conversation. The contact between either the IBM Tivoli Workload Scheduler for z/OS dialog or the program interface application and the IBM Tivoli Workload

Scheduler for z/OS subsystem is thereby broken.

System programmer response: Stop the server, or the IBM Tivoli Workload Scheduler for z/OS Controller if the message is in the Controller message log, and restart it in a larger region.

EQQPH13E FAILED TO LOAD SERVICE MODULE MOD

Explanation: A dialog user or a program interface application tries to invoke IBM Tivoli Workload Scheduler for z/OS remotely. A IBM Tivoli Workload Scheduler for z/OS server module required for the remote communication cannot be located.

System action: The system waits for you to respond.

System programmer response: Check that the module can be accessed. If the problem recurs, report the error to IBM Software Support.

EQQPH14E USER USER AT LU LU TERMINATED COMMUNICATION WITHOUT DEALLOCATE

Explanation: This message is issued in the APPC server message log. The communication terminated prematurely on the user side, either because the TERM request in a program interface running through the APPC was not processed or a dialog user terminated prematurely an APPC session (for example, by pressing the Escape key). It might be also due to a program abend.

System action: The communication is terminated on the server side.

System programmer response: Check the communication on the server side.

EQQPH15E COMMUNICATION FAILED. TCPIP SOCKET_CALL VERB CALLED IN STATE STATEINVALID SOCKET CALL OR STATE SOCKET CALL RETURN_CODE RC, REASON_CODE RS

Explanation: The TCP/IP connection between a dialog user and a IBM Tivoli Workload Scheduler for z/OS server failed. Either the TCP/IP socket service or the connection subtask state is invalid.

System action: The server closes the TCP/IP connection. Contact between the IBM Tivoli Workload Scheduler for z/OS dialog and the IBM Tivoli Workload Scheduler for z/OS subsystem is lost. The partner of the TCP/IP connection is informed about the error.

User response: Verify that the value specified in the message (case sensitive) is the same reported in the RACF profile for TMEADMIN. Search the IBM Support database for a solution at <http://www.ibm.com/>

| [software/sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

EQQPH16E COMMUNICATION FAILED. TCPIP SOCKET_CALL VERB FAILED IN STATE STATE RETURN_CODE RC, REASON_CODE(ERRNO) RS

Explanation: The TCP/IP connection between a dialog user and a IBM Tivoli Workload Scheduler for z/OS server failed. A TCP/IP socket service call failed.

System action: The server closes the TCP/IP connection. Contact between the IBM Tivoli Workload Scheduler for z/OS dialog and the IBM Tivoli Workload Scheduler for z/OS subsystem is lost. The partner of the TCP/IP connection is informed about the error.

User response: Look at the TCP/IP return codes to discover the reason. If the problem recurs, report the error to IBM Software Support.

EQQPH17E COMMUNICATION FAILED, INSUFFICIENT VIRTUAL STORAGE AVAILABLE, DIAGNOSTIC INFO ALT

Explanation: The TCP/IP connection between a dialog user and a IBM Tivoli Workload Scheduler for z/OS server failed due to insufficient storage for the server task.

System action: The server deallocates the TCP/IP connection. Contact between the IBM Tivoli Workload Scheduler for z/OS dialog and the IBM Tivoli Workload Scheduler for z/OS subsystem is lost. The partner of the TCP/IP connection is informed about the error.

User response: Stop the server and restart it in a larger region.

EQQPH18E COMMUNICATION FAILED, THE FUNCTION SOCKET CALL FAILED WITH ERROR CODE ERRNO

Explanation: The TCP/IP connection between a dialog user and a IBM Tivoli Workload Scheduler for z/OS server failed. A TCP/IP socket service call failed.

System action: If the TCP/IP connection is active, the connection is closed and contact between the IBM Tivoli Workload Scheduler for z/OS dialog and the IBM Tivoli Workload Scheduler for z/OS subsystem is lost.

User response: Look at the TCP/IP return codes to discover the reason. If the problem recurs, report the error to IBM Software Support. Typical examples are ERRNO=1011 (the DD card SYSTCP might be missing in the TCP/IP started task), ERRNO=156 (the OMVS segments for the server STC could not be defined), and ERRNO=13 (the server is related to a different port number in the TCP/IP profile data set).

EQQPH19E COMMUNICATION FAILED, THE COMMUNICATION WAS TIMED OUT. COMMUNICATION CLOSED

Explanation: The TCP/IP connection between a dialog user and a IBM Tivoli Workload Scheduler for z/OS server was timed out. The connection was inactive for too long.

System action: The server closes the TCP/IP connection. Contact between the IBM Tivoli Workload Scheduler for z/OS dialog and the IBM Tivoli Workload Scheduler for z/OS subsystem is lost. The partner of the TCP/IP connection is informed about the error. The IBM Tivoli Workload Scheduler for z/OS server continues processing.

User response: Try to locate the previous error messages in the message log, and contact your system programmer.

EQQPH20E COMMUNICATION FAILED, A PROTOCOL ERROR WAS DETECTED BY THE SERVER. COMMUNICATION CLOSED

Explanation: The TCP/IP connection between a remote interface (dialog or batch interface) and a IBM Tivoli Workload Scheduler for z/OS server failed due to a protocol error. Possibly, an incorrect connection parameter was provided.

System action: The server closes the TCP/IP connection. Contact between the remote interface and subsystem is lost. The partner of the TCP/IP connection is informed about the error.

User response: Check the connection parameters. It is very likely that there is a firewall misalignment between the server and the client (for example, the server is set with the SSLFORCE option to YES, but the client does not use SSL).

EQQPH21E TYPE IS NOT CORRECT. TYPE MUST BE IN THE RANGE FROM 0 TO 65535, DEFAULT TYPEDEFAULT IS CURRENTLY USED.

Explanation: An incorrect *TYPE* parameter value has been specified.

System action: The *TYPE* parameter value is set to *DEFAULT*.

User response: If you do not want to use the default value, check the *TYPE* value in the *SERVOPTS* statement. It must be within the range 0 to 65535.

EQQPH22E COMMUNICATION FAILED, TCPIP SOCKET CALL *VERB* CALLED IN STATE *STATE*. UNEXPECTED COMBINATION SOCKET CALL RETURN_CODE *RC*, REASON_CODE *RS*

Explanation: The TCP/IP connection between a dialog user and a IBM Tivoli Workload Scheduler for z/OS server failed.

System action: The server closes the TCP/IP connection. Contact between the IBM Tivoli Workload Scheduler for z/OS dialog and the IBM Tivoli Workload Scheduler for z/OS subsystem is lost. The partner of the TCP/IP connection is informed about the error.

User response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQPH23E NO DEFAULT CALENDAR IS SPECIFIED, IT IS REQUIRED WHEN PROTOCOL IS JSC

Explanation: The default calendar name is required by the protocol.

System action: The server initialization is terminated.

System programmer response: Make sure that the *INIT* statement is present in the server parameter library and that the *CALENDAR* keyword is specified.

EQQPH24E REQUIRED PARAMETER *PAR* MISSING IN *STMT* STATEMENT

Explanation: The required parameter is missing in the related statement of the server parameter file.

System action: None.

User response: Check the statement and correct the errors.

EQQPH25E TME USER ID MISSING IN RACF CLASS TMEADMIN: *USER*

Explanation: The server rejected the request for either of the following reasons:

- The server table for the mapping of the Tivoli administrator and the RACF user ID does not exist.
- The Tivoli administrator is not defined in the *TMEADMIN* mapping table.

System action: None.

User response: Check that the mapping table exists or that the Tivoli administrator is defined in the table. For detailed information about implementing security, see *Customization and Tuning*

EQQPH26E TME USER ID MISSING IN TME USER TO RACF USER ID MAPPING TABLE: USER

Explanation: The user ID is not defined in the server table containing the mappings from TME users to RACF users.

System action: The server rejected the request.

User response: Check the USERMAP parameter that identifies the mapping table in the SERVOPTS statement. Check the table entries and the user ID that are provided.

EQQPH27I TYPE IS NOT SPECIFIED, DEFAULT TYPEDEFAULT IS CURRENTLY USED.

Explanation: The *TYPE* parameter is missing. The default *DEFAULT* value is currently used.

System action: The parameter *TYPE* is set to the *DEFAULT* value.

User response: If you do not want to use the default value, enter a valid value for the parameter.

EQQPH28I THE TCP/IP STACK IS AVAILABLE.

Explanation: A Tivoli Workload Scheduler for z/OS server can communicate with TCP/IP.

System action: The Tivoli Workload Scheduler for z/OS is continuing the process.

User response: If you do not want to use the default value, enter a valid value for the parameter.

EQQPH29I INVALID TYPE SPECIFIED, DEFAULT TYPE DEFAULT IS CURRENTLY USED.

Explanation: An invalid value has been specified for the *Type* parameter. The Default value is currently used.

System action: The parameter *type* is set to the default value.

User response: If you do not want to use the default value, enter a valid value for the parameter.

EQQPH30E COMMUNICATION TO FT WORKSTATIONS FAILED, THE SCHEDULER REQUIRES SERV AS END-TO-END SERVER. THE COMMUNICATION WITH FTWs CANNOT BE STARTED

Explanation: The server cannot start the communication with fault-tolerant workstations, because the end-to-end server defined in the controller is another one.

System action: The server does not start

communication with fault-tolerant workstations and continues processing.

System programmer response: Change the end-to-end server parameter and restart the controller and the server

Problem determination: The end-to-end server parameters could be wrong.

EQQPH31E COMMUNICATION TO FT WORKSTATIONS FAILED, SERVER CANNOT FIND THE CONTROLLER SSNM THE COMMUNICATION WITH FTWs CANNOT BE STARTED

Explanation: The server cannot start communication with fault-tolerant workstations, because the specified controller is not found in the system.

System action: The server does not start communication with fault-tolerant workstations and continues the processing.

System programmer response: Check the controller specified in the server parameters and restart the controller before starting the server.

Problem determination: The controller specified in the server parameters could be wrong or the controller is not active.

EQQPH32E COMMUNICATION TO FT WORKSTATIONS FAILED, THE SERVER SHOULD ACT AS END-TO-END WITH THE SSNM CONTROLLER BUT THE TOPOLOGY PARAMETER IS MISSING IN SERVOPTS STATEMENT

Explanation: The server is not defined as an end-to-end server but is defined as the end-to-end server in the controller parameter.

System action: The server does not start communication with fault-tolerant workstations and continues the processing.

System programmer response: If the server must be the end-to-end server, introduce the topology parameters in the server parameters, then restart the server.

Problem determination: The topology parameters are not defined in the server parameters.

EQQPH33I THE END-TO-END PROCESSES HAVE BEEN STARTED

Explanation: The server has successfully started the UNIX processes required to communicate with fault-tolerant workstations.

System action: The server continues processing.

User response: None.

EQQPH34I THE END-TO-END PROCESSES HAVE ENDED

Explanation: The server has detected that the UNIX processes required to communicate with fault-tolerant workstations have ended as required.

System action: The server continues to shut down.

User response: None.

EQQPH35E CANNOT START STARTER PROCESS: BPX1ATX FAILED WITH RC=RC, RSN=RSNC

Explanation: The server has detected an error starting UNIX processes required to communicate with fault-tolerant workstations. The USS Assembler Callable Service BPX1ATX has failed with the specified return code *RC* and reason code *RSNC*.

System action: The server does not start the UNIX processes and continues processing other server functions.

Problem determination: Check the return code (*RC*) and reason code (*RSNC*) in the *UNIX System Services Messages and Codes* manual to determine which error has caused the BPX1ATX to fail. In the scheduler parameters, check the value of the BINDIR keyword in the TOPOLOGY statement. This controls the access mode and extended attributes of the starter executable file on the HFS or ZFS file system.

EQQPH36E COMMUNICATION TO FAULT TOLERANT WORKSTATIONS FAILED, NO TOPOLOGY PARAMETERS DEFINED TO CONTROLLER. THE COMMUNICATION WITH FAULT TOLERANT WORKSTATIONS CANNOT BE STARTED.

Explanation: The server cannot start the communication with Fault Tolerant Workstations, because the topology parameters aren't defined in Controller.

System action: The Server doesn't start the communication with Fault Tolerant Workstations and continue the processing.

System programmer response: Add the topology parameters on Controller and restart Controller and Server.

Problem determination: The topology parameters couldn't be provided in the controller parameters member.

EQQPH37I SERVER CAN RECEIVE REQUESTS

Explanation: The server has acknowledged that the z/OS connector is up and running and that the TCP/IP communication is now open.

System action: The server is now ready to process input.

User response: None.

EQQPH40I JSC HOSTNAME NOT SPECIFIED, THE IP ADDRESS VALUE IS TAKEN FROM TCP/IP CONFIGURATION.

Explanation: See message text.

System action: Processing continues.

User response: Verify that your configuration is correctly set up.

EQQPH41E APPC IS EITHER INACTIVE OR NOT READY.

Explanation: The APPC started task is inactive or not ready.

System action: The server task waits for the APPC started task to be reactivated; APPC connections toward the controller are impossible.

User response: Make the APPC started task working properly.

EQQPH42E NO TPLGYPRM IS SPECIFIED, IT IS REQUIRED WHEN PROTOCOL IS E2E

Explanation: The *TPLGYPRM* parameter is required by end-to-end distributed environment.

System action: The server initialization is terminated.

System programmer response: Make sure that the *TPLGYPRM* parameter is present in the server parameter library.

User response: Enter a valid value for the parameter. *TPLGYPRM* is a member of parameter library.

EQQPH44W BOTH SERVOPTS AND TCPOPTS STATEMENTS ARE SPECIFIED FOR THE SERVER. JSCHOSTNAME AND PORTNUMBER VALUES IN SERVOPTS HAVE BEEN REPLACED.

Explanation: You specified both the SERVOPTS and TCPOPTS server initialization statements. Both of them contain host name and connection timeout parameters.

System action: HOSTNAME and SRVPORTNUMBER values in the TCPOPTS statement override JSCHOSTNAME and PORTNUMBER values in the SERVOPTS statement.

User response: If the HOSTNAME and

SRVPORTNUMBER values in the TCPOPTS statement are the ones that you expect, no action is required; anyway you can remove the unneeded SERVOPTS keywords. Otherwise, remove or correct the HOSTNAME and SRVPORTNUMBER parameter in the TCPOPTS statement.

EQQPH45E AN ERROR OCCURRED IN TCP/IP CALL *FUNC.* RETURN CODE: RC ERRNO: *ERRNO*. DIAGNOSE TCP/IP MESSAGE FOLLOWS.

Explanation: The server detected the error indicated by the message variables. When a connection attempt is going to be retried, this message is followed by EQQPH47W, to inform about the connection retry interval.

System action: The server gets TCP/IP information and processes it to set EQQPH46I message variable.

User response: To obtain additional information, look for EQQPH46I in the message log (EQQMLOG).

EQQPH46I *TCPIPMSG*

Explanation: This message contains additional information for a previous EQQPH45E message. If *TCPIPMSG* is TIMEOUT EXPIRED MONITORING A CONNECTION, the problem is due to a lack of network resources causing the network to slow down.

System action: Processing continues.

User response: Integrate this information with the previous EQQPH45E message information. In case of SSL error, the most common causes are listed in Chapter 236, "SSL errors," on page 1431.

EQQPH47W THE SERVER COULD NOT INITIALIZE THE COMMUNICATION WITH TCP/IP. A NEW ATTEMPT WILL OCCUR EVERY 60 SECONDS.

Explanation: This message is issued after EQQPH45E when the connection attempt is going to be retried.

System action: The system waits approximately for 1 minute before attempting an automatic restart.

User response: None.

EQQPH48E THE CONNECTION TIMEOUT EXPIRED. THE CONNECTION WAS NOT ESTABLISHED WITHIN THE TIME SPECIFIED WITH THE CONNTIMEOUT PARAMETER.

Explanation: This message is issued on the client when the connection cannot be established within the time specified in the CONNTIMEOUT parameter. This condition might occur because of one of the following reasons: the server has temporarily reached the

maximum number of concurrent connection requests it can manage. Message EQQPH49W is also issued in the server MLOG.

System action: The connection is rejected.

User response: On the client, increase the value set for the CONNTIMEOUT parameter.

EQQPH49W MAXIMUM NUMBER OF CONNECTIONS REACHED IN THE SERVER STARTED TASK.

Explanation: This message is issued when the server cannot temporarily manage further TCP/IP connections from clients, because there is not enough storage available below the 16 MB line.

System action: After this message is issued, the connection requested by the client can either remain queued until the server is able to establish it, or can be rejected because the time specified in the CONNTIMEOUT parameter is exceeded (in this case, message EQQX619E THE CONNECTION TIMEOUT EXPIRED, THE CONNECTION WAS NOT ESTABLISHED is issued).

This message is issued in the server MLOG the first time the maximum number of connections is reached. It will be reissued only when it again reaches the maximum number.

User response: None.

EQQPH50I THE SERVER IS WAITING FOR REQUESTS ON *PROTOCOL* NETWORK.

Explanation: The server is ready to process network requests with the *PROTOCOL* protocol.

System action: The processing continues.

User response: None.

EQQPH51E THE COMMUNICATION WAS UNEXPECTEDLY RESET BY THE PEER.

Explanation: A problem occurred at the server side. Most common causes of this problem are:

- The server was stopped.
- The partner connection parameters are inconsistent.

System action: The server closes the TCP/IP connection. Contact between the remote interface and subsystem is lost. The partner of the TCP/IP connection is informed about the error.

User response: Check the status of the server and the connection parameters. Look for additional information in the peer EQQMLOG. If the problem persists, report the error to IBM Software Support.

EQQPH52I A CONNECTION HAS BEEN ESTABLISHED TO THE SERVER AT NETWORK ADDRESS AND PORT *HOST PORT*.

Explanation: A session was established between the remote partner and the server.

System action: The processing continues.

EQQPH53E THE COMMUNICATION TASK ENDED UNEXPECTEDLY.

Explanation: The task used to establish connection between the interface and the server ended.

System action: The task abnormally ends without a stop request.

User response: Contact your system programmer. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQPH55I PARENT TASK STOPPED BEFORE THE CHILD COMMUNICATION TASK.

Explanation: The task used to establish connection between the interface and the server ended after the parent task ended.

System action: The task abnormally ends without a stop request.

User response: Verify the shutdown process for the parent task. If you run a programming interface, verify that a TERM request is performed before closing the user program.

EQQPH56W RAN MOMENTARILY OUT OF STORAGE. WAITING FOR RESOURCES TO BECOME AVAILABLE.

Explanation: The server cannot at this moment manage further TCP/IP connections from clients, because sufficient storage is momentarily unavailable.

System action: All the available memory resources are currently being used by the already established connections. As soon as enough memory is released, the requested connection will be established (unless in the meantime the time specified in the CONNTIMEOUT parameter is exceeded, then the connection is rejected and message EQQX619E THE CONNECTION TIMEOUT EXPIRED, THE CONNECTION WAS NOT ESTABLISHED will be issued).

User response: None.

EQQPH57I THE TCPIP COMMUNICATION SUBTASK BUILD DATE IS:YYYYMMDD.

Explanation: Shows the build date of the TCPIP COMMUNICATION SUBTASK used to communicate with the remote user interfaces.

EQQPH59E CHARACTER *CURCHAR* NOT VALID FOR *STMT* STATEMENT.

Explanation: This error message is issued while a row of the USERMAP member in the parameter library is being parsed.

CURCHAR

Is the offending character.

STMT Can be one of the following parameters: *USER* or *USERMAP*.

System action: The server closes the TCP/IP connection.

User response: Correct the offending USERMAP entry.

EQQPH60I THE TCP/IP COMMUNICATION SUBTASK HAS STARTED.

Explanation: The TCP/IP communication subtask has successfully completed initialization.

System action: Processing of the TCP/IP communication subtask continues.

User response: None.

EQQPH61I THE TCP/IP COMMUNICATION SUBTASK HAS ENDED.

Explanation: The TCP/IP communication subtask has ended either because the controller is in the process of shutting down or as a result of an operator MODIFY command to terminate this task or a related task.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQPH62E THE TCP/IP COMMUNICATION SUBTASK FAILED TO INITIALIZE THE C PROCESS.

Explanation: An error occurred while attaching a task to run the C code as an MVS executable program: an invocation to the BPX1ATM callable service failed.

System action: Initialization of the TCP/IP communication subtask fails.

User response: Try to restart the TCP/IP communication subtask with the MODIFY command. If the problem persists, contact IBM Software Support.

EQQPH63E TOO MANY WILD CARDS USED IN
STMT STATEMENT.

Explanation: This error message is issued while a row of the USERMAP member in the parameter library is being parsed. *STMT* can be one of the following parameters: *USER* or *USERMAP*.

System action: The server closes the TCP/IP connection.

User response: Correct the offending USERMAP entry.

EQQPH64I USER *USER* WAS MAPPED TO THE
RACF *RACUSR* USER ID AND *RACGRP*
RACF GROUP.

EQQPH65I NO RACF USER ID MATCHES USER
USER.

EQQPH66I USER *USER* WAS MAPPED TO THE
RACF *RACUSR* USER ID.

EQQPH67I SERVER IS ACTIVATING SECURE
SOCKETS LAYER (SSL) PROTOCOL
FOR COMMUNICATAION.

System action: Only SSL-type requests are accepted.

User response: Use clients with SSL ON only.

EQQPH68E TOO MANY CONNECTIONS OPEN IN
THE SYSTEM.

Explanation: The maximum number of possible concurrent connections was reached.

System action: The involved user interface session is closed.

User response: Increase the value of the MAXTHREADS system parameter in the BPXPRMxx system parameters member or wait for another connection to close.

EQQPH69E INSUFFICIENT RESOURCES
AVAILABLE, DIAGNOSTIC
INFORMATION: *message*.

Explanation: Details provided by *message*.

System action: If the connection was up, it is closed.

User response: Wait for resources to become available.

EQQPH70W USER *USER* IS ASSOCIATED TO THE
RACF PATTERN: *PATTERN* IN THE
USER MAP. THE RESULTING VALUE
IS TOO LONG. IT WILL BE
TRUNCATED TO *SHORTRAC*.

Explanation: The value for RACFUSER or

RACFGROUP exceeds the 8-character limit after being matched with the wildcarded USER.

System action: The value of is truncated to the 8-character limit.

User response: None.

EQQPH71E SECURITY ENVIRONMENT CREATE
FAILED FOR USER *USER* AND
GROUP *GROUP*. DIAGNOSTICS: SAF
RC *XSSRC*, RACF RC *XSSRS*, RACF RS
XSSAB.

Explanation: The server failed to create a security environment for this user. The SAF return code and the RACF return and reason codes of the failing RACROUTE VERIFY=CREATE is given in the message.

System action: User cannot start the scheduler dialog remotely.

User response: Check the authorizations related to user *USER* and group *GROUP* provided by the API or Tivoli Dynamic Workload Console.

EQQPS00E PRE SUBMITTER TASK HAS
IGNORED AN INVALID QUEUE
ELEMENT: *DQE*

Explanation: A queue element did not contain the correct eye catcher or version number.

System action: The Pre Submitter task does not process the invalid element, but continues normal processing.

System programmer response: Save the scheduler Pre Submitter task message log and contact IBM Software Support.

User response: Contact your system programmer.

EQQPS01I PRE SUBMITTER TASK
INITIALIZATION COMPLETE

Explanation: The Pre Submitter task has successfully completed its initialization.

System action: Pre Submitter task processing starts.

User response: None.

EQQPS02E PRE SUBMITTER TASK
INITIALIZATION FAILED

Explanation: The Pre Submitter task could not acquire all the resources needed for normal operation.

System action: The Pre Submitter task does not start and all other active tasks close.

System programmer response: Correct the errors and restart the submit task.

Problem determination: Review earlier messages in

the message log to determine the cause of the error.

**EQQPS03E PRE SUBMITTER TASK DQE
SUBTYPE UNEXPECTED**

Explanation: The Pre Submitter task kept a DQE containing an invalid subtype.

System action: The Pre Submitter task does not process the invalid element, but continues normal processing.

System programmer response: Save the scheduler Pre Submitter task message log. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

**EQQPS04E PRE SUBMITTER ABENDED WHEN
PROCESSING THE FOLLOWING
QUEUE ELEMENT DQE**

Explanation: An ABEND prevented the Pre Submitter task from processing a queue element.

System action: Recovery/termination is requested to generate a dump. The Pre Submitter task attempts to continue normal processing.

System programmer response: Save the message log and dump data sets and contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Review the data store message log data set, the EQQDUMP data set, and the SYSMDUMP data set to determine the cause of the problem.

**EQQPS05E PRE SUBMITTER QUEUE POINTER IS
DESTROYED. ARCQ IS LOST**

Explanation: The Pre Submitter task abended while processing elements on the ARCQ because queue chaining is invalid.

System action: Recovery/termination is requested to generate a dump. The Pre Submitter task attempts to continue normal processing.

System programmer response: Save the MLOG, dump and BEX data sets. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your systems programmer.

Problem determination: Review the data store message log data set, the BEX diagnostic data set, and the dump data set to determine the cause of the problem.

**EQQPS06E PRE SUBMITTER JCL TAILORING
FAILURE: MODULE MNAME RETURN
CODE: RC - REASON CODE: RSC**

Explanation: An internal error occurred during Pre Submitter task jcl tailoring in module MNAME.

System action: The Pre Submitter task does not process the current JCL, but continues normal processing.

System programmer response: Save the scheduler Pre Submitter task message log. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

**EQQPS07E NO PRE SUBMITTER JCL TAILORING:
JCL MEMBER IS IN USE FOR ADID:
ADID IA: IA OPNUM: OPNUM**

Explanation: Pre Submitter task is unable to perform JCL tailoring action because jcl is currently in use by another task or user.

System action: The Pre Submitter task does not process the current JCL, but continues normal processing.

User response: Free the JCL resource and restart the process.

**EQQPS08W NO PRE SUBMITTER JCL TAILORING:
JS VSAM JCL NOT FOUND FOR
ADID: ADID IA: IA OPNUM: OPNUM**

Explanation: Pre Submitter task is unable to perform JCL tailoring action because the requested JCL is not present in JS VSAM data set.

System action: If there are no other EQQPSxx error messages, the JCL is processed normally by using the JCL located in the PDS JOBLIB.

User response: A user probably manually deleted JCL from JS VSAM data set using an online scheduler function.

**EQQPS09E NO PRE SUBMITTER JCL TAILORING:
INSUFFICIENT STORAGE FOR ADID:
ADID IA: IA OPNUM: OPNUM**

Explanation: Pre Submitter task is unable to perform JCL tailoring action because there is insufficient storage to perform operation.

System action: The Pre Submitter task does not process the current JCL, but continues normal processing.

System programmer response: If the problem occurs often, try to solve it by enlarging the size of the scheduler main storage. Search the IBM Support database for a solution at <http://www.ibm.com/>

software/sysmgmt/products/support.

User response: Contact your System Programmer.

**EQQPS10E NO PRE SUBMITTER JCL TAILORING:
JCL MEMBER NOT FOUND FOR:
ADID: ADID IA: IA OPNUM: OPNUM**

Explanation: Pre Submitter task is unable to perform JCL tailoring action because the requested JCL is not present neither in JS VSAM data set and nor in PDS job library.

System action: The Pre Submitter task does not process the current JCL, but continues normal processing.

User response: A user probably manually deleted JCL from JS VSAM data set using an online scheduler function and from PDS JCL library.

**EQQPS11E THE JCL LIBRARY, DDNAME
EQQJBLIB, COULD NOT BE OPENED**

Explanation: The Pre Submitter task could not open the JCL library.

System action: The Pre Submitter task does not start and all other active tasks close.

System programmer response: Correct the errors and restart the submit task. If the problem persists save message log. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Review earlier messages in the message log to determine the cause of the error.

**EQQPS12E LOGICAL RECORD SIZE FOR THE
JCL LIBRARY, DDNAME EQQJBLIB, IS
INVALID**

Explanation: The Pre Submitter task could not open the JCL library because its record size is invalid. It must be 80.

System action: The Pre Submitter task does not start and all other active tasks close.

System programmer response: Correct the errors and restart the submit task. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

**EQQPS13E NO PRE SUBMITTER JCL TAILORING:
SYSIN MERGE PROBLEMS FOR
ADID: ADID IA: IA OPNUM: OPNUM
RSNTXT**

Explanation: The operation identified by *ADID*, *IA* and *OPNUM* was not rerun because the needed expanded jcl could not be correctly restored merging the missing SYSIN DD * statement from JS JCL. The *RSNTXT* explains in detail the kind of problem occurred:

- EXPANDED JCL MISSING
- JS JCL SYSIN INFO MISSING
- EXPANDED JCL SYSIN INFO MISSING
- EXPANDED JCL AND JS JCL SYSIN MISMATCH
- ERROR DURING MERGED JCL CREATION
- ERROR DURING MERGE SYSIN PROCESS

System action: IBM Tivoli Workload Scheduler for z/OS set the operation in error with error code CLNA (error during apply logic processing)

System programmer response: Try to identify the origin of the problem from EQQMLOG and EQQDUMP messages. If the problem persists save message log. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Except number 2 and 4, the reasons indicate internal errors. Reason 4 indicates that a mismatch was found between the expanded JCL and the JCL got from JS VASM: a sysin DD found empty in the expanded JCL was not found at all in the JS JCL. One possible reason is that sysin were in external procedures. If possible, restart the operation from the dialog, setting the sysin manually. Reason 2 indicates that the JS JCL was not found (maybe it has been deleted from JS). Try to restore it with edit command. For all other reasons contact system administrator.

**EQQPT01I PROGRAM PROG HAS BEEN
STARTED, PID IS PID**

Explanation: The starter process has started the process *PROG*, the process ID is *PID*.

System action: None.

User response: None.

**EQQPT02E SPAWN ERROR STARTING PROG:
ERRNO=ERR_NUM: ERR_MSG,
REASON=RSN**

Explanation: An error has occurred during the spawn of the *PROG* process. The error is indicated by *ERR_NUM* (described by the *ERR_MSG*) with reason code *RSN*.

System action: The system will retry later to start the *PROG*.

EQQPT03I • EQQPT13E

User response: Verify and solve the error that is preventing the starter from spawning the process, then stop and restart the server.

EQQPT03I STARTER PROCESS WAITING FOR STOP COMMAND

Explanation: The starter process has started all the required processes and is now inactive until a stop command is received.

System action: None.

User response: None.

EQQPT04I STARTER HAS DETECTED A STOP COMMAND

Explanation: The starter process has detected a stop command issued to the server by the user.

System action: The starter process now shuts down all its child processes.

User response: None.

EQQPT05E KILL ERROR KILLING TRANSLATOR PROCESS (PID=PID): ERRNO=ERR_NUM: ERR_MSG, REASON=RSN

Explanation: An error occurred while the starter sent a signal to shutdown the translator process. pid is the process ID of the translator process. The error is *ERR_NUM* (described by the *ERR_MSG*) with reason code *RSN*.

System action: The starter waits for the end of the translator process.

User response: If the server does not shut down, cancel the server started task

EQQPT06I THE SIG SIGNAL HAS BEEN SENT TO PROC PROCESS

Explanation: The signal sig has been successfully sent to the process *PROC*.

System action: None.

User response: None.

EQQPT07I STARTER IS WAITING FOR NUM SONS TO END

Explanation: Starter is waiting for the end of *NUM* child processes before it exits

System action: None.

User response: None.

EQQPT08W WAIT ERROR: ERRNO=ERR_NUM: ERR_MSG, REASON=RSN

Explanation: An error as occurred while the starter waited for the end of a child process. The error is *ERR_NUM* (described by the *ERR_MSG*) with reason code *RSN*.

System action: None.

User response: None.

EQQPT09E THE PROC PROCESS (pid=PID) ENDED ABNORMALLY

Explanation: The PROC process with process id *PID* has ended abnormally.

System action: None.

User response: Check the TWS logs in *WRKDIR/stdlist/logs* directory. If a TWS process running in Unix System Services has ended abnormally, an error message should be printed to the log in this directory. See this message for additional information about the error. (*WRKDIR* is the HFS or ZFS directory specified in the *TOPOLOGY WRKDIR* parameter)

EQQPT10I ALL STARTER'S SONS ENDED

Explanation: The starter process stopped waiting for the end of its child processes.

System action: The starter process exits.

User response: None.

EQQPT11I THE PROCESS WITH PID=PID HAS BEEN KILLED BY SIGNAL SIG

Explanation: The process with *PID* has been killed by a signal *SIG*. Ignore this message if you are stopping the server.

System action: The functions related to the killed process are disabled.

User response: Stop and restart the server to reactivate the functions.

EQQPT12I THE PROCESSNAME PROCESS ENDED SUCCESSFULLY

Explanation: The process ended successfully.

System action: Processing continues.

User response: None.

EQQPT13E TCPIP STACK (JOBNAME = JOBNAME) NOT FOUND. THE DEFAULT = TCPIP HAS BEEN TAKEN.

Explanation: The TCP/IP stack with job *JOBNAME* has not been found.

System action: The Server used as TCP/IP name the default (TCPIP), because it did not find the job name specified.

User response: Check why the job *JOBNAME* started task was not available.

EQQPT14W TCPIP STACK IS DOWN. A CONNECTION RETRY WILL BE ATTEMPTED IN 60 SECONDS.

Explanation: The connection to TCP/IP failed because TCP/IP is not active.

System action: The server end-to-end initialization is suspended. Attempting to connect to TCP/IP is repeated every 60 seconds. When the connection is established, the end-to-end initialization is automatically resumed and completed.

User response: Start the TCP/IP stack.

EQQPT15I The USS BINDIR BINDIR MAINTENANCE LEVEL IS APAR.

Explanation: The PTF related to apar *APAR* is the latest maintenance applied on the IBM Tivoli Workload Scheduler for z/OS USS *bindir BINDIR*.

System action: IBM Tivoli Workload Scheduler for z/OS continues its processing.

User response: None.

EQQPT16E THE PROC PROCESS ENDED ABNORMALLY TWICE. STARTER AND CHILD PROCESSES BEGINNING TO SHUT DOWN.

Explanation: The netman or translator process running in Unix System Services (USS) ended abnormally twice within two hours. No more restarts will be attempted. All end-to-end server activities will be terminated.

System action: To determine the cause of the problem, review the IBM Tivoli Workload Scheduler for z/OS server message log, EQQDUMP diagnostic, and dump data sets.

System programmer response: Save the message log, diagnostic, and dump data sets and contact IBM Support for assistance.

User response: Contact your system programmer.

EQQPT20I INPUT TRANSLATOR HAS STARTED; WAITING FOR BATCHMAN AND MAILMAN TO START

Explanation: The input translator thread has started; it waits until it reads an event indicating that mailman and batchman have started.

System action: The input translator waits until it

reads an event indicating that batchman has started.

User response: If the message EQQPT21I is not displayed within a few minutes of EQQPT20I, check the Tivoli Workload Scheduler logs in WRKDIR/stdlist/logs directory to see what is preventing mailman and/or batchman from starting. (WRKDIR is the HFS or ZFS directory specified in the TOPOLOGY WRKDIR parameter).

EQQPT21I INPUT TRANSLATOR HAS CONFIRMED THAT MAILMAN AND BATCHMAN HAVE STARTED

Explanation: batchman has notified the input translator that batchman and mailman have started.

System action: The input translator thread starts again and starts processing input events.

User response: None.

EQQPT22I INPUT TRANSLATOR THREAD STOPPED UNTIL NEW SYMPHONY WILL BE AVAILABLE

Explanation: The input translator thread has stopped while it waits for a new Symphony to be produced from a Daily Planning or Renew Symphony batch job.

System action: The input translator thread stops until the new Symphony is available.

User response: If the Daily Planning or Refresh Symphony batch job is finished and the message EQQPT23I is not displayed in few minutes, check the MLOG job to see what is preventing the Daily Planning or Refresh Symphony from creating the Symphony.

EQQPT23I INPUT TRANSLATOR THREAD IS RUNNING

Explanation: A new Symphony has been installed and the input translator thread has started again.

System action: The input translator thread starts again and starts processing input events.

User response: None.

EQQPT24I SYNCHRONIZATION BETWEEN SERVER AND CONTROLLER ENDED

Explanation: The synchronization process completed.

System action: The input translator thread communicates to the controller that the synchronization process is over. The thread stops until the new Symphony is available.

User response: None.

EQQPT30I STARTING SWITCHING SYMPHONY

Explanation: The translator has received an event from the scheduler to stop the fault-tolerant workstations because of the creation of a new Symphony.

System action: The translator starts the procedure to switch the Symphony file.

User response: None.

EQQPT31I SYMPHONY SUCCESSFULLY SWITCHED

Explanation: The translator has installed the new symphony file produced by a Daily Planning or Renew Symphony batch job.

System action: The translator restarts the processing of distributing the new Symphony file to the fault-tolerant workstations.

User response: None.

EQQPT32E AN INVALID STATUS TRANSITION REQUEST HAS BEEN RECEIVED

Explanation: The translator has received an incorrect event containing an unsupported status transition for a job.

System action: The event is discarded.

User response: See the translator trace for more details about the invalid event.

EQQPT33E MAILMAN OR BATCHMAN ENDED ABNORMALLY. TRANSLATOR BEGINNING TO SHUT DOWN.

Explanation: An error occurred while running the mailman or batchman. The translator is stopped and the starter process tries to restart translator, mailman, and batchman.

System programmer response: Save the message log, diagnostic, and dump data sets and contact IBM support for assistance.

User response: If the problems persists at the next restart, contact your system programmer.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log, EQQDUMP diagnostic, and dump data sets to determine the cause of the problem.

EQQPT34I ACTION ACTION ON OBJECT OBJECT HAS BEEN CORRECTLY PERFORMED

Explanation: The end-to-end server performed action ACTION on object OBJECT correctly.

System action: Processing continues.

User response: None.

EQQPT35E UNABLE TO OPER OBJECT, REASON: RSN

Explanation: An error has occurred performing the *oper* operation on the *object*. *Rsn* provides a description of the error cause.

System action: The event is discarded. A misalignment between the scheduler Current Plan and the Symphony file is possible.

User response: Run Renew Symphony batch job to re-establish the alignment between the scheduler Current plan and the symphony file.

EQQPT36W UNABLE TO OPER OBJECT, REASON: RSN

Explanation: An error has occurred performing the *oper* operation on the *object*. *Rsn* provides a description of the error cause.

System action: The event is discarded. The Translator continues its processing without waiting for the change of the Symphony.

User response: Correct the problem reported by reason RSN and do the operation again.

EQQPT37W PROBLEMS TO OPEN/READ SYMPHONY AND/OR EVENTS FILES.

Explanation: Translator cannot access the Symphony file or the event files and read network information to perform a progressive shutdown.

System action: All the workstations attached to OPCMASTER will be stopped simultaneously.

User response: None.

EQQPT38W UNABLE TO GET THE SCRIPT FOR OPERATION OPNUM IN OCCURRENCE OCCNAME. REASON: RSN

Explanation: Operation OPNUM in occurrence OCCNAME uses a centralized script. The Translator thread cannot get the script from the EQQTWSCS data set: Find the cause of the error in the RSN field.

System action: The sender task tries again to send the script to the agent for a maximum of 10 attempts; then, the operation fails.

System programmer response: Fix the cause of the error.

EQQPT39I STOPPING OBJECTS

Explanation: The Output Translator process is stopping *OBJECTS*. The server is running the synchronization process with the controller during a daily planning activity.

OBJECTS are one of the following:

- Mailman and batchman processes
- Input Translator thread activities
- All fault-tolerant workstations
- All fault-tolerant workstations in the master domain

System action: The end-to-end server continues processing.

User response: None.

EQQPT40I THD THREAD IS SHUTTING DOWN

Explanation: The translator thread *THD* has detected a stop command and is exiting.

System action: The thread closes all opened files and exits.

User response: None.

EQQPT41I AN EVENT FROM "SYSTEM" HAS BEEN PROCESSED

Explanation: The translator has processed an event received from *system*.

System action: The translator waits for the next event.

User response: None.

EQQPT42I A EVENTTYPE EVENT FROM "SYSTEM" HAS BEEN RECEIVED

Explanation: The translator has received from *system* an event of type *EVENTTYPE*.

System action: The translator processes the event.

User response: None.

EQQPT43E TRANSLATOR STARTED WITHOUT ENOUGH PARAMETERS SPECIFIED, EXITING ...

Explanation: The translator has been started without the required parameters.

System action: The translator process is terminated.

User response: Check that the starter and translator programs have been installed correctly. The programs are probably misaligned.

EQQPT44I NO EVENT AVAILABLE

Explanation: The translator has not yet received any event from the scheduler.

System action: The translator process waits for another event.

User response: None.

EQQPT46E ERROR CALLING FUNCTION : ERR_MSG

Explanation: An error has been returned during function activity. The error is described by *ERR_MSG*.

System action: The translator aborts the current operation.

User response: Try to locate the previous error messages in the message log, and contact your system programmer.

EQQPT47E Error ACTION "FILE" : ERR_MSG

Explanation: An error has occurred while performing an action on a file. The *ERR_MSG* describes the cause of the error; the *ERR_MSG* information is not available when the action is *COPYING*.

System action: The translator aborts the current operation.

User response: Check the server logs on the USS for further messages explaining the error and contact your system programmer.

EQQPT48E INVALID HEADER IN EVENT QUEUE DDNAME

Explanation: The scheduler event queue indicates by *DDNAME* has a corrupted header.

System action: The translator stops the operations until the scheduler queue is restored.

User response: Restart the end-to-end task to rebuild the scheduler queue.

EQQPT49E AN ERROR HAS OCCURRED READING HEADER RECORD

Explanation: The translator was unable to read the header record of a scheduler queue. A previous error specifies which error has been encountered.

System action: This message is embedded as a reason for another error.

User response: Try to locate the previous error messages in the message log, and contact your system programmer.

EQQPT50I WRITER OF MAILBOX FILE *FILE* HAS GONE

Explanation: The process that was writing on message file *FILE* has stopped running and no events in *FILE* are processed.

System action: The translator stops processing events from the file.

User response: None.

EQQPT51E CANNOT FIND THE *FILE* SYMPHONY FILE

Explanation: The *FILE* Symphony file is not present.

System action: The Symphony can not be switched.

User response: Check why the file disappeared. You might need to run a Refresh Symphony batch job to re-create the Symphony file.

EQQPT52E CANNOT SWITCH TO THE NEW SYMPHONY FILE: RUN NUMBERS OF SYMPHONY (*SYMRN*) AND CP (*CPRN*) AREN'T MATCHING

Explanation: The new Symphony file that the translator has found does not have the same run number as the scheduler Current Plan.

System action: The translator does not switch the Symphony file.

User response: If the Symphony is not switched with the next event, run a Refresh Symphony batch job to re-create the Symphony file.

EQQPT53I *THD* THREAD HAS TERMINATED

Explanation: The *THD* thread has finished executing.

System action: None.

User response: None.

EQQPT54W THE *DDNAME* QUEUE IS *PERCENTAGE*% FULL

Explanation: The queue specified by *DDNAME* and used to exchange between controller and translator is full to the degree specified by *PERCENTAGE*.

System action: None.

System programmer response: Allocate a bigger data set for the specified *DDNAME* and restart the controller and server.

EQQPT55E THE *DDNAME* QUEUE IS 100% FULL

Explanation: The queue specified by *DDNAME* and used to exchange between the controller and the translator is completely full.

System action: The task or process that is writing in the specified data set is held until the data set is partially free.

System programmer response: Allocate a bigger data set for the specified *DDNAME* and restart the controller and the server.

EQQPT56W THE *DDNAME* QUEUE HAS NOT BEEN FORMATTED YET

Explanation: The queue specified by *ddname* and used to exchange events between the controller and the translator is not formatted yet.

System action: The task or process that is writing in the specified data set is held until the data set is formatted.

System programmer response: Check that the controller is started and that it has completed its initialization without error. Verify that the *DDNAME* specified in the message refers to the same data set in both the controller and server JCL.

EQQPT59I PROCESS *PROCESS* HAS GONE

Explanation: The process *PROCESS* is no longer running.

System action: The translator process is no longer receiving the events from the *PROCESS* process.

System programmer response: None.

EQQPT60E AN END-TO-END PROCESS COULD END ABNORMALLY

Explanation: This message is issued if the batchman process is not active. Batchman is started by mailman while mailman is started by netman. Generally it can indicate that one of these processes ended abnormally.

Anyway a slow initialization of mailman can cause the EQQPT60E to be issued even if no process has ended abnormally. Mailman is initialized at server start and when switching a new symphony file; possible causes of the slowness can be unreachable workstations or, when switching the new symphony file, lots of unprocessed events present in the message files.

System action: None.

User response: Check if mailman is initializing correctly in the TWSMERGE log in *WRKDIR/stdlist/logs* directory and in this case wait for mailman to complete its initialization; note that the initialization starts with message AWSBCV086I and ends with message "AWSBCV108I Started Batchman, pin

xxx". Otherwise check the logs in WRKDIR/stdlist/logs directory for additional error messages; verify if a dump is available, otherwise take a console dump of the server address space; collect the entire workdir and contact the IBM Software Support. Try to recover from the error by shutting down and restarting the E2E server.

EQQPT61E INVALID DATE AND TIME FOUND IN A TWS EVENT (OPERATION NUMBER: *OPNUM* - OCCURRENCE TOKEN: *TOKEN*). CURRENT DATE AND TIME ARE USED.

Explanation:

The date and time contained in an event coming from an FT workstation were invalid.

System action: The date and time in the event are ignored; the current date and time are used instead. For example, if the event was tracking the start of an operation, the current date and time will be used for the job start date and time, instead of the invalid values in the event.

User response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQPT62W THE BATCHMAN AND MAILMAN PROCESSES ARE STILL ACTIVE. STARTING WAITING FOR THEIR STOP.

Explanation:

Before switching the symphony file, the batchman and mailman processes required to be stopped.

System action: During the switch of the Symphony file, if the batchman and mailman processes are not stopped yet, the Output Translator tries to stop it for 10 minutes. If within this time the processes are still active, the error message EQQPT63E is displayed in the Server MLOG. If the processes instead, will be stopped within 10 minutes, the Output Translator continues its normal process and the Symphony file is correctly switched. In this case, the message EQQPT31I is shown in the Server MLOG.

User response: Check for further messages.

EQQPT63E AN ERROR OCCURRED WHILE STOPPING THE BATCHMAN AND MAILMAN PROCESSES. THE SYMPHONY FILE CANNOT BE SWITCHED.

Explanation:

During the switch of the symphony file, the batchman and mailman processes have not been stopped.

System action: During the switch of the Symphony file, the Output Translator unsuccessfully tried to stop the batchman and mailman processes for 10 minutes. As a consequence, the symphony file is not switched.

User response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQPT64I STOP COMMAND SENT TO FAULT TOLERANT WORKSTATION *CPU*

Explanation: The output translator sent a STOP command to the fault-tolerant workstation *CPU*. The workstation is stopped only if it can be reached in the network. The message is not shown for an extended agent workstation.

System action: Processing continues.

User response: None.

EQQPT65I STOP COMMAND SENT TO OPCMASTER

Explanation: The output translator sent a STOP command to the OPCMASTER. Mailman and batchman are stopped in the server.

System action: Processing continues.

User response: None.

EQQPT66I VALUE CONTAINED IN THE SERVER CHECKPOINT FILE: *KEYWORD* = *VALUE*

Explanation: This message is issued at Translator startup and every time the *KEYWORD* value is modified. It shows the current value of the *KEYWORD* contained in the server checkpoint file. The data contained in the server checkpoint file Translator.chk represents the actual server status.

KEYWORD can be one of the following:

FirstValidSymRun

The first valid symphony run number used by the server

CPAvailable

The copy of the active current plan (SCP) available or not available

SymAvailable

A new Symphony available to the server

SymRunNumber

The current Symphony run number

CPRunNumber

The Symphony run number related to the active current plan

SpecialSynchStart

A special synchronization in progress

EQQPT67E • EQQPT74I

StopCpusPostponed

Stopping the CPUs must be postponed after symphony creation

System action: Processing continues.

User response: None.

EQQPT67E A DUMP WAS TAKEN FOR PROBLEM DETERMINATION PURPOSES

Explanation: An I/O error occurred while accessing a file. The system performed a dump to assist in determining the problem.

System action: Processing continues.

User response: Make a tar file of the IBM Tivoli Workload Scheduler for z/OS work directory. Contact IBM Support and provide the tar file and system dump.

EQQPT68E PUTENV() ENVVAR FAILED ERRNO=ERRNO: ERRMSG, REASON=RSC

Explanation: While running the call PUTENV, an error occurred when a new environment variable was being added or the value of an existing one was being changed. ENVVAR contains the string used in the PUTENV call. The error is indicated by ERRNO (described by ERRMSG), with reason code RSC.

System action: The program runs without this environment setting.

User response: Check the error code explanation in the IBM Tivoli Workload Scheduler for z/OS publications to determine the cause of the problem and resolve it accordingly. If the error persists, save the message log EQQMLOG and contact IBM Software Support for assistance.

EQQPT69I SENDING STOP COMMAND TO FAULT-TOLERANT WORKSTATION CPU

Explanation: The output translator is stopping the fault-tolerant workstation CPU. This message is not shown for an extended agent workstation.

System action: Processing continues.

User response: None.

EQQPT70I THE STOP COMMAND WAS SENT TO ALL THE OBJECTS

Explanation: The output translator sent a STOP command to all the OBJECTS, which can be one of the following:

- Fault-tolerant workstations
- Fault-tolerant workstations in the master domain

The fault-tolerant workstations are stopped only if they can be reached in the network.

System action: Processing continues.

User response: None.

EQQPT71I WAITING OBJECT

Explanation: The server is waiting for OBJECT during a daily planning activity. OBJECT can be either one of the following strings:

- for a new Symphony file
- until the current plan starts executing again

System action: The end-to-end server waits for OBJECT.

User response: None.

EQQPT72I THE CURRENT PLAN IS RUNNING AGAIN

Explanation: During a DP extend, DP replan, or Symphony renew the CP VSAM data set is available and execution is active again. If an SCP was also created, it is available to the planning batch job. (SCP is a copy of the CP created by the planning batch job, which uses it to add information to the Symphony file).

System action: Processing continues.

User response: None.

EQQPT73I THE SYMNEW FILE WAS CREATED (RUN NUMBER IS RUNNO)

Explanation: A planning batch job (DP extend, DP replan, or Symphony renew) created a new Symphony file (Sinfonia) which is ready to be processed by the server.

System action: The output translator copies Symnew into Symphony and Sinfonia. Sinfonia is distributed to the network, while Symphony is available on z/OS for production.

User response: None.

EQQPT74I STARTING ACTIVITY

Explanation: When the new Symphony file (Synfonia) is ready to be processed, the server (output translator) starts some activities to switch the Symphony file. ACTIVITY can be either one of the following strings:

- Mailman and batchman processes
- Input translator activities

System action: The server proceeds to switch the Symphony file.

User response: None.

EQQPT75I SYNCHRONIZATION BETWEEN
SERVER AND CONTROLLER
STARTED

Explanation: The controller started the synchronization process with the server during a daily planning activity.

System action: The translator starts all the actions required for synchronization.

User response: None.

EQQPT76W CANNOT ACTION OBJECT BECAUSE
SYMPHONY IS NOT YET UPDATED;
WAITING AND RETRYING.

Explanation: The end-to-end server is trying to release or to delete dependency *OBJECT* but it cannot perform the action because the job or the dependency has not been added to the Symphony file yet. This message appears if the Symphony file has not been updated after one minute.

System action: The server will try to release or delete the dependency again for a maximum of 5 minutes. If after this period the Symphony file is not updated with the object to be released or deleted, the action fails and message EQQPT35E is issued. Otherwise, message EQQPT34I is issued indicating that the action was performed successfully.

User response: Check the TWSMERGE file in the stdlist/logs directory of the USS work directory to verify if the mailman and batchman processes are working correctly.

EQQPT77E THE STAT() FAILED ACCESSING
FILENAME. *ERRNO=ERRNO: ERRMSG*.

Explanation:

An error occurred during the running of the stat call accessing the information about the file or directory specified. *Filename* is the file accessed by the stat call. The error is indicated by the *errno* and described by the *errmsg*.

System action: The request is rejected.

System programmer response: Check the error code to determine the cause of the problem and resolve it accordingly. If the error persists, contact IBM Software Support:

EACCESS

The process does not have permission to access some components of the path containing the files specified.

ENOTDIR

A component of the path containing the file specified is not a directory.

EQQPT95I SYNCHRONIZATION BETWEEN
SERVER AND CONTROLLER ENDED

Explanation: The controller ended the synchronization process with the server during a daily planning activity.

System action: Processing continues.

User response: None.

EQQP010E *VERB* in state *STATE* failed with RC *RC*,
SR *SR*, DR *DR*

Explanation: An APPC service request issued for server communication failed. The verb *VERB* was issued when the conversation was in state *STATE*. APPC returned: Return_Code *RC*, Status_Received *SR* and Data_Received *DR*.

System action: The request is rejected.

System programmer response: Check the meaning of the APPC return codes. Check the message log of the server for a message explaining the communication loss. If the problem recurs, report the error to IBM Software Support.

User response: Check that the correct LU name is specified. For the dialog the LU name is set via the OPTIONS menu. A program interface application sets the LU name through the EQQYPARM parameter file or through the INIT request. Repeat the dialog action from the IBM Tivoli Workload Scheduler for z/OS Primary Option panel or rerun the program interface application.

EQQP011E INSUFFICIENT VIRTUAL STORAGE,
DIAGNOSTIC INFO *ALT*

Explanation: A routine for communication with the server failed because it could not obtain sufficient amount of virtual storage.

System action: The request is rejected.

User response: Logon to TSO with a larger SIZE parameter value or rerun the program interface application with a larger specified region

EQQP012E APPC/MVS VERB *VERB* FAILED WITH
RC *RC*, SR *SR*, DR *DR*

Explanation: An APPC service request issued for server communication failed. The verb *VERB* was issued when the conversation was in state *STATE*. APPC returned: Return_Code *RC*, Status_Received *SR* and Data_Received *DR*.

System action: The request is rejected.

System programmer response: Check the meaning of the APPC return codes. Check the message log of the server for a message explaining the communication loss. If the problem recurs, report the error to IBM Software Support.

EQQP014E • EQQP109E

User response: Check that the correct LU name is specified. For the dialog the LU name is set via the OPTIONS menu. A program interface application sets the LU name through the EQQYPARM parameter file or through the INIT request. Repeat the dialog action from the IBM Tivoli Workload Scheduler for z/OS Primary Option panel or rerun the program interface application.

System action: Processing goes on until the double freed tie block is used for the second time by means of a cpool GET. Then an abend S0C4 can occur.

User response: Run a Dp batch re-plan or extend and contact IBM customer support.

EQQP014E REQUEST FAILED, SEVERE ERROR AT THE SERVER, LU

Explanation: An error occurred at the server.

System action: The dialog or program interface application cannot continue.

System programmer response: Check the message log of the server for a message explaining the error at the server.

System programmer response: Check the message log of the server for a message explaining the communication problem. If the problem recurs, report the error to IBM Software Support.

User response: Check that the correct LU name is specified. For the dialog the LU name is set via the OPTIONS menu. A program interface application sets the LU name through the EQQYPARM parameter file or through the INIT request. Repeat the dialog action from the IBM Tivoli Workload Scheduler for z/OS Primary Option panel or rerun the program interface application.

EQQP015E FAILED TO SET UP COMMUNICATION WITH SERVER LU, RC RC

Explanation: An APPC allocate request issued for server communication failed. *LU* shows the LU name of the server. *RC* shows the return code of the allocate request.

System action: The user cannot start the IBM Tivoli Workload Scheduler for z/OS dialog. The INIT request of program interface application gets a return code of 8.

User response: Check that the correct LU name is specified and that LU is active. For the dialog the LU name is set via the OPTIONS menu. A program interface application sets the LU name through the EQQYPARM parameter file or through the INIT request. Repeat the dialog action from the IBM Tivoli Workload Scheduler for z/OS Primary Option panel or rerun the program interface application.

EQQP109E FREEING A TIE THAT IS ALREADY FREE

Explanation: During the scheduling activity or because of a manual action on an operation, a tie block is being freed for the second time.

Chapter 219. EQQQnnn messages

EQQQ001 - EQQQ519

EQQQ001E THE ENTRY IS INVALID, ENTER A VALUE IN THE RANGE 0 TO 999999.

Explanation: The value for MAX USAGE LIMIT is not valid.

System action: The request is rejected.

User response: Change the MAX USAGE LIMIT value to a number from 0 to 999999.

EQQQ002E THE SPECIAL RESOURCE GROUP IS INVALID

Explanation: The group ID value contains characters that are not valid.

System action: The request is rejected.

User response: Change the group ID so that it contains national characters or any character in the range A-Z or 0-9.

EQQQ003E MUST BE: OCHCYES, OCHCNO, OCHCRSET, OR BLANK

Explanation: The ON COMPLETE value is not valid.

System action: The request is rejected.

User response: Change the ON COMPLETE value with a valid one.

EQQQ004E THE ENTRY IS INVALID, ENTER EITHER A OCHCYES OR A OCHCNO

Explanation: You have entered an invalid character in the field. It must be either a OCHCYES or a OCHCNO.

System action: The request is rejected.

User response: Change the character to a OCHCYES or a OCHCNO.

EQQQ005E THE ENTRY MUST NOT BE BLANK

Explanation: You must not leave this field blank.

System action: The request is rejected.

User response: Change the field to a nonblank value.

EQQQ006E THE ENTRY IS INVALID, ENTER A VALUE IN THE RANGE 1 TO 999999

Explanation: You have entered an invalid quantity in the field. It must be in the range 1-999999.

System action: The request is rejected.

User response: Change the quantity to a valid value.

EQQQ007E THE ENTRY IS INVALID, ENTER OSROEF, OSROEFS, OSROEFX, OSROEK OR BLANK.

Explanation: You have entered an invalid keep on error option.

System action: The request is rejected.

User response: Change the entry to a valid value.

EQQQ008E THE MEMBER NAME IS NOT IN A VALID ISPF FORMAT

Explanation: You have entered an invalid name.

System action: The request is rejected.

User response: Change the name to a format recognised by ISPF.

EQQQ009E THE DAY ENTERED IS INVALID

Explanation: You have entered an invalid day. Enter either a valid day or a valid date.

System action: The request is rejected.

User response: Enter a valid value.

EQQQ010E THE INTERVAL OVERLAPS WITH A PRIOR INTERVAL

Explanation: You have entered a combination of day/date and time that is invalid because it overlaps another interval.

System action: The request is rejected.

User response: Correct the day/date or time, or both.

EQQQ011E THE TO TIME MUST BE GREATER THAN THE FROM TIME

Explanation: You have entered an invalid combination of to-time and from-time.

System action: The request is rejected.

User response: Ensure that the to-time is greater than the from-time.

EQQQ012E 24.00 IS NOT ALLOWED AS TO TIME

EQQQ013W • EQQQ025E

Explanation: Data entry error; see "Data entry errors" on page 803.

Valid to-times are 00.00 through 23.59.

EQQQ013W THE SELECTED OPERATION COULD NOT BE FOUND IN THE CURRENT PLAN

Explanation: You have selected to view an operation that no longer exists in the current plan.

System action: The request is rejected.

User response: Refresh the list of operations and select another operation.

EQQQ014W THE SELECTED OPERATION IS NO LONGER IN THE QUEUE OR LIST

Explanation: You have requested to delete an operation from the queue or list that no longer exists in the queue or list.

System action: The request is rejected.

User response: Refresh the list of operations and select another operation.

EQQQ015E THE ENTRY IS INVALID, ENTER S OR LEAVE BLANK

Explanation: You have entered an invalid value in the rules field.

System action: The request is rejected.

User response: Change the field to one of the valid values.

EQQQ016E MUST BE: OCHCYES, OCHCNO, OR OCHCRSET

Explanation: The MAX USAGE TYPE value is not valid.

System action: The request is rejected.

User response: Change the MAX USAGE TYPE value with a valid one.

EQQQ017E THE ENTRY IS INVALID, ENTER A DAY IN THE RANGE 1 TO 366

Explanation: You have entered an invalid day in the field. It must be in the range 1–366.

System action: The request is rejected.

User response: Change the day to a valid value.

EQQQ019E THE ENTRY IS INVALID, ENTER A VALUE IN THE RANGE -999999 TO 999999

Explanation: You have entered an invalid deviation in the field. It must be in the range -999999 to 999999.

System action: The request is rejected.

User response: Change the quantity to a valid value.

EQQQ021E 00.00 IS NOT ALLOWED AS FROM TIME

Explanation: Data entry error; see "Data entry errors" on page 803.

Valid from-times are 00.01 through 24.00.

EQQQ022W THE WORK STATION DOES NOT EXIST

Explanation: You have entered the name of a workstation that does not exist.

System action: The panel is redisplayed so that you can press End again and confirm that the workstation does not exist.

User response: Change the workstation to one that exists, define the work station, blank the field out, or ignore the warning.

EQQQ023E THE WORK STATION IS ALREADY INCLUDED

Explanation: You have entered a workstation that has already been defined as connected to the resource.

System action: The request is rejected.

User response: Remove the duplicate workstation name.

EQQQ024I THE SPECIAL RESOURCE HAS NO OPERATIONS FOR YOU TO EXAMINE

Explanation: You have attempted to access either the in-use list or waiting queue for a special resource and it has no operations either using or waiting for it.

System action: The request is rejected.

User response: Choose another special resource.

EQQQ025E THE ENTRY IS INVALID, IT MUST BE OCHCYES, OCHCNO OR LEFT BLANK

Explanation: You have entered an invalid value in the On Error field.

System action: The request is rejected.

User response: Change the field to one of the valid values.

EQQQ026E THE WORK STATION CONTAINS INVALID CHARACTERS

Explanation: You have entered the name of a workstation that contains invalid characters. The first character must be a national character, an alphabetic character, or one of the IBM Tivoli Workload Scheduler for z/OS generic selection characters. The remainder of the workstation name must consist of alphanumeric characters, national characters or IBM Tivoli Workload Scheduler for z/OS generic search characters.

System action: The panel is redisplayed forcing you to change the entry.

User response: Change the workstation name to one that contains valid characters.

EQQQ028I NO DEFAULT WS CONNECT LIST HAS BEEN DEFINED

Explanation: You have attempted to access the list of connected workstations that acts as the defaults, but none have been defined.

System action: The request is rejected.

User response: If they are required, define a list of connected workstations to be used as defaults.

EQQQ029I WS CONNECT LIST NOT DEFINED FOR THIS INTERVAL, DEFAULTS WILL BE USED

Explanation: You have attempted to access the list of connected workstations in an interval for which no list has been defined. The default connected workstations that are defined for this special resource are used.

System action: The request is rejected.

User response: If the default list should not be used, define a list of connected workstations for this interval.

EQQQ030I THE SPECIAL RESOURCE HAS NO INTERVALS FOR YOU TO BROWSE

Explanation: You have attempted to access the list of intervals, but none have been defined.

System action: The request is rejected.

User response: If they are required, define a list of intervals.

EQQQ031E THE SPECIAL RESOURCE IS BEING UPDATED BY ANOTHER USER, THE CONTROLLER OR SRSTAT

Explanation: You have attempted to access a special resource that is currently locked by one of the following:

- Another user.

- The controller. This might occur when the global availability of the resource is being changed due to the On Complete, Max Usage Limit.
- An SRSTAT command.

System action: The system waits for you to respond.

User response: Try to update the special resource later.

EQQQ032I THE SPECIAL RESOURCE HAS BEEN SUCCESSFULLY CREATED

Explanation: The special resource has been created and stored.

System action: Processing continues.

User response: None.

EQQQ033I THE SPECIAL RESOURCE HAS BEEN SUCCESSFULLY MODIFIED

Explanation: The special resource has been modified and stored.

System action: Processing continues.

User response: None.

EQQQ034I THE SPECIAL RESOURCE HAS BEEN SUCCESSFULLY DELETED

Explanation: The special resource has been deleted and removed.

System action: Processing continues.

User response: None.

EQQQ035E INVALID ENTRY, ENTER OCHCCNTL, OCHCLPLAN, OCHCBOTH, OR OCHCNONE

Explanation: You have entered an invalid value in the usage field.

System action: The request is rejected.

User response: Change the field to one of the valid values.

EQQQ036E YOU ARE NOT AUTHORIZED TO ACCESS THE SR

Explanation: You have attempted to access the special resource database for the modify current plan, but you are not authorized to access it.

System action: The request is rejected.

User response: If you require access, contact your security administrator.

EQQQ038E A SPECIAL RESOURCE WITH THIS NAME ALREADY EXISTS

Explanation: You have attempted to create a special resource that already exists.

System action: The request is rejected.

User response: Change the special resource name to a unique name.

EQQQ039E YOU ARE NOT AUTHORIZED TO ACCESS THE RD

Explanation: You have attempted to access the special resource description (RD) database, but you are not authorized to access it.

System action: The request is rejected.

User response: If you require access, contact your security administrator.

EQQQ040I THE SPECIAL RESOURCE IS NOT CURRENTLY ALLOCATED TO ANY OPERATIONS

Explanation: The special resource has no operations in the current plan that are currently allocated to it.

System action: The system waits for you to respond.

User response: The special resource has no in-use list. Select another special resource.

EQQQ041I THERE ARE NO OPERATIONS WAITING TO ALLOCATE THE SPECIAL RESOURCE

Explanation: The special resource has no operations in the current plan that are currently waiting for it.

System action: The system waits for you to respond.

User response: The special resource has no waiting queue. Select another special resource.

EQQQ043I NO MATCHING SPECIAL RESOURCE(S) FOUND

Explanation: No special resource (or resources) matched the generic or nongeneric search criteria that you specified to generate a list of special resources.

System action: The system waits for you to respond.

User response: Retry, using new selection criteria.

EQQQ044W THE SPECIAL RESOURCE WAS NOT FOUND

Explanation: The special resource could not be found.

System action: The request is rejected.

User response: Select another special resource.

EQQQ050W THIS DEPENDENCY COULD BE IGNORED

Explanation: The operator is adding a dependency on a special resource to a job running on a Fault Tolerant Workstation. The system warns that the job could run even if the resource is not available. This could only happen if it is the first dependency on a special resource for this job; in fact, when there are no dependencies on Special Resources, the WS decides by itself if the job can start or not. So it could happen that the WS starts the job before being notified that the dependency has been added. In this case if the resource is available the scheduler allocated it correctly; or else if the resource isn't available, it is overallocated.

System action: The panel is redisplayed so that you can press Cancel or End to confirm the dependency addition.

User response: Choose if cancel or confirm the request.

EQQQ501E SPECIAL RESOURCE DATASPACE DELETE FAILED. REASON CODE IS REASON

Explanation: IBM Tivoli Workload Scheduler for z/OS could not delete the special resource data space. The storage is not freed.

System action: Normal IBM Tivoli Workload Scheduler for z/OS processing continues.

System programmer response: Perform the actions described for the DSPSERV reason code.

Problem determination: Use the reason code *REASON* from DSPSERV to determine the cause of the error. Refer to the z/OS documentation that describes DSPSERV reason codes.

EQQQ502I SPECIAL RESOURCE DATASPACE HAS BEEN CREATED. SIZE PAGES ARE USED FOR NUM SPECIAL RESOURCE RECORDS

Explanation: A data space has been successfully created for special resource records. *SIZE* shows the number of pages (each 4096 bytes) used to create the data space. *NUM* shows the maximum number of special resource records that the data space can contain.

IBM Tivoli Workload Scheduler for z/OS uses a minimum of 20 pages.

System action: Normal processing continues. IBM Tivoli Workload Scheduler for z/OS uses the data space when accessing special resources.

System programmer response: None.

EQQQ503E SPECIAL RESOURCE DATASPACE CREATION FAILED. REASON CODE IS REASON. SIZE PAGES WERE REQUESTED FOR NUM SPECIAL RESOURCES

Explanation: IBM Tivoli Workload Scheduler for z/OS could not create a data space for special resource storage. Reason code *REASON* is set by the DSPSERV service. *SIZE* shows the number of pages (each 4096 bytes) that IBM Tivoli Workload Scheduler for z/OS needed. *NUM* shows the number of special resource records that IBM Tivoli Workload Scheduler for z/OS wanted to store in the data space.

System action: If the error occurred in batch, the batch program terminates. If the error occurred in the controller, the normal mode manager (NMM) terminates.

System programmer response: Correct the error and restart the NMM subtask or, if the error occurred in batch, resubmit the batch job.

Problem determination: Use the reason code *REASON* from DSPSERV to determine the cause of the error. Refer to the z/OS documentation that describes DSPSERV reason codes.

EQQQ504I STAT SPECIAL RESOURCE RESNAME HAS BEEN DYNAMICALLY ADDED BY USER

Explanation: A requested special resource *RESNAME* did not exist in the current plan, but has been dynamically added to the special resource data space by you or by the function *USER*. Status *STAT=NEW* means that the special resource did not previously exist in the resource description (RD) database. Status *STAT=OLD* means that the special resource had already been defined.

Note: If the special resource already exists in the RD database, the DYNAMICADD keyword of the RESOPTS statement has no effect. This message can be issued at daily planning, when an operation becomes ready or when a special resource event record is processed.

System action: Normal processing continues. If another operation allocates the special resource with a larger value or to avoid contention, IBM Tivoli Workload Scheduler for z/OS increases the quantity of a dynamically created special resource.

User response: None.

EQQQ505E UNSUCCESSFUL DATASPACE ACCESS REQUEST, INFORMATION FOLLOWS: ACCESS REQUEST IS FROM MODID , REASON CODE IS RSN , REQUESTED FUNCTION IS FUNC , INDEX NUMBER IS INDEX

Explanation: A IBM Tivoli Workload Scheduler for z/OS subtask encountered an unexpected error when accessing a resource in the resource data space.

System action: The messages that follow this message in the IBM Tivoli Workload Scheduler for z/OS message log indicate the action taken by the IBM Tivoli Workload Scheduler for z/OS subtask.

System programmer response: Correct the error and, if necessary, restart the subtask that encountered the error.

EQQQ506I SPECIAL RESOURCE DATASPACE HAS BEEN EXTENDED SIZE PAGES ARE USED FOR NUM SPECIAL RESOURCE RECORDS

Explanation: A data space for special resource records has been successfully extended. *SIZE* shows the number of pages (each 4096 bytes) to which the data space was extended. *NUM* shows the maximum number of special resource records that the data space can contain.

System action: Normal processing continues. IBM Tivoli Workload Scheduler for z/OS uses the data space when accessing special resources.

System programmer response: None.

EQQQ507I A SPECIAL RESOURCE DATASPACE BACKUP PROCESS HAS STARTED

Explanation: The normal mode manager has started a current plan copy process. This copy process causes a backup of the special resource data space. Updated records in the data space are written to the current plan extension data set (EQQCXDS).

System action: Normal processing continues.

System programmer response: None.

EQQQ508I A SPECIAL RESOURCE DATASPACE BACKUP PROCESS HAS ENDED NUM RECORDS WERE WRITTEN TO CX

Explanation: The normal mode manager has successfully written all updated records from the special resource data space to the current plan extension data set (EQQCXDS).

System action: Normal processing continues.

System programmer response: None.

EQQQ509E A SPECIAL RESOURCE DATASPACE BACKUP PROCESS HAS FAILED

Explanation: The normal mode manager (NMM) could not write all updated records in the special resource data space to the current plan extension data set (EQQCXDS).

System action: The NMM subtask is terminated.

System programmer response: Correct the error and restart the NMM subtask.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the reason for this message.

EQQQ510W SPECIAL RESOURCE *RESNAME* WAS NOT DYNAMICALLY ADDED

Explanation: A special resource dynamic add request has been rejected. The reason is either of the following:

- An SRSTAT command specifying a special resource that does not exist and DYNAMICADD is not set to OPER or NO.
- A job that refers to a special resource that does not exist is about to be submitted and DYNAMICADD is not set to EVENT or NO.

System action: Processing continues and any operations that refer to this special resource are not submitted.

System programmer response: None.

User response: Add the special resource manually or delete the special resource reference from the operation.

EQQQ511W RESOURCE: *RESNAME* IS TOO LARGE. THE LAST INTERVAL USED STARTS AT *DATETIME*

Explanation: This message is issued to the message log when a special resource is too large to fit into the CX file.

System action: The special resource record is truncated to fit into the CX file. The start time of the last interval used in the record is displayed in the message.

User response: Allocate the CX file with a larger record size or change the special resource description so that it uses less intervals.

EQQQ514I RESOURCE *RES* LIFESPAN ACTION HAS BEEN REMOVED.

Explanation: An SRSTAT command with LIFESPAN interval time 0 was specified for the special resource *RES*. As a consequence, the LIFESPAN pending action for the resource has now been removed.

System action: LIFESPAN pending action is canceled.

User response: None.

EQQQ515W OPERATION *ADIDOPID*, *JOB* IA *IADATE* *IATIME* HAS WAITED FOR RESOURCE *RES* FOR *CTIME* MINUTES

Explanation: This message is issued by the controller when an operation has waited a longer time to allocate a given resource than the time specified in the RESOPTS CONTENTIONTIME parameter value. The message variables are:

- ADID* Application ID of operation.
- OPID* Workstation name and operation number.
- JOB* Jobname of the operation or blank if no jobname is defined.
- IADATE* Input arrival date of the operation.
- IATIME* Input arrival time of the operation.
- RES* Name of the special resource that the operation has requested.
- CTIME* The time now spent on the waiting queue

System action: Processing continues. The operation remains on the waiting queue for the required resource.

User response: Use the dialog to inspect the special resource queues for the special resource indicated by the message. If the situation needs to be corrected, modify the queues or the operations.

EQQQ516W RESOURCE *RES* USAGE COUNTER WAS RESET DUE TO MAX USAGE LIMIT DEACTIVATION.

Explanation: The MAX USAGE LIMIT value was set to 0 to deactivate the MAX LIMIT function for the special resource *RES*.

The value for the usage counter was greater than 0 because some operations using this special resource were run with MAX USAGE LIMIT function active.

System action: The usage counter is reset to 0.

User response: None.

EQQQ517I RESOURCE *RES* GLOBAL AVAILABILITY WAS SET TO *STATUS* DUE TO MAX USAGE LIMIT *TYPE*. USAGE COUNTER WAS RESET.

Explanation: The global availability of the special resource *RES* was changed to the value *STATUS*. This occurred because the special resource usage counter exceeded the MAX USAGE LIMIT value set for the special resource. The current global availability value was set according to the MAX USAGE TYPE value of the special resource.

After the global availability was changed, the usage counter was reset to 0. Consider that the usage counter is increased by 1 at each job start.

System action: The global availability is changed

according to the MAX USAGE TYPE value. The usage counter is reset to 0.

User response: None.

EQQQ518I RESOURCE *RES* GLOBAL
 AVAILABILITY WAS SET TO *STATUS*
 DUE TO OPERATION COMPLETE
 APPL *APPLID* IA: *IA* OPNUM: *OPNO*

Explanation: The global availability of the special resource *RES* was changed to the value *STATUS*. This occurred because the operation identified by the application name *APPLID*, Input Arrival time *IA*, and operation number *OPNO* was completed.

The current global availability (*STATUS*) was taken from one of the following values, considered in this order:

- The Available on Complete value that was set at operation definition level, if not blank.
- The On Complete value that was set at special resource definition level, if not blank.
- The ONCOMPLETE or DYNONCOMPLETE keyword set in the RESOPTS statement (respectively for resources added not dynamically or dynamically), in all the other cases.

System action: The global availability is reset according to the On Complete value.

User response: None.

EQQQ519I RESOURCE *RES* GLOBAL
 AVAILABILITY WAS SET TO *STATUS*
 DUE TO LIFESPAN EXPIRATION

Explanation: The global availability of the special resource *RES* was changed to the value *STATUS*. This occurred because the LIFESPAN interval, specified through SRSTAT or data set triggering mechanism, expired. To update the special resource, the new LIFESPAN global availability value is used.

System action: The global availability is reset according to the LIFESPAN value.

User response: None.

Chapter 220. EQQRnnn messages

EQQR000 - EQQR714

EQQR000E YOU ARE NOT AUTHORIZED TO ACCESS THE READY LIST

Explanation: You have attempted to access the ready list, but you are not authorized to access it.

System action: The requested access to the ready list is rejected.

User response: If you require access to the ready list, contact your security administrator.

EQQR008E YOU ARE NOT AUTHORIZED TO ACCESS THE JS DATA SET

Explanation: You have attempted to access the job setup facility, but you are not authorized to access it.

System action: The requested access to the job setup facility is rejected.

User response: If you want only to browse the JCL, you need read access authority. If you want to update the JCL, you need update access authority. Contact your security administrator.

EQQR010I ERDR *ERC#* TERMINATED

Explanation: Event reader *ERC* processing has completed and control is returned to the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: Event reader *ERC* processing is terminated.

User response: None.

EQQR011I EVENT READER *ERC#* HAS BEEN REQUESTED TO STOP

Explanation: Event reader *ERC*. has been requested to stop while waiting for positioning information in the event data set to become available.

System action: The event reader frees all acquired resources and is terminated.

System programmer response: None.

EQQR012I ERDR *ERC#* RESTARTED

Explanation: Event reader *ERC* has been restarted. This message is issued only for event readers that service the NCF application at remote sites. The probable reason is that the event reader is restarted either with new positions in the event data set after a

control plan refresh or when an NCF session is reestablished after failure.

System action: Event reader *ERC* restart processing continues.

User response: None.

EQQR013E ERDR UNABLE TO LOAD MODULE EQQERBEX - INITIALIZATION IS TERMINATED

Explanation: An event reader task was unable to locate the EQQERBEX load module.

System action: The event reader initialization is terminated.

System programmer response: Stop the event readers using the MODIFY command. Make sure that the EQQERBEX module resides in a load library that can be accessed by IBM Tivoli Workload Scheduler for z/OS and restart the event readers.

EQQR014W ERDR *ERC#* NO VALID HEADER IN EVENT DATA SET WITH DDNAME *DDN*

Explanation: Event reader *ERC* encountered a header record that contained invalid information, for example, the track capacity and the total number of records in the data set were missing. The most probable reason is that a new event data set has been created and it is being formatted by the event writer before usage. The header record is not updated with the characteristics of the data set until the formatting job has completed. This might take some time if the event data set is large.

System action: Event reader *ERC* processing continues. It makes a new attempt to extract valid information from the header record every 10 seconds. This message is written in the IBM Tivoli Workload Scheduler for z/OS message log, with a frequency determined by the ERWAIT parameter. If ERWAIT is set to its default value (10 seconds), this message is written every minute until a valid header is read or until the IBM Tivoli Workload Scheduler for z/OS subsystem posts a stop request. If ERWAIT is set to a value other than the default, this message is written with a frequency calculated according to the following rule: $\text{TIME FREQUENCY} = \text{ERWAIT_value} \times 6$.

System programmer response: Use the MODIFY command to stop the event readers, correct the error, and restart the event readers.

Problem determination: If this message appears more than 10 times on the IBM Tivoli Workload Scheduler for z/OS message log data set, stop the event readers. Check that the *DDN* ddname connects to the correct event data set, and if so, find out why the header record is not valid.

EQQR015E SEQUENCE NUMBER *SEQNO* IS ALREADY IN USE BY AN EVENT WRITER SUBTASK

Explanation: At event reader initialization, an event writer was already started with the sequence number specified in the *ERSEQNO* keyword of *ERDROPTS*.

The number specified in the *ERSEQNO* keyword of *ERDROPTS* must be unique within the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The event reader initialization fails. The event reader subtask is terminated.

Programmer response: Update the *ERSEQNO* keyword with a unique sequence number and restart the event reader subtask.

EQQR021E ERDR *ERC#* UNABLE TO OPEN EVENT DATA SET WITH DDNAME *DDN*

Explanation: Event reader *ERC* could not open its associated input data set (ddname *DDN*).

System action: Event reader *ERC* processing is terminated.

System programmer response: Use the *MODIFY* command to stop the event readers, correct the errors, if any, and restart the event readers.

Problem determination: Verify that the ddname statement associated with this event reader is correctly specified. The ddname is *EQQEVDxx*, where *xx* should be equal to *ERC*.

EQQR023E ERDR *ERC#* RECORDS OVERWRITTEN ON EVENT DATA SET (DDNAME *DDN*) *LR#* EVENTS HAVE BEEN LOST

Explanation: Event reader *ERC* encountered a situation where the event writer overwrites event records not yet processed by the event reader. Event data sets are used in a wrap-around fashion and for some reason the event reader cannot keep up with the event writer.

System action: Event reader *ERC* processing continues. The event records that were overwritten (*LR*) are lost and cannot be recaptured.

System programmer response: Use the *MODIFY* command to stop the event readers, modify the appropriate parameters, and restart the event readers.

User response: Describe the scenario that caused the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: The problem is probably one of the following:

- An inadequate allocation in the event data set, so that it wraps around too fast.
- The wait interval (*ERWAIT* of the *ERDROPTS* statement) is too long, that is, the event reader waits too long between successive read attempts.

You should also check the dispatching priority of the reader task to make sure that its priority is similar to that of the event writer.

EQQR024E ERDR *ERC#* TERMINATION DUE TO INITIALIZATION FAILURE

Explanation: Event reader *ERC* has encountered initialization errors.

System action: Event reader *ERC* processing is terminated.

System programmer response: Use the *MODIFY* command to stop the event readers, correct the errors, if any, and restart the event readers.

Problem determination: This message is preceded by other messages in the IBM Tivoli Workload Scheduler for z/OS message log. They indicate the exact reason for the failure.

EQQR025I ERDR *ERC#* STARTED

Explanation: Event reader *ERC* has successfully completed its initialization processing and is now ready.

System action: Event reader *ERC* processing continues.

EQQR026E ERDR *ERC#* I/O-ERROR ON EVENT DATA SET WITH DDNAME *DDN*-SYNAD INFORMATION: *SYNADMSG*

Explanation: Event reader *ERC* encountered an I/O error when reading its associated event data set (ddname *DDN*). The event data set is defined on the *DDN* ddname statement.

System action: Event reader *ERC* processing is terminated.

System programmer response: Either correct the error and use the *MODIFY* command to restart the event readers or stop IBM Tivoli Workload Scheduler for z/OS, correct the error and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: The SYNAD routine collects information such as jobname, stepname, unit address, device type, ddname, operation, error description, and access method. The SYNADAF macro is used to extract this information. For a detailed description of the layout refer to the appropriate documentation for the MVS/DFP product installed on this system.

**EQQR027E ERDR ERC# INITIALIZATION FAILED
- KEYWORD SPECIFICATION
MISSING**

Explanation: Event reader *ERC* found that the *KEYWORD* keyword was not specified on the ERDROPTS statement.

System action: Event reader *ERC* processing is terminated.

System programmer response: Use the MODIFY command to stop the event readers, correct the errors, if any, and restart the event readers.

**EQQR028E ERDR ERC# INITIALIZATION FAILED
- KEYWORD SPECIFICATION INVALID**

Explanation: Event reader *ERC* found that the keyword *KEYWORD* was not specified correctly on the ERDROPTS statement. If the ERSEQNO keyword specification was in error, *ERC* consists of **.

System action: Event reader *ERC* processing is terminated.

System programmer response: Use the MODIFY command to stop the event readers, correct the errors, if any, and restart the event readers.

**EQQR029E ERDR ERC# INITIALIZATION FAILED
- NO ERDROPTS STATEMENT
SPECIFIED**

Explanation: Event reader *ERC* found no ERDROPTS statement in the member (specified on the OPCOPTS statement) that was to hold initialization parameters for an event reader. Because no event reader sequence number is available, *ERC* consists of **.

System action: Event reader *ERC* processing is terminated.

System programmer response: Use the MODIFY command to stop the event readers, add a correct ERDROPTS statement to the member in error, and restart the event readers.

Problem determination: The IBM Tivoli Workload Scheduler for z/OS message log contains messages that identify the parameter member that is in error.

**EQQR101E THE LAYOUT RLLAYOUT CANNOT BE
ADDED TO THE LAYOUT TABLE**

Explanation: The ready list layout table already contains the layout that you tried to add.

System action: The ready list layout table is not updated.

User response: Change the layout name and repeat the request.

**EQQR102I THE LAYOUT RLLAYOUT HAS BEEN
ADDED TO THE LAYOUT TABLE**

Explanation: The layout has been successfully added to the ready list layout table and saved.

System action: The ready list layout table is updated.

User response: None.

**EQQR103I THE LAYOUT RLLAYOUT HAS BEEN
DELETED FROM THE LAYOUT TABLE**

Explanation: The layout has been successfully deleted from the ready list layout table.

System action: The ready list layout table is updated.

User response: None.

**EQQR104I THE LAYOUT RLLAYOUT HAS BEEN
UPDATED IN THE LAYOUT TABLE**

Explanation: The layout has been successfully updated in the ready list layout table.

System action: The ready list layout table is updated.

User response: None.

**EQQR105E TO EXIT FROM THIS PANEL, EITHER
SELECT A LAYOUT OR CANCEL THE
REQUEST**

Explanation: A layout is required for the requested ready list display.

System action: The system waits for you to respond.

User response: Select an existing layout or create a new one.

| **EQQR106E FAILURE TO OPEN THE LAYOUT
| TABLE**

| **Explanation:** IBM Tivoli Workload Scheduler for z/OS
| could not open the ready list layout table.

| **System action:** The system waits for you to respond.

| **System programmer response:** Check that the ISPTLIB
| data set contains the EQQRLOUT table.

EQQR107W A DEFAULT LAYOUT CANNOT BE DELETED

Explanation: You have attempted to delete an installation-defined layout, but you are allowed to delete only your own layouts.

System action: The request is rejected.

User response: Check that the layout you attempted to delete is the layout you want to delete.

EQQR108W THE LAYOUT *RLLAYOUT* CANNOT BE FOUND IN THE LAYOUT TABLE

Explanation: The layout *RLLAYOUT* does not exist.

System action: The system waits for you to respond.

User response: Select one of the layouts in the list or create a new one.

EQQR109E THE LAYOUT *RLLAYOUT* CANNOT BE FOUND IN THE LAYOUT TABLE

Explanation: The layout *RLLAYOUT* does not exist.

System action: The system waits for you to respond.

User response: Select one of the layouts in the list or create a new one.

| **EQQR110E THE LAYOUT ID MUST BE SPECIFIED**

| **Explanation:** Data entry error.

| **User response:** Enter the required value and rerun the task to use the selected value. See "Data entry errors" on page 803.

| **EQQR111E SELECT AN ITEM BY SPECIFYING SELECT OR A NUMBER 01-99**

| **Explanation:** Data entry error.

| **User response:** Enter the required value and rerun the task to use the selected value. See "Data entry errors" on page 803.

| **EQQR112E LEAVE BLANK OR SPECIFY *OCHCYES* OR *OHCNO***

| **Explanation:** Data entry error.

| *OCHCYES* is the national language character for Y (yes) and *OHCNO* is for N (no).

| **User response:** Enter a valid value and rerun the task to use the selected value. See "Data entry errors" on page 803.

EQQR120E NO LAYOUT WAS SELECTED, *RSRLT* IS USED

Explanation: The ready list was to be displayed using the default layout, *RSRLT*, that is, the layout that was used last time the ready list was displayed for the same workstation. That layout could not be found and the first layout in the layout table is used.

System action: The ready list is displayed.

User response: If the used layout is not appropriate, change the layout ID.

EQQR121E A LAYOUT MUST BE SELECTED TO DISPLAY ERROR LISTS

Explanation: The Ended in Error List cannot be displayed without a layout ID.

System action: A panel listing the possible layouts is displayed.

User response: Select a layout from the selection list or specify a valid ID in the layout input field.

| **EQQR200E INVALID PARAMETER WHEN CALLING MODULE *MODNM***

| **Explanation:** There is an invalid parameter in the input to the ready list module (module name *MODNM*).

| **System action:** The requested access to a ready list function is rejected.

| **System programmer response:** Check that the panel has not been inadvertently overlaid in the panel library (*ISPLLIB*).

| **Problem determination:** This message indicates that there is an error in the current panel.

EQQR201I RETURN CODE *URC* WAS RETURNED FROM READY LIST USER EXIT

Explanation: The active exit for this ready list layout ended with a return code greater than or equal to 8.

System action: The status is not changed.

User response: Contact the person responsible for ready list exit to determine the reason for the return code that was set.

EQQR202I SET STATUS REQUEST CANCELLED BY USER EXIT

Explanation: The active exit for this ready list layout has returned a code of 9 in the status field *URNSTAT*, which means cancel the request.

System action: The status is not changed.

User response: None.

EQQR300E PRIORITY MUST BE A NUMBER 1 - 9

Explanation: Data entry error.

User response: Enter a valid value and rerun the task to use the selected value. See "Data entry errors" on page 803.

EQQR302E SELECT THE WORK STATION TO
DISPLAY A READY LIST

Explanation: Data entry error.

User response: Select the required field and rerun the task to use the selected value. See "Data entry errors" on page 803.

EQQR303E A CHARACTER THAT IS NOT A
STATUS CODE IS IN THE CODE
STRING

Explanation: A character that you have specified as a selection criterion for status codes is not a valid status code.

System action: The system waits for you to respond.

System programmer response: Check panel EQQXINIX for valid values and reenter.

User response: Contact your system programmer.

Problem determination: The convention on status codes for the installation is defined in the ISPLIB library panel EQQXINIX.

EQQR400W THERE ARE NO OPERATOR
INSTRUCTIONS FOR THIS
OPERATION

Explanation: There are no operator instructions for the operation that you selected in the ready list.

System action: The system waits for you to respond.

User response: Check your input.

EQQR401W JS AND JOBLIB DATA SETS CONTAIN
NO JCL FOR THIS OPERATION

Explanation: There is no JCL for the operation that you selected in the ready list.

System action: The system waits for you to respond.

User response: Check your input.

EQQR402W THERE IS A JCL RECORD ON THE JS
DATA SET, BUT IT CONTAINS NO
JCL

Explanation: There is a JCL record for the operation that you selected, but the record does not contain JCL.

System action: The system waits for you to respond.

User response: Check your input.

EQQR403E CHECK JCL RECORD KEY:
(JSADIDJSIAD JSIATJSOPNUM)

Explanation: A read failed when trying to read the JCL record with the key JSADIDJSIADJSIATJSOPNUM. The key is derived from ISPF variables set up in a panel.

System action: The system waits for you to respond.

System programmer response: Check that the panel has not been inadvertently overlaid in the panel library (ISPLIB).

Problem determination: This message indicates that there is an error in the current or previous panel.

EQQR404E STORAGE PROBLEMS OCCURRED

Explanation: In a modify control plan (MCP) dialog for a JCL edit session the controller returned data that could not be retrieved and displayed, because not enough storage had been preallocated to receive it.

Problem determination: This message indicates that, in the ISPF environment, there is not enough main storage to receive and display the JCL modified and returned from the controller.

EQQR600E STATUS ENTERED OR GIVEN BY
EXIT MUST BE STR, STS, STI, STE, OR
STC

Explanation: Data entry error.

STR is the national language character for R (ready), *STS* is for S (started), *STI* is for I (interrupted), *STE* is for E (ended-in-error), and *STC* is for C (complete).

User response: Enter a valid value and rerun the task to use the selected value. See "Data entry errors" on page 803.

EQQR601E STATUS ENTERED OR GIVEN BY
EXIT MUST BE STR OR STC

Explanation: Data entry error.

STR is the national language character for R (ready), *STS* is for S (started), *STI* is for I (interrupted), *STE* is for E (ended-in-error), and *STC* is for C (complete).

User response: Enter a valid value and rerun the task to use the selected value. See "Data entry errors" on page 803.

EQQR602E ENTER OSOPSTS, OSOPSTI, OSOPSTE,
OR OSOPSTC

Explanation: Data entry error.

OSOPSTS is the national language character for S (started), *OSOPSTI* is for I (interrupted), *OSOPSTE* is

| for E (ended-in-error), and *OSOPSTC* is for C
| (complete).

| **User response:** Enter a valid value and rerun the task
| to use the selected value. See “Data entry errors” on
| page 803.

| **EQQR603E** ENTER *OSOPSTS*, *OSOPSTE*, OR
| *OSOPSTC*

| **Explanation:** Data entry error.

| *OSOPSTS* is the national language character for S
| (started), *OSOPSTE* is for E (ended-in-error), and
| *OSOPSTC* is for C (completed).

| **User response:** Enter a valid value and rerun the task
| to use the selected value. See “Data entry errors” on
| page 803.

| **EQQR604E** ENTER *OSOPSTI*, *OSOPSTE*, OR
| *OSOPSTC*

| **Explanation:** Data entry error.

| *OSOPSTI* is the national language character for I
| (interrupted), *OSOPSTE* is for E (ended-in-error), and
| *OSOPSTC* is for C (complete).

| **User response:** Enter a valid value and rerun the task
| to use the selected value. See “Data entry errors” on
| page 803.

EQQR615E ONLY OPERATIONS WITH STATUS
ARRIVING CAN BE SET TO READY

Explanation: You have attempted to set an operation
in the current plan to “ready”, but only operations with
status “arriving” can be set to ready.

System action: The system waits for you to respond.

User response: Enter a valid status or leave blank.

| **EQQR616W** REQUEST TO SET THE STATUS TO
| STARTED IS IGNORED

| **Explanation:** You have attempted to set an operation
| in the current plan to “started”, but the operation has
| already started.

| **System action:** The request is ignored.

| **User response:** Enter a valid status or leave it blank.

| **EQQR617E** ONLY OPERATIONS WITH THE
| STATUS STARTED CAN BE
| INTERRUPTED

| **Explanation:** You have attempted to interrupt an
| operation that has not yet started. You can interrupt an
| operation only if it has already started.

| **System action:** The system waits for you to respond.

| **User response:** Enter a valid status or leave it blank.

EQQR618W REQUEST TO SET THE STATUS TO
ERROR IS IGNORED

Explanation: You have attempted to set an operation
in the current plan to “ended-in-error” status, but the
operation is already set to that status.

System action: The request is ignored.

User response: Enter a valid status or leave it blank.

| **EQQR619W** REQUEST TO SET THE STATUS TO
| COMPLETE IS IGNORED

| **Explanation:** You have attempted to set an operation
| in the current plan to “complete” status, but the
| operation has already completed.

| **System action:** The request is ignored.

| **User response:** Enter a valid status or leave it blank.

| **EQQR620W** THE INTERRUPT REQUEST IS
| IGNORED

| **Explanation:** You have attempted to interrupt an
| operation in the current plan, but the operation has
| already been interrupted.

| **System action:** The request is ignored.

| **User response:** Select a valid request for the operation.

| **EQQR621E** DURATION REQUIRED FOR
| OPERATIONS THAT HAVE NOT BEEN
| STARTED

| **Explanation:** Data entry error.

| **User response:** You must specify a duration for
| operations that have not started. Enter the required
| value and rerun the task to use the selected value.

EQQR622E AN OPERATION WAITING FOR
ARRIVAL CANNOT BE RESET

Explanation: You have attempted to reset an operation
that is waiting for arrival. This is not allowed.

System action: The system waits for you to respond.

User response: Enter a valid status or leave blank.

EQQR623E AN OPERATION WITH READY
STATUS CANNOT BE RESET

Explanation: You have attempted to reset an operation
that is ready. This is not allowed.

System action: The system waits for you to respond.

User response: Enter a valid status or leave blank.

EQQR624E OP BEING UPDATED BY ANOTHER USER, REQUEST IS REJECTED, RSNC: XSSRS

Explanation: The operation either cannot be read from the current plan or has another status, real duration, or error code than is displayed. The operation has been changed from its condition in the ready list.

System action: The ready list is refreshed and the system waits for you to respond.

User response: Review the operation, and if it is still valid, reenter the request.

EQQR626E THE REQUESTED STATUS CHANGE MUST BE DONE VIA A RESET REQUEST

Explanation: The intended status change is not supported. You must enter a reset request and a request to get the desired status.

System action: The ready list is displayed.

User response: Enter the row command R and enter N-x, where x is the required status.

EQQR627E RESET OF OSEQ OPERATION MUST BE DONE VIA MODIFY CURRENT PLAN

Explanation: You attempted to reset an operation with error code OSEQ from the Ready List dialog. This cannot be done. The error code OSEQ indicates that a job began to execute before all the predecessors to the operation were complete.

System action: The ready list is displayed.

User response: Reset can be done when all predecessors to the OSEQ operation are complete. To reset the operation status to Waiting, issue the operation command RERUN from the error list in the Modify Current Plan dialog.

EQQR629E THE JCL IS BEING UPDATED BY USER &USR, REQUEST IS REJECTED

Explanation: You have attempted to update the JCL, but it is being updated by another user &usr.

System action: The request is rejected and the system waits for you to respond.

User response: Try again later.

EQQR638E WHEN SETTING STATUS TO OSOPSTI, SPECIFY DURATION OF OPERATION

Explanation: Data entry error; see "Data entry errors" on page 803.

A duration of operation is required when setting the

status to *OSOPSTI*, the national language character for I (interrupted).

User response: You must specify a duration of operation when setting the status to *OSOPSTI*, the national language character for I (interrupted). Enter the required value and rerun the task to use the selected value.

EQQR639E WHEN SETTING STATUS TO OSOPSTE, THE TYPE OF ERROR MUST BE SPECIFIED

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You must specify a type of error when setting the status to *OSOPSTE*, the national language character for E (ended-in-error). Enter the required value and rerun the task to use the selected value.

EQQR640I THE JCL FOR THIS OPERATION CONTAINS UNRESOLVED SETUP VARIABLES

Explanation: You tried to resolve variables using the program interface request JCLPREPA, with SIMTYPE FULL, and IBM Tivoli Workload Scheduler for z/OS found one or more unresolvable variables in the JCL for the operation.

System action: None.

User response: Browse the IBM Tivoli Workload Scheduler for z/OS message log data set (EQQMLOG) for message EQQJ510, which gives you the name of the failing variable. Correct the failing variable and retry the request.

EQQR656E THE VALUE ENTERED DOES NOT MATCH THE VARIABLE'S VERIFICATION RULES

Explanation: Data entry error.

The value that you entered is invalid according to the validation criteria defined for this variable.

User response: Use the S row command to check if help is defined for the current variable. If no help is defined, contact the person responsible for variable definitions to see what rules apply to the variable. See "Data entry errors" on page 803.

EQQR657E A VALUE MUST BE ENTERED FOR THIS VARIABLE

Explanation: Data entry error; see "Data entry errors" on page 803.

According to the definition of this variable, a value must be entered.

User response: Enter the required value and rerun the

| task to use the selected value.

| **EQQR658E THE EDIT OPTION CHARACTER**
| **MUST BE Y OR N**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** Enter Y (yes) or N (no) and rerun the
| task to use the selected value.

EQQR662E A VARIABLE WITH VAL REQ=Y
MUST NOT HAVE A BLANK VALUE

Explanation: If it is specified that a JCL variable
requires a value other than blank, the default value
must not be blank.

System action: The system waits for you to respond.

User response: Insert a default value other than blank
in the Default Value field.

EQQR674E AN ERROR OCCURRED DURING
INSERT HANDLING

Explanation: An error was detected during INSERT JS
PROGRAM INTERFACE (PIF) processing. This message
is issued in the EQQMLOG for the PIF job when a user
tries to add a JCL already present in the JS file.

System action: The job is terminated with a return
code of 0.

User response: Correct the errors and retry the
request..

Problem determination: Check the controller message
log (EQQMLOG) for messages describing the error.

EQQR675E AN ERROR OCCURRED DURING
JCL-VARIABLE SUBSTITUTION

Explanation: An error was detected during JCL
variable substitution processing. This message can be
issued to a:

Dialog user

In the JCL Setup dialog to indicate that an
error has been detected during variable
substitution

PIF application

In the EQQMLOG for the program interface
(PIF) job when any type of substitution or
validation error occurs.

System action: In the dialog, the system waits for you
to respond. If the error occurred while using the PIF,
the job is terminated with a return code of 0008.

User response: Correct the errors and retry the
request.

Problem determination: In the dialog, look at the
detailed error message that has been inserted into the

JCL. You can find the message by entering ISPF
command LOCATE SPECIAL.

If you are using the PIF, check the controller message
log (EQQMLOG) for messages describing the error.

EQQR676E AN ERROR OCCURRED DURING JCL
MEMBER READ

Explanation: An error occurred while reading a JCL
member.

System action: The request is rejected.

User response: Either the JCL is not present in the
JOB LIB data set, or an access problem occurred while
the JCL was being read.

| **EQQR701E GROUP ID INVALID. ALARM=YES**

| **Explanation:** Run cycle group name is missing or
| invalid.

| **System action:** No action is taken.

| **User response:** Enter a valid run cycle group name.

| **EQQR702E PERIOD/RULE MISSING. ALARM=YES**

| **Explanation:** A period/rule name must be specified.

| **System action:** No action is taken.

| **User response:** Specify a valid, existing period or rule
| name.

| **EQQR707E RUN CYCLE GROUP EXISTS.**
| **ALARM=YES**

| **Explanation:** A run cycle group with this ID already
| exists.

| **System action:** The system is waiting for a valid,
| pristine ID.

| **User response:** Enter a brand new run cycle group ID.

| **EQQR708E RUN CYCLE GROUP IN USE.**
| **ALARM=YES**

| **Explanation:** The run cycle group is being updated by
| another user. Try later.

| **System action:** No action is taken.

| **User response:** Retry later.

| **EQQR709E THE RUN CYCLE SUBSET ID IS**
| **INVALID**

| **Explanation:** One or more invalid characters were
| used in the subset name. Only alphanumeric characters
| are admitted.

| **System action:** The run cycle is not saved.

| **User response:** Use only alphanumeric characters to
| specify the subset name.

| **EQQR711E A PERIOD NAME MUST BE
| SPECIFIED**

| **Explanation:** See text.

| **System action:** None.

| **User response:** Specify a correct value and press Enter.

| **EQQR712E THE PERIOD NAME DOES NOT
| EXIST IN THE CALENDAR**

| **Explanation:** The period name that you specified is
| not defined in the calendar database.

| **System action:** The system waits for you to respond.

| **User response:** Enter an existing period name, or use
| the Calendar dialog to define the period name.

| **EQQR713E A VALID RULE NAME MUST BE
| SPECIFIED**

| **Explanation:** You have not entered a valid rule name.
| A valid rule name has a maximum of 8 characters,
| where the first character is alphabetical and the
| remaining characters are alphanumeric or national.

| **System action:** The request is rejected.

| **User response:** Specify a valid rule name.

| **EQQR714E SPECIFY AT LEAST ONE RUNDAY**

| **Explanation:** You selected a period, but failed to
| specify any offsets.

| **System action:** None.

| **User response:** Specify an offset and press Enter.

Chapter 221. EQQREnn messages

EQQRE01 - EQQRE53

EQQRE01E I/O ERROR OCCURRED WHEN READING THE EQQDBMSG DATA SET.

Explanation: An error occurred while running the REXX program EQQRXARC to archive historical run data in the relational database. The process cannot read the database specified in the EQQDBMSG DD card of the submitted JCL.

System action: The program terminates.

User response: Correct the EQQDBMSG DD card in the submitted JCL and submit the JCL again.

EQQRE02E INPPARM DD CARD IS MISSING.

Explanation: An error occurred while running the REXX program EQQRXARC to archive historical run data in the relational database. The INPPARM DD card is not specified in the submitted JCL.

System action: The program terminates.

User response: Specify the INPPARM DD card in the submitted JCL and submit the JCL again.

EQQRE03I UNKNOWN PARAMETER *UNKPARAM.* IT WILL BE IGNORED.

Explanation: An error occurred while running the REXX program EQQRXARC to archive historical run data in the relational database. An incorrect input parameter for the REXX program was specified in the INPPARM DD card.

System action: The program continues. The unknown parameter is ignored.

User response: Remove the incorrect parameter from the INPPARM DD card in the submitted JCL.

EQQRE04E

Explanation: An error occurred while running the REXX program EQQRXARC to archive historical run data in the relational database. The program is invoked by EQQDBARZ JCL. A GDG root is specified as input parameter for the REXX program in the INPPARM DD card. The specified GDG root is incorrect.

System action: The program terminates.

User response: Correct the INPPARM DD card in the submitted JCL and submit the JCL again.

EQQRE05E COPY FAILED FOR THE DATA SET *GDGDS*. RETURN CODE IS *RC*.

Explanation: An error occurred while running the REXX program EQQRXARC to archive historical run data in the relational database. The program copies the input GDG sequential data set to a VSAM file. The IDCAMS REPRO utility failed with the specified return code.

System action: The program terminates.

User response: Correct the error in the submitted JCL and submit the JCL again.

EQQRE06E ARCHIVING PROCESS FAILED FOR *GDGDS* WITH RETURN CODE *RC*.

Explanation: An error occurred while running the REXX program EQQRXARC to archive historical run data in the relational database. The REXX launches a Java program that archives the old current plan. The Java program failed to archive the data and terminated with the specified return code.

System action: The GDG data set corresponding to this old current plan is not removed and the program terminates.

User response: Check the Java program logs for messages describing the error that caused the archiving to fail. Correct the error in the submitted JCL and submit the JCL again.

EQQRE07E DELETION OF DATA SET *GDGDS* FAILED WITH RETURN CODE *RC*.

Explanation: An error occurred while running the REXX program EQQRXARC to archive historical run data in the relational database. When the old current plan corresponding to the GDG data set has been archived, the GDG data set must be deleted to avoid the current plan being archived twice. The REXX program was unable to delete the GDG data set.

System action: The program terminates.

User response: Delete the specified GDG data set and submit the JCL again.

EQQRE08E MANDATORY PARAMETER *KEYWORD* NOT SPECIFIED IN *INPPARM*.

Explanation: An error occurred while running the

EQQRE09E • EQQRE51E

REXX program EQQRXARC to archive historical run data in the relational database. A mandatory input parameter for the REXX program was not specified in the INPPARM DD card.

System action: The program terminates.

User response: Add the mandatory parameter to the INPPARM DD card of the submitted JCL and submit the JCL again.

EQQRE09E PARAMETER KEYWORD IS DUPLICATED IN INPPARM.

Explanation: An error occurred while running the REXX program EQQRXARC to archive historical run data in the relational database. The specified input parameter for the REXX program is duplicated in the INPPARM DD card.

System action: The program terminates.

User response: Remove the duplication from the INPPARM DD card of the submitted JCL and submit the JCL again.

EQQRE10E SYNTAX ERROR IN PARAMETER VALUE P_V.

Explanation: An error occurred while running the REXX program EQQRXARC to archive historical run data in the relational database. There is a syntax error in the specified input parameter for the REXX program in the INPPARM DD card.

System action: The program terminates.

User response: Correct the parameter in the submitted JCL and submit the JCL again.

EQQRE11E GDG ENTRIES LIST IS EMPTY. NO DATA TO BE ARCHIVED.

Explanation: The message is issued by the REXX program EQQRXARC that archives historical run data in the relational database. The program uses the GDG root which is specified in the INPPARM DD card as input parameter, in order to list the old current plan to be archived. No data set with the specified GDG root has been found.

System action: The program terminates.

User response: If the GDG root is incorrect, modify it and submit the JCL again. Otherwise no action is needed; there is no old current plan to archive at the moment.

EQQRE12I IDCAMS REPRO UTILITY SUCCESSFULLY COPIED GDGDS TO VSAMBKP.

Explanation: The message is issued by the REXX program EQQRXARC that archives historical run data

in the relational database. The copy of the specified GDG data set was successful.

System action: The program continues its processing.

User response: None.

EQQRE13I ARCHIVING PROCESS SUCCESSFULLY COMPLETED FOR GDGDS.

Explanation: The message is issued by the REXX program EQQRXARC that archives historical run data in the relational database. The old current plan corresponding to the specified GDG data set has been correctly archived.

System action: The program continues its processing.

User response: None.

EQQRE14I DATA SET GDGDS SUCCESSFULLY DELETED.

Explanation: The message is issued by the REXX program EQQRXARC that archives historical run data in the relational database. The old current plan corresponding to the specified GDG data set has been correctly archived and the GDG data set has been deleted to avoid archiving it twice.

System action: The program continues its processing.

User response: None.

EQQRE15E PROGRAM JAVAPGM COULD NOT BE LOCATED.

Explanation: An error occurred while running the REXX program EQQRXARC to archive historical run data in the relational database. The JZOS Batch Launcher load module named *JAVAPGM*, specified in the INPPARM DD card, cannot be located.

System action: The program terminates.

User response: Correct the INPPARM DD card in the submitted JCL and submit the JCL again.

EQQRE51E I/O ERROR OCCURRED WHEN READING THE EQQLIB DATA SET.

Explanation: An error occurred while running the REXX program EQQRXTRG to build the configuration files for event-driven workload automation. The process cannot read the data set specified in the EQQLIB DD card of the submitted JCL.

System action: The program terminates.

User response: Correct the EQQLIB DD card in the submitted JCL and submit the JCL again.

**EQQRE52E CONFIGURATION FILES BUILD
FAILED WITH RETURN CODE RC.**

Explanation: An error occurred while running the REXX program EQQRXTRG to build the configuration files for event-driven workload automation.

System action: The program terminates.

User response: Review the STDOUT and STDERR data set to determine the cause of the problem. If the problem persists, save the complete output of the JCL and contact IBM Software Support.

**EQQRE53I CONFIGURATION FILES BUILD
SUCCESSFULLY COMPLETED.**

Explanation: The REXX program EQQRXTRG successfully built the configuration files for event-driven workload automation. They are stored in the data set specified in the EQQEVLIB DD card.

System action: The program ends the normal processing.

User response: None.

Chapter 222. EQQRMnn messages

EQQRM01 - EQQRM29

EQQRM01I RODM SUBTASK INITIALIZATION IS COMPLETE

Explanation: The RODM subtask has completed initialization processing.

System action: Processing continues.

Operator response: None.

EQQRM02E RODM SUBTASK ABENDED WHEN PROCESSING THE FOLLOWING QUEUE ELEMENT *DQE*

Explanation: An abend prevented the RODM subtask from processing a queue element.

System action: z/OS recovery/termination is requested to generate a dump. The RODM subtask restarts, and resumes normal processing.

System programmer response: Save the EQQMLOG, EQQDUMP, and system dump data sets and contact IBM Software Support.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log data set (EQQMLOG), the diagnostic data set (EQQDUMP), and the system dump data set to determine the cause of the error.

EQQRM03W RODM CONNECT FAILED FOR RODM SUBSYSTEM *NAME*. RC IS *RC*, RSN IS *RSN*

Explanation: A nonzero return code was returned by the RODM subsystem *NAME* when the RODM subtask called the RODM API to connect.

System action: The RODM subtask attempts to connect to this RODM subsystem repeatedly until the connection succeeds or the RODM subtask is stopped.

System programmer response: Make sure that the RODMSYS keyword is specified correctly, and if so, that the specified RODM subsystem has started successfully. Refer to the *RODM Programming Guide* for more information about return codes and reason codes used by the RODM API.

EQQRM04W RODM CONNECT FAILED DUE TO RODM ERROR FOR *SYSTEM*

Explanation: The RODM subtask has not been able to connect to the specified RODM subsystem.

System action: The OPCRESOURCE/OPCFIELD specified on the RODMOPTS statement referring to this RODM subsystem is set to Inactive and processing continues. Attempts to connect to this RODM subsystem are initiated every five minutes.

System programmer response: Make sure that the RODM subsystem is properly initialized.

EQQRM05I INITIALIZATION FAILED - SUBSYSTEM STOP REQUESTED

Explanation: A stop subsystem command was issued while the RODM subtask was initializing. This caused the subtask to end.

System action: The IBM Tivoli Workload Scheduler for z/OS subsystem continues the shutdown sequence.

User response: None.

EQQRM07W THE RODM SUBTASK IGNORED THE FOLLOWING ELEMENT ON THE RODM QUEUE *DQE*

Explanation: An invalid subscription request was found on the RODM queue.

System action: Processing continues.

System programmer response: Contact IBM Software Support.

EQQRM09E RODM SUBTASK QUEUE POINTERS ARE DESTROYED, RODQ IS LOST

Explanation: The RODM subtask abended while processing elements on APPQ because the queue chaining is invalid.

System action: z/OS recovery/termination is requested to generate a dump. The RODM subtask restarts and resumes normal processing.

System programmer response: Save the EQQMLOG, EQQDUMP, and system dump data sets and contact IBM Software Support.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log data set (EQQMLOG), the diagnostic data set (EQQDUMP), and the system dump data set to determine the cause of the error.

EQQRM10E INVALID RODMRM2XE VALUE *VALUE* SPECIFIED FOR RESOURCE *NAME*

EQQRM11E • EQQRM19E

Explanation: A RODMOPTS statement specifies a RODMRM2XE value that is invalid.

System action: RODM subtask initialization fails and the controller is shutdown.

User response: Specify a valid RODMRM2XE value and restart the controller.

EQQRM11E RODM INTERFACE MODULE EKGUAPI COULD NOT BE LOADED

Explanation: A RODM interface module was not found in the library search path.

System action: IBM Tivoli Workload Scheduler for z/OS continues, but the RODM functions as requested by RODMOPTS keywords referring to this destination are disabled.

System programmer response: Make sure that the RODM interface modules can be accessed, either via the LINKLST or in the STEPLIB concatenation, and restart IBM Tivoli Workload Scheduler for z/OS

EQQRM12W RESOURCE UNKNOWN *NAME*

Explanation: A RODMOPTS statement specifies a resource unknown to IBM Tivoli Workload Scheduler for z/OS.

System action: This RODMOPTS statement is ignored. Processing continues. The status is set to Inactive.

System programmer response: Specify a valid resource name or add the resource to IBM Tivoli Workload Scheduler for z/OS.

EQQRM13E RESOURCE FIELD UNKNOWN *NAME*

Explanation: A RODMOPTS statement specifies a resource field unknown to IBM Tivoli Workload Scheduler for z/OS.

System action: RODM subtask initialization fails and the controller is shut down.

System programmer response: Specify a valid resource field name and restart the controller.

EQQRM14W RODM OBJECT UNKNOWN *NAME*

Explanation: A RODMOPTS statement specifies a RODM object that is unknown to IBM Tivoli Workload Scheduler for z/OS.

System action: The OPCRESOURCE/OPCFIELD specified on the RODMOPTS statement referring to this RODM OBJECT is set to Inactive and processing continues. New subscription attempts are performed every five minutes.

System programmer response: Specify a valid object name or add the object to the RODM subsystem.

EQQRM15W RODM OBJECT FIELD UNKNOWN *NAME*

Explanation: A RODMOPTS statement specifies a RODM field that is unknown to IBM Tivoli Workload Scheduler for z/OS.

System action: The OPCRESOURCE/OPCFIELD specified on the RODMOPTS statement referring to this RODM FIELD is set to Inactive and processing continues.

System programmer response: Specify a valid RODM field name or add the field to the object in the RODM subsystem.

EQQRM16I CONNECTION ESTABLISHED TO RODM SUBSYSTEM: *NAME*

Explanation: IBM Tivoli Workload Scheduler for z/OS has connected to a RODM subsystem.

System action: Processing continues.

User response: None.

EQQRM17W CONNECTION LOST TO RODM SUBSYSTEM: *NAME*

Explanation: IBM Tivoli Workload Scheduler for z/OS has lost the connection to a RODM subsystem.

System action: Processing continues. The status for all resources being monitored by the named RODM subsystem is set to Inactive and the values of the corresponding IBM Tivoli Workload Scheduler for z/OS resource fields are set according to the RODMLOST values in the RODMOPTS statements. Attempts to reconnect to this RODM subsystem are initiated every five minutes.

User response: None.

EQQRM18E INVALID TRANSLATION VALUE *TYPE VALUE SPECIFIED FOR* RESOURCE *NAME*

Explanation: A RODMOPTS statement specifies an invalid TRANSLATE value.

System action: RODM subtask initialization fails and the controller is shut down.

System programmer response: Specify a valid value in the TRANSLATE ordered list and restart the controller.

EQQRM19E INVALID RODMLOST VALUE *VALUE* SPECIFIED FOR RESOURCE *NAME*

Explanation: A RODMOPTS statement specifies an invalid RODMLOST value.

System action: RODM subtask initialization fails and the controller is shut down.

System programmer response: Specify a valid value in the RODMLOST keyword and restart the controller.

EQQR20E DESTINATION UNKNOWN DNAME

Explanation: A RODMOPTS statement specifies a destination that is unknown to IBM Tivoli Workload Scheduler for z/OS.

System action: RODM subtask initialization fails and the controller is shut down.

System programmer response: Specify a valid destination name and restart the controller.

EQQR21W THE AVAILABILITY OF A SPECIAL RESOURCE COULD NOT BE DETERMINED FROM A RODM OBJECT. RESOURCE NAME IS NAME

Explanation: A RODMOPTS statement specifies that the availability of a special resource should be updated by a field in a RODM object. IBM Tivoli Workload Scheduler for z/OS cannot determine whether the special resource is available or not because the value of the field is not Y, N, or a value that can be translated to Y or N.

System action: The availability of the special resource is not changed. The RODM subtask continues normal processing.

System programmer response: Verify that the RODM object has been correctly updated. Verify that the RODMOPTS statement refers to the correct RODM object.

EQQR22W A SPECIAL RESOURCE QUANTITY COULD NOT BE DETERMINED FROM A RODM OBJECT. RESOURCE NAME IS NAME

Explanation: A RODMOPTS statement specifies that a special resource quantity should be updated by a field in a RODM object. However, the value of the field is not within the valid range of special resource quantities. The valid range is 0-999 999.

System action: The special resource quantity is not changed. The RODM subtask continues normal processing.

System programmer response: Verify that the RODM object has been correctly updated. Verify that the RODMOPTS statement refers to the correct RODM object.

EQQR23W A SPECIAL RESOURCE DEVIATION COULD NOT BE DETERMINED FROM A RODM OBJECT. RESOURCE NAME IS NAME

Explanation: A RODMOPTS statement specifies that a

special resource deviation quantity should be updated by a field in a RODM object. However, the value of the field is not within the valid range of special resource deviations. The valid range is -999999 through 999999.

System action: The special resource quantity is not changed. The RODM subtask continues normal processing.

System programmer response: Verify that the RODM object has been correctly updated. Verify that the RODMOPTS statement refers to the correct RODM object.

EQQR24W SUBSCRIBE FOR RODM OBJECT NAME FAILED. RETURN CODE IS RC, REASON IS RSN

Explanation: A nonzero return code was returned by a RODM subsystem when the RODM subtask called the RODM API to add a notify subscription.

System action: The RODM subtask continues normally. If the RODM object is modified later, the RODM subtask is not notified and the corresponding IBM Tivoli Workload Scheduler for z/OS resource is not updated.

System programmer response: Make sure that the current field in the RODM object has a notify subfield. Refer to the *RODM Programming Guide* for more information about return codes and reason codes used by the RODM API.

EQQR25I SUBSCRIBE FOR RODM OBJECT NAME WAS SUCCESSFUL

Explanation: A zero return code was returned by a RODM subsystem when the RODM subtask called the RODM API to add a notify subscription.

System action: The RODM subtask continues normally. If the RODM class is modified later, the RODM subtask is notified and the corresponding IBM Tivoli Workload Scheduler for z/OS resource is updated.

System programmer response: None.

EQQR26W SUBSCRIBE FOR RODM CLASS NAME FAILED. RETURN CODE IS RC, REASON IS RSN

Explanation: A nonzero return code was returned by a RODM subsystem when the RODM subtask called the RODM API to add a notify subscription.

System action: The RODM subtask continues normally. If the RODM class is modified later, the RODM subtask is not notified and the corresponding IBM Tivoli Workload Scheduler for z/OS resource is not updated.

System programmer response: Make sure that the

EQQRM27I • EQQRM29W

current field in the RODM class has a notify subfield. Refer to the *RODM Programming Guide* for more information about return codes and reason codes used by the API.

EQQRM27I SUBSCRIBE FOR RODM CLASS NAME WAS SUCCESSFUL

Explanation: A zero return code was returned by a RODM subsystem when the RODM subtask called the RODM API to add a notify subscription.

System action: The RODM subtask continues normally. If the RODM class is modified later, the RODM subtask is notified and the corresponding IBM Tivoli Workload Scheduler for z/OS resource is updated.

System programmer response: None.

EQQRM28W SUBSCRIBE FOR RODM OBJECT NAME FAILED. RETURN CODE IS RC, REASON IS RSN THE SCHEDULER WILL RETRY EVERY 3 MINUTES

Explanation: A nonzero return code was returned by a RODM subsystem when the RODM subtask called the RODM API to add a notify subscription for a RODM object.

System action: The RODM subtask continues normally. IBM Tivoli Workload Scheduler for z/OS tries again after three minutes to add the notify subscription for the RODM object.

System programmer response: None.

EQQRM29W SUBSCRIBE FOR RODM CLASS NAME FAILED. RETURN CODE IS RC, REASON IS RSN THE SCHEDULER WILL RETRY EVERY 3 MINUTES

Explanation: A nonzero return code was returned by a RODM subsystem when the RODM subtask called the RODM API to add a notify subscription for a RODM class.

System action: The RODM subtask continues normally. IBM Tivoli Workload Scheduler for z/OS tries again after three minutes to add the notify subscription for the RODM object.

System programmer response: None.

Chapter 223. EQQSnnn messages

EQQS000 - EQQS418

EQQS000E YOU DO NOT HAVE AUTHORITY TO ACCESS THE QUERY CP DIALOG

Explanation: You have attempted to access the Query Current Plan dialog, but you are not authorized.

System action: The request is rejected and the system waits for you to respond.

User response: If you need access to the Query Current Plan dialog, contact your security administrator.

EQQS001E AN INVALID MODULE PARAMETER WAS DETECTED

Explanation: There is an invalid parameter in the input to a query current plan module.

System action: The requested access to the query current plan function is rejected.

System programmer response: Check that the panel has not been inadvertently overlaid in the panel library (ISPPLIB). Verify that the user is not running a customized panel version.

User response: Check that your TSO logon profile points to the proper panel product library (ISPPLIB).

Problem determination: This message indicates that there is an error in the current panel.

EQQS003I THE TRACKER HAS NOT PROVIDED ANY SYSTEM INFORMATION

Explanation: System information is not available for the destination defined for this workstation. Tracker system information is available only when the controller has performed the initial synchronization and handshaking with the tracker.

System action: None.

System programmer response: This message is an indication that handshaking is not completed between the controller and the tracker. If the destination is Active, that is, there is not a communication failure, the event writer subtask at the indicated destination is not active. If this message is not expected, take appropriate actions to correct the problem with the tracker.

User response: The handshaking process may be in progress. Retry the request when the workstation is in Active status. The message can also indicate an error in the IBM Tivoli Workload Scheduler for z/OS configuration.

EQQS004E PROBLEMS ENCOUNTERED ATTEMPTING TO LOCATE SYSTEM INFORMATION

Explanation: The controller encountered an error when processing the request for system information. This message is always an indication of an internal error in IBM Tivoli Workload Scheduler for z/OS.

System action: Normal processing continues.

System programmer response: This message indicates that there is an error either in the processing of the ROUTOPTS initialization statement or in the current plan (CP) data set. If IBM Tivoli Workload Scheduler for z/OS is operating normally, no action needs be taken immediately. Review the involved workstation definition (either in WS and CP repository) and the destination defined for it. If you are unable to determine the cause of the problem, take a copy of the active CP data set, the active job-tracking log, the job-tracking archive, the controller message log, and the WS data set. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysgmt/products/support>.

User response: Take note of the workstation name, the approximate time when this message was issued in your dialog, and the action you were performing.

EQQS005E SYSTEM INFORMATION IS ONLY POSSIBLE FOR COMPUTER WORKSTATIONS

Explanation: System information is passed to the controller by the tracker executing on a system destination as specified in the workstation description. System information is only available for computer workstations.

System action: The request is rejected.

User response: Choose a computer workstation that represents the system for which you need information.

EQQS006E OPEN INTERVALS NOT AVAILABLE FOR VIRTUAL WORKSTATIONS.

Explanation: The selected workstation has the VIRTUAL option set to Y. Open intervals do not apply to virtual workstations: they apply to the single destination associated to a virtual workstation.

System action: The request is rejected.

User response: Use the Summary information (S)

EQQS007E • EQQS106E

command to get the virtual workstation panel flow.

EQQS007E D COMMAND IS ALLOWED ONLY FOR VIRTUAL WORKSTATIONS.

Explanation: The selected workstation has the VIRTUAL option set to N. The D command is only meaningful for virtual workstations.

System action: The request is rejected.

User response: Use the Open intervals (O) or System Information (S) command from the BROWSING WORKSTATION ACTIVITY panel.

EQQS008E YOU DO NOT HAVE AUTHORITY TO ISSUE ALL DEPS QUERY

Explanation: It is required that the person who issues the ALL DEPS command has the proper RACF authorization.

System action: The request is rejected.

User response: Enhance the RACF authorization of the user or ensure that the ALL DEPS command be issued by another user having the correct authorization.

EQQS100E THE ONLY VALID VALUES ARE OCHCYES AND OCHCNO

Explanation: You entered an invalid value in the AVAIL column.

System action: The system waits for you to respond.

User response: Enter a correct value in the AVAIL column.

EQQS101E YOU ARE NOT AUTHORIZED TO MODIFY SPECIAL RESOURCES

Explanation: To display a IBM Tivoli Workload Scheduler for z/OS panel where special resources can be modified, you need update authority to special resources. You do not have this authority.

System action: The request is rejected.

User response: Contact your security administrator.

EQQS102E SPECIAL RESOURCES ARE BEING UPDATED. TRY LATER

Explanation: Another IBM Tivoli Workload Scheduler for z/OS dialog user is currently updating special resources. To avoid overlaying another user's changes, only one dialog user can actively modify special resources.

System action: Processing continues.

User response: Try again later.

EQQS103E LEAVE BLANK OR SPECIFY ONE OF OSROEF, OSROEFS, OSROEFX, OR OSROEK

Explanation: You entered an invalid action code in the On error field for a special resource.

System action: The system waits for you to respond.

User response: Enter a valid value or leave the field blank.

EQQS104E YOU ARE NOT AUTHORIZED TO BROWSE SPECIAL RESOURCES

Explanation: To display a IBM Tivoli Workload Scheduler for z/OS panel where special resources can be shown, you need read authority to special resources. You do not have this authority.

System action: The request is rejected.

User response: Contact your security administrator.

EQQS105E EACH SPECIAL RESOURCE MUST NOT BE DEFINED BY MORE THAN ONE ROW

Explanation: You have modified the table containing special resources so that there is more than one row defining a special resource. This is not allowed.

System action: The system waits for you to respond.

User response: Delete all duplicate resource definition rows for the special resource.

| EQQS106E ERRORS DETECTED WHEN TRYING TO UPDATE SPECIAL RESOURCES

| **Explanation:** An error occurred while updating special resource information in the subsystem.

| **System action:** The updated special resource is not stored.

| **System programmer response:** Review the Special Resource definitions and any related error message in the MLOG and System Log. If you are unable to determine the cause of the problem. Take a copy of the active CP data set, the active job-tracking log, the job-tracking archive. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Review the log data set for error messages issued at the time of the request. If you cannot determine the cause of the problem and the error persists, take note of the special Resource name and of the action you were performing and contact your system programmer.

**EQQS107E DLF INDICATOR CANNOT BE
UPDATED WHILE RESOURCE IS
ALLOCATED**

Explanation: The update cannot be performed until all operations currently allocating the resource have completed.

System action: The update request is rejected.

User response: Retry the update request later.

**EQQS300E PRIORITY MUST BE A NUMBER
FROM 1 - 9**

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: Review your input in the Priority field of the panel. Select a number in the range 1-9.

**EQQS301E THE MCP ADDED INDICATOR MUST
BE OCHCYES OR OCHCNO**

Explanation: Data entry error; see "Data entry errors" on page 803.

OCHCYES is the national language character for 'Y' (yes) and *OCHCNO* is the national language character for 'N' (no).

User response: Review your input in the Occurrence Added field of the panel. Enter Yes, No, or leave it blank.

**EQQS302E THE RERUN INDICATOR MUST BE
OCHCYES OR OCHCNO**

Explanation: Data entry error; see "Data entry errors" on page 803.

OCHCYES is the national language character for 'Y' (yes) and *OCHCNO* is the national language character for 'N' (no).

User response: Review your input in the Rerun field of the panel. Enter Yes, No, or leave it blank.

**EQQS303E AN INVALID STATUS CODE *STT* WAS
FOUND IN THE CODE STRING**

Explanation: One or more of the status codes (*STT*) that you specified is not valid.

System action: The system waits for you to respond.

User response: Enter valid status codes.

Problem determination: The convention on status codes for the installation is defined in the ISPLIB library panel EQQXINIX.

**EQQS304E MOST CRITICAL OCCURRENCE LIST,
DO NOT SELECT ON STATUS *STT***

Explanation: The most critical occurrence list contains all occurrences that were not completed or deleted. It is not possible to further restrict the list base on the occurrence status.

System action: The system waits for you to respond.

User response: Remove the status code. If you want selection on status, go back to the Current Plan and Status Inquiry panel and select **1, APPLICATIONS**.

**EQQS305E CODE MUST BE ONE OF *ST1E* , *ST1D* ,
ST1P OR *ST1A***

Explanation: You entered an invalid code for selecting occurrences from the current plan in the Query Current Plan dialog.

System action: The system waits for you to respond.

User response: Enter the correct code.

**EQQS306E SELECTION TYPE MUST BE
SPECIFIED**

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: Review your input in the Type of Selection field of the panel. Type of Selection is a required field and you cannot leave it blank. You can specify one of the following values: AP, NP, AS, or NS.

**EQQS307E SELECTION TYPE MUST BE
OCHALLP , *OCHNONP* , *OCHALLS* , OR
*OCHNONS***

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: Review your input in the Type of Selection field of the panel. You can specify one of the following values: AP, NP, AS, or NS.

EQQS308E NESTING LEVEL MUST BE SPECIFIED

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: Review your input in the Nesting Level field of the panel. Nesting Level field is a required field and you cannot leave it blank. You can specify a value in the range 1-999.

EQQS309E NESTING LEVEL MUST BE 1-999

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: Review your input in the Nesting

EQQS400I • EQQS409E

| Level field of the panel. You can specify a value in the
| range 1-999.

EQQS400I NO ENTRIES WERE SELECTED FOR THE LIST

Explanation: A request for a list of records resulted in an empty list. Either there were no records that matched the selection criteria or you were not authorized to access those that were found.

System action: None.

User response: None.

EQQS401I NO OPEN INTERVAL SPECIFIED IN THE WORK STATION DEFINITION

Explanation: The workstation description in the current plan has no open interval.

System action: None.

User response: None.

EQQS402E UNABLE TO RETRIEVE &CPREC DATA, NO RECORDS FOUND

Explanation: This message is issued when an attempt to read a record from the current plan or application description (AD) database fails. The &CPREC variable can be any of the following:

- Operation: when an attempt to read an operation record (CP3P) from the current plan failed.
- Occurrence: when an attempt to read an occurrence record (CP3C) from current plan failed.
- AD: when an attempt to read an application record (ADR) from the application description database failed.

This message displays when, while browsing an application, occurrence, or operation from the advanced ISPF panels, you change an object key and then go back to the browse panel of that object. After this message displays, you are taken back to the previous list panel (EQQNALSL or EQQMOPRV).

System action: The system waits for you to respond.

User response: Refresh the screen to reflect the current status of the plan or database. For ready lists and the ended-in-error list, this is automatically done at any dialog request or when you press Enter. For other operation lists, it is necessary to exit from the list and redisplay the list unless you are using the advanced panels. When using the advanced panels, the refresh of operation lists happens automatically at any dialog request or when you press Enter.

EQQS403E NESTING DETAIL MUST BE SPECIFIED

Explanation: Data entry error.

EQQS404E NESTING DETAIL MUST BE OCHALL OR OCHNONE

Explanation: Data entry error.

EQQS405E SELECTION NOT VALID

Explanation: System automation information is not available for a workstation that is not-Automation.

User response: You selected System Automation Info, but the workstation is not defined as a System Automation WS. Review your workstation selection, and select a System Automation workstation.

EQQS406E INVALID TEMPLATE NAME

Explanation: The template for this panel has not been found.

System action: The template cannot be used.

Operator response: Check if the template is present in EQQTMPL.

EQQS407E ERROR USING TEMPLATE CTPLNAME. DEFAULT TEMPLATE USED.

Explanation: The template used is not available. The default template will be used.

System action: The default template is selected.

Operator response: Check if the template is present in EQQTMPL. Correct the error.

EQQS408E ERROR LOADING DEFAULT TEMPLATE

Explanation: Error using default panel template which cannot be loaded.

System action: The default template cannot be used.

Operator response: Check if the template is present in EQQTMPL.

EQQS409E ERROR USING BOTH TEMPLATE CTPLNAME AND DEFAULT TEMPLATE.

Explanation: The template used and the default template are not available.

System action: None.

Operator response: Check if the template and default template are present in EQQTMPL. Correct the error.

| **EQQS416E** AUTHORIZATION FAILED. YOU DO
| NOT HAVE THE AUTHORITY
| REQUIRED TO ISSUE THE HIST
| COMMAND

| modify it. An high value (or zero) might have
| performances impacts.

| **Explanation:** You issued a HIST command to retrieve
| data from the IBM Tivoli Workload Scheduler for z/OS
| history database, but you are not authorized to perform
| that operation.

| **System action:** The command request is rejected.

| **Operator response:** You have issued the HIST
| command, but it is a protected resource and you are
| not authorized to use it. Ask your System programmer
| to verify your authorization and to authorize you to
| run the History command.

| **Programmer response:** The HIST fixed resource is
| defined in RACF. Verify if the user is entitled to run the
| HIST command and if he has got the correct RACF
| authorizations for that secured resource.

| **EQQS417I** REQUEST IGNORED. THE HIST
| COMMAND HAS NOT BEEN
| CONFIRMED.

| **Explanation:** You submitted a HIST command to
| retrieve data from the Tivoli Workload Scheduler for
| z/OS history database, but you answered N in the
| confirmation panel.

| **System action:** The command request is not
| processed.

| **Operator response:** You submitted the HIST
| command, but you did not select Yes to continue on the
| confirmation panel. The command is ignored.

| **EQQS418W** MAX HIST LIMIT REACHED. COULD
| NOT RETRIEVE DATA ACCORDING
| TO THE MAXHISTORYROWS VALUE.

| **Explanation:** You submitted a HIST command to
| retrieve data from the IBM Tivoli Workload Scheduler
| for z/OS history database. The number of rows
| retrieved from the database exceeds the maximum
| allowed by the MAXHISTORYROWS keyword.

| **System action:** The request is cancelled. No data is
| returned from the history database.

| **Operator response:** You submitted the HIST command
| and the number or rows retrieved from the history data
| base exceeds the maximum value defined in the
| MAXHISTORYROWS initialization parameter. Change
| your selection criteria to be more restrictive or ask your
| System Programmer to review the
| MAXHISTORYROWS parameter setting.

| **Programmer response:** If needed, increase the value
| set for the MAXHISTORYROWS keyword. The
| MAXHISTORYROWS value defined in OPCOPTS is not
| high enough to satisfy the result of the user request.
| Review the value and evaluate if it is necessary to

Chapter 224. EQQSUnn messages

EQQSU01 - EQQSU39

EQQSU01I THE SUBMIT TASK HAS STARTED

Explanation: The submit task has successfully completed initialization.

System action: The submit task processing starts.

User response: None.

EQQSU02I THE SUBMIT TASK HAS ENDED

Explanation: The submit task has terminated processing normally. An operator has stopped the submit task or the IBM Tivoli Workload Scheduler for z/OS subsystem has stopped.

System action: The submit task processing is terminated.

User response: None.

EQQSU03E THE SUBMIT TASK HAS ENDED DUE TO PROCESSING ERRORS

Explanation: The submit task cannot continue processing due to a severe error.

System action: The submit task processing is terminated.

System programmer response: Correct the errors and restart the submit task.

User response: Review previous messages in the IBM Tivoli Workload Scheduler for z/OS message log. Correct them e restart the task.

EQQSU04E THE SUBMIT TASK INITIALIZATION FAILED, THE TASK IS TERMINATED

Explanation: The submit task could not acquire the resources required for normal operation.

System action: The submit task processing is terminated.

System programmer response: Correct the errors and restart the submit task.

User response: Review previous messages in the IBM Tivoli Workload Scheduler for z/OS message log. Correct them e restart the task.

EQQSU05E THE INTERNAL READER FILE, DDNAME = EQQBRDS, COULD NOT BE OPENED

Explanation: The submit task could not open the internal reader data set.

System action: If the error occurs when the submit task is being initialized, the submit task processing is terminated and message EQQSU04 is issued.

If the error occurs when the submit task tries to reopen the internal reader to perform a submit for a user, the submit task processing continues, but the current job is not submitted.

System programmer response: Correct the errors and restart either the submit task or the IBM Tivoli Workload Scheduler for z/OS subsystem.

User response: Check that DDNAME EQQBRDS is correctly specified in the startup procedure. Also review previous messages in the IBM Tivoli Workload Scheduler for z/OS message log and in the system message log (for example analyze the messages issued by the DFSMS) referencing the EQQBRDS DD dataset name, that indicates an unusual condition.

EQQSU06E A SEVERE ERROR IN THE SUBMIT TASK HAS CAUSED ONE OR MORE REQUESTS TO BE LOST

Explanation: The submit task abended while processing elements on SUBQ. The chaining of elements on SUBQ has been corrupted.

System action: z/OS recovery/termination is requested to generate a dump. All elements currently on SUBQ are skipped. The submit task attempts to continue normal processing.

System programmer response: Correct the errors and restart either the submit task or the IBM Tivoli Workload Scheduler for z/OS subsystem. If the problem persists, save the message log and dump data sets. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Review the Tivoli Workload Scheduler for z/OS message log data set and the dump data set to determine the cause of the problem. Provide the info to your System Programmer.

EQQSU07E THE SUBMIT TASK ABENDED WHILE PROCESSING THE FOLLOWING REQUEST: REQUEST

Explanation: An abend prevented the submit task from processing a queue element.

| **System action:** z/OS recovery/termination is requested to generate a dump. The submit task attempts to continue normal processing.

| **System programmer response:** Analyze the errors, correct them, and restart either the submit task or the IBM Tivoli Workload Scheduler for z/OS subsystem. Retry the operation. If the problem persists, save the message log and dump data sets. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Review the IBM Tivoli Workload Scheduler for z/OS message log data set and the dump data set to determine the cause of the problem. Provide the info to your System Programmer.

| **EQGSU09W JOB JOBNAME(JOBNUM) COULD NOT BE RELEASED. REPEATED RETRIES HAVE FAILED**

| **Explanation:** The submit task received a release request for a job, but could not communicate successfully with JES while trying to release the job from hold.

| **System action:** No more attempts to release the job are made. The submit task continues processing.

| **System programmer response:** Review system and JES load for any unusual peak causing response degradation in the 5 minutes retry window. Try to better balance the system workload.

| **User response:** Review the system log and look for previous JES messages that indicate unusual conditions. Determine the current status of the job. If necessary, release the job manually.

| **EQGSU10E JOB JOBNAME IN APPLICATION APPL COULD NOT BE SUBMITTED BECAUSE THE SUBMIT EXIT RETURNED A SUBMITTING USER ID, USER, WHOSE AUTHORITY COULD NOT BE DETERMINED**

| **Explanation:** The job submit exit returned a TSO user ID. A job submit environment could not be built for this user ID, because of an authority error.

| **System action:** The current job is not submitted. The submit task continues processing.

| **User response:** If necessary, submit the job manually.

| **Problem determination:** Check that the job submit exit, EQQX001, returns only valid TSO user IDs.

| **EQGSU11W DDNAME EQQEVDS IS MISSING OR SPECIFIES DD DUMMY**

| **Explanation:** The submit task is starting and does not have access to an event data set. The header record (record 0) in the event data set is used for submit

| checkpointing, and with no event data set available for submit checkpointing, submit requests may be lost or duplicated.

| **System action:** The submit task continues processing, but does not checkpoint submit requests. The first submit request received after start up causes message EQGSU22E to be issued.

| **System programmer response:** Allocate a unique event data set to the EQQEVDS DD statement. If this IBM Tivoli Workload Scheduler for z/OS address space does not start an event writer subtask, that is, EWTRTASK(NO) in OPCOPTS, allocate the event data set with two tracks of space.

| **User response:** Verify the JCL procedure for this IBM Tivoli Workload Scheduler for z/OS address space. Verify the dataset name specified in the DDNAME EQQEVDS.

| **EQGSU12I MAX NUMBER OF WORKSTATIONS CHECKPOINTED BY THIS SUBMIT TASK: #WS**

| **Explanation:** Using the EQQEVDS data set LRECL, the submit task has calculated the maximum number (#WS) of workstations that can be checkpointed by this submit task.

| **System action:** Normal processing continues.

| **System programmer response:** None.

| **User response:** None.

| **Problem determination:** This message is for information only.

| **EQGSU13E THE STARTED TASK FILE, DDNAME = EQQSTC, COULD NOT BE OPENED FOR OUTPUT**

| **Explanation:** The submit task was unable to open the started task temporary proclib data set. This file is defined by the EQQSTC DD statement in the JCL procedure used to start the IBM Tivoli Workload Scheduler for z/OS subsystem.

| **System action:** If the error is discovered during the start of IBM Tivoli Workload Scheduler for z/OS, the submit task issues message EQGSU04 and is terminated. If the error is discovered during submit of a started task, this message is followed by message EQQW759W and the submit task stops submitting started tasks.

| **System programmer response:** Make sure that the IBM Tivoli Workload Scheduler for z/OS subsystem is properly authorized to use the temporary proclib data set, that the EQQSTC DD statement is correctly defined, and restart either the submit task or the IBM Tivoli Workload Scheduler for z/OS subsystem.

| **User response:** Check that the EQQSTC DD statement

| is correctly specified in the startup procedure. Verify
| that the IBM Tivoli Workload Scheduler for z/OS
| subsystem is authorized to open the temporary proclib
| data set for output. If RACF is installed, determine if
| the SYSLOG file contains an ICH408 access violation
| message for the temporary proclib data set.

| **EQQSU14W THE SUBMIT TASK IS IN
| TERMINATION PHASE, JOB *JOBNAME*
| (*JOBNUM*) COULD NOT BE RELEASED**

| **Explanation:** The submit task received a STOP
| command and IBM Tivoli Workload Scheduler for
| z/OS could not release the job from hold.

| **System action:** No more attempts to release the job
| are made, because the submit task is stopped.

| **System programmer response:** Make sure that the
| submit task termination is an expected situation and is
| not caused by a preceding error condition.

| **User response:** Determine the current status of the job.
| If required, release the job manually when IBM Tivoli
| Workload Scheduler for z/OS is restarted.

| **EQQSU20E UNABLE TO READ EQQEVDS
| HEADER RECORD FOR REQUEST
| TYPE *DQETYPE* ON WORKSTATION
| *WSNAME***

| **Explanation:** The submit task was unable to execute a
| submit checkpoint request for the stated reason. Valid
| requests for the request type are:

- | **J0** Request for submit checkpoint sequence
| number
- | **J1** Job submit checkpoint request
- | **J2** STC start checkpoint request
- | **WTO** Message checkpoint request.

| **System action:** The submit task continues normal
| processing.

| **System programmer response:** If necessary, stop IBM
| Tivoli Workload Scheduler for z/OS, take corrective
| action, and restart IBM Tivoli Workload Scheduler for
| z/OS.

| **User response:** Review earlier messages in the IBM
| Tivoli Workload Scheduler for z/OS message log and
| system message log (I/O or dasd related errors) to
| determine the cause of the error during Header
| retrieval.

| **EQQSU21E UNABLE TO UPDATE EQQEVDS
| HEADER RECORD FOR REQUEST
| TYPE *DQETYPE* ON WORKSTATION
| *WSNAME***

| **Explanation:** The submit task was unable to execute a
| submit checkpoint request for the stated reason. Valid
| requests for the request type are:

- | **J0** Request for submit checkpoint sequence
| number

- | **J1** Job submit checkpoint request
- | **J2** STC start checkpoint request
- | **WTO** Message checkpoint request.

| **System action:** The submit task continues normal
| processing.

| **System programmer response:** If necessary, stop IBM
| Tivoli Workload Scheduler for z/OS, take corrective
| action, and restart IBM Tivoli Workload Scheduler for
| z/OS.

| **User response:** Review earlier messages in the IBM
| Tivoli Workload Scheduler for z/OS message log and
| system message log (I/O or dasd related errors) to
| determine the cause of the error during Header
| replacement.

| **EQQSU22E UNABLE TO ACCESS THE EQQEVDS
| FILE FOR REQUEST TYPE *DQETYPE*
| ON WORKSTATION *WSNAME***

| **Explanation:** The submit task was unable to execute a
| submit checkpoint request for the stated reason. Valid
| requests for the request type are:

- | **J0** Request for submit checkpoint sequence
| number
- | **J1** Job submit checkpoint request
- | **J2** STC start checkpoint request
- | **WTO** Message checkpoint request

| **System action:** The submit task continues normal
| processing.

| **System programmer response:** If necessary, stop IBM
| Tivoli Workload Scheduler for z/OS, take corrective
| action, and restart IBM Tivoli Workload Scheduler for
| z/OS.

| **Problem determination:** Review earlier messages in
| the IBM Tivoli Workload Scheduler for z/OS message
| log related to disabled checkpointing to determine the
| cause of the error.

| **EQQSU23E NO FREE SPACE IN EQQEVDS
| HEADER RECORD FOR REQUEST
| TYPE *DQETYPE* ON WORKSTATION
| *WSNAME***

| **Explanation:** The submit task was unable to run a
| submit checkpoint request because all workstation
| entries in the header record of the event data set are
| used. Valid requests for the request type are:

- | **J0** Request for submit checkpoint sequence
| number
- | **J1** Job submit checkpoint request
- | **J2** STC start checkpoint request
- | **WTO** Message checkpoint request

| **System action:** The submit task continues normal
| processing.

| **System programmer response:** If necessary, stop IBM
| Tivoli Workload Scheduler for z/OS, scrap and
| reallocate the EQQEVDS with a larger LRECL, and

EQQSU24W • EQQSU33W

| restart IBM Tivoli Workload Scheduler for z/OS.
| **User response:** The maximum number of workstations
| that this EQQEVDS can checkpoint is indicated in
| message EQQSU12I. If you have more workstations
| defined for this destination to checkpoint, you should
| reallocate the EQQEVDS with a larger logical record
| length. Refer to the *Planning and Installation* for more
| details.

| **EQQSU24W WORKSTATION WSNAME IS NOT**
| **PRESENT IN THE EQQEVDS HEADER**
| **RECORD**

| **Explanation:** The submit task could not remove a
| workstation name from the header record in the event
| data set because the name is not present.

| **System action:** The submit task continues normal
| processing.

| **System programmer response:** If necessary, stop IBM
| Tivoli Workload Scheduler for z/OS, take corrective
| actions, and restart IBM Tivoli Workload Scheduler for
| z/OS.

| **User response:** Verify if the EQQEVDS DD data set
| name is the correct one to use. Verify if the used
| EQQEVDS was reallocated from scrap.

EQQSU30W JOB CARD NOT FOUND OR
INVALID. SPIN PREVENTION NOT
POSSIBLE FOR: TYPJOB NAME in
Application APPL IA IA

Explanation: The job or started task (the value of
TYPJOB shows you whether it is a job or started task)
identified by:

- Application name *APPL*
- Input Arrival Time *IA*
- Job name *NAME*

required tailoring for SPIN prevention, but no JOB card
was found in the JCL.

System action: The job or started task is submitted as
it is.

User response: Misplacement of the JOB card could
also be due to a JCL coding error. If the problem is a
JCL error, correct it.

If the JOB card is missing, consider the following:

- SPIN prevention is applied only if Restart and Clean
Up or the JCC functions are active.

• The Restart and Clean Up functions automatically
add the JOB card when it is missing.

If you are using JCC but no Restart and Clean Up, you
need to transform your started task in JOB to have

SPIN prevention applied. If SPIN prevention is not
required for the started task, ignore this message.

EQQSU31I TYPJOB NAME IN APPLICATION APPL
IA IA HAD JESLOG KEYWORD SET
TO JKEY. IT HAS BEEN REPLACED BY
JESLOG=NOSPIN.

Explanation: The job or started task (the value of
TYPJOB shows you whether it is a job or started task)
identified by:

- Application name *APPL*
- Input Arrival Time *IA*
- Job name *NAME*

has the JESLOG set to *JKEY* and not to *NOSPIN*.

System action: The job or started task is submitted
after having replaced the *JESLOG=JKEY* with
JESLOG=NOSPIN.

User response: None.

EQQSU32W GETMAIN FAILED. SPIN
PREVENTION NOT POSSIBLE FOR
TYPJOB NAME IN APPLICATION
APPLN IA IA

Explanation: The job or started task (the value of
TYPJOB shows you whether it is a job or started task)
identified by:

- Application name *APPL*
- Input Arrival Time *IA*
- Job name *NAME*

could not be tailored by inserting or replacing the
JESLOG=NOSPIN keyword because of storage
problems.

Tailoring is needed to apply SPIN prevention.

System action: The job or started task is submitted as
it is.

User response: Check the JCL to see if it is possible to
split the JOB card into more lines so that tailoring for
SPIN prevention does not require additional storage
allocation.

Increase the region of tracker address space, if possible.

EQQSU33W TAILORING FAILURE. SPIN
PREVENTION NOT POSSIBLE FOR:
TYPJOB NAME IN APPLICATION APPL
IA IA

Explanation: The job or started task (the value of
TYPJOB shows you whether it is a job or started task)
identified by:

- Application name *APPL*
- Input Arrival Time *IA*

- Job name *NAME*
- could not be tailored by inserting or replacing the JESLOG=NOSPIN keyword.

Tailoring is needed to apply SPIN prevention and consists of the insertion of the JESLOG=NOSPIN keyword. This was not possible for one of the following reasons:

- The JOB card does not allow a new keyword to be added
- The JOB card was not found
- Not enough storage is available
- There are JCL coding problems

System action: The job or started task is submitted as it is.

User response: Check if the JCL can be changed to add the JESLOG=NOSPIN keyword.

EQQSU34E JOB CARD NOT FOUND OR INVALID. SCHEDULING ENVIRONMENT TAILORING NOT POSSIBLE FOR: TYPJOB NAME IN APPLICATION APPL IA IA

Explanation: The job or started task (the value of *TYPJOB* shows you whether it is a job or started task) identified by:

- Application name *APPL*
- Input Arrival Time *IA*
- Job name *NAME*

could not be tailored by inserting or replacing the SCHENV=Scheduling Environment Name keyword.

Misplacement of the JOB card could also be due to a JCL coding error.

System action: The job or started task is set to error with code OSUB.

User response: If the problem is a JCL error, correct it. See if you can change it to add the SCHENV keyword. If the JOB card is missing, add one.

EQQSU35W SCHEDULING ENVIRONMENT SCHE NOT AVAILABLE FOR JOB: NAME IN APPLICATION APPL IA IA JPLEX

Explanation: The job identified by:

- Application name *APPL*
- Input Arrival Time *IA*
- Job name *NAME*

could not be submitted because the associated scheduling environment *SCHE* is not available. The *JPLEX* parameter specifies if the scheduling environment is unavailable at the JESplex level only or throughout the entire sysplex.

System action: The job is set to ready status with extended status Waiting for SE. It will be submitted again when the Scheduling Environment becomes available.

User response: Check why the specified scheduling environment is unavailable and make it available, if possible.

EQQSU36W SCHEDULING ENVIRONMENT SCHE NOT DEFINED FOR JOB: NAME IN APPLICATION APPL IA IA

Explanation: The job identified by:

- Application name *APPL*
- Input Arrival Time *IA*
- Job name *NAME*

could not be submitted because an associated scheduling environment was not defined to WLM.

System action: The job is set to error with code SEUN.

User response: Check whether the scheduling environment is defined incorrectly in the JCL or in the CP operation record, or if the WLM definition is missing. Fix the error so that the job can be submitted.

EQQSU37E SCHEDULING ENVIRONMENT SCHE CHECK FAILED FOR JOB: NAME IN APPLICATION APPL IA IA

Explanation: The job identified by:

- Application name *APPL*
- Input Arrival Time *IA*
- Job name *NAME*

could not be submitted because the check on the associated scheduling environment *SCHE* failed. The check is performed using the IWMSEQRY WLM macro.

System action: The job is set to error with code OSUB.

User response: For details, see message EQQZ215E in the log.

EQQSU38E GETMAIN FAILED: TAILORING OF SCHEDULING ENVIRONMENT SCHE CHECK NOT POSSIBLE FOR JOB: NAME IN APPLICATION APPL IA IA

Explanation: The job identified by:

- Application name *APPL*
- Input Arrival Time *IA*
- Job name *NAME*

could not be submitted because the associated scheduling environment *SCHE* could not be tailored due to storage problems.

System action: The job is set to error with code OSUB.

EQQSU39E

User response: See if the tracker region can be increased.

**EQQSU39E TAILORING OF SCHEDULING
ENVIRONMENT SCHE FAILED FOR
JOB: NAME IN APPLICATION APPL IA
IA**

Explanation: The job identified by:

- Application name *APPL*
- Input Arrival Time *IA*
- Job name *NAME*

was not submitted because the associated scheduling environment *SCHE* could not be tailored.

System action: The job is set to error with code OSUB.

User response: See if the JCL has enough room to insert the *SCHENV=* statement.

Chapter 225. EQQTnnn messages

EQQT002 - EQQT307

EQQT002E END DATE FOR PRINTOUT MUST BE SPECIFIED

Explanation: Data entry error.

User response: You did not specify a required value. Specify a correct value and proceed with the operation. See "Data entry errors" on page 803

EQQT003W ENTER END AGAIN TO LEAVE OR PRESS ENTER TO PRINT

Explanation: Reenter END to leave without initiating a printout or press ENTER to initiate the printout.

System action: The system waits for you to respond.

User response: Reenter END or press ENTER.

EQQT005E THE CALENDAR FILE IS SIMULTANEOUSLY BEING UPDATED BY ANOTHER USER

Explanation: The calendar that you specified cannot be added because a calendar is simultaneously being added by another user.

System action: The system waits for you to respond.

User response: Try again later.

EQQT011E THE CALENDAR NAME *T01101* DOES NOT EXIST

Explanation: The requested calendar was not found in the calendar database. Either you entered the wrong name or the requested calendar has not yet been created.

System action: None.

User response: Enter the correct calendar name or create the requested calendar.

EQQT012E A CALENDAR NAME MUST BE SPECIFIED

Explanation: You did not specify a calendar name.

System action: None.

User response: Enter the name of the calendar that you need.

EQQT013E INVALID PARAMETER INPUT TO MODULE *MOD*

Explanation: A programming error has occurred in module *MOD*.

System action: The system waits for you to respond.

System programmer response: Ensure that the IBM-supplied panel is being used.

User response: Contact the system programmer to ensure that the IBM-supplied panel is used.

EQQT014E CALENDAR *CALENDAR* IS BEING UPDATED BY USER *USR* TRY LATER

Explanation: You cannot update the calendar because another user is already updating it.

System action: The system waits for you to respond.

User response: Try again later.

EQQT015I A CALENDAR HAS BEEN DELETED

Explanation: A calendar has been deleted and the database has been updated.

System action: None.

User response: None.

EQQT016E CALENDAR ID IS NOT SPECIFIED

Explanation: A calendar ID must be given.

System action: None.

User response: Enter the calendar ID that you need.

EQQT017I A CALENDAR HAS BEEN UPDATED

Explanation: A calendar has been updated and the database has been updated.

System action: None.

User response: None.

EQQT018E CALENDAR *CALENDAR* NOT CREATED - MAXIMUM NUMBER EXCEEDED

Explanation: The maximum number of calendars, 32768, has been exceeded.

System action: The system waits for you to respond.

User response: Delete a calendar to allow a new one to be added.

EQQT019E **DUPLICATE SPECIFIC DATES / WEEKDAYS EXIST IN TABLE**

Explanation: Data entry error.

User response: Remove the duplication and proceed with the operation. See "Data entry errors" on page 803

EQQT020I **A CALENDAR HAS BEEN ADDED**

Explanation: A calendar has been added and the database has been updated.

System action: None.

User response: None.

EQQT021E **CALENDAR ID IS MISSING OR INVALID**

Explanation: Data entry error.

A calendar ID can be made up of the following characters: A through Z, 0 through 9, and national characters (that is, #, \$, and @). The first character must be alphabetic.

User response: You did not specify a required value. Specify a correct value and proceed with the operation. See "Data entry errors" on page 803

EQQT022E **ENTERED CALENDAR ID ALREADY EXISTS**

Explanation: The calendar ID that you specified already exists in the database.

System action: The system waits for you to respond.

User response: Reselect the calendar ID using MODIFY, or specify another calendar ID if using COPY or CREATE.

EQQT023E **SPECIFY WEEK DAY OR SPECIFIC DATE IN USER DEFINED FORMAT**

Explanation: Data entry error.

User response: Specify a correct value and proceed with the operation. See "Data entry errors" on page 803

EQQT024E **UNABLE TO READ CALENDAR DESCRIPTION RECORD**

Explanation: The calendar description record could not be read because either it may have been deleted by another user or an error in the calendar description database made it impossible to read the record.

System action: The system waits for you to respond.

System programmer response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, "Chapter 3. Problem analysis procedures", "Section: Information

needed for all problems". Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Go back to the previous panel and retry. If the error persists, contact your system programmer.

EQQT025E **WORK DAY END TIME MUST BE SPECIFIED**

Explanation: Data entry error.

User response: You did not specify a required value. Specify a correct value and proceed with the operation. See "Data entry errors" on page 803

EQQT026E **SPECIFY A VALID DAY OR DATE IN USER DEFINED FORMAT**

Explanation: A valid week day or specific date must be given in the user specified format.

User response: Specify a day or date in the correct format and proceed with the operation. See "Data entry errors" on page 803

EQQT030E **END DATE MUST BE LESS THAN FOUR YEARS FROM CURRENT DATE**

Explanation: You specified a time span, from current date to end date, that exceeded four years.

System action: The system waits for you to respond.

User response: Specify an end date less than four years from the current date.

EQQT031E **THE END DATE IS PRIOR TO CURRENT DATE**

Explanation: You specified an end date that is prior to the current date.

System action: The system waits for you to respond.

User response: Specify an end date that is after the current date.

EQQT100E **PARAMETER MUST BE A PERIOD NAME**

Explanation: Data entry error.

User response: Specify a value in the correct format and proceed with the operation. See "Data entry errors" on page 803

EQQT101W **PERIOD PERIOD IS BEING UPDATED BY USER USR TRY LATER**

Explanation: You cannot access the period PERIOD because it is being updated by another user.

System action: The system waits for you to respond.

User response: Try again later.

EQQT102I A CALENDAR PERIOD HAS BEEN CREATED

Explanation: A calendar period has been created and the database has been updated.

System action: None.

User response: None.

EQQT103I A CALENDAR PERIOD HAS BEEN DELETED

Explanation: A calendar period has been deleted from the calendar database.

System action: None.

User response: None.

EQQT106I A CALENDAR PERIOD HAS BEEN UPDATED

Explanation: A calendar period has been updated in the calendar database.

System action: None.

User response: None.

EQQT108E PERIOD *PERIOD* NOT CREATED - ALREADY EXISTS

Explanation: The calendar period *PERIOD* that you specified could not be created because it already exists in the calendar database.

System action: The system waits for you to respond.

User response: Enter a unique period name. If you want to create versions of an already existing period, use the COPY function.

EQQT110E LIST OF ORIGIN DATES CONTAINS DUPLICATES

Explanation: Data entry error.

User response: Remove the duplicate value and proceed with the operation. See "Data entry errors" on page 803

EQQT111E ONLY ONE ORIGIN DATE CAN BE SPECIFIED IN CYCLIC PERIODS

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQT112E ORIGIN DATE MUST BE SPECIFIED

Explanation: You have not specified an origin date.

System action: The request is rejected.

User response: Specify the required origin date and proceed with the operation.

EQQT113E INTERVAL INCONSISTENT WITH TYPE OF PERIOD

Explanation: Data entry error.

User response: Specify a correct value and proceed with the operation. See "Data entry errors" on page 803

EQQT114E CYCLIC TYPE MUST BE ANY OF THE LISTED VALUES

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQT115E PERIOD NAME IS MISSING OR INVALID

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQT116E THE VARIABLE TABLE NAME CONTAINS AN INVALID CHARACTER

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQT117E THE VARIABLE TABLE IS NOT DEFINED

Explanation: Data entry error.

You have tried to define a variable table ID that does not exist in IBM Tivoli Workload Scheduler for z/OS's database.

User response: Define the variable table in the correct format and proceed with the operation. See "Data entry errors" on page 803

EQQT118E YOU ARE NOT AUTHORIZED TO READ THE JCL VARIABLE TABLE DATA BASE

Explanation: You have attempted to refer to a JCL variable table. To do this, you need read authority to the JCL variable table database.

System action: The system waits for you to respond.

User response: If you need to refer to JCL variable table names, contact your security administrator.

EQQT121E • EQQT307E

EQQT121E NON-CYCLIC PERIOD INTERVALS MUST NOT OVERLAP

Explanation: You have entered a period interval origin or an end date within an already existing interval.

System action: The request is rejected.

User response: Change the interval origin or end date so that it falls outside other intervals. .ALARM=YES

EQQT122E NON-CYCLIC PERIOD INTERVAL END DATE MUST NOT PRECEDE ORIGIN DATE

Explanation: The interval end date is prior to the associated origin date.

System action: The request is rejected.

User response: Change the interval end date or the interval origin date, so that the interval end date is later than the interval origin date.

EQQT123E INTERVAL END DATE MAY NOT BE SPECIFIED FOR CYCLIC PERIODS

Explanation: You have entered an interval end date for a cyclic period. This is allowed only for noncyclic periods.

System action: The request is rejected.

User response: Erase the specified interval end date specified or change the period type to noncyclic.

| EQQT305E DAY STATUS MUST BE SPECIFIED AS | OCHWORK OR OCHFEE

| **Explanation:** Data entry error.

| *OCHWORK* is the national language character for 'W'
| (work day) and *OCHFEE* is for 'F' (free day).

| **User response:** Define a value in the correct format
| and proceed with the operation. See "Data entry
| errors" on page 803

EQQT307E CALENDAR MUST CONTAIN AT LEAST ONE WORK DAY, CHECK CALID

Explanation: A calendar must contain at least one work day, but the calendar you are trying to create has none.

System action: No calendar is created. IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: Make sure that the calendar definition specifies at least one work day and recreate the calendar.

Chapter 226. EQQUnnn messages

EQQU000 - EQQU406

EQQU000E YOU ARE NOT AUTHORIZED TO USE
FUNCTION *UUFUNC*

Explanation: You have attempted to use function *UUFUNC*, but you are not authorized.

System action: The request is rejected.

User response: If you want to use *UUFUNC*, contact your security administrator.

EQQU005I THE REQUEST TO *UUFUNC* OF
UUUSUBS IS HANDLED

Explanation: Your request has been processed.

System action: The requested action is carried out.

User response: None.

EQQU040E THE SUBTASK HAS TERMINATED

Explanation: The request that you have made was not accepted by the subsystem because the normal mode manager (NMM) has terminated.

System action: The request is rejected.

System programmer response: Check the IBM Tivoli Workload Scheduler for z/OS message log for messages that may explain why the NMM is not available.

User response: Exit the dialog and contact your system programmer.

Problem determination: Review the IBM Tivoli Workload Scheduler for z/OS message log for messages concerning the NMM.

EQQU041I THE FUNCTION IS ALREADY ACTIVE
AND ENABLED FOR SERVICE

Explanation: You have attempted to activate the function, but it is already active and enabled for service.

System action: None.

User response: None.

EQQU042I THE FUNCTION IS ALREADY
INACTIVE AND DISABLED FOR
SERVICE

Explanation: You have attempted to deactivate the

function, but it is already inactive and disabled for service.

System action: None.

User response: None.

EQQU044I AUTOMATIC RECOVERY
UNAVAILABLE: CHECK OPCOPTS
INIT. STATEMENT

Explanation: Automatic recovery is unavailable because RECOVERY(NO) is specified on the OPCOPTS initialization statement.

System action: The request is rejected.

System programmer response: Change the OPCOPTS initialization statement to RECOVERY(YES).

User response: If automatic recovery is required, contact your system programmer.

EQQU045E VALID REPLY IS *hostyes, ftwyes, bothyes*
or N

Explanation: Data entry error.

System action: None.

User response: You specified an incorrect value. Specify one of the values listed in the message text and proceed with the operation. See "Data entry errors" on page 803

EQQU046E JOB SUBMISSION REQUEST
REJECTED, E2E FEATURE NOT
ACTIVE

Explanation: It is impossible to activate or deactivate job submission on FTW when end-to-end feature is not active.

System action: The request is rejected.

User response: Start the end-to-end feature before running the command

Chapter 227. EQQVnnn messages

EQQV000 - EQQV045

EQQV000E DUPLICATE NAMES IN THE ROUTOPTS SNA DESTINATIONS

Explanation: One or names in the SNA keyword destination list in the ROUTOPTS initialization statement is a duplicate of an existing name. These names are the application names of potential session partners and must be unique.

System action: The NCF processing is terminated.

System programmer response: Correct the name (or names) in error and restart the subsystem.

EQQV001I NCF APPLICATION STARTED

Explanation: The NCF task has received control from the IBM Tivoli Workload Scheduler for z/OS subsystem and is about to start initialization processing.

System action: The NCF continues processing.

User response: None.

EQQV002E NCF APPLICATION TERMINATED - SETLOGON EXECUTION FAILURE

Explanation: A VTAM SETLOGON macro used for enabling the NCF logon processing has failed. The reason for this failure is defined in detail by message EQQV015E, which precedes this message in the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The NCF processing is terminated.

System programmer response: Correct the error (or errors) and restart the subsystem.

Problem determination: Review message EQQV015E to determine the exact reason for the failure.

EQQV003E INITIALIZATION FAILED - SNA DESTINATION NOT SPECIFIED IN TRROPTS

Explanation: In a tracker system, the NCF initialization processing failed because no partner application IDs were specified in the SNAHOST keyword of the TRROPTS statement

System action: The NCF processing is terminated.

System programmer response: Add the missing information and restart the subsystem.

EQQV004E NCF APPLICATION TERMINATED -

PARAMETER PROCESSING FAILURE

Explanation: The NCF initialization processing encountered an error in the parameters defined for it.

System action: The NCF processing is terminated.

System programmer response: Correct all errors and restart the subsystem.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for the failure.

EQQV005E NCF APPLICATION TERMINATED - INITIALIZATION PROCESSING FAILURE

Explanation: The NCF initialization processing failed. Messages issued preceding this message define the cause of the failure.

System action: The NCF processing is terminated.

System programmer response: Correct all errors and restart the subsystem.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for the failure.

EQQV006I NCF APPLICATION ENDED

Explanation: The NCF processing has completed and control is returned to the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The NCF processing is terminated.

User response: None.

EQQV007E INITIALIZATION FAILED - SNA DESTINATION NOT SPECIFIED IN ROUTOPTS

Explanation: In a controller system, the NCF initialization processing failed because no partner application IDs were specified in the SNA keyword of the ROUTOPTS statement.

System action: The NCF processing is terminated.

System programmer response: Add the missing information and restart the subsystem.

EQQV008I INITIALIZATION FAILED - SUBSYSTEM STOP REQUESTED

EQQV009E • EQQV014E

Explanation: The NCF received a subsystem stop request while in the initialization phase. The NCF was most likely waiting for some other IBM Tivoli Workload Scheduler for z/OS resource to become active.

System action: The NCF processing is terminated.

User response: None.

EQQV009E INITIALIZATION FAILED - NCFAPPL KEYWORD NOT SPECIFIED OR INVALID

Explanation: The NCF initialization processing failed because the NCFAPPL keyword was not specified or was invalid.

System action: The NCF initialization processing is terminated.

System programmer response: Add the missing information and restart the subsystem.

EQQV010E NIB BUILD PROCESSING FAILED - R15 = R15R00 = R00

Explanation: The GENCB macro request issued to generate a NIB block did not complete normally.

System action: The NCF processing is terminated.

System programmer response: If insufficient main storage was the cause of the failure, increase the region size and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. For any other cause of the failure, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Use the R15 and R00 return codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this z/OS system.

EQQV011E RPL BUILD PROCESSING FAILED - R15 = R15R00 = R00

Explanation: The GENCB macro request issued to generate an RPL block did not complete normally.

System action: The NCF processing is terminated.

System programmer response: If insufficient main storage was the cause of the failure, increase the region size and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. For any other cause of the failure, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Use the R15 and R00 return codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this z/OS system.

EQQV012E NIB EXLST BUILD PROCESSING FAILED - R15 = R15R00 = R00

Explanation: The GENCB macro request issued to generate a NIB EXLST block did not complete.

System action: The NCF processing is terminated.

System programmer response: If insufficient main storage was the cause of the failure, increase the region size and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. For any other cause of the failure, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Use the R15 and R00 return codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this z/OS system.

EQQV013E ACB EXLST BUILD PROCESSING FAILED - R15 = R15R00 = R00

Explanation: The GENCB macro request issued to generate a ACB EXLST block did not complete normally.

System action: The NCF processing is terminated.

System programmer response: If insufficient main storage was the cause of the failure, increase the region size and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. For any other cause of the failure, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Use the R15 and R00 return codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this z/OS system.

EQQV014E ACB BUILD PROCESSING FAILED - R15 = R15R00 = R00

Explanation: The GENCB macro request issued to generate the NCF ACB did not complete normally.

System action: The NCF processing is terminated.

System programmer response: If insufficient main storage was the cause of the failure, increase the region size and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. For any other cause of the failure, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Use the R15 and R00 return codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this z/OS system.

EQQV015E VTAM MACRO REQUEST FAILURE -
 DIAGNOSTIC INFORMATION: NODE
 = *NODE*, REQUEST = X'REQ'
 (NAMEREQ), RTNCD = X'RC' (DECRC)
 FDBK2 = X'FDBK2' (DFDBK2), SSENSMI
 = SMI USENSEI = USEI, SSENSEI =
 SSEI R00 = X'R00', R15 = X'R15'

Explanation: An error occurred when a VTAM request was executed or scheduled. The variable items in the message provide diagnostic information and have the following meanings:

- NODE** NCF application LU-name
- REQ** VTAM request code in hexadecimal
- NAMEREQ**
VTAM request name
- RC** RTNCD feedback field value from RPL in hexadecimal
- DECRC**
RTNCD feedback field value from RPL in decimal
- FDBK2** FDBK2 feedback field value from RPL in hexadecimal
- DFDBK2**
FDBK2 feedback field value from RPL in decimal
- SMI** System sense modifier information from RPL
- USEI** User sense information from RPL
- SSEI** System sense information from RPL
- R00** Register 0 return code after a VTAM macro request
- R15** Register 15 return code after a VTAM macro request.

System action: The action taken depends on the severity of the error situation. The NCF attempts to continue processing, if at all possible. For the most serious errors, for example, undefined feedback code, the NCF abends with a dump and a user code.

System programmer response: Analyze the diagnostic information and the dump, if produced, to determine the cause of the failure. If this was not a user error, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Use the diagnostic information in the message to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this z/OS system.

EQQV016E NAMEREQ REQUEST FAILURE -
 LU/APPLICATION NODE NOT FOUND

Explanation: The VTAM *NAMEREQ* request failed to complete successfully because the LU-name *NODE* could not be found. The most likely reason for the failure is either an invalid specification of an LU-name in the SNAHOST keyword of the TRROPTS initialization statement or the name *NODE* has not

been properly defined to VTAM.

System action: The NCF processing is terminated.

System programmer response: Review the name specified in the SNAHOST keyword. Make sure that it is correct and that a counterpart exists in the VTAM definition statements. Correct the items in error and restart NCF.

EQQV017E NAMEREQ REQUEST FAILURE -
 LU/APPLICATION NODE NOT
 ACTIVE

Explanation: The VTAM *NAMEREQ* request failed to complete successfully because the LU-name *NODE* was not active.

System action: The NCF processing is terminated.

System programmer response: Investigate why *NODE* suddenly became inactive. Restart NCF when *NODE* is active again.

EQQV018E NAMEREQ REQUEST FAILURE -
 VTAM ERROR, OR NCP/VTAM
 INCOMPATIBILITY

Explanation: The VTAM *NAMEREQ* request failed to complete successfully because there was an error in VTAM or an NCP/VTAM incompatibility. This message is preceded by message EQQV015E in the IBM Tivoli Workload Scheduler for z/OS message log.

System action: The NCF processing is terminated.

System programmer response: Restart NCF when the VTAM errors have been corrected.

Problem determination: Refer to message EQQV015E to determine the cause of the failure.

EQQV019E SESSION SETUP FAILED - PLU=LU
 NOT AVAILABLE

Explanation: The NCF has not been able to establish a session because of one of the following reasons:

- The controller is not started.
- The NCF task in the controller is not available.
- The LU specified in the SNAHOST keyword of the TRROPTS initialization is not active or is not defined.
- The controller has started without a valid current plan, for example at first startup after installation or after a REFRESH function (option 9.5).

The NCF retries every 10 seconds until it is successful, or until the subsystem is stopped, or until the NCF is deactivated.

System action: The NCF continues to attempt to establish the LU-LU session.

System programmer response: Review the name specified in the SNAHOST keyword of the TRROPTS

EQQV020I • EQQV027E

initialization statement and make sure that it is the correct one. If it is correct, ask the system operator at the controller system to activate or define the required resource.

EQQV020I ACB SUCCESSFULLY CLOSED

Explanation: The NCF has been successfully disconnected from VTAM.

System action: The NCF termination processing continues.

EQQV021W UNABLE TO CLOSE ACB

Explanation: The NCF is unable to successfully disconnect from VTAM.

System action: The NCF termination processing continues even though the ACB could not be closed.

System programmer response: None.

Problem determination: It is most likely that a VTAM error has caused this error. Check the system log for VTAM error messages that can be related to this failure.

EQQV022E LOGON ATTEMPTED BY UNDEFINED LU/APPLICATION LU- CLSDST ISSUED

Explanation: A session establishment attempt was made by a remote NCF application unknown to this host IBM Tivoli Workload Scheduler for z/OS subsystem. This message is issued only for a NCF application at a IBM Tivoli Workload Scheduler for z/OS host.

System action: The request for the session is turned down by issuing a CLSDST macro. Processing continues for the IBM Tivoli Workload Scheduler for z/OS host NCF application.

System programmer response: Stop the NCF task for which erroneous specifications have been given. Correct the specifications on the ROUTOPTS statement and restart the NCF.

Problem determination: It is most likely that a name in the ROUTOPTS SNA keyword list of names has been misspelled or left out entirely.

EQQV023E LOGON REQUEST FOR LU/APPLICATION LU THAT IS ACTIVE - CLSDST ISSUED

Explanation: A session establishment attempt is made from a remote NCF application that is already in session with the IBM Tivoli Workload Scheduler for z/OS host NCF application. This message is issued only for a NCF application at a IBM Tivoli Workload Scheduler for z/OS host.

System action: The request for a session is turned

down and NCF processing continues.

System programmer response: Stop all NCF tasks that have incorrect NCFAPPL keyword specifications. Correct the NCFAPPL specifications and restart the NCF tasks.

Problem determination: The most likely reason for this error is that more than one remote NCF application has the same LU-name specified. Check the NCFAPPL keyword of the OPCOPTS statement for all remote NCF applications and make sure that they are unique.

EQQV024I ACB SUCCESSFULLY OPENED

Explanation: The NCF has successfully established contact with VTAM and is ready for further VTAM processing.

System action: The NCF processing continues.

User response: None.

EQQV025I ACB OPEN FAILURE (RC=X'RC') - VTAM SHUTTING DOWN

Explanation: The NCF was unable to establish contact with VTAM due to an OPEN ACB failure. RC is the ACB error flag value in hexadecimal.

System action: The NCF continues processing.

User response: None.

EQQV026E ACB OPEN FAILURE (RC=X'RC') - NCF IMPROPERLY DEFINED

Explanation: The NCF was unable to establish contact with VTAM due to an OPEN ACB failure. RC is the ACB error flag value in hexadecimal.

System action: The NCF processing is terminated.

System programmer response: Correct the problem and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Use the return code to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this z/OS system.

EQQV027E ACB OPEN FAILURE (RC=X'RC') - ABEND 1104 DUE TO SERIOUS ERROR

Explanation: The NCF was unable to establish contact with VTAM due to an OPEN ACB failure. RC is the ACB error flag value in hexadecimal.

System action: The NCF processing is abnormally terminated with a dump (abend code 1104).

System programmer response: Analyze the 1104 abend dump. If this was not a user error, contact IBM Software Support.

Problem determination: Use the R15 and R00 return codes to determine the cause of the error. For more information, refer to the appropriate documentation for the VTAM product installed on this z/OS system.

EQQV028W ACB OPEN FAILED FOR THE LAST 2 MINUTES - VTAM NOT ACTIVE

Explanation: The NCF failed to establish contact with VTAM during the last two minutes because VTAM was not active. The NCF attempts to establish contact every 10 seconds until contact is made. This message is issued every two minutes until contact is made.

System action: The NCF continues to attempt to establish contact with VTAM until contact is made or until the IBM Tivoli Workload Scheduler for z/OS subsystem is stopped.

System programmer response: Ask your network operator to activate VTAM.

EQQV029I VTAM TERMINATION, OR NCF DEACTIVATION, STOPPED SESSION SETUP ATTEMPTS

Explanation: Session initiation attempts were stopped because VTAM is terminating or the NCF application was deactivated.

System action: The NCF termination processing continues.

User response: None.

EQQV031I SUBSYSTEM STOP REQUEST TERMINATED SESSION SETUP ATTEMPTS

Explanation: A remote NCF application was in the process of initiating a session when the subsystem was stopped.

System action: The NCF termination processing continues.

User response: None.

EQQV032I SUBSYSTEM STOP REQUEST TERMINATED ACB OPEN ATTEMPTS

Explanation: The NCF was in the process of establishing contact with VTAM when the subsystem was stopped.

System action: The NCF termination processing continues.

Operator response: None.

EQQV033E ACB OPEN FAILED FOR THE LAST 2 MINUTES - NCF APPLICATION NOT ACTIVE

Explanation: The NCF failed to establish contact with VTAM during the last two minutes because the NCF application was not activated. The NCF attempts to establish contact every 10 seconds until contact is made. This message is issued every two minutes until contact is established.

System action: The NCF continues to attempt to establish contact with VTAM until contact is made or until the IBM Tivoli Workload Scheduler for z/OS subsystem is stopped.

System programmer response: Ask the network operator to activate the VTAM LUs.

EQQV034E NAMEREQ REQUEST FAILURE - LU/APPLICATION NODE INHIBITED

Explanation: The VTAM *NAMEREQ* request failed to complete successfully because the LU-name *NODE* was inhibited. The most likely reason for the failure is that either the cross-domain NCF partner *NODE* has been deactivated or the partner VTAM system has been taken down.

System action: If *NAMEREQ* is the *REQSESS* request, the NCF continues processing with session establishment attempts every 10 seconds. For other VTAM requests, NCF processing is terminated.

System programmer response: Ask the network operator to activate the VTAM or NCF application, or both applications, on the cross-domain partner system.

EQQV036I SESSION HOME-DEST ESTABLISHED

Explanation: A session has been established between the home application *HOME* and the destination application *DEST*.

System action: The NCF continues processing.

Operator response: None.

EQQV037I SESSION HOME-DEST ENDED

Explanation: The session between the home application *HOME* and the destination application *DEST* has ended.

System action: The NCF continues processing.

Operator response: None.

EQQV040I CURRENTLY RUNNING WITH 'LU' AS CONTROLLER

Explanation: The NCF in a IBM Tivoli Workload Scheduler for z/OS tracker system has received a controller identification.

EQQV041E • EQQV045E

System action: NCF continues processing.

User response: None.

EQQV041E THE NCF TASK IGNORED THE FOLLOWING ELEMENT ON THE NCF QUEUE DQE

Explanation: An invalid element has been found by the NCF task. Possibly, the first four bytes of the element do not match the IBM Tivoli Workload Scheduler for z/OS character string 'DQE'. (The fourth byte is a blank space.)

If EQQV039E was issued previously, EQQV041E is issued for all elements containing the destination specified in EQQV039E.

System action: The NCF task does no more processing of the element, but continues normal processing.

System programmer response: If EQQV039E was issued previously, perform the actions described for that message. Otherwise, save the IBM Tivoli Workload Scheduler for z/OS message log data set containing this error message. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference manual*, Chapter 3. Problem analysis procedures. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQV042E THE NCF TASK IGNORED THE FOLLOWING DATA, RECEIVED FROM 'NODE' DQE

Explanation: The receiving NCF task did not recognize the type of data received from the application. This message is issued once for every invalid receive operation.

System action: The NCF continues processing

System programmer response: Verify that the session parameters specified in the VTAM LOGMODE table are valid. Especially check that the ru-sizes are not zero.

If this message occurs during normal execution and the VTAM LOGMODE definitions are correctly specified, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQV043E INVALID RU-SIZE SPECIFIED IN 'LU' SESSION PARAMETERS

Explanation: The ru-sizes specified in the session parameters are not valid.

System action: The NCF continues processing, but the specified session is not established.

System programmer response: Verify that the ru-sizes specified in the tracker node are valid. If necessary,

specify different ru-sizes, and stop and restart the tracker NCF.

EQQV044E OPNDST FAILURE WHEN CONFIRMING SESSION WITH TRACKER 'LU'

Explanation: The OPNDST macro issued to confirm session establishment between the NCF controller and a remote tracker failed. The most likely reason for the failure is that either there is no active route back to the tracker from the controller node or the VTAM environment of the tracker requesting the session is going down.

System action: The NCF continues processing and the NCF controller logon exit is ready to handle subsequent logon attempts from the remote tracker.

System programmer response: Ask the network operator to activate the necessary links to secure an active route back to the tracker.

EQQV045E THE NCF TASK HAS BEEN CONTACTED BY AN UNKNOWN DESTINATION: LU

Explanation: The NCF task has recognized a session control request from a destination that is not defined in the ROUTOPTS or TRROPTS initialization statement. One possible reason for this message is that an APPC program is attempting to allocate a conversation with another APPC program, but is mistakenly using the LU name of the NCF program.

System action: A bind request from an unknown destination is rejected and the NCF continues normal processing. If an APPC program is attempting to allocate a conversation it gets a failing return code from the APPC service routine.

System programmer response: If the NCF task should support the destination specified in this message, update the ROUTOPTS or TRROPTS initialization statement and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. If an APPC program is attempting to allocate a conversation with APPC functions in a IBM Tivoli Workload Scheduler for z/OS controller system, inform the owner of the APPC program at the remote location of the LU name that is to be used if APPC services are to be provided. This LU name is defined by an APPCPMxx member in the SYS1.PARMLIB library.

Problem determination: Use the name of the unknown destination to determine which program and which location is attempting to access NCF resources.

Chapter 228. EQQWnnn messages

EQQW000 - EQQW805

EQQW000E NO AUTHORITY TO ACCESS THE WORK STATION DESCRIPTION

Explanation: You have attempted to access the workstation description database, but you are not authorized to access it. Or, you do not have access authority to at least one of the following IBM Tivoli Workload Scheduler for z/OS resources that are used together with the workstation description database: the application description database, the calendar database, or the operator instruction database.

System action: The request is rejected and the system waits for you to respond.

User response: Ask the security administrator to provide you the appropriate permissions to perform the required action. Retry the operation.

EQQW001E NO AUTHORITY TO UPDATE THE WORK STATION DESCRIPTION

Explanation: You have attempted to update the workstation description database, but you are not authorized to update it. Or, you do not have access authority to at least one of the following IBM Tivoli Workload Scheduler for z/OS resources that are used together with the workstation description database: the application description database, the calendar database, or the operator instruction database.

System action: The request is rejected and the system waits for you to respond.

User response: Ask the security administrator to provide you the appropriate permissions to perform the required action. Retry the operation.

EQQW002I WORK STATION DESCRIPTION HAS BEEN UPDATED

Explanation: The workstation description record has been updated and added to the workstation description database.

System action: None.

User response: None.

EQQW003I WORK STATION DESCRIPTION HAS BEEN DELETED

Explanation: The workstation description record has been deleted from the workstation description database.

System action: None.

User response: None.

EQQW004I WORK STATION DESCRIPTION HAS BEEN CREATED

Explanation: The workstation description record has been created and added to the workstation description database.

System action: None.

User response: None.

EQQW005E DESCRIPTION BEING UPDATED BY USER USER, TRY LATER

Explanation: You cannot update a workstation description that is being updated by another user.

System action: The system waits for you to respond.

User response: Try again later.

EQQW006E DUPLICATE NAME - WORK STATION DESCRIPTION CANNOT BE CREATED

Explanation: You have attempted to create a workstation description with a name that already exists in the workstation description database.

System action: The system waits for you to respond.

User response: Use another name for the workstation description.

EQQW007E UNABLE TO READ WORK STATION DESCRIPTION RECORD

Explanation: The workstation description record could not be read because either it may have been deleted by another user or an error in the workstation description database meant that it could not be read.

System action: The system waits for you to respond.

User response: Verify that the workstation description was not deleted or that it was correctly defined in the database. If the error persists, contact your system programmer.

EQQW008E INCORRECT ENTRY, ENTER C OR N.

Explanation: You entered a not valid value in the parallel server or resource usage field.

EQQW009E • EQQW014E

System action: The request is rejected.

User response: Correct your input. Valid values are C or N.

EQQW009E INCORRECT ENTRY, ENTER P OR N.

Explanation: You entered a not valid value in the server usage field.

System action: The request is rejected.

User response: Correct your input. Valid values are P or N.

EQQW010W THE JCC INCIDENT FILE IS NOT AVAILABLE. ERROR CODE = *ERRCODE*

Explanation: The job completion checker (JCC) incident log data set cannot be used. Valid values for the error code *ERRCODE* are:

- 001 No incident log data set name was defined in the JCCOPTS statement.
- 004 The incident log data set could not be allocated.
- 005 An unrecoverable error occurred writing to the incident work file.
- 006 The incident log data set could not be unallocated.
- 008 The incident log data set could not be opened.
- 009 The incident log work data set could not be opened.
- 012 An unrecoverable I/O error occurred whilst writing to the incident log or the incident work data set.

System action: The JCC continues processing without creating any incident records.

System programmer response: Correct all errors and restart the JCC.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQW011I THE EVENT WRITER ENDED NORMALLY

Explanation: The initialization of the event writer has completed and the event writer has been requested to stop execution.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQW012E THE EVENT WRITER TERMINATED BECAUSE OF UNRECOVERABLE ERRORS

Explanation: The initialization of the event writer has completed, but a severe error caused the event writer to stop execution.

System action: The event writer terminates execution. Message EQQZ045W is issued.

System programmer response: Correct all errors and restart the event writer.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQW013E DISK SPACE WAS EXHAUSTED ON JCC INCIDENT FILE, DDNAME = *DDNAME*

Explanation: An end-of-volume error has been detected while writing to the incident log data set (ddname *EQQINCFL*) or the incident work data set (ddname *EQQINCWK*).

System action: If the incident log data set is full, the job completion checker (JCC) continues logging to the incident work data set. If the incident work data set is full, the JCC issues message EQQW010W and stops writing incident log records.

System programmer response: If the incident log data set is full, either allocate a larger data set or release space in the current data set. If the incident work data set is full, make sure that the JCC can allocate the incident log data set. Empty the work data set by copying its contents to the incident log. Restart the JCC to continue incident logging.

EQQW014E THE JCC TASK ABENDED WHILE PROCESSING THE FOLLOWING EXIT RECORD: *EXITREC*

Explanation: An abend prevented the job completion checker (JCC) from processing all SYSOUT data sets for a batch job.

System action: z/OS recovery/termination is requested to generate a dump. The JCC attempts to continue normal operation with the next ending job. The current job is put on the ended-in-error list with an error code of JCCE.

Operator response: Note the job name and job number from the exit record. If necessary, set the correct status for the job manually.

Problem determination: Review the SYSLOG data set, the IBM Tivoli Workload Scheduler for z/OS message log data set, and the dump data set to determine the cause of the error.

**EQQW015E THE JOB COMPLETION CHECKER
COULD NOT FIND ANY SYSOUT
DATA SETS FOR JOB
JOBNAME(JOBNUM). REPEATED
RETRIES HAVE FAILED**

Explanation: The job completion checker (JCC) has tried to retrieve the SYSOUT data sets for a batch job but no data sets have been returned by the JES.

System action: No more attempts to retrieve SYSOUT data sets are made for the current job. The JCC attempts to continue normal operation with the next ending job. The current job is put on the ended-in-error list with an error code of JCCE.

Operator response: Determine the current status of the job. If necessary, set the correct status for the job manually.

System programmer response: If necessary, correct any incorrectly specified operands in the JCCOPTS statement and restart the JCC.

Problem determination: In a JES3 system, check that the JCC SYSOUT classes are defined as external writer classes to JES3. For both JES2 and JES3, ensure that the CHKCLASS sysout classes used are not being processed by a sysout archival product or JES offload. If using data store, ensure the classes are different from the ones specified in DSTCLASS keyword of RCLOPTS parameter.

**EQQW016E AN UNRECOVERABLE I/O ERROR
OCCURRED. SYNAD MESSAGE
FOLLOWS: SYNMSG**

Explanation: An I/O error occurred when the event writer was updating the event data set.

System action: The event writer attempts to continue processing.

System programmer response: Correct all errors and, if necessary, restart the event writer.

Problem determination: The SYNAD routine collects information such as jobname, stepname, unit address, device type, ddname, operation, error description, and access method. The SYNADAF macro is used to extract this information. For a detailed description of the layout refer to the appropriate documentation for the MVS/DFP product installed on this system.

**EQQW017E THE EVENT WRITER WAS UNABLE
TO OPEN THE EVENT DATA SET**

Explanation: The event writer could not open its output data set, ddname EQQEVDS.

System action: The event writer issues message EQQW062E and is terminated.

System programmer response: If necessary, restart the event writer.

Problem determination: Check that ddname EQQEVDS is correctly specified and that the IBM Tivoli Workload Scheduler for z/OS started task is authorized to open the data set for update.

**EQQW018E SYSOUT CLASS CLASS IS ALREADY
BEING PROCESSED BY ANOTHER
JCC TASK**

Explanation:

A Job Completion Checker (JCC) task has been requested to process SYSOUT data sets in a SYSOUT class which is already being processed by another JCC task on the same MVS system. The SYSOUT class can only be processed by one JCC task at a time.

System action: The initialization of the JCC is terminated.

System programmer response: Check the value of JCCOPTS and CHKCLASS of all Tivoli Workload Scheduler for z/OS subsystem started on the system. Correct the error and restart and restart the JCC task or the Tivoli Workload Scheduler for z/OS subsystem.

Problem determination: The JCC task uses the classes defined by the JCCOPTS CHKCLASS parameter. Check that on the same spool are not defined more JCC's using the same CHKCLASS values.

**EQQW019E A SEVERE ERROR IN THE JCC TASK
HAS CAUSED ONE OR MORE
EVENTS TO BE LOST**

Explanation: An abend in the job completion checker (JCC) queue processing routine prevented the JCC from processing all queued jobs.

System action: z/OS recovery/termination is requested to generate a dump. The JCC attempts to continue processing.

Operator response: Check the ready list for the computer workstation that is serviced by the abending JCC task. Check that all operations that have the started status are in fact executing. If necessary, set the correct status for jobs that are listed as started, but have completed execution.

Problem determination: Review the SYSLOG data set, the IBM Tivoli Workload Scheduler for z/OS message log data set, and the dump data set to determine the cause of the error.

**EQQW021E THE EVENT WRITER OUTPUT DATA
SET IS TOO SMALL**

Explanation: The event writer requires that the event data set is large enough to contain a minimum of 100 events. The data set defined by the ddname EQQEVDS does not fulfill this requirement.

System action: The event writer processing is

terminated. Message EQQW062E is issued.

System programmer response: Allocate a larger event data set. If necessary, restart IBM Tivoli Workload Scheduler for z/OS to pick up the new event data set.

EQQW022I THE JOB COMPLETION CHECKER ENDED NORMALLY

Explanation: The initialization of the job completion checker (JCC) has completed and the JCC has been requested to stop execution.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing.

User response: None.

**EQQW023E UNEXPECTED SUBSYSTEM REQUEST RETURN CODES FOR JOB
JOBNAME(JOBNUM) REQUEST TYPE:
TYPE, R15: R15, SSOBRETN: SSOBRETN**

Explanation: An error occurred when the job completion checker (JCC) was retrieving information from the JES about job *JOBNAME*. The information request is either a status request (request type = CS) or a process SYSOUT request (request type = SO). *R15* and *SSOBRETN* are return codes from JES. JCC issues this message because there is no code to handle this combination of return codes.

System action: An incident record is written to the JCC incident log and the job is flagged as having encountered a JCC error.

Operator response: Set the correct status for the job manually and, if necessary, delete or requeue SYSOUT data sets for the job.

EQQW024E THE EVENT WRITER ABENDED WHILE PROCESSING THE FOLLOWING EXIT RECORD: EXITREC

Explanation: An abend prevented the event writer from writing an event record to the event data set.

System action: z/OS recovery/termination is requested to generate a dump. The event writer attempts to continue normal operation with the next queued event.

Operator response: Note the job name and job number from the exit record. If necessary, set the correct status for the job manually.

Problem determination: Review the SYSLOG data set, the IBM Tivoli Workload Scheduler for z/OS message log data set, and the dump data set to determine the cause of the error.

EQQW025W THE EVENT WRITER HAS IGNORED THE FOLLOWING INVALID EXIT RECORD: EXITREC

Explanation: An invalid event record *EXITREC* has been found by the event writer. The most likely reason is that the last four bytes of the record do not contain the IBM Tivoli Workload Scheduler for z/OS character string *EQQ3*. It is also possible that the first three characters of the job ID field do not contain the character string *JOB*.

If the last four bytes of the record contain the character string *ERA2*, an abend has occurred during the event creation, and the event contains the following information:

- EXRJOBN**
Name of the abending CSECT
- EXRJOBID**
Compile date of the abending CSECT
- EXRCREAT**
Compile time of the abending CSECT
- EXRRDATE+1**
Abend code (from SDWACMPC)
- EXRRTIME**
Offset in CSECT at which the abend occurred

If the last four bytes of the record contain the character string *ERU2*, the event creation has been called by an unsupported exit, and the event contains the following information:

- EXRJOBN**
Name of the unsupported exit.

Refer to the *Diagnosis Guide and Reference* for details of the EXR control block.

System action: The event writer terminates processing of the event, but continues normal processing. If the invalid event was of the *ERA2* or *ERU2* type (see previous explanations), the events are created only if a minimum of five minutes have passed since the last creation of the same type.

System programmer response: Save the IBM Tivoli Workload Scheduler for z/OS message log data set (*EQQMLOG*) containing this error message and contact IBM Software Support.

Problem determination: If the message is issued for all events (in which case the event data set is empty), check that the *EQQSSCMD* module and the event writer are at the same release level.

EQQW026I THE JOB COMPLETION CHECKER STARTED

Explanation: The initialization of the job completion checker (JCC) has completed and the JCC is about to start processing.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

User response: None.

EQQW027E THE JOB COMPLETION CHECKER TERMINATED DUE TO UNRECOVERABLE ERRORS

Explanation: An abend has occurred in the job completion checker (JCC) task that is not related to the processing of any specific job.

System action: z/OS recovery/termination is requested to generate a dump. The JCC processing is terminated.

System programmer response: Correct all errors and restart the JCC.

Problem determination: Review the SYSLOG data set, the IBM Tivoli Workload Scheduler for z/OS message log data set, and the dump data set to determine the cause of the error.

EQQW028E JOB COMPLETION CHECKER INITIALIZATION FAILED

Explanation: The job completion checker (JCC) could not acquire all resources required for normal operation. The most likely reason is that either the JCC message library could not be opened or the library is incorrectly defined. It is also possible that there was an error in the JCCOPTS statement.

System action: The JCC processing is terminated. Message EQQZ045W is issued.

System programmer response: Correct all errors and restart the JCC.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQW029E JCC FOUND INVALID NUMERICS BETWEEN COLUMNS BCOL AND ECOL IN MEMBER MEMBER IN THE EQQJCLIB MESSAGE TABLE FILE. INCORRECT RECORD FOLLOWS: MSGREC

Explanation: A message table record contains invalid information and cannot be used.

System action: The job completion checker (JCC) does not use the incorrect message library member. If the member name is EQQGJCCCT, message EQQW063E is

issued. In all other cases, the JCC continues processing.

System programmer response: Correct the message table definition error and replace member *MEMBER* in the EQQJCLIB message table data set.

EQQW030I A DISK DATA SET WILL BE FORMATTED, DDNAME = DDNAME

Explanation: IBM Tivoli Workload Scheduler for z/OS has started to format an event data set or a submit/release data set for the ddname *DDNAME*.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing.

User response: None.

EQQW031E JCC ALLOCATION OF A SYSOUT DATA SET FAILED FOR JOBNAME(JOBNUM) DYNAMIC ALLOCATION ERROR CODE: RETC, INFORMATION REASON CODE: RSNC

Explanation: The job completion checker (JCC) could not allocate a SYSOUT data set for the job *JOBNAME(JOBNUM)*. The dynamic allocation error and information reason codes are given in hexadecimal.

System action: An incident record is written to the JCC incident log and the job is flagged as having encountered a JCC error. The JCC stops processing the current job.

Operator response: Check that the correct status is set for the job. If necessary, set the status manually.

System programmer response: Look up the meaning of the dynamic allocation error and information reason codes, and take appropriate action.

Problem determination: Use the DYNALLOC return code and reason code to determine the cause of the error. For more information, refer to the appropriate DYNALLOC documentation for the currently active z/OS system.

EQQW032E THE JOB COMPLETION CHECKER LIBRARY, DDNAME EQQJCLIB, COULD NOT BE OPENED

Explanation: The job completion checker (JCC) could not open a required input data set, ddname EQQJCLIB.

System action: The JCC processing is terminated. Message EQQW028E is issued.

System programmer response: If necessary, restart the JCC.

Problem determination: Check that EQQJCLIB is correctly defined and that the IBM Tivoli Workload Scheduler for z/OS started task is authorized to open the data set.

EQQW033W JOB *JOBNAME(JOBNUM)* WILL NOT BE RELEASED. REPEATED RETRIES HAVE FAILED

Explanation: The event writer has received a release command on a submit/release data set and was not able to release job *JOBNAME(JOBNUM)* from hold status.

System action: No more attempts to release the job are made. The event writer continues processing.

Operator response: Determine the current status of the job. If necessary, release the job manually.

EQQW034E LRECL FOR THE JOB COMPLETION CHECKER LIBRARY, DDNAME EQQJCLIB, IS NOT VALID

Explanation: The job completion checker (JCC) cannot use the message table library data set because its logical record length is not 80 bytes.

System action: The JCC processing is terminated. Message EQQW028E is issued.

System programmer response: Check that EQQJCLIB is correctly defined. Correct all errors and restart the JCC.

EQQW035E JCC UNALLOCATION OF A SYSOUT DATA SET FAILED FOR *JOBNAME(JOBNUM)* DYNAMIC ALLOCATION ERROR CODE: *RETC*, INFORMATION REASON CODE: *RSNC*

Explanation: An error occurred when the job completion checker (JCC) was deallocating a SYSOUT data set for the job *JOBNAME(JOBNUM)*. The dynamic allocation error and information reason codes are given in hexadecimal.

System action: An incident record is written to the JCC incident log and the job is flagged as having encountered a JCC error. The JCC stops processing the job.

Operator response: Check that the correct status is set for the job. If necessary, set the status manually.

Problem determination: Use the DYNALLOC return code and reason code to determine the cause of the error. For more information, refer to the appropriate DYNALLOC documentation for the currently active z/OS system.

EQQW036E JCC OPEN OF A SYSOUT DATA SET FAILED FOR *JOBNAME(JOBNUM)* DDNAME: *DDNAME*, DSNAME: *DSNAME*

Explanation: An error occurred when the job completion checker (JCC) was trying to open a

SYSOUT data set for the job *JOBNAME(JOBNUM)*.

System action: An incident record is written to the JCC incident log and the job is flagged as having encountered a JCC error. The JCC stops processing the job.

Operator response: Check that the correct status is set for the job. If necessary, set the status manually.

System programmer response: Determine the reason for the JCC open failure. Correct all errors.

EQQW037E JCC ABEND CODE *ABCODE* OPENING A SYSOUT DATA SET FOR *JOBNAME(JOBNUM)* DDNAME: *DDNAME*, DSNAME: *DSNAME*

Explanation: A serious error occurred when the job completion checker (JCC) was trying to open a SYSOUT data set for the job *JOBNAME(JOBNUM)*.

System action: An incident record is written to the JCC incident log and the job is flagged as having encountered a JCC error. The JCC stops processing the job.

Operator response: Check that the correct status is set for the job. If necessary, set the status manually.

System programmer response: Determine the reason for the abend. Correct all errors.

EQQW038I A DISK DATA SET HAS BEEN FORMATTED, DDNAME = *DDNAME*

Explanation: IBM Tivoli Workload Scheduler for z/OS has finished formatting an event data set or a submit/release data set for the ddname *DDNAME*.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing.

User response: None.

EQQW039E JCC FOUND BAD HEXADECIMAL VALUE BETWEEN COLUMNS *BCOL* AND *ECOL* IN MEMBER *MEMBER* IN THE EQQJCLIB MESSAGE TABLE FILE. INCORRECT RECORD FOLLOWS: *MSGREC*

Explanation: A message table record contains invalid information and cannot be used.

System action: The job completion checker (JCC) does not use the incorrect message library member. If the member name is EQQGJCCT, message EQQW063E is issued. In all other cases, the JCC continues processing.

System programmer response: Correct the message table definition error and replace member *MEMBER* in the EQQJCLIB message table data set.

EQQW040W JOB *JOBNAME*(*JOBNUM*) WILL NOT BE RELEASED. RELEASE RECORD IS TOO OLD

Explanation: The event writer found a release request in a submit/release data set that could not be executed. The reason is that the request was older than the limit defined to the event writer by the SKIPTIME and SKIPDATE keywords in the EWTROPTS statement.

System action: The event writer continues reading the submit/release data set.

Operator response: If necessary, set the correct status for the job manually.

EQQW041W JCL BATCH WITH FIRST JOB *JOBNAME* WILL NOT BE SUBMITTED BECAUSE SUBMIT RECORD IS TOO OLD

Explanation: The event writer found job submit records in a submit/release data set that could not be processed. The reason is that the records were older than the limit defined to the event writer by the SKIPTIME and SKIPDATE keywords in the EWTROPTS statement.

System action: The event writer continues reading the submit/release data set.

Operator response: If necessary, resubmit the job.

EQQW042W JCL BATCH WITH FIRST JOB *JOBNAME* WILL NOT BE SUBMITTED BECAUSE THE EVENT WRITER DID NOT RECEIVE ALL SUBMIT RECORDS

Explanation: The event writer found job submit records in a submit/release data set that could not be processed because some submit records were missing.

System action: The event writer continues reading the submit/release data set.

Operator response: If necessary, resubmit the job.

Problem determination: Check that only one IBM Tivoli Workload Scheduler for z/OS subsystem is updating this submit/release data set.

EQQW043E THE EVENT WRITER WAS UNABLE TO OPEN THE SUBMIT/RELEASE DATA SET

Explanation: The event writer could not open its input data set, ddname EQQSUDS.

System action: The event writer issues message EQQW062E and is terminated.

System programmer response: If necessary, restart the event writer.

Problem determination: Check that ddname EQQSUDS is correctly defined and that the IBM Tivoli Workload Scheduler for z/OS started task is authorized to open the data set.

EQQW044E UNEXPECTED ERROR SUBMITTING JOB *JOBNAME* TO THE JES INTERNAL READER

Explanation: An error occurred when submitting the job *JOBNAME* to the JES.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing.

Operator response: If necessary, submit the job manually.

EQQW045W JCL BATCH WITH FIRST JOB *JOBNAME* WILL NOT BE SUBMITTED BECAUSE SUBMIT RECORDS WERE RECEIVED IN INCORRECT ORDER BY THE EVENT WRITER

Explanation: The event writer found job submit records in a submit/release data set that could not be processed because the records were not in sequence.

System action: The event writer continues reading the submit/release data set.

Operator response: If necessary, resubmit the job *JOBNAME*.

Problem determination: Check that only one IBM Tivoli Workload Scheduler for z/OS subsystem is updating this submit/release data set.

EQQW046E SEQUENCE NUMBER *SEQNO* IS ALREADY IN USE BY AN EVENT READER SUBTASK

Explanation: At initialization of the event writer, an event reader was already started with the sequence number specified in the EWSEQNO keyword of EWTROPTS.

The number specified in the EWSEQNO keyword of EWTROPTS must be unique within the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The initialization of the event writer fails. The event writer task is terminated.

Programmer response: Review the ERSEQNO keyword of the ERDROPTS initialization statements to get a sequence number that is unused. Update the EWSEQNO keyword with a unique sequence number and use the IBM Tivoli Workload Scheduler for z/OS **Modify** command to restart the event writer task.

EQQW047W SUBMIT/RELEASE RECORDS WERE LOST BECAUSE THE SUBMIT/RELEASE DATA SET BECAME FILLED WITH UNPROCESSED RECORDS

Explanation: The event writer could not process records in a submit/release data set as fast as the sending IBM Tivoli Workload Scheduler for z/OS subsystem was generating them.

System action: The event writer tries to reposition on the oldest record in the data set.

Operator response: Determine if any held jobs should be released and, if so, release them manually. Resubmit all missing jobs.

System programmer response: Allocate a larger submit/release data set and restart the event writer.

EQQW048E THE EVENT FILTERING EXIT, EQQUX004, ABENDED AND HAS BEEN DISABLED

Explanation: An abend in the event filtering exit prevented the event writer from writing an event record to the event data set.

System action: z/OS recovery/termination is requested to generate a dump. The event writer attempts to continue normal operation with the next queued event, but the event filtering exit is not called again.

Operator response: Note the job name and job number from the exit record. If necessary, set the correct status for the job manually.

System programmer response: Correct all errors and restart the event writer.

Problem determination: Review the SYSLOG data set, the IBM Tivoli Workload Scheduler for z/OS message log data set, and the dump data set to determine the cause of the error.

EQQW049E UNABLE TO FORMAT DATA SET WITH DDNAME DDNAME BECAUSE THE DATA SET IS NOT A SINGLE EXTENT, DISK RESIDENT, DATA SET

Explanation: IBM Tivoli Workload Scheduler for z/OS was unable to format an event data set or a submit/release data set for the ddname *DDNAME*. A data set to be formatted must be a disk resident, single extent data set.

System action: The IBM Tivoli Workload Scheduler for z/OS function that uses the data set fails to initialize correctly.

Operator response: None.

System programmer response: Correct the IBM Tivoli

Workload Scheduler for z/OS started task procedure and restart IBM Tivoli Workload Scheduler for z/OS.

EQQW051E JOB JOBNAME COULD NOT BE SUBMITTED. REASON: AUTHORITY FOR RUSER USER, SUPPLIED BY USER EXIT EQQUX001, COULD NOT BE DETERMINED

Explanation: A user ID was supplied by the submit exit, EQQUX001, and the job was then sent using the submit/release data set to the DRVP macro. The buffer pool was successfully built.

System action: The job is not submitted and IBM Tivoli Workload Scheduler for z/OS continues normal processing.

User response: Make sure that the supplied user ID is defined to the external security manager.

EQQW052E THE EVENT DATASET, DDNAME DDNAME, LRECL BLKSIZE IS INVALIDLY DEFINED. DATASET IS NOT USABLE

Explanation: The event data set referenced by ddname *DDNAME* has been allocated with an invalid logical record length.

System action: The initialization of the event writer fails.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS, reallocate the data set and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: An event data set must have a logical record length (LRECL) not less than 100 and not greater than 32000. Check that the LRECL is within the supported range.

EQQW053E THE SYSOUT ARCHIVING EXIT, EQQUX005, ABENDED AND HAS BEEN DISABLED

Explanation: The sysout archiving exit, EQQUX005, abended while processing a job's SYSOUT data set. IBM Tivoli Workload Scheduler for z/OS has disabled the exit for this type of function for the remainder of the IBM Tivoli Workload Scheduler for z/OS session.

System action: z/OS recovery/termination is requested to generate a dump. The exit is not called again for this particular function, but IBM Tivoli Workload Scheduler for z/OS continues processing.

System programmer response: Correct the error and, if necessary, restart the job completion checker (JCC) task using the modify commands or restart the Tivoli OPC tracker.

Problem determination: Review the SYSLOG data set, the IBM Tivoli Workload Scheduler for z/OS message

log, and the dump data set to determine the cause of the error.

EQQW056W *JOBNAME* *JOBNUM* HAS NO HELD
SYSOUT IN CLASS *CLASS*

Explanation: The CATMCLAS keyword specifies the SYSOUT class *CLASS*, but job *JOBNAME* with job ID *JOBNUM* created output that is not held in this class.

System action: The job is tracked as normal, but the job log cannot be sent to the controller.

System programmer response: Make sure that the CATMCLAS keyword specifies only held SYSOUT classes.

Problem determination: If the job-log output for the job is a held SYSOUT class, make sure the most current EQQSSCMD lmod is active (see the SSCMNAME parameter).

EQQW058W JES CLASS *CLASS* WAS DEFINED
BOTH FOR JCC AND DATASTORE
PROCESSING: STRUCTURE JOBLOG
DATA FOR DATASTORE MAY BE
LOST.

Explanation: The same class has been defined in the CHKCLASS keyword in the JCOPTS statement and in the DSTCLASS keyword in the RCLOPTS statement.

System action: The job is tracked as normal, but the joblog data for datastore may be lost.

System programmer response: Change CHKCLASS keyword for DSTCLASS keyword to avoid the risk of losing the joblog data.

Problem determination: Refer to the explanation of the DSTCLASS keyword in Customization and Tuning.

EQQW059E WRONG HEADER IN END-TO-END
EVENTS DATASET, DDNAME =
DDNAME

Explanation: The End-to-End events data set specified by DDNAME has a wrong header.

System action: The controller initialization fails.

User response: Specify the correct data set in the DDNAME and restart the controller.

EQQW060E SUBMIT/RELEASE SKIP LIMIT DATE
OR TIME *SKIPLIM* IS NOT VALID

Explanation: Initialization of the event writer failed because an operand of the SKIPDATE or SKIPTIME keyword in the EWTROPTS statement was incorrectly specified.

System action: The event writer processing is terminated.

System programmer response: Correct the operand in the EWTROPTS statement and restart the event writer.

Problem determination: None.

EQQW061W THE EVENT FILTERING EXIT LOAD
MODULE, *MODULE*, COULD NOT BE
LOADED

Explanation: The event writer could not locate the event filtering exit load module, EQQUX004.

System action: The event filtering exit is not used by the event writer.

System programmer response: If the event filtering exit is meant to be used, make sure that the EQQUX004 load module is present in a library that can be reached by IBM Tivoli Workload Scheduler for z/OS. Correct all errors and, if necessary, restart the event writer.

Problem determination: None.

EQQW062E EVENT WRITER INITIALIZATION
FAILED

Explanation: The event writer could not acquire all resources required for normal operation. The most likely reason is that the event data set or a submit/release data set could not be opened. It is also possible that there was an error in the EWTROPTS statement.

System action: The event writer processing is terminated. Message EQQZ045W is issued.

System programmer response: Correct all errors and restart the event writer.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQW063E THE JOB COMPLETION CHECKER
WAS UNABLE TO BUILD THE
GENERAL MESSAGE TABLE

Explanation: An error occurred while processing the general message table for the job completion checker (JCC). The general message table is defined by member EQQJCCCT in the library defined by the EQQJCLIB DD statement.

System action: The initialization of the JCC fails.

System programmer response: Correct all errors and restart the JCC.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQW064E THE JOB COMPLETION CHECKER WAS UNABLE TO BUILD THE JOB MESSAGE TABLE FOR JOB *JOBNAME*(*JOBNUM*)

Explanation: An error occurred while processing the message table for the specified job in the job completion checker (JCC). The job message table is defined by member *JOBNAME* in the library defined by the EQQJCLIB DD statement.

System action: An incident record is written to the JCC incident log and the job is flagged as having encountered a JCC error.

Operator response: Set the correct status for the job manually and, if necessary, delete or requeue SYSOUT data sets for the job.

System programmer response: Correct all errors in the job message table.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQW065I EVENT WRITER STARTED

Explanation: The initialization of the event writer has completed and the event writer is now about to start processing.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing.

User response: None.

EQQW066E JCC WAS UNABLE TO ALLOCATE STORAGE TO PROCESS MEMBER *MEMBER* OF EQQJCLIB

Explanation: An error occurred when allocating storage for a job message table.

System action: Message EQQW064E is issued.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS and restart it in a larger region.

Problem determination: None.

EQQW067E A SEVERE ERROR IN THE EVENT WRITER HAS CAUSED LOSS OF CSA EVENT BUFFERS

Explanation: An abend in the queue processing routine of the event writer prevented the event writer from returning all event buffers to the free chain.

System action: z/OS recovery/termination is requested to generate a dump. The event writer attempts to continue processing.

System programmer response: None.

Problem determination: Review the SYSLOG data set, the IBM Tivoli Workload Scheduler for z/OS message log data set, and the dump data set to determine the cause of the error.

EQQW068E JCC WAS UNABLE TO FIND MEMBER *MEMBER* IN EQQJCLIB MESSAGE TABLE FILE

Explanation: The general message table member *MEMBER* of the job completion checker (JCC) could not be found in the library defined by the EQQJCLIB DD statement.

System action: Message EQQW063E is issued.

System programmer response: Create a general message table member for the JCC and add it to the EQQJCLIB library.

EQQW069E MEMBER *MEMBER* IN EQQJCLIB MESSAGE TABLE FILE IS EMPTY

Explanation: The general message table member *MEMBER* of the job completion checker (JCC) exists in the library defined by the EQQJCLIB DD statement, but there are no records in the member.

System action: If the member name is EQQGJCCT, message EQQW063E is issued. If not, the JCC continues processing.

System programmer response: If necessary, add the correct message table member to the EQQJCLIB library.

EQQW070I THE EW CANNOT REPOSITION AT RESTART POSITION: *CYCREC*

Explanation: An event writer is started in event reader mode (with an EWSEQNO). The event writer cannot position on the event data set with the event data set position that it has received. The restart position was probably overwritten when the event data set wrapped around.

System action: The event writer continues normal processing.

Programmer response: The event data set may be too small. Make sure that it is large enough to hold all the generated events when the connection between the controller and the tracker with the started event writer is down.

EQQW071I UNKNOWN RECORD TYPE SKIPPED BECAUSE IT IS TOO OLD

Explanation: The event writer encountered an unknown record type when skipping records of the submit/release data set that are too old.

System action: The record is skipped.

User response: None.

EQQW072E EVENT WRITER SEQUENCE NUMBER, EWSEQNO, MUST BE 1 TO 16

Explanation: An invalid sequence number was found in the EWSEQNO keyword of the initialization statement for an event writer.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Change the sequence number to a number within the range 1 to 16 that is not already used by an event reader task in the same address space.

EQQW073E IT IS NOT VALID TO START AN EVENT WRITER IN EVENT READER MODE WITH THIS TYPE OF HOST CONNECTION

Explanation: The IBM Tivoli Workload Scheduler for z/OS configuration does not support starting an event writer in event reader mode. When the event writer is started with the EWSEQNO, it tries to pass events directly to the controller. EWSEQNO can only be used in these circumstances:

- The event writer is started in the same address space as the controller.
- XCF connections. The event writer is started at a tracker system connected to the controller using XCF communication links.
- SNA connections. The event writer is started at a tracker system connected to the controller using VTAM.

System action: The initialization of the event writer is terminated.

System programmer response: Remove the EWSEQNO keyword from the EWTROPTS initialization statement.

EQQW074E THE SUBMIT/RELEASE DATA SET WITH DDNAME = DDNAME IS TOO SMALL

Explanation: The submit/release data set must be large enough to contain 100 records.

System action: The workstation analyzer processing stops. Message EQQW502E is issued.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS, allocate a larger submit/release data set, and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: None.

EQQW075W THE HEADER RECORD IN FILE DDNAME IS INCOMPATIBLE WITH THE DEVICE TYPE

Explanation: The information in the header record does not match the calculated records per tracks value. Normally this is caused by moving the data set to a different device type.

Note: This message may be issued if you have reallocated the data set using a method that does not put an end of file at the beginning of the data set. It can then be ignored.

System action: The data set is reformatted.

User response: None.

EQQW076W NO CONTROLLER PULSE. EVENT WRITER WILL STOP PULSE DETECTION

Explanation: There are two situations that can cause this message to be issued:

1. When handshake processing is in use, each connected tracker system sends an identification (ID) event to the controller at the specified interval defined by the ROUTOPTS PULSE keyword, and the controller responds to the tracker system. This message is issued if the tracker detects that the controller has not responded to two consecutive ID events. In the case of a SHARED-DASD-connected tracker, this indicates that either there is a problem in the controller address space or the communication vehicle has failed.
2. When a tracker is started in a separate address space and is not receiving work from the controller, the tracker waits for two default intervals (2 x 10 minutes) and issues this message.

System action: The event writer task stops sending handshake events.

System programmer response: In the case of a SHARED-DASD-connected tracker, verify if the Scheduler controller address space is active and check the message log data set for error messages or communication failures. If required, restart the controller. For any other configuration where the connection between tracker and controller is NCF or XCF, or where the tracker issuing this message has a blank destination ID, the message can be ignored.

EQQW077E THE SUBMIT/RELEASE DATASET IS NOT INITIALIZED

Explanation: A IBM Tivoli Workload Scheduler for z/OS tracker system tried to update the submit/release data set, ddname EQQSUDS, but the data set is not initialized by the controller. This message is issued only when starting with a new submit/release data set.

System action: The initialization of the event writer

EQQW079W • EQQW085E

fails and the task is terminated.

User response: Stop the tracker and start the controller so as to initialize the submit/release data set.

EQQW079W JBNAM WILL NOT BE SUBMITTED TO WLM FOR PROMOTION. WLM REQUEST IS TOO OLD

Explanation: The event writer found a record for WLM job promotion in the submit/release data set that could not be executed. The reason is that the request is older than the limit defined to the event writer by the SKIPTIME and SKIPDATE keywords in the EWTRPTS statement.

System action: The event writer continues reading the submit/release data set.

EQQW081W THE ROUTINE TO SEND EVENTS TO FTW COULD NOT BE LOADED

Explanation: The scheduler could not locate the subsystem routine used to send events to an FTW (fault-tolerant workstation).

System action: The scheduler ABENDs.

User response: Ensure that the EQQZTWE load module is present in the scheduler library.

Problem determination: The scheduler could not be installed correctly.

EQQW082E THE END-TO-END TASK WAS UNABLE TO OPEN AN END-TO-END DATA SET

Explanation: The end-to-end task could not open one of its event data sets (end-to-end input/output queue).

System action: The subtasks of the end-to-end task issues message EQQW083I and terminates.

System programmer response: If necessary, restart the subtasks of the end-to-end task.

Problem determination: Check that *DDNAME* EQQTWSIN/EQQTWSOU is correctly specified and that the scheduler started task is authorized to open the data set for update.

EQQW083I SSNAME EQQTWSIN/EQQTWSOU ERRCODE ERROR: ERRMSG

Explanation: An error occurred in the TWS enabler event data sets:

SSNAME
is the name of the scheduler subsystem

ERRCODE
is the code of the error.

ERRMSG
the cause of the error.

Explanation: The subtask of the end-to-end task issues

a message terminated. Problem determination: Check that EQQTWSIN/EQQTWSOU is correctly specified, the task is authorized to open the data set for update and the data sets are correctly allocated.

System programmer response: Check the status of the TWS enabler data sets. If necessary, restart the subtask of the end-to-end task.

Problem determination: Check that EQQTWSIN/EQQTWSOU is correctly specified, the task is authorized to open the data set for update and the data sets are correctly allocated.

EQQW084E THE EVENT DATASET, DDNAME DDNAME, LRECL BLKSZ IS INVALID. THE DATASET CANNOT BE USED. VALID RANGE IS FROM 160 TO 32000.

Explanation: The data set referenced by *DDNAME* *DDNAME* has been allocated with an invalid logical record length. The minimum record length allowed is 160 and the maximum is 32000.

System action: If the message is issued for an end-to-end event data set (EQQTWSOU and EQQTWSIN), the subtask of the end-to-end task issues the message EQQW083I and terminates. If the message is issued for the output collector event data set (EQQOUCFV), the event manager issues the message EQQE143E and joblogs for jobs that run on z-centric and dynamic agents are not collected or written to JES.

System programmer response: Reallocate the data set and, if the message is issued for

- An end-to-end event data set, restart the subtask of the end-to-end task.
- The output collector event data set, restart the controller.

Problem determination: The data set must have a logical record length (LRECL) in the range 160 to 32000. Check that the LRECL is within the supported range.

EQQW085E THE EVENT DATASET, DDNAME DDNAME, IS TOO SMALL

Explanation: The data set referenced by *DDNAME* *DDNAME* must be allocated to contain at least 1000 events. The data set does not meet this requirement.

System action: If the message is issued for an end-to-end event data set (EQQTWSOU and EQQTWSIN), the subtask of the end-to-end task issues the message EQQW083I and terminates. If the message is issued for the output collector event data set (EQQOUCFV), the event manager issues the message EQQE143E and joblogs for jobs that run on the z-centric and dynamic agents are not collected or written to JES.

System programmer response: Reallocate the data set and, if the message is issued for

- An end-to-end event data set, restart the subtask of the end-to-end task.
- The output collector event data set, restart the controller.

EQQW086E ERROR IN TASK SUBTASK OF END-TO-END ENABLER TASK, IN MODULE *MODULE* DURING A FUNCTION *FUNCTION* (ERROR CODE = *ERRCODE*)

Explanation: An error occurred in the subtask of the end-to-end *TASK* in module *MODULE* performing the *FUNCTION* function. The error code is *ERRCODE*

System action: The subtask of the end-to-end task continue the processing.

System programmer response: If the error code is different from zero, save the message log data set (EQQMLOG) containing this error message and contact IBM Software Support.

EQQW087E THE END-TO-END TASK WAS UNABLE TO OPEN AN EVENTS DATA SET

Explanation: The end-to-end task could not open one of its event data sets (end-to-end input/output queue).

System action: The subtask of the end-to-end task terminates.

System programmer response: If necessary, restart the subtask of the end-to-end task.

Problem determination: Check that DDNAME EQQTWSIN/EQQTWSOU is correctly specified and that the scheduler started task is authorized to open the data set for update.

EQQW088W THE END-TO-END *QUETYPE* QUEUE UTILIZATION HAS EXCEEDED THRESHOLD VALUE *PERCENT* % OF END-TO-END *QUETYPE* QUEUE IN USE

Explanation: The END-TO-END *QUETYPE* queue is used for *PERCENT* %. This could be dangerous for the events loss.

System action: The subtasks of the end-to-end task continue processing.

System programmer response: Start the end-to-end server and the end-to-end task. If the problem persists, the *QUETYPE* queue (DDNAME EQQTWSIN/EQQTWSOU) might be too small and should be increased. If so, stop the end-to-end server and the end-to-end task, reallocate the *QUETYPE* queue and restart the server and the TWS enabler.

Problem determination: Check that the end-to-end server and the subtasks of the end-to-end task (sender

and receiver task) are running correctly. If so, the *QUETYPE* queue (DDNAME EQQTWSIN/EQQTWSOU) might be too small.

EQQW089W THE END-TO-END *QUETYPE* QUEUE IS FULL. 100% OF TWS *QUETYPE* QUEUE IN USE

Explanation: The END-TO-END *QUETYPE* queue is 100% full. This could cause event loss.

System action: The subtasks of the end-to-end task continue processing.

System programmer response: Start the end-to-end server and the end-to-end task. If the problem persists then the *QUETYPE* queue (DDNAME EQQTWSIN/EQQTWSOU) might be too small and should be increased. If so, stop the end-to-end server and the end-to-end task, reallocate the *QUETYPE* queue and restart server and the TWS enabler.

Problem determination: Check that the end-to-end server and the subtasks of the end-to-end task (sender and receiver task) are running correctly. If so, the *QUETYPE* queue (DDNAME EQQTWSIN/EQQTWSOU) could be too small.

EQQW090I THE NEW SYMPHONY FILE HAS BEEN SUCCESSFULLY SWITCHED

Explanation: The Translator process has successfully switched the new Symphony File.

System action: The new Symphony file is sent to fault-tolerant workstations and used for scheduling on distributed agents.

User response: None.

EQQW091E THE NEW SYMPHONY FILE CANNOT BE SWITCHED

Explanation: The Translator was unable to switch the new Symphony file.

System action: The Translator waits until a new Symphony is available. Scheduling on distributed agents does not start.

User response: Check the MLOG server to see which error is preventing the Translator process from using the new Symphony. Correct the problems and run Symphony Renew to create a new Symphony.

EQQW092E ERROR SENDING SCRIPT FOR OPERATION *OPINUM* IN OCCURRENCE *OCCNAME* WITH OCCURRENCE TOKEN *APP1TOK*

Explanation: The submission of operation *OPINUM* in occurrence *OCCNAME* failed. The operation has a centralized script and an error occurred while sending the script: The sender task was unable to write the

EQQW093E • EQQW099I

script in the EQQTWSCS data set.

System action: The task tries to submit the job again.

System programmer response: Refer to messages EQQW093, EQQW094, or EQQW095 for a possible cause of the error and correct it.

EQQW093E EQQTWSCS OPENING FAILED

Explanation: The task is unable to open the PDSE specified by ddname EQQTWSCS.

System action: The task continues its own processing, but the submission of jobs with centralized scripts is jeopardized.

User response: Check that ddname EQQTWSCS is correctly defined.

EQQW094E EQQTWSCS INVALID RECORD LENGTH

Explanation: The task is unable to open the PDSE specified by ddname EQQTWSCS because of an incorrect record length.

System action: The task continues its own processing, but the submission of jobs with centralized scripts is jeopardized.

User response: Check that ddname EQQTWSCS is correctly defined and that the specified data set is allocated as described in the installation guide.

EQQW095E ERROR IN MACRO STOW: RC=RETCODE, RSN=RSNCODE

Explanation: An error occurred while sending a script to an agent for an operation that uses a centralized script; this message always follows message EQQW092E. The sender task caused an error while writing in the EQQTWSCS data set. The return code and the reason code of the macro STOW are reported.

System action: The task tries to submit the job again.

System programmer response: Refer to the DFSMS Macro Instructions for Data Sets manual to find the cause of the error and correct it.

EQQW096E A COMPLETE SYNCHRONIZATION BETWEEN END-TO-END RECEIVER AND EVENT MANAGER IS NOT POSSIBLE. NUMLOSTEVENTS HAVE BEEN LOST

Explanation: When initializing, the Event Manager asks the End-to-End Receiver for synchronization. The events already sent by End-to-End Receiver to Event Manager, but unprocessed by it, should be sent again to the Event Manager. If events to be re-sent are no more present in EQQTWSIN data set, a complete

synchronization is not possible, and *numlost* events are lost.

System action: The End-to-End Receiver continues synchronizing with the Event Manager, reprocessing the events still present in the EQQTWSIN data set.

System programmer response: Check inside the controller MLOG for possible EQQE110W and EQQE111W messages.

EQQW097I END-TO-END RECEIVER STARTED SYNCHRONIZATION WITH THE EVENT MANAGER. NUM EVENTS IN EQQTWSIN WILL BE REPROCESSED

Explanation: When initializing, the Event Manager asks the End-to-End Receiver for synchronization. *num* events already sent by the Receiver to the Event manager, but unprocessed by it, will be sent again. If Event Manager and End-to-End Receiver are synchronized, zero events will be reprocessed.

System action: The End-to-End Receiver starts reprocessing *num* events.

System programmer response: None.

EQQW098I END-TO-END RECEIVER FINISHED SYNCHRONIZATION WITH THE EVENT MANAGER

Explanation: When initializing, the Event Manager asked the End-to-End Receiver for synchronization. Now the End-to-End receiver has finished synchronizing with the Event Manager.

System action: The End-to-End Receiver continues with its normal processing.

System programmer response: None.

EQQW099I END-TO-END RECEIVER ACTION WAITING FOR THE EVENT MANAGER TO BECOME ACTIVE

Explanation: End-to-End Receiver must read events from the EQQTWSIN data set only if the Event Manager is active. If the action is STARTED, the Event Manager is no more active and so the End-to-End Receiver is in a waiting status until it receives a stop request, or the Event Manager is active again. If the action is STOPPED, the Event Manager has become active, so the End-to-End Receiver can continue with its normal processing.

System action: None.

System programmer response: None.

| **EQQW100E WORK STATION NAME IS NOT**
| **DEFINED OR IT IS INVALID**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** You entered an incorrect value. The
| first character must be an alphabetic character.

| **EQQW101E WORK STATION TYPE IS NOT**
| **DEFINED OR IT IS INVALID**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** You entered an incorrect value. Valid
| workstation types are: **G** for general, **C** for computer,
| and **P** for printer workstation.

| **EQQW102E WORK STATION REPORTING**
| **ATTRIBUTE INVALID OR NOT**
| **DEFINED**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** You entered an incorrect value. Valid
| workstation reporting attributes are:

- | **A** Automatic. Reporting is done by a user
| program for both start and completion of an
| operation, for example, a computer
| workstation.
- | **S** Manual start and completion. The workstation
| operator reports when work is started and
| when it is completed, for example, a data
| entry workstation.
- | **C** Manual completion only. The workstation
| operator reports only when work is
| completed, for example, a login workstation.
- | **N** Nonreporting. The workstation does not report
| on work.

| **EQQW103E WORK STATION SYSOUT ROUTING**
| **INVALID OR NOT DEFINED**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** You entered an incorrect value. Specify
| a correct value and proceed with the operation.

| **EQQW104E CONTROL ON PARALLEL SERVERS**
| **INVALID OR NOT DEFINED**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** You entered an incorrect value. The
| valid input for control on parallel servers is: **C** for
| control, **P** for planning, **B** for both planning and
| control, or **N** for none.

| **EQQW105E JOB INTERRUPTION ATTRIBUTE**
| **INVALID OR NOT DEFINED**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** You entered an incorrect value. Valid
| job interruption attributes are **Y** for yes and **N** for no.

| **EQQW106E JOB SETUP ATTRIBUTE IS NOT**
| **DEFINED OR IT IS INVALID**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** You entered an incorrect value. Valid
| job setup attributes are **Y** for yes and **N** for no.

| **EQQW107E DESTINATION IS NOT DEFINED OR**
| **IT IS INVALID**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** You entered an incorrect value. You
| can specify a destination only for a computer
| workstation. Enter a valid destination.

| **EQQW108E VALID WORK STATION TYPES ARE**
| **WSYPG, WSTYPC, WSTYPP, WSTYPR**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** You entered an incorrect value. Valid
| workstation types are: **WSTYPG** is the national
| language character for 'G' (general workstation),
| **WSTYPC** is for 'C' (computer workstation), and
| **WSTYPP** is for 'P' (printer workstation), **WSTYPR** is for
| 'R' (remote engine workstation) .

| **EQQW109E GENERAL OR PRINTER REQUIRED**
| **FOR JOB SPLITTABLE**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** You entered an incorrect value. You
| can split only a job on a general or printer workstation.
| You cannot split a job on a computer workstation.

| **EQQW110E JOB SETUP ALLOWED ONLY IF**
| **WORK STATION TYPE IS GENERAL**

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** You entered an incorrect value. Job
| setup is allowed if the workstation type is general, but
| not if the workstation type is computer or printer.

EQQW111E WORK STATION RESOURCE NAME
INVALID OR NOT DEFINED

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You entered an incorrect value. Enter a valid workstation name.

EQQW112E A PLANNING ATTRIBUTE IS
REQUIRED, SPECIFY EITHER Y OR N

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You did not enter a required value. Specify either Y or N and proceed with the operation.

EQQW113E A CONTROL ATTRIBUTE IS
REQUIRED, SPECIFY EITHER Y OR N

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You did not enter a required value. Specify either Y or N and proceed with the operation.

EQQW114E WORK STATION OPEN INTERVAL
INVALID OR NOT DEFINED

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You entered an incorrect value. Enter a valid workstation open interval and proceed with the operation.

EQQW115E VALID ATTRIBUTES ARE OWSDATTA,
OWSDATTS, OWSDATTC, OWSDATTN

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You entered an incorrect value. Valid values are: *OWSDATTA* is the national language character for 'A' (automatic workstation reporting), *OWSDATTS* is for 'S' (manual start/stop), *OWSDATTC* is for 'C' (completion only), and *OWSDATTN* is for 'N' (nonreporting).

EQQW116E COMPUTER OR REMOTE ENGINE
MUST BE SPECIFIED IF
DESTINATION DEFINED

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You did not enter a required value. Specify the required value and proceed with the operation.

EQQW117E WORK STATION NAME IS NOT
DEFINED OR IT IS INVALID

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You entered an incorrect value. Specify a correct value and proceed with the operation.

EQQW118E NO DESCRIPTION IS ALLOWED
WHEN STATUS IS STANDARD

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You entered an incorrect value. Only days that have status *closed* or *defined* can have an entry in the description field.

EQQW119E IF AUTOMATION IS YES, GENERAL
AND AUTOMATIC MUST BE ALSO
SPECIFIED

Explanation: If Automation is Yes, the workstation must be of type General and Automatic reporting.

User response: You did not specify a required value. Specify a workstation of type General and Automatic reporting.

EQQW120E ENGINE TYPE MUST BE Z OR D

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You entered an incorrect value. Specify Z or D and proceed with the operation.

EQQW121E REMOTE ENGINE TYPE MUST BE
BLANK

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW122E AUTOMATIC MUST BE SPECIFIED IF
DESTINATION DEFINED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW123E CORRECT VALUES ARE OCHRE NZ
OR OCHRE ND

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW124E REMOTE ENGINES CANNOT USE
RESOURCES AT PLANNING AND
CONTROL

Explanation: The resources for a remote engine workstation are not allowed and they must not be used

either for planning or control.

System action: None

User response: In the ISPF panel to set the proper values automatically for the remote engine workstation, press the PF3 key or the END command. If the error occurred in batch, correct the data and submit the job again.

EQQW125E REMOTE ENGINE TYPE IS NOT DEFINED OR IT IS INVALID

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW126E SERVER USAGE MUST BE N FOR REMOTE ENGINE WORKSTATIONS

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW200E THE STANDARD DAY IS NOT DEFINED OR IS INVALID

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You did not define correctly the standard day. A minimum of one open interval must be defined for the standard day. You cannot define the standard day as *closed*.

EQQW201E THE OPEN INTERVAL TABLE CONTAINS DUPLICATE ENTRIES

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW202E DAY OR DATE IS NOT DEFINED OR IT IS INVALID

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW203E OPEN INTERVAL FOR STANDARD DAY IS INVALID OR NOT DEFINED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW204E INTERVALS OVERLAP IN THE OPEN INTERVAL TABLE

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW205E OPEN INTERVAL END TIME MUST BE LATER THAN THE START TIME

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW206E OPEN INTERVAL START OR END TIME INVALID OR NOT DEFINED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW207E CAPACITY OF PARALLEL SERVERS INVALID OR NOT DEFINED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW208E RESOURCE CAPACITY IS NOT DEFINED OR IT IS INVALID

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW209E THE STANDARD DAY CANNOT BE CLOSED

Explanation: Data entry error; see "Data entry errors" on page 803.

EQQW210E ALTERNATE WS IS NOT ALLOWED FOR THE SELECTED WORKSTATION TYPE

Explanation: You can specify an alternative workstation only for computer workstations, general workstations with the WTO attribute set, and distributed remote engine workstations.

System action: The database is not updated. All changes are ignored.

User response: None.

EQQW211E THE ALTERNATE WS MUST BE OF THE SAME TYPE

Explanation: You specified an alternative workstation that is not defined in the workstation description database as a computer type workstation.

System action: The database is not updated. All changes are ignored.

User response: Specify the name of a computer type workstation or alter the attributes of the workstation in the workstation description database.

EQQW212E THE ALTERNATE WS IS NOT FOUND IN THE WS DATA BASE

Explanation: The alternative workstation that you specified is not defined in the workstation description database.

System action: The database is not updated. All changes are ignored.

User response: Specify the name of an existing computer type workstation or add the workstation that you specified to the workstation description database.

EQQW213E THE CURRENT WS CANNOT BE ALTERNATE TO ITSELF

Explanation: The alternative workstation cannot be the current workstation.

System action: The status of the workstation does not change.

User response: Change the name of the alternative workstation.

EQQW214E NODE ADDRESS CANNOT BE SET IF ACCESS METHOD NAME IS BLANK

Explanation: If the access method name is blank, the node address cannot be set. To specify a node address value, first set the access method name.

System action: Processing continues. IBM Tivoli Workload Scheduler for z/OS waits for your next input.

User response: Set the access method name and set the node address.

EQQW215E PORT NUMBER CANNOT BE SET IF NODE ADDRESS IS BLANK

Explanation: If the node address is blank, the port number cannot be set. To specify a port number value, first set the node address.

System action: Processing continues. IBM Tivoli Workload Scheduler for z/OS waits for your next input.

User response: Set the node address and set the port number.

EQQW216E ACCESS METHOD CAN BE SET ONLY FOR NON-VIRTUAL WS, COMPUTER TYPE

Explanation: You specified an access method name. Access method is supported only for non-virtual computer workstations.

System action: Processing continues. IBM Tivoli Workload Scheduler for z/OS waits for your next input.

User response: Specify a valid workstation type and set the VIRTUAL option to N.

EQQW217E PORT NUMBER MUST BE NUMERIC AND IN THE RANGE 0-65535

Explanation: You specified a port number value that was not numeric or was greater than 65535. The port number must be a numeric value in the range 0–65535.

System action: Access-method-specific data is not saved.

User response: Specify a valid port number.

EQQW218E D COMMAND IS ALLOWED ONLY FOR VIRTUAL WORKSTATIONS

Explanation: You specified the destination command on a workstation whose virtual flag is set to N. The destination command is only allowed for virtual workstations.

System action: The request is rejected.

User response: Specify a valid command.

EQQW219E THE DESTINATION TABLE CONTAINS DUPLICATE DESTINATIONS

Explanation: Data entry error; see “Data entry errors” on page 803.

User response: The destination you specified already exists. Specify a different destination.

EQQW300I ALL CLOSED WORK STATIONS HAVE BEEN UPDATED

Explanation: “All workstations closed” has been updated.

System action: None.

User response: None.

EQQW301E SOME DATES MAY NOT HAVE BEEN UPDATED

Explanation: Due to a failure in the subsystem, some dates may not have been updated as specified.

System action: The system waits for you to respond.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log for I/O errors that immediately precede this message. Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

User response: Exit from the Modify All Work Stations Closed panel. On the Work Station dialog, reenter option 4, **MODIFY CLOSED** to determine which dates were updated and which were not. Enter

the necessary changes and retry. If the error persists, contact your system programmer.

EQQW302E ALL WORK STATION CLOSED ISPF TABLE ERROR. NOTHING UPDATED

Explanation: An ISPF table contains duplicate entries.

System action: The changes are not saved.

System programmer response: Make sure that the supplied panel is being used.

User response: Contact your system programmer to make sure that the supplied panel is used.

EQQW303E ANOTHER USER IS UPDATING ALL WS CLOSED, TRY LATER

Explanation: You cannot update the all-work-station-closed database because another user is currently updating it.

System action: The system waits for you to respond.

User response: Try again later.

EQQW304E A VALID DATE MUST BE ENTERED AS CLOSE DATE

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: Specify a valid data for the close date and retry the operation.

EQQW306E BOTH CLOSED-FROM AND CLOSED-TO TIME MUST BE ENTERED

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: Specify both the closed-from date and the closed-to date.

EQQW307E SPECIFIED FROM-TIME LATER THAN TO-TIME

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: Specify a to-time that is later than the from-time.

EQQW308E DUPLICATE WORK STATION CLOSED DATES EXIST IN TABLE

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: Remove the duplicated value and retry the operation.

EQQW309I ALL WORK STATION CLOSED INFO MISSING, NO ACCESS TO DATA BASE

Explanation: Information about whether or not all workstations are closed for this date could not be retrieved because you do not have access to the all-work-station-closed database.

System action: None.

User response: None.

EQQW400E WTO OPTION ONLY ALLOWED IF WORK STATION TYPE IS GENERAL

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You cannot specify the write-to-operator (WTO) option for this workstation type. The write-to-operator (WTO) option is allowed if the workstation type is general, but not if the workstation type is computer or printer.

EQQW401E THE WTO OPTION IS MUTUALLY EXCLUSIVE WITH THE SPECIFIED OPTION

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You cannot specify the write-to-operator (WTO) option if the workstation option is job setup, task or splittable.

EQQW402E STARTED TASK OPTION ONLY ALLOWED IF WORK STATION TYPE IS CPU

Explanation: Data entry error; see "Data entry errors" on page 803.

Started task (STC) option is allowed if the workstation type is computer, but not if the workstation type is general or printer.

User response: You cannot specify the started task (STC) option if the workstation type is general or printer. Specify it if the workstation type is computer.

EQQW403E THE STC OPTION IS MUTUALLY EXCLUSIVE WITH THE SPECIFIED OPTION

Explanation: Data entry error; see "Data entry errors" on page 803.

Started task (STC) option is not allowed if the workstation option is job setup, write-to-operator (WTO), or splittable.

User response: You cannot specify the started task (STC) option if the workstation option is job setup,

EQQW404E • EQQW414E

| write-to-operator (WTO), or splittable.

EQQW404E THIS DESTINATION REPRESENTS AN OPC/A V1R2 NEC SYSTEM

Explanation: The specified destination is defined as an OPC/A Version 1 Release 2 NEC system in the ROUTOPTS initialization statement. Any work that should be transmitted to such a system must be handled by NJE.

System action: The workstation description is not updated.

System programmer response: If IBM Tivoli Workload Scheduler for z/OS should initiate work at this destination, start a IBM Tivoli Workload Scheduler for z/OS tracker. Change the ROUTOPTS initialization statement to reflect the new system type.

EQQW405E THIS DESTINATION IS NOT DEFINED

Explanation: The specified destination is not defined to IBM Tivoli Workload Scheduler for z/OS in the ROUTOPTS initialization statement.

System action: The workstation description is not updated.

System programmer response: In the ROUTOPTS initialization statement, define all IBM Tivoli Workload Scheduler for z/OS tracker systems that are connected to the controller.

User response: Verify that the destination is correctly specified.

EQQW406E STARTED TASK OPTION INVALID OR NOT DEFINED

| **Explanation:** Data entry error; see "Data entry errors"
| on page 803.

| **User response:** You can specify Y (yes) or N (no) for
| the started task option.

EQQW407E WTO OPTION INVALID OR NOT DEFINED

| **Explanation:** Data entry error; see "Data entry errors"
| on page 803.

| **User response:** You can specify Y (yes) or N (no) for
| the WTO option.

EQQW408E FOR FTW, CONTROL, AND PLANNING ON SERVER MUST HAVE THE VALUE N

| **Explanation:** When a fault-tolerant workstation is
| defined, no control and planning on parallel server
| must be done. The valid value is N.

| **System action:** The record is not created.

| **User response:** Specify N for the FTW option.

EQQW409E AUTOMATION OPTION NOT VALID OR NOT DEFINED

| **Explanation:** Automation option not valid or not
| defined.

| **User response:** Valid values for the option are Y and
| N. Specify one of the valid value.

EQQW410E AUTOMATION OPTION ALLOWED ONLY IF WORK STATION TYPE IS GENERAL

| **Explanation:** The Automation option is allowed only
| if workstation type is General.

| **User response:** You can specify the Automation option
| only if the workstation type is General.

EQQW411E AUTOMATION OPTION ALLOWED ONLY IF WORK STATION IS AUTOMATIC REPORTING

| **Explanation:** The Automation option is allowed only
| if workstation type is Automatic.

| **User response:** You can specify the Automation option
| only if the workstation is Automatic.

EQQW412E AUTOMATION OPT MUTUALLY EXCLUSIVE WITH JOB, STC, AND WTO WS OPTS

| **Explanation:** The Automation option is mutually
| exclusive with the workstation options JOB, STC, and
| WTO.

EQQW413E WAIT OPTION INCORRECT OR NOT DEFINED

| **Explanation:** Data entry error; see "Data entry errors"
| on page 803.

| **User response:** You specified an incorrect value.
| Specify Y (yes) or N (no).

EQQW414E WAIT OPTION ALLOWED ONLY FOR GENERAL NON REPORTING WORK STATIONS

Explanation: Data entry error; see "Data entry errors"
on page 803.

The Wait option is allowed only if workstation type is
general and work station attribute is non reporting.

EQQW415E WAIT OPTION NOT ALLOWED WITH JOB SETUP, SPLITTABLE OR WTO OPTIONS

Explanation: Data entry error; see “Data entry errors” on page 803.

The Wait option is not allowed if the workstation option is job setup, splittable, or WTO.

EQQW416E VIRTUAL OPTION INCORRECT OR NOT DEFINED

Explanation: Data entry error; see “Data entry errors” on page 803.

The option can be Y (yes) or N (no).

EQQW418E DESTINATION FIELD CANNOT BE SPECIFIED IF VIRTUAL FLAG IS Y

Explanation: You specified a value for destination field. You cannot specify a destination field for virtual workstations.

System action: Processing continues. IBM Tivoli Workload Scheduler for z/OS waits for your next input.

User response: Remove the destination field or change the VIRTUAL option to N.

EQQW419E COMMAND NOT ALLOWED FOR VIRTUAL WORK STATIONS

Explanation: The commands A, R, and M are not allowed for virtual workstations because the related information must be specified at destination level only after using the D command.

System action: The request is rejected.

User response: Specify a valid command.

EQQW420E MAIN DESTINATION MUST BE BLANK FOR VIRTUAL WORKSTATION

Explanation: You specified a value for destination field. You cannot specify a destination field for virtual workstations.

System action: The request is rejected.

User response: Remove the destination field or change the VIRTUAL option to N.

EQQW421E AT LEAST ONE DESTINATION IS NEEDED FOR VIRTUAL WORKSTATION

Explanation: You are defining a workstation with the VIRTUAL option set to Y, therefore you must specify also a destination list.

System action: The request is rejected.

User response: Define a destination list or change the VIRTUAL option to N.

EQQW424E VIRTUAL WORKSTATION CANNOT BE MODIFIED

Explanation: A user program requested to replace the common data of a workstation in the database, changing the current virtual attribute.

System action: The request is rejected.

User response: If you want to redefine the virtual attribute for the workstation, you must delete the current definition and insert a new workstation definition.

EQQW425E OPTION NOT ALLOWED FOR VIRTUAL WORKSTATIONS

Explanation: You cannot specify this option for virtual workstations.

System action: The request is rejected.

User response: Reset the specified option or change the VIRTUAL option to N.

EQQW426E VIRTUAL WORKSTATIONS MUST HAVE AT LEAST ONE DESTINATION

Explanation: You are defining a workstation with the VIRTUAL option set to Y, therefore you must specify also a destination list.

System action: The request is rejected.

User response: Define a destination list or change the VIRTUAL option to N.

EQQW427E DESTINATION DEST IS NOT DEFINED

Explanation: The specified destination is not defined in the ROUTOPTS initialization statement.

System action: The workstation description is not updated.

System programmer response: In the ROUTOPTS initialization statement, define all Tivoli Workload Scheduler for z/OS tracker systems that are connected to the controller.

User response: Verify that the destination is correctly specified.

EQQW428E ALTERNATE DEFINITION NOT APPLICABLE TO VIRTUAL WORKSTATIONS

Explanation: You specified a virtual workstation as alternate workstation. The alternate workstation

EQQW429E • EQQW506E

concept is not applicable to virtual workstations, either at workstation level or at single destination level.

System action: The workstation description is not updated.

User response: Specify a non-virtual workstation as alternate workstation.

EQQW429E DESTINATION DEST IS DUPLICATED

Explanation: The specified destination is duplicated.

System action: The workstation description is not updated.

User response: Remove the duplicate destination.

EQQW430E Z-CENTRIC AGENT OPTION INCORRECT OR NOT DEFINED

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: You specified an incorrect value. Specify Y (yes) or N (no).

EQQW500E THE JCL LIBRARY, DDNAME EQQJBLIB, COULD NOT BE OPENED

Explanation: IBM Tivoli Workload Scheduler for z/OS could not open the JCL library (ddname EQQJBLIB) to read a member.

System action: If the failure occurred during job submission the operation extended status is set to error.

System programmer response: Check that the ddname EQQJBLIB is correctly specified and that the task started by IBM Tivoli Workload Scheduler for z/OS is authorized to open the data set for input. When the error is corrected, stop IBM Tivoli Workload Scheduler for z/OS and restart it.

User response: Contact your system programmer.

Problem determination: Review the preceding messages in the IBM Tivoli Workload Scheduler for z/OS message log for a message describing an error on the EQQJBLIB file.

EQQW501E LOGICAL RECORD SIZE FOR THE JCL LIBRARY, DDNAME EQQJBLIB, IS NOT VALID

Explanation: IBM Tivoli Workload Scheduler for z/OS could not read the JCL library (ddname EQQJBLIB) because the logical record length is not 80 bytes.

System action: If the failure occurred during job submission the operation extended status is set to error.

System programmer response: Check that the ddname EQQJBLIB is correctly specified. When the error is corrected, stop IBM Tivoli Workload Scheduler for z/OS and restart it.

User response: Contact your system programmer.

Problem determination: Check the definition of the EQQJBLIB DD statement.

EQQW502E WORK STATION ANALYZER INITIALIZATION FAILED

Explanation: The workstation analyzer could not acquire all the resources required for normal operation. The most likely reason is that the subsystem is being stopped, but the normal mode manager task has not started. It is also possible that a submit/release data set or the EQQJBLIB data set could not be opened.

System action: If this message was issued while the IBM Tivoli Workload Scheduler for z/OS subsystem was being stopped, subsystem termination continues normally. Otherwise, message EQQZ045W is issued.

System programmer response: Correct all errors and restart the workstation analyzer.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact cause of the error.

EQQW503I THE WORK STATION ANALYZER ENDED NORMALLY

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem is being stopped and initialization of the workstation analyzer has completed successfully or a request has been made by an operator modify command to stop the workstation analyzer.

System action: If this message was issued while the IBM Tivoli Workload Scheduler for z/OS subsystem was being stopped, subsystem termination continues normally. Otherwise, message EQQZ045W is issued.

System programmer response: None.

EQQW505I THE WORK STATION ANALYZER TASK HAS STARTED

Explanation: The initialization of the workstation analyzer has completed and the workstation analyzer is about to start processing.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing.

System programmer response: None.

EQQW506E THE SCHEDULER COULD NOT ALLOCATE STORAGE TO PROCESS EQQJBLIB MEMBER MEMBER

Explanation: The workstation analyzer was attempting to build a record in the VSAM data set that was to be inserted in the JCL repository data set, but it was unable to do so because of insufficient virtual storage.

System action: The operation remains in ready status. The workstation analyzer is unable to submit the job to JES.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS and restart in a larger region.

User response: Submit the job manually.

EQQW507W THE SCHEDULER COULD NOT SAVE JOB MEMBER IN THE JS DATASET FOR APPL. APPL

Explanation: An error occurred when the workstation analyzer was trying to update the JCL repository data set.

System action: The job is submitted to JES, but the JCL repository data set would not be correctly updated.

System programmer response: Correct all errors and restart the workstation analyzer.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQW508W EQQUX013 PREVENTED JOB TAILORING FOR JOB MEMBER IN APPL APPL DESPITE THE OPERATION HAS CLEANUP TYPE DIFFERENT FROM NONE

Explanation: The scheduler has been requested by the EQQUX013 user exit not to tailor a job with the //TIVDSTxx OUTPUT statements, even though for the corresponding operation the cleanup type is set to a value different from None.

System action: The job is submitted without being tailored with the //TIVDSTxx OUTPUT statements required for the restart and cleanup processing.

User response: Check if the cleanup type specified at operation level can be changed to None, or the EQQUX013 source requires to be modified.

EQQW510E WS ANALYZER WAS UNABLE TO READ OR UPDATE CURRENT PLAN JNT RECORD FOR: JOB = JOBNAME, APPLICATION = APPL, INPUT ARRIVAL = ARRTIME

Explanation: The workstation analyzer encountered a VSAM error when reading or updating the current plan data set.

System action: The workstation analyzer continues normal processing with the next ready operation.

System programmer response: Correct all errors and restart the workstation analyzer.

Problem determination: Review earlier messages in

the IBM Tivoli Workload Scheduler for z/OS message log and the SYSLOG data sets to determine the exact cause of this error.

EQQW511E WS ANALYZER WAS UNABLE TO RELEASE JOB JOBNAME(JOBNUM) FROM HOLD

Explanation: The workstation analyzer was unable to communicate successfully with JES while trying to release job *JOBNAME(JOBNUM)* from hold.

System action: The hold status of the current job is not changed. The workstation analyzer continues normal processing.

Operator response: Check that the job is still held by JES. If it is, enter an appropriate operator command to release the job from hold.

Problem determination: Check that JES is executing normally.

EQQW512E WS ANALYZER WAS UNABLE TO READ OR UPDATE CURRENT PLAN OPERATION RECORD WITH KEY (HEXADECIMAL): F0F3OPRINDEX

Explanation: The workstation analyzer encountered a VSAM error when reading or updating the current plan data set.

System action: The workstation analyzer continues normal processing with the next ready operation.

System programmer response: Correct all errors and restart the workstation analyzer.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log and the SYSLOG data sets to determine the exact cause of this error.

EQQW513E THE SUBMIT/RELEASE DATA SET WITH DDNAME = DDNAME COULD NOT BE OPENED

Explanation: The workstation analyzer could not open a submit/release data set with the indicated ddname. The ddname is defined as a submit/release data set ddname in one of the computer workstations in the current plan data set.

System action: The workstation analyzer issues message EQQW502E and is terminated.

System programmer response: Correct all errors and restart the workstation analyzer.

Problem determination: Check that the ddname is correctly specified and that the IBM Tivoli Workload Scheduler for z/OS started task is authorized to open the data set for update.

EQQW514W TOO MANY SUBMIT/RELEASE DATA SETS DEFINED. DDNAME = DDNAME IS IGNORED

Explanation: More than 16 ddnames for the submit/release data set are defined in the current plan data set.

System action: Only the first 16 submit/release ddnames found are used by the workstation analyzer.

System programmer response: Correct all errors and, if necessary, restart the workstation analyzer.

Problem determination: Check that all computer workstations have been correctly specified.

EQQW515W THE SUBMIT USER EXIT MODULE, EQQUX001, COULD NOT BE LOADED

Explanation: IBM Tivoli Workload Scheduler for z/OS could not locate the job submit exit load module, EQQUX001.

System action: The job submit exit is not used by the workstation analyzer.

System programmer response: If the job submit exit is meant to be used, make sure that the EQQUX001 load module is present in a library that can be reached by IBM Tivoli Workload Scheduler for z/OS. Restart the workstation analyzer.

EQQW516E THE EQQUX002 EXIT COULD NOT OPEN AN INPUT DATA SET TO READ JOB MEMBER

Explanation: The joblib I/O exit was called and gave a return code indicating that it could not open one of its input data sets.

System action: The job is not submitted by the workstation analyzer as intended. The operation remains in ready status.

System programmer response: Correct all errors and restart the workstation analyzer.

User response: If necessary, submit the job manually.

Problem determination: Check that all DD statements needed by the EQQUX002 exit have been correctly specified and that the IBM Tivoli Workload Scheduler for z/OS started task is authorized to open the data set for input.

EQQW517E INSUFFICIENT STORAGE TO PROCESS JOB MEMBER FOR EQQUX002 EXIT

Explanation: The workstation analyzer was building a record in the VSAM data set to be inserted in the JCL repository data set, but it was unable to do so because of insufficient virtual storage.

System action: The operation remains in ready status. The workstation analyzer is unable to submit the job to JES.

System programmer response: Stop IBM Tivoli Workload Scheduler for z/OS and restart it in a larger region.

User response: Submit the job manually.

EQQW518E THE EQQUX002 EXIT COULD NOT FIND JOB MEMBER IN ANY INPUT DATA SET

Explanation: The workstation analyzer was attempting to submit a job to JES for a ready operation on a computer workstation. However, no JCL for this operation is saved in the JCL repository data set, and the joblib I/O exit could not find the job in any input data set.

System action: The operation remains in ready status. IBM Tivoli Workload Scheduler for z/OS assumes that some other function submits the job to JES.

System programmer response: Correct all errors and restart the workstation analyzer.

User response: If necessary, submit the job manually.

Problem determination: Check that all DD statements needed by the EQQUX002 exit have been correctly specified and that all required members are specified.

EQQW519W THE EQQUX002 EXIT DID NOT RETURN ANY DATA FOR JOB MEMBER

Explanation: The joblib I/O exit was called to retrieve a job to be submitted, but the exit did not return any data.

System action: The job is not submitted by the workstation analyzer as intended. The operation remains in ready status.

System programmer response: Correct all errors and restart the workstation analyzer.

User response: If necessary, submit the job manually.

Problem determination: Check that the joblib I/O exit has been correctly installed and that it works properly.

EQQW520E THE EQQUX002 EXIT RETURNED THE FOLLOWING I/O ERROR MESSAGE FOR JOB MEMBER: PLUSMSG

Explanation: The joblib I/O exit was called to retrieve a job to be submitted, but the exit gave a return code indicating that an I/O error had occurred on an input data set.

System action: The job is not submitted by the workstation analyzer as intended. The operation remains in ready status.

System programmer response: Correct all errors and restart the workstation analyzer.

User response: If necessary, submit the job manually.

Problem determination: Check that the joblib I/O exit can access all required input data sets and that it works properly.

EQQW521E THE JOBLIB I/O USER EXIT MODULE, EQQUX002, COULD NOT BE LOADED

Explanation: IBM Tivoli Workload Scheduler for z/OS could not locate the joblib I/O exit load module, EQQUX002.

System action: The joblib I/O exit is not used by the workstation analyzer.

System programmer response: If the joblib I/O exit is meant to be used, make sure that the EQQUX002 load module is present in a library that can be reached by IBM Tivoli Workload Scheduler for z/OS. Restart the workstation analyzer.

User response: If necessary, submit the job manually.

EQQW522E JOB MEMBER RETURNED BY THE EQQUX002 EXIT EXCEEDS MAXIMUM SUPPORTED SIZE

Explanation: The joblib I/O exit was called to retrieve a job to be submitted, but the returned job exceeds the maximum supported size, which is 608 KB (kilobytes) of data.

System action: The job is not submitted by the workstation analyzer as intended. The operation remains in ready status.

System programmer response: Correct all errors and restart the workstation analyzer.

User response: If necessary, submit the job manually.

Problem determination: Check that the joblib I/O exit has been correctly installed and that it works correctly.

EQQW523E JOB MEMBER IN APPLICATION APPL IS TOO LARGE TO BE SAVED ON THE JS DATA SET

Explanation: A job that is about to be submitted to JES is too large to be saved in the JCL repository data set.

System action: The job is submitted, but the JCL repository data is not updated.

System programmer response: If necessary, allocate a new JCL repository data set with a larger maximum record size. Refer to *Customization and Tuning* for instructions.

Problem determination: Use the IDCAMS LISTCAT function to determine the maximum size of records in

the data set defined by the EQQJSxDS DD statement. Use dialog option 6.6 to determine the current JCL repository.

EQQW524E JOB MEMBER IN APPLICATION APPL COULD NOT BE SUBMITTED BECAUSE THE EQQUX001 EXIT RETURNED AN ERROR CODE NOT ZERO

Explanation: The job submit exit was called and returned an error code that was different from '0000'.

System action: The job is not submitted and its error status is set to the error code that was returned by the submit exit job.

User response: Check why the submit exit job, EQQUX001, stopped submission.

EQQW525E JOB MEMBER IN APPLICATION APPL COULD NOT BE SUBMITTED BECAUSE OF AN ERROR IN THE JOB CARD

Explanation: IBM Tivoli Workload Scheduler for z/OS has been requested to submit a job that has an incorrect job card.

System action: The job is not submitted.

User response: Correct the JCL for this job and use the Modify Current Plan dialog to restart the occurrence at the failing operation.

EQQW526E JOB MEMBER IN APPLICATION APPL COULD NOT BE SUBMITTED BECAUSE NO JOB CARD COULD BE FOUND

Explanation: IBM Tivoli Workload Scheduler for z/OS has been requested to submit a job that does not have a job card or a job that has been packed by ISPF in EQQJBLIB.

System action: The job is not submitted.

User response: Check that the JCL for this job has not been packed by ISPF. Correct the JCL for this job and use the Modify Current Plan dialog to restart the occurrence at the failing operation.

EQQW527W THE JOB CARD OF JOB MEMBER IN APPLICATION APPL SPECIFIES JOB NAME CURNAME. THE JOB IS SUBMITTED ANYWAY

Explanation: IBM Tivoli Workload Scheduler for z/OS has been requested to submit a job whose name is different from the job name of the current operation.

System action: IBM Tivoli Workload Scheduler for z/OS submits the job without any changes.

User response: If the difference in job names is intentional, the message can be ignored. If the message is not expected, make sure that the operation corresponding to this job has the correct status.

EQW528W INSUFFICIENT STORAGE TO BUILD NEW JCLAREA. EXIT01 CANNOT INCREASE JCL SIZE. APPLICATION IS: *ADID*, OPERATION NO IS: *OPNO*, INPUT ARRIVAL DATE IS: *IAD* AND INPUT ARRIVAL TIME IS: *IAT*

Explanation: IBM Tivoli Workload Scheduler for z/OS tried to allocate storage to build a new JCLAREA as requested by the OPCOPTS EXIT01SZ keyword during the EXIT01 processing, but the request for storage failed.

System action: The scheduler submits the job without any change.

User response: Ensure that the load module implementing the job-submit exit is link-edited with RMODE(24) and AMODE(31) attributes.

EQW529E JOB MEMBER IN APPLICATION APPL COULD NOT BE SUBMITTED BECAUSE THE JOB CARD SPECIFIES JOB NAME CURNAME

Explanation: IBM Tivoli Workload Scheduler for z/OS has been requested to submit a job whose name is different from that specified by the corresponding operation. JOBCHECK(SAME) has been defined on the JTOPTS initialization statement.

System action: The job is not submitted.

User response: Change the JCL for this job to use the correct job name and use the Modify Current Plan dialog to restart the occurrence at the failing operation.

EQW531E RE-RUN OF JCL WAS NOT POSSIBLE. STORAGE NOT AVAILABLE TO BUILD EXIT01 JCLAREA. APPLICATION IS: *ADID*, OPERATION NO IS: *OPNO*, INPUT ARRIVAL DATE IS: *IAD* AND INPUT ARRIVAL TIME IS: *IAT*

Explanation: The workstation analyzer task tried to allocate an area to copy the JCL to be passed to the EQQUX001 user exit, but the storage allocation failed.

System action: The job is submitted but the EQQUX001 user exit is not called.

User response: Relink-edit the EQQUX001 user exit to be loaded over 16MB.

EQW532E THE WSA TASK IS TERMINATING DUE TO A SEVERE ERROR. REFER TO THE *SYSUDUMP* DATA SET FOR MORE INFORMATION

Explanation: The workstation analyzer task has encountered a severe error.

System action: The workstation analyzer task terminates and a dump of the Tivoli Workload Scheduler for z/OS subsystem address space is generated.

User response: Refer to the SYSUDUMP data set to determine the cause of the error. If the problem is caused by either of the exits taken by the workstation analyzer, that is, by EQQUX001 or by EQQUX002, the exit must be updated. After correcting all errors, restart the Tivoli Workload Scheduler for z/OS subsystem.

EQW533E THE WSA TASK WILL ATTEMPT TO RECOVER FROM A SEVERE ERROR. REFER TO THE *SYSUDUMP* DATA SET FOR MORE INFORMATION

Explanation: The workstation analyzer task has encountered a severe error.

System action: The workstation analyzer task generates a dump of the IBM Tivoli Workload Scheduler for z/OS subsystem address space and attempts to continue normal processing.

User response: Refer to the SYSUDUMP data set to determine the cause of the error. If the problem is caused by either of the exits taken by the workstation analyzer, that is, by EQQUX001 or by EQQUX002, the exit must be updated.

EQW534E THE WSA TASK HAS DETECTED A LOOP. SNAP OF DOA, CPLREC3P, AND WAP FOLLOWS:

Explanation: The workstation analyzer task has tried to start the same operation repeatedly. The associated DOA, CPLREC3P, and WAP are written to the message log (MLOG). The operation status is set to error, with error code LOOP.

System action: The failing operation is not dispatched and the workstation analyzer task continues processing.

System programmer response: This might be a user error or an internal IBM Tivoli Workload Scheduler for z/OS error. Keep copies of the MLOG, JTARC and active JTnn, and CP. If you suspect that this is not a user error, contact IBM Software Support.

Problem determination: Review the MLOG, job tracking (JT) log, and current plan (CP) to determine the cause of the error.

**EQQW536E JOB MEMBER IN APPLICATION APPL
COULD NOT BE SUBMITTED
BECAUSE PRE-SUBMIT TAILORING
FAILED**

Explanation: The scheduler has been requested to submit a job that needed the pre-submit task tailoring, but the tailoring failed.

System action: The job is not submitted.

User response: Check the EQQMLOG for additional messages. One of the possible reasons might be lack of storage: if so, increase the controller region size.

**EQQW537E WS ANALYZER WAS UNABLE TO
READ OR UPDATE CURRENT PLAN
OCCURRENCE RECORD WITH KEY
(HEXADECIMAL): X'F0F3'occindex**

Explanation: The workstation analyzer encountered a VSAM error when reading or updating the current plan data set (occurrence record: see Diagnosis DCLCPR3C).

System action: The workstation analyzer continues normal processing with the next ready operation.

Problem determination: Review earlier messages in the message log and SYSLOG data set to determine the cause of this error. If the error can be reproduced, activate the VSAM trace (/F subsystem,VSTRC=START).

**EQQW538E WS ANALYZER WAS UNABLE TO
READ OR UPDATE CURRENT PLAN
JOBLOG RECORD WITH KEY
(HEXADECIMAL): X'F1F4'logindex**

Explanation: The workstation analyzer encountered a VSAM error when reading or updating the current plan data set (Joblog record: see Diagnosis DCLCPR14).

System action: The workstation analyzer continues normal processing with the next ready operation.

Problem determination: Review earlier messages in the message log and SYSLOG data set to determine the cause of this error. If the error can be reproduced, activate the VSAM trace (/F subsystem,VSTRC=START).

**EQQW539E THE EXECUTE COMMAND FAILED
DUE TO INACTIVE WORKSTATION
APPL: APPLID IA: IA OPERATION:
OPNO**

Explanation: The workstation analyzer task has detected that there is no active workstation for the actual operation.

System action: The workstation analyzer task resets the execute indicator. The operation remain in ready status and is scheduled as any normal operation.

User response: If an immediate execution of the operation is desired, activate the ordinary workstation or, if the operation is reroutable, activate the alternative workstation. Reissue the EXECUTE command.

**EQQW550W ADID OPERATION NO: OPNO WITH
INPUT ARRIVAL: IA AND JOBNAME:
JOBNM CANNOT BE RESUBMITTED
BECAUSE MANUAL CLEAN UP IS
REQUESTED**

Explanation: The workstation analyzer detected an operation to resubmit that can not be scheduled. This is because the operation has a cleanup type of Manual and it is waiting for cleanup actions to be started through the Start Clean Up command.

System action: The workstation analyzer ignores this operation and continues processing normally.

System programmer response:

1. Select the operation mentioned in the message text in the MCP panel.
2. Issue the RC line command to enter the Restart and Cleanup main panel.
3. Select the START CLEANUP option and wait for the cleanup to complete.

When the cleanup is complete, the WSA schedules the operation automatically.

**EQQW551E SUBMISSION FAILED FOR
OPERATION OPERNUM, IN
APPLICATION APPL, IA=ARRTIME
BECAUSE IT HAS EXCEEDED THE
MAXIMUM NUMBER OF RETRY
SENDING THE SCRIPT TO THE
AGENT**

Explanation: The submission of operation *OPERNUM* in application *APPL* with input arrival *ARRTIME* failed while the engine was sending the script for the operation to the distributed agent. The controller has retried 10 times but the error persists.

System action: The Workstation Analyzer task stops trying to submit the job and sets the operation status according to the SUBFAILACTION option specified in the JTOPTS statement of the controller's initialization parameters.

System programmer response: Check the Controller and the server MLOG for the error that has caused the failure.

User response: Contact your system programmer to solve the problem and reset the operation status to Ready to retry job submission.

EQQW552W JOB MEMBER, IN APPLICATION APPL WAS NOT STORED IN JS DUE TO STORAGE PROBLEMS

Explanation: When a job is submitted in a Restart and Cleanup path (Step Restart, Job Restart, or rerun of an operation with automatic Cleanup type), IBM Tivoli Workload Scheduler for z/OS controller requires the removal of the EQQCLEAN pre-step from the submitted JCL, before storing it in JS VSAM. During this process, storage cannot be allocated and the EQQCLEAN removal cannot be done.

System action: If no other problems occur (for example, OJCV error), the job is submitted. The job is not stored in JS VSAM.

User response: None.

EQQW553E A NOT NUMERIC STRING HAS BEEN SPECIFIED AS STARTING OFFSET IN SDEPFILTER KEYWORD.

Explanation: SDEPFILTER must specify a number from 1 to 20 as starting position to activate the check on the JOB card programmer name.

System action: The scheduler cannot use SDEPFILTER as filter criteria to produce the step-end event.

User response: Specify a correct value as *startpos*.

EQQW554E STARTING OFFSET VALUE IS NOT VALID FOR SDEPFILTER KEYWORD. THE OFFSET MUST NOT BE GREATER THAN PROGRAMMER NAME FIELD LENGTH.

Explanation: SDEPFILTER must specify a maximum value of 20 as starting position to activate the check on the JOB card programmer name.

System action: The scheduler cannot use SDEPFILTER as filter criteria to produce the step-end event.

User response: Specify a correct value as *startpos*.

EQQW555E WRONG SDEPFILTER KEYWORD SPECIFICATION: SPECIFIED VALUE STARTING AT THE SPECIFIED OFFSET EXCEEDS PROGRAMMER NAME FIELD LENGTH.

Explanation: SDEPFILTER must specify no more than 20 characters as string value to activate the check on the JOB card programmer name.

System action: The scheduler cannot use SDEPFILTER as filter criteria to produce the step-end event.

User response: Specify a correct value as *stringvalue*.

EQQW750W STC STCNAME IS DEFINED AS A SUBSYSTEM THAT IS NOT MANAGED BY JES. THE SCHEDULER DOES NOT SUPPORT THIS STC

Explanation: The submitter task cannot start this STC because it is defined as a subsystem not handled by JES.

System action: The corresponding operation is set to ended-in-error with error code OSUB.

System programmer response: Check the active IEFSSNem in the SYS1.PARMLIB data set to see if the STC STCNAME is defined as a subsystem. If it is not defined, contact IBM Software Support.

EQQW751E THE SUBMITTOR TASK GOT RC IN RETURN CODE FROM THE MGCR MACRO WHEN THE STC STCNAME WAS ABOUT TO BE STARTED

Explanation: The submitter task cannot start this STC. The MGCR macro (SVC34) failed with the indicated return code in register 15.

System action: The corresponding operation is set to ended-in-error with error code OSUB.

System programmer response: Contact IBM Software Support.

EQQW752W A SUBMIT EVENT RECORD (TYPE I) WILL BE CREATED FOR STC STCID, BUT IT MAY BE TOO LATE

Explanation: The submitter task has been restarted after ending abnormally. The abnormal termination occurred immediately after the start command was performed for an STC, before the I event record could be created.

If more than five minutes has passed since the submitter task ended abnormally, the A1 event record is timed out. IBM Tivoli Workload Scheduler for z/OS tracking of the operation fails.

System action: None.

System programmer response: Investigate why the submitter task ended abnormally and take appropriate action.

User response: Check the status of the corresponding operation. If the status is wrong, correct it manually.

EQQW753E STC STCID HAS BEEN STARTED, BUT THE MVS EXIT IEFUJI WAS NEVER OR INCORRECTLY INVOKED. THE TRACKING WILL FAIL FOR THE STC

Explanation: The submitter task started an STC, but did not receive the expected acknowledgment from the z/OS SMF exit IEFUJI. The tracking of the STC fails.

System action: None.

System programmer response: Check that the active SMFPRM $_{xx}$ member in the SYS1.PARMLIB data set specifies that IEFUJI is to be invoked for STCs.

Carefully check that the IEFUJI supplied with IBM Tivoli Workload Scheduler for z/OS is correctly installed.

User response: Check the status of the corresponding operation. If the status is wrong, correct it manually.

EQQW754E THE STARTED TASK FILE, DDNAME = EQQSTC, COULD NOT BE OPENED

Explanation: The submitter task failed to open the started task temporary proclib file, EQQSTC.

System action: The submitter task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

System programmer response: Add an EQQSTC ddname to your IBM Tivoli Workload Scheduler for z/OS start procedure JCL. The ddname must specify an empty partitioned data set.

Problem determination:

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the JCL from the failing job or started task.

EQQW755E THE STARTED TASK FILE, DDNAME = EQQSTC, IS NOT A PDS

Explanation: The started task temporary proclib file, EQQSTC, was not allocated as a partitioned data set.

System action: The submitter task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

System programmer response: Check that the data set allocated to the EQQSTC ddname is a partitioned data set.

Problem determination:

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the JCL from the failing job or started task.
- Run the AMASPZAP utility specifying ABSDUMP ALL on the data set and save the output.

EQQW756E THE STARTED TASK FILE, DDNAME = EQQSTC, IS NOT EMPTY

Explanation: The started task temporary proclib file, EQQSTC, is not empty.

System action: The submitter task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

System programmer response: Check that the data set

allocated to the EQQSTC ddname is an empty partitioned data set.

Problem determination:

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the JCL from the failing job or started task.
- Run the AMASPZAP utility specifying ABSDUMP ALL on the data set and save the output.

EQQW757E THE STARTED TASK FILE, DDNAME = EQQSTC, HAS WRONG LRECL OR WRONG BLOCK SIZE

Explanation: The started task temporary proclib file, EQQSTC, was allocated with either a record length not equal to 80 or an invalid block size.

System action: The submitter task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

System programmer response: Check that the data set allocated to the EQQSTC ddname is an empty partitioned data set.

Problem determination:

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the JCL from the failing job or started task.
- Run the AMASPZAP utility specifying ABSDUMP ALL on the data set and save the output.

EQQW758E THE SUBMITTOR TASK DETECTED THAT THE STC STCID IS STILL IN JES3 INPUT SERVICE (STARTING)

Explanation: The started task has not passed the JES3 input service phase.

This message is repeated every ten minutes.

System action: The submitter task does not submit started tasks until the STC has passed JES3 input service, but continues to submit batch jobs and write-to-operator (WTO) operations.

System programmer response: None.

Problem determination:

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the SYSLOG from the primary system console.
- Produce a dynamic console dump of the IBM Tivoli Workload Scheduler for z/OS address space. Make sure that CSA is part of the SDUMP option.

EQQW759E THE SUBMITTOR TASK COULD NOT HANDLE STC STCNAME. THE STC SUBMISSION IS STOPPED

Explanation: The started task was queued to the submitter queue, SUBQ. The STC could not be

submitted because of errors (indicated by previous messages).

System action: The submitter task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

System programmer response: Investigate the MLOG and look for other messages that explain the error. After the error has been corrected, the STC submission functionality can be reactivated by restarting either the submit task or the IBM Tivoli Workload Scheduler for z/OS subsystem after deleting any entry that might have been left in the data set allocated to the EQQSTC ddname.

User response: Manually set the corresponding operation to the correct status.

Problem determination:

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Produce a dynamic console dump of the IBM Tivoli Workload Scheduler for z/OS address space. Make sure that CSA is part of the SDUMP option.

EQQW760E AN I/O ERROR OCCURRED ON THE EQQSTC DATA SET WHEN THE SUBMITTOR TASK WAS WRITING THE JCL FOR STC STCNAME. THE SYNAD ERROR MESSAGE WAS: SYNMSG

Explanation: The submitter task encountered an I/O error writing to the started task temporary proclib file, EQQSTC. A SYNAD error routine was given control and issued an error message.

System action: The submitter task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

The corresponding operation is set to status E.

System programmer response: This is probably a hardware error. Contact IBM Software Support.

Problem determination: The SYNAD routine collects information such as jobname, stepname, unit address, device type, ddname, operation, error description, and access method. The SYNADAF macro is used to extract this information. For a detailed description of the layout, refer to the appropriate documentation for the MVS/DFP product installed on this system.

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the SYSLOG from the primary system console.
- Run the AMASPZAP utility specifying ABSDUMP ALL on the data set and save the output.

EQQW761E AN ABEND OCCURRED WHEN THE SUBMITTOR TASK WAS WRITING THE JCL FOR STC STCNAME ON THE EQQSTC DATA SET. THE ABEND CODE WAS: ABCODE

Explanation: The submitter task received an ABEND when writing the started task temporary proclib file, EQQSTC. An ABEND exit routine was given control and issued an ABEND code.

System action: The submitter task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

The corresponding operation is set to status E.

System programmer response: See Chapter 233, "Abend codes," on page 1415 for an explanation of the ABEND code and take the appropriate action.

Problem determination:

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the SYSLOG from the primary system console.
- Run the AMASPZAP utility specifying ABSDUMP ALL on the data set and save the output.

EQQW762E AN I/O ERROR OCCURRED ON THE EQQSTC DATA SET WHEN THE SUBMITTOR TASK WAS STOWING THE MEMBER FOR STC STCNAME. THE SYNAD ERROR MESSAGE WAS: SYNMSG

Explanation: The submitter task encountered an I/O error during a STOW to the started task temporary proclib file, EQQSTC. A SYNAD error routine was given control and issued an error message.

System action: The submitter task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

The corresponding operation is set to status E.

System programmer response: This is probably a hardware error. Contact IBM Software Support.

Problem determination: The SYNAD routine collects information such as jobname, stepname, unit address, device type, ddname, operation, error description, and access method. The SYNADAF macro is used to extract this information. For a detailed description of the layout, refer to the appropriate documentation for the MVS/DFP product installed on this system.

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the SYSLOG from the primary system console.
- Run the AMASPZAP utility specifying ABSDUMP ALL on the data set and save the output.

EQQW763E AN ABEND OCCURRED WHEN THE SUBMITTOR TASK WAS STOWING THE MEMBER FOR STC *STCNAME* ON THE EQQSTC DATA SET. THE ABEND CODE WAS: *ABCODE*

Explanation: The submittor task received an ABEND when stowing on the started task temporary proclib file, EQQSTC. An ABEND exit routine was given control and issued an ABEND code.

System action: The submittor task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

The corresponding operation is set to status E.

System programmer response: See Chapter 233, "Abend codes," on page 1415 for an explanation of the ABEND code and take the appropriate action.

Problem determination:

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the SYSLOG from the primary system console.
- Run the AMASPZAP utility specifying ABSDUMP ALL on the data set and save the output.

EQQW764E THE SUBMITTOR TASK GOT AN UNEXPECTED RETURN CODE WHEN STOWING THE MEMBER NAME FOR STC *STCNAME* ON THE EQQSTC DATA SET THE RETURN AND REASON CODE WAS *RC*

Explanation: The submittor task received an unexpected return code when stowing a member on the started task temporary proclib file, EQQSTC.

The return code is the content of register 15 and the reason code is the content of register 0 after the STOW macro.

The corresponding operation is set to status E.

System action: The submittor task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

System programmer response: Use the return code and reason code to determine the cause of the error. For more information, refer to the documentation about the STOW macro for the currently active z/OS system.

Problem determination:

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the SYSLOG from the primary system console.
- Run the AMASPZAP utility specifying ABSDUMP ALL on the data set, and save the output.

EQQW765E THE SUBMITTOR TASK GOT AN UNEXPECTED RETURN CODE WHEN ISSUING THE MGCR MACRO FOR STC *STCNAME*

Explanation: The submittor task received an unexpected return code when the MGCR macro was invoked to start an STC.

The corresponding operation is set to status E.

System action: The submittor task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

System programmer response: Use the return code and reason code to determine the cause of the error. For more information, refer to the documentation about the MGCR macro for the currently active z/OS system.

EQQW766W THE EVENT CREATION ROUTINE DETECTED THAT THE JES2 EXIT7 (EQQEXIT) IS ON A LOWER RDMID LEVEL THAN THE SCHEDULER SUBSYSTEM MODULE EQQZEV2X

Explanation: The level of the EQQEXIT macro in JES2 EXIT7 (OPCAXIT7) is at a lower maintenance level than the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The event creation routine continues to create event records. The event records may contain invalid tracking information, causing the corresponding operation status to be inaccurate.

Operator response: If necessary, set the correct operation status manually.

System programmer response: Reapply the EXIT7, and make sure that the appropriate maclibs are used in the SYSLIB concatenation. If you are assembling the OPCAXIT7 outside the JES2 SMP environment, make sure that you have the SMPMTS data set concatenated first in the SYSLIB concatenation.

EQQW767W THE EVENT CREATION ROUTINE DETECTED THAT THE IATUX29 WAS GENERATED AGAINST A JES3 LEVEL THAT DOES NOT MATCH THE CURRENT EXECUTING JES3 LEVEL

Explanation: The level of the JES3 macros used to generate the IBM Tivoli Workload Scheduler for z/OS IATUX29 does not match the level of the active JES3 system.

System action: The event creation routine continues to create event records. The event records may contain invalid tracking information, causing the corresponding operation status to be inaccurate.

Operator response: If necessary, set the correct operation status manually.

System programmer response: Reapply the IATUX29 and IATUX19, and make sure that the appropriate maclibs are used in the SYSLIB concatenation. If you are assembling the IATUX29 and IATUX19 outside the JES3 SMP-environment, make sure that you have the SMPMTS data set top concatenated in the SYSLIB concatenation.

EQQW768W AN I/O ERROR OCCURRED ON THE EQQSTC DATA SET WHEN THE SUBMITTOR TASK WAS READING. THE SYNAD ERROR MESSAGE WAS: SYNMSG

Explanation: The submittor task encountered an I/O error reading the started task temporary proclib file, EQQSTC.

System action: The submittor task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

The corresponding operation is set to status E.

System programmer response: This is probably a hardware error. Contact IBM Software Support.

Problem determination: The SYNAD routine collects information such as jobname, stepname, unit address, device type, ddname, operation, error description, and access method. The SYNADAF macro is used to extract this information. For a detailed description of the layout, refer to the appropriate documentation for the MVS/DFP product installed on this system.

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the SYSLOG from the primary system console.
- Run the AMASPZAP utility specifying ABSDUMP ALL on the data set and save the output.

EQQW769W AN ABEND OCCURRED WHEN THE SUBMITTOR TASK WAS READING ON THE EQQSTC DATA SET. THE ABEND CODE WAS: ABCODE

Explanation: The submittor task received an ABEND when reading the started task temporary proclib file, EQQSTC.

System action: The submittor task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

The corresponding operation is set to status E.

System programmer response: This is probably a hardware error. Contact IBM Software Support.

Problem determination:

- Save the message log (MLOG) from the IBM Tivoli Workload Scheduler for z/OS subsystem.
- Save the SYSLOG from the primary system console.
- Run the AMASPZAP utility specifying ABSDUMP ALL on the data set, and save the output.

EQQW770E EQQSTC DDNAME IS MISSING

Explanation: The submittor task could not find the EQQSTC ddname in the JCL.

System action: The submittor task does not submit started tasks, but continues to submit batch jobs and write-to-operator (WTO) operations.

System programmer response: Add an EQQSTC ddname to the IBM Tivoli Workload Scheduler for z/OS JCL procedure and specify an empty data set that is allocated on the JES proclib concatenation.

For more information, refer to the *Planning and Installation*

EQQW771W THE JCL FOR STC JOBNAME WILL NOT BE SUBMITTED BECAUSE SUBMIT RECORD IS TOO OLD

Explanation: The started task JCL records in a submit/release data set are older than the limit defined by the SKIPTIME and SKIPDATE keywords in the EWTROPTS statement.

System action: The old records are not processed. The event writer continues to read the submit/release data set.

Operator response: If necessary, restart the corresponding operation.

EQQW772W THE WTO WITH JOBNAME JOBNAME WILL NOT BE ISSUED BECAUSE SUBMIT RECORD IS TOO OLD

Explanation: A write-to-operator (WTO) message in a submit/release data set is older than the limit defined by the SKIPTIME and SKIPDATE keywords in the EWTROPTS statement.

System action: The old message is not processed. The event writer continues to read the submit/release data set.

Operator response: If necessary, restart the corresponding operation.

EQQW773W THE EVENT CREATION ROUTINE DETECTED THAT JES2 EXIT51 (EQQEXIT) IS ON A LOWER R MID LEVEL EXITL THAN THE SCHEDULER SUBSYSTEM MODULE EQQZEV2Y WHOSE LEVEL IS J2LVL

Explanation: The level of the EQQEXIT macro in JES2 EXIT51 (TWSXIT51) is at a lower maintenance level than the Tivoli Workload Scheduler for z/OS subsystem.

System action: The event creation routine continues to create event records. The event records may contain invalid tracking information, causing the corresponding

operation status to be inaccurate.

Operator response: If necessary, set the correct operation status manually.

System programmer response: Reapply exit EXIT51, and make sure that the appropriate mac1ibs are used in the SYSLIB concatenation. If you are assembling TWSXIT51 outside of the JES2 SMP environment, make sure that the SMPMTS data set is placed first in the SYSLIB concatenation.

EQQW774W THE EVENT CREATION ROUTINE DETECTED THAT JES2 EXIT51 (EQQEXIT) IS ON A HIGHER RMID LEVEL EXITL THAN THE SCHEDULER SUBSYSTEM MODULE EQQZEV2Y WHOSE LEVEL IS J2LVL

Explanation: The EQQEXIT macro used to generate the currently active JES2 EXIT51 is on a higher maintenance level than the EQQZEV2Y subsystem module of Tivoli Workload Scheduler for z/OS.

System action: The event creation routine continues to create event records. The event records may contain invalid tracking information, causing the corresponding operation status to be inaccurate.

Operator response: If necessary, set the correct operation status manually.

System programmer response: EQQZEV2Y is part of the EQQSSCMD load module, which is normally loaded during IPL. To activate a new EQQSSCMD, until a planned IPL can be performed, specify SSCMNAME(EQQSSCMD) in the OPCOPTS initialization statement and restart the tracker address space.

EQQW775I APPLICATION: ADID OP#: OPNO WITH INPUT ARRIVAL: IA AND JOBNAME: JOBNM ON WORK STATION: WSNM HAS BEEN STARTED. OPERATION TEXT: OPTXT

Explanation: A write-to-operation (WTO) operation has been started by IBM Tivoli Workload Scheduler for z/OS.

This message is for information only. It can be intercepted and interpreted in a customer-defined manner.

System action: None.

User response: None.

EQQW776I APPLICATION: ADID OP#: OPNO WITH INPUT ARRIVAL: IA AND JOBNAME: JOBNM ON WORK STATION: WSNM HAS PASSED DEADLINE: DEADL OPERATION TEXT: OPTXT

Explanation: An operation has passed its deadline.

This message is for information only. It can be intercepted and interpreted in a customer-defined manner, for example to automate termination.

System action: None.

User response: None.

EQQW777W THE EVENT CREATION ROUTINE DETECTED THAT THE JES2 EXIT7 (EQQEXIT) IS ON A HIGHER RMID LEVEL (EXITL) THAN THE SCHEDULER SUBSYSTEM MODULE EQQZEV2X WHOSE LEVEL IS J2LVL

Explanation: The EQQEXIT macro used to generate the currently active JES2 EXIT7 is on a higher maintenance level than the subsystem module EQQZEV2X.

System action: The event creation routine continues to create event records. The event records may contain invalid tracking information, causing the corresponding operation status to be inaccurate.

Operator response: If necessary, set the correct operation status manually.

System programmer response: The EQQZEV2X is part of the EQQSSCMD load module, which is normally loaded during IPL. To activate a new EQQSSCMD, until a planned IPL can be performed, specify SSCMNAME(EQQSSCMD) in the OPCOPTS initialization statement and restart the tracker address space.

EQQW778W EQQEVDS DDNAME IS NOT PRESENT OR SPECIFIES DD DUMMY

Explanation: The submitter task could not find the EQQEVDS DDNAME in the JCL for the IBM Tivoli Workload Scheduler for z/OS address space or the DDNAME specifies DD DUMMY.

System action: The submitter task does not checkpoint submit requests, but continues to submit jobs.

System programmer response: It is not mandatory to run a IBM Tivoli Workload Scheduler for z/OS address space with the EQQEVDS data set, that is, when EWTRTASK(NO) is specified. However, to gain the submit checkpointing benefits, add this data set. When the data set is used only for submit checkpointing, allocate it with the minimum size, which is two tracks.

EQQW779I NO CHECKPOINTING FOR SUBMITS ON WORKSTATION WSNM (DQETYPE DQETYPE) WHY

Explanation: The submitter task could not checkpoint a submit request for a DQETYPE (J1=JOB, J2=STC,

EQQW780E • EQQW788E

WTO=WTO) defined on workstation *WSNAME*. The reason is defined by *WHY*, which can be any of the following:

1. Access to the EQQEVDS data set is not available
2. A Read from the EQQEVDS header record failed
3. No entries are left in the EQQEVDS header record
4. A delete WS from EVDS failed: WS not found
5. A Write to the EQQEVDS header record failed.

System action: The submitter task does not checkpoint submit requests, but continues to submit jobs.

System programmer response: For all reasons except number 3, other associated messages are present in the message log (MLOG). Reason number 3 indicates that the maximum number of entries (13) that the checkpoint record can hold has been reached. If this limit has been reached, verify that all 13 workstations that are defined in the record still exist in the current plan. If the workstations are not in the current plan, the workstation name can be blanked out or zeroed to make the position eligible for a new workstation. Alternatively, you can delete and reallocate the EQQEVDS data set. The entries are built only for workstations in the current plan. Refer to *Customization and Tuning* for details of instructions for deleting and reallocating an EQQEVDS data set.

EQQW780E FT WORK STATION OPTION INVALID OR NOT DEFINED

Explanation: You have entered an incorrect FTW value. Allowed values are: Y for FTW, or N for not FTW.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQW781E IF THE FTW OPTION IS SET TO YES, DO NOT DEFINE THE DESTINATION

Explanation: For a fault-tolerant workstation, the destination value is not defined.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQW782E IF THE FTW OPTION IS SET TO YES, THE WS TYPE MUST BE COMPUTER

Explanation: For a fault-tolerant workstation, the workstation type must be only C Computer.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQW783E IF THE FTW OPTION IS SET TO YES, THE REP.ATTR. MUST BE AUTOMATIC

Explanation: For a fault-tolerant workstation, the reporting attribute of the workstation must be only A Automatic.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQW784E FT WORKSTATION HAS DEFAULT VALUES EQUAL N FOR PLANNING CONTROL

Explanation: For a fault-tolerant workstation, the resources must have the value equal N for planning and control.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQW785E FT WORKSTATION HAS DEFAULT VALUES FOR AVAILABILITY

Explanation: For a fault-tolerant workstation, the availability must have the default values.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQW786E FT WORKSTATION HAS DEFAULT VALUES FOR ACCESS METHOD

Explanation: For a fault-tolerant workstation, the access method must have the default values.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQW787E FOR FT WORKSTATIONS RESOURCES CANNOT BE USED AT PLANNING

Explanation: For a fault-tolerant workstation you must specify not to use the R1 and R2 resources availability during daily planning.

System action: The request is rejected.

User response: Enter the correct value.

EQQW788E FOR FT WORKSTATIONS RESOURCES CANNOT BE USED FOR CONTROL

Explanation: For a fault-tolerant workstation, you cannot specify to submit a job if the requested R1 and R2 resources amount is only available.

System action: The request is rejected.

User response: Enter the correct value.

EQQW789E IF THE FTW OPTION IS SET TO YES, THE STARTED TASK MUST BE N

Explanation: For a fault-tolerant workstation, the started task attribute of the workstation must be only 'N' No.

System action: The system waits for you to respond.

User response: Enter the correct value.

EQQW790E THE ALTERNATE WORKSTATION CANNOT BE A FAULT-TOLERANT WORKSTATION

Explanation: It is impossible to assign a fault-tolerant workstation as an alternate workstation in the database.

System action: Request is rejected.

User response: Enter the correct value.

EQQW791W FT WORKSTATION HAS DEFAULT VALUES FOR A, M AND R ATTRIBUTES

Explanation: The availability, the access method, and the resources for a fault-tolerant workstation must have the default values.

- Resources not allowed
- Access method not available
- Open intervals always opened

System action: None.

User response: To set the default values automatically for the fault-tolerant workstation, press the PF3 key or the END command. To save the new settings change the fault-tolerant workstation to a computer workstation with the automatic reporting attribute.

EQQW792E Z-CENTRIC AGENT OPTION ALLOWED ONLY FOR COMPUTER AUTOMATIC

Explanation: The Z-CENTRIC AGENT option is allowed only on a Computer Automatic workstation.

System action: None.

User response: Change either the workstation type or the selected option.

EQQW793E Z-CENTRIC AGENT OPTION NOT ALLOWED WITH STC OPTION

Explanation: The STC option is not allowed when the Z-CENTRIC AGENT option is selected.

System action: None.

User response: Change one of the selected options.

EQQW794E DESTINATION TYPE IS NOT ALLOWED FOR THE WORK STATION

Explanation: The destination specified is not set in the ROUTOPTS statement (with either the HTTP or HTTPS keyword).

System action: The workstation is not modified or created.

User response: Change the destination defined for this workstation.

EQQW795E DESTINATION CANNOT BE BLANK

Explanation: A workstation with the Z-CENTRIC AGENT option selected supports only non blank destinations.

System action: None.

User response: Specify a valid destination.

EQQW796E DESTINATION CANNOT BE BLANK

Explanation: The command issued is not valid for an operation defined on a Z-CENTRIC AGENT workstation.

System action: The command is not run.

User response: Specify a valid command.

EQQW797E INCONSISTENT OPTION FOR AN OPERATION ON Z-CENTRIC OR DYNAMIC WORKSTATION

Explanation: The operation option specified is not supported on operations defined on Tivoli Workload Scheduler for z/OS Agent or dynamic agent workstations.

System action: None.

User response: Specify a valid option.

EQQW798E ACTION ALLOWED ONLY FOR OPERATIONS ON FT AND Z-CENTRIC WORK STATIONS

Explanation: The operation command specified is supported only on operations defined on fault-tolerant or z-centric workstations.

System action: None.

User response: Specify a valid command.

EQQW799E INVALID FIELD FIELD VALUE IF OPERATION RUNS ON Z-CENTRIC OR DYNAMIC.

Explanation: You tried to modify or add an operation that runs on a z-centric or dynamic agent workstation, but the value set for field *FIELD* is not valid. For field

EQQW800E • EQQW805W

FIELD, the following values are allowed:

CRT Workload monitor critical path

SE Scheduling Environment name

System action: The request is rejected.

User response: Specify a valid value.

EQQW800E INVALID OPTION

Explanation: Z-Centric option not allowed with Dynamic option.

System action: The system rejects the option.

User response: Specify either z-centric or dynamic option.

EQQW801E INVALID COMMAND

Explanation: The O command is allowed only for z-centric or dynamic workstations.

System action: The system rejects the invalid command.

User response: Specify a valid command.

EQQW802E VALUE INVALID. ALARM=YES

Explanation: Correct values are Y, N, A or blank.

System action: The system rejects the invalid value.

User response: Specify a valid value.

EQQW803E DYNAMIC OPTIONS NOT ALLOWED FOR Z-CENTRIC WORKSTATION

Explanation: Dynamic options are not supported for Tivoli Workload Scheduler for z/OS Agent workstations.

System action: Specify N for Tivoli Workload Scheduler for z/OS Agent workstations.

User response: None.

| EQQW804E INCONSISTENT DYNAMIC OPTIONS

| **Explanation:** Dynamic options have been specified
| incorrectly, for example, the broker option is specified
| as Yes and the pool name is also specified. You cannot
| specify both of these options together.

| **System action:** The workstation changes are not
| saved.

| **User response:** You specified the Dynamic options
| incorrectly, for example, the broker option is specified
| as Yes and the pool name is also specified. You cannot
| specify both of these options together.

EQQW805W POOL INFORMATION HAS BEEN RESET IN COPIED WORKSTATION

Explanation: The workstation description record has been created and added to the workstation description database but the Pool or Dynamic Pool information has been reset and the Broker option is set to Yes.

System action: None.

User response: If you want to create a Pool or Dynamic Pool workstation, use the Dynamic Workload Console.

Chapter 229. EQQWLnn messages

EQQWL10 - EQQWL51

EQQWL10W WORK STATION *WSID* HAS BEEN SET TO *STAT* STATUS *CPUTYPE*

Explanation: The status of the workstation *WSID* has changed to *STAT*. The *WSID* identifies the workstation by specifying:

Workstation name

If a workstation (virtual or not) changed its status.

Workstation name-Destination name

If a virtual workstation destination changed its status.

If it is a fault-tolerant workstation, the CPU type and domain name are also shown. The CPU type refers to the following information:

DOMMNGR:

Domain manager

FTA: Fault tolerant

SAGENT:

Standard agent

XAGENT:

Extended agent

The domain name refers to the belonging domain.

An authorized user might have changed the status. This message might also be caused by a system failure or by a workstation becoming available again.

System action: The status of the workstation is changed. This might affect the ongoing work.

User response: If you do not want the workstation to have this status, use the IBM Tivoli Workload Scheduler for z/OS dialog to change the status.

EQQWL11I ACTIONS ARE: *FAILACT*, *RERACT*, *STARTACT*

Explanation: The previous message, EQQWL12I, identifies which workstation has a new status. This message documents the actions defined for the workstation.

FAILACT

Represents the restart policy for started operations at this workstation, specified in installation parameters or by a manual request to vary the workstation status.

RERACT

Represents the reroute actions for ready operations (status A, R, or *) from this point on.

STARTACT

Represents the actions that are taken when the workstation is made available again, either automatically or by a manual activate request.

System action: The actions described in this message are performed for operations on the workstation identified in message EQQWL12I.

User response: If you want different actions, use the Modify Current Plan dialog to change them.

EQQWL12I WORK STATION *WSID* IS MANUALLY VARIED TO *STATUS* STATUS

Explanation: You have used the IBM Tivoli Workload Scheduler for z/OS dialog, to change the status of a workstation. This message is followed by EQQWL11, which indicates the restart, reroute, and start actions. The *WSID* identifies the workstation by specifying:

Workstation name

If a workstation (virtual or not) changed its status.

Workstation name-Destination name

If a virtual workstation destination changed its status.

System action: The status of the workstation is changed. If the status is changed to failed or offline, a restart or reroute action may be performed.

User response: Verify that you want the workstation to have this status.

EQQWL13I REROUTING IN EFFECT FOR WORK STATION *WSID*

Explanation: The workstation indicated in the message is unavailable to receive work. IBM Tivoli Workload Scheduler for z/OS routes work scheduled for this workstation to another workstation.

System action: Operations are not started on this workstation.

User response: Verify that the workstation should be unavailable.

EQQWL14W WSSTAT STARTOPR HAS BEEN FORCED TO THE VALUE L FOR WORKSTATION *WSID*.

Explanation: The status of workstation *WSID* has been set to OFFLINE by using WSSTAT. For remote engine or dynamic workstations, the only value supported for the STARTOPR parameter is L (leave the operations in started status).

System action: The workstation is set to OFFLINE, using the L (leave the operations in started status) restart action.

User response: None.

EQQWL15I REROUTING IS WITHDRAWN

Explanation: Work that was previously scheduled for this workstation was routed to another workstation. This workstation is available again.

This message may follow message EQQWL10W or EQQWL12I.

System action: Work is now scheduled on this workstation.

User response: None.

EQQWL16I LIMIT FOR WORKSTATION *WSID* HAS BEEN SET TO *LIMIT*

Explanation: The CPULIMIT value for workstation *WSID* was changed with a conman command. The new CPULIMIT value is *LIMIT*.

System action: None.

User response: None.

EQQWL17W WORK STATION *WSID* CANNOT BE VARIED TO ACTIVE STATUS. A QUERY AGENT INFO REQUEST HAS BEEN SENT TO THE AGENT AT DESTINATION *DEST*.

Explanation: An attempt was made to vary the status of a z-centric agent workstation to ACTIVE, but the workstation had been automatically set to OFFLINE. It is not possible to set the status to ACTIVE when the z-centric agent cannot be reached.

System action: The controller tries to send a Query Agent Info request to the z-centric agent. If the result of the request is positive, the z-centric agent workstation is automatically set to ACTIVE.

User response: None.

EQQWL18W WSSTAT REROUTE HAS BEEN FORCED TO THE VALUE L FOR WORKSTATION *WSID*.

Explanation: The status of workstation *WSID* has been set to OFFLINE by using WSSTAT. For remote engine workstations, the only value supported for the REROUTE parameter is L (leave the operations in started status).

System action: The workstation is set to OFFLINE, using the L (leave the operations in started status) restart action.

User response: None.

EQQWL21W EVENT EVENT IGNORED FOR WORKSTATION *WSID*

Explanation: An event has been received that is not possible because of the status of the workstation.

You cannot change the status of a workstation to its existing status. For example, if a workstation already has failed status, a failure event produces this message.

System action: The event is ignored. The workstation status does not change.

User response: Verify that the IBM Tivoli Workload Scheduler for z/OS status of the workstation is correct. If the status is incorrect, use the IBM Tivoli Workload Scheduler for z/OS dialog to correct it.

EQQWL22I WORK STATION IS IN STATUS *STAT*

Explanation: This message follows message EQQWL21W.

System action: None.

User response: None.

EQQWL23W WORK STATION *WSID* IS PENDING ONLINE. MANUAL ACTION REQUIRED

Explanation: An automatic online event has been received for the destination represented by this workstation. Either the workstation status is offline and the WSOFFLINE activate action is MANUAL or the workstation status is failed and the WSFAILURE activate action is MANUAL.

This message is for information only.

System action: The status of the workstation does not change until you activate it manually from the IBM Tivoli Workload Scheduler for z/OS dialog.

User response: If you want to activate the workstation, use the Modify Current Plan Work Station communication dialog.

EQQWL24W A FAIL EVENT IS IGNORED. WORK STATION *WSID* IS ALREADY OFFLINE

Explanation: A failure event has been received for an XCF workstation that has already been set to offline. Since the offline event was received first, the workstation does not subsequently change status to failure.

System action: The event is ignored. The workstation status does not change. The WSOFFLINE actions are taken.

User response: Verify the reasons for the offline and failure events. If you wish different actions to be taken, review your WSOFFLINE and WSFAILURE keywords and adjust them as necessary.

EQQWL25W THE STATUS OF WORKSTATION *WSID* CAN BE CHANGED ONLY USING WSSTAT

Explanation: An automatic online or offline event has been received for the destination that this workstation represents but the status had previously been set using the WSSTAT command.

System action: The event is ignored. The WS status does not change.

User response: If you want to change the workstation status, use the WSSTAT command.

EQQWL30E LOOP IN ALTERNATE WORK STATIONS. FIRST WS IS: *WSID*

Explanation: This workstation has been put in reroute mode. This workstation is part of a circular set of alternative workstations. For example, workstation A reroutes to B, B to C, and C to A.

All of the other workstations in the circle are unavailable. Thus, this workstation must perform the impossible task of rerouting messages to itself.

System action: No rerouting is performed for the workstation indicated in the message. This may affect the workload to be scheduled for this workstation.

User response: Use the IBM Tivoli Workload Scheduler for z/OS dialog to check the names for the alternative workstation starting with this workstation. Correct any workstation specifications that are incorrect.

To make the operations scheduled to start on this workstation eligible for IBM Tivoli Workload Scheduler for z/OS scheduling, you must perform manual actions. If no actions are taken, the operations on this workstation remain in RE status until a workstation available event is received by the IBM Tivoli Workload Scheduler for z/OS controller.

EQQWL31E REROUTE ATTEMPT OF OPERATION NAMED *OP*, WITH APPL IA *APPL* FAILED

Explanation: Rerouting could not be performed for this operation. Either reroute parameters are incorrect or an offline or failure situation caused IBM Tivoli Workload Scheduler for z/OS to try to reroute an operation that is not reroutable.

Note: The *OP* variable is substituted with the job name if present, otherwise, the operation number.

System action: The operation remains in the current status. If the workstation that this operation uses is not active, the operation is not started.

User response: If the operation should be rerouted, change the reroute parameter.

EQQWL32I NO ALTERNATE WORK STATION FOUND

Explanation: This message follows EQQWL31E. It indicates the specific problem.

System action: None.

User response: None.

EQQWL35E RESTART ATTEMPT OF OPERATION *OP*, IN APPL *APPL* FAILED

Explanation: This operation was not restarted successfully, because of incorrect restart parameters.

System action: The operation is set to RE status.

User response: Use the Modify Current Plan dialog to correct the restart parameters for this application or operation.

EQQWL40W OPERATION *JOBNAME*, *OP* IS FORCED TO ENDED IN ERROR STATUS

Explanation: A manual vary offline command was issued for the workstation on which this operation has started.

System action: The status of the operation is set to ended-in-error. The operation may be restarted or rerouted. Any further tracking information for the operation is ignored.

Restarting or rerouting an operation that has already started may cause an integrity problem.

User response: If the IBM Tivoli Workload Scheduler for z/OS reroute and restart actions are inappropriate for this operation, use the IBM Tivoli Workload Scheduler for z/OS dialog either to cancel the operation or to change its status.

EQQWL50I COMMAND COMMAND SENT FOR WSID

Explanation: You have used the scheduler dialog to send command status START/STOP or command link LINK/UNLINK to change status ACTIVE/OFFLINE or link LINK/UNLINK of the workstation.

System action: The message is displayed in the controller's log.

User response: Verify that the command was sent.

EQQWL51W WORK STATION *WSID* COULD NOT BE SET TO *STAT* STATUS

Explanation: You requested to change the status of a virtual workstation to Active, Failed or Offline. To complete such a request, the scheduler needs to change all the destination statuses consistently, but it could not complete this process.

System action: No change occurs.

User response: Check the previous messages in the controller *EQQMLOG* to determine the cause of the problem.

Chapter 230. EQQXnnn messages

Any APPC return codes referenced by these messages may be found in *Appendix B. "Explanations of Return Codes for CPI Communications Services"* in *"MVS Programming: Writing Transaction Programs for APPC/MVS"* (SA22-7621).

EQQX000 - EQQX724

| **EQQX000E** XROW IS NOT A VALID ROW
| COMMAND

| **Explanation:** Data entry error.

| **User response:** Specify a valid row command and
| rerun the task to use the selected value. See "Data
| entry errors" on page 803

| **EQQX001E** ZCMD IS NOT A VALID PRIMARY
| COMMAND

| **Explanation:** Data entry error.

| **User response:** Specify a valid primary command and
| rerun the task to use the selected value. See "Data
| entry errors" on page 803

| **EQQX002E** A ROW CANNOT BE SELECTED
| INSIDE A BLOCK THAT IS TO BE
| DELETED

| **Explanation:** Data entry error.

| **User response:** Select the row command outside a
| block that is to be deleted. See "Data entry errors" on
| page 803.

| **EQQX003E** COMMANDS AT START AND END
| OF REPEAT BLOCK DO NOT MATCH

| **Explanation:** Data entry error.

| **User response:** You assigned different iteration factors
| at the start and the end of a repeat block. Either use the
| same factor at both the start and the end, or set the
| iteration factor at the start or the end only. See "Data
| entry errors" on page 803.

| **EQQX004E** A DELETE BLOCK CANNOT BE
| ENTERED INSIDE A REPEAT BLOCK

| **Explanation:** Data entry error.

| **User response:** Specify a delete block outside a repeat
| block and rerun the task. See "Data entry errors" on
| page 803.

| **EQQX005E** A ROW COMMAND IS FOUND
| INSIDE A BLOCK THAT IS TO BE
| DELETED

| **Explanation:** Data entry error.

| **User response:** Specify a row command outside a
| block that must be deleted and rerun the task. See
| "Data entry errors" on page 803.

| **EQQX006E** A BLOCK COMMAND HAS NO
| MATCHING END

| **Explanation:** Data entry error.

| **User response:** Specify a matching end for the block
| command and rerun the task. See "Data entry errors"
| on page 803.

| **EQQX007E** ISPF DISPLAY SERVICE FOR PANEL
| PAN GAVE RC DISPRET

| **Explanation:** Panel *PAN* could not be displayed.

| **System action:** Processing continues.

| **System programmer response:** Check that the panel is
| available in the panel library allocated to the TSO
| session. If it is a user-specified JCL EDIT panel, check
| that the correct name is specified in the IBM Tivoli
| Workload Scheduler for z/OS dialog, option 0.6.

| **EQQX008E** XCMD IS NOT A VALID PRIMARY
| COMMAND

| **Explanation:** Data entry error.

| **User response:** Specify a valid primary command and
| rerun the task. See "Data entry errors" on page 803.

| **EQQX009I** XSELTR

| **Explanation:** This message is written to the ISPF log
| data set when an IBM Tivoli Workload Scheduler for
| z/OS module is loaded or when an ISPF select is
| requested by the dialog. The message is used to trace
| IBM Tivoli Workload Scheduler for z/OS activity for a
| dialog user.

| **System action:** Processing continues.

User response: None.

EQQX010E SPECIFY FORMAT FOR DATE

Explanation: Data entry error.

User response: Specify a valid date format and rerun the task. See "Data entry errors" on page 803.

EQQX011E YEAR MUST BE SPECIFIED AS YY IN THE DATE FORMAT

Explanation: Data entry error.

User response: Specify the year in the format YY and rerun the task. See "Data entry errors" on page 803.

EQQX012E Y MAY BE SET ONLY ONCE AND ONLY IN YY

Explanation: Data entry error; see "Data entry errors" on page 803.

User response: Specify Y only once and in the YY date format. See "Data entry errors" on page 803.

EQQX013E MONTH MUST BE SPECIFIED AS MM IN THE DATE FORMAT

Explanation: Data entry error.

User response: Specify the month in the format MM and rerun the task. See "Data entry errors" on page 803.

EQQX014E M MAY BE SET ONLY ONCE AND ONLY IN MM

Explanation: Data entry error.

User response: Specify M only once and in the MM date format. See "Data entry errors" on page 803.

EQQX015E DAY MUST BE SPECIFIED AS DD OR DDD IN THE DATE FORMAT

Explanation: Data entry error.

User response: Specify the day in the format DD or DDD and rerun the task. See "Data entry errors" on page 803.

EQQX016E D MAY BE SET ONLY ONCE AND ONLY IN DD OR DDD

Explanation: Data entry error.

User response: Specify D only once in the DD or DDD date format and rerun the task. See "Data entry errors" on page 803.

EQQX017E MONTH CANNOT BE SPECIFIED TOGETHER WITH JULIAN DATE

Explanation: Data entry error.

User response: Do not specify month if you specified the Julian date. Delete the invalid value and rerun the task. See "Data entry errors" on page 803.

EQQX018E THE NAME DOES NOT CONFORM TO THE RULES FOR SUBSYSTEM NAMES

Explanation: Data entry error.

User response: Specify a valid value and rerun the task. See "Data entry errors" on page 803.

EQQX019E CENTURY MUST BE SPECIFIED AS TWO ADJACENT CHARACTERS

Explanation: Century is optional. If it is specified, it must be two adjacent characters.

System action: The system waits for you to respond.

User response: If century is used, specify century as CC and rerun the task.

EQQX020E VER STATEMENT HAS INVALID SYNTAX

Explanation: An error in the panel has caused invalid syntax in the VER statement.

System action: The system waits for you to respond.

System programmer response: Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQX021E AN INVALID DELIMITER WAS FOUND

Explanation: Data entry error.

System programmer response: Specify a valid delimiter and rerun the task. See "Data entry errors" on page 803.

EQQX022E YEAR MUST BE 00 - 99, OR CENTURY WITH YEAR MUST BE 1972 - 2071

Explanation: Year must be specified as 72 to 99 for years 1972 to 1999 or 00 to 71 for years 2000 to 2071. If century is specified, century and year must be specified as 1972 to 2071.

System action: The panel is redisplayed with this error message.

User response: Specify a valid value and rerun the task. See "Data entry errors" on page 803.

| **EQQX023E** JULIAN DAY NUMBER IS NOT
| COMPATIBLE WITH YEAR

| **Explanation:** Data entry error.

| **User response:** Specify a Julian day in the range 1-365
| and rerun the task. See "Data entry errors" on page
| 803.

| **EQQX024E** MONTH MUST BE 01 - 12

| **Explanation:** Data entry error.

| **User response:** Specify a month value in the range
| 01-12 and rerun the task. See "Data entry errors" on
| page 803.

| **EQQX025E** DAY IS NOT COMPATIBLE WITH
| MONTH AND YEAR

| **Explanation:** Data entry error.

| **User response:** Specify a day compatible with the
| month and the year and rerun the task. See "Data entry
| errors" on page 803.

| **EQQX026E** HOUR MUST BE 00 - 24

| **Explanation:** Data entry error.

| **User response:** Specify a value in the range 00-24 and
| rerun the task. See "Data entry errors" on page 803.

| **EQQX027E** MINUTE MUST BE 00 - 59

| **Explanation:** Data entry error.

| **User response:** Specify a value in the range 00-59 and
| rerun the task. See "Data entry errors" on page 803.

| **EQQX028E** MINUTE MUST BE 00 WHEN HOUR
| IS 24

| **Explanation:** Data entry error; see "Data entry errors"
| on page 803.

| **User response:** Specify the 00 value and rerun the
| task. See "Data entry errors" on page 803.

| **EQQX029E** YEAR MUST BE 00 - 99, OR CENTURY
| WITH YEAR MUST BE 1972 - 2071

| **Explanation:** Year must be specified as 72 to 99 for
| years 1972 to 1999 and 00 to 71 for years 2000 to 2071.
| If century is specified, century and year must be
| specified as 1972 to 2071.

| **System action:** The panel is redisplayed with this
| error message.

| **User response:** Enter a value in the supported range.

| **EQQX030I** NO CHANGE WAS MADE

| **Explanation:** You selected a data item using the M
| command, but you did not actually changed it.

| **System action:** The processing continues.

| **User response:** None.

| **EQQX031E** SORT ORDER MUST BE A NUMERIC
| VALUE

| **Explanation:** Data entry error.

| **User response:** Specify a numeric value and rerun the
| task. See "Data entry errors" on page 803.

| **EQQX032E** DIRECTION MUST BE A -
| ASCENDING OR D - DESCENDING

| **Explanation:** Data entry error.

| **User response:** Specify A or D and rerun the task. See
| "Data entry errors" on page 803.

| **EQQX033E** SPECIFY FORMAT FOR TIME

| **Explanation:** Data entry error.

| **User response:** Specify the format for time and rerun
| the task. See "Data entry errors" on page 803.

| **EQQX034E** HOURS MUST BE SPECIFIED AS HH
| IN TIME FORMAT

| **Explanation:** Data entry error.

| **User response:** Specify the hours in the HH format
| and rerun the task. See "Data entry errors" on page
| 803.

| **EQQX035E** H MAY BE SET ONLY ONCE AND
| ONLY IN HH

| **Explanation:** Data entry error; see "Data entry errors"
| on page 803.

| **User response:** Specify H only in HH date format and
| rerun the task. See "Data entry errors" on page 803.

| **EQQX036E** MINUTES MUST BE SPECIFIED AS
| MM IN TIME FORMAT

| **Explanation:** Data entry error.

| **User response:** Specify the minutes in the MM format
| and rerun the task. See "Data entry errors" on page
| 803.

| EQQX037E M MAY BE SET ONLY ONCE AND
| ONLY IN MM

| **Explanation:** Data entry error; see “Data entry errors”
| on page 803.

| **User response:** Specify M only in MM date format
| and rerun the task. See “Data entry errors” on page
| 803.

| EQQX038E COLOR MUST BE ONE OF THOSE
| LISTED ON THE PANEL

| **Explanation:** Data entry error.

| **User response:** Specify one of the colors listed on the
| panel and rerun the task. See “Data entry errors” on
| page 803.

| EQQX039E HIGHLIGHT ATTRIBUTE MUST BE
| ONE OF THOSE LISTED ON THE
| PANEL

| **Explanation:** Data entry error.

| **User response:** Specify one of the value listed on the
| panel and rerun the task. See “Data entry errors” on
| page 803.

EQQX040I THE JOB HAS BEEN SUBMITTED FOR
SUBFUNC

Explanation: The job has been submitted.

System action: Normal processing continues.

User response: None.

| EQQX041E THE NAME SPECIFIED FOR THE
| SYSOUT DATA SET IS INVALID

| **Explanation:** Data entry error.

| **User response:** Specify a valid value and rerun the
| task. See “Data entry errors” on page 803.

EQQX042E AT LEAST THE FIRST JOB
STATEMENT MUST BE SPECIFIED

Explanation: Data entry error.

User response: Specify the job statement in the card
and rerun the task. See “Data entry errors” on page
803.

| EQQX043E THE EDIT OPTION MUST BE EITHER
| S OR E

| **Explanation:** Data entry error.

| **User response:** Specify S to submit the job or E to edit
| the job and rerun the task. See “Data entry errors” on
| page 803.

| EQQX044E VALID REPLY IS Y OR N

| **Explanation:** Data entry error.

| **User response:** Confirm deletion of OI list from AD
| specifying Y or N and rerun the task. See “Data entry
| errors” on page 803.

EQQX045W PRESS ENTER TO GENERATE JCL OR
END TO CANCEL

Explanation: Press ENTER to generate the JCL or
enter END to leave the panel without generating the
JCL.

System action: The system waits for you to respond.

User response: Press ENTER or enter END.

EQQX047E YEAR MUST BE 00 - 99, OR CENTURY
WITH YEAR MUST BE 1972 - 2071

Explanation: Year must be specified as 72 to 99 for
years 1972 to 1999 or 00 to 71 for years 2000 to 2071. If
century is specified, century and year must be specified
as 1972 to 2071.

System action: The panel is redisplayed with this
error message.

User response: Enter a value in the supported range.

EQQX048E CORRECT VALUES ARE Y AND N

Explanation: The only allowed values are Y and N.

System action: The panel is redisplayed with this
error message.

User response: Enter a value of Y or N.

EQQX049E CONFIRM PANEL MUST BE N WHEN
CONSISTENCY CHECK IS N

Explanation: The Confirm Panel value is meaningful
only if consistency checking has been activated.
Therefore, if Consistency Check is set to No, the
Confirm Panel value must also be No.

System action: The panel is redisplayed with this
error message.

User response: Set the correct value.

EQQX051E DURATION FORMAT MISSING

System action: The panel is redisplayed with this
error message.

User response: Set duration format.

EQQX052E CONFLICTING CHARACTER

Explanation: Duration format not allowed. It must be:

- HH.MM.SS
- HHMMSS
- HHMM.SS
- MMMM.SS
- MMMMSS

System action: The panel is redisplayed with this error message.

User response: Set the correct duration format.

EQQX053E SECOND INVALID

Explanation: Invalid value for seconds. You can specify a number from 00 to 59.

System action: The panel is redisplayed with this error message.

User response: Set the correct seconds value.

EQQX054E MINUTE INVALID

Explanation: Invalid value for minute. You can specify a number from 0000 to 5999.

System action: The panel is redisplayed with this error message.

User response: Set the correct minutes value.

EQQX055E DURATION IS INVALID

Explanation: Operation duration must be greater than zero.

System action: The panel is redisplayed with this error message.

User response: Set duration value greater than zero.

EQQX056E DURATION IS INVALID

Explanation: Operation duration must be not greater than 5999 M, 1 S.

System action: The panel is redisplayed with this error message.

User response: Set the correct duration value.

EQQX057E DURATION IS INVALID

Explanation: Operation duration must be not greater than 99 H, 59 M, 1 S.

System action: The panel is redisplayed with this error message.

User response: Set the correct duration value.

EQQX058E DURATION IS INVALID

Explanation: Duration must be greater than zero and not greater than 99 H, 59 M, 1 S.

System action: The panel is redisplayed with this error message.

User response: Set the correct duration value.

EQQX059E DURATION IS INVALID

Explanation: Duration format is XDFM.

System action: The panel is redisplayed with this error message.

User response: Set duration value in the correct format XDFM.

EQQX060E CONFLICTING VALUES FOR USE EXTENDED INFO AND EXTENDED NAME FIELDS.

Explanation: Use extended info cannot be set to Y if Extended name is not specified.

System action: The request is rejected.

User response: Correct the input. If the message is issued in a Mass update batch program, check the EQQDUMP data set showing the current Application Description and the position of the invalid value in the AD record.

EQQX061E EXTENDED INFO NOT AVAILABLE.

| **Explanation:** Extended info not available for the operation browsed.

| **System action:** The request is rejected.

| **User response:** Specify an extended info for the selected operation and run the task again.

EQQX062E THE CORRECT VALUES FOR USE EXTENDED INFO ARE Y OR N.

Explanation: The only correct values for the Use Extended Info field are Y or N.

System action: The request is rejected.

User response: Check the entered data and correct it, if the error occurred in batch, resubmit the job.

| **EQQX063E SE NAME REQUIRED - CONFLICTING VALUES FOR USE SE NAME FIELD AND SE NAME FIELD.**

| **Explanation:** Data entry error.

| **System action:** None.

| **User response:** Specify a scheduling environment

| name and run the task again. See "Data entry errors"
| on page 803.

EQQX064E INVALID VALUE - THE ACCEPTED
VALUES FOR USE SE NAME ARE Y
OR N.

| **Explanation:** Data entry erro.

| **System action:** None.

| **User response:** Specify Y or N and run the task again.
| See "Data entry errors" on page 803.

EQQX065E AUTOMATION INFO CANNOT BE
BLANK OR EMPTY. VALID VALUES
ARE Y OR N.

Explanation: System automation information cannot
be blank or empty. Valid values are Y (yes) and N (no).

System action: The request is rejected.

User response: Specify a valid value.

EQQX067E AUTOMATED FUNCTION NAME
MUST BE UPPERCASE
ALPHANUMERIC

Explanation: The automated function must be an
alphanumeric value, all uppercase.

System action: The request is rejected.

User response: Specify a valid value.

EQQX069E SYSTEM AUTOMATION INFO NOT
AVAILABLE

Explanation: System automation information is not
available.

System action: The request is rejected.

User response: Specify a valid value.

EQQX070E CONFLICTING VALUES FOR USE
AUTOMATION INFO AND SA
INFORMATION

Explanation: Conflicting values were specified for Use
Automation Info and system automation information.

System action: The request is rejected.

User response: Specify a valid value.

EQQX071E SYSTEM AUTOMATION COMMAND
TEXT CANNOT BE EMPTY

Explanation: The System Automation command text
cannot be empty or blank.

System action: The request is rejected.

User response: Specify a valid value.

EQQX072E THE SELECTED OPERATION IS NOT
ON A CRITICAL PATH.

| **Explanation:** You entered the TCJ row command for
| an operation that is not a logical predecessor of a
| critical job.

| **System action:** The request is rejected.

| **User response:** Select a critical job and run the task
| again. See "Data entry errors" on page 803.

EQQX073E NO WORKSTATION DEFINITION IS
FOUND IN THE WS DATABASE.

Explanation: The workstation database is empty.

System action: The request is rejected.

User response: Specify the required workstation
definitions in the database, and submit the request
again.

EQQX074E THE NUMBER OF CONDITIONS
MUST BE GREATER OR EQUAL 0

Explanation: You requested to define a conditional
dependency without specifying any condition.

System action: The request to write the record is
rejected.

System programmer response: Review the IBM Tivoli
Workload Scheduler for z/OS message log to determine
the cause of the error.If you cannot determine the cause
of the error and the error persists, contact IBM Software
Support.

User response: Specify at least one condition.

Problem determination: Look in the dump data set
(ddname EQQDUMP) for further information. This
data set contains a copy of the record and the position
of the error.

EQQX075E THE CONDITION DEPENDENCIES
NUMBER MUST BE GREATER OR
EQUAL 0

Explanation: You requested to define a condition
without specifying any conditional dependency.

System action: The request to write the record is
rejected.

System programmer response: Review the IBM Tivoli
Workload Scheduler for z/OS message log to determine
the cause of the error.If you cannot determine the cause
of the error and the error persists, contact IBM Software
Support.

User response: Specify at least one condition
dependency.

Problem determination: Look in the dump data set
(ddname EQQDUMP) for further information. This

data set contains a copy of the record and the position of the error.

EQQX076E COND (OP CCID) IS A DUPLICATE CONDITION

Explanation: You defined the same condition twice.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Remove the duplicate entry.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX077E CONDITION CONTAINS NOT VALID CHARACTERS

Explanation: The condition segment contains incorrect characters. Possible reasons for this error are free fields not initialized.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Check the format of the segment fields. Consider initializing unused character fields to blank and unused signed field to zero.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX078E THE CONDITION ID MUST BE 1 - 999

Explanation: Condition number incorrect. It must be in the range 1-999.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify a condition number in the range 1-999.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX079E NUMBER OF CONDITION DEPENDENCIES IS NOT VALID FOR COND CCID

Explanation: No condition dependency defined.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify at least one condition dependency.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX081E COND(OP CCID): SUBSET VALUE CCCNT NOT VALID.

Explanation: You specified an incorrect number as subset value. It cannot exceed the number of defined conditional dependencies.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Correct the number.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX082E COND(OP SCID SCAD SCWS SCOP): IS DUPLICATED.

Explanation: You defined the same conditional dependency twice.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

EQQX083E • EQQX088E

User response: Remove the duplicate entry.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX083E COND(OP SCID SCAD SCWS SCOP):
COND ID NOT FOUND.**

Explanation: The process did not find any condition matching the specified condition ID value.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Correct the condition ID value.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX084E COND(OP SCID SCAD SCWS SCOP):
TYPE SCTYP NOT VALID.**

Explanation: You specified an incorrect predecessor type. It must be I or E.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify I or E as predecessor type.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX085E COND(OP SCID SCAD SCWS SCOP):
INT PRED AD NOT VALID.**

Explanation: The process did not find any internal predecessor matching the specified predecessor application ID value.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Correct the predecessor application ID value.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX086E COND(OP SCID SCAD SCWS SCOP):
EXT PRED AD NOT VALID.**

Explanation: The process did not find any external predecessor matching the specified predecessor application ID value.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Correct the predecessor application ID value.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX087E COND(OP SCID SCAD SCWS SCOP):
PRED WS NOT VALID.**

Explanation: The process did not find any predecessor matching the specified predecessor workstation value.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Correct the predecessor workstation value.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX088E COND(OP SCID SCAD SCWS SCOP):
PRED OP.NO NOT VALID.**

Explanation: The process did not find any predecessor matching the specified predecessor operation number value.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli

Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Correct the predecessor operation number value.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX089E COND(OP SCID SCAD SCWS SCOP):
TYPE SCTYP NOT VALID.**

Explanation: You specified an incorrect type value. It must be RC or ST.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify RC or ST as type value.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX090E COND(OP SCID SCAD SCWS SCOP):
OPERATOR SCLOG NOT VALID.**

Explanation: You specified an incorrect logical operator. Valid values are GE, GT, LE, LT, EQ, NE, and RG. With condition type ST, valid values are EQ or NE only.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify a valid value.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX091E COND(OP SCID SCAD SCWS SCOP):
RC VALUE SCVRC NOT VALID.**

Explanation: You specified an incorrect return code value, or you used the RG operator without specifying

both the required boundaries. Valid values are in the range 0-9999.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify a valid value.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX092E COND(OP SCID SCAD SCWS SCOP):
ST VALUE SCVST NOT VALID**

Explanation: You specified an incorrect ST value. Valid values are C, E, S, and X. Value S is allowed using the EQ operator only.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify a valid value.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX093E COND(OP SCID SCAD SCWS SCOP):
NOT VALID CHARACTERS.**

Explanation: The conditional dependency segment contains incorrect characters. Possible reasons for this error are free fields not initialized.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Check the format of the segment fields. Consider initializing unused character fields to blank and unused signed field to zero.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX094E COND (OP SCID SCAD SCWS SCOP):
INTERNAL PRED NOT VALID.**

Explanation: The job specified as conditional internal predecessor does not exist in the database.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error.If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Check the operation number and the workstation name that identify the predecessor.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX095E COND (OP CCID): CANNOT BE
DEFINED ON NOT CENTRALIZED
OPERATION.**

Explanation: You cannot define a conditional predecessor for a not centralized job.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error.If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Remove the inconsistency.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX096E COND (OP SCID SCAD SCWS SCOP):
ALSO NORMAL PRED.**

Explanation: You cannot define the same job as both conditional and normal predecessor.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error.If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Remove the inconsistency.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This

data set contains a copy of the record and the position of the error.

**EQQX097E COND (OP CCID): INCONGRUENT
NUMBER OF CONDITION
DEPENDENCIES.**

Explanation: The number of defined conditional dependencies must match the number of definitions specified in the current condition.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error.If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Remove the inconsistency.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX098E COND (OP SCID SCAD SCWS SCOP):
RANGE SCVRC-SCVR2 NOT VALID.**

Explanation: One or both the specified return codes are incorrect. They must be numeric values in the range 0-9999, or string values in the form Uxxx amd Sxxx.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error.If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify valid return code values.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX099E COND (OP SCID SCAD SCWS SCOP):
CANNOT REFER ITSELF.**

Explanation: The operation number specified for the conditional predecessor is equal to the owning operation number.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error.If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Remove the inconsistency.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX100E ONLY ONE ROW COMMAND CAN BE SPECIFIED ON THIS PANEL

Explanation: You are not allowed to specify more than one row command on this panel.

System action: The system waits for you to respond.

User response: Enter the RESET command to remove all row commands and enter one row command.

EQQX101I PENDING APPLICATION DESCRIPTIONS DO NOT GIVE OCCURRENCES

Explanation: The Modify LTP One program, which is generated with the L command, deletes any entry of the pending version of the application and adds any active versions of it. Also, being a Modify LTP One, dependencies are not resolved.

System action: Processing continues.

User response: Decide whether to submit the job.

EQQX102W NO DURATION ALERT IS ISSUED FOR VALUE ODUR

Explanation: No duration alert is issued for a value of 99 hours 59 minutes 01 second.

System action: The panel is redisplayed with this warning message. Processing continues after pressing Enter.

User response: Check your operation network.

EQQX103E COND(OP SCID SCAD SCWS SCOP): PRINT WS CANNOT HAVE INT. PRED.

Explanation: You requested to define an internal conditional predecessor for an operation associated to a print workstation.

System action: The request is rejected.

User response: Verify the specified input.

EQQX104E COND(OP SCID SCAD SCWS SCOP): INTERNAL COND PRED NOT FOUND.

Explanation: The process tried to define SCAD SCWS SCOP as conditional predecessor of OP, but SCAD SCWS SCOP is not defined in the database.

System action: The request is rejected.

User response: Verify the specified input.

EQQX105E CONDITION TYPE RC IS REQUIRED TO DEFINE STEP LEVEL DEPENDENCIES.

Explanation: You specified a condition type different from RC.

System action: The request is rejected.

User response: Specify RC as condition type.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX106E PROCSTEP CANNOT BE BLANK WHEN STEPNAME IS SPECIFIED.

Explanation: When STEPNAME is specified, PROCSTEP is required.

System action: The request is rejected.

User response: Specify STEPNAME and PROCSTEP only if the step is in a procedure, otherwise use PROCSTEP to identify a step in the predecessor job.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX107E USER FIELDS NAME MUST BE UNIQUE FOR THE SAME OPERATION.

Explanation: The same user field name was specified twice.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Remove the duplicated entry.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX109E USER FIELD CANNOT BE BLANK.

Explanation: User field name cannot be blank or empty.

System action: The request is rejected.

| **User response:** Specify a user field name and run the task again.

EQQX110E XOPCNM IS NOT A VALID SUBSYSTEM NAME

Explanation: Data entry error; see “Data entry errors” on page 803.

User response: Change the subsystem name to a valid name by using 0, **OPTIONS** on the IBM Tivoli Workload Scheduler for z/OS main menu.

EQQX111E XOPCNM IS NOT AN ACTIVE SUBSYSTEM

Explanation: The subsystem (XOPCNM) that you selected is not active.

System action: The system waits for you to respond.

System programmer response: Start the subsystem.

User response: Change the subsystem name to a valid name by using 0, **OPTIONS** on the IBM Tivoli Workload Scheduler for z/OS main menu. If the name is a valid subsystem name, ask your system programmer to start the subsystem.

| **EQQX112E** NOT ENOUGH STORAGE AVAILABLE

| **Explanation:** A GETMAIN failed at the logon to IBM Tivoli Workload Scheduler for z/OS because there is not enough available storage.

| **System action:** The system waits for you to respond.

| **User response:** Log on again to TSO with a larger region size.

| **EQQX113E** INCORRECT PARAMETERS TO THE LOGON ROUTINE

| **Explanation:** The logon failed because of incorrect parameters in the input to the logon routine.

| **System action:** The system waits for you to respond.

| **System programmer response:** Make sure that the correct load module library is accessed and that the data set contains the correct version of the IBM Tivoli Workload Scheduler for z/OS modules. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it may be dependent on. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

EQQX114E PRODUCT SERVICES REQUIRE TSO/E R2

Explanation: IBM Tivoli Workload Scheduler for z/OS cannot be run because the prerequisite TSO/E Release 2 system programs are not installed.

System action: The system waits for you to respond.

System programmer response: Make sure that TSO/E Release 2 is installed before any user attempts to use the IBM Tivoli Workload Scheduler for z/OS dialogs.

User response: Contact your system programmer.

EQQX115E TSO SERVICE FACILITY RC: XSSRC, RSNC: XSSRS, ABEND: XSSAB

Explanation: The TSO Service facility, IKJEFTSR, which is used for communication between the dialog and the IBM Tivoli Workload Scheduler for z/OS subsystem, gave an error return code. The field RC gives the IKJEFTSR return code (XSSRC). The values and their meanings are:

- 8 Confirms that the requested function is terminated as a result of a user pressing ATTN (attention).
- 12 The invoked function has abended. The RSNC field contains the IKJEFTSR reason code and the ABEND field contains the abend code.
- 20 There is a problem with the IKJEFTSR parameter list. XSSRS is the reason code for the problem.

System action: The request is rejected.

System programmer response: Make sure that the correct load module library is accessed and that the data set contains the correct version of the IBM Tivoli Workload Scheduler for z/OS modules. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it may be dependent on. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: If the return code is other than 8 (a result of you pressing ATTN), leave the dialog and retry. If the error persists, contact your system programmer.

Problem determination: Use the return code, reason code, and abend code to determine the cause of the error. For more information, refer to the documentation of IKJEFTSR for the currently active z/OS system.

| **EQQX116E** ERROR IN SUBSYSTEM INTERFACE, RETURN CODE: XRC

| **Explanation:** An error occurred in the subsystem interface. Return code XRC provides debugging information.

| **System action:** The request is rejected.

| **System programmer response:** Make sure that the correct load module library is accessed and that the data set contains the correct version of the IBM Tivoli Workload Scheduler for z/OS modules. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it may be dependent on. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **EQQX117E ERROR IN EQQMINOx ROUTINE,
RETURN CODE: XRC**

| **Explanation:** An error, with return code *XRC*, occurred in the EQQMINOx routine. The return code is returned from the z/OS subsystem interface routine at a subsystem call request.

| **System action:** The request is rejected.

| **System programmer response:** Make sure that the correct load module library is accessed and that the data set contains the correct version of the IBM Tivoli Workload Scheduler for z/OS modules. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it may be dependent on. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Use the return code to determine the cause of the error. For more information, refer to the documentation of return codes from the IEFSSREQ macro for the currently active z/OS system.

| **EQQX118E ERROR IN LOGON ROUTINE.
RETURN CODE: XSSRC. REASON
CODE XSSRS**

| **Explanation:** An error, with return code *XSSRC* and reason code *XSSRS*, occurred in the logon routine. Return code *XSSRC* and reason code *XSSRS* provide debugging information.

| **System action:** The request is rejected.

| **System programmer response:** Make sure that the correct load module library is accessed and that the data set contains the correct version of the IBM Tivoli Workload Scheduler for z/OS modules. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it may be dependent on. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

**EQQX119E LOGOFF REQUEST REJECTED, USER
IS NOT LOGGED ON**

Explanation: You have attempted to disconnect a session from IBM Tivoli Workload Scheduler for z/OS, but you are not connected.

System action: None.

User response: Use the IBM Tivoli Workload Scheduler for z/OS message log, to determine why you are logged off. (IBM Tivoli Workload Scheduler for z/OS has been stopped and restarted since you logged on.)

**EQQX120E THE EQQMINOI PROGRAM CAN
ONLY BE CALLED BY AN
APF-AUTHORIZED TASK**

Explanation: The cause of the problem is one of the following:

- The EQQMINOI program could not be called by an APF-authorized task because it does not reside in an APF-authorized library. EQQMINOI is one of a number of IBM Tivoli Workload Scheduler for z/OS load modules that must reside in an APF-authorized library.
- The EQQMINOI program is not defined in the IKJTSONn member of the SYS1.PARMLIB data set.

System action: The request is rejected.

System programmer response: Move EQQMINOI to an APF-authorized library and verify that it is defined in the IKJTSONn member of the SYS1.PARMLIB data set. For further information refer to *Installation Guide*.

User response: Contact your system programmer.

**EQQX121E YOU ARE NOT AUTHORIZED TO
REQUEST ON FIXED RESOURCE
RESOURCE**

Explanation:

REQUEST is READ or UPDATE, *RESOURCE* is the name of a Tivoli Workload Scheduler fixed resource. For details about fixed resources and how to implement security, refer to *Customization and Tuning*.

System action: The request is rejected.

User response: Contact your security administrator.

**EQQX122E CURRENT SUBSYSTEM REQUEST
WAS NOT RECOGNIZED**

Explanation: The subsystem interface has been called with an invalid parameter.

System action: The request is rejected.

System programmer response: Make sure that the correct load module library is accessed and that the data set contains the correct version of the IBM Tivoli

EQQX123E • EQQX130E

Workload Scheduler for z/OS modules. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it may be dependent on. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQX123E XOPCNM IS NOT A PRODUCT SUBSYSTEM NAME

Explanation: XOPCNM may be a subsystem name, but it is not a valid IBM Tivoli Workload Scheduler for z/OS subsystem name.

System action: The system waits for you to respond.

User response: Enter a valid IBM Tivoli Workload Scheduler for z/OS subsystem name.

EQQX124E YOU ARE NOT CONNECTED TO XOPCNM. RESTART FROM PRIMARY PANEL

Explanation: The subsystem XOPCNM has been restarted. You are no longer connected to it.

System action: The system waits for you to respond.

User response: Restart from the primary panel.

EQQX125E YOU ARE ALREADY CONNECTED TO THE PRODUCT

Explanation: You have attempted to reconnect your session to IBM Tivoli Workload Scheduler for z/OS, but you are already connected.

System action: The system waits for you to respond.

System programmer response: Make sure that the correct load module library is accessed and that the data set contains the correct version of the IBM Tivoli Workload Scheduler for z/OS modules. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it may be dependent on. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Log off from TSO and log on again. If the problem persists, contact your system programmer.

EQQX127E USER NOT AUTHORIZED TO REQUESTRESOURCE, RC:XRC, RSNC:XRSN

Explanation:

You have attempted to access (read or update) a IBM Tivoli Workload Scheduler for z/OS resource, but you are not authorized. The retrieval and update of data in the IBM Tivoli Workload Scheduler for z/OS database is controlled by parameter values in the AUTHDEF

initialization statement, the definition of the RACF resources, and the access lists to the RACF resources. RESOURCE is the name of a Tivoli Workload Scheduler fixed resource. For details about fixed resources and how to implement security, refer to *Customization and Tuning*.

System action: The request is rejected.

User response: Check your RACF authorizations.

Problem determination: Use the RACROUTE return code and reason code to determine the cause of the error. For more information, refer to the appropriate documentation for the security product installed on this z/OS system.

EQQX128E YOU ARE NOT AUTHORIZED TO REQUESTRESOURCE MEMBER

Explanation: You have attempted to access (read or update) a IBM Tivoli Workload Scheduler for z/OS resource, but you are not authorized. The retrieval and update of data in the IBM Tivoli Workload Scheduler for z/OS database is controlled by parameter values in the AUTHDEF initialization statement, the definition of the RACF resources, and the access lists to the RACF resources.

System action: The request is rejected.

User response: Check your RACF authorizations.

EQQX129E YOU CANNOT DELETE AN ALLOCATED SPECIAL RESOURCE

Explanation: You have attempted to delete a special resource that is allocated currently for operations. This deletion is not allowed.

System action: The request for the delete of a special resource is rejected.

User response: Wait till the special resource is released by the operations using it.

EQQX130E THE NUMBER OF USER FIELDS MUST BE GREATER THAN OR EQUAL TO 0.

Explanation: The number of user fields is an invalid value.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This

data set contains a copy of the record and the position of the error.

EQQX131E NOT ENOUGH STORAGE AVAILABLE

Explanation: A GETMAIN for communication storage area between the dialog and the IBM Tivoli Workload Scheduler for z/OS subsystem failed. The request is for common storage area (CSA) storage, subpool 241.

System action: The request is rejected.

System programmer response: Make sure that sufficient CSA storage is available.

User response: Contact your system programmer. When more CSA storage is available, log on to TSO again.

EQQX132E YOU ARE NOT CONNECTED TO XOPCNM. RESTART Z/OS SERVER.

Explanation: While you were attempting to perform an operation, the connection to the subsystem *XOPCNM* was interrupted.

System action: The operation is stopped.

User response: Start the Tivoli Workload Scheduler for z/OS server again.

EQQX133E THE SPECIFIED SUBSYSTEM, XOPCNM, IS ENDING

Explanation: You cannot access subsystem *XOPCNM*, because it is terminating.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the reason for the subsystem termination.

User response: Contact your system programmer.

EQQX134E REQUESTED SERVICE IS CURRENTLY NOT AVAILABLE

Explanation: Your request to use the general service function could not be granted because the general service task is not active.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine why the general service task is not active.

User response: Contact your system programmer.

EQQX135E AN ERROR OCCURRED WHILE POSTING THE SUBSYSTEM

Explanation: Your request to use the general service function could not be granted because the general service task is inaccessible due to an error that occurred

in the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log and look for messages concerning the general service task to determine the cause of the error.

User response: Check if the subsystem is running.

EQQX137E THE LOGICAL VSAM FILE IS NOT DEFINED

Explanation: Your request to use the general service function failed because the logical VSAM file is not defined. This error indicates that a serious error has occurred in the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log and look for messages concerning the general service task and the logical file handler to determine the cause of the error.

User response: Check if the VSAM file is defined and catalogued.

EQQX138E AN I/O REQUEST SPECIFIES TOO LARGE A VSAM KEY SIZE

Explanation: Your request to use the general service function failed because an I/O request specifies a VSAM key size that is too large. This error indicates that a serious error has occurred in the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log and look for messages concerning the general service task and the logical file handler to determine the cause of the error.

User response: Verify that the VSAM key is not greater than 19 bytes.

EQQX139E VSAM I/O REQUEST FAILED. RETURN CODE: XSSRC, REASON CODE: XSSRS

Explanation: Your request to use the general service function resulted in a VSAM I/O that failed. The reason for the failure is indicated by return code *XSSRC* and reason code *XSSRS*, which are the VSAM return and reason codes for a record management request.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log and look for

VSAM I/O error messages to determine the cause of the error.

User response: Contact your system programmer.

Problem determination: Use the VSAM return code and reason code to determine the cause of the error. For more information, refer to the appropriate documentation for the MVS/DFP product installed on this z/OS system.

EQQX140E REMAINING STORAGE NOT ENOUGH TO OPEN LOGICAL VSAM FILE

Explanation: Your request to use the general service function failed because the remaining storage is not enough to open a logical VSAM file.

System action: The request is rejected.

System programmer response: Allocate a larger region to the IBM Tivoli Workload Scheduler for z/OS subsystem and restart the subsystem.

User response: Try again. If the error persists, contact your system programmer.

EQQX142E VSAM I/O WAS ATTEMPTED ON AN UNOPENED LOGICAL VSAM FILE

Explanation: Your request to use the general service function failed because the VSAM I/O was attempted on an unopened logical VSAM file. This error indicates that a serious error has occurred in the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log and look for messages concerning the general service task and the logical file handler to determine the cause of the error.

User response: Open the logical VSAM file before attempting to perform an I/O operation on it.

EQQX143E OPEN WAS REQUESTED FOR ALREADY OPENED LOGICAL VSAM FILE

Explanation: Your request to use the general service function failed because the open request was for an already opened logical VSAM file. This error indicates that a serious error has occurred in the IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log and look for messages concerning the general service task and the logical file handler to determine the cause of the error.

User response: Check if another process is already using the same VSAM file.

EQQX144E ERROR IN DB RECORD AT OFFSET OFFS, REASON CODE: XSSRS

Explanation: The subsystem detected an inconsistency in a record that it was requested to write.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error. If you cannot find a valid reason for the error, contact your system programmer.

EQQX145E THE SUBSYSTEM PROGRAM IS NOT OF THE CORRECT RELEASE

Explanation: The dialog or IBM Tivoli Workload Scheduler for z/OS batch program is from a later release of IBM Tivoli Workload Scheduler for z/OS than the IBM Tivoli Workload Scheduler for z/OS subsystem. IBM Tivoli Workload Scheduler for z/OS checks that the subsystem name specified in your dialog or in the SUBSYS parameter of the BATCHOPTS batch initialization statement (or its default) matches the name of one of your IBM Tivoli Workload Scheduler for z/OS subsystems. If there is a match, IBM Tivoli Workload Scheduler for z/OS checks if the dialog or batch program and the IBM Tivoli Workload Scheduler for z/OS subsystem are from the same release of IBM Tivoli Workload Scheduler for z/OS. This message is issued only if the subsystem is from an earlier release than the dialog or batch program.

Note: During the migration phase could happen that you have the following temporary situation in your environment: LPAR (a) with controller placed in Tivoli Workload Scheduler for z/OS at level *x* and the SSX is in Tivoli Workload Scheduler for z/OS at level *x* also; LPAR (b) referencing in its definition the updated LOADLIB of Tivoli Workload Scheduler for z/OS subsystem of LPAR (a). If in this LPAR the SSX subsystem has not been updated by an IPL at the start of the migration, it is still at level *x-n*, and it does not match the level of the Tivoli Workload Scheduler for z/OS batch processing. For this transitory environment setup, the EQQX145E message is issued.

System action: The subsystem request is rejected.

System programmer response: Check that the correct subsystem start JCL is used and that the correct data sets are allocated to ISPLLIB. If you cannot determine the cause of the error, and if the error persists, search the IBM Support database for a solution at

<http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check on the main panel that you are using the correct subsystem. If the message is given by a batch program, check that the BATCHOPTS initialization statement specifies the correct subsystem. If the error persists, contact your system programmer.

Problem determination: This message is expected if the controller is started using the BUILDSSX(REBUILD) keyword and the address space is not currently started.

EQQX146E THE EQQMINOI LEVEL DOES NOT MATCH THE SUBSYSTEM LEVEL.

Explanation: This error occurs if a non-authorized STEPLIB or JOBLIB is used for the step that runs EQQMINOI and the EQQMINOI in the LINKLIST is from a different Tivoli Workload Scheduler for z/OS version.

System action: The request is rejected.

System programmer response: If you cannot determine the cause of the error contact your IBM representative.

User response: Use the EQQMINOI at the same level of the SUBSYSTEM.

Problem determination: Check the EQQMINOI level you are using.

EQQX150E PDF BROWSE/EDIT WORK FILE CONNECT FAILURE - RC = MSGRC

Explanation: The connect to the work data set used by PDF EDIT or BROWSE failed. Return code *MSGRC* gives the reason.

System action: The function is terminated.

System programmer response: If the return code indicates that this is not a user error, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Use the return code to determine the cause of the error. For more information, refer to the appropriate documentation for the ISPF/PDF product installed on this z/OS system.

EQQX152E PDF BROWSE/EDIT WORK FILE - RC = MSGRC, REASON CODE = MSGEF

Explanation: Dynamic allocation for the PDF BROWSE/EDIT work file failed. Return code *MSGRC* and reason code *MSGEF* give the reason.

System action: The function is terminated.

System programmer response: Determine the cause of the error and take the appropriate action.

User response: Contact your system programmer.

Problem determination: Use the DYNALLOC return code and reason code to determine the cause of the error. For more information, refer to the appropriate DYNALLOC documentation for the currently active z/OS system.

EQQX153E PDF BROWSE/EDIT WORK FILE - RC = MSGRC, REASON CODE = MSGEF

Explanation: Dynamic deallocation for PDF BROWSE/EDIT work file failed. Return code *MSGRC* and reason code *MSGEF* give the reason.

System action: The function is terminated.

System programmer response: Determine the cause of the error and take the appropriate action.

User response: Contact your system programmer.

Problem determination: Use the DYNALLOC return code and reason code to determine the cause of the error. For more information, refer to the appropriate DYNALLOC documentation for the currently active z/OS system.

EQQX154E OPERATOR INSTRUCTION CANNOT BE EMPTY

Explanation: A PIF request was received with no text line in the input operator instruction segment.

System action: The request is rejected.

User response: Check that the text field is specified in the input operator instruction segment.

EQQX161E AN INTERNAL CONTROL BLOCK IS IN ERROR

Explanation: An internal IBM Tivoli Workload Scheduler for z/OS control block is in error.

System action: The system waits for you to respond.

System programmer response: Make sure that the correct load module library is accessed and that the data set contains the correct version of the IBM Tivoli Workload Scheduler for z/OS modules. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it may be dependent on. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQX162E AN AUTHORITY CHECK FAILED, RESOURCE RESOURCE NOT RECOGNIZED

Explanation: You have attempted to access a IBM Tivoli Workload Scheduler for z/OS resource, but the

| resource *RESOURCE* is unknown to IBM Tivoli Workload Scheduler for z/OS. The retrieval and update of data in the IBM Tivoli Workload Scheduler for z/OS database is controlled by parameter values in the AUTHDEF initialization statement, the definition of the RACF resources, and the access lists to the RACF resources.

| **System action:** The request is rejected.

| **System programmer response:** Make sure that the correct load module library is accessed and that the data set contains the correct version of the IBM Tivoli Workload Scheduler for z/OS modules. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it may be dependent on. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Verify that you have specified the correct resource name.

EQQX163E INCORRECT PARAMETER IN GENERAL SERVICE REQUEST

Explanation: Your request for the general service function failed because of an incorrect parameter in the request.

System action: The system waits for you to respond.

System programmer response: Make sure that the correct load module library is accessed and that the data set contains the correct version of the IBM Tivoli Workload Scheduler for z/OS modules. If the error persists, collect information in the form of the sequence of actions leading to this error and, if possible, the data it may be dependent on. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Try again. If the error persists, contact your system programmer.

EQQX164E AN ERROR OCCURRED WHILE UPDATING THE RESOURCE DATASPACE

Explanation: The request to update a special resource record failed because an error occurred when the general service task updated the resource data space.

System action: The request is rejected.

System programmer response: Look for message EQQQ505E in the IBM Tivoli Workload Scheduler for z/OS message log, EQQMLOG. This message contains additional information about the error. If the error persists, collect information in the form of the sequence of actions leading to this error and, if possible, the data it may be dependent on. Search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQX198E ERROR, RC: XRC, RS: XRSN, FROM SUBSYSTEM RC: XSSRC, RS: XSSRS

| **Explanation:** A IBM Tivoli Workload Scheduler for z/OS request failed with an error code that is not recognized by the message module. XRC, XRSN, XSSRC, and XSSRS provide debugging information.

| **System action:** The request is rejected.

| **System programmer response:** Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

EQQX213E The command is not valid for operations in X or W status.

Explanation: The command submitted is not valid for operations in X (Suppressed by condition) or W (Wait) status. For example, you cannot submit a set NEXT logical status (N) command on operations in X or W status.

System action: The command does not run.

User response: Submit a command consistent with the current status of the operation.

EQQX220E THE INPUT ENTERED IS TOO LONG

Explanation: Data entry error; see "Data entry errors" on page 803.

The longest value accepted is *HH.MM*, where:

HH The hour in the range 00–24

MM The minute

User response: Specify a value in the range 00–24 and rerun the task.

EQQX226E HOUR PART MUST BE A NUMBER FROM 0 TO 99

| **Explanation:** Data entry error.

| **User response:** Specify a value in the range 0–99 and rerun the task. See "Data entry errors" on page 803.

EQQX227E OPERATION DURATION MUST BE GREATER THAN 00.00

| **Explanation:** Data entry error; see "Data entry errors" on page 803.

| **User response:** Specify a value greater than 00.00 and rerun the task. See "Data entry errors" on page 803.

EQQX229E OPERATION OP DEADLINE EARLIER THAN OPERATION INPUT ARRIVAL

Explanation: The deadline must be the same as, or later than, the input arrival time.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Change the deadline or the input arrival time and resubmit the job. If the error persists, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX255E BROWSE PERIOD NOT ALLOWED. ALARM=YES

Explanation: It is not possible to perform a **BROWSE PERIOD** row command on rule-based run cycles.

System action: The command is rejected.

User response: Select an offset-based run cycle and rerun the task.

EQQX256E MODIFY PERIOD NOT ALLOWED. ALARM=YES

Explanation: It is not possible to perform a **MODIFY PERIOD** row command on rule-based run cycles.

System action: The command is rejected.

User response: Select an offset-based run cycle and rerun the task.

EQQX257E GENDAYS NOT ALLOWED. ALARM=YES

Explanation: It is not possible to perform a **GEN** row command on a run cycle that is offset-based and not rule-based.

System action: The command is rejected.

User response: Select a rule-based run cycle and rerun the task.

EQQX259E NORMAL MODE MANAGER SUPPORT REQUIRED; TASK NOT ACTIVE

Explanation: The request has resulted in a request to the IBM Tivoli Workload Scheduler for z/OS subsystem. The request cannot be handled because the

normal mode manager (NMM) is not active.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log and look for messages concerning the NMM. Correct all errors and restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

User response: Verify that the normal mode manager (NMM) is active. If it is not active, reactivate it and rerun the task.

EQQX260E AN INTERNAL CONTROL BLOCK IS IN ERROR: REASON CODE XSSRS

Explanation: Validation checking of the data received as input to a routine has detected a damaged control block. Reason code XSSRS provides debugging information. Reason code 102 is given when the dialog code is of an earlier release than the IBM Tivoli Workload Scheduler for z/OS subsystem code.

System action: The request is rejected.

System programmer response: Make sure that the correct load module library is set up to the IBM Tivoli Workload Scheduler for z/OS subsystem and to the user. Check that the library contains the correct version of the IBM Tivoli Workload Scheduler for z/OS modules. If the error persists, collect information in the form of the sequence of actions leading to this error and, if possible, the data it may be dependent on. Contact IBM Software Support.

User response: If the reason code in the message is 102, check your ISPLLIB concatenation against the release of the subsystem that you are using. If the error persists, contact your system programmer.

EQQX261E NOT ENOUGH STORAGE AVAILABLE: REASON CODE XSSRS

Explanation: The general service task has failed to carry out a request due to failure to allocate enough virtual storage because either the controller or the server region is too small. Reason code XSSRS provides debugging information.

System action: The request is rejected.

System programmer response: Allocate a larger region to the IBM Tivoli Workload Scheduler for z/OS subsystem and restart the subsystem. If the error persists, contact IBM Software Support.

User response: If possible try to limit the storage demand of the request. For example, if this is a request for a list of operations, choose a narrower selection criterion remembering that there is a limit of 16MB for all data transfers. If the error persists, contact your system programmer.

EQQX262E TIME LIMIT EXCEEDED WHEN TRANSFERRING DATA FROM OR TO THE SUBSYSTEM

Explanation: The request was terminated because the IBM Tivoli Workload Scheduler for z/OS subsystem had to wait too long for data to be transferred to or from the dialog address space. The IBM Tivoli Workload Scheduler for z/OS subsystem rejected the request to be able to service other requests.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log and look for messages concerning the general service task and preceding the long delay. Correct all errors and restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

User response: Try again, and if the error persists, contact your system programmer.

EQQX264E THE REQUEST TO CHANGE THE OPERATION FAILED, REASON CODE XSSRS

Explanation: The request to change the status of the operation was rejected by the event manager. Reason code XSSRS provides debugging information.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log and look for messages concerning the event manager and those issued at the time of the request. Correct all errors and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems", sub-section, "Information to collect for critical path problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQX265E ATTEMPT TO READ A RECORD FAILED, REASON CODE XSSRS

Explanation: The attempt to read a record failed. Reason code XSSRS provides debugging information.

System action: The request is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log and look for I/O error messages issued at the time of the request. Correct all errors and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it

may be dependent on. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems", sub-section, "Information to collect for critical path problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQX266E A JOBLIB OR PROCLIB RECORD READ FAILED, REASON CODE XSSRS

Explanation: Reason code XSSRS gives the reason for the failure to read a record. The code issued depends on the type of request.

The reason codes and their meanings are:

- 1 The IBM Tivoli Workload Scheduler for z/OS JCL library data set (EQQJBLIB) could not be opened. Message EQQW500E in the IBM Tivoli Workload Scheduler for z/OS message log, when issued at the time of IBM Tivoli Workload Scheduler for z/OS start, further explains the reason for the failure.
- 2 The IBM Tivoli Workload Scheduler for z/OS JCL library data set (EQQJBLIB) contains records with invalid length. Message EQQW501E in the IBM Tivoli Workload Scheduler for z/OS message log, when issued at the time of IBM Tivoli Workload Scheduler for z/OS start, further explains the reason for the failure.
- 3 The joblib I/O exit, EQQUX002, was not loaded. Message EQQW521E in the IBM Tivoli Workload Scheduler for z/OS message log, when issued at the time of IBM Tivoli Workload Scheduler for z/OS start, further explains the reason for the failure.
- 4 The joblib I/O exit, EQQUX002, gave a return code of 241, which indicates that an I/O error has occurred in the exit routine. Message EQQW520E in the IBM Tivoli Workload Scheduler for z/OS message log further explains the reason for the I/O error.
- 5 The joblib I/O exit, EQQUX002, gave a return code of 242, which indicates that it could not open one of its input data sets. Message EQQW516E in the IBM Tivoli Workload Scheduler for z/OS message log further explains the reason for the I/O error.
- 6 The joblib I/O exit, EQQUX002, gave an invalid return code.

System action: An empty JCL member is presented.

System programmer response: To determine the cause

of the error, use the reason code and the corresponding message (if any) in the IBM Tivoli Workload Scheduler for z/OS message log. Correct all errors and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it may be dependent on. Contact IBM Software Support.

User response: Edit the empty JCL member. Notify your system programmer about the error.

EQQX267W ACCESS REJECTED, DATA SET USED BY ANOTHER FUNCTION

Explanation: The record could not be read because the data set was held for update by another IBM Tivoli Workload Scheduler for z/OS function.

System action: The request is rejected.

User response: Try again later.

EQQX268W UPDATE REJECTED, DATA SET USED BY ANOTHER FUNCTION

Explanation: The record update could not be carried out because the data set was held for update by another IBM Tivoli Workload Scheduler for z/OS function.

System action: The request is rejected.

User response: Try again later.

EQQX269E THE LTP DATA SET IS BEING USED BY A BATCH FUNCTION, TRY LATER

Explanation: You cannot access the long term plan (LTP) data set because it is being used by a batch function.

This message is issued during the invocation of a DP function, when a previous ongoing DP function did not release the LTP dataset yet.

System action: The request is rejected.

User response: You can repeat the request after few seconds: the invocation of the DP function is submitted successfully after that the following messages, related to the previous ongoing DP function, appear in the subsystem EQQMLOG:

```
EQQN051I A CURRENT PLAN BACKUP PROCESS HAS STARTED
...
...
EQQN090I THE JOB TRACKING LOG DATA SET DEFINED BY
DDNAME EQQJTxx HAS BEEN COPIED
EQQN090I TO THE JOB TRACKING LOG ARCHIVE DATA SET
```

EQQX270E THE JS DATA SET IS IN USE, TRY LATER

Explanation: You have requested a function that requires access to the JCL repository file, but this file is not available.

System action: The request is rejected.

User response: Wait a few seconds and repeat the request.

EQQX271E A SEVERE ERROR OCCURRED IN THE GENERAL SERVICE TASK

Explanation: The request to use the general service function could not be granted because a severe error occurred in the general service task.

System action: The request is rejected.

System programmer response: To determine the cause of the error, review the IBM Tivoli Workload Scheduler for z/OS message log and look for messages concerning the general service task and those issued at the time of the request. Correct all errors and restart the IBM Tivoli Workload Scheduler for z/OS subsystem. If the error persists, collect information in the form of the sequence of actions leading to the error and, if possible, the data it may be dependent on. Contact IBM Software Support.

User response: Try again later. If the error persists, contact your system programmer.

EQQX274E AN I/O REQUEST SPECIFIES TOO LARGE RECORD SIZE

Explanation: The request to create or modify a record resulted in the record exceeding the maximum size of the VSAM record.

System action: The request is rejected.

System programmer response: Check the record size against the VSAM file definition. For more information, refer to the *Planning and Installation*

User response: Contact your system programmer.

EQQX275E CANNOT DELETE FALSE CONDITIONS

Explanation: The status of the condition you requested to delete is false. Conditions in false status cannot be deleted.

System action: The request is rejected.

User response: Check the condition status before repeating the request.

EQQX300E AN APPLICATION DESCRIPTION RECORD IS TOO LARGE TO BE SAVED

Explanation: The current application description (AD) record is larger than the maximum record size of the AD database.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support. If the current AD record is valid, it may become necessary to change the maximum record size of the AD file. The recommended way of doing this is to define a new VSAM cluster similar to the current AD file, but with a larger maximum record size. Copy the current AD file to the new AD file using IDCAMS REPRO. Change all JCL that references the old AD file so that it references the new AD file. Restart the controller and retry the failing AD file update request.

User response: Check the entered data and, if the error occurred in batch, resubmit the job. The application may have to be split into two applications. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX301E THE DB RECORD VERSION VERS IS INVALID

Explanation: The version of the record is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures. If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX302E THE APPLICATION ID AD IS INVALID

Explanation: The application ID that was entered contains invalid characters.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Enter a valid application ID and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX303E STATUS AST FOR AD AD IS INVALID

Explanation: The application status is not A or P in the indicated application description.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Check the entered data and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX304E THE DB VALID-TO DATE VALTO IS INVALID

Explanation: The valid-to date is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Enter a valid date and, if the error occurred in batch, resubmit the job. If you cannot find a

valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX305E THE RUN CYCLE POINTER IS INVALID

Explanation: The pointer to the next run cycle is invalid. All run cycles must be before the first operation in the application description record.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX306E THE RECORD SIZE DOES NOT INCLUDE THE RUN CYCLE

Explanation: The size of the application description record does not include the run cycles.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX307E OFFSET TO NEXT RUN CYCLE IN RECORD IS INVALID

Explanation: The offset to the next run cycle in the application description record is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX308E THE OPERATION POINTER IS INVALID

Explanation: All operations must be last in the application description record.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX309E THE RECORD SIZE DOES NOT INCLUDE OPERATION DATA

Explanation: The size of the application description record does not include operation data.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine

EQX310E • EQX313E

the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQXDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQX310E OFFSET TO NEXT OPERATION IN RECORD IS INVALID

Explanation: The offset to next operation in the application description record is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQXDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQX311E THE RECORD SIZE DOES NOT INCLUDE DEPENDENCIES AND SRS

Explanation: The application description record size does not include dependencies and special resources.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQXDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQX312E THE DB VALID-FROM DATE VALFR IS INVALID

Explanation: The valid-from date entered is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid date and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQXDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQX313E VALID-FROM DATE VALFR IS LATER THAN VALID-TO DATE VALTO

Explanation: The valid-to date must be later than the valid-from date.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter correct dates and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQXDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX314E AUTHORIZATION GROUP AUTHGR IS INVALID

Explanation: The authorization group field contains invalid characters.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid authorization group name and the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX315E OWNER ID IS MISSING IN DBNAME

Explanation: Owner ID is a required input field.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter an owner ID and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX316E LATEST UPDATE DATE LUDATE IS INVALID OR MISSING

Explanation: The date for the latest update is invalid or missing.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX317E LATEST UPDATE TIME LUTIME IS INVALID OR MISSING

Explanation: The time for the latest update is invalid or missing.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX318E APPLICATION PRIORITY PRIO IS INVALID OR MISSING

Explanation: The application priority is invalid or missing.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM

| Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Enter a valid application priority and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX319E THE NUMBER OF OPERATIONS IS NOT IN THE RANGE 1 - 255

Explanation: The number of operations cannot be less than one or greater than 255.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX320E THE NUMBER OF RUN CYCLES NRUNC IS INVALID

| **Explanation:** The number of run cycles in the application description record is invalid.

| **System action:** The request to write the record is rejected.

| **System programmer response:** Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX321E THE DB RECORD IDENTIFIER RECID IS INVALID

Explanation: The record identifier is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX322E OFFSET TO FIRST RUN CYCLE IS INVALID IN AD AD

| **Explanation:** The offset to the first run cycle is invalid in the indicated application description record.

| **System action:** The request to write the record is rejected.

| **System programmer response:** Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX323E OFFSET TO FIRST OPERATION IS INVALID IN AD AD

| **Explanation:** The offset to the first operation is invalid in the indicated application description record.

| **System action:** The request to write the record is rejected.

| **System programmer response:** Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQX324E INVALID CHARACTERS IN COMMON PART IN AD AD

| **Explanation:** The common part of the indicated application description contains invalid characters.

| **System action:** The request to write the record is rejected.

| **System programmer response:** Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQX325E INVALID CALENDAR ID CALID IN AD AD

| **Explanation:** An invalid calendar ID was entered in the indicated application description.

| **System action:** The request to write the record is rejected.

| **System programmer response:** Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM

Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Enter a valid calendar ID and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQX326E THE CALENDAR CALID DOES NOT EXIST

| **Explanation:** The calendar ID that was entered does not exist in the calendar database.

| **System action:** The request to write the record is rejected.

| **System programmer response:** Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQX327E THE DB VALID-FROM TIME TVALFR INVALID

| **Explanation:** The valid-from time for the indicated record is invalid.

| **System action:** The request to write the record is rejected.

| **System programmer response:** Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

| **User response:** Enter a valid date and, if the error occurred in batch, resubmit the job. If you cannot find a

valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX328E THE DB VALID-TO TIME TVALTO IS INVALID

Explanation: The valid-to time for the indicated record is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid date and, if the error occurred in batch, resubmit the job.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX329E THE RUN CYCLE PERIOD RUNPER CANNOT BE FOUND

Explanation: The period that was entered could not be found in the calendar database.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX330E A POSITIVE RUN DAY OFFSET IS NOT BLANK OR NUMERIC 1 - 999

Explanation: The positive run day offset that was entered is not blank or a number from 1 to 999.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid offset and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX331E THE FREE DAY SPECIFICATION FDRULE IS INVALID

Explanation: The free day rule that was entered is not E, 1, 2, 3, or 4.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid free day rule and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX332E THE RUN CYCLE TYPE RCTYPE IS INVALID. IT MUST BE N, X, R OR E

Explanation: The run cycle type that was entered is invalid. Valid run cycle types are:

- N Normal offset-based run cycles
- X Negative offset-based run cycles
- R Regular rule-based run cycles
- E Exception rule-based run cycles.

System action: The request to write the record is rejected.

User response: Enter a valid run cycle type and, if the error occurred in batch, resubmit the job.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX333E THE INPUT ARRIVAL TIME IAT IS INVALID

Explanation: The input arrival time that was entered is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid time and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX334E INVALID RELATIVE DEADLINE DAY DLINER, MUST BE NUMERIC 0 - 99

Explanation: The relative deadline day that was entered is not a number from 0 to 99.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate

documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid relative day and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX335E THE DEADLINE TIME DLINET IS INVALID

Explanation: The deadline time that was entered is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid time and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX336E INVALID CHARACTERS IN RUN CYCLE SECTION IN AD AD

Explanation: The run cycle section in the indicated application description contains invalid characters.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM

EQQX337E • EQQX340E

Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX337E THE WORK STATION DESCRIPTION WS DOES NOT EXIST

Explanation: The workstation description for the indicated workstation could not be found in the workstation database.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX338E INVALID OPERATION NUMBER OP IN AD AD

Explanation: The indicated operation number is invalid in the indicated application description.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid operation number and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX339E THE DURATION OF OPERATION WSOP IS INVALID, DUR

Explanation: The duration time is invalid for the indicated operation.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid duration time and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX340E SMOOTHING FACTOR OF WSOP IS INVALID, SMOOTH, must be 0 - 999

Explanation: The smoothing factor is not a number between 0 and 999.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid smoothing factor and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX341E FEEDBACK LIMIT OF WSOP IS INVALID, FBLIM, MUST BE 100 - 999

Explanation: The feedback limit is not a number between 100 and 999.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid feedback limit and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX342E ERROR TRACKING INDICATOR OF WSOP IS INVALID, AEC, MUST BE Y or N

Explanation: The error tracking indicator is not Y (yes) or N (no).

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid value and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX343E THE JOBNAME JOBNAME INVALID IN OPERATION WSOP

Explanation: The job name that was entered contains invalid characters.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid job name and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX344E START DAY OF WSOP IS INVALID, STRELD, MUST BE 0 - 99

Explanation: The relative input arrival day of the indicated operation is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid day and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX345E OPERATION WSOP INPUT ARRIVAL TIME IS INVALID

Explanation: The input arrival time of the indicated operation is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid time and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX346E DEADLINE DAY OF WSOP IS INVALID, DLINER, MUST BE 0 - 99

Explanation: The relative deadline day of the indicated operation is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid day and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX347E OPERATION WSOP DEADLINE TIME IS INVALID

Explanation: The relative deadline time of the indicated operation is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid deadline time and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX348E WS RESOURCE USAGE OF WSOP IS INVALID, RWS, MUST BE 0 - 99

Explanation: The amount of workstation resource that was entered is not a number between 0 and 99.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a number between 0 and 99 and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX349E NUMBER OF PS REQUIRED BY WSOP
INVALID, PARSE RV, MUST BE 1 - 99**

Explanation: The number of parallel servers for the indicated operation is not a number between 1 and 99.

If the operation is related to a shadow job, the number of parallel servers is not considered, but it is anyway required that you insert a valid number.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid number and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

If the operation is related to a shadow job, the number of parallel servers is not considered, but it is anyway required that you insert a valid number.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX350E NUMBER OF INTERNAL
PREDECESSORS NOINPR INVALID IN
WSOP**

Explanation: The number of internal predecessors is invalid in the operation part of the application description record for the indicated operation.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX351E NUMBER OF EXTERNAL
PREDECESSORS NOEXPR INVALID IN
WSOP**

Explanation: The number of external predecessors is invalid in the operation part of the application description record for the indicated operation.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX352E NUMBER OF SPECIAL RESOURCES
NOSR INVALID IN WS OP**

Explanation: The number of special resources is invalid in the operation part of the application description record for the indicated operation.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX353E INVALID CHARACTERS IN
OPERATION PART IN AD AD**

Explanation: The operation part of the indicated application description contains invalid characters.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX354E WORK STATION PREIWS IS INVALID AS A PREDECESSOR TO WSOP

Explanation: The indicated internal predecessor workstation could not be found in the workstation description database.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX355E INVALID OPERATION NUMBER IOP IN PREDECESSOR TO WSOP

Explanation: The indicated internal predecessor operation number could not be found.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the

Diagnosis Guide and Reference manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid operation number and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX356E INVALID TRANSPORT TIME TRTI FOR PREDECESSOR PREIWSIOP

Explanation: The transport time for the indicated internal predecessor is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid transport time and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX357E INVALID CHARACTERS IN PREDECESSOR BLOCK FOR WSOP

Explanation: The predecessor part for the indicated operation contains invalid characters.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

www.ibm.com/software/sysmgmt/products/support.

User response: Check the entered data and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX358E INVALID AD PREAD IN THE
PREDECESSOR FOR WSOP**

Explanation: The indicated external predecessor application description (AD) could not be found in the AD database.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX359E INVALID WORK STATION PREEWS IN
THE PREDECESSOR FOR WSOP**

Explanation: The indicated external predecessor workstation could not be found.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If

you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX360E INVALID OPERATION NUMBER EOP
IN PREDECESSOR FOR WSOP**

Explanation: The indicated external predecessor operation number could not be found.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid operation number and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX361E INVALID LTP PRINT OPTION LTPPO
IN PREDECESSOR PREEWSEOP**

Explanation: The long term plan (LTP) print option in the indicated external predecessor is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid print option and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This

data set contains a copy of the record and the position of the error.

EQQX362E SPECIAL RESOURCE NAME IS BLANK IN OPERATION *WSOP*

Explanation: The special resource name for the indicated operation is blank.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a special resource name and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX363E SPECIAL RESOURCE HELD OPTION TYPE *HOPT IS INVALID*

Explanation: The special resource held option type is not X or S.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid held option type and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX364E SPECIAL RESOURCE BLOCK CONTAINS INVALID CHARACTERS

Explanation: The special resource part in the application description contains invalid characters.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX365E DUPLICATE OPERATIONS *OP EXIST IN AD AD*

Explanation: The indicated application description contains two or more operations with the same operation number.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter unique operation numbers for all operations and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX366E A PREDECESSOR TO OPERATION
WSOP DOES NOT EXIST**

Explanation: One predecessor for the indicated operation could not be found in the application description record.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX367E THERE IS A LOOP IN THE
APPLICATION NETWORK**

Explanation: The application network contains a loop.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX368E ALL OPERATIONS NOT IN
NETWORK IN AD AD**

Explanation: All operations are not in the network in the indicated application description.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX369E JOBNAME MISSING FOR
OPERATION WSOP**

Explanation: The indicated job setup, processor, or print operation has no job name.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid job name and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX370E JOB SETUP OPERATION WSOP HAS NOT A PROCESSOR SUCCESSOR

Explanation: The indicated job setup operation does not have a processor successor.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX371E PRINT OPERATION WSOP HAS NO PREDECESSOR

Explanation: The indicated operation does not have a predecessor. A predecessor is required for print operations.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and, if the error persists, contact IBM Software Support.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX372E PRINT OPERATION WSOP HAS MORE THAN ONE PREDECESSOR

Explanation: Only one predecessor is allowed for print operations.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX373E PRINT OPERATION WSOP HAS NOT A PROCESSOR PREDECESSOR

Explanation: Print operations must have a processor as predecessor.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX374E WSOP HAS A PREDECESSOR WITH A DIFFERENT JOBNAME

Explanation: The indicated print operation has a predecessor with a different job name.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3.

Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the job name and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX375E THE RUN CYCLE VALIDITY END
VALTO IS INVALID OR BEFORE/AT
THE START**

Explanation: The run cycle valid-to date that was entered either is invalid or is not later than the start date.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid date and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX376E A NEGATIVE RUN DAY OFFSET IS
NOT BLANK OR NUMERIC 1 - 999**

Explanation: The negative run day offset that was entered is invalid.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM

Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid offset, and if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX377E THE APPLICATION DESCRIPTION AD
DOES NOT EXIST**

Explanation: The indicated application description (AD) does not exist in the AD database.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX378E APPLICATION DESCRIPTION AD
HAS NO WS WORK STATION**

Explanation: The indicated workstation does not exist in the indicated application description.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If

you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX379E APPLICATION DESCRIPTION AD HAS NO OPERATION OP

Explanation: The indicated operation does not exist in the indicated application description.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX380E APPLICATION DESCRIPTION AD HAS NO WS OP operation

Explanation: The indicated operation does not exist in the indicated application description.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check the entered data and correct the error. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This

data set contains a copy of the record and the position of the error.

EQQX381E RUN CYCLE VALID-FROM DATE VALFR IS INVALID OR MISSING

Explanation: The valid-from date for the run cycle in invalid or missing.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid date, and if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX382E APPLICATION ID AD IS NOT BRACKETED DBCS

Explanation: The application identification field is specified to be in DBCS format, which means that it should start with a shift-out (X'0E') character and end with a shift-in (X'0F') character. Either shift-out or shift-in, or both, are missing.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

**EQQX383E OWNER ID OWNER IS NOT
BRACKETED DBCS**

Explanation: The owner identification field is specified to be in DBCS format, which means that it should start with a shift-out (X'0E') character and end with a shift-in (X'0F') character. Either shift-out or shift-in, or both, are missing.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

**EQQX384E DBCS FIELD OF APPLICATION ID AD
IS BLANK**

Explanation: The application identification field is blank, and as it must contain at least one DBCS character, it is invalid.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

**EQQX385E APPL ID AD CONTAINS UNPAIRED
SHIFT-OUT / SHIFT-IN CHAR**

Explanation: The application identification field contains one or more superfluous shift-out or shift-in characters.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

**EQQX386E OWNER ID OWNER CONTAINS
UNPAIRED SHIFT-OUT / SHIFT-IN
CHAR**

Explanation: The owner identification field contains one or more superfluous shift-out or shift-in characters.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

**EQQX387E APPLICATION ID AD CONTAINS
INVALID DBCS-CHARACTER(S)**

Explanation: The field indicated by the cursor contains out-of-range DBCS characters. With the exception of DBCS blank, X'4040', each byte must be in the range X'41'– X'FE'.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

**EQQX388E OWNER ID OWNER CONTAINS
INVALID DBCS-CHARACTER(S)**

Explanation: The field indicated by the cursor contains out-of-range DBCS characters. With the exception of DBCS blank, X'4040', each byte must be in the range X'41'– X'FE'.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX389E OWNER ID OWNER IS BLANK

Explanation: The owner identification field is blank and, as it must contain at least one DBCS character, it is invalid.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

**EQQX390E THE APPLICATION ID WAS NOT
SPECIFIED**

Explanation: No data has been entered in the application identification field.

System action: An empty field is not accepted.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX391E THE OWNER ID WAS NOT SPECIFIED

Explanation: No data has been entered in the owner identification field.

System action: An empty field is not accepted.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX392E THE APPLICATION ID AD CONTAINS AN ODD NUMBER OF BYTES

Explanation: The application identification field is specified as a DBCS field and requires two bytes per character. Hence, 2, 4, 6, ..., bytes per character must be entered.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX393E THE OWNER ID OWNER CONTAINS AN ODD NUMBER OF BYTES

Explanation: The owner identification field is specified as a DBCS field and requires two bytes per character. Hence, 2, 4, 6, ..., bytes per character must be entered.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the

Diagnosis Guide and Reference manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX394E ALL SPECIAL RESOURCES IN AN OPERATION MUST BE UNIQUE

Explanation: A special resource must have a unique name in an operation.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check for misspellings or delete the duplicate entry. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX395E ALL INTERNAL PREDECESSORS IN AN OPERATION MUST BE UNIQUE

Explanation: A duplicate internal predecessor was found in an operation.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

www.ibm.com/software/sysmgmt/products/support.

User response: Delete the duplicate internal predecessor and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX396E ALL EXTERNAL PREDECESSORS IN AN OPERATION MUST BE UNIQUE

Explanation: A duplicate external predecessor was found in an operation.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Delete the duplicate external predecessor and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX397E OWNER ID OWNER CONTAINS LOWER CASE CHARACTERS

Explanation: The owner ID cannot contain lowercase characters.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX398E DUPLICATE POSITIVE RUN DAY OFFSETS WERE FOUND IN A RUN CYCLE

Explanation: All positive run day offsets must be unique in a run cycle.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Delete the duplicates and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX399E DUPLICATE NEGATIVE RUN DAY OFFSETS WERE FOUND IN A RUN CYCLE

Explanation: All negative run day offsets must be unique in a run cycle.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Delete the duplicate run days and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This

data set contains a copy of the record and the position of the error.

EQQX400E THE CALENDAR DATA BASE RECORD SIZE IS INVALID

Explanation: The calendar description record cannot be greater than 32768 bytes (32KB) or less than the size of the common part of the calendar.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: If the size is too large, the calendar may have to be split into two calendars. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX401E THE CALENDAR ID CALID IS INVALID

Explanation: The calendar ID in the calendar description record either contains invalid characters or does not start with a capital letter or national language characters.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the calendar ID and retry. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX402E WORK DAY END TIME IS INVALID OR MISSING

Explanation: Work day end time must be a value in the range '0000' to '2400', where the first two characters represent the hour and the last two characters represent the minutes.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the time and retry. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX403E NUMBER OF WEEKDAYS / SPECIFIC DATES IS INVALID

Explanation: The number of weekday/specific dates has an invalid value in the calendar description record.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Investigate the record and correct the error. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX404E INVALID CHARACTERS IN
COMMON SECTION OF CALENDAR**

Explanation: An invalid character was found in a reserved field in the common section of the calendar description record.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Investigate the record and correct the error. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX405E THE RECORD SIZE DOES NOT
INCLUDE WEEK DAYS/SPECIFIC
DATES**

Explanation: The total record size of the calendar description record is too short to contain the common section and all week days/specific dates.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Investigate the record and correct the error. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX406E A WEEK DAY IN CALENDAR IS
INVALID**

Explanation: For a week day, the second character in the variable section is blank. The first character has a value of 1 to 7, which corresponds with Monday to Sunday.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the day and retry. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX407E WEEK DAYS IN CALENDAR ARE NOT
IN ASCENDING ORDER**

Explanation: The week days are not correctly sorted.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the sequence and retry. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX408E STATUS OF WEEK DAY / SPECIFIC
DATE IS NOT WORK NOR FREE**

Explanation: The status of weekday/specific date in the calendar description record must be W (work) or F (free).

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the error and retry. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX409E A SPECIFIC DATE IN CALENDAR IS INVALID

Explanation: A specific date must have the format YYMMDD where YY is the last two characters in the year, MM is the month number, and DD is the day in the month.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the date and retry. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX410E SPECIFIC DATES IN CALENDAR ARE NOT IN ASCENDING ORDER

Explanation: Specific dates are not correctly sorted.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate

documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Correct the sequence and retry. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX411E VARIABLE SECTION OF CALENDAR CONTAINS INVALID CHARACTERS

Explanation: An invalid character was found in a reserved field in the variable section of the calendar description record.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Investigate the record and correct the error. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX412E CANCEL IF LATE IS ONLY ALLOWED FOR TIME JOBS

Explanation: Cancel if late can only be specified for time-dependent jobs.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

www.ibm.com/software/sysmgmt/products/support.

User response: Specify cancel = no or make the operation time dependent. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX413E RELATIVE START DAY IS MISSING FOR WSOP

Explanation: If the operation is time dependent, an operation input relative start day must be specified.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a relative start day and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX414E START TIME IS MISSING FOR WSOP

Explanation: If the operation is time dependent, an operation input start time must be specified.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a start time and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX415E JOBNAME IS MISSING IN OPERATION WSOP

Explanation: Job name must be specified for the computer, printer, and job setup operations.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid job name and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX416E JOB SETUP OPERATION WSOP HAS NO SUCCESSOR WITH SAME JOBNAME

Explanation: The indicated job setup operation has no successor with the same job name.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Check and correct the job names for the computer operations succeeding the indicated operation. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This

data set contains a copy of the record and the position of the error.

EQQX417E THE VARIABLE TABLE NAME CONTAINS AN INVALID CHARACTER

Explanation: Data entry error.

User response: Specify a valid value and run the task again. See “Data entry errors” on page 803.

EQQX418E THE VARIABLE TABLE IS NOT DEFINED IN THE AD FILE

Explanation: Data entry error; see “Data entry errors” on page 803.

You have tried to define a variable table ID that does not exist in IBM Tivoli Workload Scheduler for z/OS's database.

User response: Define the variable table and run the task again. See “Data entry errors” on page 803.

EQQX419E NUMBER OF PARALLEL SERVERS MUST BE 1 FOR OPERATION WSOP

Explanation: The specified operation runs on a computer workstation and can use only one parallel server.

System action: The application description is not updated. The current application description record is printed on the dump data set (ddname EQQDUMP).

User response: Change the number of parallel servers to one and, if the error occurred in batch, resubmit the batch job.

EQQX420E REQUEST TYPE REQ IS NOT SUPPORTED

Explanation: An internal parameter list, consisting of a sequence of control blocks, is validated and found to have an invalid request type.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

System programmer response: If you cannot find a valid reason for the error, make the dump data set and the message log available and contact IBM Software Support.

User response: This is likely to be an internal error. If the error occurs in a program using the program interface function, do the requests in a different order and rerun.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks.

EQQX421E THE SPECIFIED CONTROL BLOCK LENGTH LEN IS INVALID

Explanation: An internal parameter list, consisting of a sequence of control blocks, is validated and found to have an invalid length.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

System programmer response: If you cannot find a valid reason for the error, make the dump data set and the message log available and contact IBM Software Support.

User response: This is likely to be an internal error. If the error occurs in a program using the program interface function, do the requests in a different order and rerun.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks.

EQQX422E THE INPUT ARRIVAL DATE IS REQUIRED BUT NOT AVAILABLE

Explanation: The input arrival date is a required parameter in the request. No input arrival date is specified.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

User response: Specify input arrival date as an argument in the program interface request.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks validated when the error was detected.

EQQX423E INPUT ARRIVAL DATE IAD IS INVALID

Explanation: The input arrival date is not a valid internal IBM Tivoli Workload Scheduler for z/OS date, in the format YYMMDD.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

User response: Correct the invalid date and rerun.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks validated when the error was detected.

EQQX424E THE INPUT ARRIVAL TIME IS REQUIRED BUT NOT AVAILABLE

Explanation: The input arrival time is a required parameter in the request. No input arrival time is specified.

EQQX425E • EQQX431E

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

User response: Specify input arrival time as an argument in the program interface request.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks validated when the error was detected.

EQQX425E THE REQUEST CONTAINS INCONSISTENT APPLICATION IDS, AD and RAD

Explanation: In the program interface request an application description is given by the data area parameter. The ID of an application is also given by the arguments parameters. The data area application description ID differs from the ID given by the arguments.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

User response: Either set the data area pointer to zero or remove the application ID from the arguments parameter of the program interface request.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks validated when the error was detected.

EQQX426E EITHER BOTH DEADLINE DATE AND TIME MUST BE GIVEN OR NEITHER DATE NOR TIME

Explanation: If the deadline date is specified, the deadline time must also be specified, and vice versa.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

User response: Specify both deadline date and deadline time or remove both from the arguments parameter of the program interface request.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks validated when the error was detected.

EQQX427E THE DEADLINE DATE DLD IS INVALID

Explanation: The deadline date is not a valid internal IBM Tivoli Workload Scheduler for z/OS date, in the format YYMMDD.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

User response: Correct the invalid date and rerun.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks validated when the error was detected.

EQQX428E THE PREDECESSOR INPUT ARRIVAL DATE IS REQUIRED BUT NOT AVAILABLE

Explanation: The predecessor input arrival date is a required parameter in the request. It is not specified.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

User response: Specify predecessor input arrival date as an argument in the program interface request.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks validated when the error was detected.

EQQX429E THE PREDECESSOR INPUT ARRIVAL TIME IS REQUIRED BUT NOT AVAILABLE

Explanation: The predecessor input arrival time is a required parameter in the request. It is not specified.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

User response: Specify predecessor input arrival time as an argument in the program interface request.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks validated when the error was detected.

EQQX430E THE PREDECESSOR APPLICATION ID IS REQUIRED BUT NOT AVAILABLE

Explanation: The predecessor application ID is a required parameter in the request. It is not specified.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

User response: Specify the predecessor application ID as an argument in the program interface request.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the control blocks validated when the error was detected.

EQQX431E AST IS NOT A VALID STATUS CODE

Explanation: Status *AST* is not a valid status code. The supported codes are V, T, S, and C.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli

Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and, if the error persists, contact IBM Software Support.

User response: Enter a valid status code and resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX432E AEC IS NOT A VALID CODE FOR ADDING FUNCTION

Explanation: Code *AEC* specifies an updating function that is not supported.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If the error persists, contact IBM Software Support.

User response: Check the entered data and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX433E A MAXIMUM OF 100 EXTERNAL PREDECESSORS ARE ALLOWED

Explanation: No more than 100 external predecessors can be specified in an application.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and, if the error persists, contact IBM Software Support.

User response: Check the entered data and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX434E IADIATAD CANNOT HAVE A DEPENDENCY ON ITSELF

Explanation: An occurrence cannot be dependent on itself.

System action: A dump of the record is written to the dump data set (EQQDUMP).

User response: Check your dependency specifications.

EQQX435E ROW COMMAND IS NOT VALID FOR A PENDING APPLICATION

Explanation: Calculate and Print run days (A) row command is valid only for application versions that are active.

System action: The request is rejected.

User response: Use these row commands against only active applications.

EQQX436E NO RUNCYCLE OFFSETS HAVE BEEN DEFINED FOR RUNCYCLE PERIOD = RUNPER

Explanation: An attempt was made to save an invalid application description record. The record being saved contained a run cycle that did not have any run cycle offsets. This is not valid since each run cycle must contain at least one run cycle offset.

System action: If this message is issued in a Tivoli Workload Scheduler for z/OS dialog, the dialog waits for you to correct the error. If the message is issued in a Tivoli Workload Scheduler for z/OS batch program, additional messages may be issued and the batch program may terminate. The invalid application description record is not saved.

User response: Enter at least one run cycle offset value.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current application description is printed in the dump data set and the position of the invalid value in the record is given.

EQQX437E NEGATIVE RUNDAY SPECIFICATION CONTAINS ERRORS

Explanation: The runday fields in the current application description contain embedded blanks and the application description cannot be saved.

System action: The dialog waits for you to correct the error.

User response: Enter a valid runday value.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current application description is printed in the dump

data set and the position of the invalid runday in the record is given.

EQQX438E THE RESOURCE QUANTITY IS NOT IN THE RANGE 1 - 999,999

Explanation: The quantity specified for a resource is not within the valid range.

System action: The request to write the record is rejected.

User response: Enter a valid resource quantity. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current application description is printed in the dump data set and the position of the invalid resource in the record is given.

EQQX439E THE ON ERROR FIELD FOR A RESOURCE CONTAINS AN INVALID VALUE

Explanation: The value of the On error field for a resource is invalid.

System action: The request to write the record is rejected.

User response: Enter a valid On error value. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current application description is printed in the dump data set and the position of the invalid resource in the record is given.

EQQX440E THE ETT DATA BASE RECORD SIZE IS INVALID

Explanation: The size of the record in the event-triggered tracking (ETT) database is not acceptable by the system.

System action: The request to write the record is rejected.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The

current record in the ETT database is printed in the dump data set and the position of the invalid field in the record is given.

EQQX441E THE NAME OF THE ETT TRIGGER IS BLANK

Explanation: The error is detected when you try to validate the record before writing it to the database.

System action: The request to write the record is rejected.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current record is printed in the dump data set and the position of the invalid field in the record is given.

EQQX442E RESERVED FIELDS IN ETT RECORD MUST BE NULLS

Explanation: The error is detected when you try to validate the record before writing it to the database.

System action: The request to write the record is rejected.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current record is printed in the dump data set and the position of the invalid field in the record is given.

EQQX443E THE ALL WORK STATION CLOSED DATA BASE RECORD SIZE IS INVALID

Explanation: The error is detected when you try to validate the record before writing it to the database.

System action: The request to write the record is rejected.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all

problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current record is printed in the dump data set and the position of the invalid field in the record is given.

EQQX444E RESERVED FIELDS IN ALL WORK STATION CLOSED RECORD MUST BE BLANK

Explanation: The error is detected when you try to validate the record before writing it to the database.

System action: The request to write the record is rejected.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current record is printed in the dump data set and the position of the invalid field in the record is given.

EQQX445E THE PERIOD DATA BASE RECORD SIZE IS INVALID

Explanation: The error is detected when you try to validate the record before writing it to the database.

System action: The request to write the record is rejected.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current record is printed in the dump data set and the position of the invalid field in the record is given.

EQQX446E THE PERIOD INTERVAL START OR END DATE IS INVALID

Explanation: The error is detected when you try to validate the record before writing it to the database.

System action: The request to write the record is rejected.

User response: If the error occurred in batch, correct the record and resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current record is printed in the dump data set and the position of the invalid field in the record is given.

EQQX447E RESERVED FIELDS IN PERIOD RECORD MUST BE BLANK

Explanation: The error is detected when you try to validate the record before writing it to the database.

System action: The request to write the record is rejected.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current record is printed in the dump data set and the position of the invalid field in the record is given.

EQQX448E PERIOD TYPE MUST BE REQCLEANUP
 - Created by ActiveSystems 12/10/99 Entity not defined., REQCLEANUP - Created by ActiveSystems 12/10/99 Entity not defined.
OR REQCLEANUP - Created by ActiveSystems 12/10/99 Entity not defined.

Explanation: Data entry error.

CYCA is the national language character for 'A' (?), CYCW is for 'W' (?), and CYCN is for 'N' (?).

User response: Specify one of the valid values and run the task again. See "Data entry errors" on page 803.

EQQX450E THE WORK STATION DATA BASE RECORD SIZE IS INVALID

Explanation: The error is detected when you try to validate the record before writing it to the database.

System action: The request to write the record is rejected.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the

EQQX451E • EQQX458E

| error and the error persists, search the IBM Support
| database for a solution at [http://www.ibm.com/
| software/sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

| **Problem determination:** Review the dump data set
| (ddname EQQDUMP) for further information. The
| current record is printed in the dump data set and the
| position of the invalid field in the record is given.

EQQX451E RESERVED FIELDS IN WORK STATION RECORD MUST BE BLANKS

| **Explanation:** The error is detected when you try to
| validate the record before writing it to the database.

| **System action:** The request to write the record is
| rejected.

| **User response:** To collect appropriate documentation
| for problem determination, see the *Diagnosis Guide and
| Reference* manual, Chapter 3. Problem analysis
| procedures, section, "Information needed for all
| problems". If you cannot determine the cause of the
| error and the error persists, search the IBM Support
| database for a solution at [http://www.ibm.com/
| software/sysmgmt/products/support](http://www.ibm.com/software/sysmgmt/products/support).

| **Problem determination:** Review the dump data set
| (ddname EQQDUMP) for further information. The
| current record is printed in the dump data set and the
| position of the invalid field in the record is given.

EQQX452E A DEADLINE TIME *DLTIME* BEFORE INPUT ARRIVAL TIME *IAT* WAS SPECIFIED

Explanation: The deadline time specified is earlier
than the input arrival time.

System action: The request to write the record is
rejected.

User response: Specify a valid deadline time and, if
the error occurred in batch, submit the job again.

Problem determination: Review the dump data set
(ddname EQQDUMP) for further information. The
current record is printed in the dump data set and the
position of the invalid field in the record is given.

EQQX453E AN INVALID WEEK DAY NAME WAS SPECIFIED

Explanation: The error is detected when validating the
record before writing it to the database.

System action: The request to write the record is
rejected.

User response: If the error occurred in batch, correct
the record and resubmit the job. If you cannot find a
valid reason for the error, contact your system
programmer.

Problem determination: Review the dump data set

(ddname EQQDUMP) for further information. The
current record is printed in the dump data set and the
position of the invalid field in the record is given.

EQQX454E WEEK DAY/SPECIFIC DATES NOT ENTERED IN ASCENDING ORDER

Explanation: The error is detected when validating the
record before writing it to the database.

System action: The request to write the record is
rejected.

User response: If the error occurred in batch, correct
the record and resubmit the job. If you cannot find a
valid reason for the error, contact your system
programmer.

Problem determination: Review the dump data set
(ddname EQQDUMP) for further information. The
current record is printed in the dump data set and the
position of the invalid field in the record is given.

EQQX455E AN INVALID SPECIFIC DATE WAS SPECIFIED

| **Explanation:** Data entry error.

| **User response:** Specify a valid value and run the task
| again. See "Data entry errors" on page 803.

EQQX456E INVALID DATES HAVE BEEN SPECIFIED FOR RUN DAYS GENERATION

Explanation: For the specified rule, the application
valid from date is greater than the application valid to
date.

User response: On the Application Description
dialogs, check the valid from date and on the Run Days
dialog, check the specified rules.

EQQX457E NO RUN DAYS HAVE BEEN GENERATED FOR THIS RULE

Explanation: The Gendays command has not
generated run days for the specified rule.

System programmer response: Activate the General
Service diagnose flag and look at the return code from
the Spawner in EQQSGNS.

EQQX458E THE REPEAT EVERY *REPEV* IS INCORRECT FOR RUN CYCLE *RUNC*

Explanation: The REPEAT EVERY value must be in
the format HH.MM and within the range 00.01-23.59. If
you set the REPEAT EVERY, you must also set the
REPEAT END TIME.

System action: The request to write the record is
rejected.

System programmer response: Specify a valid value for the REPEAT EVERY.

EQQX459E THE REPEAT END TIME REPET IS INCORRECT FOR RUN CYCLE RUNC

Explanation: The REPEAT END TIME must be:

- In the format HH.MM
- In the range 00.00-23.59
- Different from the input arrival time of the run cycle and work day end time of the application
- A value between the input arrival time of the run cycle and the calendar work day end time of the application

If you set the REPEAT END TIME, you must also set the REPEAT EVERY.

System action: The request to write the record is rejected.

System programmer response: Specify a valid value for the REPEAT END TIME.

EQQX461E INCORRECT DEADLINE FEEDBACK LIMIT FBLIM FOR ADID. MUST BE 100-999

Explanation: The deadline feedback limit must be a number from 100 to 999.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error.

To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Enter a valid value for the feedback limit and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current record is printed in the dump data set and the position of the error is given.

EQQX462E FIELD HIPERBATCH IS INVALID, MUST BE Y OR N

System action: The request to write the record is rejected.

User response: Enter a valid Hiperbatch value. If the

error occurred in batch, resubmit the job.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given.

EQQX463E FIELD USED FOR IS INVALID, MUST BE N,P,C OR B

System action: The request to write the record is rejected.

User response: Enter a valid Used For value. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given.

EQQX464E DAY OF WEEK MUST BE ZERO OR DATE MUST BE BLANK IN FIRST INTERVAL

System action: The request to write the record is rejected.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given. The first interval contains default values, that is, Day of Week must be zero or Date must be blank.

EQQX465E DEFAULT QUANTITY INVALID, MUST BE IN INTERVAL 1 TO 999999.

System action: The request to write the record is rejected.

User response: Set Default Quantity in the common segment of the resource record to an integer value as given in the message. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump

data set and the position of the invalid resource specification in the record is given.

EQQX466E DAY OF WEEK IS ZERO AND DATE IS BLANK IN INTERVAL OTHER THAN FIRST

System action: The request to write the record is rejected.

User response: The Day of week or Date must be specified in all but the first interval of a resource description. Set either Day of week to the value for a week day (1-7) or the value for the Standard day (8). In that case the Date field should be reset. Or, set the Day of week to 0 and the Date to a specific date in the form YYMMDD. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given.

EQQX467E DEFAULT AVAILABILITY IS INVALID, MUST BE Y OR N

User response: Enter a valid Default Avail value. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given.

EQQX468E FIELD AVAIL IS INVALID IN INTERVAL *IVLID*. IT MUST BE Y, N OR BLANK

User response: Enter a valid Avail value. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given. *IVLID* identifies the interval by the week day number (1-7), the standard day number (8) or a date, followed by the interval start time.

EQQX469E INCORRECT DEADLINE SMOOTHING FACTOR *SMOOTH* FOR *ADID*. MUST BE 0-999

Explanation: The deadline smoothing factor must be a number from 0 to 999.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Enter a valid value for the smoothing factor and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current record is printed in the dump data set and the position of the error is given.

EQQX470E FIELD WEEK DAY IS INVALID IN INTERVAL *IVLID*, MUST BE IN RANGE 0-8

User response: Enter a valid Week day value. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given. *IVLID* identifies the interval by the week day number (1-7), the standard day number (8) or a date, followed by the interval start time.

EQQX471E BOTH FIELD WEEK DAY AND DATE IN INTERVAL *IVLID* HAVE A VALUE

User response: Reset either Week day or Date. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given. *IVLID* identifies the interval by the week day number (1-7), the standard day number (8) or a date, followed by the interval start time.

EQQX472E FIELD DATE IS INVALID IN INTERVAL *IVLID*, MUST BE IN FORMAT YYMMDD

User response: Enter a Date in format YYMMDD. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given. *IVLID* identifies the interval by the week day number (1-7), the standard day number (8) or a date, followed by the interval start time.

EQQX473E FIELD FROM TIME IS INVALID IN INTERVAL *IVLID*, MUST HAVE FORMAT HHMM

User response: Enter a From time in format HHMM. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given. *IVLID* identifies the interval by the week day number (1-7), the standard day number (8) or a date, followed by the interval start time.

EQQX474E FIELD TO TIME IS INVALID IN INTERVAL *IVLID*, MUST BE IN FORMAT HHMM

User response: Enter a To time in format HHMM. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given. *IVLID* identifies the interval by the week day number (1-7), the standard day number (8) or a date, followed by the interval start time.

EQQX475E FIELD FROM TIME NOT EARLIER THAN TO TIME IN INTERVAL *IVLID*

User response: Change the From time or To time, From time must be earlier than To time. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given. *IVLID* identifies the interval by the week day number (1-7), the standard day number (8) or a date, followed by the interval start time.

EQQX476E ANOTHER INTERVAL OVERLAPS INTERVAL *IVLID*

User response: Change the From and To times in the interval definitions for the identified day. An interval may start on the same minute as the preceding interval ends, or later. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given. *IVL* identifies the interval by the week day number (1-7), the standard day number (8) or a date, followed by the interval start time.

EQQX477E FIELD ONERROR IS INVALID, MUST BE F, FX, FS, K OR BLANKS

System action: The request to write the record is rejected.

User response: Set Onerror in the common segment of the resource record to a two character value as given in the message. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current resource is printed in the dump data set and the position of the invalid resource specification in the record is given.

EQQX478E FIELD DEVIATION IS INVALID, MUST BE IN INTERVAL -999999 TO 999999

System action: The request to write the record is rejected.

User response: Set Deviation in the common segment of the resource description record to an integer value as given in the message. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current resource is printed in the dump data set and the position of the invalid resource

specification in the record is given.

EQQX479E FIELD GLOBAL AVAILABILITY IS INVALID, MUST BE Y, N OR A BLANK

System action: The request to write the record is rejected.

User response: Set Global (override) Availability in the common segment of the resource record to a one character value as given in the message. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current resource is printed in the dump data set and the position of the invalid resource specification in the record is given.

EQQX480E FIELD GLOBAL QUANTITY IS INVALID, MUST BE IN INTERVAL 0 TO 999999

System action: The request to write the record is rejected.

User response: Set Global (override) Quantity in the common segment of the resource description record to an integer value as given in the message. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current resource description is printed in the dump data set and the position of the invalid resource specification in the record is given.

EQQX481E FIELD INTERVAL DATE IS OMITTED, THERE MUST BE A VALID DATE

System action: The request to write the record is rejected.

User response: Set Date in the interval segments of the resource record to a valid date. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current resource is printed in the dump data set and the position of the invalid resource specification in the record is given.

EQQX482E FIELD INTERVAL QUANTITY IS NEGATIVE, MUST BE IN INTERVAL 0 TO 999999

System action: The request to write the record is rejected.

User response: Set Quantity in the interval segments of the resource record to a valid value. If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current resource is printed in the dump data set and the position of the invalid resource specification in the record is given.

EQQX483E WORKSTATION NAME WS DOES NOT MATCH ANY EXISTING WORKSTATION

System action: The request to write the record is rejected.

User response: Set Workstation Names in the default segment and in the interval segments of the resource record to values that each match at least one of the workstation descriptions or, if this is a current plan resource, at least one of the current plan workstations. Or, if the error occurred in batch and it is a resource description, set the resource verification option to accept the workstation names as they are. The verification option can be set either via the program interface OPTIONS request or via the program interface INIT statement in the EQQYPARM file. Resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current resource is printed in the dump data set and the position of the invalid resource specification in the record is given.

EQQX484E WORKSTATION NAME WS DOES NOT MATCH ANY EXISTING WORKSTATION

User response: Remove the duplicate.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The erroneous resource is printed in the dump data set and the position of the invalid specification is given.

EQQX485E THE RESOURCE NAME MUST NOT BE BLANK.

System action: The request to write the record is rejected.

User response: Specify a valid resource name.

Problem determination: Review the dump data set (ddname EQQDUMP) for further information. The erroneous resource is printed in the dump data set and the position of the invalid specification is given.

EQQX486E THE CRITICAL JOB ATTRIBUTE MUST BE P, W OR N.

Explanation: The critical job attribute is invalid.

System action: The request is rejected.

System programmer response: If you are using the programming interface, provide the correct critical job attribute, and if the error persists, contact IBM Software Support.

User response: Enter a valid critical job attribute. If you cannot find a valid reason for the error, contact your system programmer.

EQQX487E THE LATE JOB POLICY MUST BE E, D, L, C, OR BLANK

Explanation: The late job policy is invalid. The only valid values are:

- E** Estimated Duration. The job is assisted if it runs beyond its estimated duration.
- D** Deadline. The job is assisted if it has not finished when its deadline time is reached.
- L** Latest Start Time. The job is assisted if it is submitted after its latest start time.
- C** Conditional An algorithm calculates whether to apply the Deadline policy or the Latest Start Time policy.
- "** The scheduler WLM will eventually use the policy specified in OPCOPTS.

System action: The request is rejected.

System programmer response: If you are using the programming interface, provide the correct late job policy attribute, and if the error persists, contact IBM Software Support.

User response: Enter a valid late job policy attribute. If you cannot find a valid reason for the error, contact your system programmer.

EQQX488E JCL SIZE RETRIEVED THROUGH EXIT2 CANNOT EXCEED 608 KB

Explanation: The size of the JCL to be retrieved through the EXIT2 exceeds the documented limit of 608 000 bytes.

System action: The request is rejected.

User response: Reduce the size of the JCL to the lowest between the value of 608 000 bytes and the record size of the JCL repository. For information about

JCL repository data sets, refer to *Managing the Workload and Installation Guide*.

EQQX489E INVALID DURATION

Explanation: Duration of operation WS OP is invalid, the value is DUR in the format FORMAT.

System action: The request is rejected.

User response: Set the correct duration value in the current FORMAT.

EQQX490E FIELD ONCOMPLETE IS INVALID, MUST BE Y, N, R, OR BLANK

Explanation: The controller received a request to write a special resource record, but the value of the On Complete field is not valid.

System action: The request to write the record is rejected.

User response: Set a correct value for the specified field (Y, N, R, or blank).

If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current resource is printed in the dump data set and the position of the incorrect resource specification in the record is given.

EQQX491E FIELD MAXUSAGELIMIT IS INVALID, MUST BE IN RANGE 0 TO 999999

Explanation: The controller received a request to write a special resource record but the value of the Max Usage Limit field is not valid.

System action: The request to write the record is rejected.

User response: Set a correct value for the specified field (an integer from 0 to 999999).

If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current resource is printed in the dump data set and the position of the incorrect resource specification in the record is given.

EQQX492E FIELD MAXUSAGETYPE IS INVALID, MUST BE Y, N, OR R

Explanation: The controller received a request to write a special resource record but the value of the Max Usage Type field is not valid.

System action: The request to write the record is rejected.

User response: Set a correct value for the specified field (Y, N, or R).

If the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current resource is printed in the dump data set and the position of the incorrect resource specification in the record is given.

EQQX493E ON COMPLETE FIELD IS INVALID, MUST BE Y, N, R, OR BLANK

Explanation: The controller received a request to write an operation record, but the special resource segment On Complete value is not valid.

System action: The request to write the record is rejected.

User response: Set a correct value for the specified field (Y, N, R, or blank).

If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current application description resource is printed in the dump data set and the position of the incorrect resource specification in the record is given.

EQQX500E GROUP DEFINITION ID GRPDEF IS INVALID

Explanation: The group definition ID field contains invalid characters.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error, contact IBM Software Support.

User response: Specify a valid group definition ID. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX501E GROUP DEF ID GRPDEF NOT IN BRACKETED DBCS FORMAT

Explanation: The group definition ID field should be in DBCS format, that is, it should start with a shift-out (X'0E') character and end with a shift-in (X'0F') character. Either shift-out or shift-in, or both, are missing.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error, contact IBM Software Support.

User response: Specify a valid group definition ID. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX502E UNPAIRED SHIFT-OUT OR SHIFT-IN CHARS IN GRPDEF

Explanation: The group definition ID field contains one or more extra shift-out or shift-in characters.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error, contact IBM Software Support.

User response: Specify a valid group definition ID. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX503E INVALID DBCS-CHARACTER(S) IN GRPDEF

Explanation: The group definition ID field contains out-of-range DBCS characters. With the exception of DBCS blank, X'4040', each byte must be in the range X'41' to X'FE'.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error, contact IBM Software Support.

User response: Specify a valid group definition ID. If the error occurred in batch, resubmit the job. If you

cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX504E ODD NUMBER OF BYTES IN GRPDEF

Explanation: The group definition ID field is specified as a DBCS field and requires two bytes per character, that is, the number of bytes must be a multiple of two.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error, contact IBM Software Support.

User response: Specify a valid group definition ID. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX505E NO ID SPECIFIED FOR DBCS GROUP DEFINITION

Explanation: The group definition ID field contains shift-out and shift-in DBCS characters, but you have not specified a valid value for the group definition.

System action: The data is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error, contact IBM Software Support.

User response: Specify a valid group definition ID. If the error occurred in batch, resubmit the job. If you cannot find the reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX506E THE APPLICATION DESCRIPTION (GROUP DEFINITION) GRPDEF DOES NOT EXIST

System action: The request to write the record is rejected.

User response: Set Application Group Definition in the common segment of the application description record to the name of an existing application

description that is defined as an Application Group Definition. Or, if the error occurred in batch, set the Application Group verification option to accept the application group names as they are. Use either the program interface OPTIONS request or the program interface INIT statement in the EQQYPARM file to set the verification option. Resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Review the dump data set (ddname EQQDUMP) of the controller for further information. The current application description is printed in the dump data set and the position of the invalid specification in the record is given.

EQQX507E EXTENDED INFORMATION ARE ASSOCIATED TO AN INVALID OP NUMBER

Explanation: A program interface (PIF) program has requested an ADEXT insert with an invalid argument in OWNOPN value.

System action: The request is rejected.

User response: Correct the PIF program and resubmit the job.

EQQX508E OPERATION OPN HAS MORE THAN 40 DEPENDENCIES

Explanation: The request failed because the GENERAL SERVICE task detected more than 40 dependencies defined for the operation. A dependency can be:

- a predecessor operation;
- one or more special resources required by the operation. In this case, one dependency has to be considered regardless the number of required resources.

System action: The request is rejected.

User response: Check the controller message log for EQQG016E message. It provides the complete key of the object which breaks the dependencies limit. Decrease the number of dependencies specified for the operation and repeat the request.

| EQQX509E CANNOT APPLY RC RESTART TO A NOPED OPERATION

| **Explanation:** You cannot execute the following restart | and clean actions: STEP RESTART, JOB RESTART, FSR | and FJR fast commands, to a noped operation.

| **System action:** RESTART is not executed.

| **User response:** None.

EQQX510E REMOTE JOB INFORMATION CANNOT BE SPECIFIED FOR OPERATION *OP*

Explanation: You are creating or modifying an operation defined to run on a workstation that is not a remote engine workstation. For this operation you cannot specify the remote job information.

System action: The data is rejected.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX511E REMOTE JOB INFORMATION MUST BE SPECIFIED FOR OPERATION *OP*

Explanation: You are creating or modifying an operation defined to run on a remote engine workstation. For this operation you must specify the remote job information.

System action: The data is rejected.

User response: Correct the data and reenter. If the error occurred in batch, resubmit the job.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX512E COMPLETE IF BIND FAILS OPTION MUST BE Y OR N FOR OPERATION *OP*

Explanation: The only correct values for the "Complete if bind" option are Y or N.

System action: The request is rejected.

User response: Check the entered data and correct it, if the error occurred in batch, submit the job again.

EQQX513E REMOTE APPLICATION ID IS MISSING OR INVALID FOR OPERATION *OP*

Explanation: No data has been entered in the remote application ID field or the remote application ID that was entered contains invalid characters.

System action: The request to write the record is rejected.

User response: Enter a valid application ID and, if the error occurred in batch, resubmit the job.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This

data set contains a copy of the failing record and the position of the error.

EQQX514E REMOTE OPERATION NUMBER MUST BE 1-255 FOR OPERATION *OP*

Explanation: The indicated remote operation number is invalid. It must be a number in the range 1-255.

System action: The request to write the record is rejected.

User response: Enter a valid operation number and, if the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX515E REMOTE JOB NAME IS MISSING OR INVALID FOR OPERATION *OP*

Explanation: No data has been entered in the remote job name field or the remote job name that was entered contains invalid characters.

System action: The request to write the record is rejected.

User response: Enter a valid job name and, if the error occurred in batch, resubmit the job.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX516E REMOTE JOB STREAM WORKSTATION IS MISSING OR INVALID FOR *OP*

Explanation: No data has been entered in the remote job stream workstation name field or the remote job stream workstation name that was entered contains invalid characters.

System action: The request to write the record is rejected.

User response: Enter a valid job stream workstation and, if the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX517E REMOTE JOB STREAM NAME IS MISSING OR INVALID FOR OPERATION *OP*

Explanation: No data has been entered in the remote job stream name field or the remote job stream name

that was entered contains invalid characters.

System action: The request to write the record is rejected.

User response: Enter a valid job stream name and, if the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX518E REMOTE APPLICATION ID CONTAINS AN ODD NUMBER OF BYTES FOR OP OP

Explanation: The remote application identification field is specified as a DBCS field and requires two bytes per character. Hence, 2, 4, 6, ..., bytes per character must be entered.

System action: The data is rejected.

User response: Correct the data and reenter. If the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX519E REMOTE APPLICATION ID IS NOT BRACKETED DBCS FOR OPERATION OP

Explanation: The remote application identification field is specified to be in DBCS format, which means that it should start with a shift-out (X'0E') character and end with a shift-in (X'0F') character. Either shift-out or shift-in, or both, are missing.

System action: The data is rejected.

User response: Correct the data and reenter. If the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX520E REMOTE JOB INFORMATION CANNOT BE SPECIFIED FOR OPERATION OP

Explanation: The remote application identification field is blank, and as it must contain at least one DBCS character, it is invalid.

System action: The data is rejected.

User response: Correct the data and reenter. If the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set

(ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX521E REMOTE APPL ID CONTAINS UNPAIRED SHIFT-OUT/SHIFT-IN CHAR FOR OP OP

Explanation: The remote application identification field contains one or more superfluous shift-out or shift-in characters.

System action: The data is rejected.

User response: Correct the data and reenter. If the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX522E REMOTE APPLICATION ID CONTAINS INVALID DBCS-CHARACTER(S) FOR OP OP

Explanation: The field indicated by the cursor contains out-of-range DBCS characters. With the exception of DBCS blank, X'4040', each byte must be in the range X'41'– X'FE'.

System action: The data is rejected.

User response: Correct the data and reenter. If the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

EQQX523E RESOURCES AND CONDITIONS CANNOT BE SPECIFIED FOR OPERATION OP.

Explanation: The specified operation is a shadow job. Shadow jobs cannot have special resources, resources or conditions defined.

System action: The request to write the record is rejected.

User response: Correct the definition and, if the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

**EQQX524E SCHEDULING ENVIRONMENT
CANNOT BE SPECIFIED FOR
OPERATION OP.**

Explanation: The specified operation is a shadow job. Shadow jobs cannot use scheduling environment.

System action: The request to write the record is rejected.

User response: Correct the definition and, if the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

**EQQX525E DEADLINE WTO MESSAGES
CANNOT BE ISSUED FOR
OPERATION OP.**

Explanation: The specified operation is a shadow job. Shadow jobs cannot have deadline WTO option set to Y.

System action: The request to write the record is rejected.

User response: Correct the definition and, if the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

**EQQX526E OPERATION OP CANNOT BE SET
ELIGIBLE FOR WLM ASSISTANCE.**

Explanation: The specified operation is a shadow job. Shadow jobs cannot have critical job option set to W.

System action: The request to write the record is rejected.

User response: Correct the definition and, if the error occurred in batch, submit the job again.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the failing record and the position of the error.

**EQQX530E A RUN CYCLE GROUP RECORD
CANNOT BE SAVED BECAUSE IS
TOO SHORT**

Explanation: The size of the current application description (AD) record is less than the minimum record size of the AD database.

System action: The request to write the record is rejected.

User response: Check the entered data and, if the

error occurred in batch, resubmit the job.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX531E THE RUN CYCLE GROUP ID RG IS
INVALID**

Explanation: The run cycle group ID that was entered contains invalid characters.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Enter a valid run cycle group ID and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

**EQQX532E THE RULE NAME MUST BE UNIQUE
WITHIN A RUN CYCLE GROUP**

Explanation: You have specified a rule name that has already been defined in this run cycle group.

System action: The request is rejected.

User response: Specify a unique rule name.

**EQQX533E OFFSET TO FIRST RUN CYCLE IS
INVALID IN RG RG**

Explanation: The offset to the first run cycle is invalid in the indicated run cycle group record.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX534E INVALID CALENDAR ID CALID IN
RG RG

Explanation: An invalid calendar ID was entered in the indicated run cycle group.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Enter a valid calendar ID and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX535E INVALID CHARACTERS IN
COMMON PART IN RG RG

Explanation: The common part in the indicated run cycle group contains invalid characters.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX536E A VALID RULE NAME MUST BE
SPECIFIED

Explanation: You have not entered a valid rule name. A valid rule name has a maximum of 8 characters, where the first character is alphabetical and the remaining characters are alphanumeric or national.

System action: The request is rejected.

User response: Specify a valid rule name.

EQQX537E THE RULE ON WHICH THE RUN
CYCLE IS BASED MUST BE DEFINED

Explanation: A run cycle was inserted or replicated in the run cycle group, but no rule definition was specified.

System action: The request is rejected.

User response: Use the S row command to select the Rule Modification panel and define the rule.

EQQX538E RUN CYCLE RUN_CYCLE_ID IN RG RG
HAS NO IA TIME NOR DEFAULT
VALUE

Explanation: The input arrival time is mandatory in a run cycle group, either at run cycle group level or in each run cycle of the group.

System action: The request is rejected.

User response: Specify an IA time either for the run cycle group (which becomes the default for all run cycles in the group) or for each run cycle in the group.

EQQX539E THE FREE DAY SPECIFICATION
FDRULE IS INVALID

Explanation: The free day rule that was entered is not E, 1, 2, 3, or 4.

System action: The request to write the record is rejected.

System programmer response: Review the IBM Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Enter a valid free day rule and, if the error occurred in batch, resubmit the job. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX540E THE RUN CYCLE TYPE RCTYPE IS
INVALID. IT MUST BE R, E, A, OR D

Explanation: The run cycle type that was entered is invalid. Valid run cycle types are:

R Regular rule-based run cycles

E Exception rule-based run cycles.

A Regular rule-based run cycles belonging to the same set.

D Exception rule-based run cycles belonging to the same set.

System action: The request to write the record is rejected.

User response: Enter a valid run cycle type and, if the error occurred in batch, resubmit the job.

Problem determination: Look in the dump data set

EQQX541E • EQQX607E

| (ddname EQQDUMP) for further information. This
| data set contains a copy of the record and the position
| of the error.

| **EQQX541E** MULTIPLE INSTANCES DETECTED.
| SPECIFY IA TO OVERRIDE THEM.

| **Explanation:** Multiple instances have been detected.
| They cannot be accepted.

| **System action:** None.

| **User response:** Specify an Input Arrival in the
| application to ignore the detected multiple instances.

| **EQQX542E** THE RUN CYCLE SUBSET ID IS
| INVALID

| **Explanation:** One or more invalid characters were
| used in the subset name. Only alphanumeric characters
| are admitted.

| **System action:** The run cycle is not saved.

| **User response:** Use only alphanumeric characters to
| specify the subset name.

EQQX601E CONNINFO FUNC IN STATE STATE
FAILED, RC RC, RS RS, TCPIPMSG.

Explanation: The TCP/IP communication between the
server and either the dialog or the program interface
application failed. The server issued a TCP/IP service
request that ended with a nonzero return code.

System action: The server deallocates the TCP/IP
conversation. The communication between the server
and either the dialog or the program interface
application is broken.

User response: Check the meaning of the TCP/IP
return codes. In case of SSL error, the most common
causes are listed in Chapter 236, "SSL errors," on page
1431. *CONNINFO* contains the IP address and the port
number of the server you are connecting to. *TCPIPMS*
contains an additional diagnostic message. If the
problem recurs, report the error to IBM Software
Support.

EQQX602E THE COMMUNICATION WAS
UNEXPECTEDLY RESET BY THE PEER.

Explanation: A problem occurred at the server side.
Most common causes of this problem are:

- The server was stopped.
- The partner connection parameters are inconsistent.

System action: The server closes the TCP/IP
connection. Contact between the remote interface and
subsystem is lost. The partner of the TCP/IP
connection is informed about the error.

User response: Check the status of the server and the
connection parameters. Look for additional information

in the peer EQQMLOG. If the problem persists, report
the error to IBM Software Support.

EQQX604E SELECT ONE OF THE LU NAME
LINES

Explanation: There must be at least one entry in the
subsystem name table and exactly one row must be
selected by a / in the first column.

System action: The system waits for you to respond.

User response: If you are logged on to TSO on the
z/OS where the controller is running, select the row
with the Controller subsystem name and no Server LU
name. If you are logged on to TSO on another z/OS,
select a row with a LU name specified, thereby
selecting the proper Controller subsystem and the LU
name of the Server handling the communication to the
Controller.

EQQX605E SELECT ONE AND ONLY ONE OF
THE LU NAME LINES

Explanation: Only one of the entries in the subsystem
name table can be selected by a / in the first column.

System action: The system waits for you to respond.

User response: If you are logged on to TSO on the
z/OS where the controller is running, select the row
with the Controller subsystem name and no Server LU
name. If you are logged on to TSO on another z/OS,
select a row with a LU name specified, thereby
selecting the proper Controller subsystem and the LU
name of the Server handling the communication to the
Controller.

EQQX606E EACH ROW MUST HAVE A
DIFFERENT SUBSYSTEM
NAME/LU/HOST NAME
COMBINATION.

Explanation: The subsystem name table must have
unique rows.

System action: The system waits for you to respond.

User response: Remove one of the rows with the same
values on both controller subsystem name and server
destination.

EQQX607E EACH ROW MUST SPECIFY ONE
PROTOCOL. HOST NAME AND LU
NAME ARE BOTH SET.

Explanation: Select either the APPC or the TCP/IP
communication protocol to perform the remote logon to
the subsystem. The LU NAME field is used for APPC,
while the HOST NAME field is used for TCP/IP. You
cannot specify both.

System action: The logon parameters are not saved.

User response: Deselect the unneeded value.

EQQX608E VALID VALUES FOR PORT NUMBER ARE FROM 0 TO 65535.

Explanation: Data entry error; see “Data entry errors” on page 803.

EQQX609E ERROR IN PARSING TCPOPTS STATEMENTS OR MSG LOG MISSING.

Explanation: An error occurred while processing the TCPOPTS statement during the remote dialog execution. Either the TCPOPTS statement contains a syntax error or the TSO logon procedure does not specify the EQQMLOG file.

System action: The request is rejected.

User response: Check the TSO user EQQMLOG file to identify the reason for the TCPOPTS parsing error. If you do not find the EQQMLOG file, you might have missed to define the EQQMLOG DD statement in the TSO logon procedure; this can be confirmed by message EQQZ030E in the TSO user JESMSGLG file.

EQQX610E VERB IN STATE STATE FAILED, RC RC, SR SR, DR DR

Explanation: An APPC service request issued for server communication failed. The verb *VERB* was issued when the conversation was in state *STATE*. APPC returned: Return_Code *RC*, Status_Received *SR* and Data_Received *DR*.

System action: The request is rejected.

System programmer response: Check the meaning of the APPC return codes (see Chapter 230, “EQQXnnn messages,” on page 1279). Check the message log of the server for a message explaining the communication loss. If the error recurs, report the error to IBM Software Support.

User response: Check that the proper LU name is specified. For the dialog the LU name is set via the OPTIONS menu. A program interface application sets the LU name through the EQQYPARM parameter file or through the INIT request. Repeat the dialog action from the IBM Tivoli Workload Scheduler for z/OS primary option panel or rerun the program interface application.

EQQX611E APPC/MVS VERB VERB FAILED RC RC, SR SR, DR DR

Explanation: An APPC service request issued for server communication failed. The verb *VERB* was issued when the conversation was in state *STATE*. APPC returned: Return_Code *RC*, Status_Received *SR* and Data_Received *DR*.

System action: The request is rejected.

System programmer response: Check the meaning of the APPC return codes (see Chapter 230, “EQQXnnn messages,” on page 1279). Check the message log of the server for a message explaining the communication loss. If the error recurs, report the error to IBM Software Support.

User response: Check that the proper LU name is specified. For the dialog the LU name is set via the OPTIONS menu. A program interface application sets the LU name through the EQQYPARM parameter file or through the INIT request. Repeat the dialog action from the IBM Tivoli Workload Scheduler for z/OS primary option panel, or rerun the program interface application.

EQQX612E INSUFFICIENT VIRTUAL STORAGE, DIAGNOSTIC INFO ALT

Explanation: A routine for communication with the server failed because it could not obtain sufficient amount of virtual storage.

System action: The request is rejected.

User response: Log on to TSO with a larger SIZE parameter value or rerun the program interface application with a larger specified region.

EQQX614E REQUEST FAILED, SEVERE ERROR AT SERVER LU

Explanation: An error occurred at the server preventing it from completing a service.

System action: The dialog or program interface application cannot continue.

System programmer response: Check the message log of the server for a message explaining the error at the server.

System programmer response: Check the message log of the server for a message explaining the communication problem. If the problem recurs, report the error to IBM Software Support.

User response: Check that the proper LU name is specified. For the dialog the LU name is set via the OPTIONS menu. A program interface application sets the LU name through the EQQYPARM parameter file or through the INIT request. Repeat the dialog action from the IBM Tivoli Workload Scheduler for z/OS primary option panel, or rerun the program interface application.

EQQX615E FAILED TO SET UP COMMUNICATION WITH SERVER LU, RC RC

Explanation: An APPC allocate request issued for server communication failed. *LU* shows the LU name of

the server. RC shows the return code of the Allocate request.

System action: The user cannot enter the scheduler dialog. The INIT request of program interface application gets a return code of 8.

System programmer response: Check the meaning of the APPC return codes (see Chapter 230, "EQQXnnn messages," on page 1279). Check the message log of the server for a message explaining the communication loss. If the error recurs, report the error to IBM Software Support.

User response: Check that the proper LU name is specified. For the dialog the LU name is set via the OPTIONS menu. A program interface application sets the LU name through the EQQYPARM parameter file or through the INIT request. Repeat the dialog action from the IBM Tivoli Workload Scheduler for z/OS primary option panel or rerun the program interface application.

EQQX616E SECURITY ENVIRONMENT CREATE FAILED, THE SERVER RECEIVED NO USERID

Explanation: No user ID was available for the server. It is required by the server when building a security environment for this user.

System action: The user cannot start the scheduler dialog via this server. The INIT request of program interface application gets a return code of 8.

User response: Check that the LU name has been defined in the APPL statement, in SYS1.VTAMLST. Refer to the *Planning and Installation* for the correct value of the SECACPT keyword. For the dialog the LU name is set via the OPTIONS menu. A program interface application sets the LU name through the EQQYPARM parameter file or through the INIT request. Repeat the dialog action from the IBM Tivoli Workload Scheduler for z/OS primary option panel or rerun the program interface application.

EQQX617E SECURITY ENVIRONMENT CREATE FAILED, SAF RC XSSRC RACF RC XSSRS, RS XSSAB

Explanation: The server failed to create a security environment for this user. The SAF return code and the RACF return and reason codes of the failing RACROUTE VERIFY=CREATE is given in the message.

System action: The user cannot start the scheduler dialog remotely. The INIT request of program interface application gets a return code of 8.

User response: If you are using APPC communication, check that the correct LU name is specified. For the dialog, the LU name is set via the OPTIONS menu. A program interface application sets the LU name through the EQQYPARM parameter file or through the

INIT request. Repeat the dialog action from the IBM Tivoli Workload Scheduler for z/OS primary option panel or rerun the program interface application.

If you are using the TCP/IP communication to access IBM Tivoli Workload Scheduler for z/OS, you should check the authorizations related to the RACF user linked to the IBM Tivoli Workload Scheduler for z/OS user provided by the API or Tivoli Workload Dynamic Console.

EQQX618E THE TCP/IP COMMUNICATION SUBTASK ABENDED.

Explanation: The ISPF dialog abnormally ended during the current dialog-to-server TCP/IP session.

System action: The dialog-to-server TCP/IP session and the TCP/IP server subtask abnormally end.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQX619E THE CONNECTION TIMEOUT EXPIRED, THE CONNECTION WAS NOT ESTABLISHED.

Explanation: This message is issued on the client when the connection cannot be established within the time specified in the CONNTIMEOUT parameter. This condition might occur because the server has temporarily reached the maximum number of concurrent connection requests it can manage. Message EQQPH49W is also issued in the server MLOG.

System action: The connection is rejected, and the client receives an error.

User response: On the client, increase the value set for the CONNTIMEOUT parameter.

EQQX620E VERB in state STATE failed, RC RC, SR SR, DR DR, APPCMG MID

Explanation: An APPC service request issued for server communication failed. The verb VERB was issued when the conversation was in state STATE. APPC returned: Return_Code RC, Status_Received SR, Data_Received DR and APPC_Message_Code MID.

System action: The request is rejected.

System programmer response: Check the meaning of the APPC return codes (see Chapter 230, "EQQXnnn messages," on page 1279). Check the message log of the server for a message explaining the communication loss. If the error recurs, report the error to IBM Software Support.

User response: Check that the proper LU name is specified. For the dialog the LU name is set through the OPTIONS menu. A program interface application sets the LU name through the EQQYPARM parameter file or through the INIT request. Repeat the dialog action from the Tivoli Workload Scheduler for z/OS primary option panel or rerun the program interface application.

EQQX700E PREDECESSOR PREAD EOP NOT VALID MANDATORY FOR WS OP.

Explanation: The Application Description validation failed. The predecessor identified by Application name *PREAD* and Operation number *EOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an invalid value in the Is mandatory field.

System action: The request to write the AD record is rejected.

System programmer response: Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify a valid Is mandatory value. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX701E PREDECESSOR PREAD EOP NOT VALID CRITERIA FOR WS OP.

Explanation: The Application Description validation failed. The predecessor identified by Application name *PREAD* and Operation number *EOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an invalid value in the Dependency field.

System action: The request to write the AD record is rejected.

System programmer response: Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify a valid dependency value. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX702E PREDECESSOR PREAD EOP NOT VALID ADID FOR WS OP.

Explanation: The Application Description validation failed. The external predecessor identified by Application name *PREAD* and Operation number *EOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an interval definition with an invalid application name.

System action: The request to write the AD record is rejected.

System programmer response: Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify a valid dependency interval. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX703E PREDECESSOR PREAD EOP NOT VALID OP.NUM FOR WS OP.

Explanation: The Application Description validation failed. The external predecessor identified by Application name *PREAD* and Operation number *EOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an interval definition with an invalid operation number.

System action: The request to write the AD record is rejected.

System programmer response: Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

User response: Specify a valid operation number. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

EQQX704E PREDECESSOR PREAD EOP NOT VALID TYPE FOR WS OP.

Explanation: The Application Description validation failed. The external predecessor identified by Application name *PREAD* and Operation number *EOP*, and referenced by the operation identified by

| workstation *WS* and operation number *OP* contains an interval definition with an invalid resolution criteria value.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid resolution criteria. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname *EQQDUMP*) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX705E PREDECESSOR PREAD EOP NOT VALID FROM: FOR WS OP.**

| **Explanation:** The Application Description validation failed. The external predecessor identified by Application name *PREAD* and Operation number *EOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an interval definition with an invalid FROM: value.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid FROM: value. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname *EQQDUMP*) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX706E PREDECESSOR PREAD EOP NOT VALID TO: FOR WS OP.**

| **Explanation:** The Application Description validation failed. The external predecessor identified by Application name *PREAD* and Operation number *EOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an interval definition with an invalid TO: value.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid TO: value. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname *EQQDUMP*) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX707E COND. PRED. SCID SCAD SCOP NOT VALID ADID FOR WS OP.**

| **Explanation:** The Application Description validation failed. The conditional external predecessor identified by Condition Id *SCID*, Application name *SCAD*, and Operation number *SCOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an interval definition with an invalid Application name.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid Application name. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname *EQQDUMP*) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX708E COND. PRED. SCID SCAD SCOP NOT VALID OP.NUM FOR WS OP.**

| **Explanation:** The Application Description validation failed. The conditional external predecessor identified by Condition Id *SCID*, Application name *SCAD*, and Operation number *SCOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an interval definition with an invalid operation number.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid operation number. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX709E** NUMBER OF EXTERNAL PRED. IVL
| NOEXPR NOT VALID IN WS OP.

| **Explanation:** The Application Description validation failed. The number of external predecessor intervals NOEXPR in the operation identified by workstation WS and operation number OP contains an invalid value: it must be 0 or greater.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid number of external predecessor intervals. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX710E** NUMBER OF CONDITIONAL PRED.
| IVL NOEXPR NOT VALID IN WS OP.

| **Explanation:** The Application Description validation failed. The number of conditional predecessor intervals NOEXPR in the operation identified by workstation WS and operation number OP contains an invalid value: it must be 0 or greater.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid number of conditional predecessor intervals. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX711E** COND. PRED. SCID SCAD SCOP NOT
| VALID IVL TYPE FOR WS OP.

| **Explanation:** The Application Description validation failed. The conditional external predecessor identified by Condition Id SCID, Application name SCAD, and Operation number SCOP, and referenced by the operation identified by workstation WS and operation number OP contains an interval definition with an invalid resolution criteria value.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid resolution criteria value. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX712E** COND. PRED. SCID SCAD SCOP NOT
| VALID FROM: FOR WS OP.

| **Explanation:** The Application Description validation failed. The conditional external predecessor identified by Condition Id SCID, Application name SCAD, and Operation number SCOP, and referenced by the operation identified by workstation WS and operation number OP contains an interval definition with an invalid FROM: value.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid FROM: value. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX713E COND. PRED. SCID SCAD SCOP NOT**
| **VALID TO: FOR WS OP.**

| **Explanation:** The Application Description validation failed. The conditional external predecessor identified by Condition Id *SCID*, Application name *SCAD*, and Operation number *SCOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an interval definition with an invalid TO: value.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid TO: value. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname *EQQDUMP*) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX714E COND. PRED. SCID SCAD SCOP NOT**
| **VALID COND ID: FOR WS OP.**

| **Explanation:** The Application Description validation failed. The conditional external predecessor identified by Condition Id *SCID*, Application name *SCAD*, and Operation number *SCOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an interval definition with an invalid Condition id value.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid Condition id value. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname *EQQDUMP*) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX715E NO EXTERNAL PRED FOUND FOR**
| **EXT PRED IVL PREAD EOP.**

| **Explanation:** The Application Description validation failed. The external predecessor interval must refer to an existing external predecessor. This is not true for the external predecessor identified by Application name *PREAD* and by operation number *EOP*.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify an existing external predecessor. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname *EQQDUMP*) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX716E NO EXTERNAL PRED FOUND FOR**
| **EXT COND IVL SCID SCAD SCOP.**

| **Explanation:** The Application Description validation failed. The conditional external predecessor interval must refer to an existing external predecessor. This is not true for the conditional external predecessor identified by Condition id *SCID*, Application name *SCAD*, and operation number *SCOP*.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify an existing external predecessor. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname *EQQDUMP*) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX717E CRITERIA DEFINITION NOT**
| **COHERENT WITH INTERVAL**
| **DEFINITION.**

| **Explanation:** The Application Description validation failed. The conditional or external predecessor interval type is not coherent with the resolution criteria value. For example, this can happen if a resolution criteria R

| is specified but no interval definition, or an absolute interval, is provided.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a coherent definition. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX719E NOT VALID DEPENDENCY
RESOLUTION FROM SPECIFICATION
IN WS OP.**

| **Explanation:** The Application Description validation failed. The value in the FROM field in the Resolution criteria data for the cross dependency predecessor is not valid for the operation identified by workstation *WS* and by operation number *OP*.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid FROM value. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX720E NOT VALID DEPENDENCY
RESOLUTION TO SPECIFICATION IN
WS OP.**

| **Explanation:** The Application Description validation failed. The value in the TO field in the Resolution criteria data for the cross dependency predecessor is not valid for the operation identified by workstation *WS* and by operation number *OP*.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli

| Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid TO value. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX722E COND. PRED. SCID SCAD SCOP NOT
VALID CRITERIA FOR WS OP.**

| **Explanation:** The Application Description validation failed. The conditional external predecessor identified by Condition Id *SCID*, Application name *SCAD*, and Operation number *SCOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an invalid value for the resolution criteria.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

| **User response:** Specify a valid value for the resolution criteria. If the error occurred in batch, submit the job again. If you cannot find a valid reason for the error, contact your system programmer.

| **Problem determination:** Look in the dump data set (ddname EQQDUMP) for further information. This data set contains a copy of the record and the position of the error.

| **EQQX723E START IS AFTER END OF EXT PRED
IVL PREAD EOP FOR WS OP.**

| **Explanation:** The Application Description validation failed. The external predecessor identified by Application name *PREAD* and Operation number *ECOP*, and referenced by the operation identified by workstation *WS* and operation number *OP* contains an invalid resolution criteria interval. This is because the start of the interval was defined to be later than the end.

| **System action:** The request to write the AD record is rejected.

| **System programmer response:** Review the Tivoli Workload Scheduler for z/OS message log to determine the cause of the error. If you cannot determine the cause of the error and the error persists, contact IBM Software Support.

EQQX724E

| **User response:** Specify a valid value for the resolution
| criteria interval. If the error occurred in batch, submit
| the job again. If you cannot find a valid reason for the
| error, contact your system programmer.

| **Problem determination:** Look in the dump data set
| (ddname EQQDUMP) for further information. This
| data set contains a copy of the record and the position
| of the error.

| EQQX724E START IS AFTER END OF COND
| PRED IVL SCID SCAD SCOP FOR WS
| OP.

| **Explanation:** The Application Description validation
| failed. The conditional external predecessor identified
| by Condition id *SCID*, Application name *SCAD*, and
| Operation number *SCOP*, and referenced by the
| operation identified by workstation *WS* and operation
| number *OP*, contains an invalid resolution criteria
| interval. This is because the start of the interval was
| defined to be later than the end.

| **System action:** The request to write the AD record is
| rejected.

| **System programmer response:** Review the Tivoli
| Workload Scheduler for z/OS message log to determine
| the cause of the error. If you cannot determine the
| cause of the error and the error persists, contact IBM
| Software Support.

| **User response:** Specify a valid value for the resolution
| criteria interval. If the error occurred in batch, submit
| the job again. If you cannot find a valid reason for the
| error, contact your system programmer.

| **Problem determination:** Look in the dump data set
| (ddname EQQDUMP) for further information. This
| data set contains a copy of the record and the position
| of the error.

Chapter 231. EQQYnnn messages

EQQY001 - EQQY914

EQQY001I STATEMENTS FOR AD *AD*
PROCESSED SUCCESSFULLY

Explanation: The statements for creating an application description (AD) have been received. Syntax checking has revealed no error.

System action: Processing continues.

User response: None.

EQQY002I STATEMENTS FOR OI TO *AD*
PROCESSED SUCCESSFULLY

Explanation: The statements for creating an operator instruction (OI) have been received. Syntax checking has revealed no error.

System action: Processing continues.

User response: None.

EQQY003E OPTIONS STATEMENT MISPLACED
IN INPUT FILE. PROCESSING IS
DONE IN SCAN MODE

Explanation:

Before the PQ83269 APAR there was a limitation in the design of the batch loader for which it was allowed to have only one options statement in the sysin file and this should have been the first not commented card. This design limitation was not reflected in a consistent way in the code. With the PQ83269 APAR it is now allowed to have more options statements in the sysin file, with the rule that the following not commented card must be another options card or an ADSTART or an OISTART. If the sysin file does not comply with this rule, the new EQQV003E message is issued.

System action: The statements are processed in SCAN mode.

User response: Correct the input file and resubmit the job.

EQQY004I END OF PROCESSING. HIGHEST
RETURN CODE *RC*

Explanation: No more statements remain to be processed. The highest return code set when processing the statements is *RC*.

System action: Processing is ended.

User response: If *RC* is not zero, review the message log to determine the cause of the nonzero return code.

EQQY005W OPEN OF *FILE* FILE FAILED,
VALIDATION OF THE *RECS* WILL BE
INCOMPLETE

Explanation: A file required for validation of the created records cannot be opened. For validation of application descriptions, a file with workstation descriptions and calendar descriptions is required (ddname EQQWSDS). For validation of operator instructions, a file with application descriptions is required (ddname EQQADDS). These files are required only if the output is directed to a VSAM file.

System action: The rest of the input statements are scanned for data type errors.

User response: Check that the correct names of data sets are specified in the JCL and resubmit the job.

EQQY007W THIS *STM* STATEMENT IS NOT
PRECEDED BY A VALID *MSTM*
STATEMENT THE STATEMENT IS
PROCESSED IN SCAN MODE.

Explanation: The ADSTART and OISTART statements start up the creation of a record. After ADSTART is entered, only an application description (AD) details statement or another ADSTART or OISTART statement is allowed. After an OISTART statement, only an OIT statement or another ADSTART or OISTART statement is allowed. *MSTM* is an ADSTART or OISTART statement; *STM* is a details statement.

System action: The statement is scanned only for data type errors.

User response: Correct the input file, grouping all statements for the creation of one record together, and resubmit the job.

EQQY008W STATEMENT *STM* IS BYPASSED DUE
TO PARSER DETECTED ERROR

Explanation: The statement parser has detected an error in statement *STM*.

System action: Processing continues. The creation of the current record is abandoned and the remaining statements for the same record are bypassed.

User response: Correct the error described by the previous message and rerun.

Problem determination: The parser-detected error is given by the preceding message.

EQQY009W STATEMENT *STM* IS PROCESSED IN SCAN MODE DUE TO ERROR IN PREVIOUS STATEMENT

Explanation: This statement is for the same record as an earlier statement in which an error was detected.

System action: Processing continues.

User response: Correct the erroneous statement and rerun.

EQQY011E INSERT OF APPLICATION *ADID* FAILED

Explanation: The program interface request to INSERT application *ADID* into the current plan failed.

System action: Processing continues.

User response: Correct the error described by the previous message and rerun.

Problem determination: The preceding message gives the reason why the insert could not be done.

EQQY014W SUBSYS(NAME) AND CHECK(N) SPECIFICATIONS ARE MUTUALLY EXCLUSIVE. THE CHECK REQUEST IS IGNORED

Explanation: The validation of the output data cannot be suppressed when the output data from the batch loader goes to a IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: Processing continues. The normal data validation is applied.

User response: Remove the CHECK keyword.

EQQY015W ACTION(SCAN) AND CHECK(Y) SPECIFICATIONS ARE MUTUALLY EXCLUSIVE. THE CHECK REQUEST IS IGNORED

Explanation: No validation of output data is performed when ACTION(SCAN) is specified. By ACTION(SCAN), a check is done (on the batch loader statements) to verify that keywords are correctly specified and that the required values are set. No output data is produced and no consistency checking is done.

System action: Processing continues. No data validation is done.

User response: Remove the CHECK keyword.

EQQY020W CONFLICTING FORMAT SPECIFICATION BETWEEN *SUBS* AND THE *KW* KEYWORD FORMAT *FORM* IS USED

Explanation: The character format for the application

ID and owner ID used in the IBM Tivoli Workload Scheduler for z/OS subsystem is used by the batch loader when the output is directed to a subsystem.

System action: Processing continues using the DBCS option *FORM* for the *KW* data.

User response: Remove the *KW* keyword.

EQQY021E SUBSYS *SUBS* IS SPECIFIED IN OPTIONS STATEMENT, IT IS SET TO *YSUBS* IN THE INIT STATEMENT OF THE EQQYPARM FILE

Explanation: Two different subsystem names are specified.

System action: The record being created is considered in error and is not created. The following statements are scanned and validated.

User response: Remove or change the SUBSYS parameter of the SYSIN file OPTIONS statement or change the SUBSYS parameter of the EQQYPARM file INIT statement.

EQQY031E ADRULE VALID ONLY FOR RUN CYCLES WITH TYPE R OR E

Explanation: You can specify the ADRULE control statement only for run cycles with type R (Regular rule) or E (Exception rule).

System action: The application is not saved in the application description database because the run cycle is invalid.

User response: Change the run cycle type or remove the rule definition, and rerun the job.

EQQY032E DUPLICATE ADRULE CONTROL STATEMENT. ONLY 1 ADRULE IS ALLOWED FOR EACH ADRUN

Explanation: You can specify only one ADRULE control statement for each run cycle.

System action: The application is not saved in the application description database because the run cycle is invalid.

User response: Remove the extra ADRULE control statement or add an ADRUN statement before the second ADRULE.

EQQY033E NO ADRULE SPECIFIED FOR A RUN CYCLE WITH TYPE R OR E

Explanation: The ADRUN control statement specifies type R (Regular rule) or E (Exception rule), but there is no ADRULE statement.

System action: The application is not saved in the application description database because the run cycle is invalid.

User response: Add the ADRULE control statement to define a rule or change the TYPE on the ADRUN statement.

Problem determination: Review the dump data set (ddname EQQDUMP) for more information. The run cycle part of the current application description is printed in the data set and the position of the invalid value in the record is given.

EQY034E ERROR IN ADRULE CONTROL STATEMENT FOR RUN CYCLE VADRN IN APPLICATION VADID

Explanation: The ADRULE control statement for run cycle VADRN contains an error. Messages that precede this message give more details about the error.

System action: The application is not saved in the application description database because the run cycle is invalid.

User response: Correct the error and rerun the job.

Problem determination: Review the dump data set (ddname EQQDUMP) for more information. The run cycle part of the current application description is printed in the data set and the position of the invalid value in the record is given.

EQY035E INCORRECT LENGTH FIELD FOR ADRULE IN RUN CYCLE VADRN

Explanation: The length specified in the ADRIRDLEN field is not the same as the length in the ADRULEL field of the rule.

System action: The application is not saved in the application description database because the run cycle is invalid.

User response: Specify the correct length in both fields and rerun the job.

Problem determination: Review the dump data set (ddname EQQDUMP) for more information. The run cycle part of the current application description is printed in the data set and the position of the invalid value in the record is given.

EQY036E NO ADRULE SPECIFIED FOR A RUN CYCLE GROUP

Explanation: The RGRUN control statement is missing an ADRULE statement.

System action: The run cycle group is not saved in the database because the run cycle is invalid.

User response: Add the ADRULE control statement to define a rule.

Problem determination: Review the dump data set (ddname EQQDUMP) for more information. The run cycle part of the run cycle group is printed in the data

set and the position of the invalid value in the record is given.

EQY037E ERROR IN ADRULE CONTROL STATEMENT FOR RUN CYCLE VADRN IN RUN CYCLE GROUP VRGID

Explanation: The ADRULE control statement for run cycle VADRN contains an error. Messages that precede this message give more details about the error.

System action: The run cycle group is not saved in the database because the run cycle is invalid.

User response: Correct the error and rerun the job.

Problem determination: Review the dump data set (ddname EQQDUMP) for more information. The run cycle part of the run cycle group is printed in the data set and the position of the invalid value in the record is given.

EQY038E INCORRECT LENGTH FIELD FOR ADRULE FOR RUN CYCLE VADRN IN RUN CYCLE GROUP VRGID

Explanation: The length specified in the RGRIRDLEN field is not the same as the length in the RGRULEL field of the rule.

System action: The run cycle group is not saved in the database because the run cycle is invalid.

User response: Specify the correct length in both fields and rerun the job.

Problem determination: Review the dump data set (ddname EQQDUMP) for more information. The run cycle part of the run cycle group is printed in the data set and the position of the invalid value in the record is given.

EQY050E VALIDATION FAILED FOR: BLOCK, REASON: REASON, OFFSET: POS

Explanation: The control block BLOCK contains an error at offset POS.

System action: If this is a request to the program interface function, the request is rejected and control is returned with the return code set to error.

System programmer response: If you cannot find a valid reason for the error, save the dump data set and the message log, and contact IBM Software Support.

User response: Correct the request according to the specified reason codes. If you cannot find a valid reason for the error, contact your system programmer.

Problem determination: The dump data set (ddname EQQDUMP) contains a dump of the failing control block.

The reason code REASON indicates the reason for the failure. See Chapter 234, "Reason codes," on page 1417

EQQY102E • EQQY109E

for a list of the reason codes and their meanings.

EQQY102E THE RUN CYCLE SHIFT SIGN IS INVALID, ENTER EITHER B (BACK) OR F (FORTH).

Explanation: The value for the SHSIGN keyword is incorrect. Enter B (for a negative shift) or F (for a positive shift).

System action: The keyword value is rejected.

System programmer response: Enter B (for a negative shift) or F (for a positive shift).

EQQY103E KEYWORD KEY WITH VALUE VALUE NOT ALLOWED WHEN ACTION(ADD)

Explanation: In the OPTIONS statement, ADVALFROMCHG(Y) cannot be specified if the ACTION is ADD. ADVALFROMCHG(Y) is allowed only with ACTION(REPLACE) and ACTION(SCAN).

System action: The keyword value is rejected.

System programmer response: In the OPTIONS statement, change the value either for the ADVALFROMCHG or ACTION keyword, and submit the job again.

EQQY104E KEYWORD KEY WITH VALUE VALUE NOT ALLOWED WHEN STATUSCHANGE(Y)

Explanation: In the OPTIONS statement, ADVALFROMCHG(Y) cannot be specified if the STATUSCHANGE is Y. ADVALFROMCHG(Y) is allowed only with ACTION(REPLACE) and ACTION(SCAN).

System action: The keyword value is rejected.

System programmer response: In the OPTIONS statement, change the value either for the ADVALFROMCHG or STATUSCHANGE keyword, and submit the job again.

EQQY105I KEYWORD KEY IN STATEMENT STMT IS IGNORED

Explanation: The keyword KEY has no significance in the current environment.

System action: Processing continues.

System programmer response: Remove the keyword KEY from the statement STMT.

EQQY106E KEYWORD KEY CANNOT BE GIVEN A DEFAULT

Explanation: When ACTION(SETDEF) is specified, KEY cannot be specified.

System action: The record being created is considered in error and is not created. The statements following this record that add details to the record are scanned for valid data types.

User response: Correct the input file and resubmit the job.

For more information about the keyword, refer to *Managing the Workload*.

EQQY107E KEYWORD KEY IS REQUIRED

Explanation: You did not specify the required keyword. The keyword KEY is a required keyword and cannot be omitted.

System action: The record being created is considered in error and is not created. The statements following this record that add details to the record are scanned for valid data types.

User response: Correct the input file and resubmit the job.

For more information about the keyword, refer to *Managing the Workload*.

EQQY108E KEYWORD KEY HAS AN UNSUPPORTED VALUE VAL

Explanation: You specified an invalid value for the keyword. The keyword KEY can have only a certain set of values or abbreviations of these values.

System action: The record being created is considered in error and is not created. The statements following this record that add details to the record are scanned for valid data types.

User response: Correct the input file and resubmit the job.

For more information about the keyword, refer to *Managing the Workload*.

EQQY109E KEYWORD KEY HAS AN UNAMBIGUOUS VALUE VAL

Explanation: The value of the keyword KEY is abbreviated so that it matches more than one of the valid values.

System action: The record being created is considered in error and is not created. The statements following this record that add details to the record are scanned for valid data types.

User response: Correct the input file and resubmit the job.

For more information about the keyword, refer to *Managing the Workload*.

EQQY120E REMOTE PORT NUMBER MUST BE USED IN CONJUNCTION WITH REMOTE HOST NAME.

Explanation: If you specify REMPORTNUMBER in the INIT statement, you must specify also REMHOSTNAME in the same statement. Or, if you specify REMPORT directly in the PIF program initialization, you must specify also REMHOST in the same program.

System action: The processing stops.

User response: You can either remove the remote port number from the initialization or add also the remote host name.

EQQY121E LENGTH OF KEY VALUE IS L, MAXIMUM LENGTH IS MAXL

Explanation: The character field that is specified as a keyword value is too long.

System action: The following statements for the same record are bypassed. No record is produced.

User response: Modify the keyword and rerun.

EQQY122I KEY VALUE V EXCEEDS THE MAXIMUM MAXV, THE MAXIMUM VALUE IS USED

Explanation: The integer value that is specified as a keyword value is too large.

System action: The maximum value is used.

User response: Correct the keyword value.

EQQY123W THE VALUE VAL IS NOT VALID FOR KEYWORD KEY IN STATEMENT STMT. THE DEFAULT VALUE IS USED.

Explanation: You specified an incorrect value VAL for keyword KEY in statement STMT.

System action: The processing continues using the default value for keyword KEY.

User response: If you do not want the processing to use the default, specify a valid value and rerun.

EQQY124I KEYWORD KEY IN STATEMENT STMT IS NOT SPECIFIED, THE DEFAULT IS USED.

Explanation: Keyword KEY is missing in statement STMT.

System action: The processing continues using the default value for keyword KEY.

User response: If you do not want the processing to use the default, specify a value for keyword KEY in statement STMT, and then rerun.

EQQY125I OPTIONAL KEYWORD KEY IN STATEMENT STMT IS NOT SPECIFIED.

Explanation: Keyword KEY is missing in statement STMT.

System action: No default value applies for keyword KEY.

User response: If you need to specify keyword KEY, add it to statement STMT and rerun.

EQQY126I KEYWORD KEY IN STATEMENT STMT IS IGNORED.

Explanation: You specified keyword KEY in statement STMT, but it does not apply to the current action.

System action: That keyword value is ignored.

User response: You can remove the keyword from the statement and rerun.

EQQY127E KEYWORD KEY IN STATEMENT STMT CANNOT BE SPECIFIED WITH LUNAME KEYWORD.

Explanation: KEY and LUNAME are mutually exclusive keywords.

System action: The request is rejected.

User response: Remove either the LUNAME keyword or the KEY keyword and rerun.

EQQY128E LU NAME AND REMOTE HOST NAME VALUES ARE MUTUALLY EXCLUSIVE.

Explanation: LUNAME parameter cannot be specified together REMHOST parameter, because they correspond to different communication protocols.

System action: The processing stops.

User response: Correct the instruction and rerun.

EQQY129I REMHOST AND REMPORT VALUES SPECIFIED IN EQQYPARM WILL BE USED,

Explanation: You specified REMHOST and REMPORT values in both EQQYPARM and EQQYRPRM.

System action: EQQYPARM values replaced EQQYRPRM values.

User response: If you want to use EQQYRPRM values, remove REMHOST and REMPORT from EQQYPARM, and rerun.

EQQY132E *FLD VALUE INT IS OUTSIDE SUPPORTED RANGE MINV- MAXV*

Explanation: The value of the field *FLD* in a program interface control block is required to be in a certain range. A value outside this range is detected when a database record is created from the control block.

System action: Processing continues.

User response: Check the input data.

Problem determination: If this message is issued in a batch loader run, use the MSGLEVEL keyword of the OPTION statement to get more information and to find the batch loader statement specifying a keyword value that is outside its valid range.

EQQY133E *FLD VALUE IND IS NOT ONE OF THE SUPPORTED VALUES: ABC*

Explanation: The value of the field *FLD* of a program interface control block is required to have one of the values shown in the message. Another value is detected when a database record is created from the control block.

System action: Processing continues.

User response: Check the input data.

Problem determination: If this message is issued in a batch loader run, use the MSGLEVEL keyword of the OPTION statement to get more information and to find the batch loader statement specifying a keyword value that is not one of the accepted values.

EQQY134E *LENGTH OF REMHOST VALUE IS NOT VALID, MAXIMUM LENGTH IS 52.*

Explanation: The specified REMHOST exceeds the allow length.

System action: The processing ends.

User response: Correct the parameter value and resubmit the job.

EQQY135W *KEYWORD KEYWD IN STATEMENT STMT IS NOT VALID. THE VALUE IS OUTSIDE THE VALID RANGE. WILL USE DEFAULT DEFAULT.*

Explanation: The value specified for keyword *KEYWD* is incorrect.

System action: The processing continues using the default value for keyword *KEYWD*.

User response: Consider resubmitting the request with a valid *KEYWD* value.

EQQY201E *AN REC RECORD TO BE ADDED WOULD REPLACE AN EXISTING ONE, NO UPDATE IS DONE KEY OF THE RECORD IS: KEY. THE REPLACE OPTION IS NOT SPECIFIED*

Explanation: The application description or operator instruction already exists.

System action: The present value is kept and the new value is rejected.

User response: Update the record by specifying the REPLACE option and rerunning the statements to create the record.

EQQY202E *TOO MANY VERSIONS, AD WITH KEY KEY IS NOT ADDED*

Explanation: When applications with the same application ID, but different valid-from dates are specified, only four different dates can be specified.

System action: The new application description is rejected.

User response: Choose the versions you want and update accordingly.

EQQY204E *WHEN KEY IS SPECIFIED, ALSO THE TIME MUST BE SPECIFIED*

Explanation: When you specify the input day for an application, you must also specify the input arrival time. When you specify the deadline day for an application, you must also specify the deadline time. *KEY* indicates which of these times is missing.

System action: The new application description is rejected.

User response: Check the statements for a missing time when the day has been set and update accordingly.

EQQY205E *NO PREDECESSOR OPERATION SPECIFIED, SPECIFY PREWSID, PREOPNO AND/OR PREJOBN*

Explanation: An ADDEP statement that does not identify any predecessor operation is received from the input file.

System action: The application description is rejected.

User response: Correct the input file and resubmit the job.

EQQY206E *FAILED TO UPDATE AD KEY OPERATION OP WITH PREDECESSOR INFORMATION THE PREDECESSOR IS AD PID OPERATION POP*

Explanation: An application has been written with

temporary information in the external predecessor section. It is now to be updated by the correct predecessor information, predecessor operation number or the workstation name, or both. The update fails because the predecessor section cannot be identified. The application might have been modified since it was written by the batch loader.

System action: The application description is deleted.

User response: Repeat the batch loader execution with only this application description in the input. If the problem recurs, report the error to IBM Software Support.

EQQY207E AN APPLICATION BELONGING TO AN APPLICATION GROUP CANNOT HAVE RUN CYCLES KEY OF THE RECORD IS: *KEY*

Explanation: An application that references a group definition for run cycle information cannot itself contain run cycles.

System action: The application description is rejected.

User response: Correct the input file and resubmit the job.

EQQY208E A GROUP DEFINITION CANNOT HAVE OPERATIONS KEY OF THE RECORD IS: *KEY*

Explanation: A group definition cannot contain operations.

System action: The application description is rejected.

User response: Correct the input file and resubmit the job.

EQQY209E A GROUP DEFINITION CANNOT HAVE PREDECESSOR OPERATIONS KEY OF THE RECORD IS: *KEY*

Explanation: A group definition cannot contain predecessor operations.

System action: The application description is rejected.

User response: Correct the input file and resubmit the job.

EQQY211E TOO MANY *SIGN* START DAYS ENTERED, AT MOST *NUM* ARE ACCEPTED

Explanation: The application can only be selected *NUM* times for one run cycle.

System action: The application description is rejected.

User response: Correct the input file and resubmit the job. If you need to select more days, repeat the run cycle the necessary number of times.

EQQY212E EQQUXPIF EXIT REJECTED *TYPE RESOURCE* REQUEST. REASON IS: *REASON*.

Explanation: The PIF called the EQQUXPIF checks to validate the operation *type* about the resource *resource*. *type* can assume the value REPLACE or INSERT. *resource* can only be AD. The exit rejected the request and the reason for this is specified into the string *reason*. This string is filled up by the exit with any value customer decides to put in it (limit is of 80 characters).

System action: RC=8 is returned by PIF. PIF request fails.

User response: Check the messages issued by the exit to understand why the action has been rejected.

EQQY213E A GROUP DEFINITION CANNOT HAVE SA INFO. KEY OF THE RECORD IS: *KEY*

Explanation: You cannot specify system automation information to a group definition.

System action: The application description is rejected.

User response: Correct the input file and resubmit the job.

EQQY214W THE INCONSISTENCIES SIGNALLED BY MESSAGE EQQY221E COULD HAVE BEEN REMOVED. VERIFY THAT THE RELATED APPLICATIONS HAVE BEEN LOADED OR RERUN THE JOB.

Explanation: The possible inconsistencies met during the process could have been removed during the second scan, which was run because the OPTIONS parameter is set to MSGLEVEL(3).

System action: The job ends with RC=8.

User response: Verify that all applications signaled by message EQQY221E were correctly inserted into the Application Description database, or run the job again and ensure it ends with RC=0.

EQQY221E NO OPERATION IN *PID* MATCHES THE PREDECESSOR SPECIFICATION SUCCESSOR KEY: *KEY*, SUCCESSOR OPERATION: *OP* PREDECESSOR SPECIFICATION JOBNAME: *JOB*, WORK STATION: *WS*

Explanation: No operation in the predecessor application matches the specification given in the message text. A blank means that no value is specified. A predecessor operation can be specified by workstation name, operation number, or job name, or by any combination of the three items. If the predecessor is required by another application or

EQQY222E • EQQY226E

another occurrence of the same application, an application ID is also required.

System action: The application description is rejected.

User response: Correct the input file and resubmit the job. Review previous messages in the Batch Loader message log.

**EQQY222E MORE THAN ONE OPERATION IN
PID MATCHES THE PREDECESSOR
SPECIFICATION SUCCESSOR KEY:
KEY, SUCCESSOR OPERATION: OP
PREDECESSOR SPECIFICATION:
JOBNAME: JOB, WORK STATION: WS**

Explanation: More than one operation in the predecessor application matches the specification given in the message text. A blank means that no value is specified. A predecessor operation can be specified by workstation name, operation number, or job name, or by any combination of the three items. If the predecessor is required by another application or another occurrence of the same application, an application ID is also required.

System action: The application description is rejected.

User response: Correct the input file and resubmit the job.

**EQQY223E FAILED TO UPDATE KEY,
OPERATION OP WITH PREDECESSOR
INFORMATION PREDECESSOR: PID,
OPERATION: POP. REASON CODE RS**

Explanation: An application has been written to the database with temporary predecessor information. The update of the predecessor section, to add the correct information, has failed.

Possible reasons as given by RS are:

- The read failed for the application to be updated.
- The update write failed.
- The update failed because the predecessor could not be identified. The application description might have been updated previously.

System action: The application description is rejected.

User response: Resubmit the job with only this application description. If the problem recurs, report the error to IBM Software Support.

Problem determination: The message log of the subsystem contains a detailed description of the error.

**EQQY224E FAILED TO UPDATE KEY TO BE
VALID UP TO VTO. REASON CODE
RS**

Explanation: A new application description overlaps the validity period of an existing application description. You tried to adjust the validity of the

existing version to the day before the new version becomes valid, but this update failed.

Possible reasons as given by RS are:

- The read failed for the application description to be updated.
- The update write failed.

System action: The application description is rejected.

User response: Resubmit the job with only this application description. If the problem recurs, report the error to IBM Software Support.

Problem determination: The message log of the subsystem contains a detailed description of the error.

**EQQY225E FAILED TO DELETE KEY. REASON
CODE RS**

Explanation: The deletion of an application description failed.

The application description to delete can be one of the following as given by RS:

1. The new application description was output to a VSAM file.
2. An existing application description whose valid-to date has been adjusted to create two versions. The update of the new version failed.
3. The new application description could not be updated correctly.

System action: None.

User response: If the output is to a subsystem, use the Application Description dialog to delete the application description. If the problem recurs, report the error to IBM Software Support.

Problem determination: For reasons 2 and 3, the message log should also contain a message explaining why the new application could not be updated and a detailed description of the error.

**EQQY226E FAILED TO UPDATE APPLICATION
ADID WITH VALIDFROM EQUALS TO
VFROM. STATUS CHANGE IS
REQUESTED AND THERE IS BOTH
AN ACTIVE AND A PENDING
VERSION WITH THE SAME
VALDIFROM DATE.**

Explanation: Status Change was requested by OPTIONS parameter STATUSCHANGE(Y). Batch loader statements are processed for changing the application description identified in the message from active to pending or from pending to active.

The version of the application description to be changed must be uniquely identified. Both an active and pending version exist already.

System action: The change request is rejected.

User response: If the output is to a subsystem, use the dialog to change the application description, if required.

EQQY227E NO OPERATION IN *PID* MATCHES THE SPECIFICATION OPERATOR INSTRUCTION KEY: *KEY*. OWNING OPERATION SPECIFIED BY JOBNAME: *JOB*, WORK STATION: *WS*

Explanation: An owning operation can be specified by workstation name, operation number, or job name, or by any combination of the three items, together with the application ID.

No operation in the application matches the specification given in the message text. A blank means that no value is specified.

System action: The operator instruction is rejected.

User response: Correct the input file and resubmit the job.

EQQY228E MORE THAN ONE OPERATION IN *PID* MATCHES THE SPECIFICATION OPERATOR INSTRUCTION KEY: *KEY*. OWNING OPERATION SPECIFIED BY JOBNAME: *JOB*, WORK STATION: *WS*

Explanation: An owning operation can be specified by workstation name, operation number, or job name, or by any combination of the three items, together with the application ID.

More than one operation in the application matches the specification given in the message text. A blank means that no value is specified.

System action: The application description is rejected.

User response: Correct the input file and resubmit the job.

EQQY229E SETUP FOR OPERATION: *POP* IN APPLICATION: *PID* NOT COMPLETE

Explanation: A SELECT JCLPREP was done without completion of the listed operation.

System action: None.

User response: Correct the error and resubmit the job. The operation in the application matches the specification given in the message text. A blank means that no value is specified.

EQQY233E FAILED TO ADD OPERATOR INSTRUCTION FOR AD: *AD*, OPERATION: *OP* REASON CODE *RS*

Explanation: An operator instruction has been written to the database with temporary information. The update of it, together with the correct information

about the operation to which it belongs, has failed.

Possible reasons as given by *RS* are:

- The read of the temporary instruction failed.
- The update failed.

System action: The operator instruction is rejected.

User response: Resubmit the job with only this operator instruction. If the problem recurs, report the error to IBM Software Support.

Problem determination: The message log contains a detailed description of the error. If the output is to a IBM Tivoli Workload Scheduler for z/OS subsystem, these descriptions are found in the message log of the subsystem.

EQQY234E FAILED TO DELETE OPERATOR INSTRUCTION: *KEY*. REASON CODE: *RS*

Explanation: The deletion of an operator instruction failed.

Possible reasons as given by *RS* are:

- A read of the operator instructions failed.
- The delete operation failed.

System action: None.

User response: Check if the operator instruction still exists there, by allocating the output file to a IBM Tivoli Workload Scheduler for z/OS subsystem. If it does, use the Operator Instruction dialog to delete it. If the problem recurs, report the error to IBM Software Support.

Problem determination: The message log contains a detailed description of the error.

EQQY235E NO OPERATION SPECIFIED, SPECIFY WSID, OPNO AND/OR JOBN

Explanation: An OISTART statement, which does not identify the owning operation, is received from the input file.

System action: The operator instruction is rejected.

User response: Correct the input file and resubmit the job.

EQQY236E NO SETUP SESSION HAS YET BEEN ESTABLISHED FOR THE CURRENT OPERATION

Explanation: You tried to issue an INSERT request for resource JCLPREP without first issuing a successful SELECT JCLPREP request.

System action: The update of JCL variable values is rejected.

User response: Correct the program interface (PIF) user program and retry.

EQQY237E PROMPT VARIABLES HAVE NOT BEEN SET

Explanation: You tried to perform an INSERT of JCLPREP. At least one of the required prompt variables has not been set.

System action: The update of JCL variable values is rejected.

User response: Check your program to see if it processes correctly.

EQQY238E A GROUP DEFINITION CANNOT HAVE SPECIAL RESOURCES KEY OF THE RECORD IS: KEY

Explanation: A group definition cannot contain special resources.

System action: The application description is rejected.

User response: Correct the input file and resubmit the job.

EQQY239E INVALID ARGUMENT VALUE VAL FOR SIMTIME ARGUMENT

Explanation: A program interface (PIF) program has requested simulated substitution (resource JCLPREPA). A SIMTIME value that is not in CCYYMMDDHHMM format or that contains an invalid value has been requested.

System action: The simulated substitution of the JCL for this operation is not performed.

User response: Correct the PIF program and retry.

EQQY240E INVALID ARGUMENT VALUE VAL FOR SIMTYPE ARGUMENT

Explanation: A program interface (PIF) program has requested simulated substitution (resource JCLPREPA). A SIMTIME value that is not 'FULL' or 'PARTIAL' has been requested.

System action: The simulated substitution of the JCL for this operation is not performed.

User response: Correct the PIF program and retry.

EQQY241E INVALID ARGUMENT VALUE VAL FOR ARGUMENT ARG. THE REQUEST IS REQRES

Explanation: In the request argument name ARG is specified. The corresponding argument value pointer locates the value VAL. Argument ARG cannot have this value.

System action: The request is rejected.

User response: Correct the request and resubmit the job.

EQQY242E MULTIPLE MATCHTYP ARGUMENTS IN A REQ REQUEST FOR RES

Explanation: The ARGN parameter can contain only one argument controlling the selection on resource name and operation status and only one argument controlling selection by owner ID.

System action: The request is rejected.

User response: Check that there is a blank entry indicating the end of the ARGN parameter. Correct the request and resubmit the job.

EQQY243E INVALID ARGUMENT ARG IN SELECT REQUEST AFTER LIST REQUEST FOR SEQUENTIAL RETRIEVAL

Explanation: This message is issued for a SELECT request. The SELECT request reads elements from a list. Argument NEXT is specified. When the list was created, argument SEQN was specified in the LIST request. When processing a list in this way the only arguments accepted in the SELECT request are NEXT and SEQN, not the argument given in the message.

System action: The request is rejected.

User response: Correct the program interface application.

EQQY244E THE VALUE OF ARG IS VAL, MUST BE ZERO. THE REQUEST IS REQ RES

Explanation: When the argument NEXT is specified, the argument value address must be binary zero or point to a binary zero fullword field.

System action: The request to write the record is rejected.

User response: Correct the program interface application.

EQQY245E THE DEFAULT CALENDAR NAME IS REQUIRED BUT IS NOT AVAILABLE. THE REQUEST IS REQRES

System action: The request to write the record is rejected.

User response: Make sure that a default calendar is specified for the program interface. If necessary, use either the program interface OPTIONS request or the program interface INIT statement in the EQQYPARM file to set the default calendar name. In the program interface application, if the CALENDAR argument is unintentionally left out in a SELECT statement for the CL resource, correct the program.

EQQY246E KEYWORD WSNAMES USED AS OI OR OICOM ARGUMENT NOT ALLOWED. PROCESSING IS ENDED.

Explanation: The WSNAMES keyword was used as an argument for the OI/OICOM resource in a delete, list, or select request. As from Tivoli OPC Version 2.2.0, WSNAMES was no longer significant as argument. The workstation name (WSNAMES) was therefore removed from the OI (operator instruction) record and, consequently, it was also removed as an argument of OI/OICOM resource code in PIF programming.

System action: Processing is ended.

User response: Set the OIWSNAMES parameter of the INIT statement to the ignore value and run the PIF user program again. INIT is defined in the parameter file identified by the EQQYPARM DD statement in the JCL of the PIF application. For more information, refer to *Customization and Tuning*.

EQQY247E MULTIPLE ARG ARGUMENTS IN A REQ REQUEST FOR RES

Explanation: The program interface was called to do the request *REQ* for the resource *RES*. It is possible to use only one argument *ARG*.

System action: The request is rejected.

User response: Check that only one argument *ARG* is used.

EQQY248E NO MORE JOBLIN LINES

Explanation: All the joblog lines have been already returned.

System action: The request is rejected.

EQQY301E FAILED TO OPEN DATA SET WITH DDNAME DDN

Explanation: The file given by ddname *DDN* is required for processing, but could not be opened. The file can be either *SYSIN* or *EQQOIPDS*.

System action: If *SYSIN* fails to open, the batch loader processing is terminated. If *EQQOIPDS* fails to open, no operator instructions are created for *OISTART* statements with *MEMBER* specified as the keyword.

User response: Determine why the file is not available. Correct the input and resubmit the job.

EQQY302E LOGICAL RECORD SIZE OF OI MEMBER DATA SET, DDNAME EQQOIPDS, IS NOT VALID

Explanation: The *EQQOIPDS* data set must have a logical record length of 80.

System action: No operator instructions are created

for *OISTART* statements with the *MEMBER* specified as the keyword.

User response: Convert the *EQQOIPDS* data set to a record length of 80 and resubmit the job.

EQQY303E MEMBER MEM DOES NOT EXIST IN THE EQQOIPDS DATA SET

Explanation: The batch loader statement *OISTART* specifies a PDS member name that does not exist in the data set allocated to ddname *EQQOIPDS*.

System action: Processing continues. The creation of the current record is abandoned and the remaining statements for the same record are bypassed.

User response: Correct the member name or check that the correct data set is allocated to ddname *EQQOIPDS*.

EQQY304E ERROR OCCURRED WHILE READING MEMBER MEM FROM THE EQQOIPDS DATA SET

Explanation: The PDS member could not be read.

System action: Processing continues. The creation of the current record is abandoned and the remaining statements for the same record are bypassed.

User response: Follow the instructions for the preceding message.

Problem determination: The preceding message gives detailed information about the read error.

EQQY306W TOO LONG OI ROW ENTERED, STARTS BY ST. IT IS TRUNCATED

Explanation: You entered an operator instruction (OI) text row that is longer than 72 characters. It is truncated to 72 characters.

System action: The OI is created.

User response: Correct the input file and resubmit the job.

EQQY307E REQUIRED PARAMETER FOR ADCNC ARE CONDID, CONDDEPNO

Explanation: You must specify at least the condition identifier and how many condition dependencies are to be included in this condition.

System action: The request is rejected.

User response: Correct the input file and resubmit the job.

EQQY308E REQUIRED PARAMETER FOR ADCNS ARE CONDID, PREWSID, PREOPNO, DEPTYPE, TYPE, LOG

Explanation: The required parameters are missing.

Note:

The message text omits the CONDDEP prefix. You must actually specify CONDDEPCONDID, CONDDEPPREWSID, CONDDEPPREOPNO, CONDDEPDEPTYPE, CONDDEPTYPE, and CONDDEPLOG.

System action: The request is rejected.

User response: Correct the input file and resubmit the job.

EQQY700E THE COMMUNICATION BLOCK PARAMETER DOES NOT POINT TO A COMMUNICATION BLOCK

Explanation: The validation of the parameters in a program interface call found that the communication block address is not locating a valid communication block.

System action: Processing continues.

User response: Make sure that the communication block address returned at the INIT request is used in the following program interface requests. Also make sure that the area located by the communication block address is not overlaid and that there was no error at the INIT request.

EQQY701E INVALID PARAMETER VALUE IN CALL TO EQQYCOM, PARAMETER: PAR, VALUE: REQ

Explanation: The *PAR* parameter (could be either REQUEST or RESOURCE) has an unsupported value *REQ*.

System action: The request is rejected.

User response: Correct the request and resubmit the job.

EQQY702E UNSUPPORTED ARGUMENT NAME: ARG IN REQ STATEMENT, RESOURCE IS RES

Explanation: The *ARG* argument is not supported for the specified request type and resource.

System action: The request is rejected.

User response: Correct the request and resubmit the job.

EQQY703E ONLY ONE OF THE ARGUMENTS FIRST, NEXT, PREV AND LAST IS ACCEPTED

Explanation: The *ARGN* parameter can contain only one of the codes mentioned in the message text.

System action: The request is rejected.

User response: Check that there is a blank entry indicating the end of the *ARGN* parameter. Correct the request and resubmit the job.

EQQY704E ARGV ENTRY IS ZERO FOR ARGN VALUE ARG IN REQ REQUEST FOR RESOURCE RES

Explanation: The *ARGN* parameter indicates that there is a parameter with an associated value, but the corresponding *ARGP* entry does not contain a valid data address.

System action: The request is rejected.

User response: Check that the *ARGN* and *ARGP* parameters have the corresponding entries assigned to them. Correct the request and resubmit the job.

EQQY705E A LIST SELECT REQUEST WITHOUT A PRECEDING LIST REQUEST, RESOURCE IS RES

Explanation: The *ARGN* parameter indicates list select (one of the values FIRST, NEXT, PREV, and LAST is specified), but there has been no preceding LIST request made for the resource *RES*.

System action: The request is rejected.

User response: Check that the proper RESOURCE is specified. If it is, precede SELECT by a LIST request. Correct the request and resubmit the job.

EQQY706E A SELECT REQUEST WITH NO ARGN/ARGV SPECIFICATION, RESOURCE IS RES

Explanation: A SELECT request requires at least one selection parameter, but the *ARGN* parameter indicates that there is none.

System action: The request is rejected.

User response: Check the *ARGN* and *ARGP* parameters. Correct the request and resubmit the job.

EQQY707E A SELECT REQUEST WITH INCONSISTENT ARGN/ARGV SPECIFICATION, RESOURCE IS RES

Explanation: IBM Tivoli Workload Scheduler for z/OS encountered one of the following problems:

- A record area has been specified by the *ARGN* parameter in a SELECT request to hold the data for

selection of a record. The ARGN parameter also specifies additional selection items. This is not supported. A record area must be the only selection item.

- The STATUS argument or the TYPE argument has been specified twice in the ARGN parameter. This is not supported. These arguments can be specified only once.

System action: The request is rejected.

User response: Check the ARGN and ARGP parameters. Correct the request and resubmit the job.

EQQY708E A SELECT REQUEST WITH MORE THAN ONE RECORD SELECTED, RESOURCE IS RES

Explanation: More than one record matches the selection criteria set up by the ARGN parameter or the ARGV parameter, or both parameters.

System action: The request is rejected.

User response: Check the ARGN and ARGP parameters. Correct the request and resubmit the job.

EQQY709E AN ABEND OCCURRED IN THE PROGRAM INTERFACE FUNCTION, IT IS RESTARTED

Explanation: A serious error caused the program interface function to end in error.

System action: The program interface function resumes normal processing.

User response: See message EQQG004E.

Problem determination: Review the dump data set (ddname EQQDUMP) to determine the cause of the problem.

EQQY711E THE RESOURCE RES IS NOT SUPPORTED FOR REQUEST REQ

Explanation: The combination of RES and REQ is not supported. REQ is a program interface request type. RES is either a resource in the program interface call or the resource in a record header.

System action: The request is rejected.

User response: Check the REQ and RES parameters and the record header. Correct the request and resubmit the job.

EQQY712E THE RESOURCE RES IS NOT SUPPORTED WHEN SELECTION FROM LIST

Explanation: The RES resource is not supported in a SELECT request to the program interface function.

System action: The request is rejected.

User response: Check the REQ and RES parameters. Correct the request and resubmit the job.

EQQY713E REQUIRED ARGUMENT ARG MISSING IN REQ REQUEST FOR RESOURCE RES

Explanation: The program interface request requires that a specific argument be present in the ARGN parameter or the ARGV parameter, or both parameters, for the specified resource.

System action: Processing continues.

User response: Correct the program interface request.

EQQY714E THE DATA ADDRESS PARAMETER DATAP IS ZERO IN REQ REQUEST

Explanation: The REQ request requires that the data address parameter (DATAP) contains a valid address.

System action: The request is rejected.

User response: Check the DATAP parameter. Correct the request and resubmit the job.

EQQY715E THE DATA ADDRESS PARAMETER DATAP MUST BE ZERO IN AN INSERT LTOC REQUEST

Explanation: When adding an application to the long-term plan, You cannot use the data address parameter (DATAP) to supply an application description.

System action: The request is rejected.

User response: Do either of the following:

- Add the application description to the model database before the INSERT LTOC request.
- Use an existing application description and modify it after it is added by the INSERT LTOC request.

EQQY716E UNSUPPORTED HEADER RESOURCE HRES IN REQ STATEMENT, RESOURCE IS RES

Explanation: The record header contains an unsupported header resource.

System action: The request is rejected.

User response: Check the record header. Correct the request and resubmit the job.

EQQY717E NO COMMON SECTION HEADER RESOURCE HRES IN REQ STATEMENT

Explanation: The REQ request requires that the record header contains a resource for the common section of a record.

System action: The request is rejected.

User response: Check the record header. Correct the request and resubmit the job.

EQQY718E COMMON SECTION HEADER RESOURCE HRES TWICE IN REQ STATEMENT

Explanation: The *HRES* resource can exist only once in the buffer header.

System action: The request is rejected.

User response: Check the record header. Correct the request and resubmit the job.

EQQY719E THE DATA ADDRESS PARAMETER DATAP IS NOT ZERO IN REQ REQUEST

Explanation: The *REQ* request requires that the data address parameter (*DATAP*) is set to zero.

System action: The request is rejected.

User response: Check the *DATAP* parameter. Correct the request and resubmit the job.

EQQY721W CONCURRENT UPDATE (REQ) OF RECORD WITH KEY KEY, UPDATE PERFORMED

Explanation: The record with key *KEY* has been updated by another function since it was read by the program interface function.

System action: The update is performed.

User response: Check that this update did not cancel any additional update to be done to the record.

EQQY722W DELETE RECORD WITH KEY KEY NOT DONE, IS BEING UPDATED. RESOURCE IS RES

Explanation: The record with key *KEY* is being updated by another function.

System action: The delete is not performed.

User response: Check if the record should be deleted.

EQQY723W DANGER OF CONCURRENT UPDATE TO RECORD WITH KEY KEY, UPDATE PERFORMED THE DATA BASE RECORD WAS UPDATED AT UPDT BY USER

Explanation: The record with key *KEY* has been updated by another function since it was read by the program interface function.

System action: The update is performed.

User response: Check that this update did not cancel any additional update to be done to the record.

EQQY724E INSERT OF RECORD WITH KEY KEY NOT DONE, EXISTS. RESOURCE IS RES

Explanation: The record cannot be inserted as it already exists.

System action: The insert is not performed.

User response: Check if the record needs to be updated. If replace is intended, use *REPLACE* instead of *INSERT*.

EQQY725E REPLACE OF RECORD WITH KEY KEY NOT DONE, RECORD NOT FOUND. RESOURCES IS RES

Explanation: A *REPLACE* request is issued, but the record to be replaced does not exist.

System action: The replacement is not supported.

User response: Check if the record needs to be updated. If insert is intended, use *INSERT* instead of *REPLACE*.

EQQY726E REQUEST REQ TO RESOURCE RES WITH KEY KEY FAILED. THE RECORD IS HELD FOR UPDATE BY SOMEONE ELSE

Explanation: The request could not be handled as the record was already being updated by another dialog or program interface user.

System action: Processing continues.

User response: Either use the IBM Tivoli Workload Scheduler for z/OS dialog to perform the update or rerun the program interface program.

Problem determination: Check the data defined in the message using the IBM Tivoli Workload Scheduler for z/OS dialog.

EQQY727E REQUEST REQ TO RESOURCE RES WITH KEY KEY FAILED. AN ENQ ON THE KEY VALUE FAILED WITH RETURN CODE RC

Explanation: The *ENQ* macro is issued via the program interface. The *ENQ* fails with a return code indicating an error: previous request for control of the same resource has been made for the same task.

System action: The request is not performed.

User response: Update the program interface application and rerun.

Problem determination: Check the meaning of the return code in the *ENQ* macro description.

EQQY728E REQUEST REQ TO RESOURCE RES WITH KEY KEY FAILED. A DEQ ON THE KEY VALUE FAILED WITH RETURN CODE RC

Explanation: The DEQ macro is issued either due to a direct request via the program interface or a record read, update or delete request. The DEQ fails with a return code indicating an error. A return code of 8 means that the DEQ is made without a preceding ENQ for the record by the same program interface user.

System action: Processing continues.

User response: Update the program interface application and rerun.

Problem determination: Check the meaning of the return code in the DEQ macro description.

EQQY729E CONCURRENT UPDATE (REQ) OF RECORD WITH KEY KEY, REQUEST REJECTED

Explanation: The record with key KEY is being updated by another user.

System action: The request is rejected.

User response: Submit one program interface (PIF) program at a time to serialize update requests.

EQQY730E SELECT RES REQUIRES THE FULL KEY, FIELDS ADID, IA AND OPNO

Explanation: A JCL record is identified by its application ID, input arrival time (date and time), and operation number. You cannot omit any of these fields in a SELECT JS or SELECT JSCOM request.

System action: The request is rejected.

User response: If you do not know the values for all of the identifier fields, issue a SELECT CPOPCOM request before the SELECT request. If you want to get JCL from only the IBM Tivoli Workload Scheduler for z/OS JCL repository, issue a LIST JSCOM request before the SELECT request.

EQQY731E A REQRES REQUEST IS RECEIVED, NO OCCURRENCE IS IDENTIFIED

Explanation: The program interface is called to update the details of an occurrence. No occurrence is identified.

System action: Processing continues.

User response: The occurrence details request must be preceded by a request identifying the occurrence, that is, a request to MODIFY the resource CPOC with the occurrence identified by the argument names ADID and IA.

EQQY732E A REQRES REQUEST IS RECEIVED, NO OPERATION IS IDENTIFIED

Explanation: The program interface is called to update the details of an operation. No operation is identified.

System action: Processing continues.

User response: The operation details request must be preceded by a request identifying the operation, that is, a request to MODIFY the resource CPOP with the operation identified by the argument name OPNO.

EQQY733E INPUT DATA WHEN ADDING OCCURRENCE MUST BE AN AD, ARG IS NOT SUPPORTED

Explanation: The data address in a program interface call to insert an occurrence is not zero. The data address should therefore locate an application description. A header defining the rest of the data area must come first in the data area. The header to be located at the beginning of the data area does not start with a header entry for the common part of an application description.

System action: Processing continues.

User response: Check that the area located by the data address starts with a correct header. If an existing application description should be used, the ARGN parameter or the ARGP parameter, or both parameters, should be used to identify the application description, and the data address must be zero.

EQQY734E THE MAXIMUM 4 ACTIVE VERSIONS ALREADY EXIST

Explanation: The program interface was called to insert a new version of an application description record among the existing versions, but four active versions were already existing in the application description data set. No more active versions of the application are allowed.

System action: The request is rejected.

User response: Correct the program interface request to insert the application with a different Application ID or, if possible, with the status of the application set to pending.

EQQY735E THE MAXIMUM 4 PENDING VERSIONS ALREADY EXIST

Explanation: The program interface was called to insert a new version of an application description record among the existing versions, but four pending versions were already existing in the application description data set. No more pending versions of the application are allowed.

System action: The request is rejected.

User response: Correct the program interface request to insert the application with a different Application ID or, if possible, with the status of the application set to active.

EQQY736E ONLY ONE OF THE ARGUMENTS EDUR AND DURATION CAN BE USED

Explanation: The program interface was called to modify duration. It is possible to change CPOPEDU using the arguments EDUR and CPOPEDUI using DURATION. But only one of these arguments can be used in a request.

System action: Request rejected.

User response: Decide which argument you want to use.

EQQY738E A REQRES REQUEST IS RECEIVED, NO WORK STATION IS IDENTIFIED.

Explanation: The program interface was called to modify the open time interval data for a current plan workstation or workstation instance. No current plan workstation or instance was identified.

System action: The request is rejected.

User response: Identify the workstation or instance by a MODIFY CPWS or MODIFY CPWSV request before requesting to modify the open time interval data.

EQQY739E THIS VERSIONS VALID-FROM DATE CANNOT PRECEDE VALF

Explanation: The program interface tried to modify an application version validity period, making sure that all existing versions would be back-to-back. When the valid-from date is changed to an earlier date and the application version has an earlier version, the valid-from date must be greater than the valid-from date of the earliest version. Otherwise, this version would be deleted by the back-to-back mechanism.

System action: The request is rejected.

User response: Check the valid-from date of the earlier version of the application, correct the program interface request and rerun.

EQQY740E A REQ RES REQUEST IS RECEIVED, NO CONDITION IS IDENTIFIED

Explanation: You requested to insert or delete a condition dependency without identifying the corresponding condition.

System action: The request is rejected.

User response: Correct your request by identifying occurrence, operation, and condition in the request sequence.

EQQY741E CURRENT PLAN CONDITION CID TO BE MODIFIED DOES NOT EXIST. APPLICATION ID: ID, INPUT ARRIVAL TIME: IA, OPERATION: OP

Explanation: The condition that is to be modified does not exist in the current plan.

System action: Processing continues.

User response: Use the product dialog to check the occurrence defined in the message. Correct the program interface request and rerun it.

EQQY742E CURRENT PLAN CONDITION CIDTO BE ADDED DOES ALREADY EXIST. APPLICATION ID: ID, INPUT ARRIVAL TIME: IA, OPERATION: OP

Explanation: The condition that is to be modified already exists in the current plan.

System action: Processing continues.

User response: Use the product dialog to check the occurrence defined in the message. Correct the program interface request and rerun it.

EQQY801E FAILED TO WRITE REC RECORD WITH KEY: KEY

Explanation: A write record failed.

System action: The request is rejected.

User response: Check the message log for messages giving detailed information about the write error.

EQQY802E FAILED TO READ RECORD WITH KEY: KEY

Explanation: A read record failed.

System action: The request is rejected, unless the message is issued during the EQQPIFJX delete JCL process. In this case, the process continues.

User response: Check the message log for messages giving detailed information about the read error.

EQQY803E AN EMPTY LIST WAS RETURNED AS THE RESULT OF A LIST REQUEST SELECTION VALUES USED: KEY

Explanation: A list request was done to the IBM Tivoli Workload Scheduler for z/OS subsystem, but no items were returned. This is either because the selection argument in the request was too narrow or because you are not authorized to read the requested data.

Note:

1. The key value is returned in the IBM Tivoli Workload Scheduler for z/OS internal format, therefore you might need to read the value in

hexadecimal format to obtain the data actually used by the product as selection criteria.

2. Any dates that appear in the key value are displayed in internal format, which is 72 years before the actual date.

System action: Processing continues.

User response: Check the key value or obtain the correct authorization.

EQQY804W YOU ARE NOT AUTHORIZED TO READ THE OI DATA BASE AD AND OI WERE NOT CHECKED FOR CONSISTENCY

Explanation: During a consistency check between the application description (AD) and the operator instruction (OI) databases, you have attempted to read the OI database, but you are not authorized.

System action: Processing continues.

User response: Obtain the correct authorization.

EQQY805W YOU ARE NOT AUTHORIZED TO UPDATE THE OI DATA BASE AD AND OI WERE NOT CHECKED FOR CONSISTENCY

Explanation: During a consistency check between the application description (AD) and the operator instruction (OI) databases, you have attempted to update the OI database, but you are not authorized.

System action: Processing continues.

User response: Obtain the correct authorization.

EQQY807E IAD CANNOT BE EARLIER THAN 1984/01/01

Explanation: An invalid input arrival date was specified while adding an application to the current plan.

System action: The requests are rejected.

User response: Define a new date starting from 1984/01/01.

EQQY808W A SELECT CPOP REQUEST DID NOT RETURN ANY OPERATION. VALUES USED: KEY

Explanation: A list request was made to the Tivoli Workload Scheduler for z/OS subsystem, but some item, that matched the filter criteria when the listing process started, changed during the process.

Note:

1. The key value is returned in the Tivoli Workload Scheduler for z/OS internal format, therefore you

might need to read the value in hexadecimal format to obtain the data actually used by the product as selection criteria.

2. Any dates that appear in the key value are displayed in internal format, which is 72 years before the actual date.

System action: Processing continues.

User response: Specify an existing operation and run the task again.

EQQY811E FAILED TO READ RECORD: TYPE

Explanation: The program interface failed to read the record during a restart and cleanup action requested from the Dynamic Workload Console.

System action: The request is rejected.

User response: Retry the failing scenario. If it still fails contact your system programmer.

EQQY812E INVALID SEQUENCE OF RESTART AND CLEANUP REQUESTS: REQ2 RES2 CANNOT FOLLOW A SUCCESSFUL REQ1 RES1

Explanation: The program interface detected an invalid sequence of restart and cleanup actions requested from the Dynamic Workload Console.

System action: The requests are rejected.

User response: To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems" sub-section, "Information to collect for restart and cleanup problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

EQQY813E INVALID SEQUENCE OF RESTART AND CLEANUP REQUESTS: REQ2 RES2 MUST BE PRECEDED BY A SUCCESFUL REQ1 RES1

Explanation: The program interface detected an invalid sequence of restart and cleanup actions requested from the Dynamic Workload Console.

System action: The requests are rejected.

User response: Contact your system programmer.

EQQY821E CURRENT PLAN WORK STATION WS TO BE MODIFIED DOES NOT EXIST

Explanation: The current plan workstation WS to be modified does not exist or the specified instance of a workstation cannot be found.

System action: Processing continues.

User response: Check the program interface call identifying the workstation that is to be modified. Modify the ARGN or ARGP parameter, or both, by adding the name of the correct current plan workstation, or workstation and destination combination.

EQQY822E CURRENT PLAN OCCURRENCE TO BE MODIFIED DOES NOT EXIST
APPLICATION ID: ID, INPUT
ARRIVAL TIME: IA

Explanation: The current plan occurrence that is to be modified does not exist.

System action: Processing continues.

User response: Check the program interface call identifying the occurrence that is to be modified. Modify the ARGN parameter or the ARGP parameter, or both parameters, by adding the application ID and input arrival date and time of the correct current plan occurrence.

EQQY823E CURRENT PLAN OPERATION OP TO BE MODIFIED DOES NOT EXIST
APPLICATION ID: ID, INPUT
ARRIVAL TIME: IA

Explanation: The current plan operation *OP* that is to be modified does not exist in the specified occurrence.

System action: Processing continues.

User response: Check the program interface call identifying the occurrence and the operation that is to be modified. There must be a MODIFY CPOC request identifying the occurrence. Modify the ARGN parameter or the ARGP parameter, or both parameters, by adding the application ID and the input arrival date and time of the correct occurrence. Following the MODIFY CPOC request, there must be a MODIFY CPOP request identifying the operation. Modify the ARGN parameter or the ARGP parameter, or both parameters, by adding the correct operation number.

EQQY824E CURRENT PLAN OPERATION OP TO BE ADDED DOES ALREADY EXIST
APPLICATION ID: ID, INPUT
ARRIVAL TIME: IA

Explanation: The current plan operation *OP* that is to be added already exists.

System action: Processing continues.

User response: Use the IBM Tivoli Workload Scheduler for z/OS dialog to check the occurrence defined in the message. Correct the program interface request and rerun it.

EQQY825E CHANGE STATUS OF OCCURRENCE TO STAT IS NOT SUPPORTED

Explanation: Changing the status of an occurrence in the current plan to *STAT* is invalid.

System action: Processing continues.

User response: Check that the status change supplied in the status argument of the CPOC call is either W (Waiting) or C (Complete).

EQQY826E CURRENT PLAN OCCURRENCE TO BE MODIFIED ALREADY ALTERED.
APPLICATION ID: ID, INPUT
ARRIVAL TIME: IA.

Explanation: The program interface does not let you modify or delete a current plan occurrence that you have already modified or deleted since the last Execute request.

It is recommended that you issue the Execute request every time you modify or delete a current plan occurrence.

System action: The MODIFY CPOC or DELETE CPOC request is rejected.

User response: Correct the program and rerun it.

EQQY827E CURRENT PLAN WORKSTATION WS TO BE MODIFIED ALREADY MODIFIED

Explanation: The program interface does not let you modify a workstation or virtual workstation instance that you have already modified since the last Execute request.

System action: The MODIFY CPWS or MODIFY CPWSV request is rejected.

User response: Correct the program request and rerun it.

EQQY830I THE REQUEST IS REQUESTRESOURCE, OCCURRENCE LTOC

Explanation: A program interface request for a long-term plan is identified by:

- The request type
- One of the long-term plan resources
- The key of the occurrence that is being inserted, deleted, or updated.

System action: None.

User response: None.

EQQY832W UNRESOLVED DEPENDENCY

Explanation: There are two possibilities:

- You were adding an occurrence to the long-term plan, using automatic dependency resolution.
- You were adding a predecessor to an existing occurrence in the long-term plan.

A predecessor could not be resolved because the predecessor application does not have an occurrence with an earlier start time or the same start time.

System action: None.

User response: Use the IBM Tivoli Workload Scheduler for z/OS dialog to display the occurrence and to find out which dependency is missing.

Problem determination: This message is followed by message EQQY830I, which identifies the inserted or updated occurrence of the long-term plan.

EQQY833E FAILED TO DELETE PREDECESSOR SPECIFICATION, STORAGE ALLOCATION FAILED

Explanation: There are two possibilities:

- You were deleting an occurrence from the long-term plan.
- You were deleting a predecessor from an existing occurrence in the long-term plan.

The occurrence could not be deleted because of a storage allocation problem.

System action: None.

User response: Repeat the request.

Problem determination: This message is followed by message EQQY830I, which identifies the deleted or updated occurrence in the long-term plan.

EQQY834E FAILED TO ADD PREDECESSOR
LTPDERR

Explanation: There are two possibilities:

- You were adding an occurrence to the long-term plan.
- You were adding a predecessor to an existing occurrence in the long-term plan.

The occurrence could not be added because of an I/O error.

System action: None.

User response: Look in the message log of the IBM Tivoli Workload Scheduler for z/OS subsystem for an error message that gives more information about the cause of the error.

Problem determination: This message is followed by

message EQQY830I, which identifies the inserted or updated occurrence of the long-term plan.

EQQY835E FAILED TO DELETE DEPENDENCY
LTPDERR

Explanation: There are two possibilities:

- You were deleting an occurrence from the long-term plan.
- You were deleting a predecessor from an existing occurrence in the long-term plan.

The occurrence could not be deleted because of an I/O error.

System action: None.

User response: Look in the message log of the IBM Tivoli Workload Scheduler for z/OS subsystem for an error message that gives more information about the cause of the error.

Problem determination: This message is followed by message EQQY830I, which identifies the deleted or updated occurrence in the long-term plan.

EQQY836E DBOPT PARAMETERS ARE MISSING.

Explanation: The connector encountered an error while retrieving the information needed to connect to the historical database used by the Dynamic Workload Console reporting feature. The DBOPT statement is not available.

System action: The request is rejected.

User response: Check the server SERVOPT statement and make sure that it contains the DBOPTPRM parameter referring to a member included in the parameter library. Verify that this member contains the DBOPT statement with the DBURL and DBUSER parameters.

EQQY837E A DELETE REQUEST WITH MORE THAN ONE RECORD SELECTED, RESOURCE IS RES

Explanation: More than one record matches the selection criteria set up by the ARGN or ARGV parameter, or by both parameters, for the DELETE operation.

System action: The request is rejected.

User response: Check the ARGN and ARGV parameters. Correct the request and submit the job again.

EQQY900E THE VARIABLE TABLE NAME
JCLVCTAB IS INVALID

Explanation: A JCL variable table name must:

- Consist of 1 through 8 alphanumeric characters
- Begin with an alphabetic character.

System action: None.

User response: Correct the JCL variable table name.

EQQY901E THE FIELD *FIELD* IN TABLE *JCLVCTAB*
IS INVALID

Explanation: A field in a table has an invalid format.

System action: None.

User response: Correct the field.

EQQY902E THE FIELD *FIELD* IN TABLE *JCLVCTAB*
IN VARIABLE *VARNAME* IS INVALID

Explanation: A field in a variable in a table has an invalid format.

System action: None.

User response: Correct the field.

EQQY903E THE VARIABLE *VARNAME* IN TABLE
JCLVCTAB HAS MORE THAN 360
DEPENDENCIES

Explanation: You tried to define more than 360 dependencies.

System action: None.

User response: Reduce the number of dependencies.

EQQY904E THE PIFHD KEYWORD HAS NOT
BEEN DEFINED IN THE SUBSYSTEM
PARMS.

Explanation: The INTFOPTS initialization statement keyword PIFHD is required. It has not been defined.

System action: The program interface application is terminated without further processing.

User response: Define the PIFHD keyword in the initialization statement member for the subsystem and restart the subsystem.

EQQY905E THE NUMBER OF TEXT ROWS IN A
JS RECORD, *JSLINES*, MUST NOT BE 0

Explanation: You are trying to insert or replace a JS record that contains no text rows. The value of *JSLINES* must be greater than 0.

System action: The JS record is not inserted.

System programmer response: Delete the whole JS record or insert at least one text row into the JS record.

EQQY906E FAILED TO READ RECORD TO
UPDATE, TYPE: *REC*, KEY: *KEY*

System action: The request to write the record is rejected.

User response: Make sure that the record to be modified exists. If you cannot find a valid reason for the error, contact your system programmer.

EQQY907E IF USE EXTENDED INFO IS Y,
EXTENDED NAME MUST CONTAIN
AT LEAST ONE CHARACTER
DIFFERENT FROM BLANK OR
UNDERSCORE

Explanation: The Extended Name cannot be composed by all blank characters or by all underscore characters or by combination of blank and underscore characters.

System action: Processing is ended.

User response: Write a significant Extended Name and resubmit the job.

EQQY908E AT LEAST ONE ARGUMENT
REQUIRED IN *REQ* REQUEST FOR
RESOURCE *RES*

Explanation: For the specified resource *res*, the Program Interface Request requires that at least one argument be present in the *ARGN* or *ARGV* parameter, or in both.

System action: The Program Interface Request fails.

User response: Correct the Program Interface Request.

EQQY909E IF USE SCHEDULING
ENVIRONMENT IS Y, THE
SCHEDULING ENVIRONMENT
NAME MUST HAVE AT LEAST ONE
CHARACTER OTHER THAN BLANK
OR UNDERSCORE

Explanation: The scheduling environment name cannot be made up entirely of blank or underscore characters.

System action: The Program Interface Request fails.

User response: Correct the Program Interface Request by setting a correct value for the scheduling environment name.

EQQY910E DEFAULT VALUE OF VARIABLE
VARNAME IN TABLE *JCLVCTAB*
CANNOT BE BLANK BECAUSE THE
FIELD *FIELD* IS SET TO Y.

Explanation: The variable *varname* cannot be blank, because the field *field* is set to Y.

System action: Processing is ended.

User response: Specify a default value different from blank or set the field *field* to N, and resubmit the job.

| **EQQY912E** THE VARIABLE NAME *VARNAME* IN
| TABLE *TABNAME* CONTAINS AN
| INVALID CHARACTER.

| **Explanation:** See message text.

| **System action:** Processing is ended.

| **User response:** Correct the name of the variable and
| retry the operation.

EQQY913E IF YOU INSERT OPERATIONS
RUNNING ON AUTOMATION
WORKSTATIONS, THE RELATED
CPSAI SEGMENT IS REQUIRED

Explanation: You cannot add an operation that runs on an Automation workstation without specifying the related CPSAI segment.

System action: The modification of the CP operation is rejected.

User response: Correct the input file and resubmit the job.

EQQY914E SYSTEM AUTOMATION INFO
CANNOT BE INSERTED FOR NOT
AUTOMATION WORKSTATIONS

Explanation: You cannot use the CPSAI segment to insert system automation info for not automation workstations.

System action: The modification of the CP operation is rejected.

User response: Correct the input file and resubmit the job.

Chapter 232. EQQZnnn messages

EQQZ000 - EQQZ505

EQQZ000I A STOP COMMAND HAS BEEN RECEIVED

Explanation: The IBM Tivoli Workload Scheduler for z/OS started task has received an operator stop command.

System action: IBM Tivoli Workload Scheduler for z/OS posts all active subtasks for termination and terminates when all subtasks have terminated.

EQQZ001E JES IS NOT ACTIVE. THE SCHEDULER CANNOT START

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem could not start because no primary JES subsystem is active.

System action: The subsystem task module, EQQMAJOR, is terminated.

System programmer response: Wait for JES to start and reissue the start command.

EQQZ002E THE PRODUCT SUBSYSTEM IS ALREADY ACTIVE. IT CANNOT START AGAIN

Explanation: An operator START command has been entered for a IBM Tivoli Workload Scheduler for z/OS subsystem that is already active.

System action: The second attempt to invoke IBM Tivoli Workload Scheduler for z/OS is terminated.

System programmer response: If you want to restart the IBM Tivoli Workload Scheduler for z/OS subsystem, stop it and issue the START command.

EQQZ003E INVALID JOBNAME *JOBNAME*. NAME MUST BE 4 CHARACTERS OR LESS

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem task module, EQQMAJOR, has been incorrectly invoked.

System action: The EQQMAJOR module is terminated.

System programmer response: Change the name of the IBM Tivoli Workload Scheduler for z/OS subsystem started task to one of the subsystem names defined in SYS1.PARMLIB and reissue the start command.

EQQZ004E UNABLE TO ATTACH SUBTASK *SUBTASK*

Explanation: An error occurred when the IBM Tivoli Workload Scheduler for z/OS subsystem attempted to attach the subtask *SUBTASK*.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log and SYSLOG data sets to determine the exact reason for this message. One possibility is that IBM Tivoli Workload Scheduler for z/OS is being started in a region that is too small.

EQQZ005I SUBTASK *SUBTASK* IS BEING STARTED

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem has successfully attached the subtask *SUBTASK*.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing. If the startup process is successful, the subtask issues its own start message.

EQQZ006I NO ACTIVE PRODUCT SUBTASKS. THE SCHEDULER IS ENDING

Explanation: All IBM Tivoli Workload Scheduler for z/OS subtasks have terminated. The IBM Tivoli Workload Scheduler for z/OS subsystem is about to enter its own termination process.

System action: The IBM Tivoli Workload Scheduler for z/OS subsystem frees all acquired resources and is terminated.

EQQZ007E JOBNAME *JOBNAME* IS NOT A VALID SUBSYSTEM NAME

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem task module, EQQMAJOR, has been incorrectly invoked.

System action: The EQQMAJOR module is terminated.

System programmer response: Change the name of the IBM Tivoli Workload Scheduler for z/OS subsystem started task to one of the subsystem names defined in

SYS1.PARMLIB and reissue the start command.

EQQZ008E THE INITIALIZATION PROGRAM, EQQINITD, HAS NOT BEEN SUCCESSFULLY EXECUTED. THE PRODUCT SUBSYSTEM IS UNABLE TO START.

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem could not start, because the required CSA resident control blocks could not be located or were invalid. These control blocks are built during IPL by the EQQINITD program.

System action: Processing continues.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS after an IPL of the z/OS system.

Problem determination: Check that the currently active IEFSSNxx member of SYS1.PARMLIB defines the IBM Tivoli Workload Scheduler for z/OS subsystem correctly. Check also that EQQINITD is present in SYS1.LINKLIB or in a library in the LNKLSTxx concatenation of libraries. Review the master console messages issued during IPL.

EQQZ010E MEMBER MEMBER CANNOT BE FOUND IN PARAMETER LIBRARY

Explanation: The parameter library member *MEMBER* could not be found in the library defined by the EQQPARM DD statement.

System action: The IBM Tivoli Workload Scheduler for z/OS subtask that issues this message is terminated.

System programmer response: Correct all errors and restart the failing subtask.

Problem determination: Check that the EQQPARM DD statement is correctly defined. Check also that the OPCOPTS initialization statement is correctly defined.

EQQZ011E PARAMETER LIBRARY MEMBER MEMBER IS EMPTY

Explanation: There are two possibilities:

- The parameter library member *MEMBER* exists in the library defined by the EQQPARM DD statement, but there are no records in the member.
- The data set referenced by the SYSIN DD statement is empty.

System action: The IBM Tivoli Workload Scheduler for z/OS subtask that issues this message is terminated.

System programmer response: Correct all errors and restart the failing subtask.

Problem determination: Check that the EQQPARM DD statement is correctly defined, or that the SYSIN DD statement uses the correct data set name. Check

also that the OPCOPTS initialization statement is correctly defined.

EQQZ012E I/O ERROR READING PARAMETER LIBRARY MEMBER MEMBER

Explanation: The parameter library member *MEMBER* could not be read from the library defined by the EQQPARM DD statement.

System action: The IBM Tivoli Workload Scheduler for z/OS subtask that issues this message is terminated.

System programmer response: Correct all errors and restart the failing subtask.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message.

EQQZ013I NOW PROCESSING PARAMETER LIBRARY MEMBER MEMBER

Explanation: A IBM Tivoli Workload Scheduler for z/OS subtask has started processing the parameter library member *MEMBER*.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

System programmer response: None.

EQQZ014I MAXIMUM RETURN CODE FOR PARAMETER MEMBER MEMBER IS: MAXCC

Explanation: A IBM Tivoli Workload Scheduler for z/OS subtask has finished processing the parameter library member *MEMBER*. *MAXCC* is the maximum return code encountered for IBM Tivoli Workload Scheduler for z/OS initialization statements in the member.

System action: If the maximum return code is not zero, the IBM Tivoli Workload Scheduler for z/OS subtask that issues this message is terminated.

System programmer response: Correct any initialization errors and, if necessary, restart any failing subtask.

EQQZ015I INIT STATEMENT: CARD

Explanation: A IBM Tivoli Workload Scheduler for z/OS subtask that is processing a parameter library member prints the entire member using this message.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

System programmer response: None.

EQZ016I RETURN CODE FOR THIS STATEMENT IS: MAXCC

Explanation: A IBM Tivoli Workload Scheduler for z/OS subtask has finished processing an initialization statement. *MAXCC* is the return code sent by the subtask. It indicates if the statement was successfully processed.

System action: The IBM Tivoli Workload Scheduler for z/OS subtask continues processing initialization statements.

System programmer response: If the return code is not zero, correct all initialization statement errors. If necessary, restart the subtask.

EQZ017E RESOURCE NAME SPECIFIED, RESNAME, IS NOT RECOGNIZED

Explanation: An error has been found while processing the *SUBRESOURCES* keyword in the *AUTHDEF* statement.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Change the list of resource names in the *SUBRESOURCES* keyword to include only valid resource names.

EQZ018E INITIALIZATION STATEMENT SPECIFICATION IS LONGER THAN 455 RECORDS

Explanation: An initialization statement cannot exceed 455 input records.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Reduce the total number of records in the statement by entering as many keywords and keyword values per record as possible. You can abbreviate any keyword and can use up to 72 characters of each 80-character record for your specification. For more information, refer to *Customization and Tuning*

EQZ019E DB2 MODULE DB2MOD LOAD FAILED

Explanation: The DB2 module *DB2MOD* failed to load during IBM Tivoli Workload Scheduler for z/OS startup.

System action: IBM Tivoli Workload Scheduler for z/OS is stopped.

System programmer response: Check the reason for the failure and correct the problem.

EQZ022W THE SSCM LOAD MODULE SPECIFIED, SSCM, COULD NOT BE LOADED

Explanation: The module name specified in the *SSCMNAME* parameter of the *OPCOPTS* initialization statement could not be found.

System action: Initialization continues, using the *EQZSSCMD* module defined by *IEFSSNxx* for IBM Tivoli Workload Scheduler for z/OS event generation.

System programmer response: Check that the module name specified in *SSCMNAME* is correct and that the module is contained in an APF-authorized library, accessible to IBM Tivoli Workload Scheduler for z/OS either by the *STEPLIB DD* statement or by the *LNKLSTxx* concatenation.

EQZ023W THE SSCMNAME LOAD MODULE SPECIFIED, SSCM, IS NOT VALID

Explanation: A module name specified in an *SSCMNAME* keyword on an *OPCOPTS* initialization statement is not valid.

System action: The IBM Tivoli Workload Scheduler for z/OS subsystem continues to create event records using the *EQZSSCMD* module that was loaded during IPL.

System programmer response: Specify a valid IBM Tivoli Workload Scheduler for z/OS event creation routine.

EQZ024I BEXTXT

Explanation: This message contains output from the IBM Tivoli Workload Scheduler for z/OS internal diagnostic routines.

System action: IBM Tivoli Workload Scheduler for z/OS continues normal processing.

System programmer response: None.

EQZ025E THE SUBSYSTEM SSNAME IS USING AN INVALID EQZSSCM MODULE

Explanation: The event creation module, *EQZSSCMD*, used by the subsystem named in the message is not valid for IBM Tivoli Workload Scheduler for z/OS. This error was discovered during system IPL.

System action: The IPL continues. The subsystem named in the message is active, but the tracking event that it creates is not reliable.

System programmer response: Verify that the correct *EQZSSCMD* module is accessible to the operating system during the IPL. Check that the *SYS1.PARMLIB* member *IEFSSNxx* is correctly updated.

For more information, refer to *Planning and Installation*

EQQZ028E THE ACTION CHARACTER OF ONE OR MORE OF THE CATMDISP VALUES IS INCORRECT

Explanation: You have specified an invalid action for a message class in the CATMDISP keyword. The only valid value is Q.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated.

User response: Correct the CATMDISP values and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ029E INVALID COMBINATION OF ACTION AND NEW CLASS IN THE CATMDISP KEYWORD

Explanation: You have specified an invalid combination for the action character and the new class section of the CATMDISP keyword value. A new class must be specified when the action character is Q, meaning that the output is to be requested to a different class.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated.

User response: Correct the CATMDISP value and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ030E THE SCHEDULER WAS UNABLE TO OPEN THE MESSAGE LOG DATA SET

Explanation: IBM Tivoli Workload Scheduler for z/OS cannot open its message log data set.

System action: The subsystem task module, EQQMAJOR, is terminated.

System programmer response: Correct the errors and reissue the start command.

Problem determination: Check that the EQQMLOG DD statement exists and is correctly coded. Verify that the subsystem started task is authorized to update the message log data set.

EQQZ031E THE SCHEDULER WAS UNABLE TO OPEN THE MESSAGE LIBRARY FILE

Explanation: IBM Tivoli Workload Scheduler for z/OS cannot open its message library data set.

System action: The subsystem task module, EQQMAJOR, is terminated.

System programmer response: Correct the errors and reissue the start command.

Problem determination: Check that the EQQMLIB DD statement exists and is correctly coded. Verify that the subsystem started task is authorized to read the message library data set.

EQQZ032E SIZE OF MESSAGE LIBRARY RECORDS MUST BE 80 BYTES

Explanation: IBM Tivoli Workload Scheduler for z/OS cannot use its message library data set because the data set does not contain message records of 80 bytes.

System action: The subsystem task module, EQQMAJOR, is terminated.

System programmer response: Correct the errors and reissue the start command.

Problem determination: Check that the EQQMLIB DD statement is correctly coded.

EQQZ033E THE SCHEDULER IS ENDING. MESSAGE ROUTINE COULD NOT BE INITIALIZED

Explanation: IBM Tivoli Workload Scheduler for z/OS cannot initialize its message services.

System action: The subsystem task module, EQQMAJOR, is terminated.

System programmer response: Correct the errors and reissue the start command.

Problem determination: Check the previous WTO messages from this subsystem.

EQQZ034I SUBTASK *SUBTASK* HAS ENDED. SUBTASK WAS ACTIVE *ACTIVE* SECONDS AND USED *CPUT* CPU SECONDS

Explanation: A IBM Tivoli Workload Scheduler for z/OS subtask has ended after being requested to stop processing. A possible cause might be the lack of a current plan. This message documents how long the subtask was active and how much CPU time it used.

System action: IBM Tivoli Workload Scheduler for z/OS continues normal processing.

System programmer response: None.

EQQZ035E MAXIMUM QUEUE SIZE (*MAXNUM*) WAS REACHED ON THE *QNAME* QUEUE. *NUMLOST* EVENTS HAVE BEEN LOST

Explanation: An IBM Tivoli Workload Scheduler for z/OS queue has reached its maximum size and a number of events could not be added. The most likely reason is that IBM Tivoli Workload Scheduler for z/OS has been inactive (not started) for some time and more job tracking events have occurred than could fit into the ECSA buffers available to this IBM Tivoli Workload Scheduler for z/OS subsystem.

QNAME can be one of the following:

WTRQ The event writer queue

JCCQ The job completion checker queue

MGRQ The event manager queue
GENQ The general service task queue
MSGQ The IBM Tivoli Workload Scheduler for z/OS message queue
RTRQ The data router queue
NCFQ The NCF queue
SUBQ The submit queue
TWSQ The end-to-end queue

System action: IBM Tivoli Workload Scheduler for z/OS continues processing.

System programmer response: If the message is issued for the WTRQ of a production IBM Tivoli Workload Scheduler for z/OS subsystem that is being started during IPL, increase the maximum ECSA space for event buffering by changing the definition of the subsystem in SYS1.PARMLIB. If the message is issued for a queue other than WTRQ, contact IBM Software Support.

Problem determination: This message is sometimes issued for the WTRQ of a test IBM Tivoli Workload Scheduler for z/OS system that is started only infrequently. If the message is issued for a production system, the error may be caused by an unusually long delay in starting IBM Tivoli Workload Scheduler for z/OS or by insufficient ECSA storage for IBM Tivoli Workload Scheduler for z/OS event buffering.

**EQQZ036E ERROR RETRIEVING INFORMATION FOR DDNAME = DDNAME
DYNALLOC RETCODE = RC, INFO
CODE = INFO, REASON CODE = RSN**

Explanation: IBM Tivoli Workload Scheduler for z/OS tried to retrieve information from the definition of a IBM Tivoli Workload Scheduler for z/OS ddname, but failed.

System action: The task issuing this message is terminated.

System programmer response: Correct the error and restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

Problem determination: Use the DYNALLOC return code and reason code to determine the cause of the error. For more information, refer to the appropriate DYNALLOC documentation for the currently active system.

**EQQZ037E A REQUIRED DD-CARD IS MISSING.
DDNAME = DDNAME**

Explanation: An EQQMLOG, EQQCKPT, EQQCP1DS, or EQQJT1DS DD statement is needed, to start IBM Tivoli Workload Scheduler for z/OS in the manner defined by the current input parameter statements.

System action: If the EQQMLOG DD statement is missing, the subsystem task module, EQQMAJOR, is terminated. If one of the other DD statements is

missing, the normal mode manager subtask is terminated.

System programmer response: Add the missing DD statement to the started task procedure and restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

EQQZ038E TWO PRODUCT SYSTEMS CANNOT USE THE SAME MESSAGE LOG DATA SET

Explanation: You tried to start a IBM Tivoli Workload Scheduler for z/OS subsystem or batch job that does not have an EQQMLOG DD statement or the message log data set is being used by another IBM Tivoli Workload Scheduler for z/OS subsystem or batch job.

System action: The subsystem or batch job is terminated.

System programmer response: Change the definition of the EQQMLOG DD statement and restart the IBM Tivoli Workload Scheduler for z/OS subsystem or batch job. If the message is issued for a program interface job, give the failing INIT request a unique message log ddname. Use the MLOGDDN argument.

EQQZ039E DATA SET CONFLICT. THE DATA SET DEFINED BY DDNAME DDNAME IS USED BY ANOTHER PRODUCT SYSTEM. DSNAME IS DSNAME

Explanation: You tried to start a IBM Tivoli Workload Scheduler for z/OS subsystem using an output data set that is being used by another IBM Tivoli Workload Scheduler for z/OS subsystem.

System action: The subsystem is terminated.

System programmer response: Change the definition of the DD statement and restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

EQQZ040E NCF APPLICATION NAME IS REQUIRED WHEN NCFTASK(YES) IS SPECIFIED

Explanation: The NCFAPPL keyword is required, because you specified NCFTASK(YES) in the OPCOPTS initialization statement.

System action: The subsystem is terminated.

System programmer response: Add the NCFAPPL keyword to the OPCOPTS statement and restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

EQQZ041E THE ERDRTASK KEYWORD SPECIFIES A VALUE THAT IS NOT IN THE RANGE 0 - 16

Explanation: The ERDRTASK keyword on the OPCOPTS initialization statement specifies an invalid value.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Change the ERDRTASK value to a number within the range 0–16 and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ042E ONE OR MORE EVENT READER MEMBER NAMES ARE NOT DEFINED

Explanation: The ERDRPARM keyword on the OPCOPTS initialization statement does not define enough member names. The number of member names must be equal to the number of reader tasks to be started. This number is defined by the ERDRTASK keyword.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Change the ERDRTASK value or the number of names in the ERDRPARM list and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ043E DUPLICATE NAMES IN THE EVENT READER MEMBER NAME LIST

Explanation: The ERDRPARM keyword on the OPCOPTS initialization statement specifies the same member name more than once.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Change the ERDRPARM member name list so that all names are specified only once and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ044E TOO MANY NAMES IN THE EVENT READER MEMBER NAME LIST

Explanation: The ERDRPARM keyword on the OPCOPTS initialization statement defines too many member names. The number of member names must be equal to the number of reader tasks to be started. This number is defined by the ERDRTASK keyword.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Change the ERDRTASK value or the number of names in the ERDRPARM list and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ045E SUBTASK *SUBTASK* ENDED UNEXPECTEDLY

Explanation: An IBM Tivoli Workload Scheduler for z/OS subtask ended without having been requested to terminate.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

Operator response: If necessary, use a IBM Tivoli Workload Scheduler for z/OS Modify command to restart the failing task.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log to determine the exact reason for this message. Check if a dump has been created on any dump data set allocated to the IBM Tivoli Workload Scheduler for z/OS started task.

EQQZ046E EQQMLOG DD CARD MISSING OR MESSAGE LOG NOT AVAILABLE

Explanation: The EQQMLOG DD CARD is not valid or the message log data set is being used by another IBM Tivoli Workload Scheduler for z/OS subsystem or batch job.

System action: The subsystem or batch job is terminated.

System programmer response: Change the definition of the EQQMLOG DD statement and restart the IBM Tivoli Workload Scheduler for z/OS subsystem or batch job. If the message is issued for a program interface job, assign a unique message log dname to the failing INIT request by using the MLOGDDN.

EQQZ047E THE GSTASK KEYWORD SPECIFIES A VALUE THAT IS NOT IN THE RANGE 1 - 5

Explanation: The GSTASK keyword in the OPCOPTS initialization statement specifies an invalid value.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Change the GSTASK value to a number within the range 1-5 and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ048I A MODIFY COMMAND HAS BEEN PROCESSED. MODIFY *SSNAME,FPARAM*

Explanation: An IBM Tivoli Workload Scheduler for z/OS modify command has been processed successfully.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

System programmer response: None.

EQQZ049W AN INCORRECT MODIFY COMMAND HAS BEEN IGNORED. MODIFY SSNAME,FPARAM

Explanation: A IBM Tivoli Workload Scheduler for z/OS Modify command could not be processed because parameters on the modify command could not be recognized or they are inappropriate.

System action: The incorrect command is ignored. IBM Tivoli Workload Scheduler for z/OS processing continues.

Operator response: Change the Modify command and issue it again.

Problem determination: Check that the syntax of the Modify command is correct. If it is correct, you probably have attempted to start a function that is already active or to stop a function that is not active.

EQQZ050W THE PRODUCT SUBSYSTEM HAS BEEN CANCELLED

Explanation: An operator cancel command has been received.

System action: IBM Tivoli Workload Scheduler for z/OS terminates without waiting for subtasks to end.

System programmer response: None.

EQQZ051E THE PRODUCT SUBSYSTEM MOTHER TASK HAS ABENDED

Explanation: A severe error has occurred in the IBM Tivoli Workload Scheduler for z/OS subsystem task.

System action: IBM Tivoli Workload Scheduler for z/OS terminates without waiting for subtasks to end. If a dump data set is allocated, a dump is created.

System programmer response: Save the message log data set containing this error message, the dump data set, and the SYSLOG data set. Contact IBM Software Support.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log data set, SYSLOG data set, and the dump data set to determine what caused the subsystem to abend.

EQQZ052E THE PARAMETER LIBRARY FILE, DDNAME = EQQPARM OR DDNAME = EQQYPARM, COULD NOT BE OPENED.

Explanation: IBM Tivoli Workload Scheduler for z/OS could not open the parameter library file, ddname EQQPARM or EQQYPARM, which is a required input data set for IBM Tivoli Workload Scheduler for z/OS.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated. Message EQQZ054E is issued.

System programmer response: Check that ddname EQQPARM or EQQYPARM is correctly specified and that the IBM Tivoli Workload Scheduler for z/OS started task is authorized to open the data set for input. Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ053E LOGICAL RECORD SIZE FOR THE PARAMETER LIBRARY, DDNAME EQQPARM, IS NOT VALID

Explanation: IBM Tivoli Workload Scheduler for z/OS cannot use the parameter library data set, ddname EQQPARM, because its logical record length is not 80 bytes.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated. Message EQQZ054E is issued.

System programmer response: Check that EQQPARM is correctly defined. Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ054E ERRORS DETECTED PROCESSING PRODUCT PARAMETERS. THE SCHEDULER IS ENDING

Explanation: IBM Tivoli Workload Scheduler for z/OS found one or more errors while processing its initialization member.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ055E THE INTERNAL READER FILE, DDNAME = EQQBRDS, COULD NOT BE OPENED

Explanation: IBM Tivoli Workload Scheduler for z/OS could not open the internal reader data set.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated. Message EQQZ054E is issued.

System programmer response: Check that ddname EQQBRDS is correctly specified. Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ056E THE LOOP LOG DATA SET EQQLOOP COULD NOT BE OPENED

Explanation: IBM Tivoli Workload Scheduler for z/OS cannot open the EQQLOOP data set.

System action: EQQBATCH module terminates.

System programmer response: Correct the errors and run the daily plan batch process again.

User response: Check that the EQQLOOP DD statement exists and it is correct. Verify that the daily

| plan batch process is authorized to update the loop log
| data set.

EQQZ057E EQQLOOP DD CARD MISSING OR LOOP MESSAGE LOG NOT AVAILABLE

Explanation: The EQQLOOP DD CARD is not valid or the loop message log data set is being used by another batch job.

System action: The batch job is terminated.

System programmer response: Change the definition of the EQQLOOP DD statement and restart the batch job.

EQQZ058E THE BEX INTERFACE MODULE, EQQBEX, COULD NOT BE LOADED

Explanation: IBM Tivoli Workload Scheduler for z/OS could not locate the IBM Tivoli Workload Scheduler for z/OS service routine interface load module EQQBEX.

System action: Normal mode manager (NMM) initialization fails.

System programmer response: Make sure that the EQQBEX load module is present in a library that can be reached by IBM Tivoli Workload Scheduler for z/OS and restart the NMM.

EQQZ059E DD-CARD EQQJTABL MISSING OR LOG DATA SET NOT AVAILABLE.

Explanation: The current plan contains at least one critical job, but you did not specify the EQQJTABL data set in the controller start procedure JCL.

System action: The NMM task initialization fails.

System programmer response: Specify the EQQJTABL data set in the controller start procedure JCL, then stop and restart the NMM task using the MODIFY command or restart the controller.

EQQZ060E THE SYSOUTDISP VALUE, DISP, IS NOT RECOGNIZED

Explanation: The first character of the SYSOUTDISP value is not one of the four valid characters: blank, H, R, or D.

System action: The job-completion checker initialization fails.

System programmer response: Change the SYSOUTDISP value and restart the job-completion checker.

EQQZ061E THE INCDSN VALUE MUST NOT CONTAIN A MEMBER NAME. THE FILE MUST BE SEQUENTIAL

Explanation: The INCDSN keyword on the JCCOPTS initialization statement must specify the name of a sequential, cataloged, disk resident data set.

System action: The job-completion checker initialization fails.

System programmer response: Change the INCDSN value and restart the job-completion checker.

EQQZ062W THE START/STOP USER EXIT MODULE COULD NOT BE LOADED

Explanation: IBM Tivoli Workload Scheduler for z/OS could not locate the subsystem start/stop exit load module EQQUX000.

System action: The subsystem start/stop exit is not used by IBM Tivoli Workload Scheduler for z/OS.

System programmer response: If the subsystem start/stop exit is meant to be used, make sure that the EQQUX000 load module is present in a library that can be reached by IBM Tivoli Workload Scheduler for z/OS. Restart the IBM Tivoli Workload Scheduler for z/OS started task.

EQQZ063E JCCTASK(YES) AND JCCTASK(DST) NEED EWTRTASK(YES)

Explanation: The job-completion checker can only be started when the event writer is also started.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ064I THE SCHEDULER WILL USE THE NJE NODE NAME *NJENODE* FOR JOBS HELD ON THIS NODE

Explanation: During initialization of the event writer, HOLDJOB(YES) or HOLDJOB(USER) was encountered. This message displays the name of the network job entry (NJE) node that IBM Tivoli Workload Scheduler for z/OS uses for reader events created on this node.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

System programmer response: Check that the NJE node name is correct. If the NJE node name is not correct, check the installation of the JES2 EXIT7 or the JES3 IATUX29, as appropriate. If the shipped EQQEXIT macro has been user-modified, make sure that it does not prevent or filter the tracking of IBM Tivoli Workload Scheduler for z/OS itself.

EQQZ065I THE SCHEDULER RELEASES HELD JOBS USING THE JES2 COMMAND CHARACTER CMDCHAR

Explanation: During initialization of the event writer, HOLDJOB(JES) or HOLDJOB(USER) was encountered. This message displays the JES command character that IBM Tivoli Workload Scheduler for z/OS uses to release JES2 jobs from hold.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

System programmer response: Check that the correct command character is displayed. If the command character is not correct, check the installation of the JES2 EXIT7. If the shipped EQQEXIT macro has been user-modified, make sure that it does not prevent or filter the tracking of IBM Tivoli Workload Scheduler for z/OS itself.

EQQZ066W THE SCHEDULER HAS NOT BEEN ABLE TO DETERMINE THE JES TYPE. JES3 IS ASSUMED.

Explanation: IBM Tivoli Workload Scheduler for z/OS could not determine whether it is running on a JES2 or a JES3 system. *NJENODE* is the name of this network job entry (NJE) node.

System action: Processing continues. A JES3 system is assumed.

System programmer response: Check the installation of the JES2 EXIT7 or JES3 IATUX29, as appropriate. If the shipped EQQEXIT macro has been user-modified, make sure that it does not prevent or filter the tracking of IBM Tivoli Workload Scheduler for z/OS itself.

EQQZ067E COMMAND SYNTAX ERROR: CARD FURTHER STATEMENT PROCESSING STOPPED

Explanation: The statement contains a syntactically incorrect command.

A possible cause for this error is when the start (/*) and end (*\) comment delimiters are not used on the same record line.

System action: No more statements are processed. The program is terminated with a return code of 8.

User response: Correct the error.

For problems related to the start and end comment delimiters, ensure they are specified for each record line.

EQQZ068E CMD IS AN UNKNOWN COMMAND AND WILL NOT BE PROCESSED FURTHER STATEMENT PROCESSING IS STOPPED

Explanation: IBM Tivoli Workload Scheduler for z/OS has detected an unknown command in this statement.

System action: No more statements are processed. The program is terminated with a return code of 8.

User response: Correct the error.

EQQZ069W EQQSDUMP DDNAME IS MISSING

Explanation: The subsystem job-step task could not find the ddname EQQSDUMP in the JCL.

System action: The subsystem job-step task sends any dump triggered on a message number to the SYS1.DUMP data sets.

Operator response: None

System programmer response: If necessary, include the ddname EQQSDUMP in the IBM Tivoli Workload Scheduler for z/OS started-task procedure, and restart IBM Tivoli Workload Scheduler for z/OS.

User response: None

Programmer response: None

Problem determination: Check if your customization of IBM Tivoli Workload Scheduler for z/OS involves sending message triggered dumps to SYS1.DUMP data sets.

EQQZ070E THE SSCMNAME KEYWORD SPECIFIES AN OPTION THAT IS NOT RECOGNIZED

Explanation: The SSCMNAME keyword on the OPCOPTS initialization statement specifies a load option that is not supported.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Change the SSCMNAME option to one of the supported values, TEMPORARY or PERMANENT, or remove the currently specified value to let the option default, and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ071E OPTION PERMANENT FOR THE SSCMNAME KEYWORD REQUIRES THE BUILDSSX KEYWORD

Explanation: The SSCMNAME keyword on the OPCOPTS initialization statement specifies the PERMANENT load option. This is supported only when the BUILDSSX keyword has been specified.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Add the BUILDSSX keyword to the OPCOPTS initialization statement and restart IBM Tivoli Workload Scheduler for z/OS.

EQZ072W OPTION PERMANENT FOR THE SSCMNAME KEYWORD REQUIRES STEPLIB DD-STATEMENT

Explanation: The SSCMNAME keyword on the OPCOPTS initialization statement specifies the PERMANENT load option. This is supported only when a STEPLIB DD statement has been defined.

System action: IBM Tivoli Workload Scheduler for z/OS starts without loading the SSCM module permanently.

System programmer response: Add a STEPLIB DD statement to the JCL used to start the subsystem and restart IBM Tivoli Workload Scheduler for z/OS.

EQZ073I THE SCHEDULER HAS RECOGNIZED THAT THIS IS A JESTYPE SYSTEM WITH COMMAND CHARACTER CMDCHAR AND THAT THE NJE NODE NAME IS NJENODE

Explanation: *JESTYPE* is JES2 or JES3. *CMDCHAR* is the command character that IBM Tivoli Workload Scheduler for z/OS uses when issuing JESx commands. *NJENODE* is the name of this network job entry (NJE) node.

System action: Normal processing continues.

System programmer response: If *JESTYPE*, *CMDCHAR*, or *NJENODE* is not correct, check the installation of the JES2 EXIT7 or JES3 IATUX29, as appropriate. If the shipped EQQEXIT macro has been user-modified, make sure that it does not prevent or filter the tracking of IBM Tivoli Workload Scheduler for z/OS itself.

EQZ074W THE SCHEDULER HAS NOT BEEN ABLE TO DETERMINE NJE NODE NAME FOR THIS SYSTEM

Explanation: The NJENODE parameter was not specified. During initialization of the event writer, IBM Tivoli Workload Scheduler for z/OS was unable to determine the name of the network job entry (NJE) node for this system.

System action: Processing continues.

System programmer response: Check the installation of the JES2 EXIT7 or JES3 IATUX29, as appropriate. If the shipped EQQEXIT macro has been user-modified, make sure that it does not prevent or filter the tracking of IBM Tivoli Workload Scheduler for z/OS itself.

EQZ075W THE JES2 COMMAND CHARACTER MAY BE INCORRECT

Explanation: The JES2 command character that IBM Tivoli Workload Scheduler for z/OS uses (stated in message EQZ073I) may be incorrect.

System action: Processing continues.

System programmer response: If the JES2 command character is incorrect, check the installation of the JES2 EXIT7 or JES3 IATUX29, as appropriate. If the shipped EQQEXIT macro has been user-modified, make sure that it does not prevent or filter the tracking of IBM Tivoli Workload Scheduler for z/OS itself.

EQZ076E DB2SYSTEM KEYWORD NOT SPECIFIED

Explanation: The OPCOPTS or the BATCHOPTS initialization statement defines OPERHISTORY(YES), but the statement does not specify the DB2SYSTEM keyword.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated.

System programmer response: Edit the OPCOPTS or BATCHOPTS statement and either remove the OPERHISTORY keyword or specify the name of a DB2 system in the DB2SYSTEM keyword.

EQZ077W OPERHISTORY IS NO BUT RELATED PARAMETERS ARE SPECIFIED: IGNORED

Explanation: The OPCOPTS initialization statement specifies the DB2SYSTEM or CONTROLLERTOKEN parameter, either without specifying the OPERHISTORY keyword or with OPERHISTORY set to NO.

System action: Processing continues.

System programmer response: Check whether the history function is intentionally disabled or whether the OPERHISTORY keyword was omitted. If the OPERHISTORY keyword was omitted, add it, setting the value to YES.

EQZ078I DB2SYSTEM DB2SYS IS NOT AVAILABLE

Explanation: The DB2 system specified in the DB2SYSTEM keyword of the OPCOPTS initialization statement is not active.

System action: Processing continues, but the history function is not available.

System programmer response: Start the DB2 system.

EQZ079I DB2SYSTEM DB2SYS IS AVAILABLE

Explanation: The DB2 system specified in the DB2SYSTEM keyword of the OPCOPTS statement has been started. The IBM Tivoli Workload Scheduler for z/OS history function is now available.

System action: Processing continues.

System programmer response: None.

EQQZ080I A STOP COMMAND HAS BEEN RECEIVED

Explanation: The IBM Tivoli Workload Scheduler for z/OS address space has received an operator stop command.

System action: IBM Tivoli Workload Scheduler for z/OS posts all active subtasks for termination and terminates when all subtasks have terminated.

User response: None.

EQQZ081E VARFAIL VALUE INVALID. AT MAXIMUM ONLY 3 CHARACTERS &, %, ? ARE ALLOWED. CHARACTERS CANNOT BE REPEATED

Explanation: The VARFAIL keyword contains a value different from the three characters that are allowed.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Correct the value (or values) in the VARFAIL keyword and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ082W DATABASE CONNECTION OBJ LOAD MODULE COULD NOT BE LOADED.

Explanation: The scheduler could not locate the load module *OBJ* needed by the parser process for the DBOPT statement.

System action: The initialization of the server started task fails.

User response: Ensure that the server references a library that contains the *OBJ* load module, and then restart the server.

EQQZ083E INVALID JOBNAME JOBNAME. NAME MUST BE 4 CHARACTERS OR LESS

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem task module, EQQMAJOR, has been incorrectly invoked.

System action: The EQQMAJOR module is terminated.

System programmer response: Change the name of the IBM Tivoli Workload Scheduler for z/OS subsystem started task to one of the subsystem names defined in SYS1.PARMLIB and reissue the start command.

EQQZ084E UNABLE TO ATTACH SUBTASK SUBTASK

Explanation: An error occurred when the IBM Tivoli Workload Scheduler for z/OS subsystem attempted to attach the subtask *SUBTASK*.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS.

Problem determination: Review earlier messages in the IBM Tivoli Workload Scheduler for z/OS message log and SYSLOG data sets to determine the exact reason for this message. One possibility is that IBM Tivoli Workload Scheduler for z/OS is being started in a region that is too small.

EQQZ085I SUBTASK SUBTASK IS BEING STARTED

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem has successfully attached the subtask *SUBTASK*.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing. If the startup process is successful, the subtask issues its own start message.

User response: None.

EQQZ086I NO ACTIVE SUBTASKS. THE SCHEDULER IS ENDING

Explanation: All IBM Tivoli Workload Scheduler for z/OS subtasks have terminated. The IBM Tivoli Workload Scheduler for z/OS address space is about to enter its own termination process.

System action: The IBM Tivoli Workload Scheduler for z/OS address space frees all acquired resources and is terminated.

User response: None.

EQQZ087E JOBNAME JOBNAME IS NOT A VALID SUBSYSTEM NAME

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem task module, EQQMAJOR, has been incorrectly invoked.

System action: The EQQMAJOR module is terminated.

System programmer response: Change the name of the IBM Tivoli Workload Scheduler for z/OS subsystem started task to one of the subsystem names defined in SYS1.PARMLIB and reissue the start command.

EQQZ088E THE INITIALIZATION PROGRAM, EQQINIT, HAS NOT BEEN SUCCESSFULLY EXECUTED. THE PRODUCT SUBSYSTEM IS UNABLE TO START

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem could not start because the required CSA resident control could not be located or was

invalid. These control blocks are built during IPL by the EQQINIT program.

System action: The subsystem task module, EQQMAJOR, is terminated.

System programmer response: Correct all errors and restart IBM Tivoli Workload Scheduler for z/OS after an IPL of the z/OS system.

Problem determination: Check that the currently active IEFSSNxx member of SYS1.PARMLIB defines the IBM Tivoli Workload Scheduler for z/OS subsystem correctly. Check also that EQQINIT is present in SYS1.LINKLIB or in a library in the LNKSTxx concatenation of libraries. Review the master console messages issued during IPL.

EQZ090W THE NOERROR VALUE, VALUE, IS INCORRECTLY SPECIFIED

Explanation: A NOERROR statement or the NOERROR keyword of the JTOPTS contains an error. Entry *VALUE* is not valid.

System action: Depending on how you specified the NOERROR value, the normal mode manager (NMM) processing continues or terminates:

- If you specified the NOERROR value in the EQQPARAM library, the NMM subtask terminates.
- If you specified the NOERROR value by using a MODIFY command, the NMM processing continues.

System programmer response: Correct the entry. If the NMM subtask terminated, restart the subtask or the scheduler address space, otherwise reenter the MODIFY command.

EQZ091W WRONG NUMBER OF PERIODS IN THE NOERROR VALUE, VALUE

Explanation: A NOERROR statement or the NOERROR keyword of JTOPTS contains an error. Entry *VALUE* is not valid. The number of periods in each entry must be either zero or three.

System action: The normal mode manager (NMM) is terminated.

System programmer response: Correct the entry and restart the NMM subtask or the IBM Tivoli Workload Scheduler for z/OS address space.

EQZ092W PERIODS ARE NOT PLACED CORRECTLY IN THE NOERROR VALUE, VALUE

Explanation: A NOERROR statement or the NOERROR keyword of JTOPTS contains an error. Entry *VALUE* is not valid. The periods in an entry must be separated by not less than one and not greater than eight nonblank characters.

System action: The normal mode manager (NMM) is terminated.

System programmer response: Correct the entry and restart the NMM subtask or the IBM Tivoli Workload Scheduler for z/OS address space.

EQZ093E FILE KEYWORD IS MISSING

Explanation: The current AUDIT statement does not contain the FILE keyword.

System action: The normal mode manager (NMM) is terminated.

System programmer response: Add the FILE keyword to the current AUDIT statement and restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

EQZ094E A PARAMETER IS REQUIRED FOR THE FILE KEYWORD

Explanation: The FILE keyword in the current AUDIT statement does not specify a value.

System action: The normal mode manager (NMM) is terminated.

System programmer response: Add the FILE keyword to the current AUDIT statement and restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

EQZ095I GENSERV: STG CPLOCK: STC EVENTS: STE WSATASK: STW EVELIM VALUE: EVE STATIM VALUE: STA

Explanation: This message is issued after the /F *subsys*,DSPSTA command has been given. It indicates whether the keywords GENSERV, CPLOCKS, EVENTS, and WSATASK have been activated. (These are activated either by the STATIM initial parameter statement or by the appropriate modify command.) The message also displays the current value of the EVELIM and STATIM keywords. These values can be used to specify how often statistics messages are issued.

The values of the message variables are:

- STG* "Active" if GENSERV statistic messaging is currently active. Otherwise, "Inactive".
- STC* "Active" if CPLOCK statistic messaging is currently active. Otherwise, "Inactive".
- STE* "Active" if EVENTS statistic messaging is currently active. Otherwise, "Inactive".
- STW* "Active" if WSATASK statistic messaging is currently active. Otherwise, "Inactive".
- EVE* The current value of the EVELIM parameter, which can be in the range 0-9999.
- STA* The current value of the STATIM parameter, which can be in the range 0-99.

System action: Processing continues.

System programmer response: None.

User response: None.

EQQZ096W OBSOLETE PARAMETER SPECIFIED:*keyword*. THE PARAMETER IS IGNORED

Explanation: The keyword shown in the message text is obsolete and is no longer supported.

System action: The initialization of the scheduler or data store continues and the obsolete keyword is ignored.

System programmer response: Correct the scheduler or data store initialization statements to avoid the warning messages at the next restart.

EQQZ097W END-TO-END OBJ LOAD MODULE COULD NOT BE LOADED

Explanation: The scheduler could not locate the load module shown in the message text for the end-to-end function.

System action: The initialization of the scheduler main task continues but it is not possible to use the end-to-end function.

System programmer response: Ensure that the Topology load module shown in the message text is present in a library that can be reached by the scheduler, then restart the controller.

EQQZ098W JESLOG SPIN PREVENTION NEEDED BUT NOT APPLIED FOR JES: *JESFMID*. IT WAS NOT APPLIED BECAUSE OF PARAMETER SETTING.

Explanation: The SPIN keyword has been set to YES in the OPCOPTS statement to enable JESLOG SPIN usage while Restart and Clean up or Job Completion Checker tasks are running. An error can occur if you do not disable the usage of the JESLOG SPIN.

System action: Processing continues.

User response: None.

EQQZ099E SAVARFAIL VALUE NOT VALID. AT MAXIMUM & , % CAN BE SPECIFIED TOGETHER. CHARACTERS CANNOT BE REPEATED.

Explanation: The SAVARFAIL parameter contains a value different from the only two variable characters allowed: & and %. The variable characters cannot be specified more than once.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails.

User response: Correct the value for the SAVARFAIL parameter and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ100E THE GMTOFFSET VALUE IS REQUIRED AND MUST BE AN INTEGER

Explanation: The GMTOFFSET keyword specifies an incorrect value. The value is required and it must be a positive or negative integer.

System action: IBM Tivoli Workload Scheduler for z/OS considers the current initialization statement to be incorrectly coded. This causes IBM Tivoli Workload Scheduler for z/OS initialization to fail.

System programmer response: Correct the GMTOFFSET value and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ101E THE GMTOFFSET VALUE MUST BE IN THE RANGE -1439 TO +1439

Explanation: The GMTOFFSET keyword specifies a value that is outside the range of valid values.

System action: IBM Tivoli Workload Scheduler for z/OS considers the current initialization statement to be incorrectly coded. This causes IBM Tivoli Workload Scheduler for z/OS initialization to fail.

System programmer response: Correct the GMTOFFSET value and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ102E THE SAME SYSTEM ID OCCURS MORE THAN ONCE IN THE SYSID KEYWORD

Explanation: The same system ID occurs more than once in the SYSID keyword of the ROUTOPTS initialization statement. IBM Tivoli Workload Scheduler for z/OS cannot determine to which system ID the DESTID should be connected.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails and the subsystem is terminated.

System programmer response: Correct the SYSID keyword values and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ103W THE SAME DESTINATION ID OCCURS MORE THAN ONCE IN THE DESTID KEYWORD

Explanation: The same destination ID occurs more than once in the DESTID keyword of the ROUTOPTS initialization statement.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

System programmer response: Verify the SYSID and DESTID keywords and, if necessary, change them.

EQQZ104E UNPAIRED NUMBER OF SYSTEM IDS AND DESTINATIONS

Explanation: The number of values in the SYSID keyword of the ROUTOPTS initialization statement does not match the number of values in the DESTID keyword.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails and the subsystem is terminated.

System programmer response: Change the SYSID and DESTID keywords so that they contain the same number of values and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ105W THE DST VALUE IS NO LONGER SUPPORTED FOR THE JCCTASK PARAMETER

Explanation: You have specified JCCTASK (DST) but this value is no longer supported. This is because the Data Store does no longer uses the class re-queuing mechanism to retrieve joblogs.

System action: IBM Tivoli Workload Scheduler for z/OS continues processing. JCC is not started.

User response: Specify one of the supported values. For information about the supported values, see the *Customization and Tuning* manual, Chapter 1. Defining initialization statements, section, "JCCOPTS".

EQQZ106W PERCENT % OF QUEUE QNAME IN USE

Explanation: The utilization of a queue has exceeded a threshold value.

System action: None.

System programmer response: Ensure that all subtasks are active. Check system contention.

EQQZ107E TOO MANY DASD CONNECTIONS DEFINED

Explanation: You defined more than 16 destinations in the DASD keyword of the ROUTOPTS initialization statement. A maximum of 16 submit/release data sets can be used at the same time.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails and the subsystem is terminated.

Programmer response: Change the DASD keyword to specify fewer destinations and restart the subsystem.

EQQZ109I THE RELATIONAL OPERATOR IN THE NOERROR STATEMENT, VALUE, IS NOT EQ: EQ VALUE IS FORCED.

Explanation: The scheduler was parsing a NOERROR statement including as error code an IBM Tivoli Workload Scheduler for z/OS-defined code. The statement does not contain EQ as its relational operator. In this case EQ is the only allowed value.

System action: The scheduler overrides the statement in the NOERROR table and the EQ value is forced.

User response: Review your NOERROR statement definitions. Change the VALUE statement to specify the EQ relational operator. You can issue the modify command: /F *subsys*,LSTNOERR to verify the NOERROR table content.

EQQZ110E AN XCF CONNECTION HAS BEEN SPECIFIED IN THE OPT STATEMENT, BUT THE XCFOPTS INITIALIZATION STATEMENT IS MISSING

Explanation: A XCF connection cannot be established between the controller and a tracker because the parameter member being processed does not contain an XCFOPTS initialization statement.

The XCF connection is defined by the XCF keywords in the controller ROUTOPTS statement and the HOSTCON keyword of the tracker TRROPTS statement.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Add the XCFOPTS statement or change the SNA or HOSTCON keyword.

EQQZ111E AN SNA CONNECTION HAS BEEN SPECIFIED IN THE OPT STATEMENT, BUT NCFTASK(YES) IS NOT SPECIFIED IN OPCOPTS

Explanation: An SNA connection cannot be established between the controller and a tracker because the OPCOPTS init statement does not contain NCFTASK(YES).

The SNA connection is defined by the SNA keywords in the controller ROUTOPTS statement and the HOSTCON keyword of the tracker TRROPTS statement.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Add the NCFTASK(YES) and NCFAPPL(applid) keywords or change the SNA or HOSTCON keywords.

EQQZ112E A DESTINATION HAS BEEN SPECIFIED IN THE OPCAV1R2 KEYWORD IN THE ROUTOPTS STATEMENT. THIS DESTINATION IS NOT FOUND IN THE SNA OR THE DASD KEYWORD

Explanation: A destination specified in the OPCAV1R2 keyword must also be defined in the SNA or DASD keyword.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: If the destination represents an OPC/A Version 1 Release 2 NEC system, specify it in the SNA keyword.

If the destination represents an OPC/A Version 1 Release 2 EMS system connected to the controller through shared DASD, specify it in the DASD keyword.

EQQZ113E THE HOSTCON KEYWORD IN TRROPTS DEFINES AN SNA CONTROLLER CONNECTION, BUT THE SNAHOST KEYWORD IS MISSING

Explanation: An SNA connection cannot be established between the controller and a tracker because the SNAHOST keyword does not contain the controller VTAM application ID.

The VTAM application ID of the controller is defined in the OPCOPTS initialization statement for the controller, keyword NCFAPPL.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Update the SNAHOST with this ID.

EQQZ114E THE SNAHOST KEYWORD IN TRROPTS IS SPECIFIED, BUT THE CONTROLLER CONNECTION DEFINED IN THE HOSTCON KEYWORD IS NOT SNA

Explanation: The initialization statement is inconsistent.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Delete the SNAHOST keyword or update the HOSTCON keyword to specify SNA.

EQQZ115E THE SAME DESTINATION APPEARS IN MORE THAN ONE OF THE SNA, XCF, USER, TCP, APPC AND DASD KEYWORDS IN THE ROUTOPTS STATEMENT

Explanation: A destination name must be unique within the IBM Tivoli Workload Scheduler for z/OS configuration. A destination can be reached by only one of the supported methods.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Correct the ROUTOPTS statement.

EQQZ116E AN XCF OR APPC CONNECTION HAS BEEN REQUESTED BUT THE LEVEL OF THE MVS SYSTEM DOES NOT SUPPORT IT

Explanation: If the XCF keyword of a ROUTOPTS initialization statement or the HOSTCON keyword of a TRROPTS initialization statement requests an XCF destination, your system must be MVS™ SP 4.1 or later. If the APPC keyword of a ROUTOPTS initialization statement requests an APPC destination, your system must be MVS SP 4.2.2 or later.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Change the ROUTOPTS or TRROPTS initialization statement so that no unsupported destinations are requested.

EQQZ117E THE TRROPTS STATEMENT IS NOT APPLICABLE FOR A CONTROLLER OR STANDBY SYSTEM

Explanation: This IBM Tivoli Workload Scheduler for z/OS subsystem is defined as a controller or standby system. The TRROPTS statement is not allowed.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Remove the TRROPTS statement. Use the ROUTOPTS statement to define routing information for a controller or standby system.

EQQZ118E THE ROUTOPTS STATEMENT IS NOT APPLICABLE AT A TRACKER SYSTEM

Explanation: This IBM Tivoli Workload Scheduler for z/OS subsystem is defined as a tracker system. The ROUTOPTS statement is not allowed.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Remove the ROUTOPTS statement. Use the TRROPTS statement to

define routing information for a tracker system.

**EQQZ119E MORE THAN 1000 DESTINATIONS
DEFINED FOR CONNECTION**

Explanation: More than 1000 tracker destinations are defined on the ROUTOPTS statement for connection to the controller.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Connect fewer trackers by redefining the ROUTOPTS statement. If you have more than 1000 trackers, you can create clusters of trackers that use only one connection to the controller. For example, if you have five systems in one data center currently NCF-connected to the controller and the systems share DASD, you can start four event reader subtasks on one of the trackers and have a single VTAM link to the controller.

**EQQZ120E CF FUNCTION FUNCTION FAILED
WITH RETURN CODE=RETCODE AND
REASON CODE RESCODE**

Explanation: This message lists the service requested, the failed function, the return code, and the reason code.

System action: Depending on what kind of service failed, IBM Tivoli Workload Scheduler for z/OS either continues processing without the requested service or is terminated.

System programmer response: Correct the error and restart the IBM Tivoli Workload Scheduler for z/OS address space.

Problem determination: Review the message log (EQQMLOG) and look for preceding error messages relating to the problem. Use the *FUNCTION*, *RETCODE*, and *RESCODE* to determine the cause of the error:

- When *CF* indicates *XCF*, or *APPC* and *FUNCTION* indicates *JOINX*, refer to the appropriate z/OS SP Authorized Assembler Reference manual (see *IXCJOIN* macro) for the currently active z/OS system.
- When *CF* indicates *APPC*, function *IDEN* and code=*2C*, make sure that the *APPC* address space is started.
- For other errors, refer to the appropriate z/OS SP Authorized Callable Services manual for the currently active z/OS system.

**EQQZ121E XCF CONNECTIONS ARE NOT
SUPPORTED ON A LOCAL-SYSPLEX**

Explanation: The sysplex mode is LOCAL-SYSPLEX. This configuration is not supported by IBM Tivoli Workload Scheduler for z/OS. Only MULTISYSTEM or

MONOPLEX sysplex configurations are supported.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Change the communication method and restart IBM Tivoli Workload Scheduler for z/OS.

**EQQZ122E KEYWORD KEYWORD IN CURRENT
INITIALIZATION STATEMENT IS
MISSING**

Explanation: The specified keyword in the current initialization statement is required.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

Programmer response: Add the missing keyword to the initialization statement and restart IBM Tivoli Workload Scheduler for z/OS.

**EQQZ123E KEYWORD KEYWORD IN TRROPTS
INITIALIZATION STATEMENT IS
MISSING**

Explanation: The HOSTCON keyword in the TRROPTS initialization statement is missing.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

Programmer response: Correct the invalid TRROPTS initialization statement and restart IBM Tivoli Workload Scheduler for z/OS.

**EQQZ124E OWN KW APPEARS AS A
DESTINATION IN STMT**

Explanation: The same name appears in one of these keywords:

- XCFOPTS MEMBER
- OPCOPTS NCFAPPL

and also one of these keywords:

- ROUTOPTS SNA
- ROUTOPTS XCF
- TRROPTS SNAHOST

This duplication is not allowed.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

Programmer response: Correct the invalid initialization statement and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ125E CANNOT CONTINUE PROCESSING DUE TO FULL QUEUE: QNAME THE SUBSYSTEM IS TERMINATING

Explanation: One of the IBM Tivoli Workload Scheduler for z/OS internal queues is full. The subsystem was canceled by the task that added the last element.

System action: The IBM Tivoli Workload Scheduler for z/OS subsystem is terminated.

Programmer response: Restart the IBM Tivoli Workload Scheduler for z/OS subsystem and verify that all subtasks start normally.

Problem determination: Check the IBM Tivoli Workload Scheduler for z/OS message log for EQQZ106W messages indicating which queue is full. Check for other previous messages about the subtask that is processing the queue:

- MGRQ** Event manager
- SUBQ** Submit task
- RTRQ** Data router task
- NCFQ** NCF task

EQQZ126W THE SYSTEM WHERE THE SCHEDULER HOST IN THE XCF GROUP XCFG WAS RUNNING HAS FAILED. A TAKEOVER BY THE STANDBY HOST XCFSTB MUST BE INITIATED BY THE OPERATOR.

Explanation:

| The IBM Tivoli Workload Scheduler for z/OS standby subsystem has detected that the z/OS image on which the IBM Tivoli Workload Scheduler for z/OS host is located is down. If you set the XCFOPTS statement to automatic takeover, the first takeover and subsequent attempt (after 20 seconds) have both failed.

System action: None.

User response: Restart z/OS and the IBM Tivoli Workload Scheduler for z/OS host or use the Modify command to order the IBM Tivoli Workload Scheduler for z/OS standby subsystem to perform a takeover of the controller functions.

EQQZ127W THE SCHEDULER HOST IN XCF GROUP XCFG HAS FAILED. A TAKEOVER BY THE STANDBY HOST XCFSTB MUST BE INITIATED BY THE OPERATOR.

Explanation: This IBM Tivoli Workload Scheduler for z/OS standby subsystem has detected that the IBM Tivoli Workload Scheduler for z/OS host is not running.

System action: None.

User response: Restart the IBM Tivoli Workload Scheduler for z/OS host or use the Modify command

to order the IBM Tivoli Workload Scheduler for z/OS standby subsystem to perform a takeover.

EQQZ128I SCHEDULER ACTIVE IN STANDBY MODE

Explanation: This system has been fully initialized in standby mode.

System action: None.

System programmer response: None.

EQQZ129I TAKEOVER IN PROGRESS

Explanation: This system has started takeover processing.

System action: The system continues initialization as the new host.

System programmer response: None.

EQQZ130W XCF FUNCTION MSGO HAS FAILED DUE TO SIGNALLING FACILITY BUSY

Explanation: An XCF transmission was not successfully sent.

System action: The system tries to resend it. If the data queue element has not been successfully transmitted within five minutes, it is discarded.

System programmer response: None.

| **Problem determination:** No action is needed unless message EQQZ131W also occurs.

EQQZ131W THE FOLLOWING OUTBOUND QUEUE ELEMENT HAS BEEN DISCARDED DUE TO REPEATED TRANSMISSION ERRORS: DQE

Explanation: The system tried for five minutes to send the data queue element, but did not succeed. The data queue element is discarded.

System action: Processing continues.

| **System programmer response:** This message could indicate that insufficient space in the message buffer has been allocated in the transport class. For an explanation of how to use RMF to tune the value of the MAXMSG parameter, refer to z/OS *MVS Setting up a Sysplex*.

EQQZ132W THE FOLLOWING INBOUND QUEUE ELEMENT HAS BEEN DISCARDED DUE TO MISSING EXTENSION BUFFER SEGMENTS: DQE

Explanation: The system waited five minutes for a minimum of one missing buffer segment and then

EQQZ133W • EQQZ143E

discarded the data queue element and the incomplete extension buffer.

System action: Processing continues.

System programmer response: None.

EQQZ133W THE FOLLOWING INBOUND QUEUE ELEMENT WITH MISSING EXTENSION BUFFER SEGMENTS HAS BEEN DISCARDED DUE TO DATA ROUTER TERMINATION: DQE

Explanation: A data queue element with an incomplete buffer was present when the data router task terminated.

System action: Data router termination continues.

System programmer response: None.

EQQZ134I A CONTROLLER IS ALREADY ACTIVE WITHIN THE SAME XCF GROUP AS THIS SYSTEM

Explanation: This system has been started as a host within a IBM Tivoli Workload Scheduler for z/OS XCF group including an active host.

System action: The system is terminated.

System programmer response: Check XCFOPTS for the group keyword value. Check OPCOPTS for the OPCHOST keyword value.

EQQZ135E THE TRROPTS INITIALIZATION STATEMENT IS REQUIRED FOR A TRACKER SYSTEM

Explanation: A tracker system was started with no TRROPTS initialization statement.

If OPCHOST(NO) is specified, IBM Tivoli Workload Scheduler for z/OS needs to know how the tracker is connected to the controller. This is defined in the HOSTCON keyword in TRROPTS. The possible connections are:

Shared DASD

The controller and tracker communicate via an event data set and optionally a submit/release data set.

XCF The controller and tracker communicate via XCF communication links.

SNA The controller and tracker communicate via VTAM communication links.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails and the subsystem is terminated.

User response: Add a TRROPTS initialization statement specifying the controller connection type.

EQQZ136E EMPTY OR UNSPECIFIED EQQPARM PARAMETER LIBRARY MEMBER.

Explanation: This error is issued for one of the following reasons:

- A member for the EQQPARM DD statement was not specified
- The member of the dataset specified by the EQQPARM DD statement is empty

System action: The task that issues this message is terminated.

System programmer response: Check that the EQQPARM DD statement is defined correctly and restart the failing task.

EQQZ140E YEAR, MONTH, AND DAY MUST ALL BE TWO-DIGIT NUMBERS

Explanation: A nonnumeric date value has been specified.

System action: Processing continues.

System programmer response: Reenter a numeric date value.

EQQZ141E YEAR MUST BE IN THE RANGE 00 TO 99

Explanation: The year value is not valid. Year must be specified as 72 to 99 for years 1972 to 1999 or 00 to 71 for years 2000 to 2071.

System action: Processing continues.

System programmer response: Reenter the date value and specify a year number in the range 00 through 99.

EQQZ142E MONTH MUST BE IN THE RANGE 1 TO 12

Explanation: A date value has been specified where the month number is not valid.

System action: Processing continues.

System programmer response: Reenter the date value and specify a month number in the range 1 through 12.

EQQZ143E DAY MUST BE IN THE RANGE 1 TO 31

Explanation: A date value has been specified where the day number is not valid.

System action: Processing continues.

System programmer response: Reenter the date value and specify a day number in the range 1 through 31.

EQQZ144E DAY DD IS NOT VALID IN FEBRUARY

Explanation: A date value has been specified where the month number is 2 and the day number is greater than 29.

System action: Processing continues.

System programmer response: Reenter the date value and specify a valid day number for February.

EQQZ145E MONTH MM DOES NOT HAVE 31 DAYS

Explanation: A date value has been specified with a day value of 31 for a month that only has 30 days.

System action: Processing continues.

System programmer response: Reenter the date value and specify a valid day and month combination.

EQQZ146E YEAR YY DOES NOT HAVE 29 DAYS IN FEBRUARY

Explanation: A date value has been specified where the month number is 2 and the day number is 29 but the year is not a leap year.

System action: Processing continues.

System programmer response: Reenter the date value and specify a valid day number for February.

EQQZ147E HOUR AND MINUTE MUST BOTH BE TWO-DIGIT NUMBERS

Explanation: A nonnumeric time value has been specified.

System action: Processing continues.

System programmer response: Reenter a numeric time value.

EQQZ148E HOUR MUST BE IN THE RANGE 0 TO 23

Explanation: A time value has been specified where the hour number is not valid.

System action: Processing continues.

System programmer response: Reenter the time value and specify an hour number in the range 0 through 23.

EQQZ149E MINUTE MUST BE IN THE RANGE 0 TO 59

Explanation: A time value has been specified where the minute number is not valid.

System action: Processing continues.

System programmer response: Reenter the time value

and specify a minute number in the range 0 through 59.

EQQZ150I OLD MESSAGE TRIGGERED DUMP MESSAGE NUMBER(S)

Explanation: The message (or messages) that triggers a dump has been changed by a Modify command. Message EQQZ152I follows this message, showing the old message number (or numbers).

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

Operator response: None.

System programmer response: None.

User response: None.

Programmer response: None.

Problem determination: None.

EQQZ151I NEW MESSAGE TRIGGERED DUMP MESSAGE NUMBER(S)

Explanation: The message (or messages) that triggers a dump has been changed by a Modify command. Message EQQZ152I follows this message, showing the new message number (or numbers).

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

Operator response: None.

System programmer response: None.

User response: None.

Programmer response: None.

Problem determination: None.

EQQZ152I MSGNO

Explanation: The subsystem job-step task uses this message to print the message number (or numbers) that triggers a dump, when this number (or numbers) is changed by a Modify command.

System action: IBM Tivoli Workload Scheduler for z/OS processing continues.

Operator response: None.

System programmer response: None.

User response: None.

Programmer response: None.

Problem determination: None.

**EQQZ153E TOO MANY USER DESTINATIONS
DEFINED**

Explanation: You defined more than 64 destinations in the USER keyword of the ROUTOPTS initialization statement. A maximum of 64 user defined destinations can be used at the same time.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails and the subsystem is terminated.

Programmer response: Change the USER keyword to specify fewer destinations and restart the subsystem.

**EQQZ154E THE PIFHD KEYWORD IS MISSING
OR INVALID**

Explanation: The PIFHD keyword on the INTFOPTS initialization statement is required. You have not defined the keyword or the keyword has an invalid value.

System action: IBM Tivoli Workload Scheduler for z/OS initialization fails and the subsystem is terminated.

Programmer response: Change or add the keyword to the INTFOPTS initialization statement and restart the subsystem.

**EQQZ155E THE CONTENTIONTIME KEYWORD
IS INVALID**

Explanation: The value of 0 is invalid.

System action: IBM Tivoli Workload Scheduler for z/OS NMM initialization fails and the NMM task is terminated.

Programmer response: Change or add the CONTENTIONTIME keyword and restart the subsystem.

**EQQZ156W THE CONTENTION TIME VALUE
WILL BE IGNORED BECAUSE
RESCONT IS MISSING**

Explanation: If RESCONT is not specified, any value specified for CONTENTIONTIME is not taken into consideration.

System action: IBM Tivoli Workload Scheduler for z/OS NMM initialization ends with RC=4, but the NMM continues processing.

Programmer response: Add the missing RESCONT or remove the CONTENTIONTIME keyword.

**EQQZ157E THE MAXHISTORYROWS KEYWORD
SPECIFIES A VALUE THAT IS NOT IN
THE RANGE 0 – 999999**

Explanation: The value set for MAXHISTORYROWS in the OPCOPTS statement to define the maximum number of rows to be returned by the HIST command is outside of the allowed range.

System action: The parsing of the initialization parameters stops.

Programmer response: Modify the MAXHISTORYROWS setting. Valid values are in the range 0-999999.

When setting this value, consider that during the HIST command processing the GENERAL SERVICE task locks the CP, preventing other panel requests from accessing it.

**EQQZ160E LIBRARY WITH DDNAME EQQJCLIB
COULD NOT BE OPENED**

Explanation: IBM Tivoli Workload Scheduler for z/OS could not open a required input data set, ddname EQQJCLIB. This message can be issued:

- During initialization of the event writer task.
- When processing a Modify command with the DEPLOYCF or NEWDSLST option.

System action: If the message was issued when processing a Modify command, the configuration file that was previously built remains in effect. If the error occurs during initialization, data set triggering functions are not available.

System programmer response: If the data set triggering function should be active, check that EQQJCLIB is correctly defined and that the IBM Tivoli Workload Scheduler for z/OS started task is authorized to open the data set. Restart the tracker or issue the Modify command when the problem has been corrected.

**EQQZ161E UNABLE TO ALLOCATE STORAGE
TO PROCESS MEMBER MEMBER OF
EQQJCLIB**

Explanation: An error occurred when allocating storage to build a data set selection table. This message can be issued:

- During initialization of the event writer task.
- When processing a Modify command with the DEPLOYCF or NEWDSLST option.

System action: If the message was issued when processing a Modify command, the data set selection table that was previously built remains in effect. If the error occurs during initialization, data set triggering functions are not available.

System programmer response: Verify that the EQQEVLSST or EQQDSLST member in the EQQJCLIB

library is not too large. If it is not, determine which product or program, or both, is exhausting ECSA storage. Restart the tracker or issue the Modify command when the problem has been corrected.

EQQZ162W UNABLE TO FIND MEMBER *MEMBER* IN EQQJCLIB

Explanation: IBM Tivoli Workload Scheduler for z/OS could not find the member *EQQEVLS*T or *EQQDSL*ST in the data set referenced by the *EQQJCLIB* ddname. This message can be issued:

- During initialization of the event writer task.
- When processing a Modify command with the *DEPLOYCF* or *NEWDSL*ST option.

System action: If the message was issued when processing a Modify command, the data set selection table that was previously built remains in effect. If the error occurs during initialization, data set triggering functions are not available.

System programmer response: If the data set triggering function should be active, check that *EQQJCLIB* contains the data set selection table. Restart the tracker or issue the Modify command when the data set selection table has been created.

EQQZ163W MEMBER *MEMBER* IN EQQJCLIB IS EMPTY

Explanation: A data set selection table exists in library *EQQJCLIB*, but there are no records in the member. This message can be issued:

- During initialization of the event writer task.
- When processing a Modify command with the *DEPLOYCF* or *NEWDSL*ST option.

System action: If the message was issued when processing a Modify command, the data set selection table that was previously built remains in effect. If the error occurs during initialization, data set triggering functions are not available.

System programmer response: If the data set triggering function should be active, check that *EQQJCLIB* contains a valid data set selection table. If *EQQJCLIB* contains an *EQQDSL*ST member, consider that it must contain at least an end-of-table indicator. Restart the tracker or issue the Modify command when the problem has been corrected.

EQQZ164E MEMBER *MEMBER* CONTAINS INVALID DATA

Explanation: The data set triggering selection table contains invalid data or is missing an end-of-table marker. This message can be issued:

- During initialization of the event writer task.
- When processing a Modify command with the *DEPLOYCF* or *NEWDSL*ST option.

System action: If the message was issued when

processing a Modify command, the data set selection table that was previously built remains in effect. If the error occurs during initialization, data set triggering functions are not available.

System programmer response: Check the output of the data set selection table builder job (*EQQRXTRG* or *EQQLSENT* assembly). If you used *EQQLSENT*, consider that the data set selection table must contain at least an end-of-table indicator created with *STRING=LASTENTRY* as input to the *EQQLSENT* macro. If you cannot correct the problem, contact IBM Software Support. Restart the tracker or issue the Modify command when the problem has been corrected.

EQQZ165I MEMBER *MEMBER* OF LIBRARY *EQQJCLIB* IS SUCCESSFULLY LOADED

Explanation: IBM Tivoli Workload Scheduler for z/OS has successfully created a data set selection table from the current contents of member *EQQEVLS*T or *EQQDSL*ST in the library defined by the *EQQJCLIB* DD statement. This message is issued when an event writer first creates the table after an IPL or when the table is rebuilt during the processing of a Modify command with Modify option *DEPLOYCF* or *NEWDSL*ST.

System action: IBM Tivoli Workload Scheduler for z/OS continues normal processing.

System programmer response: None.

EQQZ166E ERROR WRITING MEMBER *MEMBER* OF EQQJCLIB LIBRARY.

Explanation: The scheduler encountered an I/O error writing to the data set triggering selection table.

System action: If the message was issued when processing a Modify command, the data set selection table that was previously built remains in effect. If the error occurs while building the selection table or during initialization, data set triggering functions are not available.

System programmer response: Check that *EQQJCLIB* is correctly defined. After correcting the error, restart the tracker or issue a Modify command with option *DEPLOYCF*.

EQQZ167E ERROR IN MACRO STOW: RC = *RET*CODE, RSN = *RSN*CODE WRITING MEMBER *MEMBER* OF EQQJCLIB LIBRARY.

Explanation: The scheduler received an error while stowing member *MEMBER* in the tracker *EQQJCLIB*.

System action: If the message was issued when processing a Modify command, the data set selection table that was previously built remains in effect. If the

EQQZ168I • EQQZ174W

error occurs while building the selection table or during initialization, data set triggering functions are not available.

System programmer response: Check that EQQJCLIB is correctly defined. After correcting the error, restart the tracker or issue a Modify command with option DEPLOYCF.

EQQZ168I MEMBER *MEMBER* OF EQQJCLIB LIBRARY HAS BEEN UPDATED.

Explanation: The scheduler successfully updated the data set triggering selection table.

System action: IBM Tivoli Workload Scheduler for z/OS continues normal processing.

System programmer response: None.

EQQZ169I CONFIGURATION FILE *MEMBER* OF EQQJCLIB LIBRARY IS LOADED TO INTERCEPT EVENTS.

Explanation: The scheduler successfully refreshed the data set triggering selection table from the current contents of member *MEMBER* in the tracker EQQJCLIB.

System action: IBM Tivoli Workload Scheduler for z/OS continues normal processing.

System programmer response: None.

EQQZ170E CODE LEVEL VERIFICATION FAILED CODE LEVEL OF THE SSX CONTROL BLOCK IS *SSXLEV* CODE LEVEL OF THE EQQMAJOR MODULE IS *MCALEV* CODE LEVEL OF THE SSCM MODULE IS *SSCMLEV*

Explanation: IBM Tivoli Workload Scheduler for z/OS initialization has determined that the SSX control block, the EQQMAJOR module and the EQQSSCMD load module are on different service levels. This difference is not supported.

System action: Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Verify that Tivoli Workload Scheduler for z/OS is using the correct load library. If the SSX control block and the EQQMAJOR module are on different code levels, modify the OPCOPTS statement, specifying the BUILDSSX keyword. If the EQQSSCMD and the EQQMAJOR modules are on different code levels, modify the OPCOPTS statement, adding or changing the SSCMNAME keyword.

After making the appropriate changes, restart the IBM Tivoli Workload Scheduler for z/OS subsystem.

EQQZ171E MERGE PARAMETER IS NOT SUPPORTED. OLD SSX AND NEW SSX ARE NOT FOR THE SAME FMID CODE LEVEL OF THE NEW SSX CONTROL BLOCK IS *SSXLEV* CODE LEVEL OF THE OLD SSX CONTROL BLOCK IS *OLDLEV*

Explanation: The MERGE parameter of the BUILDSSX keyword is supported only when the old SSX control block was built for the same FMID as the current EQQMAJOR module.

System action: Tivoli Workload Scheduler for z/OS initialization fails.

System programmer response: Change the BUILDSSX keyword to specify BUILDSSX(REBUILD).

EQQZ172I SSX BLOCK OF VERSION *SSXLEV* SUCCESSFULLY BUILT

Explanation: The *BUILDSSX* keyword was specified in the OPCOPTS control statement and Tivoli Workload Scheduler for z/OS has successfully verified that the EQQSSCMD load module is of the correct version. A new SSX control block has been built and is used by this Tivoli Workload Scheduler for z/OS address space.

System action: The Tivoli Workload Scheduler for z/OS address space initialization continues.

EQQZ173I SSX BLOCK OF VERSION *SSXLEV* SUCCESSFULLY RESTORED

Explanation: The *BUILDSSX* keyword was specified in the OPCOPTS control statement and Tivoli Workload Scheduler for z/OS has successfully restored the previous version of the SSX block as the operative version.

This message is issued only when the SSX block was rebuilt by the Tivoli Workload Scheduler for z/OS address space using the *BUILDSSX* keyword and when the address space is about to terminate.

The *SSXLEV* variable indicates the code level of the SSX that is restored. The restored SSX is used by all Tivoli Workload Scheduler for z/OS functions while the Tivoli Workload Scheduler for z/OS subsystem is inactive.

System action: The Tivoli Workload Scheduler for z/OS address space termination continues.

EQQZ174W OLD AND NEW SSX CONTROL BLOCK ARE ON THE SAME LEVEL, *SSXLEV*

Explanation: The *BUILDSSX* keyword was specified in the OPCOPTS control statement and a new SSX block has been successfully built. However, the new and the old SSX control block are at the same code level.

System action: Tivoli Workload Scheduler for z/OS initialization continues.

System programmer response: If this message is expected, modify the OPCOPTS statement, removing the BUILDSSX keyword.

If this message is not expected, verify that the load modules used by Tivoli Workload Scheduler for z/OS are coming from the correct load libraries. After making the appropriate changes, restart the Tivoli Workload Scheduler for z/OS subsystem.

EQQZ175E INCONSISTENT DEFINITION OF JOBLOGRETRIEVAL KEYWORD

Explanation: You have made an inconsistent definition of JOBLOGRETRIEVAL in JOBOPTS. Check the following conditions:

- OPCHOST(NO) must be specified on OPCOPTS
- CATMGT(YES) must be specified on OPCOPTS
- If you have specified JOBLOGRETRIEVAL(Delayed) or (DelayedExit), you must have a EXITS statement with CALL010(YES) or LOAD010(nnnnnnnn).

System action: IBM Tivoli Workload Scheduler for z/OS is terminated.

User response: Correct the inconsistent definition and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ176E INCONSISTENT DEFINITION OF CATMDISP KEYWORD

Explanation: You have made an inconsistent definition of CATMDISP in JOBOPTS. Check the following conditions:

- OPCHOST(NO) must be specified on OPCOPTS
- CATMGT(YES) must be specified on OPCOPTS
- A JOBLOGRETRIEVAL other than NONE is specified.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated

User response: Correct the inconsistent definition and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ177E INCONSISTENT DEFINITION OF MAXNUMUSYS KEYWORD

Explanation: You have made an inconsistent definition of MAXNUMUSYS in JOBOPTS. Check the following conditions:

- OPCHOST(NO) must be specified on OPCOPTS
- CATMGT(YES) must be specified on OPCOPTS
- A JOBLOGRETRIEVAL value other than NONE is specified.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated.

User response: Correct the inconsistent definition and

restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ178E INCONSISTENT DEFINITION OF JOBLOGDEST KEYWORD

Explanation: You have made an inconsistent definition of JOBLOGDEST in OPCOPTS. Check the following conditions:

- OPCHOST(YES) must be specified
- CATMGT(YES) must be specified.

Also check that the destination pairs specified are in alignment with those defined in the ROUTOPTS statement.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated.

User response: Correct the inconsistent definition and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ179E UNBALANCED PAIR OF DESTINATIONS IN JOBLOGDEST KEYWORD

Explanation: You have specified a JOBLOGDEST that contains an unbalanced definition of destinations. Either the execution destination is specified, but no retrieval destination, or a retrieval destination is specified, but no execution destination.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated.

System programmer response: None.

User response: Correct the inconsistent definition and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ180E INCONSISTENT DEFINITION OF EXIT STATEMENT AND JOBLOGRETRIEVAL KEYWORD

Explanation: You have specified the JOBLOGRETRIEVAL keyword with value DELAYED or DELAYEDEXIT. The value implies the use of a user exit, UX010, that has not been defined to IBM Tivoli Workload Scheduler for z/OS.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated.

System programmer response: Correct the inconsistent definitions and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ181E UNPAIRED DESTINATION:IPADDR SPECIFIED IN THE TCP KEYWORD

Explanation: In the TCP keyword of the ROUTOPTS statement each destination must be paired with the IP address of the corresponding tracker.

System action: IBM Tivoli Workload Scheduler for z/OS is terminated.

System programmer response: Correct the inconsistent definitions and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ182E SUBSTRING EXCEEDS BOUNDS OR LENGTH ZERO WAS FOUND IN PARMREC

Explanation: During symbol substitution of PARMLIB, a substringed symbol was encountered. It exceeds either the bounds of the substitution text or a substring, in which the length specified was 0. The incorrect record follows in message EQQZ182I.

System action: The task is terminated.

System programmer response: Correct the wrong system symbol definitions. Restrictions in usage of the system symbols are found in the Assembler Services Reference.

EQQZ183E UNEXPECTED ERROR DURING SYMBOL SUBSTITUTION

Explanation: During symbol substitution processing, an unexpected error occurred.

System action: The task is terminated.

System programmer response: Contact IBM Software Support. Provide a copy of the message log as documentation. A possible solution is to remove the system symbols from the PARMLIB member being processed.

EQQZ184E XCF STATEMENT NEEDED WHEN OPCOPT OPCHOST(PLEX) SPECIFIED

Explanation: During the processing of the XCF statement, either the MEMBER or the GROUP keyword is missing. These keywords are required when OPCOPT OPCHOST(PLEX) is specified.

System action: IBM Tivoli Workload Scheduler for z/OS stops processing.

System programmer response: Correct the statement definitions, either by adding the correct XCF MEMBER and GROUP definitions or by changing the OPCHOST(PLEX) keyword.

EQQZ185I THE SCHEDULER WILL START AS AN ACTIVE CONTROLLER

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem starts as an active controller, with job submission and tracking functions as defined in the initialization parameters.

System action: IBM Tivoli Workload Scheduler for z/OS startup continues.

System programmer response: None.

EQQZ186I THE SCHEDULER WILL START AS A STANDBY CONTROLLER

Explanation: The IBM Tivoli Workload Scheduler for z/OS subsystem starts as a standby controller, ready to take over job submission and tracking functions from the active controller, as defined in the initialization parameters.

System action: IBM Tivoli Workload Scheduler for z/OS startup continues.

System programmer response: None.

EQQZ187E CHECKPOINT DATASET WAS NOT INITIALIZED

Explanation: During the startup with OPCOPTS OPCHOST(PLEX), the checkpoint data set is not initialized. This is not supported.

System action: IBM Tivoli Workload Scheduler for z/OS stops processing.

System programmer response: Start one IBM Tivoli Workload Scheduler for z/OS controller with OPCOPTS OPCHOST(YES) to initialize the checkpoint data set with the correct FMID and service level for a Sysplex Controller configuration.

EQQZ188E UNEXPECTED RETURN CODE DURING SYMBOL SUBSTITUTION

Explanation: During symbol substitution an unexpected return code was issued by the z/OS symbol substitution services. Diagnosis messages are shown.

System action: IBM Tivoli Workload Scheduler for z/OS stops processing.

System programmer response: Save the parameter data set definitions, the message log and the current values of z/OS static symbols. Contact IBM Software Support. A possible solution is to remove the system symbols from the PARMLIB member being processed.

EQQZ189W OPCOPT OPCHOST(PLEX) WAS SPECIFIED BUT NO TAKEOVER KEYWORD FOR THE XCFOPTS STATEMENT WAS FOUND

Explanation: The initialization statement OPCOPT OPCHOST(PLEX) was specified, but no TAKEOVER keyword for the XCFOPTS statement was coded. This is necessary to avoid operator intervention in a takeover situation.

System action: IBM Tivoli Workload Scheduler for z/OS startup continues.

System programmer response: Code either TAKEOVER SYSFAIL or HOSTFAIL, as appropriate.

**EQQZ190E THE FMID FILEFMID OF DATASET
FILENAME DOES NOT MATCH CODE
FMID OPCFMID**

Explanation: The FMID *FILEEVER* of the data set *FILENAME* does not match the FMID *OPCVER* of the code trying to access the file.

System action: Either the program or IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Check that the level of IBM Tivoli Workload Scheduler for z/OS matches the level of the file indicated in the message. Possible explanations include running on backlevel code or a backlevel data set. Correct the errors and restart either IBM Tivoli Workload Scheduler for z/OS or the program.

Programmer response: Contact your system programmer.

**EQQZ191E THE CHECKPOINT DATA SET,
DDNAME EQQCKPT, COULD NOT BE
OPENED**

Explanation: The subsystem task module, *EQQMAJOR*, could not open the checkpoint data set, which is a required data set for IBM Tivoli Workload Scheduler for z/OS.

System action: IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Check that *ddname* *EQQCKPT* is correctly specified and the IBM Tivoli Workload Scheduler for z/OS started task is authorized to open the data set for updating. Correct the errors and restart IBM Tivoli Workload Scheduler for z/OS.

Programmer response: Contact your system programmer.

**EQQZ192E THE VERSION FILEEVER OF DATASET
FILENAME DOESN'T MATCH CODE
VERSION OPCVER**

Explanation: The version *FILEEVER* of the data set *FILENAME* does not match the version *OPCVER* of the code trying to access the file.

System action: Either the program or IBM Tivoli Workload Scheduler for z/OS initialization is terminated.

System programmer response: Check that the level of IBM Tivoli Workload Scheduler for z/OS matches the level of the file indicated in the message. Possible explanations include running on backlevel code or a backlevel data set. Correct the errors and restart either IBM Tivoli Workload Scheduler for z/OS or the program.

Programmer response: Contact your system programmer.

**EQQZ193I END-TO-END TRANSLATOR SERVER
PROCESS IS NOW AVAILABLE**

Explanation: The Receiver task periodically checks for the End-to-end Translator server process availability. This message is issued in the controller MLOG when the translator process is available. If the Event Manager task is not active, the Receiver starts waiting for it to become active again, and the *EQQW099I* message with action = 'STARTED' is issued in the controller MLOG and the Receiver stops checking for the server availability. When the Event manager is active again, *EQQW099I* message with action = 'STOPPED' is issued in the controller MLOG, and the Receiver restarts checking for the server availability.

System action: None.

User response: None.

**EQQZ194W RCLEANUP (YES) FORCES
OUTPUTNODE (FINAL)**

Explanation: *Outputnode* (*JTOPTS*) was set to any but *RCLEANUP* (*YES*) requires it to be set to final.

System action: *OUTPUTNODE* value is defaulted to final, initialization continue.

User response: None.

**EQQZ195I SYNCHRONIZATION BETWEEN
CONTROLLER AND SERVER ENDED**

Explanation: The server ended the synchronization process with the controller during a daily planning activity.

System action: The planning activity continues.

User response: None.

**EQQZ196E THE SAME IP ADDRESS AND PORT
APPEAR IN MORE THAN ONE TCPIP
KEYWORD OF THE ROUTOPTS
STATEMENT.**

Explanation: The pair address-port number must be unique within the TCP/IP destination list.

System action: The product initialization terminates.

System programmer response: Correct the *ROUTOPTS* statement.

**EQQZ197E AN ERROR OCCURRED WHILE
LOGGING CRITICAL JOB TABLE
DATA SPACE IN DATA SET
EQQJTABL.**

Explanation: The scheduler tried to log the critical job

table data space before closing the critical path handler, but the logging failed.

System action: The critical path handler processing ends without saving the current critical job table content.

System programmer response: Check the system log and EQQMLOG for messages that explain why the logging failed. In particular, verify that EQQJTABL is correctly defined.

EQQZ198E AN ERROR OCCURRED WHILE LOADING CRITICAL JOB TABLE ENTRIES FROM DATA SET EQQJTABL TO UPDATE DATA SPACE.

Explanation: The scheduler tried to log the critical job table data space before closing the critical path handler, but the logging failed.

System action: The scheduler cannot update the critical job table. Dynamic updates might be lost.

System programmer response: Save the message log (EQQMLOG), the job table log file (EQQJTABL) and the current plan (EQQCPxDS), and contact IBM Software Support.

User response: Contact your system programmer.

EQQZ199E AN ERROR OCCURRED WHILE RESETTING CRITICAL JOB TABLE LOG DATA SET.

Explanation: The scheduler failed to reset the critical job table when extending, recreating, or deleting the current plan.

System action: The scheduler cannot update the critical job table. Dynamic updates might be lost.

System programmer response: Save the message log (EQQMLOG), the job table log file (EQQJTABL) and the current plan (EQQCPxDS), and contact IBM Software Support.

User response: Contact your system programmer.

EQQZ200I OPCTYP SSNAME HEARTBEAT

Explanation: This message is sent by the scheduler at startup or as result of a "heartbeat" command, to state that the scheduler is active and running.

OPCTYP

One of the following values:

CONTROLLER

If the subsystem is a controller.

STAND-BY

If the subsystem is a standby controller.

TRACKER

If the subsystem is a tracker.

SSNAME

The name of the scheduler subsystem.

System action: If the scheduler instrumentation for GEM is active, this message is translated by NetView into a Heartbeat event and is sent to GEM. When GEM receives this message, it adds an icon for this component in the Job Scheduling view on the GEM console.

System programmer response: None.

EQQZ201I OPCTYP SSNAME: STATUS

Explanation: Displays the status of a subsystem of the scheduler.

OPCTYP

One of the following values:

CONTROLLER

If the subsystem is a controller of IBM Tivoli Workload Scheduler for z/OS.

STAND-BY

If the subsystem is a standby controller.

TRACKER

If the subsystem is a tracker of z/OS.

SSNAME

The name of the scheduler subsystem.

STATUS

One of the following values:

FULLY_OPERATIONAL

The subsystem is working correctly.

PARTIALLY_OPERATIONAL

The subsystem has limited functionality, for example, ER is not active. Therefore a controller can still schedule jobs, but cannot receive their status.

NOT_OPERATIONAL

Some core functionality of the scheduler is not active, for example, a controller is not able to execute a plan or to submit a job.

System action: If the scheduler instrumentation for GEM is active, this message is translated into a Monitor Threshold event and sent to GEM, which updates the Job Scheduling view correctly on the APM console.

Programmer response: If the scheduler STATUS is not FULLY_OPERATIONAL, one or more of the scheduler subtasks is inactive or is not working properly. Depending on the inactive tasks, the status can assume the values PARTIALLY_OPERATIONAL or NOT_OPERATIONAL. Message EQQZ202I lists the inactive subtasks, which you should restart.

EQQZ202I FOLLOWING SUBTASKS ARE INACTIVE: TASKLST

Explanation: Lists the names of the scheduler subtasks that are inactive. If the scheduler status is not FULLY_OPERATIONAL, this message is always issued

in conjunction with message EQQZ201I.

System action: Normal processing continues.

Programmer response: Restart the correct scheduler subtask.

EQQZ203I *TRKTYPE TRACKER TRKNAME :*
TRKADDR TRKSTAT

Explanation: Provides information about the status of a tracker connected to a controller.

TRKTYPE

The type of tracker. It can be one of the following values:

SNA
XCF
DASD
TCP
USER
APPC
HOME

TRKNAME

The name of the scheduler destination associated with that tracker.

TRKADDR

The TCP/IP or SNA address associated with that tracker.

TRKSTAT

The status of the tracker. It can be one of the following values:
ONLINE
OFFLINE

System action: If the scheduler instrumentation for GEM is active, this message is translated into a Monitor Threshold event and sent to GEM, which updates the Job Scheduling view correctly on the APM console.

Programmer response: If the status of a connected tracker is offline, either the tracker is not running or the connection is down. Restart the tracker or wait for the tracker to reestablish the connection.

EQQZ204I *SSNAME TRKTYPE TRACKER*
TRKNAME: TRKADDRHEARTBEAT

Explanation: This message is sent by the scheduler at startup or as a result of a STATUS,TRK scheduler command, to state that a tracker defined to this controller is active and running.

SSNAME

The name of the scheduler subsystem.

TRKTYPE

The type of tracker. It can be one of the following values:

SNA
XCF
DASD
TCP
USER
APPC

TRKNAME

The name of the scheduler destination associated with that tracker.

TRKADDR

The TCP/IP or SNA address associated with that tracker.

System action: If the scheduler instrumentation for GEM is active, this message is translated by NetView into a Heartbeat event for the Tracker and is sent to GEM. When GEM receives this message, it updates the Job Scheduling view in the APM server with a new component for this tracker and a new link with the related controller.

System programmer response: None.

EQQZ205I *TRKTYPE TRACKER TRKNAME :*
TRKADDR NOT FOUND

Explanation: This message is sent by the scheduler as result of a STATUS,TRK command of the scheduler, when the tracker name (or tracker address) is not defined to the controller in the ROUTOPTS initialization statements.

TRKTYPE

The type of tracker. It can be one of the following values:

SNA
XCF
DASD
TCP
USER
APPC

TRKNAME

The name of the scheduler destination associated with that tracker.

TRKADDR

The TCP/IP or SNA address associated with that tracker.

System action: Normal processing continues.

Programmer response: Specify the correct tracker name (or address) in the STATUS,TRK command of the scheduler.

EQQZ206I *SSNAME TRKTYPE TRACKER*
TRKNAME: TRKADDR TRKSTAT

Explanation: Provides information about the status of a tracker connected to this controller.

SSNAME

The name of the scheduler subsystem.

TRKTYPE

The type of tracker. It can be one of the following values:

SNA
XCF
DASD
TCP
USER
APPC

EQQZ207I • EQQZ211E

TRKNAME

The name of the scheduler destination associated with that tracker.

TRKADDR

The TCP/IP or SNA address associated with that tracker.

TRKSTAT

The status of the tracker. It can be one of the following values:

ONLINE
OFFLINE

System programmer response: If the scheduler instrumentation for GEM is active, this message is translated by NetView into a Connection Change event for the tracker and is sent to GEM. When GEM receives this message, it updates the Job Scheduling view in the APM Server by removing or creating the link between the tracker and the related controller.

Programmer response: If the status of a connected tracker is offline, either the tracker is not running or the connection is down. Restart the tracker or wait for the tracker to reestablish the connection.

EQQZ207I TASKNAM IS STATUS

Explanation: Displays the status of the specified scheduler subtask.

TASKNAM

The name of the scheduler subtask.

STATUS

The status of the scheduler subtask:

ACTIVE

The scheduler subtask is running.

INACTIVE

The scheduler subtask is not running.

System action: Normal processing continues.

Programmer response: None.

EQQZ208I DDNAMELAST-RC= LASTRC

Explanation: Provides the return code of the last I/O operation on the specified *DDNAME*.

DDNAME

The ddname of the scheduler data set.

LASTRC

The return code of the last I/O operation. It can be one of the following values:

NORMAL
WARNING
SEVERE
CRITICAL
UNKNOWN

System action: Depending on the return code value and on the specified *DDNAME*, the scheduler could stop some of its subtasks.

Programmer response: If the *LASTRC* value is other than NORMAL or WARNING, and depending on the *DDNAME* value, some of the scheduler functions could

not work correctly. In this case, check the status of the physical sequential or VSAM data set associated with *DDNAME*.

EQQZ209I OPNUM OPDESC FOR TRACKER TRKNAM

Explanation: Displays the number of operations that have been completed or ended in error for the specified tracker.

OPNUM

The number of operations that completed or ended in error.

OPDESC

The description of the operations. It can be one of the following values:

COMPLETED_OPERATIONS

The number of operations that completed successfully on that destination.

IN_ERROR_OPERATIONS

The number of operations that ended in error on the specified tracker.

TRKNAM

The name of the tracker.

System action: If the scheduler instrumentation for GEM is active, this message is translated into a Monitor Threshold event and sent to GEM, which updates the Job Scheduling view correctly on the APM console.

Programmer response: None.

EQQZ210I ERRCODE ERROR ACCESSING SSNAME DATASET: ERRMSG

Explanation: An error occurred accessing a data set, where:

SSNAME

The name of the scheduler subsystem

ERRCODE

The code of the error. It can be either SEVERE or FATAL.

ERRMSG

The cause of the error. It can be either an I/O error or unable to open the file.

System action: Depending on the *ERRCODE* value, some of the scheduler functions could not work correctly.

System programmer response: Check the status of data set.

EQQZ211E THE EDP TABLE HAS REACHED THE LIMIT OF 1000 DESTINATIONS

Explanation: The controller detected that the EDP table has reached the maximum number of entries for the remote destinations while trying to add a new one.

System action: All the controller communication tasks and event readers are stopped until a refresh of the

checkpoint data set is performed.

System programmer response: Refresh the checkpoint data set by running a daily plan extend or replan batch job after specifying the CKPTREFRESH keyword the value YES in the BATCHOPT options.

EQQZ212E ARM OPERATION (RET CODE: RTC,
RSN CODE: RSC)

Explanation: The automatic restart management (ARM) OPERATION has ended in error.

System action: The ARM operation is not completed.

System programmer response: Verify the correct configuration of the ARM function. If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQZ212I ARM OPERATION (RET CODE: RTC,
RSN CODE: RSC)

Explanation: The automatic restart management (ARM) OPERATION has completed.

System action: The ARM operation has completed.

User response: If RTC is 04, contact your system administrator.

EQQZ213W THE THRESHOLD MUST BE IN THE
RANGE FROM 0 TO 100

Explanation: The threshold value is used with the conditional policy (specified in the WLM statement as SMART). If a job has not yet reached its deadline, the job considers the time remaining before the deadline. If the remaining time is long enough compared with the interval between the latest start time and the start time, no WLM request for promotion is issued. If you want to try and apply the Deadline and Latest Start Time policies in a row, you should specify a threshold value equal to 0.

System action: None

User response: Check that the threshold value you specified in the WLM statement of OPCOPTS is in the range 0-100. If not specify a correct value and rerun the task. For information about the supported values, see the *Customization and Tuning* manual, Chapter 1. Defining initialization statements, section, "OPCOPTS".

EQQZ214E THE PROCESSING CANNOT
PROCEED: TCP/IP COMMUNICATION
FEATURE IS NOT INSTALLED

Explanation: The server could not locate a required load module.

System action: The server terminates.

System programmer response: If the TCP/IP communication is not installed, install it. Otherwise, ensure you are using the correct libraries.

EQQZ215E WLM SCHEDULING ENVIRONMENT
DEFINITIONS COULD NOT BE
DETERMINED. RETURN CODE: RETC
REASON CODE: RSNC

Explanation: The tracker could not check the scheduling environment status, because the WLM macro used for this purpose (IWMSEQRY) failed. The WLM macro return code RETC and the reason code RSNC explain why.

System action: If the tracker was to check all the currently available scheduling environments (this is performed when the Submit task starts up), the related VM event is not generated.

If the tracker was to check a specific scheduling environment, the related job is not submitted and the following EQQSU37E message specifies the name of the job.

User response: See the WLM IWMSEQRY return code and reason code on the WLM guide book, and fix the problem. (See *MVS Programming: Workload Management Services*).

EQQZ216I ENF EXIT EXNAME WAS DELETED
FROM CSA ADDRESS: ADDR SIZE:
SIZ

Explanation: At startup, the tracker or controller detected that the level of the associated EXNAME exit in CSA differs from the level of the EQQZNF57 exit loaded from the tracker STEPLIB (if) or LNKLIST library.

EXNAME can be one of the following:

- EQQZNF41
- EQQZNF57

This message reports that the pre-existing exit was deleted from CSA and specifies the new CSA address and the size of the just loaded exit.

System action: The tracker removes existing exit from CSA and loads the new exit.

User response: None.

EQQZ217W THE SAME IP ADDRESS AND PORT
APPEAR IN MORE THAN ONE HTTP
KEYWORD OF THE ROUTOPTS
STATEMENT

Explanation: The HTTP or HTTPS destinations list contains more destinations of the same type with the same address-port number. This definition is unnecessary.

EQQZ220W • EQQZ228E

System action: The product initialization terminates.

System programmer response: Correct the ROUTOPTS statement by deleting the superfluous destination.

EQQZ220W CLNJOBPX PARM NOT SPECIFIED OR INVALID: DEFAULTED TO "EQQCL"

Explanation: You specified OPCOPTS RCLEANUP(YES) but either did not specify RCLOPTS CLNJOBPX, or specified a cleanup job prefix with less than five characters: the cleanup job prefix parameter has been defaulted to "EQQCL".

System action: Processing continues.

User response: Specify the CLNJOBPX parameter for the RCLOPTS option or specify a cleanup job prefix with more than five or more characters. For information about the supported values, see the *Customization and Tuning* manual, Chapter 1. Defining initialization statements, section, "RCLOPTS".

EQQZ222W DSTDEST PARM NOT SPECIFIED DEFAULTED TO "OPC"

Explanation: You did not specify the DSTDEST parameter in RCOPTS option. It has been defaulted to "IBM Tivoli Workload Scheduler for z/OS".

System action: The scheduler continues processing.

User response: Specify the DSTDEST parameter in the RCLOPTS option and rerun the task. For information about the supported values, see the *Customization and Tuning* manual, Chapter 1. Defining initialization statements, section, "RCLOPTS".

EQQZ223E DSTRMM VALUE INVALID. MUST BE "Y" OR "N"

Explanation: You specified an invalid value for the DSTRMM parameter in RCOPTS option. Valid values are "Y" or "N".

System action: The scheduler continues processing.

User response: Check the command. Correct the error and resubmit the request.

EQQZ224W DDPRMEM NOT ALLOWED WHEN DDPROT IS SPECIFIED

Explanation: You have specified both DDPRMEM and DDPROT parameters in RCOPTS option. DDPRMEM is invalid when DDPROT is specified and it has been ignored.

System action: The scheduler continues processing.

User response: Remove the DDPRMEM parameter and rerun the task. For information about the supported values, see the *Customization and Tuning*

manual, Chapter 1. Defining initialization statements, section, "RCLOPTS".

EQQZ225W DSNPRMEM NOT ALLOWED WHEN DSNPROT IS SPECIFIED

Explanation: You have specified both DSNPRMEM and DSNPROT parameters in RCOPTS option. DSNPRMEM is invalid when DSNPROT is specified and it has been ignored.

System action: The scheduler continues processing.

User response: Remove the DDPRMEM parameter and rerun the task. For information about the supported values, see the *Customization and Tuning* manual, Chapter 1. Defining initialization statements, section, "RCLOPTS".

EQQZ226E DSTDEST VALUE INVALID

Explanation: You specified an invalid value for the DSTDEST parameter in RCOPTS option. It must be a valid z/OS name.

System action: The scheduler does not start.

User response: Check the command. Correct the error and resubmit the request.

EQQZ227E UNBALANCED PAIR OF DESTINATION AND JES CLASS IN DSTCLASS KEYWORD

Explanation: The KEYWORD DSTCLASS has been specified with an invalid syntax in the RCLOPTS statement. The values must be pairs of destination and class, such as:

DSTCLASS (Dest1:A , Dest2:B, Dest3:C)

See *IBM Tivoli Workload Scheduler for z/OS Customization and Tuning* for details.

System action: The controller stops processing and terminates.

User response: Correct the syntax errors and restart the controller.

EQQZ228E DSTCLASS VALUE INVALID

Explanation: The values specified for the tracker destination or the JES class in the keyword *DSTCLASS* of the *RCLOPTS* statement contain syntax errors. See *IBM Tivoli Workload Scheduler for z/OS Customization and Tuning* for details.

System action: The Controller stops processing and terminates.

User response: Correct the syntax errors and restart the controller.

**EQQZ229E A SEVERE ERROR, SYSTEM ABEND
ABEND, OCCURRED WHILE
ATTEMPTING TO UPDATE EQQJTABL
LOG DATA SET**

Explanation: While processing a stop or cancel command, the controller abnormally ended when attempted to write a record to the EQQJTABL data set. If the abend code is SB37 or SD37, the EQQJTABL data set is too small.

System action: The scheduler stops logging records in the EQQJTABL data set. Remaining records will not be logged. As a consequence, at controller restart, events related to critical job table entries might be only partially processed.

System programmer response: If the abend code is SB37 or SD37, scrap the EQQJTABL data set and allocate a larger one at a suitable time when the controller is stopped. The next DP batch extend or replan process will rebuild the critical job table by reading current plan data.

**EQQZ230E THE SCHEDULER DID NOT GET
ENOUGH STORAGE TO SEND AN
EVENT TO TBSM**

Explanation: In the OPCOPTS statement, the EXTMON parameter is set to YES. The scheduler tried to allocate storage for a build of the event to send to TBSM, but the request for storage failed.

System action: The event is not sent to TBSM.

System programmer response: Ensure that the product is running in a sufficiently large region, then restart it.

**EQQZ231E AN ERROR OCCURRED DURING
COMMUNICATION WITH TBSM. THE
EXTMON PARAMETER IS SET TO N**

Explanation: In the OPCOPTS statement, the EXTMON parameter is set to YES. The scheduler tried to communicate with TBSM but an ABEND occurred.

System action: The EXTMON parameter is set to NO. Communication with TBSM is interrupted.

System programmer response: Verify the communication with TBSM and restart the controller/tracker.

**EQQZ232E AN ERROR OCCURRED LOADING
AOPEDI MODULE. THE EXTMON
PARAMETER IS SET TO N**

Explanation: In the OPCOPTS statement, the EXTMON parameter is set to YES. The scheduler tried to load the AOPEDI module to communicate with TBSM, but the load failed.

System action: The EXTMON parameter is set to NO.

Communication with TBSM is interrupted.

System programmer response: Concatenate a library containing the AOPEDI module in the controller/tracker steplib and restart the controller/tracker.

**EQQZ233E AN ERROR OCCURRED LOADING
THE EQQZJBNF ROUTINE**

Explanation: The scheduler could not locate the EQQZJBNF subsystem routine. This routine is used to create the job name in the symphony file depending on the value of the TWSJOBNAME parameter of the JTOPTS statement.

System action: The scheduler abends.

User response: Ensure that the EQQZJBNF load module is present in the scheduler library.

Problem determination: The scheduler could not be installed correctly.

**EQQZ234E AN ERROR OCCURRED BUILDING
AN EVENT FOR THE FTW FOR
OPERATION(OPERNUM) IN
APPLICATION APPL, IA = IA. THE
JOBNAME USED TO ADD THE
OPERATION TO THE SYMPHONY IS
INCOMPATIBLE WITH THE
EQQTWSOU DATASET RECORD
LENGTH. EVENT COULD BE NOT
APPLICABLE**

Explanation: When adding this operation to the current plan, the criterion specified by the TWSJOBNAME parameter of the JTOPTS statement was set to EXTNAME, EXTNOCC or JOBNAME; it implies that the EQQTWSOU data set record length was 160 bytes. Now the scheduler is building an event for this operation to be sent to the distributed network, but the EQQTWSOU record length is 120, so the information necessary to address the event to the correct job in the symphony file cannot be sent to the server. The event could be non-applicable.

System action: The event is built using the occurrence name and the old format for the job name in the symphony file (OCCNAME value for the TWSJOBNAME parameter).

User response: Again migrate the EQQTWSOU data set to a record length of 160 bytes by using sample EQQMTWSO

**EQQZ235E LOGICAL ERROR IN MODULE
MODULE AT POINT POINT**

Explanation: A logical error has occurred in module MODULE at point POINT.

System action: Other traces can be issued in the message log to explain the error condition

EQQZ236E • EQQZ244I

User response: Save the IBM Tivoli Workload Scheduler for z/OS message log data set containing this message and contact IBM Support.

EQQZ236E AN ERROR OCCURRED WHILE SENDING A DQE TO CPHQ QUEUE.

Explanation: This is an internal error during the communication between the critical path handler and another task.

System action: The scheduler cannot update the critical job table. Dynamic updates might be lost.

System programmer response: Save the message log (EQQMLOG), the job table log file (EQQJTABL) and the current plan (EQQCPXDS). To collect appropriate documentation for problem determination, see the *Diagnosis Guide and Reference* manual, Chapter 3. Problem analysis procedures, section, "Information needed for all problems", sub-section, "Information to collect for critical path problems". If you cannot determine the cause of the error and the error persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

User response: Contact your system programmer.

EQQZ238E THE MANDATORY KEYWORD KEYWD IN STATEMENT STMT IS MISSING.

Explanation: The keyword *KEYWD* of the *STMT* statement was not specified, but it is required.

System action: IBM Tivoli Workload Scheduler for z/OS continues and the *STMT* statement is ignored.

User response: Specify a value for the *KEYWD* keyword and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ239E THE OSLCOPTS PRIORITY VALUE MUST BE BETWEEN 1 AND 5.

Explanation: The value specified for the *PRIORITY* keyword of the *OSLCOPTS* statement is not valid.

System action: IBM Tivoli Workload Scheduler for z/OS continues and the *OSLCOPTS* statement is ignored.

User response: Specify a value between 1 and 5 for the *PRIORITY* keyword and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ240E MONHOSTNAME NOT SPECIFIED. IT IS MANDATORY FOR MONOPTS STATEMENT

Explanation: The *MONHOSTNAME* parameter of the *MONOPTS* statement was not specified, but is required. This parameter defines the host name or IP

address of the remote Tivoli Monitoring agent

System action: IBM Tivoli Workload Scheduler for z/OS terminates. Message EQQZ054E is also issued.

User response: Provide a valid value for the *MONHOSTNAME* field and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ241I PORT VALUE IS INCORRECT. VALUE MUST RANGE FROM 0 TO 65535. DEFAULT VALUE IS CURRENTLY USED

Explanation: The value specified for the *MONPORT* or *LOCPORT* parameter in the *MONOPTS* statement, is outside the valid range. Valid values are from 0 to 65535.

System action: The default value 7500 is used for *MONPORT* or the default value 0 is used for *LOCPORT*.

User response: None.

EQQZ242I PORT PARAMETER NOT SPECIFIED. DEFAULT VALUE IS CURRENTLY USED.

Explanation: The value specified for the *MONPORT* or *LOCPORT* parameter in the *MONOPTS* statement was not specified or recognized.

System action: The default value 7500 is used for *MONPORT* or the default value 0 is used for *LOCPORT*.

User response: None.

EQQZ243I A VALUE OF MANUAL FOR MONPOL EXCLUDES ALL OTHER OPTIONS.

Explanation: If *MANUAL* is specified for the *MONPOL* statement with other values, all other values will be ignored.

System action: Only the value *MANUAL* is considered for the *MONPOL* statement.

User response: None.

EQQZ244I CONNTIMEOUT PARM NOT SPECIFIED OR OUT OF RANGE (0:10000). DEFAULTED TO 15.

Explanation: The *CONNTIMEOUT* parameter was omitted or a value outside the valid range of 0 to 10000 seconds.

System action: The default value of 15 seconds will be used for the *CONNTIMEOUT* parameter.

User response: None.

EQQZ245I CODEPAGE KEYWORD IS NOT PRESENT IN OPCOPTS STATEMENT THE DEFAULT VALUE IS USED

Explanation: The CODEPAGE parameter in the OPCOPTS statement was not specified.

System action: The default codepage IBM-037 is used.

User response: None.

EQQZ246W OBSOLETE PARAMETER SPECIFIED: CRITPATH. CRITICAL PARAMETER IS SET AUTOMATICALLY WHEN CRITPATH IS SPECIFIED

Explanation: The MONPOL statement contains the CRITPATH obsolete parameter.

System action: The scheduler activates the same processing as when CRITICAL is specified.

User response: Consider changing CRITPATH to CRITICAL in the MONPOL statement.

EQQZ249E THE TKTURI PARAMETER IN THE OSLCOPTS STATEMENTS HAS AN INVALID VALUE.

Explanation: The value specified for the TKTURI keyword of the OSLCOPTS statement is not valid.

System action: IBM Tivoli Workload Scheduler for z/OS continues and the OSLCOPTS statement is ignored.

User response: Specify a correct URI for the TKTURI keyword and restart IBM Tivoli Workload Scheduler for z/OS.

EQQZ250W KEYWORD KEYWD IN STATEMENT STMT IS NOT VALID. THE VALUE IS OUTSIDE THE VALID RANGE. WILL USE DEFAULT DEFAULT.

Explanation: The value specified for keyword KEYWD is incorrect.

System action: The processing continues using the default value for keyword KEYWD.

User response: Specify a valid value for keyword KEYWD. If you do not want the processing to use the default, restart the started task.

EQQZ251I KEYWORD KEYWD IS MISSING IN STATEMENT STMT. WILL USE DEFAULT DEFAULT.

Explanation: Keyword KEYWD was not specified in statement STMT.

System action: The processing continues using the default value for keyword KEYWD.

User response: If you do not want the processing to use the default, specify a value for keyword KEYWD in statement STMT, and then restart the started task.

EQQZ252E KEYWORD KEYWD IS MISSING BUT SSLLEVEL IS SET TO FORCE IN STATEMENT STMT.

Explanation: If the statement STMT contains SSLLEVEL(FORCE), keyword KEYWD is required.

System action: The started task initialization terminates.

User response: Correct the statement STMT either removing the SSLLEVEL(FORCE) keyword or setting the parameter KEYWD to a valid value, and then restart the started task.

EQQZ253E THE TRROPTS STATEMENT CONTAINS HOSTCON(TCP) BUT THE TCPHOSTNAME KEYWORD IS MISSING.

Explanation: A TCP/IP connection cannot be established between the controller and a tracker because the TCPHOSTNAME keyword does not contain the controller IP address or host name.

System action: The started task initialization terminates.

User response: Specify a valid value for TCPHOSTNAME keyword.

EQQZ254E EITHER THE TCPHOSTNAME OR THE TCPPORTNUMBER KEYWORD IS SPECIFIED, BUT THE TRROPTS STATEMENT DOES NOT CONTAIN HOSTCON(TCP).

Explanation: The initialization statement is inconsistent.

System action: The started task initialization terminates.

User response: Correct the TRROPTS statement either specifying the TCP value for HOSTCON keyword or deleting the TCPHOSTNAME or the TCPPORTNUMBER keyword.

EQQZ255E TCPIP KEYWORD VALUE VAL1 IS TOO LONG OR MISSING.

Explanation: A workstation destination name specified as a value of the TCPIP keyword of the ROUTOPTS statement is incorrect. The destination name is required and cannot exceed eight characters.

System action: Processing of the current ROUTOPTS statement terminates with a nonzero return code. This causes the controller initialization to fail.

User response: Specify a correct value for the TCPIP keyword, and then restart the started task.

EQQZ256E AT LEAST ONE TCPIP KEYWORD VALUE IS INCORRECT.

Explanation: The TCPIP keyword of the ROUTOPTS statement contains one or more incorrectly defined TCP/IP destinations.

System action: Processing of the current ROUTOPTS statement terminates with a nonzero return code. This causes the controller initialization to fail.

User response: Review the syntax of the TCP/IP destinations specified. Remove or correct the incorrect destination, and then restart the controller.

EQQZ257I DEFAULT VALUE DEFAULT IS USED FOR KEYWORD KEYWD IN STATEMENT STMT.

Explanation: Keyword *KEYWD* was not specified in statement *STMT*.

System action: The processing continues using the default value for keyword *KEYWD*. For the TCPOPTS statement, the possible cases are:

- TRKPORTNUMBER keyword. The default value can be one of the following:
 - 424 It applies to the controller only.
 - 0 It applies to the tracker, meaning that the process returns the actual value.
- DSTPORTNUMBER keyword. The default value can be one of the following:
 - 423 It applies to the controller only.
 - 0 It applies to the data store, meaning that the process returns the actual value.
- SRVPORTNUMBER keyword. The default value can be one of the following:
 - 425 It applies to the server only.
 - 0 Default value for an ISPF dialog or PIF program, meaning that the process returns the actual value.

User response: If you do not want the processing to use the default, specify a value for keyword *KEYWD* in statement *STMT*, and then restart the started task.

EQQZ258I KEYWORD KEYWD IN STATEMENT STMT WILL BE IGNORED.

Explanation: The parsing process for the statement *STMT* ignored the keyword *KEYWD*. It is a valid keyword of the TCPOPTS statement but it does not affect the selected function.

System action: The keyword is not used.

User response: You can remove the unneeded keyword from the TCPOPTS statement.

EQQZ259E DSTPORTNUMBER AND TRKPORTNUMBER MUST BE DIFFERENT.

Explanation: The TCPOPTS controller statement defines connection parameters for z/OS communication partners. The DSTPORTNUMBER and the TRKPORTNUMBER specify the same port number for both of the connections.

System action: The controller terminates with an error.

User response: Ensure different values are assigned to each of the port number parameters.

EQQZ260E LIBRARY WITH DDNAME EQQEVLIB COULD NOT BE OPENED.

Explanation: The controller could not open the required EQQEVLIB data set.

System action: The tracker does not find any configuration file to correlate system activities and triggered actions.

System programmer response: Check that EQQEVLIB is correctly defined and that the scheduler is authorized to open the data set. Restart the controller when the error has been corrected.

EQQZ261E UNABLE TO ALLOCATE STORAGE TO PROCESS MEMBER MEMBER OF EQQEVLIB.

Explanation: An error occurred when allocating storage to process the member indicated in the message variable.

System action: The scheduler stops processing the indicated EQQEVLIB member.

System programmer response: Verify that the member indicated in the message variable is not too large. If it is not, determine which product or program, or both, is exhausting ECSA storage.

EQQZ262E LIBRARY WITH DDNAME EQQEVLIB COULD BE USED BY ANOTHER TASK.

Explanation: Another task or user is accessing the EQQEVLIB data set.

System action: The scheduler stops processing EQQEVLIB.

System programmer response: When the EQQEVLIB data set is free, restart the process.

EQQZ263W COMMAND IS VALID JUST ON CONTROLLER SIDE.

Explanation: When issuing a command with the DEPLOYCF option, you specified a procedure name different from the controller started task name.

System action: The request is rejected.

System programmer response: Specify the controller started task name as procedure name.

EQQZ264W NO DESTINATION MEMBERS FOUND IN LIBRARY WITH DDNAME EQQEVLIB.

Explanation: The data set referenced by the EQQEVLIB does not contain any member name corresponding to a destination currently defined in the ROUTOPTS statement.

System action: There is no data correlating event conditions and actions. No action is triggered.

System programmer response: Check the destinations specified in the event rule definitions as input data for the job that builds and deploys the event configuration file. Rerun the job.

EQQZ265E THE DESTINATION \$\$\$\$\$\$ IS NOT PERMITTED.

Explanation: The \$\$\$\$\$\$ string is reserved for identifying the local destination in the event rule definition.

System action: The controller initialization fails.

System programmer response: Remove \$\$\$\$\$\$ from any destination list in the ROUTOPTS statement.

EQQZ266E ERROR WRITING MEMBER MEMBER OF EQQEVLIB LIBRARY

Explanation: The process encountered an I/O error writing to the configuration file repository.

System action: The process stops creating or updating MEMBER configuration file.

System programmer response: Check that EQQEVLIB is correctly defined. Refer to *DFSMS Macro Instructions for Data Sets* to find the cause of the error and correct it.

EQQZ267E ERROR IN MACRO STOW: RC = RETCODE, RSN = RSNCODE WRITING MEMBER MEMBER OF EQQEVLIB LIBRARY

Explanation: The process received an error while stowing MEMBER configuration file in the controller EQQEVLIB.

System action: The process stops creating or updating MEMBER configuration file.

System programmer response: Check that EQQEVLIB is correctly defined. Refer to *DFSMS Macro Instructions for Data Sets* to find the cause of the error and correct it.

EQQZ268E ERROR READING DIRECTORY BLOCKS OF EQQEVLIB LIBRARY

Explanation: An I/O error prevented the process from accessing the configuration file repository.

System action: The scheduler cannot access the selection table for data for data set triggering.

System programmer response: Check that EQQEVLIB is correctly defined and contains valid data.

EQQZ270E HTTP KEYWORD VALUE VAL1 IS TOO LONG OR MISSING.

Explanation: A workstation destination name specified as a value of the HTTP keyword of the ROUTOPTS statement is incorrect. The destination name is required and cannot exceed eight characters.

System action: Processing of the current ROUTOPTS statement terminates with a nonzero return code. This causes the controller initialization to fail.

User response: Specify a correct value for the HTTP keyword, and then restart the started task.

EQQZ271E AT LEAST ONE HTTP KEYWORD VALUE IS INCORRECT.

Explanation: The HTTP keyword of the ROUTOPTS statement contains one or more incorrectly defined HTTP destinations.

System action: Processing of the current ROUTOPTS statement terminates with a nonzero return code. This causes the controller initialization to fail.

User response: Review the syntax of the HTTP destinations specified. Remove or correct the incorrect destination, and then restart the controller.

EQQZ273E HTTPS KEYWORD VALUE VAL1 IS TOO LONG OR MISSING.

Explanation: A workstation destination name specified as a value of the HTTPS keyword of the ROUTOPTS statement is incorrect. The destination name is required and cannot exceed eight characters.

System action: Processing of the current ROUTOPTS statement terminates with a nonzero return code. This causes the controller initialization to fail.

User response: Specify a correct value for the HTTPS keyword, and then restart the started task.

EQQZ274E AT LEAST ONE HTTPS KEYWORD VALUE IS INCORRECT.

Explanation: The HTTPS keyword of the ROUTOPTS statement contains one or more incorrectly defined HTTPS destinations.

System action: Processing of the current ROUTOPTS statement terminates with a nonzero return code. This causes the controller initialization to fail.

User response: Review the syntax of the HTTPS destinations specified. Remove or correct the incorrect destination, and then restart the controller.

EQQZ275E USRNAM KEYWORD IS MISSING.

Explanation: The USRREC statement requires the USRNAM keyword.

System action: The task ends.

User response: Find all the USRREC statements without the USRNAM keyword in the users information member of EQQPARM. Add valid users names in these definitions.

EQQZ276W USER DEFINITION RECORD *USER* DOES NOT SPECIFY CPU, OR CPU NAME IS NOT CORRECT: THE USER IS NOT AVAILABLE FOR Z-CENTRIC JOB SUBMISSION.

Explanation: In a USRREC statement, the USRCPU keyword is not specified or the CPU name specified in the keyword is not an existing CPU.

System action: The task continues its processing, ignoring this record. This may impact the execution of Windows jobs that need the specified user.

System programmer response: Add or correct the CPU name specified for the user *USER*.

Problem determination: Check the USRREC statements in the scheduler parameters to make sure that the CPU specified for the Windows users is correct.

EQQZ277W THE NUMBER OF TABLES SPECIFIED FOR THE VARTABLES KEYWORD HAS EXCEEDED THE MAXIMUM LIMIT (16). THE EXCESS TABLES ARE IGNORED

Explanation: A maximum of 16 tables can be specified in the VARTABLES keyword of the HTTPOPTS statement. This number has been exceeded and, as a consequence, the excess tables are ignored.

System action: Processing continues, ignoring the tables in excess.

System programmer response: Correct the HTTPOPTS

statement by specifying 16 tables or less for the VARTABLES keyword.

EQQZ278E THE SSLKEYRING KEYWORD IS NOT SPECIFIED IN STATEMENT *STMT*. IF SSL IS ACTIVATED, THIS KEYWORD IS REQUIRED.

Explanation: If you have specified an SSL port greater than zero in HTTPOPTS, then SSL connections are enabled. You must also specify the name of the key ring containing the security certificates. If the key ring is a key database USS file, then specify the name of the file containing the key password.

System action: Processing terminates.

System programmer response: Correct the HTTPOPTS statement by specifying the required keyword.

EQQZ279E THE SSLKEYRINGPSW KEYWORD IS NOT SPECIFIED IN STATEMENT *STMT*. IF SSL IS ACTIVATED, AND THE KEY RING FILE IS A KEY DATABASE USS, THEN THIS KEYWORD IS REQUIRED.

Explanation: If you have specified an SSL port greater than zero in HTTPOPTS, then SSL connections are enabled. If the key ring is a key database USS file, then you must also specify the name of the file containing the key password.

System action: Processing terminates.

System programmer response: Correct the HTTPOPTS statement by specifying the required keyword.

EQQZ300W RCLEANUP, FLOPTS, RCLOPTS VALID ONLY FOR CONTROLLER: THEY WILL BE IGNORED

Explanation: You have specified one of the above mentioned options for a tracker, but they are meaningful only for a Controller.

System action: The options are ignored. The scheduler continues processing.

User response: Remove the RCLEANUP, FLOPTS, RCLOPTS options for the tracker configuration and run the task again.

EQQZ301W RCLEANUP (NO): RCLOPTS WILL BE IGNORED

Explanation: You have set the RCLEANUP option to NO, that is, the restart and cleanup function is not activated. The RCLOPTS statement specifies details about the restart and cleanup function: for this reason it is ignored.

System action: The RCLOPTS statement is ignored. The scheduler continues processing.

User response: None.

EQZ302I RCLEANUP(NO) : THERE ARE NO PROTECTED DATA SETS

Explanation: Currently there is no data set protected via the DD statement name or directly via the data set name. You did not specify RCLEANUP(YES) so this function is not active and data set protection is redundant.

User response: None.

EQZ303W RCLEANUP(NO): FLOPTS WILL BE IGNORED

Explanation: You have specified the FLOPTS option that describes how the Controller communicates with data store. However, the OPCOPTS RCLEANUP option is not set to YES. Therefore, the FL task (the one responsible for Controller/Data Store communication) was not started

System action: The scheduler continues processing. The restart and cleanup function is not activated. The FL task is not started.

User response: Set RCLEANUP (YES) in the OPCOPTS statement.

EQZ304E FL TASK NEEDS FLOPTS

Explanation: You have specified the OPCOPTS RCLEANUP (YES) statement but did not specify the FLOPTS option. FLOPTS is needed to allow communication between Controller and Data Store and, therefore, to support the restart and cleanup function.

System action: The scheduler stops the process.

User response: Add the FLOPTS option in the OPCOPTS statement.

EQZ305I THERE ARE NO DATA SETS PROTECTED BY DD STATEMENT NAME

Explanation: Currently there is no data set protected via the DD statement name. You did not specify any initial parameter statement for this (for example, RCLOPTS DDPROT or DDPRMEM), nor did you issue a modify command to activate a member containing such a list.

User response: None.

EQZ306I THERE ARE NO DATA SETS PROTECTED BY DATA SET NAME

Explanation: Currently there is no data set protected by data set name. You did not specify any initial parameter statement for this (for example, RCLOPTS DDPROT or DDPRMEM), nor did you issue a modify

command to activate a member containing such a list.

User response: None.

EQZ307I THE DATA SETS PROTECTED BY TYPE ARE THE FOLLOWING:

Explanation: This messages occurs after the issuing of one of the following modify commands:

/F subsystem, DSPPROTDD

- OR -

/F subsystem, DSPPROTDSN

TYPE identifies the kind of protection and can be DDNAME or DSNNAME. It is followed by one or more EQZ308I messages, one for each protected DD name or DS name.

User response: None.

EQZ308I DSNNAME

Explanation: This messages occurs after the EQZ307I message and identifies a protected data set name or DD name.

User response: None.

EQZ404I THE PENF53 COMMAND HAS BEEN IGNORED BECAUSE THE ENF EXIT EQZNF53 IS NOT ACTIVE

Explanation: The ENF exit EQZNF53 is not active, therefore your stop request is ignored.

User response: The stop request is ignored.

EQZ405I THE PENF53 COMMAND HAS BEEN IGNORED BECAUSE THE ENF EXIT EQZNF53 IS ALREADY ACTIVE

Explanation: The ENF exit EQZNF53 is already active, therefore your start request is ignored.

User response: The start request is ignored.

EQZ406I ENF EXIT EXNAME WAS ACTIVATED. TOKEN TOKEN ADDRESS ADDRESS SIZE SIZ

Explanation: At startup, the tracker or controller activated exit *EXNAME*. This message reports that the exit is loaded in CSA at Address *ADDR* with size *SIZ*.

Note that the value of *SIZ* exceeds by 8 bytes the real exit size (the value you see if you browse the partitioned data set containing the exit), because the exit module appends some extra information when it is loaded in the CSA.

The ENF deactivation request used token *TOKEN* to identify the exit.

EQQZ407I • EQQZ504W

EXNAME can be one of the following:

- EQQZNF41
- EQQZNF57

System action: Exit *EXNAME* is now active and can generate VS events about scheduling environment availability.

User response: None.

EQQZ407I ENF EXIT *EXNAME* WAS
DEACTIVATED. TOKEN *TOKEN*
ADDRESS *ADDRESS* SIZE *SIZ*

Explanation: When closing, the tracker or controller deactivated exit *EXNAME*. This message reports that the exit is loaded in CSA at Address *ADDR* with size *SIZ*.

The ENF deactivation request used token *TOKEN* to identify the exit.

EXNAME can be one of the following:

- EQQZNF41
- EQQZNF57

System action: Exit *EXNAME* is now inactive, but is still in CSA.

User response: None.

EQQZ409E EXIT *EXNAME* CANNOT BE LOADED

Explanation: At startup, the tracker or controller detected that the associated exit *EXNAME* should be loaded in CSA and for this reason tried to load, but failed.

EXNAME can be one of the following:

- EQQZNF41
- EQQZNF57

System action: Exit *EXNAME* is not loaded and the startup fails.

User response: Check if the startup procedure can access the library where the exit resides.

Note that the exit is loaded by means of the macro LOAD.

EQQZ500E UNABLE TO ALLOCATE GCAM
CACHE

Explanation: The scheduler was not able to allocate the GCAM cache required to handle the JOBLOG and OPERINFO pending requests correctly.

System action: The scheduler terminates.

System programmer response: Check EQQMLOG to understand the reason for the failure. Increase the region size if storage was not sufficient.

User response: Contact your system programmer.

EQQZ501E AN ERROR OCCURRED WHILE
UNLOADING GCAM CACHE INTO
EQQLOGRC DATA SET

Explanation: The scheduler was not able to unload the GCAM cache content into the log data set EQQLOGRC.

System action: The EQQLOGRC does not contain all the JOBLOG and OPERINFO pending requests existing at Scheduler stop time.

System programmer response: Check EQQMLOG to understand the reason for the failure. JOBLOG and OPERINFO pending requests must be restarted manually.

User response: Contact your system programmer.

EQQZ502I JOBLOG RETRIEVAL PENDING
REQUEST RESUMED FOR *JOBN* (*JID*)
APPL: *APPL*, *IA*, *OPER*

Explanation: At startup, the scheduler detected that a JOBLOG retrieval process is pending for the job identified by Job Name *JOBN*, Job ID *JID*, Application Name *APPL*, Input arrival time *IA*, operation number *OPER*. As soon as FL task and HTTP task are started, the pending request will be resumed to be restarted.

System action: The JOBLOG retrieval process is resumed.

EQQZ503I OPERINFO RETRIEVAL PENDING
REQUEST RESUMED FOR *JOBN* (*JID*)
APPL: *APPL*, *IA*, *OPER*

Explanation: At startup, the scheduler detected that an OPERINFO retrieval process is pending for the job identified by Job Name *JOBN*, Job ID *JID*, Application Name *APPL*, Input arrival time *IA*, operation number *OPER*. As soon as FL task is started, the pending request will be resumed to be restarted.

System action: The OPERINFO retrieval process is resumed.

EQQZ504W UNABLE TO RESUME JOBLOG
RETRIEVAL PENDING REQUEST FOR
JOBN (*JID*) APPL: *APPL*, *IA*, *OPER*

Explanation: At startup, the scheduler detected that a JOBLOG retrieval process is pending for the job identified by Job Name *JOBN*, Job ID *JID*, Application Name *APPL*, Input arrival time *IA*, operation number *OPER*. The pending request should have been resumed to be restarted after FL task and HTTP task were started, but an error occurred.

System action: The JOBLOG retrieval process is not resumed.

System programmer response: Check EQQMLOG to understand the reason for the failure.

User response: Contact your system programmer.

**EQQZ505W UNABLE TO RESUME OPERINFO
RETRIEVAL PENDING REQUEST FOR
JOBN (JID) APPL: APPL, IA, OPER**

Explanation: At startup, the scheduler detected that an OPERINFO retrieval process is pending for the job identified by Job Name *JOBN*, Job ID *JID*, Application Name *APPL*, Input arrival time *IA*, operation number *OPER*. The pending request should have been resumed to be restarted after FL task and HTTP task were started, but an error occurred.

System action: The OPERINFO retrieval process is not resumed.

System programmer response: Check EQQMLOG to understand the reason for the failure.

User response: Contact your system programmer.

Chapter 233. Abend codes

This chapter lists the IBM Tivoli Workload Scheduler for z/OS abend codes in numeric order.

1102 - U0003

1102

Explanation: Undefined feedback from VTAM, or a serious error after a VTAM request that makes continued processing impossible. (Note: Message EQQV015E is issued only if request parameter list (RPL) feedback is available.)

System programmer response: If an undefined feedback code was returned by VTAM, this is a VTAM problem. Contact IBM Software Support.

Problem determination: See message EQQV015E, which precedes this abend, for diagnostic information. Message EQQV015E is issued only if request parameter list (RPL) feedback is available.

1103

Explanation: VTAM has detected an error while processing a request, or VTAM has detected an error in an associated session, task, or address space.

System programmer response: Contact IBM Software Support.

Problem determination: None

1104

Explanation: Serious error opening the network communication function (NCF) ACB. The VTAM definition of the NCF application is in probably in error.

System programmer response: If the diagnosis points to a user definition error, correct the error and restart the subsystem. Otherwise, contact IBM Software Support.

Problem determination: See message EQQV027E, which precedes this abend, for diagnostic information.

1110

Explanation: Unrecoverable error when scheduling a VTAM macro.

System programmer response: Contact IBM Software Support.

Problem determination: See message EQQV015E, which precedes this abend, for diagnostic information.

Message EQQV015E is issued only if request parameter list (RPL) feedback is available.

1111

Explanation: Invalid SCB block, or invalid pointer to it. (Internal NCF error.)

System programmer response: Contact IBM Software Support.

Problem determination: None.

1112

Explanation: Invalid NAB block, or invalid pointer to it. (Internal NCF error.)

System programmer response: Contact IBM Software Support.

Problem determination: None.

1113

Explanation: Invalid BIB block, or invalid pointer to it. (Internal NCF error.)

System programmer response: Contact IBM Software Support.

Problem determination: None.

1121

Explanation: All entries in the node table have been used. (Internal NCF error.)

System programmer response: Contact IBM Software Support.

Problem determination: None.

1124

Explanation: Invalid action code. (Internal NCF error.)

System programmer response: Contact IBM Software Support.

Problem determination: None.

2001

Explanation: Problem accessing the special resource data space during daily planning, and the VALEACTION keyword of BATCHOPT specifies ABEND.

System programmer response: Take a copy of the old current-plan file, the EQQCXDS file, and the EQQRDDS file, and contact IBM Software Support.

Problem determination: None.

3900

Explanation: Not enough storage available to continue execution.

System programmer response: Make sure that the region size specified for the tracker system meets IBM Tivoli Workload Scheduler for z/OS requirements. Region size requirements are documented in Installation Guide and in IBM Tivoli Workload Scheduler for z/OS program directory. If your region size is too small, enlarge it accordingly, and restart the system. Otherwise, contact IBM Software Support.

Problem determination: None.

3999

Explanation: IBM Tivoli Workload Scheduler for z/OS' internal validity checking has discovered an error condition (internal IBM Tivoli Workload Scheduler for z/OS error). A message that contains the reason for the abend, as well as other debugging information, is written to the IBM Tivoli Workload Scheduler for z/OS diagnostic file, EQQDUMP.

System programmer response: Contact IBM Software Support.

Problem determination: None.

U0001

Explanation: The EQQSWAUP program abends because the Sysin | input file could not be opened.

System programmer response: Contact IBM Software Support.

Problem determination: None.

U0002

Explanation: The EQQSWAUP program abends because the Sysin input file contains more than 256 records.

System programmer response: Change the Sysin input file so that it contains at least 256 records and rerun the program, otherwise, Contact IBM Software Support.

Problem determination: None.

U0003

Explanation: The EQQSWAUP program abends because the Sysin file references a step that does not exist in the job or because nested procedures were used in the JCL.

System programmer response: Change the Sysin input file to delete references to steps that are not in the job or to change nested procedures, otherwise Contact IBM Software Support.

Problem determination: Check the Sysin input file for steps that do not exist in the job or for nested procedures. Nested procedures are not supported.

Chapter 234. Reason codes

The following tables provide details of the reason codes that can appear in the messages:

- “Reason Codes for EQQXnnn, EQQAnnn, EQQGnnn, EQQKnnn and EQQMnnn”
- “Reason Codes for EQQY050E” on page 1424
- “Reason Codes for EQQFAxx” on page 1426
- “Reason Codes for EQQAxxx” on page 1427

Note: In the dump data set (diagnostic file, ddname EQQDUMP), dates are represented either in real date format or in the internal IBM Tivoli Workload Scheduler for z/OS format.

Reason Codes for EQQXnnn, EQQAnnn, EQQGnnn, EQQKnnn and EQQMnnn

The following table lists the reason codes that can appear in some of the message with the EQQXnnn, EQQAnnn, EQQGnnn, EQQKnnn and EQQMnnn. For more information about a reason code, refer to the related message.

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
000	The record size exceeds the maximum record size for the application description data base.	EQQX300
002	The record version is not valid.	EQQX301
003	The application ID is not valid.	EQQX302
004	The application status is not valid. Valid application statuses are: A for active, P for pending, or blank for both active and pending.	EQQX303
005	The valid-to date is not valid.	EQQX304
006	The valid-to time is not valid.	EQQX328
007	The record identifier is not valid.	EQQX321
010	The run cycle pointer is not valid.	EQQX305
011	The record size does not include the run cycle.	EQQX306
012	The offset to the next run cycle in the record is not valid. It must be 0 if it is last.	EQQX307
013	The JCL variable table name is not valid.	EQQX417
014	The rule name is not valid.	EQQA521
020	The operation pointer is not valid.	EQQX308
021	The record size does not include operation data.	EQQX309
022	The offset to the next operation in the record is not valid. It must be 0 if it is last.	EQQX310
023	The record size does not include dependencies and special resources.	EQQX311
100	The valid-from date is either not valid or missing.	EQQX312
101	The valid-from date is later than the valid-to date; it must be <i>earlier</i> .	EQQX313
102	The authorization group is not valid.	EQQX314
103	The owner ID is missing.	EQQX315

Reason codes

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
104	The date for the last update is either not valid or missing.	EQQX316
105	The time for the last update is either not valid or missing.	EQQX317
106	The priority is either not valid or missing. A valid priority is a number from 1 through 9.	EQQX318
107	The value specified in the number of operations field is not valid. A valid value is a number from 1–99.	EQQX319
108	The number of run cycles is not valid. It does not match the actual number of run cycles in the record.	EQQX320
109	The offset to the first run cycle is incompatible with the number of run cycles.	EQQX322
110	The offset to the first operation is not valid.	EQQX323
111	The characters in the common part of the application description record are not valid.	EQQX324
112	The calendar description identifier in the application description record is not valid .	EQQX325
113	The calendar description identifier referred to by the application description record does not exist in the database.	EQQX326
114	The owner ID contains lower case characters.	EQQX397
115	An application or job description which specifies a group definition cannot contain a run cycle.	EQQA516
116	Priority cannot be specified for a group definition.	EQQA510
117	Group definitions cannot contain operations.	EQQA500
118	Calendar cannot be specified for an application in a group.	EQQA511
119	Group definition cannot belong to another group.	EQQA503
120	The valid-from time is not valid.	EQQX327
122	Validity periods of temporary OI's must not overlap.	EQQK002
200	The run cycle period cannot be found.	EQQX329
201	The positive run day offset is not blank or numeric. It must be blank or 1 to 999.	EQQX330
202	The negative run day offset is not blank or numeric. It must be blank or 1 to 999.	EQQX376
203	The free day rule specification is not valid. A valid specification is E for free days excluded; 1 for run on the closest work day before the free day; 2 for run on the closest work day after the free day; 3 for run on the free day; or 4 for do not run at all.	EQQX331
204	The run cycle valid-from date is either not valid or missing.	EQQX381
205	The run cycle valid-to date is either not valid or missing.	EQQX375
206	The negative run cycle indicator is not blank or N. It must be either blank or N.	EQQX332
207	The input arrival time is not valid.	EQQX333
208	The relative deadline day is not numeric. It must be a number from 0 through 99.	EQQX334
209	The deadline time is not valid.	EQQX335
210	The run cycle section contains not valid characters.	EQQX336
211	Duplicate positive run day offsets found in a run cycle.	EQQX398
212	The variable table is not defined in the database.	EQQX418
213	No offsets have been defined for a run cycle.	EQQX436
214	Negative runday fields contain embedded blanks.	EQQX437
215	The rule name has already been specified as a run cycle for the AD.	EQQA522
216	The specified rule name is not defined.	EQQA520

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
223	The step level dependency check type is not valid. It must be RC.	EQQM174E
224	The procedure step name is missing in a step level dependency definition.	EQQM175E
225	Incorrect procedure step name in a step level dependency definition. The first character must be alphabetic.	EQQM176E
226	Incorrect step name in a step level dependency definition. The first character must be alphabetic.	EQQM177E
227	The step name, in a step level dependency definition, contains an incorrect character.	EQQM178E
228	The procedure step name, in a step level dependency definition, contains an incorrect character.	EQQM179E
301	The workstation description does not exist in the workstation description database.	EQQX337
302	The operation number is incorrect. It must be a number from 1–255.	EQQX338
303	The duration time of the operation is not valid. It must be from 00.00 to 99.59.	EQQX339
304	The smoothing factor is not valid. It must be a number from 0 through 999.	EQQX340
305	The feedback limit is not valid. A valid feedback limit is a number from 100 through 999.	EQQX341
306	The automatic error completion code is not valid.	EQQX342
307	The job name is not valid.	EQQX343
308	The operation input arrival relative day is not valid.	EQQX344
309	The operation input arrival time is not valid.	EQQX345
310	The operation deadline relative day is not valid.	EQQX346
311	The operation deadline time is not valid.	EQQX347
312	The workstation resource 1 usage is not valid.	EQQX348
313	The workstation resource 2 usage is not valid.	EQQX348
314	The parallel processing count is not valid.	EQQX349
315	The number of internal predecessors is not valid; it is not compatible with the actual number of predecessors in the record.	EQQX350
316	The number of external predecessors is not valid; it is not compatible with the actual number of predecessors in the record.	EQQX351
317	The number of special resources is not valid; it is not compatible with the actual number of special resources in the record.	EQQX352
318	The operation part of the application description record contains not valid characters .	EQQX353
319	Cancel if late specified for the non time-dependent job.	EQQX412
320	Relative start day missing for the time-dependent job.	EQQX413
321	Start time missing for the time-dependent job.	EQQX414
322	Job name is missing for the computer, printer, or job setup operation.	EQQX415
323	Number of parallel servers must be 1 for an operation on a computer workstation.	EQQX419
350	Incorrect number of conditions.	EQQX074
351	Incorrect number of condition dependencies.	EQQX075
352	Duplicate condition.	EQQX076
353	Condition contains incorrect characters.	EQQX077
354	Condition number incorrect. It must be in the range 1-999.	EQQX078

Reason codes

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
355	Number of condition dependencies incorrect. You must specify at least one condition dependency.	EQQX079
357	Incorrect condition counter.	EQQX081
358	Duplicate condition dependency.	EQQX082
359	The condition dependency ID is not valid.	EQQX083
360	The condition dependency specifies an incorrect predecessor type. It must be I or E.	EQQX084
361	The application ID for the conditional internal predecessor is not valid.	EQQX085
362	The application ID for the conditional external predecessor is not valid.	EQQX086
363	The workstation name for the conditional predecessor is not valid.	EQQX087
364	The operation number for the conditional predecessor is not valid.	EQQX088
365	The condition dependency type is not valid. It must be RC or ST.	EQQX089
366	The condition dependency operator is not valid. Valid values are GE, GT, LE, LT, EQ, NE, and RG.	EQQX090
367	The condition dependency contains an incorrect RC value.	EQQX091
368	The condition dependency contains an incorrect ST value.	EQQX092
369	The condition dependency contains invalid characters.	EQQX093
370	The internal predecessor specified in the condition dependency does not exist.	EQQX094
371	You cannot define a conditional dependency for a not centralized operation.	EQQX095
372	You cannot define a job as both conditional and normal predecessor.	EQQX096
373	Inconsistent number of condition dependencies.	EQQX097
378	The step level dependency check type is not valid. It must be RC.	EQQX105
379	The procedure step name is missing in a step level dependency definition.	EQQX106
380	The step name, in a step level dependency definition, contains an incorrect character.	EQQA336
381	Incorrect step name in a step level dependency definition. The first character must be alphabetic.	EQQA337
382	The procedure step name, in a step level dependency definition, contains an incorrect character.	EQQA338
383	Incorrect procedure step name in a step level dependency definition. The first character must be alphabetic.	EQQA339
400	The workstation name for the internal predecessor is not valid.	EQQX354
401	The operation number for the internal predecessor is not valid.	EQQX355
402	The transport time for the internal predecessor is not valid.	EQQX356
403	The internal predecessor block contains invalid characters.	EQQX357
404	All internal processors in an operation must be unique.	EQQX395
450	The required application description does not exist.	EQQX377
455	The required application description does not contain an operator with the specified operation number and workstation name.	EQQX378
456	The required application does not contain an operation with the specified operation number.	EQQX379
457	The required application does not contain an operation on the specified workstation.	EQQX380
500	The application ID for the external predecessor is not valid.	EQQX358
501	The workstation name for the external predecessor is not valid.	EQQX359

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
502	The operation number for the external predecessor is not valid.	EQQX360
503	The transport time for the external predecessor is not valid.	EQQX356
504	The long-term plan print option for the external predecessor is not valid. Valid print options are A for always, and C for conditionally.	EQQX361
505	The external predecessor block contains invalid characters.	EQQX357
506	All external processors in an operation must be unique.	EQQX396
507	More than 100 external predecessors were specified.	EQQX433
508	criteria field for the external predecessor is not valid.	EQQX701
509	Ismandatory field for the external predecessor is not valid.	EQQX700
510	Application id for the external predecessor interval is not valid.	EQQX702
511	Operation number for the external predecessor interval is not valid.	EQQX703
512	Resolution criteria type for the external predecessor interval is not valid.	EQQX704
513	From fields for external predecessor interval are not valid.	EQQX705
514	To fields for external predecessor interval are not valid.	EQQX706
515	Application id for the conditional external predecessor interval is not valid.	EQQX707
516	Operation number for the conditional external predecessor interval is not valid.	EQQX708
517	Number of External Predecessor IVL must be 0 or positive.	EQQX709
518	Number of Condition IVL must be 0 or positive.	EQQX710
519	Resolution criteria type for the conditional predecessor interval is not valid.	EQQX711
520	From fields for conditional predecessor interval are not valid.	EQQX712
521	To fields for conditional predecessor interval are not valid.	EQQX713
522	Condition id for the conditional external predecessor interval is not valid.	EQQX714
523	External predecessor interval must refer to an existing external predecessor.	EQQX715
524	Conditional predecessor interval must refer to an existing external conditional predecessor.	EQQX716
526	From fields for the cross dependency predecessor are not valid.	EQQX719
527	To fields for the cross dependency predecessor are not valid.	EQQX720
528	External or Conditional Predecessor interval type is not coherent with resolution criteria value.	EQQX717
530	Criteria field for the conditional predecessor is not valid.	EQQX722
531	External predecessor interval must have the start time before the end time.	EQQX723
532	Conditional predecessor interval must have the start time before the end time.	EQQX724
600	The special resource name is blank.	EQQX362
601	The special resource held option type is not valid. Valid special resource held options are S for shared, and X for exclusive.	EQQX363
602	The special resource block contains invalid characters.	EQQX364
603	Duplicate special resources exist in the operation.	EQQX394
604	Resource quantity is not in the range 1-999999.	EQQX438
605	The on-error value is not valid.	EQQX429
700	Duplicate operations exist in the application description record.	EQQX365
701	A predecessor does not exist.	EQQX366

Reason codes

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
702	There is a loop in the application network.	EQQX367
703	All operations in the application do not belong to the same network.	EQQX368
704	A job setup, processor, or print operation lacks a job name.	EQQX369
705	A job setup operation has no processor operation as successor.	EQQX370
706	A print operation has no predecessors.	EQQX371
707	A print operation has more than one predecessor.	EQQX372
708	A print operation does not have a processor operation as predecessor.	EQQX373
709	A print operation has a predecessor with a different job name.	EQQX374
710	A job setup operation has no processor successor with the same job name.	EQQX416
800	The calendar record exceeds the maximum record size for the calendar description record, or has a shorter than minimum size.	EQQX400
801	The calendar description record identifier was not valid.	EQQX321
802	The calendar description record version was not valid.	EQQX301
803	The calendar description ID is not valid.	EQQX401
804	The date for the last update is either not valid or missing in the calendar description record.	EQQX316
805	The time for the last update is either not valid or missing in the calendar description record.	EQQX317
806	The time for Work Day End Time is either not valid or missing in the calendar description record.	EQQX402
807	The number of weekday/date days has an invalid value in calendar description record.	EQQX403
808	The common section of the calendar description record contains invalid characters.	EQQX404
809	The size of the calendar description is too short to hold the number of weekday/date days indicated in the common section of the record.	EQQX405
810	The weekday in the calendar description record is not valid.	EQQX406
811	The weekday days are not in ascending order in the calendar description record.	EQQX407
812	The status of the weekday/date field is not Work or Free.	EQQX408
813	The date in the calendar description record is not valid.	EQQX409
814	The date days are not in ascending order in the calendar description record.	EQQX410
815	The variable section of the calendar description record contains not valid characters.	EQQX411
835	The date and time specified in a request to modify an interval of a current plan workstation is not the start of an interval.	EQQX144
836	An invalid value was specified for the parallel server capacity. Valid values are 0 through 99.	EQQX144
837	An invalid value was specified for the capacity of a workstation resource. Valid values are 0 through 99.	EQQX144
850	The application ID was not specified.	EQQX390
851	The application ID is not bracketed by shift-in or shift-out character s.	EQQX382
852	The DBCS part of the field application ID is blank.	EQQX384
853	Check if the routine has encountered a superfluous shift-out or shift- in character within the DBCS part of the field application ID.	EQQX385

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
854	The Field application ID contains either invalid DBCS characters, that is, out of the range X'41'- X'FE', or an odd number of blanks (X'40'), in the trailing part of the DBCS part of the field.	EQQX387
855	The DBCS-field application ID contains an odd number of bytes.	EQQX392
860	Group definition ID is not valid.	EQQX500
861	Group definition ID not in bracketed DBCS format.	EQQX501
862	No ID specified for DBCS group definition.	EQQX505
863	Unpaired shift-out or shift-in characters in group definition.	EQQX502
864	Invalid DBCS characters in group definition.	EQQX503
865	Odd number of bytes in group definition.	EQQX504
870	The field owner ID was not specified.	EQQX391
871	The field owner ID is not bracketed by shift-in or shift-out character s.	EQQX383
872	The DBCS part of field owner ID is blank.	EQQX389
873	The check routine has encountered a superfluous shift-out or shift-in character in the DBCS part of the field owner ID.	EQQX386
874	The Field owner ID contains either invalid DBCS characters, that is, out of the range X'41'- X'FE', or an odd number of blanks (X'40'), in the trailing part of the DBCS part of the field.	EQQX388
875	The DBCS-field owner ID contains an odd number of bytes.	EQQX393
1001	The control block is not valid.	EQQX321
1002	The block version is not valid.	EQQX301
1003	The request type is not valid.	EQQX420
1004	The length is not valid.	EQQX421
1011	The input arrival date is missing.	EQQX422
1012	The input arrival date is not valid.	EQQX423
1013	The input arrival time is missing.	EQQX424
1014	The input arrival time is not valid.	EQQX333
1015	The application IDs are different.	EQQX425
1016	The application ID is missing.	EQQX390
1017	The DBCS application ID is not valid.	EQQX387
1018	The application ID is not valid.	EQQX302
1021	The deadline date or time is given (but not both).	EQQX426
1022	The deadline date is not valid.	EQQX427
1023	The deadline time is not valid.	EQQX335
1024	The priority is not valid.	EQQX318
1031	The predecessor input arrival date is missing.	EQQX428
1032	The predecessor input arrival date is not valid.	EQQX423
1033	The predecessor input arrival time is missing.	EQQX429
1034	The predecessor input arrival time is not valid.	EQQX333
1035	The predecessor application ID is missing.	EQQX430
1036	The DBCS predecessor application ID is not valid.	EQQX382

Reason codes

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
1037	The predecessor application ID is not valid.	EQQX302
1038	An occurrence is dependent on itself.	EQQX434
1039	The input arrival date is later than the deadline.	EQQL510
1040	The input arrival time is later than the deadline.	EQQL510
2001	The status code is not valid.	EQQX431
2002	The function code is not valid.	EQQX432
3033	The repeat every repev is incorrect for run cycle runc.	EQQX458
3034	The repeat end time repet is incorrect for run cycle runc.	EQQX459
3036	A deadline time dltime before input arrival time iat was specified.	EQQX452

Reason Codes for EQQY050E

The following table lists the reason codes that can appear in message EQQY050E.

<i>Reason code</i>	<i>Meaning (reason for failure)</i>
800	The length specified for the modify current plan control block area is not valid. It is not large enough for the MT0 (modify occurrence or workstation) and MTD (details) control blocks.
801	The control block identifier is not valid.
802	The control block version is not valid.
803	The request type is not a valid MTOTYPE request.
810	The application ID is not valid, format is EBCDIC.
811	The application ID is not valid, format is DBCS.
812	The actual input arrival date is not a valid date.
813	The actual input arrival time is not a valid time.
814	The original input arrival date is not a valid date.
815	The original input arrival time is not a valid time.
816	The deadline date is not a valid date.
817	The deadline time is not a valid time.
818	The priority is not valid. It must be a character in the range 1-9.
819	The authority group is not a valid name.
820	The owner ID is not valid, format is EBCDIC.
821	The owner ID is not valid, format is DBCS.
822	The owner ID is required but missing.
823	Either both the input arrivals (actual input arrival and original input arrival) and the deadline must be left out or all three dates and times must be set.
824	The input arrival time is missing. It is required for all requests except for the AD D OCCURRENCE request.
831	The workstation name is not valid.
832	The workstation reporting attribute is not valid.
835	The interval to Modify or Delete is not found.
836	The parallel server capacity is not valid. It must be 0-99.

<i>Reason code</i>	<i>Meaning (reason for failure)</i>
837	The workstation resource capacity is not valid. It must be 0–99.
838	The alternative workstation either is not one of the workstations in the current plan or is the same as the primary workstation.
839	The interval to be inserted overlaps one of the existing intervals.
851	The details request type is not a valid MTDTYPE request.
852	The operation number in a details request is incorrect. It must be from 1–255.
861	The job name is not a valid name.
862	The workstation name is not a valid name.
866	The resource usage is not valid. It must be S or X.
867	The resource Keep On Error is not valid. It must be Y, N or blank.
868	The resource Quantity is not valid. It must be 0–999,999.
871	The job name in change options is not a valid name.
872	The operation status is not a valid status code.
875	The operation input arrival date is not a valid date.
876	The operation input arrival time is not a valid time.
877	The operation deadline date is not a valid date.
878	The operation deadline time is not a valid time.
881	The dependency type is not valid. It must be S or P.
882	The dependency operation number is incorrect. It must be from 1–255.
883	The dependency application ID is not valid. The format is EBCDIC.
884	The dependency application ID is not valid. The format is DBCS.
885	The dependency input arrival date is not a valid date or is missing. It is required in an external dependency request.
886	The dependency input arrival time is not a valid time or is missing. It is required in an external dependency request.
887	The deadline date is earlier than the input arrival date.
888	The deadline time is earlier than the input arrival time.
889	The syntax of the JCL variable table name is not valid. The table name must be 1 to 16 alphanumeric characters, the first character being alphabetic.
890	An attempt was made to reference a JCL variable table name that does not exist.
891	The condition dependency operation number is incorrect or is missing. It must be from 1-255.
892	The condition dependency application ID is incorrect. The format is DBCS.
893	The condition dependency application ID is incorrect. The format is EBCDIC.
894	The condition dependency input arrival date is not a valid date or is missing. It is required in an external condition dependency request.
895	The condition dependency input arrival time is not a valid date or is missing. It is required in an external condition dependency request.
896	The condition dependency check type is not valid or is missing. It must be RC or ST.
897	The condition number is incorrect. It must be from 1-999.

Reason codes

Reason Codes for EQQFAxx

The following table lists the reason codes that can appear in some error messages or in answer to a controller request, when the data store is used (messages EQQFAxx). For more information about a reason code, refer to the related message.

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
1024	VSAM error	EQQFA00
1025	Bad control block	EQQFA01
1026	Bad instance	EQQFA02
1027	Bad parameter	EQQFA03
1028	Bad request	EQQFA04
1029	Bad sysout database	EQQFA05
1030	Is empty	EQQFA06
1031	Not found	EQQFA07
1032	Not initialized	EQQFA08
1034	Detach error	EQQFA10
1035	Not active	EQQFA11
1036	Not ready	EQQFA12
1037	Internal error	EQQFA13
1038	Bad data	EQQFA14
1039	No more keys	EQQFA15
1040	Not equal key	EQQFA16
1041	Command error	EQQFA17
1042	Stop in progress	EQQFA18
1043	Syntax error	EQQFA19
1044	Not open	EQQFA20
1045	Error in RPL generation for VSAM access	EQQFA21
1046	Error in Point operation on VSAM file	EQQFA22
1048	VSAM logical error in Get operation	EQQFA24
1049	VSAM physical error in Get operation	EQQFA25
1050	No parameter passed	EQQFA26
1051	Error on parameter	EQQFA27
1052	Transmission error from communication	EQQFA28
1053	No more DSID in list	EQQFA29
1054	Bad status	EQQFA30
1055	Bad page	EQQFA31
1056	Bad page	EQQFA32
1057	Bad page	EQQFA33
1058	No space available	EQQFA34
1059	Already free	EQQFA35
1060	Error during enqueue	EQQFA36
1061	Already reserved	EQQFA37

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
1062	Is already busy	EQQFA38
1063	Error in ACB generation for VSAM access	EQQFA39
1064	Unknown communication type	EQQFA40
1065	Bad number of writer	EQQFA41
1066	No DD found	EQQFA42
1067	VSAM open error	EQQFA43
1068	Generic I/O error	EQQFA44
1069	Attach error	EQQFA45
1070	Unexpected task end	EQQFA46
1071	Error during a Dynaloc operation (allocation)	EQQFA47
1072	Error during SSI request	EQQFA48
1073	Error during a Dynaloc operation (unallocation)	EQQFA49

Reason Codes for EQQAxxx

The following table lists the reason codes that can appear in some error messages with EQQAxxx prefix. For more information about a reason code, refer to the related message.

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
1	Resource is unknown	EQQA627, EQQA638
2	Resource already exists	EQQA627, EQQA638
3	Operation failed	EQQA627, EQQA638
4	Unsupported operation	EQQA627, EQQA638
5	The request is not valid	EQQA627, EQQA638
6	Illegal statement	EQQA627, EQQA638
7	Service unavailable	EQQA627, EQQA638
8	Requested resource not found	EQQA627
9	Resource name not unique	EQQA627, EQQA638
100	The protocol is not valid. Only HTTP, HTTPS are accepted	EQQA628, EQQA638
101	Server host not specified	EQQA628, EQQA638
102	Protocol not specified	EQQA628, EQQA638
103	Server port not specified	EQQA628, EQQA638

Reason codes

<i>Reason code</i>	<i>Meaning (reason for failure)</i>	<i>Related message</i>
104	The connection is already initialized	EQQA628, EQQA638
105	The connection is not initialized	EQQA628, EQQA638
106	Error opening connection	EQQA628, EQQA638
107	Server HTTP response exception	EQQA628, EQQA638
108	The broker server is unreachable	EQQA628, EQQA638
109	The server port contacted is wrong	EQQA628, EQQA638
110	Timeout expired during the communication	EQQA628, EQQA638
111	Error streaming data from/to the broker server	EQQA628, EQQA638
112	Error initializing SSL channel	EQQA628, EQQA638
113	Error sending data to the broker server	EQQA628, EQQA638
114	Error initializing SSL channel	EQQA628, EQQA638
115	Generic internal communication error	EQQA628, EQQA638
201	Error allocating and deallocating memory	EQQA629, EQQA638
300	An HTTP SELECT request was received with no input data	EQQA638
301	Retrieval of the HTTP SELECT input segment failed	EQQA638
302	The HTTP SELECT request destination has an invalid method	EQQA638
303	The HTTP SELECT request destination was not found	EQQA638
304	The HTTP SELECT request has an invalid HTTP destination type	EQQA638
305	The attach of the C process failed	EQQA638

Chapter 235. Batch program codes and messages

This chapter describes the IBM Tivoli Workload Scheduler for z/OS batch program codes and messages:

- Completion codes that are returned by batch job EQQPDLF
- Write-to-operator (WTO) messages that are generated by batch job EQQPURGE

EQQPDLF batch program condition codes

EQQPDLF returns one of the following codes upon completion.

00 - 44

00 **RETAINED OBJECT FOUND AND DELETED**

Explanation: The DLF object has been purged from Hiperspace™.

System action: EQQPDLF terminates.

User response: None.

02 **THE OBJECT DID NOT EXIST IN DLF**

Explanation: This is a return code from COFSDONO.

System action: EQQPDLF terminates; no object is purged.

User response: None.

04 **THE DATASET NAME COULD NOT BE LOCATED IN CATALOG**

Explanation: The catalog locate for this data set name was unsuccessful.

System action: EQQPDLF terminates; no object is purged.

User response: Data Sets that are to be handled by IBM Tivoli Workload Scheduler for z/OS Hiperbatch support must be cataloged, because the JCL invoking EQQPDLF is distributed to all systems where DLF is running, according to routing information in the JCL. You should expect this return code when EQQPDLF executes on a system where the DLF object does not exist.

08 **THE DATASET NAME PASSED HAS AN INVALID LENGTH**

Explanation: The data set name passed to EQQPDLF is either of length 0 or longer than 44 characters.

System action: EQQPDLF terminates without further processing.

User response: Verify that EQQPDLF was invoked with a valid IBM Tivoli Workload Scheduler for z/OS special resource name.

40 **DLF IS NOT ACTIVE**

Explanation: EQQPDLF received return code 40 from the COFSDONO macro, indicating that DLF is not active.

System action: EQQPDLF terminates without further processing.

User response: Start DLF if it should be active on this system, or update the file in EQQPROC with ddname JCLIN to avoid routing jobs to this system.

44 **UNEXPECTED ERROR IN DLF**

Explanation: EQQPDLF received return code 44 from the COFSDONO macro, that an unexpected error occurred in DLF when processing the purge request.

System action: EQQPDLF terminates without further processing.

User response: Contact your system programmer.

EQQPURGE batch program WTO messages

If EQQPURGE receives invalid input, one of the following WTO's is written to the operator console.

EQQPURGE PARAMETER CARD SPECIFIES AN INVALID NAME

Explanation: The object name passed to EQQPURGE

is either of length 0 or longer than 44 characters.

System action: The JCL from the JCLIN data set is neither substituted nor written to the internal reader.

EQQPURGE

User response: Verify that EQQPROC has been started by IBM Tivoli Workload Scheduler for z/OS.

EQQPURGE ERROR OPENING FILE WITH DDNAME JCLIN

Explanation: EQQPURGE could not open input file JCLIN.

System action: EQQPURGE terminates.

User response: Verify that the JCLIN statement is present in EQQPROC.

EQQPURGE INVALID JCLIN RECORD LENGTH, MUST BE 80

Explanation: The record length of the data set with ddname JCLIN is not 80.

System action: EQQPURGE terminates; no JCL is processed.

User response: Reallocate JCLIN with the correct record length.

EQQPURGE ERROR OPENING INTERNAL READER

Explanation: EQQPURGE could not open JES internal reader data set.

System action: EQQPURGE terminates; no JCL is processed.

User response: Verify that the JCLOUT statement is present and correctly specified in EQQPROC.

Chapter 236. SSL errors

The following table provides a set of SSL messages that can appear in messages EQQIP16I, EQQPH46I, EQQX601E, showing the most common error cause in the **Cause** column:

SSL message	Cause
SSL ERROR ON CONTEXT INITIALIZATION: Error in gsk_enviroment_init: 201 </u/twsa/gianluigiTWSA1.kdb>,</u/twsa/gianluigiTWSA1.sth> No key database password supplied.	The process cannot access the password file. A common cause is a typing error in the file name or directory authorizations not properly set.
SSL ERROR GETTING CERTIFICATE INFORMATION: The program cannot authenticate the SSL peer certificate: the requested level is not matched.	There partners' certificates do not match. For example, you set different SSLSTRING values for the communication partners.
TIMEOUT EXPIRED, WAITING FOR SSL CONNECTION.	You set different SSLLEVEL values for the communication partners. Make sure that both the communication partners specify the same value for the SSLLEVEL parameter.
TIMEOUT (15 SEC) EXPIRED WHILE WAITING FOR SSL HANDSHAKE FROM REMOTE AGENT.	It is issued in the message log of the controller or server started task, when you set different SSLLEVEL values for the communication partners. Make sure that both the communication partners specify the same value for the SSLLEVEL parameter.
SSL ERROR INITIALIZING A SECURE CONNECTION: Error in gsk_secure_socket_init: <6> : Key label is not found.	The SSL key database of the controller or server started task does not contain a default certificate.
SSL ERROR GETTING CERTIFICATE INFORMATION: The counterpart workstation did not present a valid SSL peer certificate, common name is missing.	It is issued in the message log of the controller or server started task, when the SSL key database of the client partner does not contain a default certificate.
SSL ERROR INITIALIZING A SECURE CONNECTION: Error in gsk_secure_socket_init: <420> : Socket closed by remote partner.	The message log of the communication partner is expected to show the route cause of the problem.
SSL ERROR ON CONTEXT INITIALIZATION: Error in gsk_enviroment_init: 408 </u/twsa/gianluigiTWSA1.kdb>,</u/twsa/gianluigiTWSA1.sth> Key database password is not correct.	The most common cause is that the password file does not match the database password.

SSL errors

SSL message	Cause
<p>SSL ERROR ON CONTEXT INITIALIZATION:</p> <p>Error in gsk_enviroment_init: 202</p> <p></u/twsa/gianluigiTWSA1.kdb>,</u/ twsa/gianluigiTWSA1.sth></p> <p>Error detected while opening the key database.</p>	<p>The process cannot access the key database. A common cause is a typing error in the database name.</p>

Part 3. Dynamic Workload Console messages

This part provides an overview of the Dynamic Workload Console error messages.

Chapter 237. Installation and uninstallation messages

Dynamic Workload Console generates installation and uninstallation messages.

This section lists the Dynamic Workload Console installation and uninstallation messages and their descriptions. Informational messages are not included because they are complete within themselves and do not need further explanation.

AWSJIM messages

This section lists error and warning messages that could be issued during the server installation.

The message component code is JIM.

AWSJIM001E Internal error while performing the "{0}" operation.

Explanation:

User response: Analyze the Installation Manager log files by selecting from the Installation Manager menu, File->View Log. Verify that your environment is working correctly. For example, verify that there are no corrupted files.

AWSJIM002E The field "{0}" is required.

User response: Enter the required field.

AWSJIM003E The value you specified in the field "{0}" is not a number.

User response: Specify an integer number.

AWSJIM004E The host name "{0}" you specified in the field "{1}" cannot be reached.

User response: Enter a host name that can be reached.

AWSJIM005E The value you specified in the field "{0}" is not Boolean (true or false).

User response: Specify "true" or "false".

AWSJIM006E The field "{0}" exceeds the maximum number of permitted characters: {1}.

User response: Specify the field without exceeding the maximum number of permitted characters.

AWSJIM007E The value in the field "{0}" contains reserved words.

User response: Enter a value that does not contain reserved words.

AWSJIM008E The following command lines are running on the specified instance: {0}.

User response: Stop all the running command lines and retry the validation.

AWSJIM009E The following jobs are running on the specified instance: {0}.

User response: Stop all the running jobs and retry the validation.

AWSJIM010E The directory you specified "{0}" is not empty.

User response: Specify an empty directory.

AWSJIM011E The value "{0}" is not a directory.

User response: Specify a valid directory.

AWSJIM012E The password in "{0}" is not encrypted.

User response: Specify an encrypted password.

AWSJIM013E The location "{0}" already contains a Tivoli Workload Automation instance.

User response: Specify a different installation location.

AWSJIM014E The directory "{0}" does not have the correct permissions for users other than the root user to work on this directory.

User response: Specify another directory or change the user permissions for this directory.

AWSJIM015E The field "{1}" contains the value "{0}" but must be "{2}" or "{3}"

User response: Enter a correct value.

AWSJIM016E The location "{0}" already contains a Tivoli Workload Scheduler instance of version {1} that cannot be upgraded.

User response: Specify a different install location.

AWSJIM017W The location "{0}" already contains a Tivoli Workload Scheduler instance of version {1} that will be upgraded.

User response: Continue to upgrade this Tivoli Workload Scheduler instance.

AWSJIM018E The product cannot retrieve the {0} parameter from the Tivoli Workload Scheduler instance you want to upgrade.

User response: Check the Installation Manager log for details on the error. Check the BrokerWorkstation.properties, the JobManager.ini, the TWSSConfig.properties, the ita.ini, the localopts, the globalopts files, and the registry to verify if the parameter was correctly defined.

AWSJIM019E The product cannot regenerate the registry for the Tivoli Workload Scheduler instance you want to upgrade

User response: Check that the registry for the instance you want to upgrade is not corrupt.

AWSJIM020E You are using a response file that is not appropriate for the component you want to upgrade.

User response: Use the response file for the component you want to upgrade. \n

AWSJIM021E Cannot install or upgrade the selected instance. Uninstall the Tivoli Dynamic Workload Console and/or z/OS Connector before installing or upgrading the instance.

User response: Uninstall the Tivoli Dynamic Workload Console and/or z/OS Connector and try again.

AWSJIM022E The installation user does not have write permission on the directory "{0}".

User response: Specify another directory or assign write permission on this directory.

AWSJIM023E The following processes are running on the specified instance: {0}.

User response: Stop all the active processes and retry the validation.

AWSJIM024E The path you specified does not contain a Tivoli Workload Scheduler instance that can be upgraded.

User response: Specify a path that contains a valid instance.

AWSJIM025E The path you specified for the fresh installation already contains a Tivoli Workload Scheduler instance.

User response: Specify an empty path.

AWSJIM027E The path you specified is not correct. The correct path is: {0}.

User response: Specify the path as shown in the message text.

AWSJIM100E You specified an invalid WebSphere profile location.

User response: Specify an existing WebSphere profile location.

AWSJIM101E You specified an incorrect WebSphere location.

User response: Specify a valid WebSphere location.

AWSJIM102E Invalid WebSphere Application Server version found: {0}. Minimum supported version is {1}

User response: Specify a WebSphere Application Server location that contains a supported version.

AWSJIM103E The profile {0} already exists.

User response: Specify a new profile name.

AWSJIM104E The product cannot use the profile {0} because the WebSphere Application Server profile registry already contains this name.

User response: Specify a new profile name\n or clean-up the WebSphere Application Server profile registry.

AWSJIM105E You specified a profile location in which there Jazz for Service Management is not installed.

User response: Specify a profile location where Jazz for Service Management is installed.

AWSJIM106E The "{0}" WebSphere profile location already exists.

User response: Specify a WebSphere profile location that does not exist.

AWSJIM107E The user {0} or the password you specified is not valid.

User response: Specify the correct user and password.

AWSJIM108E The value "{0}" of the field "{1}" is not valid for the offering "{2}" you selected.

User response: Enter a correct value.

AWSJIM109E The offering IBM WebSphere SDK Java Technology Edition (Optional) 7 (64-bit) is required to proceed.

User response: Install the IBM WebSphere SDK Java Technology Edition (Optional) 7 (64-bit) offering.

AWSJIM110E You already used the profile {0} when installing the master domain manager or the dynamic domain manager.

User response: Specify a different profile name.

AWSJIM111E The WebSphere Application Server {0} in profile {1} is still running.

User response: Stop the specified WebSphere Application Server.

AWSJIM112E The user {0} or password that you specified is not valid, or the WebSphere Application Server for the profile "{1}" is not running.

User response: Specify the correct user and password and run the serverStatus command to verify that the WebSphere Application Server is running.

AWSJIM113W The product cannot validate the user and password because the WebSphere Application Server security is not enabled.

User response: Check if you need to enable the WebSphere Application Server security. If you need to enable the WebSphere Application Server security stop the installation and enable it.

AWSJIM114W The product cannot validate the user and password because the WebSphere Application Server user registry is not correctly configured.

User response: Check the WebSphere Application Server user registry configuration.

AWSJIM115E The Dynamic Workload Console is already installed on the selected profile location.

User response: Select a profile location where the Dynamic Workload Console is not already installed.

AWSJIM116E The selected profile location is already used by an instance of Tivoli Workload Scheduler.

User response: You cannot use the same profile for Tivoli Workload Scheduler and the Dynamic Workload Console. Select a profile location that is not used by Tivoli Workload Scheduler.

AWSJIM150E The "{0}" and the "{1}" passwords do not match.

User response: Retype the passwords, ensuring that they are the same.

AWSJIM151E The user you specified does not have the permission requested.

User response: Specify a valid user name.

AWSJIM152E The password you specified is not valid.

User response: Specify a correct password.

AWSJIM153E The user you specified does not exist. You must create the TWS user before performing the installation.

User response: Specify an existing user name.

AWSJIM154E The value you specified in the field "{0}" contains invalid characters.

User response: Specify a valid value.

AWSJIM155E The field "{0}" you specified contains unsupported encoded character.

User response: Specify a valid value.

AWSJIM156E The user {0} you specified is already being used for the Tivoli Workload Scheduler instance "{1}".

User response: Specify a different user name.

AWSJIM157E The password does not meet the password policy requirements.

User response: Review the password policy. Check the minimum password length, password complexity, and password history requirements.

AWSJIM158E The user {0} you specified does not match with the user of this Tivoli Workload Scheduler instance.

User response: Specify the correct user.

AWSJIM159E The "Computer Browser" service is down.

User response: This service is necessary to manage Windows domain users. Open Windows Services and start the "Computer Browser" service.

AWSJIM160E The "{0}" Windows service is already present for the user you specified.

User response: Specify a different user or if this is an old or incorrect service open the Windows Services to remove this service.

AWSJIM200E The field "{0}" contains an invalid value as the first character.

User response: Enter a value without specifying a number, -, _ or a space as the first character.

AWSJIM201E The value you specified in the field "{0}" is already used in the field "{1}".

User response: Specify a different value.

AWSJIM202E The value you specified in the field "{0}" is not within the range:"{1}" and "{2}".

User response: Specify a value within the range.

AWSJIM203E The port you specified in the field "{0}" is already being used.

User response: Specify a port value that is not being used.

AWSJIM250E You specified an incorrect database type. Selected: {0}. Allowed values: {1} or {2}.

User response: Specify a valid value.

AWSJIM251E You specified an incorrect database location.

User response: Specify an existing database location.

AWSJIM252E Invalid database version found: {0}, fixpack {1}.

User response: Specify a database location that contains a supported database version.

AWSJIM253E Database access denied. Or database service is not running.

User response: Specify the correct information to connect to the database and verify that the database service is up and running

AWSJIM254E There is no database manager listening on the port {0}.

User response: Verify that the database manager is up and running and that it is listening on this port.

AWSJIM255E The DB2 instance "{0}" does not exist.

User response: Specify a valid DB2 instance.

AWSJIM256E The database you specified is not valid for configuring the master domain manager or dynamic domain manager as a backup.

User response: Specify the correct database information.

AWSJIM257E The database you specified is already present but is not a Tivoli Workload Scheduler database.

User response: Specify the correct database information.

AWSJIM258E The tablespace "{0}" you specified for the field "{1}" does not exist

User response: Specify the correct tablespace.

AWSJIM259E The user "{0}" you specified in the field "{1}" does not exist in the database you specified for configuring the master domain manager as a backup.

User response: Specify the name of an existing user.

AWSJIM260E The user "{0}" you specified in the field "{1}" cannot access the database.

User response: Ensure that the user and password you specified is correct or specify a user that has the permission to connect to the database.

AWSJIM261E The "{0}" path is either the same as or is a subpath of the "{1}" path. The paths must be different and one cannot contain the other.

User response: Choose different values for the tablespace paths, so that they are not the same and that one is not a subpath of the other.

AWSJIM262E The field "{0}" contains an invalid character as the first character.

User response: Enter the field without specifying an invalid character as the first character.

AWSJIM266E The database "{0}" you specified does not exist.

User response: Specify an existing database.

AWSJIM267E Unable to query the database to retrieve some table information.

User response: Check the logs for details. See the Planning and Installation manual, Troubleshooting chapter, Upgrade Problems section.

AWSJIM268E The database "{0}" you specified exists but is not in the catalog.

User response: Specify a different database or catalog it.

AWSJIM269E The database "{0}" you specified is already in the catalog.

User response: Specify a different database or remove it from the catalog.

AWSJIM270E The database you specified is a Tivoli Workload Scheduler database but is not valid for this instance.

User response: Specify the correct database information. If you are installing a master domain manager, specify the master domain manager database. If you are installing a dynamic domain manager, specify the dynamic domain manager database.

AWSJIM300E Disk space check failed.

User response: Check the log trace text area for details.

AWSJIM900E Replace requires {0} parameters. Only had {1} parameters. (Usage: [file] [search_string] [replacement_string])

Explanation: The installer is not passing in the correct parameters for a binary which it is trying to execute. This is an internal error which cannot be resolved by the Installation Manager.

User response: Identify the package that has the issue by looking at the installation history. In Installation Manager, click File > Installation History. In console mode, enter S on the main menu to select "View Installation History".

AWSJIM901E File {0} does not exist.

Explanation: A binary which the installer is executing is attempting to replace a string in a file which does not exist. This is an internal error which cannot be resolved by the Installation Manager.

User response: Identify the package that has the issue by looking at the installation history. In Installation Manager, click File > Installation History. In console mode, enter S on the main menu to select "View Installation History".

AWSJIM902E File {0} already exist.

Explanation: A binary which the installer is executing is attempting to replace a string in a file which does not exist. This is an internal error which cannot be resolved by the Installation Manager.

User response: Identify the package that has the issue by looking at the installation history. In Installation Manager, click File > Installation History. In console mode, enter S on the main menu to select "View Installation History".

AWSJIM903E File {0} is not writable.

Explanation: A binary which the installer is executing is attempting to replace a string in a read-only file. This is an internal error which cannot be resolved by the Installation Manager.

User response: Identify the package that has the issue by looking at the installation history. In Installation Manager, click File > Installation History. In console mode, enter S on the main menu to select "View Installation History".

AWSJIM904E String to replace cannot be an empty string.

Explanation: A binary which the installer is executing is attempting to replace the empty string in a file. This is an internal error which cannot be resolved by the Installation Manager.

User response: Identify the package that has the issue by looking at the installation history. In Installation Manager, click File > Installation History. In console mode, enter S on the main menu to select "View Installation History".

AWSJIM905E String to replace cannot be an empty string.

Explanation: A binary which the installer is executing is attempting to replace the empty string in a file. This is an internal error which cannot be resolved by the Installation Manager.

User response: Identify the package that has the issue by looking at the installation history. In Installation Manager, click File > Installation History. In console mode, enter S on the main menu to select "View Installation History".

AWSJIM906E The arguments number is wrong.

Explanation: A class which the installer is executing has been invoked with the wrong number of parameters. This is an internal error which cannot be resolved by the Installation Manager.

User response: Identify the package that has the issue by looking at the installation history. In Installation Manager, click File > Installation History. In console mode, enter S on the main menu to select "View Installation History".

AWSJIM907E An error occurred when running step {3}. Command {0}, parameters {1}, return code {2}.

Explanation: One of the installation steps failed.

User response: Check system out and system error

AWSJIM908E The application cannot stop the WebSphere Application server {0} running for the profile {1}.

Explanation: The WebSphere Application server does not respond to the stop command.

User response: Stop and restart the WebSphere Application server manually.

AWSJIM909W Step {3} ended in warning. Command {0}, parameters {1}, return code {2}.

Explanation: One of the installation step completed with warnings.

User response: Check system out and system error

AWSJIM912W The update of Tivoli Workload Automation registry ended with warning..

Explanation: Installation process cannot update the internal registry.

User response: No action required

AWSJIM913E An error occurred when running step {0}: return code {1}.

Explanation: One of the installation steps failed.

User response: Check system out and system error

AWSJIM914W Step {0} ended with a warning: return code {1}.

Explanation: One of the installation steps completed with warnings.

User response: Check system out and system error

AWSJIM920E An error occurred when installing either a master domain manager or a dynamic domain manager as a backup. The database {0} to which the product must connect does not exist.

Explanation: When installing either a master domain manager or a dynamic domain manager as a backup, the database specified during the installation must exist.

User response: Restart the installation, specifying a valid database name

AWSJIM921E An error occurred while connecting to the database {0}. Check if the database is running and the supplied authentication data (username/password) is correct.

Explanation: While installing the database, an error occurred when connecting to the node.

User response: Check if the database is running and the supplied authentication data (username/password) is correct.. Restart the installation.

AWSJIM922E An error occurred while upgrading the database {0}. It does not contain the Tivoli Workload Scheduler tables.

Explanation: When upgrading the database, the installation did not find the Tivoli Workload Scheduler tables.

User response: Restart the installation, specifying a database that contains the Tivoli Workload Scheduler tables. If you created the Tivoli Workload Scheduler database manually, check that it was created correctly.

AWSJIM923E An error occurred while installing the database {0}. The database exists, but it is not in the catalog.

Explanation: When installing the database, the installation found the database, but it did not find it in the catalog.

User response: Check if the database was cataloged. If not, catalog it and restart the installation.

AWSJIM924E An error occurred while installing the database {0}. You are installing either a master domain manager or a dynamic domain manager as a backup, but the database already exists in the catalog.

Explanation: When installing the database, the installation found the database already in the catalog.

User response: Check if the database is already cataloged. If so, remove it from the catalog and restart the installation.

AWSJIM925E The installation cannot find the database {0} to upgrade. Check that the database was cataloged and that the supplied authentication data (username and password) is correct.

Explanation: When upgrading the database, the installation could not connect to it.

User response: Check if the database exists and that you can connect to it.

AWSJIM926E The installation found that the database {0} is a database for a Master Domain Manager, but you are installing a Dynamic Domain Manager. Check that the database specifyid is the correct one.

Explanation: When installing the database for a Dynamic Domain Manager, a database for a Master Domain Manager is found. Check the database name specified.

User response: Check the database specified.

AWSJIM927E An error occurred while creating the Tivoli Workload Scheduler WebSphere Application Server profile {0} in the {1} path. Analyze the WebSphere Application Server logs at {2}. Possible causes are: the profile already exists, the path already exists and it is not empty, or you do not have enough disk space to perform the installation.

Explanation: The installation cannot create the new WebSphere Application Server profile.

User response: Check the WebSphere Application Server logs. Possible causes are: the profile already exists, the path already exists and it is not empty, or you do not have enough disk space to perform the installation.

AWSJIM928E An error occurred while creating the Windows service for the Tivoli Workload Scheduler WebSphere Application Server profile. Check the status of the Windows Service Manager.

Explanation: The installation cannot create a Windows service.

User response: Check the status of the Windows Service Manager and Windows Events.

AWSJIM929E An error occurred modifying WebSphere configuration. The file db2profile at path {0} cannot be found.

Explanation: The installation was not able to find the DB2 profile to be used.

User response: Check if the specified file exists.

AWSJIM930E An error occurred while creating the Tivoli Workload Scheduler WebSphere Application Server profile {0} in the {1} path. Analyze the WebSphere Application Server logs at {2}. Possible causes are: the profile already exists, the path already exists and it is not empty, or you do not have enough disk space to perform the installation. If no more errors occur the instance is rolled back to the previous version.

Explanation: The installation cannot create the new WebSphere Application Server profile.

User response: Check the WebSphere Application Server logs. Possible causes are: the profile already exists, the path already exists and it is not empty, or you do not have enough disk space to perform the installation.

AWSJIM931E An error occurred while creating the Windows service for the Tivoli Workload Scheduler WebSphere Application Server profile. Check the status of the Windows Service Manager. If no more errors occur the instance is rolled back to the previous version.

Explanation: The installation cannot create a Windows Service.

User response: Check the status of the Windows Service Manager and the Windows Events.

AWSJIM932E An error occurred while modifying the WebSphere Application Server configuration. The file db2profile located in the path {0} was not found. If no more errors occur the instance is rolled back to the previous version.

Explanation: The installation cannot find the DB2 profile to use.

User response: Check if the specified file exists.

AWSJIM933E An error occurred migrating the Tivoli Workload Scheduler default certificates. Check the log files for further details. Possible causes are: the profile already exists, the path already exists and it is not empty, the disk space is not enough to perform the installation.

Explanation: The installation cannot migrate the Tivoli Workload Scheduler default certificates.

User response: See message text

AWSJIM950E An error occurred while creating the backup of the instance in the folder {0}. Check the directory permissions, the disk space, and if any processes are locking files located in the Tivoli Workload Scheduler installation path. The installation cannot start.

Explanation: The installation cannot create the backup of the previous version.

User response: See message text.

AWSJIM951E An error occurred while restoring the Tivoli Workload Scheduler instance from the backup, located in the folder {0}. Check the directory permissions, the disk space, and if any processes are locking files located in the Tivoli Workload Scheduler installation path. Remove all the files located in the Tivoli Workload Scheduler installation folder and restore them manually from the backup.

Explanation: The restore operation failed. The Tivoli Workload Scheduler instance is now in a not working state.

User response: Remove all the files located in the Tivoli Workload Scheduler installation folder and restore them manually from the backup.

AWSJIM952E An error occurred creating the backup of the customized file in your Tivoli Workload Scheduler installation. Examples of them are MakePlan, jobmanrc, and configuration files. The installation has not been started. Check if they are locked.

Explanation: The installation was not able to create the backup of the customized files.

User response: Check in the installation folder if they are locked by some process.

AWSJIM953E An error occurred restoring the Tivoli Workload Scheduler customized files from their backup. Check directory permissions, disk space and if processes are locking files in the TWS installation. If no more errors are displayed the instance is restored to the previous version.

Explanation: The restore customized file operation failed.

User response: If no more errors are displayed, the instance has been restored. If other errors appears, manually restore it from the backup

AWSJIM958E An error occurred checking the Tivoli Workload Scheduler prerequisites on the machine.

Explanation: The installation failed to check some system requirements.

User response: Check the system requirements for further details.

AWSJIM959E The upgrade cannot continue because processes are locking the Tivoli Workload Scheduler files. Check if any Tivoli Workload Scheduler processes are running. If no other messages are displayed, the instance is restored to the version you installed before trying to upgrade.

Explanation: The upgrade failed because processes are locking the Tivoli Workload Scheduler files.

User response: Stop those processes and retry the operation.

AWSJIM960E The upgrade cannot continue because some jobs are still running on the selected instance. Wait for these jobs to complete and retry the operation. If no other messages are displayed, the instance is restored to the version you installed before trying to upgrade.

Explanation: The upgrade failed because there are jobs still running.

User response: Wait for these jobs to complete. Restart the operation

AWSJIM961E An error occurred installing the Tivoli Workload Scheduler binary files. Check the log files at location {0} for further details.

Explanation: The installation failed installing Tivoli Workload Scheduler binary files.

User response: Analyze the log file identified in the message.

AWSJIM962E An error occurred upgrading the Tivoli Workload Scheduler core binary files. Check the log files at location {0} for further details. If no other messages are displayed the instance is restored to the previous version.

Explanation: The upgrade failed installing Tivoli Workload Scheduler binary files.

User response: Analyze the log file identified in the message.

AWSJIM963E An error occurred while creating the Tivoli Workload Scheduler user {0} or while assigning the user policies. Verify the operating system policies and configuration. Verify the input values. If necessary, create the user manually before running the installation.

Explanation: The installation cannot create or verify the user policies of the user.

User response: Verify the operating system policies and configuration. Verify the input values. If necessary, create the user manually before running the installation.

AWSJIM964E An error occurred while verifying the password of the Tivoli Workload Scheduler user {0}. Verify the input values. Verify the operating system policies and configuration.

Explanation: The installation cannot verify the user password; either it is wrong or it cannot be verified.

User response: Verify the operating system policies and configuration. Verify the input values.

AWSJIM965E The specified Tivoli Workload Scheduler user {0} does not exist or does not have an associated home directory.

Explanation: The Tivoli Workload Scheduler user specified either does not exist or does not have an associated home directory.

User response: Verify the operating system definition of the Tivoli Workload Scheduler user.

AWSJIM966E The specified installation directory {0} is not empty. The installation cannot continue.

Explanation: You specified as installation folder a directory that already exists.

User response: Specify a different installation directory.

AWSJIM967E An error occurred while validating the instance against the Tivoli Workload Scheduler installation registry. Re-create it using the twsClusInstEnabler command.

Explanation: The installation registry for the selected instance is corrupt and the operation cannot proceed.

User response: Use the twsClusInstEnabler command to fix the registry and then retry the operation.

AWSJIM968E An error occurred while retrieving information from the old configuration files. Verify the localopts, the globalopts, the ita.ini, and the JobManager.ini files. If no other messages are displayed, the instance is restored to the version you installed before trying to upgrade.

Explanation: The installation is unable to retrieve information from the configuration files.

User response: Verify if the mentioned files are corrupt.

AWSJIM969E The upgrade cannot continue because there are command lines open on the selected instance (for example, conman or composer). Close the command lines and retry the operation. If no other messages are displayed, the instance is restored to the version you installed before trying to upgrade.

Explanation: The upgrade failed because there are command lines open.

User response: Close the command lines and retry the operation.

AWSJIM970W The installation completed, but errors occurred while adding the FINAL job stream to the database; add it manually.

Explanation: See message text

User response: See message text

AWSJIM971W The installation completed, but errors occurred while starting the WebSphere Application Server. Verify the WebSphere Application Server log files.

Explanation: See message text.

User response: See message text.

AWSJIM972W The installation completed, but errors occurred while removing the Windows service for the old installation. Remove it manually.

Explanation: See message text.

User response: See message text.

AWSJIM973W An error occurred while uninstalling the Tivoli Workload Scheduler core binary files. Analyze the log file {0} for further details.

Explanation: The uninstallation failed while uninstalling the Tivoli Workload Scheduler binary files.

User response: Analyze the log file identified in the message.

AWSJIM974W An error occurred while starting the Tivoli Workload Scheduler instance. Analyze the files in the stdlist folder for further details.

Explanation: The installation of the Tivoli Workload Scheduler completed successfully, but the Tivoli Workload Scheduler instance cannot start.

User response: Analyze the log files identified in the message to understand the reason for the failure.

AWSJIM975W An error occurred while starting the dynamic agent embedded in the instance. Analyze the files in the stdlist/JM folder for further details.

Explanation: The installation of the Tivoli Workload Scheduler completed successfully but the dynamic agent embedded in the instance cannot start.

User response: Analyze the log files identified in the message to verify the reason for the failure.

AWSJIM976W The installation completed, but an error occurred while adding the master domain manager workstation definition to the database. Analyze the WebSphere Application Server logs for further details.

Explanation: The Tivoli Workload Scheduler installation completed successfully but the master domain manager workstation definition was not added to the database.

User response: Analyze the WebSphere Application Server logs. Add the master domain manager workstation definition manually.

AWSJIM977W The installation completed, but an error occurred while adding the Windows User definition to the database. Analyze the WebSphere Application Server logs for further details.

Explanation: The Tivoli Workload Scheduler installation completed successfully, but the Windows User definition was not added to the database.

User response: See the log files identified in the message to verify the reason for the failure.

AWSJIM978W The operation completed, but an error occurred while replicating the plan data to the database. The plan data was not replicated to the database. The product continues to work with the plan saved to the Symphony file.

Explanation: During the installation or the upgrade, the replication of the plan to the database failed. The product continues to work with the plan saved to the Symphony file.

User response: See the WebSphere Application Server log files identified in the message to verify the reason for the failure. If the problem persists, search the IBM Support database for a solution at <http://www.ibm.com/software/sysmgmt/products/support>.

AWSJIM979W The installation completed, but an error occurred while setting the ownership for the Tivoli Workload Scheduler Server files. The instance is working, but some files still belong to the root owner instead of belonging to {0}. Analyze the log files for details.

Explanation: The installation successfully completed, but some files have wrong ownership.

User response: See the log files identified in the message to verify which files have the wrong ownership. Fix them manually.

Chapter 238. User interface messages

Dynamic Workload Console displays messages on its user interface.

This section lists the error and warning messages that are generated by the Dynamic Workload Console.

AWSUI - Dynamic Workload Console messages

This section lists error and warning messages that could be issued by the Dynamic Workload Console.

The message component code is UI.

AWSUI0100E The job stream list cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The job stream list could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:
com.tivoli.jsc.views.JsBaseNavigator method runQuery()

AWSUI0101E The plan view cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The plan view could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0102E The resource list cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The resource list could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:
com.tivoli.jsc.views.JSResourceQueryGUI method runQuery()

AWSUI0103E The resource plan view cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The resource plan view could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0104E The workstation list cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The workstation list could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:
com.tivoli.jsc.views.JSWorkstationQueryGUI method runQuery()

AWSUI0105E The job stream instance "instance_name" cannot be opened because of the following engine error:"engine_error_message_ID"

Explanation: The job stream instance could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0106E The job stream "job_stream_name" cannot be updated because of the following engine error:"engine_error_message_ID"

Explanation: The job stream could not be updated due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0107E The Job Stream Editor cannot be opened because of the following engine error:"engine_error_message_ID"

Explanation: The Job Stream Editor could not be opened due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0108E The Job Stream Instance Editor cannot be opened because of the following engine error:"engine_error_message_ID"

Explanation: The Job Stream Instance Editor could not be opened due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0109E The Resource Editor cannot be opened because of the following engine error:"engine_error_message_ID"

Explanation: The Resource Editor could not be updated due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0110E The structure cannot be built because of the following engine error:"engine_error_message_ID"

Explanation: The structure could not be built due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0111E The job stream cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The job stream could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0112E The resource availability definition cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The resource availability definition could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0113E The job stream cannot be saved if it does not contain at least one job, because of the following engine error:"engine_error_message_ID"

Explanation: The job stream could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0114E The job stream cannot be saved because of the following engine error:"engine_error_message_ID"

Explanation: The job stream could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0115E The resource "resource_name" cannot be saved because of the following engine error:"engine_error_message_ID"

Explanation: The resource could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0116E The resource "resource_name" cannot be saved because of the following engine error:"engine_error_message_ID"

Explanation: The resource could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0117E The dependency between the selected jobs cannot be added because they are both in the same job stream.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select a dependency on a job in another job stream. Retry the operation.

AWSUI0118E All of the fields in this panel are obligatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Complete all the fields in the panel before pressing OK.

AWSUI0119E The jobs in the job stream instance were not found. Specify different filter criteria and run the list again.

Explanation: See message text.

System action: The requested operation is not performed. The job list is returned empty.

Operator response: Try to generate a new list by specifying different filter criteria.

AWSUI0120E The job stream instance was not found. Specify different filter criteria and run the list again.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify different filter criteria and run the list again.

AWSUI0121E The dependency cannot be created because it creates a circular dependency. Define a valid dependency.

Explanation: In job A you have defined a dependency on job B, but job B is dependent, directly or indirectly, on job A.

System action: The requested operation is not performed.

Operator response: Define a valid dependency that does not create a circular dependency. Retry the operation.

AWSUI0123E A job stream must be saved in the database before it can be scheduled.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Save the job stream in the database and then schedule it.

AWSUI0124E The job stream instance cannot be found. Try a different name.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply the correct name for the job stream instance. Retry the operation.

AWSUI0125E The workstation "workstation_name" cannot be saved because of the following engine error:"engine_error_message_ID"

Explanation: The workstation could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0126E The workstation "workstation_name" cannot be saved because of the following engine error:"engine_error_message_ID"

Explanation: The workstation could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0127E A class cast exception has occurred in the engine because of the following engine error:"engine_error_message_ID"

Explanation: There was a class cast exception due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0128E The following problem has occurred with the job scheduling engine."engine_error_message_ID"

Explanation: There is a problem with the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0129E The panel cannot close because of the following engine error:"engine_error_message_ID"

Explanation: The panel could not be closed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0130E The job dependency cannot be added because of the following engine error:"engine_error_message_ID"

Explanation: The job dependency could not be added due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0131E You clicked OK, but the request cannot be processed because of the following engine error:"engine_error_message_ID"

Explanation: The OK request could not be processed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0132E The job cannot be changed because of the following engine error:"engine_error_message_ID"

Explanation: The job could not be changed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0133E The job cannot be added because of the following engine error:"engine_error_message_ID"

Explanation: The job could not be added due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0134E The instance cannot be modified because of the following engine error:"engine_error_message_ID"

Explanation: The instance could not be modified due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0135E The instance "instance_name" cannot be deleted because of the following engine error:"engine_error_message_ID"

Explanation: The instance could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0136E The instance "instance_name" cannot be held because of the following engine error:"engine_error_message_ID"

Explanation: The instance could not be held due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0137E The instance "instance_name" cannot be released because of the following engine error:"engine_error_message_ID"

Explanation: The instance could not be released due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0138E The object cannot be deleted because of the following engine error:"engine_error_message_ID"

Explanation: The object could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0139E The object cannot be undeleted because of the following engine error:"engine_error_message_ID"

Explanation: The object could not be undeleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0140E The status in the database cannot be modified because of the following engine error:"engine_error_message_ID"

Explanation: The status in the database could not be modified due to an error that occurred in the Tivoli

Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0141E The job cannot be removed because of the following engine error:"engine_error_message_ID"

Explanation: The job could not be removed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0142E The job dependency cannot be removed because of the following engine error:"engine_error_message_ID"

Explanation: The job dependency could not be removed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0143E The dependency cannot be removed because of the following engine error:"engine_error_message_ID"

Explanation: The dependency could not be removed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0144E The external dependency cannot be removed because of the following engine error:"engine_error_message_ID"

Explanation: The external dependency could not be removed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0145E The requested action on the selected objects cannot be performed because of the following engine error:"engine_error_message_ID"

Explanation: The action could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0146E The job stream operation cannot be performed because of the following engine error:"engine_error_message_ID"

Explanation: The job stream operation could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0147E The requested action on the selected object cannot be performed because of the following engine error:"engine_error_message_ID"

Explanation: The action could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0148E The requested action on the selected objects cannot be performed because of the following engine error:"engine_error_message_ID"

Explanation: The action could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0149E The instance cannot be updated from services because of the following engine error:"engine_error_message_ID"

Explanation: The instance could not be updated due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0150E The requested action on the selected object cannot be performed because of the following engine error:"engine_error_message_ID"

Explanation: The action could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0151E The requested action on the selected objects cannot be performed because of the following engine error:"engine_error_message_ID"

Explanation: The action could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0152E The requested action on the selected objects cannot be performed because of the following engine error:"engine_error_message_ID"

Explanation: The action could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0153E The requested action cannot be performed because of the following engine error:"engine_error_message_ID"

Explanation: The action could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0154E The workstation cannot be opened because of the following engine error:"engine_error_message_ID"

Explanation: The workstation could not be opened due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0155E The workstation editor cannot be opened because of the following engine error:"engine_error_message_ID"

Explanation: The workstation editor could not be opened due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0156E The requested action on the selected objects cannot be performed because of the following engine error:"engine_error_message_ID"

Explanation: The action could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0157E The workstation cannot be deleted because of the following engine error:"engine_error_message_ID"

Explanation: The workstation could not be deleted due to an error that occurred in the Tivoli Workload

Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0158E The selected workstations cannot be deleted because of the following engine error:"engine_error_message_ID"

Explanation: The selected workstations could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0159E The schedule specifications cannot be added because of the following engine error:"engine_error_message_ID"

Explanation: The schedule specifications could not be added due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0160E Another run cycle cannot be created because of the following engine error:"engine_error_message_ID"

Explanation: Another run cycle could not be created due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0161E The requested action cannot be performed because of the following engine error:"engine_error_message_ID"

Explanation: The action could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0162E The operation cannot be interrupted because of the following engine error:"engine_error_message_ID"

Explanation: The operation could not be interrupted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0163E The selected resource cannot be deleted because of the following engine error:"engine_error_message_ID"

Explanation: The resource could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0164E The selected resources cannot be deleted because of the following engine error:"engine_error_message_ID"

Explanation: The resources could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0165E Cannot read the resource header because of the following engine error:"engine_error_message_ID"

Explanation: The resource header could not be retrieved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0166E The resource cannot be opened because of the following engine error:"engine_error_message_ID"

Explanation: The resource could not be opened due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0167E The resource dependency changes cannot be saved because of the following engine error:"engine_error_message_ID"

Explanation: The resource dependency could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0168E The scheduling specifications cannot be added because of the following engine error:"engine_error_message_ID"

Explanation: The scheduling specifications could not be added due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0169E The scheduling specifications cannot be added because of the following engine error:"engine_error_message_ID"

Explanation: The scheduling specifications could not be added due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0173E The object "object_name" is currently locked because it is being updated by another user. It is displayed in read-only mode until the user releases it. Try again later.

Explanation: See message text.

System action: Processing continues but the object is displayed in read-only mode.

Operator response: Try to update the object later, after it has been released.

AWSUI0174E The connector cannot be linked. The connector is not present on the server.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check whether a connector is installed on the server. If a connector is not installed, install an instance.

Planning and Installation

AWSUI0175E This view cannot be detached. The maximum number of concurrent detachable views allowed is reached. Close one of the open views.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Close one of the open views and try to detach the view again.

AWSUI0176E The job stream cannot be saved because it contains an external job that has no link, which is not allowed. Remove the external job that has no link or link it with another job.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Remove the external job that has no link or link it with another job. Retry the save of the job stream.

AWSUI0177E The external dependency cannot be added, because a job stream cannot have external dependencies from other job scheduling engines.

Explanation: An attempt was made to add a dependency from a different job scheduling engine. A job stream cannot have external dependencies from other job scheduling engines.

System action: The requested operation is not performed.

Operator response: Add the dependency into a job stream on the same engine. Retry the operation.

AWSUI0178E The search objects cannot be found because of the following engine error:"engine_error_message_ID"

Explanation: The search objects could not be found due to an error that occurred in the Tivoli Workload

Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0180E The selected engine is not available because of the following engine error:"engine_error_message_ID"

Explanation: The selected engine is not available due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0181E The view cannot be attached for the following reason:"reason"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: The selected view probably has a pending dialog. Close the dialog before attaching the view.

AWSUI0182E The workstation plan view cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The workstation plan view could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0183E The job output cannot be loaded. The job output uses an unsupported encoding. Reason: "reason"

Explanation: The job output could not be loaded because it uses an unsupported encoding.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI0185E The common plan view for "VALUE_1" cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The plan view could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:
com.tivoli.jsc.commonviews.JsCommonPlanNavigator method runQuery()

AWSUI0186E The selected engine is not available. There might be a connection problem or it might have a version that is not valid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Verify the connection for the selected engine and make sure that the version is compatible. If necessary upgrade the engine or the console. Then try the action again.

AWSUI0188E The job "job_name" cannot be updated because of the following engine error:"engine_error_message_ID"

Explanation: The job could not be updated due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0193E The list "list_name" cannot be created because a list with the same name and the same path already exists.The panel cannot be closed.

Explanation: Two lists cannot be created with the same name in the same path.

System action: The requested operation is not performed.

Operator response: Supply a new list name. Retry the operation.

AWSUI0194E The job stream name cannot be found. The name specified might be an alias for the original job stream name. Ensure you have specified the original job stream name defined in the Tivoli Workload Scheduler database.

Explanation: The job stream was not found.

System action: The requested operation is not performed.

Operator response: Supply different filter criteria and run the list again.

AWSUI0196E The window cannot be closed.You cannot create the list "list_name" because a list with the same name and the same path already exists.

Explanation: Two lists cannot be created with the same name in the same path.

System action: The requested operation is not performed.

Operator response: Supply a new list name.

AWSUI0197W The number format is not correct.

Explanation: The number format is not correct. The value remains unchanged.

System action: The requested operation is not performed.

Operator response: Supply a new number in the correct format. Retry the operation.

AWSUI0199E The workstation definition for "workstation_name" cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The workstation definition could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0200E The resource availability definition cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The resource availability definition could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0201E The job stream list cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The job stream list could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0202E The plan view cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The plan view could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0203E The resource list cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The resource list could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0204E The workstation plan view cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The workstation plan view could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0205E The workstation list cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The workstation list could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0206E The resource "resource_name" cannot be saved because of the following engine error:"engine_error_message_ID"

Explanation: The resource could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0207E The resource availability definition for "resource_name" cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The resource availability definition could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0208E The resource instance for "resource_name" cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The resource instance could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0209E The internal class name: "class_name" is not fully qualified.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a fully qualified class name.

AWSUI0210E The date format is incorrect. The date must be in the same format as the locale settings of the computer.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply the date, month, and year in the format specified in the locale settings on the computer. Retry the operation.

AWSUI0211E The supplied deadline occurs before the start time. Supply a later deadline.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a deadline that is later than the start time. Retry the operation.

AWSUI0225E The operation cannot be performed on this job instance.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select another instance on which to perform the operation, or another operation to perform on the selected instance.

AWSUI0226E The specified calendar cannot be found.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check that you have identified the required calendar correctly. Specify another calendar or create the required calendar.

AWSUI0235E The input field is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Complete all mandatory fields. Mandatory fields are indicated by an asterisk after the field name, and a yellow background to the data input area. Retry the operation.

AWSUI0236E The value exceeds the maximum length of "maximum_length" characters (Single Byte Character Set).

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a value with a number of characters that is less than or equal to the allowed maximum length. Retry the operation.

AWSUI0237E The value is less than the minimum length of "minimum_length" characters (Single Byte Character Set).

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a value with a number of characters that is greater than the minimum length. Retry the operation.

AWSUI0238E The Node is incorrect. Supply a valid IP address (in the format 999.999.999.999) or a valid node name (in the format: <server>.<domain>).

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid IP address (in the format 999.999.999.999) or a valid node name (in the format: <server>.<domain>). Retry the operation.

AWSUI0239E The string contains one or more characters that are not alphanumeric.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a string using alphanumeric characters only. Retry the operation.

AWSUI0240E An internal application error has occurred in the job stream editor.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI0242E A runtime exception has been given by the JSDefaultRunCyclePlugIn.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI0243E The Job Stream Editor cannot be opened because of the following engine error:"engine_error_message_ID"

Explanation: The Job Stream Editor could not be opened due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0245E A job stream must contain at least one job before it can be saved.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Define at least one job before saving the job stream.

AWSUI0246E The necessary localization resources were not found.

Explanation: The resources necessary to show the localized version were not found.

System action: Processing continues but the dialogs are shown without messages.

Operator response: Contact IBM Software Support for assistance.

AWSUI0247E The string is not valid because it is not a numeric value.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a numeric string. Retry the operation.

AWSUI0248E The input is outside the accepted range of "minimum_value" to "maximum_value".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a value within the accepted range. Retry the operation.

AWSUI0253E The resource editor cannot be opened because of the following engine error:"engine_error_message_ID"

Explanation: The resource editor could not be opened due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0254E The resource name has not been supplied.

Explanation: The resource name is a mandatory field.

System action: The requested operation is not performed.

Operator response: Supply a name for the resource. Retry the operation.

AWSUI0259E The time format is not correct. The correct format is "format".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply the time in the correct format. Retry the operation.

AWSUI0260E The Job Scheduler Explorer Console must run within the Tivoli Console.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI0261E There was an unexpected error while updating. Repeat the operation.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Retry the operation.

AWSUI0262W The job stream contains unlinked external dependencies. These will not be saved.Do you want to proceed?

AWSUI0263E The Time Zone value "non_valid_time_zone_value" is not a valid Time Zone.

Explanation: See message text.

System action: Processing continues.

Operator response: Contact IBM Software Support for assistance.

AWSUI0264E The Workstation name has not been supplied.

Explanation: The Workstation name is a mandatory field.

System action: The requested operation is not performed.

Operator response: Supply a Workstation name. Retry the operation.

AWSUI0266E This file cannot contain blanks.

Explanation: The blank character is not a valid character.

System action: The requested operation is not performed.

Operator response: Supply the string again without using the blank character. Retry the operation.

AWSUI0267E The rule is not valid. Ensure that the shift origin field is consistent with the periods selected.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Ensure that all rule details are correct. Supply an inclusive shift origin value in the periods selected. Retry the operation.

AWSUI0269E The Duration of the job instance cannot be zero.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Set the Duration of the job instance to a value other than zero. Retry the operation.

AWSUI0276E The From Date or Time value is later than the To Date or Time value. Enter an earlier From Date or Time value, or a later To Date or Time value.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply an earlier From Date, or type a later To Date. Retry the query.

AWSUI0277E The query does not return any results because the Date filter is not set correctly. In the Dates section, when you set a value for the Date field you must also set a value for the Time field.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Set filter values for both the Date and the Time fields, or do not set values for either. Retry the query.

AWSUI0278E The query does not return any results because the Date filter is not set correctly. In the Dates section, when a value is set for the Time field a value must also be set for the Date field.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Set filter values for both the Date and the Time fields, or do not set values for either. Retry the query.

AWSUI0279E An engine with the specified name already exists.

Explanation: Two engines with the same name cannot exist for the same instance of the Tivoli Dynamic Workload Console.

System action: The requested operation is not performed.

Operator response: Supply a different engine name.

AWSUI0281E The host name could not be resolved, or the host computer is not running, or not accessible in the network.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the host name and make sure the computer where the host is running is active and accessible in the network (try pinging the host using the host name you supplied). Retry the operation.

AWSUI0283E The object "object_name" cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The object could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0286E A run cycle with the same name already exists in the job stream.

Explanation: Two run cycles with the same name cannot exist for the same job stream.

System action: The requested operation is not performed.

Operator response: Supply a different name for the new run cycle. Retry the operation.

AWSUI0289E The input value is greater than the upper limit of "maximum_value".

Explanation: The value must be less than or equal to 31/12/2999 23:59:59.

System action: The requested operation is not performed.

Operator response: Supply a value that is within the limit. Retry the operation.

AWSUI0291E The job stream "job_stream_name" cannot be submitted because of the following engine error:"engine_error_message_ID"

Explanation: The job stream could not be submitted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0292E Unable to add a dependency to the selected object.

Explanation:

System action:

Operator response:

AWSUI0293E Unable to add the dependency from "VALUE_0" to "VALUE_1" Reason: "VALUE_2"

Explanation:

System action:

Operator response:

AWSUI0294E Cannot find the specified internal job.

Explanation: A job that belongs to this job stream cannot be found. Perhaps it has been deleted.

System action: The requested operation is not performed.

Operator response: Check whether the job exists in the database. If it does not, remove the job from the job stream.

AWSUI0295E A job cannot depend on itself.

Explanation: You have defined a dependency so that job A depends on job B, but jobs A and B are the same.

System action: The requested operation is not performed.

Operator response: Change the dependency to a job other than itself. Retry the operation.

AWSUI0296E Cannot find the specified external dependency.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Ensure that the object of an external dependency exists before setting the dependency. Retry the operation.

AWSUI0297E Cannot find the specified job definition.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply the job name of an existing job definition.

AWSUI0298E Cannot write file "file_name". Reason: "system_error_message".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the reason given in the *system_error_message*. Resolve the problem. If you

cannot determine the problem from the error message, check that there is sufficient space to write the file, and that the user using the console has permission to write in the indicated directory. Retry the operation.

AWSUI0299E Cannot open file "file_name". Reason: "system_error_message".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the reason given in the *system_error_message*. Resolve the problem. If you cannot determine the problem from the error message, check that there is sufficient space to write the file, and that the user using the console has permission to write in the indicated directory. Retry the operation.

AWSUI0300E The file "file_name" does not exist.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: If the file exists but with a different name, rename it to the expected name. Retry the operation.

AWSUI0302E A job stream cannot contain two jobs with the same name.

Explanation: You have tried to add a job to a job stream, but the job stream already contains a job with the same name.

System action: The requested operation is not performed.

Operator response: Resolve why you wanted to add two jobs with the same name. If you want to perform the same job twice within a job stream, consult the Tivoli Workload Scheduler documentation for information on how to do this. Correct the data and retry the operation.

AWSUI0303E The same dependency cannot be defined twice in the same job stream.

Explanation: A dependency between job streams must be unique.

System action: The requested operation is not performed.

Operator response: Modify one or both dependencies to make them unique. Retry the operation.

AWSUI0304E A run cycle with the same name already exists in the Job Stream.

Explanation: Run cycle names in job streams must be unique.

System action: The requested operation is not performed.

Operator response: Modify one or both run cycles to make their names unique. Retry the operation.

AWSUI0305E Cannot logon to the remote server.

Explanation: The remote server is not reachable.

System action: The requested operation is not performed.

Operator response: Check the validity of the user name and password. Check if the connection with the remote server is available. Check if the remote server is started. Retry the operation.

AWSUI0306E The name is not valid. The initial character must be a letter, while subsequent characters can be mixed alphanumeric including "permitted_special_characters" but no blank characters are allowed.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a name that conforms to the indicated naming rules.

AWSUI0307E The query name is not valid. The initial character must be a letter or a wildcard, while subsequent characters can be mixed alphanumeric including wildcards and "permitted_special_characters"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a name that conforms to the indicated naming rules.

AWSUI0311E The job output of job "job_name" cannot be loaded because of the following engine error:"engine_error_message_ID"

Explanation: The job output could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0312E The name is not valid. It must be alphanumeric including "permitted_special_characters".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid value using only the permitted characters. Retry the operation.

AWSUI0313E No value has been entered in the workstation field. If the job definition is specified, the workstation field is mandatory.

Explanation: To rerun a job you have to specify either both the job definition and workstation, or neither of them (in this case, the original job definition and workstation will be used).

System action: The requested operation is not performed.

Operator response: Specify the workstation or clear the job definition field. Retry the operation.

AWSUI0314E No value has been entered in the job definition field. If the workstation is specified, the job definition field is mandatory.

Explanation: To rerun a job you have to specify either both the job definition and workstation, or neither of them (in this case, the original job definition and workstation will be used).

System action: The requested operation is not performed.

Operator response: Specify the job definition or clear the workstation field. Retry the operation.

AWSUI0315E The name is not valid. The initial character must be a letter, a wildcard, or a national character, subsequent characters can be mixed alphanumeric including wildcards and national characters.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid value using only the permitted characters. Retry the operation.

AWSUI0316E The name is not valid. The initial character must be a letter or "permitted_initial_characters", subsequent characters can be mixed alphanumeric including "permitted_special_characters".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid value using only the permitted characters. Retry the operation.

AWSUI0317E The string must be alphanumeric including "permitted_special_characters".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid value using only the permitted characters. Retry the operation.

AWSUI0318E The field is mandatory - the value cannot be blank.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid value for this mandatory field. Retry the operation.

AWSUI0319E An incorrect value has been supplied. The value must be an integer (whole number).

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply an integer for this value. Retry the operation.

AWSUI0324E At least one of the following fields "field_list" must be completed.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Fill at least one of the fields indicated in the error message. Retry the operation.

AWSUI0325E You must specify a value for the following field(s): "fields_name".

Explanation: See message text.

System action: The requested operation is not performed.c

Operator response: Supply a valid value for the mandatory field(s). Retry the operation.

AWSUI0326E The object cannot be found.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check and correct the object name or specify another object. Retry the operation.

AWSUI0327E The input value cannot contain only "VALUE_0" character or characters.

Explanation: A string containing less than the indicated minimum characters has been entered.

System action: The requested operation is not performed.

Operator response: Enter a valid value of more than the indicated minimum characters. Retry the operation.

AWSUI0329E The dependency cannot be created because it creates a circular dependency. Define a valid dependency.

Explanation: In job A you have defined a dependency on job B, but job B is dependent, directly or indirectly, on job A.

System action: The requested operation is not performed.

Operator response: Define a valid dependency that does not create a circular dependency. Retry the operation.

AWSUI0330E The "field_name" field is mandatory for internal dependencies.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid value for this mandatory field. Retry the operation.

AWSUI0331E . The SQL query could not be validated. The database internal message is:"database_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI0333E At least one Status must be specified.

Explanation: For the requested operation at least one Status value must be supplied.

System action: The requested operation is not performed.

Operator response: Supply at least one Status value. Retry the operation.

AWSUI0334E The CSV separator must be specified.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply the CSV separator. Retry the operation.

AWSUI0335E The Query SQL statement field is mandatory for the Custom SQL Report.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply the Query SQL statement field. Retry the operation.

AWSUI0336E The connection to the database failed.Check that the database is available and the connection parameters are correct, and retry.

Explanation: The connection to the database could not be established because the database is not active or the connection parameters set in the engine connection are not correct.

System action: The requested operation is not performed.

Operator response: Verify that the database is up and running and the connection parameters set in the engine connection are correct. Retry the operation.

AWSUI0337E The supplied To time is earlier than the From time. Supply an earlier From time, or a later To time.

Explanation: The query does not return any results because the From time is later than the To time.

System action: The requested operation is not performed.

Operator response: Supply an earlier From time, or a

later To time. Retry the query.

AWSUI0338E The selected date already exists in the list.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a different date. Retry the query.

AWSUI0339E The list can contain a maximum of "maximum_number" items.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Review the items in the list and reduce the number of them until it is not more than the indicated maximum. Retry the query.

AWSUI0340E At least one date must be included in the Specific Dates list.

Explanation: The query does not return any results because the Specific Dates list is empty.

System action: The requested operation is not performed.

Operator response: Add at least one date to the Specific Dates list. Retry the query.

AWSUI0341E The CSV separator field cannot contain any of the following "non_valid_separator_characters".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid value using only the permitted characters. Retry the operation.

AWSUI0342E You have clicked Delete without selecting a specific date.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select one or more dates from the Specific Dates list to delete. Click Delete again.

AWSUI0343E The specific dates list is empty. There is nothing to delete.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: You cannot delete a specific date unless it is in the list and has been selected.

AWSUI0344E The validate command cannot be performed on an Ask when Needed Engine.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Choose an engine in the "Enter Task Information" panel.

AWSUI0346E Database failure. Check the database is available and the connection parameters are correct and retry:database user: "database_user_name", database JDBC URL: "database_JDBC_URL".If the problem persists contact the Tivoli Workload Scheduler administrator.The database internal message is: "database_internal_message"

Explanation: The database might not be available or the parameters specified for the database configuration are not correct.

System action: The requested operation is not performed.

Operator response: Check the database credentials, if the problem persists, contact the Tivoli Workload Scheduler administrator.

AWSUI0347E The reporting feature in the database configuration is not enabled for the selected engine.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enable the reporting feature in the database configuration for the selected engine, or select a different engine where the reporting feature is enabled. Retry the operation.

AWSUI0358E The output limit must be a positive value. The maximum allowed value is:"maximum_value".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid output limit value. Retry the operation.

AWSUI0359W The new engine supports a different set of actions and event types. The previous list of selected actions and event types has been reset.

Explanation: The list of available actions and event types in the event rule task that you are editing depends on the engine specified.

The engine has been modified and the new engine supports a different set of actions and event types.

System action: The engine has been changed as requested and the list of selected actions and event types has been reset.

Operator response: Edit your event rule definition specifying a new list of actions and event types. Retry the operation.

AWSUI0360E The JDBC URL is not configured on the selected engine, so the reporting capabilities cannot be used. Contact the Tivoli Workload Scheduler administrator.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Ask the Tivoli Workload Scheduler administrator to configure the JDBC URL on the selected engine. Retry the operation.

AWSUI0361E The field must be a positive value. The minimum permitted value is:"minimum_value".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Change the input value to a positive value, greater than the indicated minimum.

AWSUI0370E This command cannot be performed on an Ask when Needed Engine.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Choose an engine in the "Enter Task Information" panel.

AWSUI0371W These event rules are already in the draft status and no action is performed on them.

Explanation: You have tried to modify the status of the event rules to be "draft", but they are already in "draft" status.

System action: The requested operation is not performed.

Operator response: None

AWSUI0372W These event rules are already in the complete status and no action is performed on them.

Explanation: You have tried to modify the status of the event rules to be "complete", but they are already in "complete" status.

System action: The requested operation is not performed.

Operator response: None

AWSUI0374E Unable to retrieve data for this engine.

Explanation: The dashboard was unable to retrieve data from this engine.

System action: The dashboard will try again at the next scheduled dashboard refresh.

Operator response: Make sure the engine is reachable and properly configured. Check log files for details.

AWSUI0376E The number of days must be a positive number not greater than:
"maximum_number_of_days"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the value for the number of days and retry the operation.

AWSUI0500E The version of the scheduler engine "engine_name" is not supported.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Choose a scheduler engine that is a supported version, and retry the operation.

AWSUI0501E The availability interval cannot be defined because the From priority is greater than the To priority.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a To priority greater than the From priority and retry the operation.

AWSUI0503E The job definition name is mandatory but has not been supplied.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid job definition name and all the other mandatory fields in the panel and retry the operation.

AWSUI0504E The number of scheduled dependencies exceeds the maximum number allowed.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Reduce the number of scheduled dependencies to less than the maximum and retry the operation.

AWSUI0505E This job cannot be added the selected job stream because a job with the same name is already present, and two jobs with the same name in one job stream are not allowed.

Explanation: See message text. You might have tried to add the same job twice.

System action: The requested operation is not performed.

Operator response: If you want to add this job to the selected job stream, modify the name of the job to make it unique, and retry the operation.

AWSUI0506E You cannot define the same dependency twice in the same job.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Determine why you are trying to define the same dependency twice. If you accidentally tried to create the same dependency twice, take to further action. Otherwise, modify a dependency in the

job stream and retry the operation.

AWSUI0507E A job stream cannot have a follows dependency from one of its own jobs.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Delete the dependency and retry the operation.

AWSUI0508E A job stream cannot have itself as a dependency.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Delete the dependency and retry the operation.

AWSUI0509E The same dependency cannot be defined twice in the same job stream.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Modify the dependencies in the job stream to make them unique and retry the operation.

AWSUI0510E Resource dependencies can be defined at job stream level or job level, but not both.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Delete one of the resource dependencies at job level or job stream level and retry the operation.

AWSUI0511E The Submit into job stream workstation name is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid job stream workstation name and all the other mandatory fields present in the panel and retry the operation.

AWSUI0512E The workstation name is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid workstation name and all the other mandatory fields present in the panel and retry the operation.

AWSUI0513E The script field is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid script and all the other mandatory fields present in the panel and retry the operation.

AWSUI0514E The command field is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid command and all the other mandatory fields present in the panel and retry the operation.

AWSUI0515E The parameter in the task string is not valid. The caret (^) character must precede the first letter and follow the last letter of a valid parameter name.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enclose the parameter name between caret (^) characters and retry the operation.

AWSUI0516E The job file field is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid job file and all the other mandatory fields present in the panel and retry the operation.

AWSUI0517E The login field is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid login and all the

other mandatory fields present in the panel and retry the operation.

AWSUI0518E The workstation class name is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid workstation class name and all the other mandatory fields present in the panel and retry the operation.

AWSUI0519E The supplied workstation class must contain at least one workstation, or a wildcard must be used.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid workstation class or use a wildcard and retry the operation.

AWSUI0520E The parameter name is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid parameter name and all the other mandatory fields present in the panel and retry the operation.

AWSUI0521E The prompt name is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid prompt name and all the other mandatory fields present in the panel and retry the operation.

AWSUI0522E The domain manager name is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid domain manager name and all the other mandatory fields present in the panel and retry the operation.

AWSUI0523E The domain name is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid domain name and all the other mandatory fields present in the panel and retry the operation.

AWSUI0524E The calendar name is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid calendar name and all the other mandatory fields present in the panel and retry the operation.

AWSUI0525E At least one day must be defined for a calendar.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply at least one day for the calendar and retry the operation.

AWSUI0526E The R/3 job information is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply the R/3 job information and all the other mandatory fields present in the panel and retry the operation.

AWSUI0527E A job stream must be selected in the list.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select a job stream in the list and retry the operation.

AWSUI0528E A job must be selected in the list.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select a job from the list and retry the operation.

AWSUI0529E The SAP job on the task panel was not selected for this workstation. Select a new SAP job on the task panel, or change the workstation to the workstation the SAP job is defined on.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select a new SAP Job on the task panel, or change the workstation to the workstation the SAP job is defined on and retry the operation.

AWSUI0530E Unable to validate the r3batch workstation because it is not in the plan, or the connection with the r3batch system has failed.

Explanation: It is not possible to establish a connection with the R/3 system.

System action: The requested operation is not performed.

Operator response: Wait for the R/3 system to become available and try again.

AWSUI0531E The job definition cannot be saved. Reason: "engine_error_message"

Explanation: The job definition could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0532E The job definition cannot be retrieved. Reason: "engine_error_message"

Explanation: The job definition could not be retrieved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0533E The job definition list cannot be loaded. Reason: "engine_error_message"

Explanation: The job definition list could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0534E The job definition cannot be deleted. Reason: "engine_error_message"

Explanation: The job definition could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0535E A new job definition cannot be created. The task type is unknown for job "job_name". Edit the properties for this job and select a new task type and workstation.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Edit the properties for this job and select a new task type and workstation and retry the operation.

AWSUI0536E Multiple job definitions cannot be deleted. Reason: "engine_error_message"

Explanation: The job definitions could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0537E The workstation classes cannot be loaded. Reason: "engine_error_message"

Explanation: The workstation classes could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0538W The workstation class cannot be loaded. Reason: "engine_error_message"

Explanation: The workstation class could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0539E Multiple workstation classes cannot be deleted. Reason: "engine_error_message"

Explanation: The multiple workstation classes could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0540E The workstation class cannot be saved. Reason: "engine_error_message"

Explanation: The workstation class could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0541E The workstation class cannot be deleted. Reason: "engine_error_message"

Explanation: The workstation class could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0542E The user list cannot be loaded. Reason: "engine_error_message"

Explanation: The user list could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0543E The user cannot be deleted. Reason: "engine_error_message"

Explanation: The user could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0544E The selected users cannot be deleted.
Reason: "engine_error_message"

Explanation: The selected user list could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0545W The user cannot be retrieved. Reason:
"engine_error_message"

Explanation: The user could not be retrieved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0546E The user cannot be saved. Reason:
"engine_error_message"

Explanation: The user could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0547E The user instance cannot be saved.
Reason: "engine_error_message"

Explanation: The user instance could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0548E The parameters cannot be loaded.
Reason: "engine_error_message"

Explanation: The parameters could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0549W The parameter cannot be retrieved.
Reason: "engine_error_message"

Explanation: The parameter could not be retrieved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0550E The multiple parameters cannot be deleted. Reason: "engine_error_message"

Explanation: The multiple parameters could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0551E The parameter cannot be saved.
Reason: "engine_error_message"

Explanation: The parameter could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0552E The parameter cannot be deleted.
Reason: "engine_error_message"

Explanation: The parameter could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0553E The prompts cannot be loaded. Reason:
"engine_error_message"

Explanation: The prompts could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0554W The prompt cannot be retrieved.
Reason: "engine_error_message"

Explanation: The prompt could not be retrieved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0555E The multiple prompts cannot be deleted. Reason: "engine_error_message"

Explanation: The multiple prompts could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0556E The prompt cannot be saved. Reason: "engine_error_message"

Explanation: The prompt could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0557E The prompt cannot be deleted. Reason: "engine_error_message"

Explanation: The prompt could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0558E The calendars cannot be loaded. Reason: "engine_error_message"

Explanation: The calendars could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0559W The calendar cannot be retrieved. Reason: "engine_error_message"

Explanation: The calendar could not be retrieved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0560E The multiple calendars cannot be deleted. Reason: "engine_error_message"

Explanation: The multiple calendars could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0561E The calendar cannot be saved. Reason: "engine_error_message"

Explanation: The calendar could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0562E The calendar cannot be deleted. Reason: "engine_error_message"

Explanation: The calendar could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0563E The domains cannot be loaded. Reason: "engine_error_message"

Explanation: The domains could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0564W The domain cannot be retrieved.
Reason: "engine_error_message"

Explanation: The domain could not be retrieved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0565E The multiple domains cannot be deleted. Reason: "engine_error_message"

Explanation: The multiple domains could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0566E The domain cannot be saved. Reason: "engine_error_message"

Explanation: The domain could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0567E The domain cannot be deleted. Reason: "engine_error_message"

Explanation: The domain could not be deleted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0568E The selected prompt "prompt_name" cannot be replied to. Reason: "engine_error_message"

Explanation: The selected prompt could not be replied to due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0569E The selected multiple prompts "list_of_prompts" cannot be replied to. Reason: "engine_error_message"

Explanation: The selected multiple prompts could not be replied to due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0570E The link action for the domain "domain_name" cannot be performed. Reason: "engine_error_message"

Explanation: The link action for selected domain could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0571E The link action for the domains "domain_names" cannot be performed. Reason: "engine_error_message"

Explanation: The link action for the selected domains cannot be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0572E The unlink action for the domain "domain_name" cannot be performed. Reason: "engine_error_message"

Explanation: The unlink action for the selected domain could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0573E The unlink action for the domains "domain_names" cannot be performed. Reason: "engine_error_message"

Explanation: The unlink action for the selected

domains could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0574E Some of the start actions for the domain"domain_name" were not completed. Reason: "engine_error_message"

Explanation: Some of the start actions were not completed for the domain due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0575E The start action for the domains"domain_names" cannot be performed. Reason: "engine_error_message"

Explanation: The start action for the selected domains cannot be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0576E Some of the stop actions for the domain"domain_name"were not completed. Reason: "engine_error_message"

Explanation: Some of the stop actions were not completed for selected domain due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0577E The stop action for the domains"domain_names" cannot be performed. Reason: "engine_error_message"

Explanation: The stop action for the selected domains could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0578E The manager for the domains"domain_names" cannot be switched. Reason: "engine_error_message"

Explanation: The manager for the selected domains could not be switched due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0579E There is an internal calendar error.An unanticipated condition was encountered during the last operation:"internal_error_condition"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select another calendar and retry the operation. If the problem persists, contact IBM Software Support for assistance.

AWSUI0580E A calendar name is required for all calendars. There is at least one calendar that has not been assigned a name.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Make sure that all the calendars have a name defined and retry the operation.

AWSUI0581E There are no days selected in the calendar. At least one day must be defined for every calendar.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply at least one day for the calendar and retry the operation.

AWSUI0582E No check boxes are selected. At least one check box must be selected in the rule panel.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one check box from the rule panel and retry the operation.

AWSUI0583E The password and confirmation password do not coincide. Enter the passwords again.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply the password and confirmation password again, making sure they are identical and retry the operation.

AWSUI0584E Passwords cannot exceed "maximum_characters" characters.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a password with a number of characters that is less than or equal to the maximum length and retry the operation.

AWSUI0585E A problem occurred during password encryption.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Retry the operation.

AWSUI0586E Workstation name is a required field.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid Workstation Name and all the other mandatory fields present in the panel and retry the operation.

AWSUI0587E The file name must include a fully qualified path.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a fully qualified valid file name (path and file name) and retry the operation.

AWSUI0589E All dependencies for job scheduling objects in the database that include this workstation name are also updated.

Explanation: A workstation class might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new name.

System action: If OK is clicked the workstation class is renamed. Otherwise the rename action is ignored.

Operator response: Click OK to rename the workstation class or click Cancel to cancel the rename action and retry the operation.

AWSUI0592E The prompt might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new name.

Explanation: The prompt might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new name.

System action: If OK is clicked the prompt is renamed. Otherwise the rename action is ignored.

Operator response: Click OK to rename the prompt or click Cancel to cancel the rename action and retry the operation.

AWSUI0595E The parameter might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new name.

Explanation: The parameter might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new name.

System action: If OK is clicked the parameter is renamed. Otherwise the rename action is ignored.

Operator response: Click OK to rename the parameter or click Cancel to cancel the rename action and retry the operation.

AWSUI0596E One or more errors occurred while the job list was being loaded."error_messages"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Retry the operation.

AWSUI0598W See the error.log file for details.

Explanation: An error has occurred. See the error.log file for details.

System action: Processing continues.

Operator response: See the error.log file for details. If you can resolve the problem, do so. Retry the operation. If you cannot resolve the problem, or the problem persists, contact IBM Software Support for assistance.

AWSUI0600E The calendar might be part of a run cycle for a scheduler object in the database. If so, the run cycle is also updated with the new name.

Explanation: The calendar might be part of a run cycle for a scheduler object in the database. If so, the run cycle is also updated with the new name.

System action: If OK is clicked the calendar is renamed. Otherwise the rename action is ignored.

Operator response: Click OK to rename the calendar or click Cancel to cancel the rename action and retry the operation.

AWSUI0602E This domain might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new name.

Explanation: A domain might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new name.

System action: If OK is clicked, the domain is renamed. Otherwise the rename action is ignored.

Operator response:

AWSUI0604W This job might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new workstation data.

Explanation: This job might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new workstation data.

System action: If OK is clicked the workstation is modified. Otherwise the request is ignored.

Operator response: Click OK to modify the workstation, or click Cancel to cancel the modification request and retry the operation.

AWSUI0605E This job might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new workstation data.

Explanation: This job might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new workstation data.

System action: If OK is clicked the workstation is modified. Otherwise the request is ignored.

Operator response: Click OK to modify the workstation, or click Cancel to cancel the modify request and retry the operation.

AWSUI0606W This resource might be a dependency for a job scheduling object. If so, the dependency is also updated with the new workstation data.

Explanation: This resource might be a dependency for a job scheduling object. If so, the dependency is also updated with the new workstation data.

System action: If OK is clicked the workstation is modified. Otherwise the request is ignored.

Operator response: Click OK to modify the workstation, or click Cancel to cancel the modify request and retry the operation.

AWSUI0607W This job stream might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new workstation data.

Explanation: This job stream might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new workstation data.

System action: If OK is clicked the workstation is modified. Otherwise the request is ignored.

Operator response: Click OK to modify the workstation, or click Cancel to cancel the modify request and retry the operation.

AWSUI0608E This job might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new job name.

Explanation: This job might be part of a dependency for a job scheduling object in the database. If so, the dependency is also updated with the new job name.

System action: If OK is clicked the job is renamed. Otherwise the rename request is ignored.

Operator response: Click OK to rename the job, or click Cancel to cancel the rename request and retry the operation.

AWSUI0609E The parameter format for the login string is not valid. The caret (^) character must precede the first letter and follow the last letter of a parameter name.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enclose the parameter name in caret (^) characters and retry the operation.

AWSUI0610E The user login format for the MPE job is not valid. The user login must have the following format: [<user>]. [<account>]<,group> where each section can have a maximum of eight characters.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply the user login in the following format: [<user>]. [<account>]<,group>, where each section can have a maximum of eight characters, and retry the operation.

AWSUI0611E The Details field is mandatory."VALUE_0"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid Details field and all the other mandatory fields presents in the panel and retry the operation.

AWSUI0612E The Time restrictions field contains a character that is not valid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid Time restriction and all the other mandatory fields presents in the panel and retry the operation.

AWSUI0613E The Repeat every field contains a character that is not valid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid "Repeat every" field and all the other mandatory fields in the panel and retry the operation.

AWSUI0614E In the Day of Month section, the start year must precede the end year.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a start year that precedes the end year and retry the operation.

AWSUI0615E In the Day of Month section, the start month must precede the end month.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a start month that precedes the end month and retry the operation.

AWSUI0616W The Job name field is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid Job name and all the other mandatory fields in the panel and retry the operation.

AWSUI0617E The Network agent field is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid Network agent and all the other mandatory fields in the panel and retry the operation.

AWSUI0618E The dependency value has exceeded the maximum field length.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a dependency value with the number of characters less than or equal to the

maximum field length and retry the operation.

AWSUI0619E If the dependency value begins with a quote character it must end with a quote character.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Make sure that if the dependency field begins with a quote character it also ends with one, and retry the operation.

AWSUI0620E There are too many quote characters in the dependency field.

Explanation: The dependency field can be enclosed in quote characters, but there can only be two - at the beginning and the end. At least one more has been found.

System action: The requested operation is not performed.

Operator response: Make sure that if the dependency field begins with a quote character it also ends with one, with no other quote characters in the field, and retry the operation.

AWSUI0621E The dependency contains a workstation name that is not valid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the workstation name in the dependency field and retry the operation.

AWSUI0622E This dependency contains a job stream name that is not valid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the job stream name in the dependency field and retry the operation.

AWSUI0623E This dependency contains a job name that is not valid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the job name in the dependency field and retry the operation.

AWSUI0624E The successors for the job stream cannot be retrieved. Reason: "engine_error_message"

Explanation: The successor for the job stream could not be retrieved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0625E The successors of the job cannot be retrieved. Reason: "engine_error_message"

Explanation: The successors for the job could not be retrieved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0626E The job or job stream cannot be submitted. Reason: "engine_error_message"

Explanation: The job or job stream could not be submitted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0627E The time zone field is required for the master domain manager when time zones are enabled.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid time zone for the master domain manager and retry the operation.

AWSUI0628W There is a Modify step error. Reason: "engine_error_message"

Explanation: There is a Modify step error due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0630E The specified workstation, job name, or both, were not found.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid workstation, job name, or both, and retry the operation.

AWSUI0631E The SAP job definition cannot be saved. Reason: "engine_error_message"

Explanation: The SAP job definition could not be saved due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0633E The SAP job definition cannot be renamed. This is not valid for a modify operation.

Explanation: The SAP job definition could not be renamed.

System action: The requested action is not completed successfully.

Operator response: Click Save and Close to rename the job. Otherwise, enter the original job name and click Modify and Close to modify the job and retry the operation.

AWSUI0634E The file plan view cannot be loaded. Reason: "engine_error_message"

Explanation: The file plan view could not be loaded due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0635E The job output could not be loaded because it uses an unsupported encoding.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI0636W The deadline is not later than the start time. Do you want to proceed?

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: The deadline must be greater than the start time, or one of the two must be set as blank. Retry the operation.

AWSUI0637E The specified workstation or job stream name, or both, were not found.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid workstation name or job stream name, or both, and retry the operation.

AWSUI0638E There is not enough memory to complete this action successfully.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Try closing other applications to free up memory. Retry the operation. If the problem persists you might need to reboot the workstation where you are running the console.

AWSUI0639E The specified calendar does not exist.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify another calendar and retry the operation.

AWSUI0640W The specified domain "domain_name" does not exist.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Click OK to continue, or click Cancel to specify a new domain and retry the operation.

AWSUI0641E The specified workstation was not found.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid workstation and retry the operation.

AWSUI0643E The specified recovery workstation and job name combination was not found.

Explanation: The workstation and job name combination specified as a recovery option was not found. Either the workstation, or the job name, or both are incorrect.

System action: The requested operation is not performed.

Operator response: Make sure that the specified workstation and specified job name exist and are typed correctly and retry the operation.

AWSUI0644E The recovery option job cannot have the same name as the job being defined.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a recovery option job name that is different from the job being defined and retry the operation.

AWSUI0645E A job stream cannot have a dependency on one of its jobs when the resolution criteria is other than Use default or Closest preceding.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Change the resolution criteria for the dependencies of the job stream jobs and retry the operation.

AWSUI0646E A job stream cannot have a dependency on itself when the resolution criteria is other than Use default or Closest preceding.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Change the resolution criteria for the dependencies of the job stream and retry the operation.

AWSUI0648E The parameter in the login string is not valid. The caret (^) character must precede the first letter and follow the last letter of a valid parameter name.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enclose the parameter name with caret (^) characters and retry the operation.

AWSUI0649E The resource "resource_name" does not exist.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Choose a resource that exists and retry the operation.

AWSUI0654E A job stream instance cannot have a dependency on itself or on its jobs.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Remove the job stream instance dependency on itself or on its jobs and retry the operation.

AWSUI0655E A job instance cannot have a dependency on itself or on its job stream instance.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Remove the job instance dependency on itself or on its job stream instance and retry the operation.

AWSUI0675W The changes will be saved unless you click 'Modify Step'. Do you want to proceed?

AWSUI0697W Reason: "engine_error_message"

Explanation: A problem has arisen due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0698W The start time is later than the latest start time. Do you want to proceed?

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply an earlier start time and retry the operation.

AWSUI0699W The latest start time is later than the deadline time. Do you want to proceed?

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply an earlier start time and retry the operation.

AWSUI0700W The parentheses in the return code expression "return_code_expression" are not correct. Each open parenthesis must match a corresponding closed parenthesis.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a correct return code expression and retry the operation.

AWSUI0701W The return code expression "return_code_expression" contains one or more operands that are not correct. Only greater than or less than operands can be used.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a correct return code expression using only boolean operators and retry the operation.

AWSUI0702W The return code expression "return_code_expression" is not valid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a correct return code expression and retry the operation.

AWSUI0703W The return code expression "return_code_expression" contains one or more operands that are not correct. Only greater than or less than operands can be used.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a correct return code expression using only boolean operators and retry the operation.

AWSUI0704W The plan cannot be submitted because an alternate plan was selected for the current engine. If an alternate plan is selected for an engine, its jobs or job streams cannot be submitted.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Restore the plan before submitting it and retry the operation.

AWSUI0705W The restore operation can be performed only if an alternate plan was previously selected for the current engine.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select an alternate plan before performing the restore operation and retry the operation.

AWSUI0707E The resource is not defined for the same workstation as the job. The job is hosted by workstation "workstation_name". The resource "resource_name" is hosted by workstation "workstation_name"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select a resource that is defined for the same workstation as the job and retry the operation.

AWSUI0708E The job output cannot be loaded because the STDLIST file is too large.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Remove some of the entries in the STDLIST file and retry the operation.

AWSUI0710W The user password cannot be changed because an alternate plan was selected for the selected engine.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Restore the plan and then change the user password.

AWSUI0713W The following external job dependencies do not exist: "external_job_dependencies".

Explanation: See message text.

System action: Processing continues.

Operator response: Make sure that all the specified dependencies are correctly defined before the job stream is run.

AWSUI0714W The following external job stream dependencies do not exist: "external_job_stream_dependencies".

Explanation: See message text.

System action: Processing continues.

Operator response: Make sure that all the specified dependencies are correctly defined before the job stream is run.

AWSUI0720E The job stream cannot be saved because either the resource "resource_name" does not exist, or the rights required to use it are not sufficient to use the resource.

Explanation: A dependency was specified on a resource that does not exist, or the rights of the specifying user are not sufficient to use the resource. The resource might have been removed from the database after the dependency was added.

System action: The requested operation is not performed.

Operator response: Remove the resource dependency. Create the resource and recreate the dependency and retry the operation.

AWSUI0721E The job stream cannot have an external dependency on a job defined in the same job stream.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select a different job stream from

the one where an external dependency is being defined and retry the operation.

AWSUI0722E A positive number of resource units must be specified.

Explanation: A negative or null number of units for the resource was specified.

System action: The requested operation is not performed.

Operator response: Modify the number of units for the specified resource to a positive value less than or equal to the number of units available and retry the operation.

AWSUI0723W An unrecognized time zone value for the date "date" was specified. Select a recognized time zone value, or no time zone is set for date "date".

Explanation: See message.

System action: Processing continues.

Operator response: Select a recognized time zone value, or leave the field blank and retry the operation.

AWSUI0724W An unrecognized time zone for the "VALUE_0" was specified. The time zone displayed is that specified for the master domain manager. Select a recognized time zone value or the master domain manager time zone value is used.

Explanation: See message.

System action: Processing continues.

Operator response: Select a recognized time zone value and retry the operation.

AWSUI0725E In the "section_name" section, the To Date is earlier than the From Date. Supply an earlier From Date, or type a later To Date.

Explanation: The query does not return any results because the From Date is later than the To Date.

System action: The requested operation is not performed.

Operator response: Supply an earlier From Date, or type a later To Date and retry the query.

AWSUI0726E In the "section_name" section, when a value for the Date field is set, a value for the Time field must also be set.

Explanation: The query does not return any results because the date filter is not set correctly.

System action: The requested operation is not performed.

Operator response: Set values for both Date and Time fields, or do not set values for either Date or Time fields and retry the query.

AWSUI0727E In the "section_name" section, when a value for the Time field is set, a value for the Date field must also be set.

Explanation: The query does not return any results because the date filter is not set correctly.

System action: The requested operation is not performed.

Operator response: Set values both for Time and Date fields, or do not set values for either Date or Time fields and retry the query.

AWSUI0728E The password for the user "Windows_user" cannot be changed.
Reason: "OS_error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Make sure that the specified user name, Windows domain and workstation correctly correspond to an existing user and retry the operation.

AWSUI0729E The object cannot be unlocked.
Reason: "OS_error_message"

Explanation: It is not possible to unlock the object. Some problem has been encountered during this operation.

System action: The requested operation is not performed.

Operator response: Refer to the reason indicated in the message to resolve the issue and retry the operation.

AWSUI0730W The value specified for the upper limit of the time interval is lower than the one specified for the lower limit.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Change one or both of the limits to give a valid interval and retry the operation.

AWSUI0731E The value specified for the validity interval end is lower than the one specified for the validity interval start.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Change one or both of the limits to give a valid interval and retry the operation.

AWSUI0732E The Start time must be defined for a time dependent job. "VALUE_0"

Explanation: When the job is a time dependent job it must have a start time defined.

System action: The requested operation is not performed.

Operator response: Define the Start time or unset the job as time independent and retry the operation.

AWSUI0733E The name specified for the Run cycle is not valid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a valid name for the Run cycle and retry the operation.

AWSUI0734E The Run cycle name is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a name for the Run cycle and retry the operation.

AWSUI0735E One or more jobs in the job stream are defined on a different workstation class than that of the job stream.

Explanation: If a job stream is defined in a workstation class, then all of its jobs must be defined either on a workstation, or in the same workstation class.

System action: The requested operation is not performed.

Operator response: Set the workstation of this job stream to the original value and retry the operation.

AWSUI0736W The value specified for the upper limit of the time interval is equal to the one specified for the lower limit.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Change one of the limits to define a valid interval and retry the operation.

AWSUI0737E The Run cycle cannot be saved because no days were selected in the list.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select one or more days in the list in order to specify the Run cycle frequency and retry the operation.

AWSUI0739E The Start date is later than the End date.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enter an End date that is later than the Start date or leave the End date blank. Retry the operation.

AWSUI0741E The Offset field value is not valid. It must be numeric.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid number of days in the Offset field and retry the operation.

AWSUI0742E The selected workstation must have Other as its operating system.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select another workstation that has Other as its operating system and retry the operation.

AWSUI0743E The prompt "prompt_name" does not exist.

Explanation: A dependency was specified on a prompt that does not exist. The prompt might have

been removed from the database after the dependency was added.

System action: The requested operation is not performed.

Operator response: Remove the prompt dependency. Create the prompt and recreate the dependency and retry the operation.

AWSUI0744E The job "job_name" cannot be submitted. Reason: "engine_error_message"

Explanation: The job could not be submitted due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0745E The Raise event did not complete successfully. Reason: "engine_error_message"

Explanation: It is not possible to raise the specified event due to an error in the Tivoli Workload Scheduler for Applications. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response: The reason displayed in the message text represents an error code reported by Tivoli Workload Scheduler for Applications. Resolve the error and retry the operation.

IBM Tivoli Workload Scheduler for Applications User's Guide for information about the error message.

AWSUI0746E The Raise event field is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid value in the Raise event field and retry the operation.

AWSUI0747E The Table criteria is in error. Reason: "engine_error_message"

Explanation: There is a problem with Table criteria due to an error in the Tivoli Workload Scheduler for Applications. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response: The reason displayed in the message text represents an error code reported by

Tivoli Workload Scheduler for Applications. Resolve the error and retry the operation.

IBM Tivoli Workload Scheduler for Applications User's Guide for information about the error message.

AWSUI0748E The requested action cannot be performed because it is supported from XBP level 2.0 and IBM Tivoli Workload Scheduler for Applications, version 8.2.1 - fix pack 1.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Choose another action, or upgrade to a supported level of XBP and retry the operation.

AWSUI0750E The specified plan cannot be generated. Reason: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Fix the problem indicated in the error message and retry the operation.

AWSUI0751E The newly generated plan cannot be used as an alternate plan. Reason: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Fix the problem indicated in the error message and retry the operation.

AWSUI0753W The job definition "VALUE_0" is being moved on the workstation class "VALUE_1", verify that job streams that are using the job definition are defined on the workstation class "VALUE_0". Do you want to continue?

Explanation: The selected job definition is used by one or more job streams. Verify that these job streams are defined on the same workstation class

System action: If OK is clicked, the job definition is saved. If cancel is clicked the save action is ignored.

Operator response: Click OK to submit or click Cancel to cancel the submit action and retry the operation.

AWSUI0754W The plan cannot be generated because an alternative plan was selected for the current engine.

Explanation: If an alternative plan is selected for an engine, neither a trial nor a forecast plan can be generated.

System action: The requested operation is not performed.

Operator response: Restore the plan before generating a new one.

AWSUI0762E A task with the same name already exists.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Change the name of the task. Retry the operation.

AWSUI0766E Test connection to ["engine"] : failed.

Explanation: The network might be down or the connection credentials might not be correct.

System action: The requested operation is not performed.

Operator response: Check the engine properties and the credentials specified. Correct any problem you find and retry the operation.

AWSUI0769E The operation cannot be performed on a task shared by another user.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: You can share your own tasks only. Create another task or duplicate the previous task and share it.

AWSUI0770E The duplicate task operation failed.

Explanation: See message text.

System action: The duplicate operation was not performed. No task was created.

Operator response: An internal problem prevents the task from being duplicated. Create the new task manually.

AWSUI0771E The tasks no longer exist. The operation failed on the following tasks:

Explanation: The task has been deleted, renamed, or unshared.

System action: The requested operation is not performed.

Operator response: Perform a refresh on the task list by reopening the task table.

AWSUI0772E A task with the same name already exists.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a different task name and retry the operation.

AWSUI0773E The permitted characters are mixed alphanumeric excluding (), wildcards, and "special_characters".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid value using only the permitted characters and retry the operation.

AWSUI0774E The From priority cannot be greater than the To priority on the "panel_name" panel.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a To priority greater than the From priority and retry the operation.

AWSUI0778E There has been an authentication failure: the user name or password is wrong.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the user name and password, correct any error, and try again.

AWSUI0779E There has been a communication failure: either the host is not available, or the address or the port (or both) are not correct.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check that the engine is available (try pinging it). Check the engine connection credentials. Retry the operation.

AWSUI0780E The connection has been refused: the engine is not available.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check with the Tivoli Workload Scheduler administrator that the engine is running. When the problem is fixed retry the operation.

AWSUI0782E The operation cannot be performed on the following shared engine (shared engine name follows):

Explanation: The selected engine has been shared by another user.

System action: The engine was not modified.

Operator response: Create another engine and share it.

AWSUI0783E The following engine no longer exists; it has been deleted or renamed (engine name follows):

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify another engine.

AWSUI0784E The specified action cannot be performed because no item has been selected.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one item from the list or table and retry the operation.

AWSUI0785E The specified action cannot be performed on multiple items.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Make sure only one item is selected in the list or table and retry the operation.

AWSUI0786E The specified action cannot be performed on the selected items.

Explanation: You tried to perform an action on multiple items, but some or all of the selected items do not support the specified action.

System action: The requested operation is not performed.

Operator response: Make sure that all the selected items are compatible with the specified action and retry the operation.

AWSUI0788E "number_of_non-compatible_items" out of the "total_items" items you have selected are not compatible with the action of type "action_type":

Explanation: You tried to perform an action on multiple items, but some of them do not support that action.

System action: The requested operation is not performed.

Operator response: Deselect the items not compatible with the action and retry the operation.

AWSUI0790E The operation could not be completed because an error has occurred while accessing the Symphony file.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the following:

- That the Symphony file has been generated
- That the Symphony file has the default name and location
- That the Symphony file is not locked by another application
- That the user running the console has the rights to open the Symphony file

Solve any problems you find and retry the operation.

AWSUI0791E The specified action cannot be completed because the following error occurred: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the error message to determine what the problem is. Fix the problem and retry the operation.

AWSUI0792E You are not the owner of the selected items. You are not authorized to share or unshare items that belong to another user.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Request the owner of the items to share or unshare them.

AWSUI0793E You have requested an operation that is allowed for distributed engines only. z/OS engines work only with the current plan.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: To perform the operation, use a distributed engine and retry the operation.

AWSUI0794E The user ID specified in the connection profile of the engine in use does not have the necessary permissions in the Security file to perform the requested action on the selected plan object.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Ask the Tivoli Workload Scheduler administrator to grant the user the appropriate permissions to perform the required action on the selected plan object. Retry the operation.

AWSUI0795E The connection to the engine has failed.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Ensure that the Tivoli Workload Scheduler engine is available in the network (try pinging it) and is up and running. Retry the operation.

AWSUI0796E The specified action cannot be performed. Reason: "engine_error_message"

Explanation: The action could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0797E The operation cannot be run on the following objects of which you are not the owner:

Explanation: See message text.

System action: The requested operation is not completed successfully for the items not owned by the user.

Operator response: Ask the owner of the items to share or unshare them and retry the operation.

AWSUI0798E The operation cannot be performed because the selected engine is a fault-tolerant-agent, which does not support the operation. Select another engine.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select another engine, and retry the action.

AWSUI0801E The engine does not support reporting.

Explanation: You attempted to test the database connection or to run a report task to an engine that does not support the reporting.

System action: The requested operation is not performed.

Operator response: Change to an engine that supports reporting.

AWSUI0802E You attempted to create the task without specifying either By day or By hour (or both). You must select at least one.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select one or both of the indicated options. Retry the operation.

AWSUI0803W Test connection to "engine_name" : engine successful, database failed.

Explanation: You have tested the connection to the indicated engine. The engine connection is working correctly but the database could not be accessed.

System action: The requested operation is not performed.

Operator response: Ask the Tivoli Workload Scheduler administrator to resolve the problem with the access to the database for the indicated engine. Retry the operation.

AWSUI0804E You tried to perform an action on multiple items, but the action has failed on some of them (a list of items for which the action failed follows):

Explanation: See message text.

System action: The requested operation is not completed successfully on the indicated items.

Operator response: Make sure only one item is selected in the list or table and retry the operation.

AWSUI0807E Reporting is not supported on fault-tolerant agents.

Explanation: You tried to enable reporting or to run a report on an engine that is a fault-tolerant agent.

System action: The requested operation is not performed.

Operator response: Clear the Enable Reporting check box in the Database section of the Scheduler Connection panel. Retry the operation.

AWSUI0808E The specified action cannot be performed because the active plan is not the current plan.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Set the current plan to be the default plan. Retry the operation.

AWSUI0809E Missing or incomplete Database User ID and Password. If you selected to enable reporting, you must also specify them to enable you to connect to the database.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Complete the Engine Connection properties panel with the Database User ID and Password. Retry the operation.

AWSUI0810E You are not authorized to delete items that belong to another user.

Explanation: The selected item has been shared by another user.

System action: The requested operation is not performed.

Operator response: Choose an object you own to delete.

AWSUI0811E The user specified in the engine configuration is not authorized to perform the selected operation. Specify another authorized user or ask the Tivoli Workload Scheduler administrator to grant the user the rights to perform the selected operation.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify another authorized user or ask the Tivoli Workload Scheduler administrator to grant the user specified in the engine configuration the rights to perform the selected operation.

AWSUI0818E Master domain manager not found.

Explanation: You have tried to change a workstation to become the master domain manager. As there can only be one master domain manager at any given time, the program must first change the definition of the existing master domain manager to remove the *manager* attribute. However it could not find the existing master domain manager definition. Perhaps someone else has performed the same action at the same time.

System action: The requested operation is not performed.

Operator response: Check the workstation definitions for the master domain and determine which workstation is the manager. Determine why the problem occurred and whether you still need to change the workstation to become the master domain manager. If so, retry the operation.

AWSUI0819W The workstation "workstation_name" is already the master domain manager.

Explanation: You have tried to set this workstation as the master domain manager, but it already is.

System action: The requested operation is not performed.

Operator response: None.

AWSUI0820W The workstation "workstation_name" is already set as event processor.

Explanation: You have tried to set this workstation as the event processor, but it already is.

System action: The requested operation is not performed.

Operator response: None.

AWSUI0822E The specified value must not contain any of the following characters: "list_of_non_valid_characters".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Remove the non-valid characters from the value. Retry the operation.

AWSUI0823E The value specified must be alphanumeric and may not include spaces.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Remove non-alphanumeric characters and spaces. Retry the operation.

AWSUI0824E An error was found while verifying the SAP task. Either the task information or the command string (if supplied) contain an error.

Explanation: See message text.

System action: The SAP task is not submitted.

Operator response: Verify the task information is correct. If a command string was supplied, verify also that it is correct. Retry the operation.

AWSUI0825E Unable to validate the r3batch workstation either because it is not in the plan or because the connection with the r3batch system failed.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check whether the r3batch workstation is in the plan. If it is not, add it. If the workstation is in the plan check that the workstation is up and running and that the R/3 system is up and running. Correct any errors and retry the operation.

AWSUI0826W To create trial and forecast plans, you need to be the owner of a an engine connection. Currently, there are no connections owned by you.

Explanation: See message text.

System action: The plan is not created.

Operator response: Create an engine connection. Retry the operation.

AWSUI0829W The event processor on workstation "workstation_name" is already up and running.

Explanation: You have tried to start the event processor but it is already up and running.

System action: Nothing. The system continues.

Operator response: None.

AWSUI0830W The event processor on workstation "workstation_name" is already stopped.

Explanation: You have tried to stop the event processor but it is already stopped.

System action: Nothing. The system continues.

Operator response: None.

AWSUI0831E The plan "plan_name" does not exist.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Verify that the plan name is correct in the report task. Correct the error and retry the operation.

AWSUI0832E The Symphony file selected is not present or is corrupted. Contact the Tivoli Workload Scheduler administrator.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Ask the Tivoli Workload Scheduler administrator to run the **Jnextplan** command on the Tivoli Workload Scheduler engine, or to determine why the file is corrupt. Retry the operation.

AWSUI0833E The operation could not be completed. There has been a communication failure. The internal message is: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the quoted error message to diagnose and correct the problem. Retry the operation.

AWSUI0834E There is more than one job stream instance with the given name. You must refer to a single instance by specifying either the job stream ID or the scheduled start time.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select a single job stream instance by specifying either the job stream ID or the scheduled start time. Retry the operation.

AWSUI0835E The start must be less than the end when defining a period to identify the Symphony data from which you wish to extract a plan.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Change either the start date and time or the end date and time (or both) to define a period to identify the Symphony data from which you wish to extract a plan. Retry the operation.

AWSUI0836E The Name field is mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid value in the Name field and all other mandatory fields and retry the operation.

AWSUI0837E The value "field_value" is not valid. The value must be an integer between "minimum_value" and "maximum_value".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid value within the indicated range. Retry the operation.

AWSUI0838E The values for Target server and Server group are mutually exclusive. Only one of the fields must contain a value.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a value for either the Target server or the Server group, but not both. Retry the operation.

AWSUI0839W You have changed the job priority or the start time, or both. However, when rerunning a job, if you change the job priority or the start time, you must also select a job definition. The job will not be rerun.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: To rerun the job with a changed job priority or start time, you must select a job definition. Otherwise, reset the job priority or the start time, or both, to the original values and rerun the job.

AWSUI0843E Missing action parameter.

Explanation: You have tried to launch a Tivoli Workload Scheduler without specifying any action in the URL.

System action: The Tivoli Workload Scheduler has not been launched.

Operator response: Launch the Tivoli Workload Scheduler specifying an action.

AWSUI0844E Some parameters are invalid (a list of the invalid parameters follows):

Explanation: You have tried to launch a Tivoli Workload Scheduler with invalid parameters.

System action: The Tivoli Workload Scheduler has not been not launched.

Operator response: Check the documentation to ensure that you have correctly typed the parameters.

AWSUI0845E The port value is not valid because it is not a numeric value.

Explanation: You have tried to launch a Tivoli Workload Scheduler with an invalid port value.

System action: The Tivoli Workload Scheduler has not been launched.

Operator response: Launch the Tivoli Workload Scheduler specifying a numeric port value.

AWSUI0846E Unknown status (a list of the invalid status follows): "action".

Explanation: You have tried to launch a Tivoli Workload Scheduler with an invalid status value.

System action: The Tivoli Workload Scheduler has not been launched.

Operator response: Launch the Tivoli Workload Scheduler specifying a valid status.

AWSUI0847E The value "field_value" is not valid. Valid values are min or all.

Explanation: You have tried to launch a Tivoli Workload Scheduler with an invalid column parameter.

System action: The Tivoli Workload Scheduler has not been launched.

Operator response: Launch the Tivoli Workload Scheduler specifying a valid value for the column parameter, valid values are "min" or "all".

AWSUI0875E The operation requested is not applicable on the selected tasks.

Explanation: You have tried to launch an operation not applicable on the selected tasks.

System action: The operation has not been launched.

Operator response: Launch the operation on a valid task.

AWSUI0876E The engine does not support the Event Management.

Explanation: You attempted to test the engine connection with or to run an operation on an engine that does not support the Event Management.

System action: The requested operation is not performed.

Operator response: Change to an engine that supports Event Management.

AWSUI0877E The engine does not support the Workload Service Assurance feature.

Explanation: You attempted to test the engine connection with or to run an operation on an engine that does not support the Workload Service Assurance feature.

System action: The requested operation is not performed.

Operator response: Change to an engine that supports Workload Service Assurance.

AWSUI0883E Refresh failed. The error is: "error_message"Old data is displayed.

Explanation: See message text.

System action: The same data that was available before the refresh request is displayed.

Operator response: Refer to the mentioned error message to diagnose and correct the problem. Retry the operation.

AWSUI0886E No plans were found satisfying the filter criteria.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Verify that there are plans in the specified time range. Correct the error and retry the operation.

AWSUI0887W The dependency you added is currently being processed. When the process completes, the dependency is displayed in the related table. To avoid deleting this dependency, wait until the process completes before you add another dependency.

Explanation: Your request was sent to the server for processing.

System action: The Tivoli Dynamic Workload Console is waiting for the server to process the request.

Operator response: None

AWSUI0888W The version of the engine you selected does not support variable tables. The variable table value will be ignored.

Explanation: Variable Tables are supported from version 8.5. If you selected an engine of an older version, the specified variable table value is ignored.

System action: Processing continues, ignoring the "variable table" field.

Operator response: No action is required. To avoid this warning message in the future, do not specify a value in the "variable table" field for engine versions prior to version 8.5.

AWSUI0893E Check date range. From date must be equal or lower than To date.

Explanation:

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI0894E Check priority range. From priority must be equal or lower than To priority.

Explanation:

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI0896W The automatic engine creation was not completed due an internal error.

Explanation: The product have detected a TWS installation inside the same TWA instance, but was unable to create automatically the engine connection into the console due to an internal error.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI0898E The regular expression specified is not valid or is not supported.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a valid regular expression. Check on the documentation for the supported regular expressions.

AWSUI0899E The interval specified is not valid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a valid interval.

AWSUI0900E The interval specified is already covered or overlapping.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a valid interval.

AWSUI0901E The operation could not be completed. Reason: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the quoted error message to diagnose and correct the problem. Retry the operation.

AWSUI0902E The version of the r3batch access method installed on the "workstation" workstation does not support the Process Chain details function.

Explanation: See text.

System action: The operation cannot be performed.

Operator response: Install the Tivoli Workload Scheduler for Applications version 8.4 Fix Pack 1.

AWSUI0903W Cannot perform the requested action because it is inconsistent with the status of the selected workstation.

Explanation: See text.

System action: The requested operation is not performed.

Operator response: Make sure that status of the selected workstation is compatible with the specified action and retry the operation.

AWSUI0904W The workstation type Workload Broker is not supported by the engine version you selected.

Explanation: The workstation type "Workload Broker" is supported starting from version 8.5. If you selected an engine with a previous version, the operation is interrupted.

System action: Processing is interrupted.

Operator response: Specify a different workstation type if the selected engine version is prior to version 8.5.

AWSUI0905E The engine does not support the Conditional logic feature.

Explanation: You attempted to test the engine connection with or to run an operation on an engine that does not support the Conditional logic feature.

System action: The requested operation is not performed.

Operator response: Change to an engine that supports Conditional logic.

AWSUI0906W Are you sure you want to share your engine credentials? If shared, all user groups authorized to share this engine connection will use them to work with it.

Explanation: For security and auditability reasons,

when an engine connection is shared to other users, the associated engine credentials are not shared. This message is presented when the default settings are overridden, for you to confirm the choice.

System action: If operator answers "Yes" the engine credentials will be shared along with the other engine properties.

Operator response: Answer "Yes" to allow sharing of engine credentials, or "No" to go back. This choice can be changed at any time by editing the engine properties.

AWSUI0907E The connector for z/OS does not support the Conditional logic feature.

Explanation: You attempted to run an operation using an old version of the connector for z/OS that does not support the Conditional logic feature.

System action: The requested operation is not performed.

Operator response: You should upgrade your connector for z/OS to have all the new features available.

AWSUI0908W Conditional predecessors and successors will not be displayed because your version of the z/OS connector does not support the conditional logic feature.

Explanation: You attempted to run an operation using an old version of the connector for z/OS that does not support the Conditional logic feature. You will not be able to display all the information

System action: The requested operation is not performed.

Operator response: Upgrade your Connector for z/OS to Version 8.5 or later to use the Conditional Logic Feature.

AWSUI0913W You have chosen to share your connection credentials, but you have not specified the user and password values.

Explanation: User name and password are required to perform this operation.

System action: The requested operation is not performed.

Operator response: Specify valid user and password values.

AWSUI0914E The selected engine does not support the Plan View feature.

Explanation: You attempted run a plan view on an engine that does not support it.

System action: The requested operation is not performed.

Operator response: Change to an engine that supports plan view.

AWSUI0915E Show Plan View tasks do not support the View As Report option. Use the Run option, or click on the task name.

Explanation: You have tried to launch an operation not applicable on the selected tasks.

System action: The operation has not been launched.

Operator response: Launch the operation on a valid task.

AWSUI0916E The engine does not support the Virtual workstation creation feature.

Explanation: You attempted to test the engine connection with or to run an operation on an engine that does not support the Virtual workstation creation feature.

System action: The requested operation is not performed.

Operator response: Change to an engine that supports Virtual workstation creation.

AWSUI0917E The connector for z/OS does not support the Virtual workstation creation feature.

Explanation: You attempted to run an operation using an old version of the connector for z/OS that does not support the Virtual workstation creation feature.

System action: The requested operation is not performed.

Operator response: You should upgrade your connector for z/OS to have all the new features available.

AWSUI0918E A task with name "task_name" does not exist.

Explanation: The task you tried to run does not exist or has been deleted.

System action: The requested operation is not performed.

Operator response: Replace this bookmark with a valid one that links an existing task.

AWSUI0919E Unable to retrieve job log for the specified job.

Explanation: The job with given id does not exist.

System action: The requested operation is not performed.

Operator response: Try and perform the action with a different id.

AWSUI0920E Invalid url specified for object documentation.

Explanation: The specified object documentation url is invalid.

System action: The requested operation is not performed.

Operator response: Change the documentation url and specify a valid url in the TdwcGlobalSettings.xml file.

AWSUI0921E Unable to retrieve object details. You might have insufficient permission or the object might have been deleted.

Explanation:

System action: The requested operation is not performed.

Operator response: Make sure you have sufficient permission and that the object was not deleted.

AWSUI0922E This action could not be run. Reason: View as Report supports only one Monitor task on Multiple Engine at a time.

Explanation:

System action: The requested operation is not performed.

Operator response: Make sure you selected only one "Monitor task on Multiple Engines" task before running View as Report action.

AWSUI0923E Uploaded file not valid: "reason"

Explanation:

System action: The requested operation is not performed.

Operator response: The file you are trying to upload it is not valid. Check file type and file size.

AWSUI0924E Preferences import operation failed: "reason"

Explanation:

System action: The requested operation is not performed.

Operator response: The file you are trying to import as preferences it is not valid. Check it is a correct XML file.

AWSUI0928E Database creation failed. See logs for further details.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Database was not successfully initialized. Be sure database is reachable, and user has enough permission to drop and create tables.

AWSUI0930E Test connection fail. Reason: "reason"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: It was not possible to connect to database. Check database connection parameters, if correct, check if the RDBMS is reachable from the system in which the TDWC is installed.

AWSUI0932E Could not save properties.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response:

AWSUI0936E It was not possible to access to preferences repository. See logs for further details.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: It was not possible to connect to database. Check database connection parameters, if correct, check if the RDBMS is reachable from the system in which the TDWC is installed.

AWSUI0937E Database has not been initialized. Run an import with recreate option or initialize it from the Manage settings portlet

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: It was not possible to use the database. The database must be initialized from the Manage settings portlet either by an import with recreate option, or in Configure settings repository section.

AWSUI0939E The specified action cannot be performed on more than "number" items

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select less items from the list or table and retry the operation.

AWSUI0940E The requested action cannot be performed because it is supported from XBP level 3.0 and IBM Tivoli Workload Scheduler for Applications, version 8.6.0.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Choose another action, or upgrade to a supported level of XBP and retry the operation.

AWSUI0941E The value for the Application return code is not compatible with the value of the Application log content field

Explanation: The Application return code cannot be set if Application log is blank or disabled

System action: The requested operation is not performed.

Operator response: Change the value for Application return code or Application log and retry the operation.

AWSUI0943E The engine does not support the User Fields feature.

Explanation: You attempted to test the engine connection with or to run an operation on an engine that does not support the User Fields feature.

System action: The requested operation is not performed.

Operator response: Change to an engine that supports User Fields.

AWSUI0945E Database update failed. See logs for further details.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Database was not successfully updated. Be sure database is reachable, and user has enough permission to create tables.

AWSUI0947E The R3 Standard Job can not be saved because no steps have been defined.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Define at least one step inside the R3 Standard Job you want to create.

AWSUI0948E The selected engine does not support the requested action.

Explanation: The action you are trying to perform is not supported by the level of the selected engine.

System action: The requested action is not performed.

Operator response: Select a different engine that supports the action being requested.

AWSUI0949E The conditions cannot be defined on not centralized operation.

Explanation: The action you are trying to perform is not able.

System action: The requested action is not performed.

Operator response:

AWSUI0952E Cannot find the specified object.

Explanation: The system is not able to find the specified object.

System action: The requested action is not performed.

Operator response:

AWSUI0953E The operation cannot be completed because the settings repository is in maintenance mode.

Explanation: The system is not complete the operation, because the system is in maintenance mode.

System action: The requested action is not performed.

Operator response:

AWSUI0954E A file dependency cannot be defined on a workstation of type agent, pool, dynamic pool, remote engine or broker.

Explanation: The system is not complete the operation, because the system is in maintenance mode.

System action: The requested action is not performed.

Operator response:

AWSUI1001E The z/OS engine "engine_name" is not supported.

Explanation: The z/OS engine version selected is not supported.

System action: The requested operation is not performed.

Operator response: Select a supported engine version. Retry the operation.

AWSUI1002E The selected period was not found. Period:"period"

Explanation: The selected period was not found in the z/OS database.

System action: The requested operation is not performed.

Operator response: Specify a valid period. Retry the operation.

AWSUI1003E The setup of the selected job instance cannot be performed. There are no valid successors for job instance: "job_instance_name".

Explanation: There are no valid successors for the selected job instance.

System action: The requested operation is not performed.

Operator response: Select at least one valid successor for the selected job instance. Retry the operation.

AWSUI1004E The setup of the selected job instance cannot be performed. Reason: "engine_error_message"

Explanation: The setup of the selected job instance could not be performed due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI1005E The following error occurred while setting the step list: "error_message"

Explanation: An error occurred when setting the step list because of one of the following reasons:

- The selected Start Step cannot be restarted. Possible reasons are the JCL logic or the RCLOPTS initial parameter setting.
- The action field is set to Start for more than one step, which is not allowed.
- The action field is set to End for more than one step, which is not allowed.
- A step marked as always executable is excluded from the selected Step List because of the RCLOPTS initial parameter setting.
- A step marked as not executable is included in the selected Step List because of the RCLOPTS initial parameter setting.
- The selected End Step does not come after the selected Start Step.

System action: The requested operation is not performed.

Operator response: Identify the appropriate error scenario from those documented in the Explanation section. Correct the error and retry the operation.

AWSUI1006E The selected workstation cannot be linked. Reason: "engine_error_message"

Explanation: The selected workstation could not be linked due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI1007E The selected workstation cannot be unlinked. Reason: "engine_error_message"

Explanation: The selected workstation could not be unlinked due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI1008E The rerun operations on the selected job stream instance cannot be performed. Reason: "engine_error_message"

Explanation: The rerun operation could not be performed on selected job stream instance due to an

error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI1009E The restart and cleanup operations on selected job instance cannot be performed. Reason: "engine_error_message"

Explanation: The restart and cleanup operations could not be performed on selected job instance due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI1011E The specified value is not valid for the PARALLELSERVERS resource. The valid range is from 1 to 99.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a value for the PARALLELSERVERS resource that is within the range 1 to 99. Retry the operation.

AWSUI1012E The specified job stream "job_stream_name" does not exist. Continue anyway?

Explanation: See message text.

System action: The GUI waits for you to click OK or Cancel.

Operator response: Click OK to continue, or Cancel to specify a new job stream. Retry the operation.

AWSUI2000E A connection error has occurred. There has been an SQL failure when running the report. Details are logged in the trace file.

Explanation: There is a connection problem with the database. Possible errors are:

- The database is down
- The database password provided when the engine was created is wrong or has been changed.

System action: The requested operation is not performed.

Operator response: Check the error log and trace files for the possible cause of the problem. Check that the database is up and that the connection credentials are

correct. Correct the problem and retry the operation.

AWSUI2005E A connection error has occurred. There has been an SQL failure when running the report. Details are shown below:
Database user ID:
 "database_user_ID"
Database JDBC url:
 "database_JDBC_url"
Database internal message: "database_internal_message".

Explanation: The database might not be available, the parameters specified for the database configuration might not be valid, or an error occurred during data transmission.

System action: The requested operation is not performed.

Operator response: Ask the database administrator to do the following:

- Check that the computer where the database is running is available in the network by pinging it
- Check that the database is up and running
- Check that the database connection credentials are correct
- Check that the database configuration is correct

Retry the operation. If the problem persists, contact IBM Software Support for assistance.

AWSUI2006E One or more errors occurred during the running of the report. Details are shown below: **Database user ID:**
 "database_user_ID"
Database JDBC url:
 "database_JDBC_url"
Errors found:
 "errors"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the listed errors to determine what problems have occurred, fix them, and retry the operation.

AWSUI2007E The following Tivoli Workload Scheduler engine error occurred during the running of the report:
 "engine_error_message"

Explanation: The report could not be produced due to an error that occurred in the Tivoli Workload Scheduler engine. The error code is specified in the message text.

System action: The requested operation is not performed.

Operator response:

AWSUI2008E The user specified in the engine configuration is not authorized to perform the selected operation. Modify the engine configuration to specify an authorized user or ask the Tivoli Workload Scheduler administrator to grant the specified user the rights to perform the selected operation.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Modify the engine configuration to specify an authorized user or ask the Tivoli Workload Scheduler administrator to grant the specified user the rights to perform the selected operation.

AWSUI2009E An error occurred during the running of the report. See log files for details.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the error log and trace files for the possible cause of the problem. Correct the problem and retry the operation.

AWSUI3040E The input value exceeds the maximum length of 4 characters.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a name that is not more than 4 characters.

AWSUI3052E The input value exceeds the permitted range of 30 to 7200.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a value between 30 and 7200, inclusive.

AWSUI3053E The system cannot retrieve any detail for the "pc_name" process chain. For details, see the trace file.

Explanation: The problem can be due to possible communication problems with Tivoli Workload Scheduler engine or with SAP. Alternatively, the Tivoli Dynamic Workload Console may not be able to process the output supplied by R3Batch process because not available or corrupted.

See message text.

System action: No information about the selected process chain is retrieved.

The requested operation is not performed.

Operator response: Ensure there is no connection problem with the engine and with SAP. Ensure SAP system is up and running. Check the trace.log file for more details about the error.

com.ibm.tws.webui.auiml.find.job.sap.
FindBWPCDetailsAction method runQuery()

AWSUI3054E The system cannot retrieve any detail for the "pc_name" process chain before the job starts.

Explanation: Process chain details cannot be retrieved until job starts running.

System action: The requested operation is not performed.

Operator response: Click Refresh to update the view until the job start time is displayed. Then click the link to view the process chain details.

AWSUI3055E The "objectType" cannot be "actionType". Reason: "reason"

Explanation: The objectType cannot be created or update or delete or read in the DB.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3057E Specify an Access Method and an Host workstation name for the Extended Agent

Explanation: An Access Method and a Host must be specified for the Extended Agent.

System action: The workstation is not created.

Operator response: Specify an Access Method and an Host workstation name for the Extended Agent.

AWSUI3058E Specify a Domain for the workstation

Explanation: A Domain must be specified for the workstation.

System action: The workstation is not created.

Operator response: Specify a Domain for the workstation.

AWSUI3059E The "object_type" name is not valid. The initial character must be a letter, while subsequent characters can be alphanumeric including dashes (-) and underscores (_).

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a name that conforms to the indicated naming rules.

AWSUI3060E The "object_type" length is not valid. The maximum allowed length is "max_length"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a length less or equal the maximum allowed length.

AWSUI3069E The following workstation cannot be loaded because it was deleted from the DataBase: "object".

Explanation: The workstation has been deleted from the DataBase.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3070E The following domain cannot be loaded because it was deleted from the DataBase: "object".

Explanation: The domain has been deleted from the DataBase.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3071E The following workstation cannot be updated because it was deleted from the DataBase: "object".

Explanation: The workstation has been deleted from the DataBase.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3072E The following domain cannot be updated because it was deleted from the DataBase: "object".

Explanation: The domain has been deleted from the DataBase.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3074E The following action cannot be performed on workstation "object": "action". Reason: "reason"

Explanation: The workstation cannot be created or update or delete or read or unlock in the DB.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3075E The following action cannot be performed on domain "object": "action". Reason: "reason"

Explanation: The domain cannot be created or update or delete or read or unlock in the DB.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3077E The specified variable table cannot be found. Try a different name.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply the correct name for the variable table. Retry the operation.

AWSUI3086E The following job stream cannot be loaded because it was deleted from the DataBase: "object".

Explanation: The job stream has been deleted from the DataBase.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3087E The following job stream cannot be updated because it was deleted from the DataBase: "object".

Explanation: The job stream has been deleted from the DataBase.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3088E The following action cannot be performed on job stream "object": "action". Reason: "reason"

Explanation: The job stream cannot be created or update or delete or read or unlock in the DB.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3089E The following job definition cannot be loaded because it was deleted from the DataBase: "object".

Explanation: The job definition has been deleted from the DataBase.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3090E The following job definition cannot be updated because it was deleted from the DataBase: "object".

Explanation: The job definition has been deleted from the DataBase.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3091E The following action cannot be performed on job definition "object": "action". Reason: "reason"

Explanation: The job definition cannot be created or update or delete or read or unlock in the DB.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3092E Unable to retrieve Master Domain.

Explanation: The master domain cannot be retrieved.

System action: The requested operation is not performed.

Operator response: Verify that the engine connection is working and that the operator is authorized to retrieve this information. Retry the operation.

AWSUI3093E The combined length of fields "field_name" and "field_name" is too long. The maximum sum of the two field lengths is "max_length"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a combined length less or equal the maximum allowed length.

AWSUI3094E The following action cannot be performed on job definition(s) "action" : "reason"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response:

AWSUI3095E The following action cannot be performed on job stream(s) "action" : "reason"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response:

AWSUI3096E The "action" action cannot be performed on workstation(s): "reason"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response:

AWSUI3097E The following action cannot be performed on domain(s) "action" : "reason"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response:

AWSUI3098E You must define at least one condition dependency.

Explanation: You are saving a condition without defining any condition dependencies

System action: The requested operation is not performed.

Operator response: Add a condition dependency or press Cancel

AWSUI3100E Incorrect range specification.

Explanation: The first value in the range must be lower than the second value.

System action: The requested operation is not performed.

Operator response: Specify a correct range or press Cancel.

AWSUI3101E The selected operator and status are incompatible.

Explanation: You cannot specify the "Not equal to" operator with an intermediate status, such as "Started".

System action: The requested operation is not performed.

Operator response: Change either the operator or status values to form a valid combination.

AWSUI3104E The procedure step name is mandatory if step name is specified.

Explanation: The procedure step name becomes mandatory if a step name is inserted.

System action: The requested operation is not performed.

Operator response: Supply a name for the procedure step name or remove the step name. Retry the operation.

AWSUI3105E The start time supplied for Earliest Start is later than the end time. Specify a later end time.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify an end time that is later than the start time. Retry the operation.

AWSUI3106E The entered value is not valid. It must be an alphanumeric string, including wildcards and "permitted_special_characters"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enter a valid value: for distributed engines: alphanumeric; for z/OS engine: numeric (0-255); for mixed engines: the field must be left blank .

AWSUI3107E You must select at least one engine.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: To define a valid task at least one engine must be selected.

AWSUI3108E The Workload broker field is required.

Explanation: Specify a Workload broker before selecting the agents.

System action: The operation is not performed.

Operator response: Specify the Workload broker from which you want to select agents. Click Add to view all the available agents and select one or more agents.

AWSUI3110E The following action cannot be performed on job(s) "object": "action".

Explanation: Kill and Job Log actions are not permitted on a Shadow Job

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance.

AWSUI3111E The required action cannot be performed on workstation "object". Reason: The name of the dynamic pool must be specified.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enter the name of the dynamic pool meeting the resource requirements associated to this workstation.

AWSUI3112E The required action cannot be performed on workstation "object". Reason: The name of the pool of dynamic agents must be specified.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enter the name of the pool of dynamic agents associated to this workstation.

AWSUI3113E Cannot retrieve job history for the selected job.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enable the reporting feature in the database configuration for the selected job. Retry the operation.

AWSUI3117E The requested action cannot be performed on the selected object because the object type is not managed by the engine connection that you are using.

Explanation: The engine connection version does not support this object type.

System action: The requested operation is not performed.

Operator response: Use a later version engine connection that supports the object type

AWSUI3121E The logical resource cannot be added because some required information is missing. Either the name or type of the logical resource must be specified.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: See message text.

AWSUI3122E The requested number of pages is outside the available range of "minimum_value" - "maximum_value".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a value within the accepted range. Retry the operation.

AWSUI3124E The value for Sap Process ID is not valid. It must be an integer.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enter an integer.

AWSUI3125E Invalid value provided as input parameter. You must specify a single value to run the requested operation. Ranges of values are not supported.

Explanation: See message text.

System action: None

Operator response: Enter a single value instead of a range of values and try the operation again.

AWSUI3126W The task was run against the Current plan, even if one ore more engines was configured to run tasks on a different plan.

Explanation: Multiple engine tasks can be run against Current plan only

System action: None

Operator response:

AWSUI4001E The supplied To Time is equal to the From Time, so the availability interval cannot be defined.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a To Time that is later than the From Time. Retry the operation.

AWSUI4002E The specified calendar was not found in the z/OS database. Specify a valid calendar name.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a valid calendar name. Retry the operation.

AWSUI4003E The option Cancel if late and the Start time specifications are in conflict. To cancel the job if it is late, an earliest start time and a deadline must be defined.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the conflicting properties. Retry the operation.

AWSUI4004E More than one dependency was defined between two jobs. You can only define one dependency.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Define only one dependency. Retry the operation.

AWSUI4008E If the job stream inherits scheduling information from a template, it cannot use the specified calendar. Complete either Inherits from template or Calendar, but not both.

Explanation: The "Inherits from template" field and the "Calendar" field are mutually exclusive.

System action: The requested operation is not performed.

Operator response: Complete either "Inherits from template" or "Calendar", but not both.

AWSUI4009E The specified template in Inherits from template does not exist. Specify a valid template.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a valid template in "Inherits from template".

AWSUI4010W Do you want to NOP the "number_of_instances" selected scheduled instances?

AWSUI4011W Do you want to UN-NOP the "number_of_instances" selected scheduled instances?

AWSUI4012W Do you want to NOP the scheduled instance "instance_name"?

AWSUI4013W Do you want to set the status of the scheduled instance "instance_name" to Complete?

Explanation: See message text.

System action: The system waits for your response.

Operator response: Click **Yes** to set the indicated scheduled instance state to “Complete” or click **No** to cancel the request.

AWSUI4016W Do you want to set the status of the scheduled instance "instance_name" to Waiting?

Explanation: See message text.

System action: The system waits for your response.

Operator response: Click **Yes** to set the indicated scheduled instance state to “Waiting” or click **No** to cancel the request.

AWSUI4017W Do you want to UN-NOP the scheduled instance "instance_name"?

Explanation: See message text.

System action: The system waits for your response.

Operator response: Click **Yes** to UN-NOP the selected scheduled instance or click **No** to cancel the request.

AWSUI4018E The Node address field is mandatory when the port number is specified. Specify a node address in the Access Methods group.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a valid Node address in the Access Methods group and retry the operation.

AWSUI4019E The Name field is mandatory when the node address is specified. Specify a Name in the Access Methods group.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a valid Name in the Access Methods group and retry the operation.

AWSUI4020E The Name and Node address fields are mandatory when the port number is specified. Specify a Name and a Node address in the Access Methods group.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a Name and a Node address in the Access Methods group and retry the operation.

AWSUI4021E The identifier is not unique.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a unique identifier and retry the operation.

AWSUI4022E The default calendar was not found in z/OS. All days will be counted as workdays.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: If you do not want all days to be treated as workdays, define a default calendar in the z/OS engine. Retry the operation.

AWSUI4023E The specified target workstation either does not exist, or cannot run the type of task associated with this job. Supply a valid workstation name.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid workstation name and retry the operation.

AWSUI4024E The Offset-based Run Cycle cannot contain offsets outside the defined interval.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply offsets that are included in the defined interval, and retry the operation.

AWSUI4025E The Rule-based Run Cycle cannot contain days outside the user-defined period.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Insert days that are included in the user-defined period, and retry the operation.

AWSUI4027E The To date precedes the From date. Supply a later To date or an earlier From date.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a To Date greater than the From Date, and retry the operation.

AWSUI4028E The specified target workstation cannot run the type of task associated with this job. Supply the name of a workstation that is enabled to run the task.

Explanation: The target workstation must be enabled to run the type of task associated with a job.

System action: The requested operation is not performed.

Operator response: Supply a name of a workstation that is enabled to run the task, or change the workstation itself so that it can run the type of task associated with this job.

AWSUI4030E In the job stream definition there is a job that is unlinked to any of the remaining jobs, which is not allowed.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Link the job to other jobs or remove it from the job stream. Retry the operation.

AWSUI4031E The job duration cannot be zero.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Set the duration of the job to a value other than zero, and retry the operation.

AWSUI4032E The specified Open time interval is not valid because it overlaps with an existing Open time interval, which is not allowed.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Set the Open time interval to define an interval that does not overlap with an existing interval, and retry the operation.

AWSUI4033E The Start time is earlier than the job stream Valid from date. Supply a later Start time.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a Start time later than the job stream Valid from date, and retry the operation.

AWSUI4034W The logical resource "object_name" is not defined. Do you want to proceed?

Explanation: See message text.

System action: The system waits for your response.

Operator response: Click **Yes** to continue or **No** to cancel.

AWSUI4035W The logical resources "object_list" are not defined. Do you want to proceed?

Explanation: See message text.

System action: The system waits for your response.

Operator response: Click **Yes** to continue or **No** to cancel.

AWSUI4036W No duration alert will be issued for 99.59.01. Do you want to proceed?

Explanation: The duration of the job has been set to 99 hours, 59 minutes, 1 second. This is an acceptable value but no alert will be displayed.

System action: The system waits for your response.

Operator response: Click **Yes** to continue or **No** to cancel.

AWSUI4037E The job duration cannot be set to greater than 99.59.01 (99 hours, 59 minutes, 1 second).

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Set the duration of the job to a value that is less than or equal to 99.59.01. Retry the operation.

AWSUI4040E The selected period was not found in the z/OS database.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a valid period, or create

the required period in the z/OS database. Retry the operation.

AWSUI4041E The availability interval cannot be defined because the From priority is greater than the To priority.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a To priority greater than the From priority, and retry the operation.

AWSUI4042E In the "VALUE_0" section, the To Date is earlier than the From Date. Supply an earlier From Date, or a later To Date.

AWSUI4049E The status change for workstation "workstation_name" failed. Reason: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the information given in the *error_message*. Correct the error and retry the operation.

AWSUI4050E The job stream name is required in order to display the properties.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a job stream name and retry the operation.

AWSUI4051E The job stream "job_stream_name" could not be found.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid job stream identifier and retry the operation.

AWSUI4052E The Occurrence Token is not a 16 character hexadecimal String (0-9, A-F).

Explanation: Either the entered value is longer than 16 characters, or non-valid characters have been used.

System action: The requested operation is not performed.

Operator response: Supply a valid value using only valid characters (0-9, A-F) and not exceeding the

allowed size. Retry the operation.

AWSUI4053E The availability interval cannot be defined because the From priority is greater than the To priority. Please specify valid priorities on the "panel_name" panel.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a To priority greater than the From priority, and retry the operation.

AWSUI4055W Do you want to link workstation "workstation_name" ?

AWSUI4056W Do you want to unlink the "workstation_names" selected workstations?

AWSUI4057W Do you want to unlink workstation "workstation_name" ?

AWSUI4058E The workstation "workstation_name" cannot be linked. Reason: "error_message"

Explanation: The system could not link the specified workstation, because it received an error from the engine connection.

System action: The requested operation is not performed.

Operator response: Use the error message to determine what problem has occurred in the engine. Correct the problem and retry the operation.

AWSUI4059E The workstation "workstation_name" cannot be unlinked. Reason: "error_message"

Explanation: The system could not unlink the indicated workstation, because of an error in the engine connection.

System action: The requested operation is not performed.

Operator response: Use the error message to determine what problem has occurred in the engine. Correct the problem and retry the operation.

AWSUI4062E The following error was found in the Dates section: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the error message to determine what is wrong with the dates, correct the error and retry the operation.

AWSUI4063E The Start Date and Time and the Deadline Date and Time of the job stream are mandatory.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enter valid values in these mandatory fields and retry the operation.

AWSUI4064E The following error occurred: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the error message to determine what is wrong, correct the error and retry the operation.

AWSUI4065E The job stream name "job_stream_name" is not valid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a valid job stream name and retry the operation.

AWSUI4066E A required value has not been entered in the Time field. The Time field is mandatory when a value is set for the Date field.

Explanation: The system can perform the requested operation only if the Date and Time fields are both specified or both empty.

System action: The requested operation is not performed.

Operator response: Supply a value in the Time field, or clear the Date field. Retry the operation.

AWSUI4067E A required value has not been entered in the Date field. The Date field is mandatory when a value is set for the Time field.

Explanation: The system can perform the requested operation only if the Date and Time fields are both specified or both empty.

System action: The requested operation is not performed.

Operator response: Supply a value in the Date field, or clear the Time field. Retry the operation.

AWSUI4068E The Date and Time fields are blank, but the corresponding check box (on their left), which indicates that they have been selected, is checked. Clear the check box or enter both the Date and the Time field.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enter valid information in the Date and Time fields, or clear the corresponding check box to ignore them. Retry the operation.

AWSUI4069E The action specified on object "object_name" cannot be performed. Reason: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the error message to correct the error, and retry the operation.

AWSUI4071E A Job Setup action cannot be performed on the selected object, because the duration is not in the format hh:mm:ss.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Change the format of the job duration to hh:mm:ss, and retry the operation.

AWSUI4072E The To Time is less than the From Time. Supply a later To Time or an earlier From Time.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a To Time greater than the From Time and retry the operation.

AWSUI4074E The status change for destination "destination_name" failed. Reason: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the information given in the *error_message*. Correct the error and retry the operation.

AWSUI4075E You cannot change the workstation for the selected job to Computer because the job is defined for "number_of_parallel_servers" parallel servers. Only one parallel server is permitted for operations on a computer workstation.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: If you want to define this job for a computer workstation you must change the parallel servers definition so that not more than one is defined.

AWSUI4076E Either the Fail or the Offline option entered is not valid. The restart option must be Restart, Set to error, or Leave.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the options and try again.

AWSUI4077E The From Date or Time value is later than the To Date or Time value. Enter an earlier From Date or Time value, or a later To Date or Time value.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply an earlier From Date or Time, or type a later To Date or Time and retry.

AWSUI4078E The object of type "object_type" and name "object_name" already exists in the table.

Explanation: Duplicate objects cannot be inserted in the table.

System action: The requested operation is not performed.

Operator response: Select a different object.

AWSUI4081E You can add conditions only on jobs in waiting or ready status.

Explanation: You cannot perform the specified operation on the jobs you selected.

System action: The requested operation is not performed.

Operator response: None.

AWSUI4082E You can delete evaluated conditions only if the job status is ready or waiting.

Explanation: You cannot perform the specified operation on the jobs you selected.

System action: The requested operation is not performed.

Operator response: None.

AWSUI4083W You cannot modify an evaluated condition.

Explanation: This condition is evaluated and cannot be modified.

System action: The condition is opened in read-only mode.

Operator response: None.

AWSUI4084E You cannot modify the status of an evaluated condition dependency.

Explanation: You cannot modify this condition because its status is true or false.

System action: The action is not performed.

Operator response: None.

AWSUI4085E You cannot modify the status of the condition dependency because the value of the column Warning about step end is No.

Explanation: See text.

System action: The action is not performed.

Operator response: None.

AWSUI4086E You cannot modify an evaluated condition dependency.

Explanation: This condition dependency is evaluated and cannot be modified.

System action: The action is not performed.

Operator response: None.

AWSUI4087W You cannot change the workstation to Remote engine without adding the remote job data. Do you want to add the remote job information?

Explanation: See message text.

System action: The system waits for your response.

Operator response: Click **Yes** to add remote job data or click **No** to cancel the request.

AWSUI4090W If you have pending changes, they will be ignored. Are you sure you want to exit without saving your changes?

Explanation: See message text.

System action: The system waits for your response.

Operator response: None

AWSUI4091E Cannot delete false Conditions.

Explanation: See message text.

System action: The system waits for your response.

Operator response: None

AWSUI5002E The value "value" for type "type" is not valid.

Explanation: The data input is not valid.

System action: none

Operator response: Enter a valid value.

AWSUI5003E A value has not been supplied for a required field.

Explanation: The data input is not valid.

System action: none

Operator response: Enter all the required values.

AWSUI5004E The input value is shorter than the minimum allowed length of "minimum_length" bytes.

Explanation: The data input is not valid.

System action: none

Operator response: Enter a longer value.

AWSUI5005E The input value is longer than the maximum allowed length of "maximum_length" bytes.

Explanation: The data input is not valid.

System action: none

Operator response: Enter a shorter value.

AWSUI5006E The input percentage value: "value" is not valid.

Explanation: The data input is not valid.

System action: none

Operator response: Enter a value between 0 and 100.

AWSUI5007E The input file size or duration cannot be negative.

Explanation: The data input is not valid.

System action: none

Operator response: See message text.

AWSUI5008E The input value is outside the required range.

Explanation: The data input is not valid.

System action: none

Operator response: See message text.

AWSUI5009E The input value is not one of the permitted values.

Explanation: The data input is not valid.

System action: none

Operator response: Provide a new value, ensuring it is supported.

AWSUI5010E The input value is outside the required range. The value must be between "minimum_value" and "maximum_value".

Explanation: The data input is not valid.

System action: none

Operator response: See message text.

AWSUI5011E The input data to be supplied is a range, but either the maximum or the minimum value is blank.

Explanation: The data input is not valid.

System action: none

Operator response: See message text.

AWSUI5012E The supplied range, from "value1" to "value2" is not valid.

Explanation: The data input is not valid.

System action: none

Operator response: See message text.

AWSUI5013E An internal error has occurred. The correlation could not be calculated due to the following error: "error".

Explanation: Unable to calculate the available correlation properties on the current events.

System action: none

Operator response: See message text.

AWSUI5014E An internal error has occurred. The program was not able to issue the heart beat to the server (that keeps the session active) because the following error occurred: "error"

Explanation: Unable to execute an Heart Beat to keep the session up.

System action: The session is not kept up

Operator response: Close current session and start a new one

AWSUI5015E Unable to open the Event Rule Editor for the following reason: "reason"

Explanation: The Rule Editor cannot be opened.

System action: none

Operator response: Ensure that the connection to the server is working properly.

AWSUI5016E Unable to close the Event Rule Editor for the following reason: "reason"

Explanation: The Rule Editor cannot be closed.

System action: none

Operator response: Ensure that the connection to the server is working properly.

AWSUI5017E Unable to save the event rule for the following reason: "reason"

Explanation: The event rule cannot be saved cannot be closed.

System action: No event rule is saved.

Operator response: Ensure that the connection to the server is working properly.

AWSUI5018E The following internal error has occurred while processing the rule definitions: "error"

Explanation: This message is displayed when a not specific internal error occurs.

System action: No change happens in the event rule.

Operator response: Close Rule Editor panel, reopen it

and try to process the rule again.

AWSUI5019E Unable to add the action [plug-in="plug-in_name" , name="action_name"] to pane "pane". The error is: "error"

Explanation: This message is displayed when an error occurs while adding an action to the action area.

System action: The action is not added or stored in the event rule.

Operator response: See message text.

AWSUI5020E Unable to remove the action [id="action_ID" , name="action_name"] from pane "pane". The error is: "error"

Explanation: This message is displayed when an error occurs while removing an action from the action's area.

System action: The action is not removed from the event rule.

Operator response: See message text.

AWSUI5021E Unable to add the event [plug-in="plug-in_name" , name="event_name"]. The error is: "error"

Explanation: This message is displayed when an error occurs while adding an event to the event's area.

System action: The event is not added or stored in the event rule.

Operator response: See message text.

AWSUI5022E Unable to remove the event [id="event_ID" , name="event_name"]. The error is: "error"

Explanation: This message is displayed when an error occurs while removing an event from the event's area.

System action: The event is not removed from the event rule.

Operator response: See message text.

AWSUI5023E The sequence of the events cannot be changed because the following event could not be moved: [id="event_ID" , name="event_name"]. The error is: "error"

Explanation: This message is displayed when an error occurs while ordering an event in sequence with others.

System action: The event has not been moved.

Operator response: Specify a different event sequence.

AWSUI5024E Unable to change the event type [type="event_type"]. The error is: "error"

Explanation: This message is displayed when an error occurs while changing the event type (filter, set, sequence).

System action: The event type is not changed

Operator response: See message text.

AWSUI5025E The event rule name is not valid because it contains characters that are not permitted.

Explanation: See message text.

System action: The event rule cannot be saved.

Operator response: Type a different name using only supported characters.

AWSUI5026E The event rule name cannot contain blanks.

Explanation: See message text.

System action: The event rule cannot be saved.

Operator response: Provide a new name, removing blanks.

AWSUI5027E The event rule name cannot be longer than 40 characters.

Explanation: See message text.

System action: The event rule cannot be saved.

Operator response: Provide a shorter name.

AWSUI5028E The event rule name cannot be blank.

Explanation: See message text.

System action: The event rule cannot be saved.

Operator response: Provide a rule name.

AWSUI5029E The date and time cannot be blank.

Explanation: The data input is not valid.

System action: The event rule cannot be saved.

Operator response: Provide date and time values.

AWSUI5030E The date is not valid.

Explanation: The data input is not valid.

System action: The event rule cannot be saved.

Operator response: Provide a valid date value.

AWSUI5031E The date and time cannot both be blank.

Explanation: See message text.

System action: The event rule cannot be saved.

Operator response: Provide date and time values.

AWSUI5032E The description cannot be longer than 120 characters.

Explanation: See message text.

System action: The event rule cannot be saved.

Operator response: Provide a shorter description.

AWSUI5033E The validity period is not valid.

Explanation: See message text.

System action: The event rule cannot be saved.

Operator response: Provide a valid validity period.

AWSUI5034E The validity date range is not valid.

Explanation: See message text.

System action: The event rule cannot be saved.

Operator response: Provide a valid date range.

AWSUI5035E A required selection has not been made.

Explanation: See message text.

System action: The event rule cannot be saved.

Operator response: Make a selection.

AWSUI5036E At least one value must be selected.

Explanation: See message text.

System action: The event rule cannot be saved.

Operator response: Select a value or more.

AWSUI5037E The time is not valid.

Explanation: See message text.

System action: The event rule cannot be saved.

Operator response: Provide a valid time value.

AWSUI5038E The event rule cannot be saved because it contains errors.

Explanation: There is an error in some field of the Rule Editor. The event rule cannot be saved.

System action: The event rule cannot be saved and the button SAVE is disabled.

Operator response: Fix the errors and proceed.

AWSUI5039W Too many results have been found.
The list has been truncated.

Explanation: See message text.

Operator response: See message text.

AWSUI5041E The search has failed. The error is:
"error"

Explanation: See message text.

System action: The search has failed.

Operator response: See message text.

AWSUI5042E The event rule cannot be saved
because it is not complete.

Explanation: See message text.

System action: The event rule cannot be saved and
the button SAVE is disabled.

Operator response: See message text.

AWSUI5043E The event rule cannot be saved
because the rule name was not
specified.

Explanation: See message text.

System action: The event rule cannot be saved and
the button SAVE is disabled.

Operator response: Specify a rule name and save the
rule again.

AWSUI5044E The event rule cannot be saved
because it is incorrect. Fix all
highlighted errors before saving the
event rule.

Explanation: See message text.

System action: The event rule cannot be saved and
the button SAVE is disabled.

Operator response: See message text.

AWSUI5045E The input value does not match the
syntax requirements for a regular
expression.

Explanation: The data input is not valid.

System action: none

Operator response: See message text.

AWSUI5046W There is no engine connection
defined. An engine connection is
required to work with the Event Rule
Editor.

Explanation: See message text.

System action: none

Operator response: Specify an engine connection.

AWSUI5047E Specify an integer between "minValue"
and "maxValue"

Explanation: The data input is not valid.

System action: none

Operator response: See message text.

AWSUI5048E Insert a value.

Explanation: The data input is not valid.

System action: none

Operator response: See message text.

AWSUI5049E Specify a value between "minValue"
and "maxValue"

Explanation: The data input is not valid.

System action: none

Operator response: See message text.

AWSUI5050W The rule editor cannot receive the data
from the server.

AWSUI5051E The inserted value for type "type" is
not valid.

Explanation: The data input is not valid.

System action: none

Operator response: See message text.

AWSUI5052E Authentication failed: the userid or
password is incorrect.

Explanation: See message text.

System action: none

Operator response: Specify the correct credentials to
access the Tivoli Workload Scheduler engine.

AWSUI5053E The event condition "event" is not
supported by the specified
"pluginName" plug-in.

Explanation: See message text.

System action: The operation is not performed.

Operator response: If you have modified the plug-in, check that you have saved it with the correct name and path. Correct any error you find and repeat the operation.

AWSUI5054E The event condition "event" has properties not supported by the specified "pluginName" plug-in.

Explanation: See message text.

System action: Unable to open the Event Rule Editor.

Operator response: If you have modified the plug-in, check that you have saved it with the correct name and path. Correct any error you find and repeat the operation.

AWSUI5055E The action "action" is not supported by the specified "pluginName" plug-in.

Explanation: See message text.

System action: Unable to open the Event Rule Editor.

Operator response: If you have modified the plug-in, check that you have saved it with the correct name and path. Correct any error you find and repeat the operation.

AWSUI5056E The action "action" has properties not supported by the specified "pluginName" plug-in.

Explanation: See message text.

System action: Unable to open the Event Rule Editor.

Operator response: If you have modified the plug-in, check that you have saved it with the correct name and path. Correct any error you find and repeat the operation.

AWSUI5500E Unable to retrieve event configurations from the given engine.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the log to find information about the problem cause. Check that the host where the engine resides is up and running, try to ping it. Ensure that Tivoli Workload Scheduler is up and running on that host.

AWSUI5501E Unable to retrieve action configurations from the given engine.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the log to find information about the problem cause. Check that the host where the engine resides is up and running. Check that Tivoli Workload Scheduler is up and running on that host.

AWSUI5502E Unexpected look-up parameter type.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Try again to perform the operation. If the problem persists, contact IBM Software Support for assistance.

AWSUI5503E The event rule does not exist or has been previously deleted.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select a different event rule and retry the operation.

AWSUI5504E The event rule already exists.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Choose a different event rule name and retry the operation.

AWSUI5505E The event rule is incorrect, the error is: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Verify the information supplied for the event rule. Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI5506E Unable to create the filtering predicate because of the following error: "error"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI5507E Event rule type "event_rule_type" is not supported.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Choose a different event rule type. Retry the operation.

AWSUI5508E The event rule cannot be renamed because it is in Active state.

Explanation: While editing an event rule, you cannot rename it.

System action: The requested operation is not performed.

Operator response: To rename an event rule, return to the "Browse Event Rules" panel, select the rule, and select "Create Another" from the "More Actions" menu. Then save the new rule with the new name, and delete the original rule.

AWSUI5509E The event rule "rule_name" already exists.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Choose a unique event rule name and retry the operation.

AWSUI5510E The engine connection "engine_connection_name" does not exist.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Create the engine connection and retry the operation.

AWSUI5511E An error has occurred. No further information is available. Check the log files for more details.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the log files and take the appropriate action. If the problem persists contact IBM Software Support for assistance.

AWSUI5512E A Distributed engine connection is not available. To create engine connections, from the navigation tree click Settings -> Manage Engines, then click New and specify the engine parameters.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: To create engine connections, open Settings, browse to Manage Engines, click New and specify the engine parameters.

AWSUI5513E The specified MTE name is not valid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: The provided MTE name is not valid. Use a valid MTE name.

AWSUI5514E Unable to retrieve information. The z/OS engine connection credentials are not properly configured.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: On the Distributed engine, check that both user and password to be used to connect to the z/OS engine are properly configured.

AWSUI5515E Unable to retrieve information. The z/OS engine connection data is not properly configured.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: On the Distributed engine, check that the z/OS engine connection data (host name, port and server name) is properly configured.

AWSUI5516E Unable to retrieve information. No workstation has been specified.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify the name of a workstation where R3BATCH is installed and retry.

AWSUI6000E The operation cannot be completed because the following error occurred: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6001E The save operation cannot be completed.\nReason: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6002E The user ID or password is missing in the engine configuration.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Provide the user ID and password in the engine configuration and try again.

AWSUI6003E An authentication failure has occurred: the user ID or password is wrong.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the user ID and password in the engine configuration, correct the error, and try again.

AWSUI6004E The user specified in the engine configuration is not authorized to perform the selected operation. Specify another authorized user or ask the Tivoli Workload Scheduler administrator to grant the user the rights to perform the selected operation.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify another authorized user or ask the Tivoli Workload Scheduler administrator to grant the user specified in the engine configuration the rights to perform the selected operation.

AWSUI6005W No engine connection is available.To create engine connections, open Settings, browse to Manage Engines, click New and specify the engine parameters.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: To create engine connections, open Settings, browse to Manage Engines, click New and specify the engine parameters.

AWSUI6006W The object "object_name" is opened in read-only mode because of the following reason: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6007E The operation on object "object_name" was not completed because the following error occurred: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6008E The operation on object "object_name" was not completed because the following engine security error occurred: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: You have not enough permission to execute the operation. Contact the administrator.

AWSUI6009E The calendar: "calendar" specified on the runcycle: "runcycle" does not exists.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: The calendar specified on the runcycle does not exists. Specify another calendar name

to resolve the problem. Retry the operation.

AWSUI6010E The runcycle "runcycle" has no calendar defined.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: The runcycle has no calendar. Specify a calendar name to resolve the problem. Retry the operation.

AWSUI6011E Default calendar not found.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: The default calendar specified on the job stream was not found. Change the calendar name to resolve the problem. Retry the operation.

AWSUI6012E Error during lookup of workstation: "runcycle"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Error during lookup of workstation. Specify another workstation to resolve the problem. Retry the operation.

AWSUI6013E Workstation not specified.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a workstation name to resolve the problem. Retry the operation.

AWSUI6014W For job "name", "date1" is not less than "date2".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a date in the correct time interval. Retry the operation.

AWSUI6015W For job "name", "date1" is not less than "date2".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a date in the correct time interval. Retry the operation.

AWSUI6016W For run cycle "name", "date1" is not less than "date2".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a date in the correct time interval. Retry the operation.

AWSUI6017W For job stream "name", the dependency resolution might never be satisfied, because the To time is not greater than the From time.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a date in the correct time interval. Retry the operation.

AWSUI6018W For external dependency "depName" of object "name", the dependency resolution might never be satisfied, because the To time is not greater than the From time.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a date in the correct time interval. Retry the operation.

AWSUI6019E There must be at least one operation in a job stream

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Add at least a job to selected job stream or define it as a "group". Retry the operation.

AWSUI6020E Group definition cannot have operations

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Remove all the jobs from the selected job stream or uncheck "Group" field. Retry the operation.

AWSUI6021E The specified days exceed the schedule cycle length.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Ensure to not specify days over the schedule cycle length;

AWSUI6022E The specified days "days" exceed the schedule cycle "schedule" length.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Ensure to not specify days over the schedule cycle length;

AWSUI6023E The specified days exceed the period length.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Ensure to not specify days over the schedule cycle length;

AWSUI6024E The job stream "object_name" cannot be created because the job stream "locked_object_name" is locked by user "user".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Ensure to not specify days over the schedule cycle length;

AWSUI6025E The job stream "object_name" cannot be created because the job stream "locked_object_name" is locked.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Ensure to not specify days over the schedule cycle length;

AWSUI6026E The operation could not be completed. There has been a communication failure. The internal message is: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6027W The object "object_name" has been created but cannot be further modified because the following engine security error occurred: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Delete the object that was created, because it cannot be used. Retry the operation.

AWSUI6028W The specified job stream group "group_name" does not exist.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify an existing job stream group name or do not specify any value. Retry the operation.

AWSUI6029W The job stream "job_stream_name" in the condition "condition_id" on job "job_number" does not exist.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify an existing job stream in the condition. Retry the operation.

AWSUI6030E Unable to find plugin for type "plugin".

Explanation: It was not possible to find the plugin with specified identifier. It may have been uninstalled from the engine.

System action: The requested operation is not performed.

Operator response: Check the plugin installation.

AWSUI6031W For Run Cycle Group "name", "date1" is not less than "date2".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a date in the correct time interval. Retry the operation.

AWSUI6032E A run cycle cannot contain more than 4 periods

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the runcycle and Retry the operation.

AWSUI6033E A run cycle cannot contain more than 6 weeks number

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the runcycle and Retry the operation.

AWSUI6102E The version of the scheduler engine "engine_version" does not support the Workload Designer.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Connect to a different scheduler engine.

AWSUI6103E The fault-tolerant agent does not support the Workload Designer.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Connect to a different scheduler engine.

AWSUI6104W Specify a user ID and password for the engine connection.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Provide the user ID and password.

AWSUI6105E The user ID and password are required.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Provide the user ID and password.

AWSUI6106E Cannot complete the operation. Reason: "reason".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6107E The password and the confirmation password do not match.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enter the passwords again. Retry the operation.

AWSUI6113W The "date2" follows or is equal to the "date1".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a date in the correct time interval. Retry the operation.

AWSUI6114E The values set for Command text or Script name and Return code mapping expression must have no more than "max_chars" characters.

Explanation: The total number of characters in one or more of the specified fields exceeds the maximum supported limit.

System action: The requested operation is not performed.

Operator response: Reduce the number of characters in the specified fields. Retry the operation.

AWSUI6115E The values set for Script name and Return code mapping expression must have no more than "max_chars" characters.

Explanation: The total number of characters in one or more of the specified fields exceeds the maximum supported limit.

System action: The requested operation is not performed.

Operator response: Reduce the number of characters

in the specified fields. Retry the operation.

AWSUI6116W The time interval value specified by the "time2" time and the "time1" time is incorrect.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a time in the correct time interval. Retry the operation.

AWSUI6120W Some of the selected objects could not be deleted, check the message history for details.

Explanation: See message text. The objects you are trying to delete might be locked by another user or you might not have the required rights.

System action: The delete operation is performed only on the objects that can be deleted. The remaining objects remain unchanged.

Operator response: Correct the errors that prevent the object deletion. Retry the operation.

AWSUI6124W Some of the selected objects could not be unlocked, check the message history for details.

Explanation: See message text. The objects you are trying to unlock might be locked by another user or you might not have the required rights.

System action: The unlock operation is performed only on the objects that can be unlocked. The remaining objects remain unchanged.

Operator response: Correct the errors that prevent the operation. Retry the operation.

AWSUI6125E Cannot display the new window for the Workload Designer. Check the pop-up blocker settings in your browser

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the browser settings. Retry the operation.

AWSUI6126E At least one day must be defined for a calendar.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one date for the

calendar. Retry the operation.

AWSUI6129W Only 1 unit of the resource "resource" is available.

AWSUI6130W Only "available quantity" units of the resource "resource" are available.

AWSUI6131E At least one week day must be selected.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one week day. Retry the operation.

AWSUI6132E At least one day must be selected.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one week day. Retry the operation.

AWSUI6133E At least one date must be selected.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one week date. Retry the operation.

AWSUI6134E The connection with engine "engine name" has been temporarily lost.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Verify your connection with the engine. Retry the operation. When the connection is available again, save all your changes.

AWSUI6137W The following objects cannot be added to the selected item because they are not compatible with it: "comma separated list of object names"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Resolve the compatibility issue, if possible, or select compatible objects. Retry the operation.

AWSUI6138W The following objects could not be added to the selected item because they have pending changes that must be saved: "comma separated list of object names". Save the objects and then try again.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: See message text.

AWSUI6139E The following objects could not be saved because they are either incomplete or in error: "comma separated list of object names"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Resolve the error condition. Retry the operation.

AWSUI6142E The start date is later than the end date.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enter an end date that is later than the start date or leave the end date blank.

AWSUI6146E The "date2" follows or is equal to the "date1".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a date in the correct time interval. Retry the operation.

AWSUI6147E At least one offset must be defined for the runcycle.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one offset for the runcycle. Retry the operation.

AWSUI6148E At least one day and one type of day must be defined for the runcycle.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one day and one type of day for the runcycle. Retry the operation.

AWSUI6149E At least one cycle specification must be selected for the runcycle.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one cycle specification for the runcycle. Retry the operation.

AWSUI6151W The object "name" has been created, with the following warnings: "warnings"

AWSUI6152W The object "name" has been modified, with the following warnings: "warnings"

AWSUI6153W The Starting parameter for the runcycle "name" is now required. The parameter was filled with the value "value"

AWSUI6154E At least one type of day must be defined for the runcycle.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one type of day for the runcycle. Retry the operation.

AWSUI6155E At least one day, one type of day and one cycle specification must be defined for the runcycle.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one day, one type of day and one cycle specification. Retry the operation.

AWSUI6156E At least one type of day and one cycle specification must be defined for the runcycle.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one type of day and one cycle specification. Retry the operation.

AWSUI6157W In the Working List there is not any selected object. Select one or more objects and click the command icon again.

AWSUI6158W None of the selected objects has been saved, because of one or more of the following causes: objects are incomplete, in error, open in read-only mode, or have no unsaved changes.

AWSUI6159W Some of the selected objects have not been saved, because of one or more of the following causes: objects are incomplete, in error, open in read-only mode, or have no unsaved changes.

AWSUI6161W Some of the selected objects could not be edited, check the message history for details.

Explanation: See message text. The objects you are trying to lock might be locked by another user or you might not have the required rights.

System action: The lock operation is performed only on the objects that can be locked. The remaining objects remain unchanged.

Operator response: Correct the errors that prevent the operation. Retry the operation.

AWSUI6164E The specified days exceed the weekly cycle length.

Explanation: See message text. The specified days are invalid for the weekly cycle length (5).

System action: The Run Cycle can be evaluated only with days valid for the selected cycle.

Operator response: Correct the errors that prevent the operation. Retry the operation.

AWSUI6165E The specified days exceed the monthly cycle length.

Explanation: See message text. The specified days are invalid for the monthly cycle length (31).

System action: The Run Cycle can be evaluated only with days valid for the selected cycle.

Operator response: Correct the errors that prevent the operation. Retry the operation.

AWSUI6166E The specified days exceed the yearly cycle length.

Explanation: See message text. The specified days are invalid for the yearly cycle length (366).

System action: The Run Cycle can be evaluated only with days valid for the selected cycle.

Operator response: Correct the errors that prevent the operation. Retry the operation.

AWSUI6167E The specified days and weekdays are invalid for the length of the selected cycle.

Explanation: See message text. The specified days and the weekdays: Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday are invalid for the specified cycle length.

System action: The Run Cycle can be evaluated only with days and weekdays valid for the selected cycle.

Operator response: Correct the errors that prevent the operation. Retry the operation.

AWSUI6168E The action cannot be performed because there is no destination object.

Explanation: See message text. There is no destination object where to perform the operation.

System action: There is no destination object where to perform the operation.

Operator response: Create the destination object before to perform the action. Retry the operation.

AWSUI6169E The operation cannot be performed because the object does not exist.

Explanation: See message text.

System action: There is no object where to perform the operation.

Operator response: Correct the error and retry the operation. Retry the operation.

AWSUI6170W You must save this object before you can copy it.

Explanation: See message text.

System action: No action performed

Operator response: Correct the error and retry the operation. Retry the operation.

AWSUI6171E The operation could not be completed because the Tivoli Dynamic Workload Console server is unreachable. Possible causes are that the Tivoli Dynamic Workload Console server has been stopped or that your login authentication has expired or has become invalid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Verify your connection and the server status. Retry the operation.

AWSUI6171W You cannot paste here.

Explanation: See message text.

System action: No action performed

Operator response: Correct the error and retry the operation. Retry the operation.

AWSUI6172E An internal error has occurred.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Contact IBM Software Support for assistance. Retry the operation.

AWSUI6172W The selected objects cannot be added to the current item because it is not editable.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6173W The job stream you are working with has not yet been created in the database. You must create it in the database before you can proceed with the paste action.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the error and retry the operation. Retry the operation.

AWSUI6174W The copied "objectType" "objectName" belongs to a job stream that has not yet been created in the database. You must save the source job stream in the database at least once before you can paste the copied item.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the error and retry the operation. Retry the operation.

AWSUI6175W You have not copied any object to be pasted here.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the error and retry the operation. Retry the operation.

AWSUI6176W The object "copiedType" "copiedName" cannot be pasted on "targetType" "targetName" as its dependency.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the error and retry the operation. Retry the operation.

AWSUI6177W The print function is available for job streams only.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select a Job Stream to print. Retry the operation.

AWSUI6178W The resolution criterion of the copied dependency is set to Use default. Job Stream "name" might have a dependency resolution criterion other than the Job Stream from which the dependency has been copied.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6179E Duplicate dates exist in the table.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Change or remove one of the selected dates. Retry the operation.

AWSUI6180E Duplicate weekdays exist in the table.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Change or remove one of the selected weekdays. Retry the operation.

AWSUI6181E The operation could not be completed because your session has expired. Log into the console and then try again.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: See message text.

AWSUI6182E The operation could not be completed because an internal error occurred. The internal error is: "error_message"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Enable the product traces (see the Troubleshooting Guide for details) and rerun the operation. Contact IBM Software Support for assistance.

AWSUI6182W You must save this object before you can search for its operator instructions.

Explanation: See message text.

System action: No action performed

Operator response: Correct the error and retry the operation. Retry the operation.

AWSUI6183E The Job stream name and the job number are required to create an operator instructions object associated to this job.

Explanation: See message text.

System action: No action performed

Operator response: Specify the Job stream name and the job number and retry the operation. Retry the operation.

AWSUI6184E Variables can have only one "attributeType".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: See message text.

AWSUI6185W The job stream you are working with has not yet been created in the database. You must create it in the database before you can proceed with the create dependency action.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Correct the error and retry the operation. Retry the operation.

AWSUI6186W You must save this object before you can create any operator instructions.

Explanation: See message text.

System action: No action performed

Operator response: Save the job stream and retry the operation. Retry the operation.

AWSUI6187W The password you are inserting seems contains a variable. Variables are not replaced in password fields.

Explanation: See message text.

System action: No action performed

Operator response: Save the job stream and retry the operation. Retry the operation.

AWSUI6188W You must save this object before you can create any SAP Job Definition.

Explanation: See message text.

System action: No action performed

Operator response: Save the R3 Standard Job and retry the operation. Retry the operation.

AWSUI6189W There are open SAP objects associated with a workstation different from the one you specified. You must close the SAP objects before you can create a new SAP object on a different SAP system.

Explanation: See message text.

System action:

Operator response:

AWSUI6191E Current SAP R3 Standard job cannot be saved because it does not contain any steps.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Define one or more step in the SAP R3 Standard job that you want to save.

AWSUI6194W You must save this object before you can export it.

Explanation: See message text.

System action: No action performed

Operator response: Correct the error and retry the operation. Retry the operation.

AWSUI6195W The object has no children and cannot be exported.

Explanation: See message text.

System action: No action performed

Operator response: Correct the error and retry the operation. Retry the operation.

AWSUI6201W Page not ready. Loading in progress...

Explanation: The page you requested is currently being loaded.

System action: The requested operation is not performed.

Operator response: Wait while the operation completes.

AWSUI6202E Page not available.

Explanation: The page you are trying to display does not exist.

System action: The requested operation is not performed.

Operator response: Try another page number.

AWSUI6203E The page number is out of range.

Explanation: The page number that you specified is out of the available page number range.

System action: The requested operation is not performed.

Operator response: Try another page number.

AWSUI6204E Incorrect page number.

Explanation: The page number that you specified is not a correct page number.

System action: The requested operation is not performed.

Operator response: Try another page number.

AWSUI6205E The specified action cannot be performed because no item has been selected.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one item from the list or table and retry the operation.

AWSUI6206E Incorrect refresh interval value.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply an integer for this value.

AWSUI6207E The input is outside the accepted range of "minimum_value" to "maximum_value".

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Supply a value within the accepted range. Retry the operation.

AWSUI6208E The specified action cannot be performed on multiple items.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select only one item from the list or table and retry the operation.

AWSUI6209E An error occurred when trying to run a query on this engine. Details follow: "details"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Fix the error on Tivoli Workload Scheduler engine and run the task again.

AWSUI6210E Cannot display a new window. Check the pop-up blocker settings in your browser

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check the browser settings. Retry the operation.

AWSUI6211E The specified action cannot be performed on more than "number" items

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select less items from the list or table and retry the operation.

AWSUI6212E An error occurred when trying to display Graphical View on the selected object. {0}

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: An internal error occurred on the server when trying to display Graphical View on the selected object. Check the logs for further details. In a z/OS environment, a possible cause of this error is because a time out was reached while waiting for the Tivoli Workload Scheduler for z/OS controller to process the request you submitted. Retrying the operation might resolve the problem.

AWSUI6213E The specified action cannot be performed because no item has been selected.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Select at least one item from the list or table and retry the operation.

AWSUI6214E The specified action cannot be performed because the server cannot be contacted. Possible causes are that the Tivoli Dynamic Workload Console server has been stopped or that your login authentication has expired or has become invalid.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Check that the Dynamic Workload Console server is up and running, and that it is reachable. Check that the user session has not expired. If the session has expired, log in to the Dynamic Workload Console and retry the operation.

AWSUI6215W A partial list of results is displayed. The maximum number of results to display is set by the administrator.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Specify a different filter to reduce the number of items returned by the query.

AWSUI6216W The filter may be not accurate, due the plan occurs during the DST changes.

Explanation: Quick filter feature has a limitation when a filter is made on one or more date column, the engine is working with plan on the database, and the plan occurs across DST change. Show results may not be the correct one

System action: The requested operation is not performed.

Operator response: Use standard filters available on the task, to filter the result.

AWSUI6401E An error occurred while submitting the action "action" on object "object". Reason: "error"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6402E A dependency cannot be created here. Choose two valid objects and create the dependency link between them.

Explanation: A dependency can be created only between two jobs belonging to the same job stream.

System action: The requested operation is not performed.

Operator response: See message text.

AWSUI6405W The job stream contains a dependency loop. The dependencies that are part of the loop have been highlighted.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6406E The following error occurred while opening the view: "error"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6409E The job stream cannot be displayed in the graphical view, because it contains more than "object" dependencies, which is the maximum supported number.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6410W You are deleting a condition for which not all the dependencies are displayed. To view all of them expand the predecessors of job "object". Do you want to proceed with deletion?

AWSUI6411E No workload definition found for object "object". This may happen in case of ad-hoc submissions, in case of objects running with an alias or you may have no enough permission to open the object.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6413E You are not authorized to perform this operation.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the

error_message to diagnose and resolve the problem. Retry the operation.

AWSUI6414E An error occurred when launching the graphical view: "error"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6415W The number of job streams returned by the query exceeds the limit of "displayed_entries". The view displays only "displayed_entries" job streams.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6418E An error occurred while submitting the action "action" on workstation "object". Reason: "error". Please note that link and unlink actions are only applicable to fault-tolerant workstations.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Use the information in the *error_message* to diagnose and resolve the problem. Retry the operation.

AWSUI6419W The selected action is not supported for engines defined when launching the task.

AWSUI6420W The specified interval is not valid. A valid interval for this preproduction plan is from "from_value" to "to_value".

Explanation: The entered time period exceeds the plan dates. You must specify a time interval included between the start and end dates of the plan associated to the selected engine.

System action: Keep the default showing whole plan or specify a time interval included between the plan start and end.

Operator response: The specified interval is ignored and the default is used. The whole preproduction plan will be shown.

AWSUI6500E The specified engine was not found. It might have been deleted or it is no longer shared to you.

Explanation: See message text.

System action: The requested operation is not performed.

Operator response: Modify the task specifying a different engine.

AWSUI6502E Error occurred while executing the action. "reason"

Explanation: See message text.

System action: The requested operation is not performed.

Operator response:

AWSUI6509W You have pending changes. Click OK to discard the changes and proceed with current action.

Explanation: See message text.

System action: The requested operation has been completed successfully.

Operator response:

AWSUI6510E Criteria profile "name" was not saved successfully.

Explanation: See message text.

System action: The requested operation has been completed successfully.

Operator response:

AWSUI6511W This action deletes all of the Dynamic Workload Console tables in the database and then recreates them from scratch. This action requires administrative authority for the database instance. Provide the credentials of a user with this level of authority.

Explanation: See message text.

System action: The requested operation has been completed successfully.

Operator response:

AWSUI6515E The required feature does not support the selected engine version. Selected engine is "versionFound"; the required feature supports engines "requiredVersion" or higher.

Explanation: You are trying to access to a feature not

supported for the specified engine.

System action: The requested operation has been completed successfully.

Operator response:

AWSUI6516W The specified criteria to relaunch jobs already exists for this profile. The relaunch criteria is not created.

Explanation: See message text.

System action: The requested operation has been completed successfully.

Operator response:

AWSUI6517E The Criteria Manager is not supported with the specified engine and workstation.

Explanation: You are trying to access to a feature not supported for the specified engine and/or workstation. Refer to the manual for supported combination

System action: The requested operation has been completed successfully.

Operator response:

AWSUI6518W This action creates all of the database tables required to use the Self-service Catalog. This action requires administrative privileges for the database. Provide the credentials of a user with these privileges.

Explanation: See message text.

System action: The requested operation has been completed successfully.

Operator response:

AWSUI6520E Workstation does not exists.

Explanation: See message text.

System action: The requested operation has been completed successfully.

Operator response:

AWSUI6524E Either the workstation or the user does not exists.

Explanation: See message text.

System action: The requested operation has been completed successfully.

Operator response:

AWSUI6525E

AWSUI6525E The selected engine does not support
Pre-Production Plan View.

Explanation: See message text.

System action: The requested operation has been
completed successfully.

Operator response: An engine at least of version 9.1 is
required to view the pre-production plan view.

Part 4. Tivoli Workload Scheduler for Applications messages

This part describes many of the messages issued by Tivoli Workload Scheduler for Applications and its agent processes.

It is divided into the following sections:

- Chapter 239, “IBM Tivoli message format,” on page 1531 explains the message standard used by Tivoli Workload Scheduler for Applications.
- The messages, presented in alphabetic order of the subcomponent codes. The following table helps you to find message help for a specific component.

Table 1. Tivoli Workload Scheduler for Applications messages - component codes

Message set description	Message component ID		Section
z/OS gateway	EEW	I	Chapter 240, “z/OS gateway messages - I,” on page 1535
PeopleSoft access method	EEW	N	Chapter 241, “PeopleSoft access method messages - N,” on page 1541
R/3 access method	EEW	O	Chapter 242, “SAP R/3 access method messages - O,” on page 1545
Oracle access method	EEW	P	Chapter 243, “Oracle access method messages - P,” on page 1583
Applications installer	EEW	AI	Chapter 244, “Applications installer messages - EEWAI,” on page 1585
Plug-in installer	EEW	AI	Chapter 245, “Plug-in installer messages - EEWAI,” on page 1587
Tivoli Workload Scheduler for Visualized Data Centers, used by the PeopleSoft access method	HTW	GT	Chapter 246, “PeopleSoft access method messages - HTWGT,” on page 1589

Note: This guide does not contain any details about Informational messages, because they are complete within themselves, and do not need further explanation.

Messages

Chapter 239. IBM Tivoli message format

This section describes the format of the message that is displayed on your screen or written in a log file. A message consists of a message number and a message text. This chapter also includes help for many of the more important error and warning messages. This help consists of an explanation of the message, a description of what the system does, and information about what you should do to solve the problem.

Message number

Tivoli Workload Scheduler for Applications message numbers (codes) have the following format:

xxxcomponent_codenumeric_identifiersseverity

where the parts of the message are as follows:

xxx The product prefix, which can be:

EEW For all Tivoli Workload Scheduler for Applications messages.

EEWAI

For Applications and Plug-in installers messages.

HTWGT

For Tivoli Workload Scheduler for Visualized Data Centers, used by the PeopleSoft access method messages.

component_code

An alphabetic code for the Tivoli Workload Scheduler for Applications component, as follows:

I Tivoli Workload Scheduler for Applications z/OS gateway messages.

O Tivoli Workload Scheduler for Applications R/3 access method messages.

P Tivoli Workload Scheduler for Applications Oracle access method messages.

N Tivoli Workload Scheduler for Applications PeopleSoft access method messages.

numeric_identifier

A 2-, 3-, or 4-digit numeric identifier that is unique within any combination of prefix and component code.

severity

The severity indicator, as follows:

I **Informational:** Informational messages provide users with information or feedback about normal events that have occurred or are occurring, or request information from users in cases where the outcome will not be negative, regardless of the response.

Examples:

- The status request is processing.
- The files were successfully transferred.

Message format

- Do you want to save your output in file a or in file b?

W **Warning:** Warning messages indicate that potentially undesirable conditions have occurred or could occur, but the program can continue. Warning messages often ask users to make decisions before processing continues.

Examples:

- The replay table could not be sent. The link to *Agent_name* proceeds with a reduced replay protocol.
- A file already exists with the same name. Do you want to overwrite this file?

E **Error:** Error messages indicate problems that require intervention or correction before the program can continue.

Examples:

- The specified file could not be found.
- You are out of space on the x drive. The file cannot be saved to this drive.

An example of an error message number is as follows:

```
EEWAI004E
```

Message text

Every attempt has been made to represent the message text exactly as it appears to the user in the displayed or written message. Any differences that occur are usually caused by the different layout of the book (in two columns) with respect to the message display panel or log.

Where the system has included variable information in the message text, this variable information is represented in this guide by an italicized label, describing the type of information referred to by the variable. For example, if the message text that appears on your screen is:

```
The replay table could not be sent.  
The link to TRC8470 will proceed with a reduced replay protocol.
```

the message text shown in the guide would be:

```
The replay table could not be sent.  
The link to agent_name will proceed with a reduced replay protocol.
```

In this case the label *agent_name* tells you that the information that will be inserted by the system is the name of the agent which could not receive the replay table.

Message help

This chapter provides you with help for many of the more important error and warning messages. This help provides the following:

Explanation

An explanation, where necessary, of the message text.

System action

A description of what the system or process does as a result of the condition that caused the message.

Operator response

What you should do in response to the condition that caused the message. Often you will be able to resolve such conditions yourself, but sometimes you will be asked to contact IBM Software Support.

See also

A reference to any Tivoli Workload Scheduler for Applications documentation that might give you assistance with understanding or resolving the problem.

Message format

Chapter 240. z/OS gateway messages - I

This section lists *error* and *warning* messages issued by the z/OS gateway processes. Most messages contains a reference to modules. Table 2 includes a list of these modules.

Table 2. z/OS module names

Module Name	Description
EEWPRE84	Previous SMF exit
EEWTCP00	Main processing routine
EEWTCP01	Server test vehicle
EEWTCP02	Main dataspace construction routine
EEWTCP05	Establish ESTAE routine to issue failure message
EEWTCP07	Find data set name associated with open ACB/DCB
EEWTCP08	Find data set name associated with DDNAME
EEWTCP10	Initialize and examine variables
EEWTCP15	Locate and initialize control blocks
EEWTCP20	Locate and initialize control blocks
EEWTCP21	Client test vehicle
EEWTCP22	Client test vehicle
EEWTCP23	Client test vehicle
EEWTCP25	Concurrent server
EEWTCP26	Concurrent server for Interlink TCP/IP provider
EEWTCP27	Concurrent server for Openconnect TCP/IP stack
EEWTCP30	Child server task
EEWTCP31	Child server task for Interlink TCP/IP stack
EEWTCP32	Child server task
EEWTCP84	SMF record exit for SMFEWTM
EEWTCP87	Tivoli Workload Scheduler interface
EEWTCP88	Tivoli Workload Scheduler interface post
EEWTCP90	Issue command and wait for response
EEWTCP91	Issues TERROR to format messages and issues WTOS
EEWTCP92	Find substring within string
EEWTCP94	STIMER exit to post ECB past in parm
EEWTCP95	Calls IKJEFF02 to extract buffer using EEWTC99
EEWTCP96	ESTAE routine to issue failure message
EEWTCP97	Calls IKJEFF19 (DAIRFAIL/VSAMFAIL) to issue message
EEWTCP98	Calls IKJEFF02 to issue message from EEWTC99
EEWTCP99	Message table
EEWTCPCA	Check application request handler
EEWTCPCF	Check file request handler

Table 2. z/OS module names (continued)

Module Name	Description
EEWTCPCJ	Check job request handler
EEWTCPCO	Check operation request handler
EEWTCPCV	Enumerate job
EEWTCPED	String encrypt/decrypt
EEWTCPEJ	Enumerate job request handler
EEWTCPFJ	Free job request handler
EEWTCPIA	Insert application
EEWTCPIE	String initialization
EEWTCPKJ	Kill job request handler
EEWTCPKO	Delete Tivoli Workload Scheduler application
EEWTCPLJ	Launch job request handler
EEWTCPLO	Insert Tivoli Workload Scheduler application
EEWTCPQJ	Query job request handler
EEWTCPQO	Query Tivoli Workload Scheduler application
EEWTCPQS	Query subsystem request handler
EEWTCPRC	Return code
EEWTCPSC	System abend
EEWTCPSE	String encryption/decryption
EEWTCPUC	User abend
EEWTCPWT	Wait for specified amount of time
EEWTCPXX	Invalid request handler

All the messages listed below are written in the EEWSPACE or in the EEWSERVE log files. These are the files indicated in the SYSTSPRT DD card of the respective procedure. In the files the messages are written starting from column 1, except for the messages that do not contain the date and time after the message identifier, for example EEWI27I. These messages display with different characteristics in the z/OS system and on the Tivoli Workload Scheduler. In the z/OS system log the messages appear in the text of another message and in some cases they might appear truncated. This is because the maximum length of each text record is 251 characters. In Tivoli Workload Scheduler they are always displayed in their complete form.

EEWI01 - EEWI42

EEWI01E *yymdd hhmmss module* **FAILED,**
MACRO *macro* **NEAR LABEL** *label*
WITH RETURN CODE = *reason code* **&**
REASON CODE = *reason code*

Explanation: The specified module failed because an error occurred in the specified macro. One possible cause might be a TCP/IP connection problem.

yymdd hhmmss

The date and time the error occurred.

module The name of the module that issued the message. For a detailed list, see Table 2 on page 1535.

macro The name of the macro after that the error message was issued.

label The name of the label in the source code nearest to the instruction that failed.

return code

The return code value.

reason code

The reason code value.

System action: The system proceeds.

Operator response: Verify the return code and the reason code specified in the message to understand the error. If the problem persists contact IBM Software Support for assistance.

EEWI02E *yymmdd hhmss module* **FAILED, MACRO** *macro* **NEAR LABEL** *label* **WITH RETURN CODE =** *return code* **& ERROR NUMBER =** *error number*

Explanation: The specified module failed because an error occurred in the specified macro. One of the possible causes can be TCP/IP connection problem.

yymmdd hhmss

The date and time the error occurred.

module The name of the module that issued the message. For a detailed list, see Table 2 on page 1535.

macro The name of the macro after which the error message is issued.

label The name of the label in the source code nearest to the instruction that failed.

return code

The return code value.

error number

The error number.

System action: The system proceeds.

Operator response: Verify the return code and the error number specified in the message to understand the error. If the problem persists contact IBM Software Support for assistance.

EEWI08S *yymmdd hhmss module* **FAILED, AT OFFSET** *offset*

Explanation: See text. This message is issued by the ESTAE routine.

yymmdd hhmss

The date and time the error occurred.

module The name of the module that issued the message. For a detailed list, see Table 2 on page 1535.

offset The offset value.

System action: The system stops.

Operator response: Set SVCDUMP to YES collect the dump and send it to IBM Software Support for assistance.

EEWI10S *yymmdd hhmss module* **ABENDED WITH ASSOCIATED REASON CODE** *reason code*

Explanation: The specified module ended abnormally with the specified reason code.

yymmdd hhmss

The date and time the error occurred.

module The name of the module that issued the message. For a detailed list, see Table 2 on page 1535.

reason code

The reason code value.

System action: The system stops.

Operator response: Restart the start task that contains the module. If the problem persists contact IBM Software Support for assistance.

EEWI15E *yymmdd hhmss module* **DATASET "dataset" DDNAME "dd" FAILED TO OPEN NEAR LABEL** *label*

Explanation: The specified data set is not available.

System action: The system proceeds.

yymmdd hhmss

The date and time the error occurred.

module The name of the module that issued the message. For a detailed list, see Table 2 on page 1535.

data set The name of the data set that failed to open.

dd The internal dd.

label The name of the label in the source code nearest to the instruction that failed.

Operator response: Verify one of the following conditions:

- The data set was not deleted.
- The data set is not in use.
- You are authorized to use the specified data set.

If the problem persists contact IBM Software Support for assistance.

EEWI18E *yymmdd hhmss module* **INVALID TERMINATOR** *term*

Explanation: You specified an invalid value for the TERMINATOR parameter.

yymmdd hhmss

The date and time the error occurred.

module The name of the module that issued the message. For a detailed list, see Table 2 on page 1535.

EEWI19E • EEWI32S

term The value you assigned to the TERMINATOR parameter.

System action: The system stops.

Operator response: Specify a valid value for the TERMINATOR parameter and restart the start task. The default value is x'25'.

EEWI19E *yymmdd hhmmss module* **near label label invalid value found** *name = value*

Explanation: You specified an invalid value for the TERMINATOR parameter.

yymmdd hhmmss

The date and time the error occurred.

module The name of the module that issued the message. For a detailed list, see Table 2 on page 1535.

label The name of the label in the source code nearest to the instruction that failed.

name The name of the variable that has an invalid value.

value The actual value of the variable.

System action: The system stops.

Operator response: Specify a valid value for the TERMINATOR parameter and restart the module. The default value is x'25'.

EEWI20E *yymmdd hhmmss module* **NEAR LABEL label FAILED TO FIND ACTIVE SMF IEFU84 EXIT**

Explanation: The IEFU84 exit is not active.

yymmdd hhmmss

The date and time the error occurred.

module The name of the module that issued the message. For a detailed list, see Table 2 on page 1535.

label The name of the label in the source code nearest to the instruction that failed.

System action: The system stops.

Operator response: Activate the IEFU84 exit.

EEWI24E *yymmdd hhmmss module* **NEAR LABEL label error description**

Explanation: The IEFU84 exit is not active.

yymmdd hhmmss

The date and time the error occurred.

module The name of the module that issued the message. For a detailed list, see Table 2 on page 1535.

label The name of the label in the source code nearest to the instruction that failed.

error description

The description of the error. Possible values are:

- Unkwown status in occurrence record
- Tivoli Workload Scheduler current plan status in not active

System action: The system stops.

Operator response: If the problem persists, contact IBM Software Support for assistance.

EEWI27I **APPLICATION** *application* **WAS INSERTED IN CURRENT PLAN WITH INPUT ARRIVAL DATE AND TIME** *yymmdd hhmmss*

Explanation: There is no further help information available.

EEWI28W *yymmdd hhmmss* **APPLICATION application WAS NOT INSERTED IN CURRENT PLAN WITH INPUT ARRIVAL DATE AND TIME** *iadatetime*

Explanation: The specified application was not submitted in the current plan.

yymmdd hhmmss

The date and time the error occurred.

application

The name of the application that was not submitted in the current plan.

iadatetime

The input arrival date and time.

System action: The system proceeds.

Operator response: Verify the following:

- The date and time on which you submitted the application is outside the validity interval specified when the application was defined.
- The input arrival date and time specified during the submission is outside the current plan validity interval.
- You did not already submit this application with the same input arrival date and time.

EEWI32S *yymmdd hhmmss module* **AT LEAST ONE INTERFACE MUST BE DIFFERENT FROM NODE**

Explanation: Both the Tivoli Workload Scheduler for z/OS and JES interfaces are set to NO. One must be set to YES, otherwise the access method has no interface with which to communicate.

yymmdd hhmmss

The date and time the error occurred.

module The name of the module that issued the message. For a detailed list, see Table 2 on page 1535.

System action: The system stops.

Operator response: Specify a value other than NO for either of the parameters: JESINTERFACE, and OPCINTERFACE. Start the started task again.

EEWI33W *yymmdd hhmss* **TASK** *task*
APPLICATION *application* **CANNOT BE**
INSERTED IN THE CURRENT PLAN

Explanation: The occurrence could not be inserted in the current plan of Tivoli Workload Scheduler for z/OS.

yymmdd hhmss
The date and time the error occurred.

task The name of the task that issued the message.

application
The name of the application that was submitted in the current plan.

System action: The system proceeds.

Operator response: Define the *application* correctly in the Tivoli Workload Scheduler for z/OS database and restart the request.

EEWI34W **APPLICATION** *application* **CANNOT BE**
INSERTED IN THE CURRENT PLAN

Explanation: The occurrence could not be inserted in the current plan of Tivoli Workload Scheduler for z/OS.

Possible reasons are:

- The application is not defined in the Tivoli Workload Scheduler for z/OS Application Description database
- The application valid-from date is later than the current plan end date

System action: The system proceeds.

Operator response: Define the *application* correctly in the Tivoli Workload Scheduler for z/OS database and restart the request.

EEWI35W **JCL** *dataset(member)* **NOT FOUND**

Explanation: The indicated JCL was not found in the JCL library.

dataset The name of the data set that was expected to contain the JCL.

member The name of the member containing the JCL.

System action: The system proceeds.

Operator response: Define the JCL in the correct member of the data set and restart the request.

EEWI36W *yymmdd hhmss* **IA AND IATIME**
CANNOT BE SPECIFIED TOGETHER

Explanation: Both the IA and the IATIME parameters were supplied in the task definition.

yymmdd hhmss
The date and time the error occurred.

System action: The system proceeds.

Operator response: Reissue the request, supplying only one of the indicated parameters.

EEWI37W *yymmdd hhmss* **DEADLINE AND**
DEADLINETIME CANNOT BE
SPECIFIED TOGETHER

Explanation: Both the DEADLINE and the DEADLINETIME parameters were supplied in the task definition.

yymmdd hhmss
The date and time the error occurred.

System action: The system proceeds.

Operator response: Reissue the request, supplying only one of the indicated parameters.

EEWI38I **jobname** (*jobid*) *n1 n2 result restype*

Explanation: See text.

jobid The identifier of the job.

n1 The number of seconds passed from the request.

n2 The number of seconds of CPU time consumed.

result Can be one of the following values:

ABEND

If the job ends abnormally. In this case *restype* can be:

Sxyz System Abend

Unnnn User Abend

CONDCOD

The job does not end successfully due to the condition code of one step that does not match the definition. In this case *restype* contains: the RC=*nnnnn* value of the return code of the last step that was run, if LASTSTEP specified, or of the worst step that does not match the definition of the job on the distributed side.

EXEC If the job is running or is in the input queue.

JCLERRO

If the job failed due to a JCL error.

EEWI42I

SUCCESS

If the job completed successfully.

UNKNOWN

If the job ID is unknown.

blank

In case of an internetwork dependency when the manual submission was not performed.

EEWI42I *yyymmdd hhmmss* TASK *task* MODULE
EEWTCP65 ISSUED, MACRO 'EZASMI
TYPE=GETPEERNAME' NEAR LABEL
'M2505710' TO GET PEER ADDRESS =
address

Explanation: See text.

yyymmdd hhmmss

The date and time the error occurred.

task

The name of the task.

address

The address of the remote partner.

Chapter 241. PeopleSoft access method messages - N

This section lists *error* and *warning* messages that might be issued by the PeopleSoft access method processes.

Note: In addition to these messages, the PeopleSoft access method also issues messages which it shares with Tivoli Workload Scheduler for Visualized Data Centers, and which are listed under the product code HTW and the component code GT (see Chapter 246, "PeopleSoft access method messages - HTWGT," on page 1589).

EEWN0070 - EEWN0120

EEWN0070E The connection to the server "*server*" for user "*user*" has failed.

Explanation: The connection to the PeopleSoft application server could not be made or has failed. This can be due to any of the following reasons:

- The PeopleSoft user ID, or its password, or both, are incorrectly specified in the options file
- The PeopleSoft application server IP address or host name, or its port number, or both, are incorrectly specified in the options file
- The PeopleSoft application server refused the connection.
- A network failure occurred.

System action: The PeopleSoft process cannot be submitted and monitored.

Operator response: Verify that the values in the options file for the PeopleSoft user, its encrypted password, the application server address, and the application server port are correct.

If the option values are correct, then analyze the PeopleSoft application server log for the failed connection attempt.

When you have found the problem, correct it and retry the operation.

EEWN0100W Option "*lower_option(lower_option_value)*" must have a value not greater than option "*higher_option(higher_option_value)*".

Explanation: See message.

System action: The program continues, using the default values for these options.

Operator response: If you do not want to use the default values, stop the program, change the options so that the value of the *lower_option* is not greater than the value of the *higher_option*, and restart the program.

EEWN0101W Option "*option(value)*" is not a positive value.

Explanation: The indicated option must have a positive value.

System action: The program continues, using the default values for this option.

Operator response: If you do not want to use the default values, stop the program, change the option to a positive value and restart the program.

EEWN0102W Option "*option(value)*" is greater than the maximum value allowed (*maximum_value*).

Explanation: See message.

System action: The program continues, using the default values for this option.

Operator response: If you do not want to use the default values, stop the program, change the option to a value not greater than the maximum allowed, and restart the program.

EEWN0104E The method failed to submit and monitor the PeopleSoft process to completion due to a connection failure.

Explanation: See message.

System action: The Tivoli Workload Scheduler job is put into the "abend" status.

Operator response: Check the values of the options that define the connection (application server name or IP address, application server port, user ID, and password). If the values are correct, check if there were network failures at the time of the submission. When you have identified and fixed the problem, run the Tivoli Workload Scheduler job again.

EEWN0105E The process submission failed due to a conflict in the PeopleSoft database. The submission was tried *number_of_tries* times.

Explanation: The access method was unable to submit the PeopleSoft process. No further submission attempts will be made because the maximum number of retries (*tws_retry* option value) has been reached. The error was due to an unmanaged conflict between concurrent database save operations in PeopleSoft. This might occur when several Tivoli Workload Scheduler jobs submit the same PeopleSoft process, and that process uses inline bind variables.

System action: The PeopleSoft process could not be submitted. The Tivoli Workload Scheduler job is put into the "abend" status.

Operator response: Rerun the Tivoli Workload Scheduler job. If the problem persists, contact IBM Software Support for assistance.

EEWN0106E The process submission has failed for an unknown reason.

Explanation: See message.

System action: The Tivoli Workload Scheduler job is put into the "abend" status.

Operator response: Check the Tivoli Workload Scheduler job definition. Check that all parameters are correct and that the referred objects all exist. Retry the operation. If the problem persists, contact IBM Software Support for assistance.

EEWN0107E The monitoring of the PeopleSoft process has failed.

Explanation: See message.

System action: The Tivoli Workload Scheduler job is put into the "abend" status.

Operator response: Monitor the PeopleSoft process in the PeopleSoft Process Monitor page.

EEWN0110W The process submission has failed due to a conflict in the PeopleSoft database. The submission is retried until the maximum number of retries is reached.

Explanation: See message.

System action: The program tries to resubmit the PeopleSoft process until the maximum number of retries is reached (the value of the *tws_reply* option).

Operator response: None.

EEWN0111E The submission, control, or monitoring of the PeopleSoft process has failed for an unknown reason. The access method does not attempt to resubmit it.

Explanation: See message.

System action: The Tivoli Workload Scheduler job is put into the "abend" status.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

EEWN0112E The process submission attempt failed due to a possible connection failure.

Explanation: See message.

System action: The Tivoli Workload Scheduler job is put into the "abend" status.

Operator response: Check the values of the options that define the connection (application server name or IP address, application server port, user ID, and password). If the values are correct, check if there were network failures at the time of the submission. When you have identified and fixed the problem, run the Tivoli Workload Scheduler job again.

EEWN0113W The attempt to monitor the progress of the PeopleSoft job has failed. The attempt is retried until the maximum number of retries is reached.

Explanation: See message.

System action: The program tries to monitor the PeopleSoft process until the maximum number of retries is reached (the value of the *tws_reply* option).

Operator response: None.

EEWN0119E The retrieved run status (*status*) has an incorrect format.

Explanation: See message.

System action: The Tivoli Workload Scheduler job is put into the "abend" status.

Operator response: Resubmit the PeopleSoft process. If the problem persists, contact IBM Software Support for assistance.

EEWN0120E An internal error "*exception*" has occurred. The error message is: "*exception_message*".

Explanation: See message.

System action: The Tivoli Workload Scheduler job is put into the "abend" status.

Operator response: Resubmit the PeopleSoft process.

If the problem persists, contact IBM Software Support for assistance.

Chapter 242. SAP R/3 access method messages - O

This section lists *error* and *warning* messages that might be issued by the SAP R/3 access method processes.

EEWO0001 - EEWOJT0214

EEWO0001E Job aborted.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0010E The extended agent has not started. The command to launch it included no options.

Explanation: See message.

System action: R3batch stops

Operator response: See the *User's Guide* for a list of the parameters you can specify with the **r3batch** command. Reissue the command with the correct parameters.

See also: The *User's Guide* for details of the command syntax.

EEWO0011E The extended agent has not started. The command to launch it has syntax errors.

Explanation: See message.

System action: R3batch stops.

Operator response: See the *User's Guide* for a list of the parameters you can specify with the **r3batch** command. Reissue the command with the correct parameters.

See also: The *User's Guide* for details about the command syntax.

EEWO0012E The extended agent could not be initialized.

Explanation: See message.

System action: R3batch stops.

Operator response: Check that the connections between the SAP system and the local host are correct. Check also that the local options file exists, is in the correct directory, has read permission for the user running **r3batch**, and is not corrupt. When you have found and corrected the error, rerun **r3batch**.

EEWO0013E The extended agent could not find the following Tivoli Workload Scheduler home directory: *TWS_home*.

Explanation: *TWS_home* is the directory where Tivoli Workload Scheduler is installed.

System action: R3batch stops.

Operator response: Check that the directory indicated in the message has the correct name, that it exists, and that it has read permission for the user running **r3batch**. When you have found and corrected the error, rerun **r3batch**.

EEWO0014E The extended agent could not find the following method options file: *accessmethod_options_file*.

Explanation: *accessmethod_options_file* is the file that contains the R/3 method options.

System action: R3batch stops.

Operator response: Check that the file indicated in the message has the correct name, that it exists, and that it has read permission for the user running **r3batch**. If the file is missing, follow the instructions that describes how to create it in the *User's Guide*. When you have found and corrected the error, rerun **r3batch**.

See also: The *User's Guide* for the instructions on how to create the method options file.

EEWO0015E The method options file: *accessmethod_options_file* for the following job: *jobname* does not contain the required options.

Explanation: *accessmethod_options_file* is the file that contains the R/3 method options.

jobname is the name of the job that you are trying to run.

System action: R3batch stops.

Operator response: Check in the *User's Guide* for details about the options that must be supplied for the job that you want to run. When you have found and corrected the error, rerun **r3batch**.

See also: The *User's Guide* for details about the

options you must include in the method options file for each type of job.

EEWO0016E The method options file: *accessmethod_options_file* for the following job: *jobname* does not contain all of the required options.

Explanation: *accessmethod_options_file* is the file that contains the R/3 method options.

jobname is the name of the job that you are trying to run.

System action: R3batch stops.

Operator response: Check in the *User's Guide* for details about the options that must be supplied for the job that you want to run. When you have found and corrected the error, rerun **r3batch**.

See also: The *User's Guide* for details about the options you must include in the method options file for each type of job.

EEWO0017E An internal I/O error occurred reading the following method options file: *accessmethod_options_file*.

Explanation: *accessmethod_options_file* is the file that contains the R/3 method options.

System action: R3batch stops.

Operator response: Check the following:

- The file system where the method options file is located has enough memory available.
- The file has read permission for the user that is running **r3batch**.
- The operating system has not reached the maximum number of files it can have open at the same time.

When you have found and corrected the error, rerun **r3batch**.

EEWO0018E An internal I/O error occurred reading the following method options file: *accessmethod_options_file*.

Explanation: *accessmethod_options_file* is the file that contains the R/3 method options.

System action: R3batch stops.

Operator response: Check the following:

- The file system where the method options file is located has enough memory available.
- The file has read permission for the user that is running **r3batch**.
- The operating system has not reached the maximum number of files it can have open at the same time.

When you have found and corrected the error, rerun **r3batch**.

If the error persists, contact IBM Software Support for assistance.

EEWO0019E An internal error occurred while trying to initialize the TWSMETH_CP code page.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0020E An internal error occurred while trying to decrypt the R/3 password.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0030E An error occurred while trying to convert a timestamp read from SAP R/3 system.

Explanation: See message.

System action: R3batch stops.

Operator response: Check the timestamp on SAP R/3 is valid.

EEWO0031E The value *EIF_Port_Number* is not a valid EIF port number.

Explanation: See message.

System action: The program stops.

Operator response: Specify a valid port number, in the range 0 - 65535.

EEWO0032E Cannot open the event configuration file *CFG_File*.

Explanation: See message.

System action: The program stops.

Operator response: Verify that the file exists and is readable.

EEWO0033E Cannot create the PID file for the extended agent *XANAME*.

Explanation: See message.

System action: The program stops.

Operator response: The monitoring process was

unable to create the file in which to store the PID number. For detailed information, see the trace file for the extended agent workstation indicated in the message.

EEWO0034E An internal error occurred while parsing the event configuration file for the *XAname* workstation.

Explanation: See message.

System action: The program stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0035E Monitoring of the *XAname* workstation is already running. Program exiting.

Explanation: See message.

System action: The program stops.

Operator response: Ensure that only one instance of the event monitoring runs on one extended agent workstation.

EEWO0036E The monitoring process failed to daemonize.

Explanation: See message.

System action: The program stops.

Operator response: For detailed information, see the trace file for the extended agent workstation indicated in the message.

EEWO0037E An error occurred: Parameter EIFSRV is missing.

Explanation: See message.

System action: R3batch stops.

Operator response: Specify the parameter EIFSRV on the command line.

EEWO0038E An error occurred: Parameter EIFPORT is missing.

Explanation: See message.

System action: R3batch stops.

Operator response: Specify the parameter EIFPORT on the command line.

EEWO0100E An internal error has occurred. The following unknown BAPI return code: *BAPI_return_code* (*BAPI_message*) was received while calling the following function: *function*.

Explanation: *BAPI_return_code* is the code returned by the BAPI module.

BAPI_message is the message associated with the code returned by the BAPI module.

function is one of the functions used by the program.

System action: R3batch stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0101E The following ABAP module cannot be found: "*ABAP_module*". All required ABAP modules must be installed before running the extended agent.

Explanation: *ABAP_module* is a required module that has not been installed.

System action: R3batch stops.

Operator response: Use the *User's Guide* to determine the ABAP modules required. Contact your SAP system administrator to have them installed.

See also: The *User's Guide* for details about the ABAP modules required.

EEWO0102E An internal error has occurred. The function *ItCreate* has failed for the following object: *object* in the following module: *module*.

Explanation: *object* is the object that the function *ItCreate* was trying to perform on.

module is the module being processed.

System action: R3batch stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0103E R3batch has run out of memory (the function *RfcAllocParamSpace* has failed in the following module: *module*).

Explanation: *module* is the module being performed.

System action: R3batch stops.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler for Applications is provided in the *Download Document*. If not, you might need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **r3batch**. Rerun **r3batch**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun **r3batch**.

EEWO0104E • EEW00112E

3. If the problem persists, reboot the workstation, and then rerun **r3batch**.
4. If the problem persists, contact IBM Software Support for assistance.

See also: The *Download Document* for details about memory requirements.

EEWO0104E An internal error has occurred. The RFC system failed while calling the following module: *module*.

Explanation: *module* is the module being performed.

System action: **R3batch** stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0107E This extended agent for R/3 does not support your version of the SAP R/3 system, which is the following: *R/3_version*.

Explanation: *R/3_version* is the version number of the SAP R/3 system on this workstation.

System action: **R3batch** stops.

Operator response: See the *User's Guide* to determine the versions of SAP supported. If you are using a lower version of SAP than those supported, upgrade to a supported version. If you are using a higher version of SAP than those supported, check on the IBM products Web site to see if there is a later version of Tivoli Workload Scheduler for Applications available.

See also: The *User's Guide* for details about the versions of SAP that are supported.

EEWO0108E **R3batch** has found that the following component is not at the correct version: *component*.

Explanation: *component* is the component of Tivoli Workload Scheduler for Applications that is at the wrong version level.

System action: **R3batch** stops.

Operator response: Upgrade the specific component. If not possible, upgrade or reinstall Tivoli Workload Scheduler for Applications. See the *User's Guide* for details about the installation.

See also: The *User's Guide* for details about the installation.

EEWO0109E An internal error has occurred. The following RFC function: *function_name* failed after the following number of attempts: *attempts*.

Explanation: *function_name* is the name of the function being performed.

attempts is a count of the number of tries that **r3batch** made at performing the function.

System action: **R3batch** stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0110E An internal error has occurred. The RFC was not initialized when calling the following function: *function_name*.

Explanation: *function_name* is the name of the function being performed.

System action: **R3batch** stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0111E This user cannot define jobs on the following SAP R/3 system: *SAP_system_name*.

Explanation: You do not have the required authority to define or create jobs on the SAP system.

SAP_system_name is the name of the SAP system where you do not have permission to define or create jobs.

System action: **R3batch** continues, but the job you are trying to run is not processed.

Operator response: Consult your local SAP or Tivoli Workload Scheduler administrator to determine if the user ID that you used is the correct one, and if this user has the authorization to run jobs on the SAP system. When the problem is resolved restart **r3batch**.

EEWO0112E The extended agent cannot create the following job: "*jobname*" with job ID: "*jobID*".

Explanation: *jobname* is the name of the job that cannot be created.

jobID is the job ID of the job that cannot be created.

System action: **R3batch** continues, but the job you are trying to run is not processed. The batch log (*r3batch_trace.log*) is produced giving more details about the steps that occurred before the job creation failed.

Operator response: Use the batch log to determine the cause of the problem.

If the log file does not contain enough information, set the *debug_level* to *MAX* as described in the *User's Guide*. Then rerun **r3batch**.

When you have located and resolved the problem, rerun **r3batch**.

EEWO0113E An internal error has occurred. An exception: *exception_number* has occurred while calling the following function module: *function_module_name*.

Explanation: *exception_number* is the error number.

function_module_name is the name of the function module being performed when the error occurred.

System action: R3batch stops.

Operator response: This error might not be repeated. Try restarting **r3batch**. If the error persists, contact IBM Software Support for assistance.

EEWO0114E An internal error has occurred. The following database name is not correct: *database_name*. The help view is not retrieved.

Explanation: *database_name* is the database name that is not correct.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0115E An internal error occurred. The following counter ID is not valid: *counter_ID*.

Explanation: *counter_ID* is the counter ID that is not valid.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0116E The extended agent could not open the following joblog (stdlist) file: *joblog_file_name*.

Explanation: Another process has locked the joblog file.

joblog_file_name is the name of the file that is locked.

System action: R3batch continues.

Operator response: Take these steps.

- Use the operating system facilities to determine which process has locked the joblog file.
- Wait until the process that has locked the file stops.
- If the process does not stop in an acceptable time frame, consider forcing it to stop (you should evaluate the risk of leaving data in a corrupted state). Use the operating system facilities to accomplish this.

EEWO0117E R3batch has failed because the workstation where it is running has insufficient memory.

Explanation: See message.

System action: R3batch stops.

Operator response: Check the following:

1. Verify if the workstation has enough memory available. Information about the memory requirements of Tivoli Workload Scheduler for Applications is provided in the *Download Document*. If not, you may need to increase the memory of the workstation or make changes in memory management and paging to make more memory available to **r3batch**. Rerun **r3batch**.
2. If the workstation memory is adequate, try closing all the applications that you do not need, and then rerun **r3batch**.
3. If the problem persists, reboot the workstation, and then rerun **r3batch**.
4. If the problem persists, contact IBM Software Support for assistance.

See also: The *Download Document* for details about memory requirements.

EEWO0118E R3batch has failed because it could not create and start a job instance.

Explanation: See message.

System action: The job instance is not created.

Operator response: Check the **r3batch** log file for the reason for the error and try to resolve it. If you have corrected the error, rerun **r3batch**.

If the problem persists, contact IBM Software Support for assistance.

EEWO0119E An internal error occurred. The cleanup task could not delete the following job: "*jobname*". The job ID is: "*jobID*".

Explanation: *jobname* is the name of the job that cannot be deleted.

jobID is the job ID of the job that cannot be deleted.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0120E The job you are trying to monitor does not exist. The job number and name are as follows: "*jobnumber: jobname*".

Explanation: *jobnumber* is the job number of the job that does not exist.

jobname is the name of the job that does not exist.

System action: The program might stop.

Operator response: Verify that the job number and job name you are trying to monitor match an existing job. To determine which jobs are available, use the **Find Job** functionality in the Job Scheduling Console. If you have corrected the error, rerun **r3batch**.

EEWO0121E The R/3 system might not be available. BDCWAIT has failed to start after the following number of failed attempts: .

Explanation: *attempts* is the number of times that **r3batch** tried to start **BDCWAIT**.

System action: The program might stop.

Operator response: Check that the R/3 system is running. Check the job status. If you have corrected the error, rerun **r3batch**.

EEWO0122E An internal error has occurred. R3batch could not scan the R/3 joblog for BDCWAIT messages.

Explanation: See message.

System action: The batch job stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0123E An internal error has occurred. R3batch could not check the BDC session status in the R/3 system.

Explanation: See message.

System action: The batch job stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0124E The following SAP R/3 system defined in the method options file is not running: SAP_system_name.

Explanation: *SAP_system_name* is the name of the SAP R/3 system that is not running.

System action: **R3batch** stops.

Operator response: Verify that the information in the options file is correct. Check that the SAP system is available, for example, by pinging the IP address of the SAP system. If you have corrected the error, rerun **r3batch**.

EEWO0125E The SAP job specified in the job definition cannot be performed, because it has an incorrect job type.

Explanation: See message.

System action: **R3batch** continues, but the job being processed is ignored.

Operator response: Check that the SAP job name specified in the job definition is correct and matches with the name of the SAP job defined in the SAP system. Check that the job type is correct. If you have corrected the error, rerun **r3batch**.

EEWO0126E The following mapping file cannot be read due to an I/O error: mapping_file_name.

Explanation: *mapping_file_name* is the name of the return code mapping file that cannot be read.

System action: The job processing continues, but the return code mapping is not performed.

Operator response: Check that the file with the indicated name exists, in the correct directory, and with read permission for the user running **r3batch**. Open the file with a text editor to ensure that it is readable. If you have corrected the error, rerun **r3batch**.

EEWO0160E An internal error has occurred. The following method: "accessmethod" was called by the following request: "request_type", which is currently not supported by the following module: module.

Explanation: *accessmethod* is the name of the method being called.

request_type is the type of request being made.

module is the module that does not support this request.

System action: **R3batch** stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0161E A syntax error occurred when r3batch was started. The following task parameter is unrecognized: task_parameter.

Explanation: *task_parameter* is the task parameter that is not recognized.

System action: **R3batch** stops.

Operator response: See the *User's Guide* for a list parameters you can specify with the **r3batch** command. Reissue the command with the correct parameters.

See also: The *User's Guide* for details about the command syntax.

EEWO0162E A syntax error occurred when r3batch was started. One or more parameters is missing from the following task: *task_name*. It needs the -c, -j, -l, -t, and '--' parameters.

Explanation: *task_name* is the name of the task that you are trying to run.

System action: R3batch stops.

Operator response: See *User's Guide* for a description of the task parameters. Rerun **r3batch**, supplying the correct task parameters.

See also: The *User's Guide* for a description of the task parameters.

EEWO0163E A syntax error occurred when r3batch was started. One or more parameters is missing from the following task: *task_name*. It needs the -c, -j, -t, and '--' parameters.

Explanation: *task_name* is the name of the task that you are trying to run.

System action: R3batch stops.

Operator response: See *User's Guide* for a description of the task parameters. Rerun **r3batch**, supplying the correct task parameters.

See also: The *User's Guide* for a description of the task parameters.

EEWO0164E A syntax error occurred when r3batch was started. One or more parameters is missing from the following task: *task_name*. It needs the -c, -t, and '--' parameters.

Explanation: *task_name* is the name of the task that you are trying to run.

System action: R3batch stops.

Operator response: See *User's Guide* for a description of the task parameters. Rerun **r3batch**, supplying the correct task parameters.

See also: The *User's Guide* for a description of the task parameters.

EEWO0165E A syntax error occurred when r3batch was started. One or more parameters is missing from the following task: *task_name*. It needs the -c, -j, -l, -o, -t, and '--' parameters.

Explanation: *task_name* is the name of the task that you are trying to run.

System action: R3batch stops.

Operator response: See *User's Guide* for a description of the task parameters. Rerun **r3batch**, supplying the correct task parameters.

See also: The *User's Guide* for a description of the task parameters.

EEWO0166E An internal error has occurred: GI and PI require task specification.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0167E An error occurred when r3batch was started. One or more internal parameters is missing from the following task: *task_name*. It needs the following parameter: *parameter_name*.

Explanation: *task_name* is the name of the task being run.

parameter_name is the name of the missing internal parameter.

System action: R3batch stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0171E You have specified a step to run an ABAP or an external program, but the step number (*step_number*) cannot be determined.

Explanation: *step_number* is the number of the step that is not in the correct format to be determined.

System action: R3batch stops.

Operator response: See the SAP system administrator.

EEWO0172E You have defined a job as a series of steps, but one of the steps has a number which is out of range: *step_number*.

Explanation: *step_number* is the number of the step that is not in the correct range.

System action: R3batch stops.

Operator response: See the SAP system administrator and determine the correct step number.

EEWO0173E You have specified a step to run the following ABAP: *ABAP_name* which requires one or more variants, but no variants have been specified.

Explanation: *ABAP_name* is the name of the ABAP

module which is specified to be run.

System action: R3batch stops.

Operator response: Determine the correct variants to use from the SAP system administrator. Change the job specification to add the variant or variants. If a variant is missing it must be created. There are two alternative ways to create a variant:

- Follow the instructions in the User's Guide to create a variant using the Job Scheduling Console
- Ask the SAP system administrator to create the variant using the SAP GUI.

EEWO0174E An internal error occurred while accessing the variant selection table J101VARSO for the following report: "*report_name*" and variant: "*variant_name*".

Explanation: *report_name* the name of the report that r3batch was trying to create.

variant_name the name of the variant that was being processed when the error occurred.

System action: R3batch continues, but the job is not processed.

Operator response: Rerun r3batch (the problem might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0175E An internal error occurred while accessing the variant counter table J101VARCO for the following report: "*report_name*" and variant: "*variant_name*".

Explanation: *report_name* the name of the report that r3batch was trying to create.

variant_name the name of the variant that was being processed when the error occurred.

System action: R3batch continues, but the job is not processed.

Operator response: Rerun r3batch (the problem might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0176E There is an error in the job information that has prevented the r3batch program from creating the following step: *step_number*.

Explanation: You are trying to add a step but an error in the step data prevents it from being added.

step_number is the number of the step you are trying to add.

System action: The step is not added.

Operator response: Verify the correctness of the information in the step, such as the name of the job, the

user name, and the variant details, correct any errors and retry the add step action. If the problem continues, also check the connectivity with the SAP system. If you find the problem and correct it, rerun r3batch.

EEWO0177E The following step is not valid, and cannot be performed: *step_number*.

Explanation: *step_number* is the number of the step that is not valid.

System action: R3batch continues, but the step is not performed.

Operator response: Verify the correctness of the information in the step. Verify the name of the job, the user name, and the variant details. If the problem continues, also check the connectivity with the SAP system. If you find the problem and correct it, rerun r3batch.

EEWO0178E An internal error has occurred. The following incorrect step type: "*step_type*" has been supplied for step: "*step_number*".

Explanation: *step_type* is the non-valid type that has been supplied by the GUI for the step.

step_number is the number of the step being processed.

System action: R3batch continues, but the step is not performed.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0179E An internal error occurred because a variant name counter field was missing for the following report: "*report_name*" and variant: "*variant_name*".

Explanation: *report_name* the name of the report that r3batch was trying to create.

variant_name the name of the variant that was being processed when the error occurred.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0180E During the preparation of the following report: "*report_name*", r3batch could not make a copy of the following variant: "*original_variant_name*" because the copy name of the variant generated automatically by the program: "*variant_copy_name*" is the same as that of an existing variant.

Explanation: *report_name* the name of the report that

r3batch was trying to create.

original_variant_name the name of the variant that was being processed when the error occurred.

variant_copy_name the name of the copy that **r3batch** is trying to create. It is also the name of the existing variant.

System action: **R3batch** stops.

Operator response: Take either of these steps:

- Change the name of the existing variant with the same name.
- Change the name of the original variant which was being copied (the copy name is based on the original, so any change in the original name will create a copy with a different name).

Rerun **r3batch**.

EEWO0181E **R3batch could not obtain the semaphore identified in the global options file (required to control access to shared resources).**

Explanation: See message.

System action: **R3batch** continues, but the variant is not processed.

Operator response: Contact the SAP system administrator to determine why the semaphore is missing. If you find the problem and correct it, rerun **r3batch**.

See also: See the *User's Guide* for more information about variants and semaphores.

EEWO0182E **R3batch could not create the following report: "report_name" because the variant: "variant_name" has one or more incorrect values (placeholders or counters).**

Explanation: *report_name* the name of the report that **r3batch** was trying to create.

variant_name the name of the variant that was being processed when the error occurred.

System action: **R3batch** continues, but the report is not created.

Operator response: Contact the SAP system administrator to determine why the values are incorrect, and to correct them. If you find the problem and correct it, rerun **r3batch**.

EEWO0183E **An internal error has occurred while calling the function "j_101_variant_maintain_sel_tbl", because the parameters to the call were not valid.**

Explanation: See message.

System action: **R3batch** stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0184E **A variant required for this job is locked by another application.**

Explanation: See message.

System action: **R3batch** stops.

Operator response: User the operating system tools to determine which application has locked the variant. Decide whether to stop that application or wait for it to stop or unlock the variant itself. If you find the problem and correct it, rerun **r3batch**.

EEWO0185E **The properties of the variant required for this job indicate that is protected by another user.**

Explanation: See message.

System action: **R3batch** continues, but the processing of the job stops.

Operator response: Request the user that protected the variant to remove the protection so that you can use it for your job. If you find the problem and correct it, rerun **r3batch**.

EEWO0186E **A variant required for this job no longer exists.**

Explanation: See message.

System action: **R3batch** stops.

Operator response: Check in the job definition that the variant is correctly specified. If it is not, correct the job definition and rerun **r3batch**. If it is correctly specified, the variant is missing and must be created. There are two alternative ways to create a variant:

- Follow the instructions in the User's Guide to create a variant using the Job Scheduling Console
- Ask the SAP system administrator to create the variant using the SAP GUI.

When the job definition is pointing to an existing variant, rerun **r3batch**.

EEWO0187E **A variant required for this job is obsolete and cannot be used.**

Explanation: See message.

System action: **R3batch** stops.

Operator response: Check in the job definition that the variant is correctly specified. If it is not, correct the job definition and rerun **r3batch**. If it is correctly specified, change the variant specification to refer to a

variant that is not obsolete or create a new variant. There are two alternative ways to create a variant:

- Follow the instructions in the User's Guide to create a variant using the Job Scheduling Console
- Ask the SAP system administrator to create the variant using the SAP GUI.

When the job definition is pointing to an existing, non-obsolete variant, rerun **r3batch**.

EEWO0189E A variant required for this job cannot be created. The variant data is not valid (too long): *variant_data*.

Explanation: *variant_data* is the data used to create a variant that is too long.

System action: The program might stop.

Operator response: Check the data used to create the variant. If you find an error and correct it, rerun **r3batch**.

EEWO0223E Either no matching job could be found in the following R/3 instance: *R/3_instance*, or a job is found with steps but no start time. The following identify the job: **Host:** *hostname* **Job:** *jobname* **User:** *username* **Client:** *client*.

Explanation: You have probably supplied incorrect information to describe the R/3 job.

hostname is the name of the SAP system host.

jobname is the name of the job for which a match cannot be found on the R/3 system.

username is the name of the user running the job.

client identifies the R/3 client.

System action: **R3batch** stops.

Operator response: Check whether there is a job on the SAP system which has a matching R/3 client, job name and user name as the Tivoli Workload Scheduler for Applications job definition for this job. Also verify that the R/3 transaction sm37 shows the job in the "released" state.

When you have identified the error, correct the Tivoli Workload Scheduler for Applications job definition and rerun **r3batch**.

EEWO0224E **R3batch** cannot perform a job because it has the same job name user name and client number as an existing job.

Explanation: See message.

System action: **R3batch** stops.

Operator response: Check if you have tried to accidentally run the same job twice. If you need to run

this job, either wait for the previous job to finish, or contact the SAP system administrator to stop the previous job. Then rerun **r3batch**.

EEWO0257E **R3batch** cannot commit the CCMS alert because the alert is already committed. **Current status of the CCMS alert:** *alert_status*.

Explanation: See message.

System action: **R3batch** stops.

Operator response: Check the ID of the alert you tried to commit to ensure that it is the correct alert ID. If it is correct ignore this message, otherwise specify the correct alert ID and rerun **r3batch**.

EEWO0260E An internal error has occurred. The recovery process has started with a non-valid or missing batch job ID: *jobID*.

Explanation: *jobID* identifies the job that cannot be processed.

System action: The recovery process does not continue. The job recovery is not performed.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0261E An internal error has occurred. The recovery process has started with a non-numeric or wrong-length batch job ID. It must be an eight digit number: *jobID*.

Explanation: *jobID* identifies the job that cannot be processed.

System action: The recovery process does not continue. The job recovery is not performed.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0262E A syntax error has been found with the job options. The following option does not start with a hyphen: *job_option*.

Explanation: *job_option* is the option that does not start with a hyphen.

System action: **R3batch** stops.

Operator response: Check the job option syntax in the *User's Guide*. Correct the syntax and rerun **r3batch**.

See also: The *User's Guide* for details about the job options syntax.

EEWO0263E A syntax error has been found with the job options. More job options were submitted than the maximum allowed: *maximum_job_options*.

Explanation: *maximum_job_options* is the maximum number of job options that you can define.

System action: R3batch stops.

Operator response: Check the job option syntax in the *User's Guide*. Reduce the number of job options for this job, for example, by dividing it into two jobs, each of which would have a reduced number of job options. Correct the syntax and rerun **r3batch**.

See also: The *User's Guide* for details about the job options syntax.

EEWO0264E A syntax error has been found with the job options. The following job option requires a value after keyword: *job_option*.

Explanation: *job_option* is the option that requires a value.

System action: R3batch stops.

Operator response: Check the job option syntax in the *User's Guide*. Correct the syntax by adding the value to the indicated option and rerun **r3batch**.

See also: The *User's Guide* for details about the job options syntax.

EEWO0265E A syntax error has been found with the job options. The following option sequence is not correct: "*job_option1*" "*job_option2*". The "*job_option3*" option requires a value, which cannot begin with a hyphen (minus sign).

Explanation: There is a problem with the syntax of the job options. The above message might exactly explain the problem. However, it might be that an error of syntax has allowed the program to interpret a value as a job option.

job_option1, is the option that must not precede *job_option2*.

job_option3 requires a value, which cannot commence with a hyphen.

System action: R3batch stops.

Operator response: Check the full job option syntax in the *User's Guide*, not only for the indicated job options, but also for all others. Correct the syntax and rerun **r3batch**.

See also: The *User's Guide* for details about the job options syntax.

EEWO0266E A syntax error has been found with the job options. The following option could not be recognized: *unrecognizable_job_option*.

Explanation: *unrecognizable_job_option* is a string that by its position in the syntax and the presence of a hyphen in the first position indicates that it is a job option, but that does not match a valid job option.

System action: R3batch stops.

Operator response: Check the job option syntax in the *User's Guide*. Correct the syntax and rerun **r3batch**.

See also: The *User's Guide* for details about the job options syntax.

EEWO0267E A syntax error has been found with the job options. The following job ID is not valid: *jobID*.

Explanation: *jobID* is the job ID that is not valid.

System action: R3batch stops.

Operator response: Check the job option syntax in the *User's Guide*. Correct the job ID and rerun **r3batch**.

See also: The *User's Guide* for details about the job options syntax.

EEWO0268E An internal error has occurred. The recovery process has started with the following non-valid parameter: *parameter*.

Explanation: *parameter* is the non-valid parameter of the job that cannot be processed.

System action: The recovery process does not continue. The job recovery is not performed.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0269E A syntax error has been found with the job options. The following option: "*job_option*" has a non-valid value: "*option_value*".

Explanation: *job_option* is the option that has a non-valid value.

option_value is the value that is not valid.

System action: R3batch stops.

Operator response: Check the job option syntax in the *User's Guide*. Correct the syntax by changing the value of the indicated option so that it is valid and rerun **r3batch**.

See also: The *User's Guide* for details about the job options syntax.

EEWO0270E A syntax error has been found with the job options. The following option: "*job_option*" has a non-valid value for the variant selection option sign: "*option_value*". The value must be one of the following: "*valid_values*".

Explanation: *job_option* is the option that has a non-valid value.

option_value is the value that is not valid for the variant selection option sign.

valid_values is a list of the permitted values for the option in this context.

System action: R3batch stops.

Operator response: Check the job option syntax in the *User's Guide*. Correct the syntax by changing the value of the indicated option so that it is valid and rerun **r3batch**.

See also: The *User's Guide* for details about the job options syntax.

EEWO0271E A syntax error has been found with the job options. The following option: "*job_option*" has a non-valid value for the variant selection option operation: "*option_value*". The value must be one of the following: "*valid_values*".

Explanation: *job_option* is the option that has a non-valid value.

option_value is the value that is not valid for the variant selection option operation.

valid_values is a list of the permitted values for the option in this context.

System action: R3batch stops.

Operator response: Check the job option syntax in the *User's Guide*. Correct the syntax by changing the value of the indicated option so that it is valid and rerun **r3batch**.

See also: The *User's Guide* for details about the job options syntax.

EEWO0335E The CCMS alert identified by the alert ID does not exist in the SAP R/3 system.

Explanation: The alert ID could not be mapped to any existing alert in the SAP R/3 system. Either the alert was already deleted, or the alert ID, given as input parameter, is not valid.

System action: R3batch stops.

Operator response: Verify that the alert exists in the SAP R/3 system, change the alert ID, and rerun **r3batch**.

EEWO0336E An internal error occurred during CCMS alert processing in the SAP R/3 system. The C function that was ultimately called could not be executed.

Explanation: An SAP R/3 internal error occurred when calling the BC-XAL interface.

System action: R3batch stops.

Operator response: Ask the SAP system administrator to check the system log in the target SAP system.

EEWO0337E A network communication error occurred during CCMS alert processing.

Explanation: See message.

System action: R3batch stops.

Operator response: Contact your network administrator and SAP system administrator to verify the network connections.

EEWO0338E An internal error occurred in the SAP R/3 system during CCMS alert processing.

Explanation: An SAP R/3 internal error occurred while calling the BC-XAL interface.

System action: R3batch stops.

Operator response: Ask the SAP system administrator to check the system log in the target SAP system.

EEWO0341E An unknown problem occurred during CCMS alert processing.

Explanation: An SAP R/3 internal error occurred while calling the BC-XAL interface.

System action: R3batch stops.

Operator response: Ask the SAP system administrator to check the system log in the target SAP system.

EEWO0342E An SAP internal error occurred. The function call could not be performed.

Explanation: See message.

System action: R3batch stops.

Operator response: Ask the SAP system administrator to check the system log in the target SAP system.

EEWO0346E An SAP internal error occurred. A problem was encountered while accessing the database.

Explanation: See message.

System action: R3batch stops.

Operator response: Ask the SAP system administrator

to check the system log in the target SAP system.

EEWO0383E R3batch failed to connect to the R/3 system on the following host:
"host_name", after the following number of attempts: attempts.

Explanation: *host_name* is the workstation where **r3batch** cannot connect to the R/3 system.

attempts is the number of times that **r3batch** has tried.

System action: **R3batch** stops.

Operator response: The problem might have one of two causes:

- Check that the client number, R/3 user ID, and password in the options file are correct.
- Check with the SAP system administrator that the XA for SAP function modules (the programs for the Tivoli Workload Scheduler Xagent feature) have been installed and activated on the host

If you have resolved the problem, rerun **r3batch**.

EEWO0384E R3batch failed to establish a connection to the following R/3 instance:
"R/3_instance" on the following host:
"host_name", after the following number of attempts: attempts.

Explanation: *R/3_instance* identifies the R/3 instance that could not be connected to.

host_name is the workstation where **r3batch** cannot connect to the R/3 system.

attempts is the number of times that **r3batch** has tried.

System action: **R3batch** stops.

Operator response: The problem might have one of two causes:

- Check that the client number, R/3 user ID and password in the options file are correct
- Check with the SAP system administrator that the indicated R/3 instance is running on the host

If you have resolved the problem, rerun **r3batch**.

EEWO0420E An internal error has occurred. R3batch either could not open or could not copy the R/3 job.

Explanation: See message.

System action: The program might stop.

Operator response: The problem might be one of several:

- Check that there is available disk space in the file set where Tivoli Workload Scheduler for Applications is installed. If there is not sufficient space, create more space and rerun **r3batch**.
- Check that the user running **r3batch** has read and write permissions in the Tivoli Workload Scheduler for Applications install directory and its subdirectories. If there is a problem with permissions, correct it and rerun **r3batch**.
- Check that the operating system has not reached the maximum number of files that it can open at the same time. If this is the problem, either use the operating system facilities to allow more file descriptors, wait for other applications that are using files to close them, or stop other applications that are using files. Rerun **r3batch**.
- If the problem is not one of these, contact IBM Software Support for assistance.

EEWO0422E The following variant option is not valid: variant_option

Explanation: *variant_option* is the variant option (parameter) that is not valid.

System action: **R3batch** stops.

Operator response: Contact the SAP system administrator to determine the correct format and value for the indicated variant option. Correct the job definition and rerun **r3batch**.

EEWO0426E R3batch cannot create the job. The following R/3 RFC user does not have the appropriate R/3 user authorization to create and start batch jobs: user_name.

Explanation: *user_name* identifies the user that does not have R/3 authorization to create and start batch jobs.

System action: **R3batch** stops.

Operator response: Either contact the SAP system administrator to have the appropriate authorizations given to the indicated user, or change the RFC user in the job definitions to a user that has the required authorizations. Rerun **r3batch**.

EEWO0428E An internal error has occurred. The program could not create the temporary variant table for this job (the rowptr from ItAppline is null).

Explanation: See message.

System action: **R3batch** stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0429E The following job was not found, or is not in a correct state: "*jobname*" with the following job ID: "*jobID*". The state must be shown in R/3 as "Scheduled", not "Released" or "Finished".

Explanation: *jobname* and *jobID* identify the job that was not found, or is not in a correct state.

System action: R3batch stops.

Operator response: Check that the job has been correctly defined in the job definitions. Contact the SAP system administrator to determine the correct identification of the R/3 job, and that it exists, and that it is in one of the above-indicated statuses. Correct the problem and rerun **r3batch**.

EEWO0439E The required options are not specified either in the global or in the local options file.

Explanation: The action being performed by the r3batch x-agent running the SAP job needs the values of one or more specific options that it expects to find in the global or local option file. It could not find those options. The details about which options are required are given in the *User's Guide*. Some options are mandatory for all actions while other options are action-specific.

System action: The program continues, if possible, ignoring the action that encountered the error.

Operator response: Check in the *User's Guide* to determine the required options. Amend the global or local options file (or both) to include those options. Rerun **r3batch**.

EEWO0441E The following client number is not valid: "*client_number*". Client numbers must be between 0 and 999.

Explanation: *client_number* is the client number (SAP port number) that is not an integer between 0 and 999.

System action: R3batch stops.

Operator response: Contact the SAP system administrator to determine the correct value (the port number) of the R/3 client. Check that the client option in the global or local options file has this value, changing it if not. For more details about the options in the global and local options files see the *User's Guide*. Rerun **r3batch**.

See also: The *User's Guide* for more details about the options in the global and local options files.

EEWO0450E The year number "*year_number*" of keyword "*keyword*" is not valid: . Year numbers must be 4 digit numeric values.

Explanation: The *year_from* or *year_to* keyword was set to a value that is not valid. The value for the year must be specified in the format *yyyy*.

System action: R3batch stops.

Operator response: Change the value of the indicated keyword to be a four-digit number and rerun the command.

See also: The *User's Guide* for more details about the values allowed for the indicated keywords.

EEWO0451E R3batch could not create the file or directory: "*filename*". Either the filename is not valid or access rights are missing.

Explanation: Either the specified *filename* is not in the correct format or **r3batch** does not have the access rights to create the file or directory.

System action: R3batch stops.

Operator response: Do one of the following and rerun the command:

- Contact your system administrator to change the access rights of the desired location so that **r3batch** is authorized to create and edit the file or directory in the path you want.
- Change the path of the indicated *filename* to a location where **r3batch** is authorized to create and edit files.

See also: The *User's Guide* for more details about the values allowed for the indicated keywords.

EEWO0452E The supplied year range is not valid. The from year:"*year_from*" is greater than the to year:"*year_to*".

Explanation: The date set for the *year_from* keyword is later than the value set for the *year_to* keyword.

System action: R3batch stops.

Operator response: Correct the year range so that the starting year is earlier than the ending year.

See also: The *User's Guide* for more details about the values allowed for the indicated keywords.

EEWO0453E R3batch could not create the following directory: "*directory*". Either the directory name is not valid or "r3batch" does not have access rights required to create the file or directory.

Explanation: See message.

System action: R3batch stops.

Operator response: Do one of the following and rerun the command:

- Contact your system administrator to change the access rights of the desired location so that **r3batch** is authorized to create and edit the directory in the path you want.
- Change the path to a location where **r3batch** is authorized to create and edit files.

See also: The *User's Guide* for more details about the values allowed for the indicated keywords.

EEWO0460E The SAP system does not have the correct XBP interface version. The XBP interface version must be 2.0 or later.

Explanation: See message.

System action: R3batch stops.

Operator response: Choose a SAP system with the correct XBP interface version.

EEWO0461E An internal error occurred during an external dependency operation.

Explanation: See message.

System action: R3batch stops.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

EEWO0462E R3batch could not commit the external dependency on the SAP system. Event name: "event_name". Event parameter: "event_parameter".

Explanation: The request to commit the external dependency, identified by the SAP event name and parameter indicated in the message, failed on the target SAP system.

System action: R3batch stops.

Operator response: Do one of the following:

- Check the log file for preceding error messages.
- Contact your system administrator to validate the XBP event history.
- Retry the operation. If the problem persists, contact IBM Software Support for assistance.

See also: The *User's Guide* for more details about using SAP background processing events as external dependencies.

EEWO0504E An internal error has occurred: (RFC failed: SXMI_LOGON).

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0505E An internal error has occurred: (RFC failed: SXMI_VERSIONS_GET).

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0506E An internal error has occurred: (RFC failed: SXMI_LOGON).

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0507E An internal error has occurred: (RFC failed: SXMI_AUDITLEVEL_SET).

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0510E An internal error has occurred: (get_record: Non-valid keyword. Expected: expected_keyword).

Explanation: *expected_keyword* is the keyword expected at this point.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0550E No job name has been specified for the following user: *user_name*.

Explanation: *user_name* identifies the user for which a job name has not been specified.

System action: The program waits for you to correct the input or exit.

Operator response: Supply a job name and continue.

EEWO0551E Either no matching job could be found, or a job is found with steps but no start time, or the job that is found has a "released" status. The following identify the job: **User:** *user_name* **Job:** *jobname*.

Explanation: *username* identifies the user for which the job cannot be run.

jobname identifies the job that cannot be run.

System action: The program waits for you to correct the input or exit.

Operator response: Check whether the R/3 job name and user name match the Tivoli Workload Scheduler for Applications job definition for this job. Check if the R/3 transaction sm37 shows the job in the "released" state; as SAP jobs in the "released" state cannot be run.

Correct the problem and continue.

EEWO0552E The R/3 job scheduling system has found an error for the following job:
User: *username* **Job:** *jobname*.

Explanation: *username* identifies the user for which the job cannot be run.

jobname identifies the job that cannot be run.

System action: R3batch stops.

Operator response: Contact the R/3 system administrator to check the R/3 syslog, which should contain more details about the error. Also check the correctness of the indicated user name and job name.

Correct the problem and rerun **r3batch**.

EEWO0553E The XBP interface has returned the following error: "The external user is missing."

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0554E R3batch has stopped because the R/3 XMI logging mechanism has returned an error. There might be a connection problem.

Explanation: See message.

System action: R3batch stops.

Operator response: Check that the connection with the R/3 system is working correctly. If it is, or if the error persists, contact IBM Software Support for assistance.

EEWO0555E R3batch could not invoke the R/3 XMI interface. There might be a connection problem.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0558E The XBP interface has returned the following error: "Cannot select the following job: *jobname* with the following job ID: *jobID*".

Explanation: *jobname* is the name of the job that cannot be selected.

jobID is the ID of the job that cannot be selected.

System action: R3batch stops.

Operator response: Check that the job name and ID are correctly identified in the job options. Ensure they match with the R/3 job. Correct any error you find and rerun **r3batch**, otherwise contact IBM Software Support for assistance.

EEWO0559E The XBP interface has returned the following error: "Cannot process the job because the job name or job ID is missing."

Explanation: See message.

System action: R3batch stops.

Operator response: Check that the job name and ID are correctly identified in the job options. Ensure they match with the R/3 job. Correct any error you find and rerun **r3batch**, otherwise contact IBM Software Support for assistance.

EEWO0561E The XBP interface has returned the following error: "Cannot delete the following job:". **Job name:** "*jobname*" **Job ID:** "*jobID*".

Explanation: *jobname* is the name of the job that cannot be deleted.

jobID is the ID of the job that cannot be deleted.

System action: R3batch stops.

Operator response: Check that the job name and ID are correctly identified in the job options. Ensure they match with the R/3 job. Contact the R/3 system administrator to check the R/3 syslog, which should contain more details about the error. Check that the user has the correct permission to run the job.

Correct any error you find and rerun **r3batch**, otherwise contact IBM Software Support for assistance.

EEWO0562E The XBP interface has returned the following error: "The ABAP program name is missing."

Explanation: See message.

System action: R3batch stops.

Operator response: Check the ABAP program name in the job definition.

Correct any error you find and rerun **r3batch**, otherwise contact IBM Software Support for assistance.

EEWO0563E The XBP interface has returned the following error: "The archive information cannot be found."

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0564E The XBP interface has returned the following error: "The supplied print parameters are not valid."

Explanation: See message.

System action: R3batch stops.

Operator response: Check the print parameters in the job definition (see the *User's Guide* for details).

Correct any error you find and rerun **r3batch**, otherwise contact IBM Software Support for assistance.

See also: The *User's Guide* for details about the print parameters.

EEWO0565E The XBP interface has returned the following error: "The supplied archive parameters are not valid."

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO0566E The target host name is required for external step definition.

Explanation: You have defined a job with an external step, but the target host name is missing in the step definition.

System action: The program waits for you to correct the input or exit.

Operator response: Specify the host name or exit.

EEWO0568E The following job cannot be started "immediately": Job name: "*jobname*" Job ID: "*jobID*".

Explanation: The indicated job has been defined to run *immediately*, but the job has dependencies that cannot be resolved immediately.

jobname is the name of the job that cannot be run immediately.

jobID is the ID of the job that cannot be immediately.

System action: R3batch stops.

Operator response: Check that the job definition settings of an "immediate" run time and dependencies is correct. If not, correct the job definition and rerun **r3batch**.

If the settings are correct, decide whether you want to wait for the dependencies to be resolved or delete them to let the job go ahead. Take the appropriate action and rerun **r3batch**.

EEWO0569E An internal error has occurred. The step count is not correct.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0570E The following job does not have steps: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* is the name of the job that does not have steps.

jobID is the ID of the job that does not have steps.

System action: R3batch waits for a response from you.

Operator response: Edit the job definition to supply the missing step definitions and continue, or cancel the job.

EEWO0571E An internal error has occurred. The step count is missing.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0572E A Process Chain cannot be started.

Explanation: See message.

System action: The program might stop.

Operator response: Contact the SAP system administrator and verify the SAP log to analyze the reason for the process chain not starting. If you find an error in the definition of the process chain in the job definitions, correct it and rerun **r3batch**. If the error is on the R/3 side, wait for it to be fixed and rerun **r3batch**.

EEWO0573E The transfer structure for the following InfoPackage is not yet active:
infopackage_name.

Explanation: *infopackage_name* identifies the InfoPackage that cannot be utilized.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0574E An internal error has occurred. The request ID could not be found.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0575E The action has been cancelled for the following InfoPackage: *infopackage_name*.

Explanation: *infopackage_name* identifies the InfoPackage that has been cancelled.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0576E The job defined in the following InfoPackage is already running:
infopackage_name.

Explanation: *infopackage_name* identifies the InfoPackage that is already running.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0577E The source system of the following InfoPackage is not correct:
infopackage_name.

Explanation: *infopackage_name* identifies the InfoPackage with the incorrect source system.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0578E The following InfoPackage does not exist: *infopackage_name*.

Explanation: The probable reason is that the InfoPackage has been deleted after the job was defined but before it was run.

infopackage_name identifies the InfoPackage that does not exist.

System action: R3batch stops.

Operator response: Check the definition of the InfoPackage in the job definitions. Ask the R/3 system administrator to check for its existence in the R/3 system. Correct any error you find and rerun **r3batch**.

EEWO0579E An internal error has occurred (incorrect parametrization) while retrieving the list of available InfoPackages.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0580E The following InfoPackage cannot be run as it is already running:
infopackage_name.

Explanation: *infopackage_name* identifies the InfoPackage that is already running.

System action: The program might stop.

Operator response: Check the definition of the InfoPackage in the job definitions. Check that you are not trying to run the same job twice. Decide whether you want to wait for the previous InfoPackage to finish, or if you want to stop the previous InfoPackage from running, to allow your job to run. In the latter case, ask the SAP system administrator to stop the previous InfoPackage. Rerun **r3batch**.

EEWO0581E The required Business Information Warehouse component is not installed on this R/3 system.

Explanation: See message.

System action: R3batch stops.

Operator response: Contact the SAP system administrator to discuss why the component is not available. Either have the component installed or change the job definition to allow the job to run without this component. Then rerun **r3batch**.

EEWO0582E An internal error occurred while retrieving the version of the Business Information Warehouse component.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Check the log for information that might explain why the version of the component cannot be retrieved. If you cannot determine such a reason, contact IBM Software Support for assistance.

EEWO0583E The required Business Information Warehouse component is not supported on this R/3 system level.

Explanation: See message.

System action: R3batch stops.

Operator response: Contact the SAP system administrator to discuss why the component is not supported. Either have the component upgraded or change the job definition to allow the job to run without this component. Then rerun **r3batch**.

EEWO0584E The following R/3 RFC user does not have the appropriate R/3 user authorization to change the status of the interception or parent-child functionality: *user_name*.

Explanation: *user_name* identifies the user that does not have the appropriate R/3 user authorization for the indicated purposes.

System action: R3batch stops.

Operator response: Contact the SAP system administrator to determine if it is possible to change the RFC user's permissions on the R/3 system, or whether you should run this job as a different R/3 RFC user. In the latter case, modify the job definitions to use the different RFC user.

Then rerun **r3batch**.

EEWO0585E The process chain *process_chain* could not be scheduled on the SAP BW system. The R/3 system level does not support this function.

Explanation: *process_chain* identifies the process chain that could not be scheduled on the SAP BW system.

System action: R3batch stops.

Operator response: Contact the SAP system administrator to have the process chain corrected on the SAP BW system, then run **r3batch** again.

EEWO0586E The process chain *process_chain* with log ID *log_id* could not be restarted on the SAP BW system, because of its status. Only process chains with status canceled or failed can be restarted.

Explanation: *process_chain* identifies the process chain that could not be restarted on the SAP BW system.

log_id identifies the run instance of the process chain.

System action: R3batch stops.

Operator response: Contact the SAP system administrator to have the process chain corrected on the SAP BW system, then run **r3batch** again.

EEWO0587E The process chain *process_chain* with log ID *log_id* is already running on the SAP BW system. It cannot be restarted.

Explanation: *process_chain* identifies the process chain that the SAP BW system indicates as running.

log_id identifies the run instance of the process chain.

System action: R3batch stops.

Operator response: Contact the SAP system administrator to have the process chain corrected on the R/3 system, then run **r3batch** again.

EEWO0590E An internal error has occurred. R3batch tried to open the *file_name* file, but the request failed with return code *return_code*.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0591E An internal error has occurred. R3batch tried to close the *file_name* file, but the request failed with return code *return_code*.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0592E An internal error has occurred. R3batch tried to update the *file_name* file, but the request failed with return code *return_code*.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0593E An internal error has occurred. R3batch tried to append records to the *file_name* file, but the request failed with return code *return_code*.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0594E An internal error has occurred. R3batch tried to initialize the *module* internal module, but the request failed.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0595E An internal error has occurred. R3batch tried to read the *file_name* file, but the request failed with return code *return_code*.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0700E An internal error has occurred. The job class is not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem

persists, contact IBM Software Support for assistance.

EEWO0701E An internal error has occurred. The print parameters are not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0702E An internal error has occurred. The external program flags are not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0703E The program cannot read the joblog.

Explanation: See message.

System action: R3batch stops.

Operator response: The problem could have various causes:

- Check that the user running the job has read permission for the job log. Give the user this permission if it does not.
- Check that there is sufficient disk space in the file system of the job log. Make more space available if it does not.
- Check that the operating system has not reached its maximum limit of open files. If it has, either extend this limit, wait for other jobs that are using files to close, or stop other jobs that are using files.

Rerun **r3batch**.

If none of these actions resolves the problem, contact IBM Software Support for assistance.

EEWO0705E The client number is missing in both the local and global options files.

Explanation: See message.

System action: R3batch stops.

Operator response: Check both the local and global options files in the method directory. Add the client number (the port of the target host) to one, other, or both of them, as appropriate. Rerun **r3batch**.

See also: The *User's Guide* for details about the contents and syntax of the options files.

EEWO0706E An internal error has occurred. The job select process failed.

Explanation: See message.

System action: The program might stop.

Operator response: This is an internal error. Check the log to identify a possible cause. If no cause is evident, contact IBM Software Support for assistance.

EEWO0707E An internal error has occurred. The dialog type is not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0708E An internal error has occurred. The initial step is not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0709E An internal error has occurred. The job data is not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0710E An internal error has occurred. The EXTCOMPANY and EXTPRODUCT parameters are different within a session.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0711E An internal error has occurred. The start date is not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem

persists, check the log to identify a possible cause. If you identify the problem, correct it and rerun r3batch. Otherwise, contact IBM Software Support for assistance.

EEWO0712E An internal error has occurred. The step number is not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, check the log to identify a possible cause. If you identify the problem, correct it and rerun r3batch. Otherwise, contact IBM Software Support for assistance.

EEWO0713E The job ID is missing.

Explanation: See message.

System action: R3batch stops.

Operator response: Check the job definition. If the job ID is missing, check with the SAP system administrator to determine the correct ID and enter it in the job definition. Rerun r3batch.

If the job ID is not missing, this is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0714E An internal error has occurred. The joblog name is missing.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0715E An internal error has occurred. The job failed to close.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0716E An internal error has occurred. A job could not be deleted. The following identify the job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job that could not be deleted.

System action: R3batch stops.

Operator response: This is an internal error. Retry the

operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0717E An internal error has occurred. A job could not be deleted because it is not active. The following identify the job:
Job name: *jobname* **Job ID:** *jobID*.

Explanation: *jobname* and *jobID* identify the job that could not be deleted.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0719E The following job does not exist: **Job name:** *jobname* **Job ID:** *jobID*.

Explanation: The R/3 job might have been deleted by a different action, or it might have the correct job name but an incorrect job ID.

jobname and *jobID* identify the job that does not exist.

System action: R3batch stops.

Operator response: Retry the operation (the error might be transient). If the problem persists, check on the SAP system to see if the job exists. If it does not, check the log to see if it has been deleted by another action, and if so, decide whether it needs to be rerun.

If it does exist, but has a different job ID from that indicated in the message, change the job definition accordingly and rerun **r3batch**.

In all other circumstances contact IBM Software Support for assistance.

EEWO0722E An internal error has occurred. A job could not be submitted. The following identify the job: **Job name:** *jobname* **Job ID:** *jobID*.

Explanation: *jobname* and *jobID* identify the job that could not be submitted.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, check the log to identify a possible cause. If you identify the problem, correct it and rerun **r3batch**. Otherwise, contact IBM Software Support for assistance.

EEWO0724E An internal error has occurred. A file or database could not be locked.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem

persists, contact IBM Software Support for assistance.

EEWO0725E The logon has failed. This user is not authorized to work with the R/3 external job management system.

Explanation: See message.

System action: R3batch stops.

Operator response: Contact the R/3 system administrator to determine if the user can be granted permission to work with the R/3 external job management system. If not, rerun the job as a user that has this permission.

EEWO0726E An internal error has occurred. The name and qid are missing.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0727E The following user does not have "execute" privileges: *user_name*.

Explanation: See message.

System action: R3batch stops.

Operator response: Determine from the system administrator whether the user can be granted "execute" privileges. If not, rerun the job as a user that has these privileges.

EEWO0729E The following user does not have any access privileges: *user_name*.

Explanation: See message.

System action: R3batch stops.

Operator response: Determine from the system administrator whether the user can be granted "access" privileges. If not, you should rerun the job as a user that has these privileges.

EEWO0730E No variants have been defined.

Explanation: See message.

System action: The program waits for you to correct the data or exit.

Operator response: Define the missing variants and continue.

See also: The *User's Guide* for details about the how to define variants.

EEWO0731E The ABAP program does not exist.

Explanation: See message.

System action: The program waits for you to correct the data or exit.

Operator response: Contact the R/3 system administrator to determine the correct name of the ABAP program. Modify the job definition and continue.

See also: The *User's Guide* for details about how to define ABAP programs.

EEWO0732E The ABAP program has no variants.

Explanation: See message.

System action: The program waits for you to correct the data or exit.

Operator response: Define the missing variants and continue.

See also: The *User's Guide* for details about how to define variants.

EEWO0733E The ABAP program is missing.

Explanation: You have tried to define variants but have not yet identified an ABAP program.

System action: The program waits for you to correct the data or exit.

Operator response: Define the ABAP program associated with the variants you were trying to enter and continue.

See also: The *User's Guide* for details about how to define ABAP programs.

EEWO0734E The ABAP program is not executable

Explanation: You have defined an ABAP program that is not an executable file.

System action: The program waits for you to correct the data or exit.

Operator response: Choose a different ABAP program, change the job definition, and continue.

See also: The *User's Guide* for details about how to define ABAP programs.

EEWO0735E ABAP and external program set

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0736E The selection has been cancelled.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0737E An internal error has occurred. The startrow is not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0738E The required interface is not supported by the R/3 system.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0739E The version of the required interface is not supported by the R/3 system.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0740E The user name is missing.

Explanation: See message.

System action: The program waits for you to correct the data or exit.

Operator response: Add the missing user name to the job definitions and continue.

EEWO0741E The following user does not have "release" privileges: *user_name*.

Explanation: See message.

System action: R3batch stops.

Operator response: Determine from the system administrator whether the user can be granted "release" privileges. If not, rerun the job as a user that has these privileges.

EEWO0742E The following user does not have "abort" privileges: *user_name*.

Explanation: See message.

System action: R3batch stops.

Operator response: Determine from the system administrator whether the user can be granted "abort" privileges. If not, rerun the job as a user that has these privileges.

EEWO0743E An internal error has occurred. The selection option is not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0744E An internal error has occurred. The select job name is missing.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0745E An internal error has occurred. The select user name is missing.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0746E The following user does not have "delete" privileges: *user_name*.

Explanation: See message.

System action: R3batch stops.

Operator response: Determine from the system administrator whether the user can be granted "delete" privileges. If not, rerun the job as a user that has these privileges.

EEWO0747E An internal error has occurred. A running job could not be deleted. The following identify the job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job that could not be deleted.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0748E An internal error has occurred. The BP_JOB_COPY function could not copy the following job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job that could not be copied.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0749E An internal error has occurred. The joblog of the job cannot be deleted. The following identify the job: Job name: *jobname* Job ID: *jobID*

Explanation: *jobname* and *jobID* identify the job with a joblog that could not be deleted.

System action: The program might stop.

Operator response: Check R/3 syslog.

EEWO0750E An internal error has occurred. An event is missing a parameter.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0751E An internal error has occurred. An event does not exist.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0752E An internal error has occurred. An event could not be raised.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0753E An internal error has occurred. The program could not commit the changes in the database tables when calling the following function module: *module*.

Explanation: See message.

System action: The program might stop.

Operator response: Check R/3 syslog.

EEWO0754E An internal error has occurred. The specified date and/or time is invalid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0755E An internal error has occurred. The specified server name is invalid

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0756E An internal error has occurred. An incorrect action was performed while maintaining the status of interception and parent-child functionality.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0757E An internal error has occurred. An incorrect confirmation type was found while confirming a job.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0758E An internal error has occurred. An incorrect client was found while retrieving intercepted jobs.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0759E The confirmation of a job has failed.

Explanation: See message.

System action: The program might stop.

Operator response: Check R/3 syslog.

EEWO0760E An internal error has occurred. A selection parameter is not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0761E Parent-child functionality is not active.

Explanation: See message.

System action: R3batch stops.

Operator response: Activate parent-child functionality as described in the *User's Guide*. Rerun **r3batch**.

See also: The *User's Guide* for instructions about how to activate parent-child functions.

EEWO0762E Interception functionality is not active.

Explanation: See message.

Operator response: Activate interception functionality as described in the *User's Guide*. Rerun **r3batch**.

See also: The *User's Guide* for instructions about how to activate interception functions.

EEWO0763E An internal error has occurred. An incorrect counter value was found while retrieving the list of reports.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0764E The specified printer is not recognized by the R/3 system.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem

persists, contact IBM Software Support for assistance.

EEWO0765E An internal error occurred during the registration of a child for the following job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job for which a child process could not be registered.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0766E An internal error has occurred. The job data for the following job could not be read: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job with data that could not be read.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0767E An internal error has occurred. The new data for a job are not valid. The following identify the job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job that has new data that is not valid.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0768E The following user does not have "modify" privileges: *user_name*.

Explanation: See message.

System action: R3batch stops.

Operator response: Determine from the system administrator whether the user can be granted "modify" privileges. If not, you should rerun the job as a user that has these privileges.

EEWO0769E An internal error occurred while locking a job in the R/3 database table. The following identify the job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job that could not be locked.

System action: R3batch stops.

Operator response: This is an internal error. Retry the

operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0770E An internal error occurred while attempting to release the following job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job that could not be released.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0771E The target server for a job is not a valid server. The following identify the job: Job name: *jobname* Job ID: *jobID*.

Explanation: The target server indicated in the job definition is not correct. It has either been incorrectly typed or is not valid for the job.

jobname and *jobID* identify the job that does not have a valid server.

System action: The program waits for you to change the job definitions and continue or to exit.

Operator response: Contact the SAP system administrator to obtain the correct name of the target server for this job. Change the job definition accordingly and continue.

EEWO0772E An internal error has occurred. The start date for a job is not valid. The following identify the job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job that has a non-valid start date.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0773E An internal error has occurred. The following job can no longer be modified: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job that could not be modified.

System action: R3batch stops.

Operator response: Retry the operation (the error might be transient). If it persists, contact the SAP system administrator to determine if the status of the indicated job has been changed such that it is no longer modifiable. If not, this is an internal error; contact IBM Software Support for assistance.

EEWO0774E An internal error has occurred. A problem has been found with the print or archive mask, or both, while modifying an ABAP step of the following job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job with an ABAP step that has a problem with the print or archive mask, or both.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0775E An internal error has occurred. The step that needs to be added to a job has the wrong step type. The following identify the job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job that has the wrong step type.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0776E An internal error has occurred. The program could not retrieve the print and archive parameters while adding a step to the following job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job for which print and archive parameters could not be retrieved.

System action: R3batch stops.

Operator response: Check that all network connections are working and retry the operation (the error might be transient). If the problem persists, this is an internal error; contact IBM Software Support for assistance.

EEWO0777E An internal error has occurred. The program could not retrieve information about the following job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job for which information could not be retrieved.

System action: R3batch stops.

Operator response: Check that all network connections are working and retry the operation (the error might be transient). If the problem persists, this is an internal error; contact IBM Software Support for assistance.

EEWO0778E An internal error has occurred. The program could not modify the following job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job that could not be modified.

System action: R3batch stops.

Operator response: Check that all network connections are working and retry the operation (the error might be transient). If the problem persists, this is an internal error; contact IBM Software Support for assistance.

EEWO0779E An internal error has occurred. The program could not modify the worktable for the following job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job for which the worktable could not be modified.

System action: R3batch stops.

Operator response: Check that all network connections are working and retry the operation (the error might be transient). If the problem persists, this is an internal error; contact IBM Software Support for assistance.

EEWO0780E An internal error has occurred. The program could not read the worktable for the following job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job for which the worktable could not be read.

System action: R3batch stops.

Operator response: Check that all network connections are working and retry the operation (the error might be transient). If the problem persists, this is an internal error; contact IBM Software Support for assistance.

EEWO0781E An internal error has occurred. The program could not modify the step for the following job because no step information has been provided: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job for which the step information is not available.

System action: R3batch stops.

Operator response: Check that all network connections are working and retry the operation (the error might be transient). If the problem persists, this is an internal error; contact IBM Software Support for assistance.

EEWO0782E The program has found an inconsistency in the data concerning the parent-child relationship for the following job: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job for which the parent-child relationship data is not consistent.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0783E An internal error has occurred. The program has found incorrect selection options.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0784E An internal error has occurred. The program has found that the following job does not have an expected step: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job for which an expected step is missing.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0785E The variant already exists.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0786E An internal error has occurred. The following user is not authorized to perform the requested action: *user_name*.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0787E An internal error has occurred. The report or variant is not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0788E An internal error has occurred. The variant name is not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0789E An internal error has occurred. The action has not been performed.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0790E An internal error has occurred. The variant selections do not match.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0791E An internal error has occurred. The variant has not been supplied.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0792E An internal error has occurred. The report does not have selection screens.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0793E An internal error has occurred. The report definition could not be loaded.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0794E An internal error has occurred. The variant could not be locked.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0795E An internal error has occurred. The variant could not be deleted.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0796E An internal error has occurred. The variant variable maintenance parameters are not valid.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0797E An internal error has occurred. The table has no fields.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0798E An internal error has occurred. The table is not active.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0799E An internal error has occurred. The table is locked.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0800E An internal error has occurred. The values for the requested field could not be read.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0801E An internal error has occurred. The function module J_1O1_DATETIME has failed. The expression could not be evaluated.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0802E An internal error has occurred. The result buffer for variant placeholders is too small.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0803E An internal syntax error has occurred in the expression.

Explanation: See message.

System action: R3batch waits for you to input data or exit.

Operator response: Check the syntax of the date expression in the job definition. If you find an error, correct it and continue. If you do not find an error in the expression, this is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

See also: The *User's Guide* for details about the syntax of the date expression.

EEWO0804E An internal error has occurred. The job last run time feature is not yet supported.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0805E An internal error has occurred. The calendar placeholder feature is not yet supported.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0806E An internal syntax error has occurred: the date expression is not terminated

Explanation: See message.

System action: R3batch waits for you to input data or exit.

Operator response: Check the syntax of the date expression in the job definition. If you find an error, correct it and continue. If you do not find an error in the expression, this is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

See also: The *User's Guide* for details about the syntax of the date expression.

EEWO0807E An internal syntax error has occurred: the date expression contains no data.

Explanation: See message.

System action: R3batch waits for you to input data or exit.

Operator response: Check the syntax of the date expression in the job definition. If you find an error, correct it and continue. If you do not find an error in the expression, this is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

See also: The *User's Guide* for details about the syntax of the date expression.

EEWO0808E An internal syntax error has occurred: the arithmetic expression is not terminated.

Explanation: See message.

System action: R3batch waits for you to input data or exit.

Operator response: Check the syntax of the arithmetic expression in the job definition. If you find an error, correct it and continue. If you do not find an error in the expression, this is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

See also: The *User's Guide* for details about the syntax of the arithmetic expression.

EEWO0809E An internal syntax error has occurred: the arithmetic expression contains no data.

Explanation: See message.

System action: R3batch waits for you to input data or exit.

Operator response: Check the syntax of the arithmetic expression in the job definition. If you find an error, correct it and continue. If you do not find an error in the expression, this is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

See also: The *User's Guide* for details about the syntax of the arithmetic expression.

EEWO0810E An internal syntax error has occurred in the arithmetic expression.

Explanation: See message.

System action: R3batch waits for you to input data or exit.

Operator response: Check the syntax of the arithmetic expression in the job definition. If you find an error, correct it and continue. If you do not find an error in the expression, this is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

See also: The *User's Guide* for details about the syntax of the arithmetic expression.

EEWO0811E An internal error has occurred. The internal buffer is too small for the arithmetic expression.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem

persists, contact IBM Software Support for assistance.

EEWO0820E An internal error has occurred. The job of the following InfoPackage has not started: *InfoPackage_name*.

Explanation: *InfoPackage_name* identifies the InfoPackage associated with this job or step.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0821E An internal error has occurred. No scheduling data can be found for the following InfoPackage: *InfoPackage_name*.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0822E An internal error has occurred. The job of the following InfoPackage does not exist: *InfoPackage_name*.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0823E An internal error has occurred. The table does not contain the requested field.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0824E An internal error has occurred. The variant has no description in the requested language.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0825E An internal error has occurred. External command steps are not supported for versions of BC-XBP less than 2.0.

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0826E The extended agent could not delete a record from the interception criteria table on the target R/3 system.

Explanation: The extended agent tried to delete an interception criteria record on the R/3 system and the remote operation failed.

System action: The operation is not performed, the agent continues.

Operator response: Retry the operation. If the problem persists, contact your R/3 system administrator.

EEWO0827E The value set for the `bdc_job_status_failed` option is not valid.

Explanation: The value set for the `bdc_job_status_failed` option is not valid. The only allowed values are: all, ignore, or an integer greater than 0.

System action: The operation is not performed.

Operator response: Set a correct value for the option and retry the operation.

EEWO0828E R3batch cannot lock the object *lockobject_name* on the SAP R/3 system.

Explanation: R3batch could not request an exclusive lock on the object *lockobject_name* on the SAP R/3 system.

System action: R3batch stops.

Operator response: Verify if the SAP R/3 system is being controlled by a job throttler instance. If applicable, stop the job throttler instance and retry the operation.

EEWO0829E R3batch cannot unlock the object *lockobject_name* on the SAP R/3 system.

Explanation: R3batch could not release an exclusive lock on the object *lockobject_name* on the SAP R/3 system.

System action: R3batch stops.

Operator response: Verify if the lock is set on the SAP

R/3 system. Contact your SAP system administrator to release the lock manually and retry the operation.

EEWO0830E R3batch cannot unregister the interception collector on the SAP R/3 system. The registration data is: Client ID="client", Name="name", Host="hostname", UID="uniqueID"

Explanation: R3batch could not remove the registration data of the job interception collector on the SAP R/3 system.

System action: R3batch stops.

Operator response: Verify if the interception collector registration record is stored in the registration table /IBMTWS/XAPPL on the SAP R/3 system. If so, contact your SAP system administrator to remove the record manually, and retry the operation.

EEWO0901W The following product could not be registered for SIGTERM handling: "product_name". SIGTERMs will be ignored.

Explanation: See message.

System action: R3batch continues but SIGTERMs are ignored.

Operator response: If you require SIGTERM handling for the correct processing of this job, stop the job, ask the system administrator to allow SIGTERM handling for this product, and rerun r3batch.

EEWO0902W The program cannot check the status of the job; but will try again later.

Explanation: See message.

System action: R3batch continues.

Operator response: If it is important to know the status of the job, look at the syslog to attempt to identify what is preventing the status from being obtained. For example, there might be a network problem restricting the communication with the job.

EEWO0903W The job has been cancelled by the Tivoli Workload Scheduler operator; see the R/3 joblog for details.

Explanation: See message.

System action: R3batch continues, but the job has been cancelled.

Operator response: Check the R/3 joblog for more details. Check with the Tivoli Workload Scheduler operator the reasons for the job cancellation and decide if you need to take any further action.

EEWO0904W The program could not copy the joblog to stdout.

Explanation: See message.

System action: R3batch continues. The problem with copying the joblog does not impact how the job is performed.

Operator response: If you need to consult the joblog, do so on the R/3 system instead of locally.

EEWO0908W An internal error has occurred. The program has found the following incorrectly formed BDCWAIT keyword: BDCWAIT_keyword.

Explanation: See message.

System action: R3batch continues, but the BDCWAIT is ignored.

Operator response: If the BDCWAIT is essential to the successful performance of the job, stop the job. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0909W An internal error has occurred. The following BDCWAIT keyword does not have the correct syntax: BDCWAIT_keyword.

Explanation: See message.

System action: R3batch continues, but the BDCWAIT is ignored.

Operator response: If the BDCWAIT is essential to the successful performance of the job, stop the job. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0910W An internal error has occurred. No BDC sessions were found that matched the following session name: "session_name". The BDCWAIT will be ignored.

Explanation: See message.

System action: R3batch continues, but the BDCWAIT is ignored.

Operator response: If the BDCWAIT is essential to the successful performance of the job, stop the job. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0911W An internal error has occurred. No BDC sessions were found that matched the following qid: "qid". The BDCWAIT will be ignored.

Explanation: See message.

System action: R3batch continues, but the BDCWAIT is ignored.

Operator response: If the BDCWAIT is essential to the successful performance of the job, stop the job. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0912W An internal error has occurred. The BDC session found previously can no longer be found in the BDC status table. The wait is terminated for the following session: "session_name" and "queue_id".

Explanation: The program creates an internal table of BDC sessions to maintain the status of each session. A session that had previously been found and loaded into the table can no longer be found.

System action: R3batch continues, but the BDCWAIT is ended.

Operator response: If the BDCWAIT is essential to the successful performance of the job, stop the job. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0913W The following trace level in the job definition is not valid: "trace_level". The default value of 3 (DEBUG_MAX) is used instead.

Explanation: The -tracelvl option in the job definition has a value that is not valid.

System action: R3batch continues, using the default trace level: DEBUG_MAX.

Operator response: Correct the value supplied in the job definition for the -tracelvl option to one of the values indicated in the *User's Guide*.

See also: The *User's Guide* for details about the -tracelvl option settings in the job definition.

EEWO0914W An internal error has occurred. Either the joblog or the job protocol for the following job does not exist: Job name: jobname Job ID: jobID.

Explanation: jobname and jobID identify the job for which the job protocol does not exist.

System action: R3batch continues, but log information is not available.

Operator response: If you need to have log information for the successful running of this job, stop the job and contact the SAP system administrator to determine why the job log or job protocol does not exist. When the problem has been resolved rerun r3batch. If the problem persists, contact IBM Software Support for assistance.

EEWO0915W An internal error has occurred. Either the job log or the job protocol for the following job is empty: Job name: jobname Job ID: jobID.

Explanation: jobname and jobID identify the job for which the job log is empty.

System action: R3batch continues, but log information is not available.

Operator response: If you need to have log information for the successful running of this job, stop the job and contact the SAP system administrator to determine why the job log or job protocol is empty. When the problem has been resolved rerun r3batch. If the problem persists, contact IBM Software Support for assistance.

EEWO0916W An internal error has occurred. The step has no spool list

Explanation: See message.

System action: R3batch continues, but log information is not available.

Operator response: If you need to have log information for the successful running of this job, stop the job and contact the SAP system administrator to determine why the step has no spool list. When the problem has been resolved rerun r3batch.

EEWO0917W An internal error has occurred. The spool ID is not valid

Explanation: See message.

System action: R3batch continues, but log information is not available.

Operator response: If you need to have log information for the successful running of this job, stop the job and contact the SAP system administrator to determine why the spool ID is not valid. When the problem has been resolved rerun r3batch. If the problem persists, contact IBM Software Support for assistance.

EEWO0918W The report list selection is finished

Explanation: The program is reading the report list from the SAP system. Depending on circumstances, this message might indicate that the process has completed successfully, or that the selection has terminated

unexpectedly, with an internal error.

System action: R3batch continues.

Operator response: Check that the reports received from the SAP system are what you are expecting. If they are not, rerun **r3batch** (the problem might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO0919W There are no background processing resources active in the R/3 system.

Explanation: See message.

System action: R3batch continues, but the job cannot be run.

Operator response: Contact the R/3 system administrator to activate background processing resources in the R/3 system.

EEWO0920W An internal error occurred. The spoolist of the following job cannot be read: Job name: *jobname* Job ID: *jobID*.

Explanation: *jobname* and *jobID* identify the job for which the spoolist could not be read.

System action: R3batch continues, but log information is not available.

Operator response: If you need to have log information for the successful running of this job, stop the job and contact the SAP system administrator to determine why the spool list cannot be read. When the problem has been resolved rerun **r3batch**.

EEWO0921W An internal error has occurred. The program requires the "-flag type=exec" parameter to be specified for dynamic job creation.

Explanation: This is an internal error caused by one module of **r3batch** not supplying the indicated parameter when calling another module.

System action: R3batch continues, but the job is not created.

Operator response: Contact IBM Software Support for assistance.

EEWO0930W The following language is not valid: "*language*". The following default language is used: "*default_language*".

Explanation: See message.

System action: R3batch continues.

Operator response: If you do not want the job to continue in the indicated default language, stop the job. To correct the language selection, edit the job options and change the `twsxa_lang` or `twsmeth_lang` parameter

values to a valid value as described in the *User's Guide*. Then rerun **r3batch**.

See also: The *User's Guide* for more information about the language options.

EEWO0950W The RFC user is already logged on

Explanation: See message.

System action: R3batch continues.

Operator response: You might choose to warn the SAP system administrator that a job for this RFC user has been submitted, but that this user is already logged on.

EEWO0960W No calendar data for the SAP Factory Calendar ID and year range defined in the input can be found in the SAP R/3 system.

Explanation: The SAP factory calendar ID and year range specified with the **r3batch** "RSC" task could not find any data to export.

System action: R3batch continues, but no output is provided.

Operator response: Change the SAP Factory Calendar ID, or year range, or both, and rerun the command.

EEWO0961W The external dependency cannot be committed because the SAP event name: "*event_name*" and event parameter: "*event_parameter*" which is the subject of the dependency has not been found on the SAP system.

Explanation: You have tried to commit an external dependency on the SAP event name and parameter indicated in the message, but the event could not be found on the SAP system. Either the SAP event is incorrectly defined in Tivoli Workload Scheduler, or it has not been created on the SAP system.

System action: R3batch continues.

Operator response: Check if the SAP event and parameter have been correctly defined in Tivoli Workload Scheduler and change them, if they have not. Check whether the SAP event exists on the SAP system. If the event does not exist, and your dependency is defined correctly, this message is for information only.

EEWO0970W The SAP component: *sap_comp* does not have the correct SAP support package level installed. For details, see the SAP Note: *sap_note*.

Explanation: R3batch tries to perform an SAP R/3 function, but the backend system does not have the correct SAP support package level installed.

System action: R3batch continues.

Operator response: Check the SAP system and follow the instructions in the SAP Note.

EEWO0997W An internal error occurred while trying to obtain the semaphore. The following RFC function module will not be synchronized: *function_module*.

Explanation: The semaphore allows the RFC function modules to synchronize their use of system resources. Without the semaphore, a module might time-out, waiting for a resource to become available.

function_module is the RFC function module that cannot obtain a semaphore.

System action: R3batch continues.

Operator response: If the use of the semaphore is important for the job being run, stop the job. Retry the operation (the error might be transient). If the problem persists, check in the log and with the SAP system administrator to try and determine why the semaphore could not be obtained. If this is not possible to determine, there is an internal error; contact IBM Software Support for assistance.

EEWO0998W An internal error occurred while trying to open the semaphore. The following RFC function module will not be synchronized: *function_module*.

Explanation: The semaphore allows the RFC function modules to synchronize their use of system resources. Without the semaphore, a module might time-out, waiting for a resource to become available.

function_module is the RFC function module that cannot open its semaphore.

System action: R3batch continues.

Operator response: If the use of the semaphore is important for the job being run, stop the job. Retry the operation (the error might be transient). If the problem persists, check in the log and with the SAP system administrator to try and determine why the semaphore could not be obtained. If this is not possible to determine, there is an internal error; contact IBM Software Support for assistance.

EEWO1005W An error occurred while retrieving the spool list for a step:

Explanation: See message.

System action: R3batch continues, but return code mapping of this job cannot be performed.

Operator response: If return code mapping is crucial to the job, stop it, and contact the SAP system administrator to determine why the spool list could not

be retrieved. When the problem has been resolved rerun r3batch.

EEWO1034E An internal error has occurred. Conman could not be run to submit the intercepted SAP job:

Explanation: See message.

System action: R3batch stops.

Operator response: This is an internal error. Retry the operation (the error might be transient). If the problem persists, contact IBM Software Support for assistance.

EEWO1063W An error occurred while adding the information about the submitted process chain to the common serialization file *file_name*. The process chain cannot be restarted.

Explanation: See message.

System action: R3batch continues, but the process chain is not restarted.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO1064W An error occurred while opening the common serialization file *file_name*. The process chain cannot be restarted.

Explanation: See message.

System action: R3batch continues, but the process chain is not restarted.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO1065W The environment variable *env_var* is not set. The process chain cannot be restarted.

Explanation: See message.

System action: R3batch continues, but the process chain is not restarted.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO1066W The file *file_name* cannot be locked. It will not be updated. The process chain is not restarted.

Explanation: See message.

System action: R3batch continues, but the process chain is not restarted.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO1067W An error occurred while updating the information about the submitted process chain in the common serialization file *file_name*. The process chain cannot be restarted.

Explanation: See message.

System action: R3batch continues, but the process chain is not restarted.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO1069E The common serialization file does not contain any information about the process chain identified by *value*.

Explanation: See message.

System action: R3batch continues, but the process chain is not restarted.

Operator response: This is an internal error. Contact IBM Software Support for assistance.

EEWO1070E The specified process ID *process_ID* is not valid. No process in the process chain will be restarted.

Explanation: See message.

System action: R3batch continues, but the process chain is not restarted.

Operator response: Specify a valid process ID and retry the operation.

EEWOJ0100W Warning, options file *options_file* not found.

Explanation: See message.

System action: The job throttler tried to open the extended agent specific options file, but the file could not be found.

Operator response: Ensure that the required options file exists and is located in the correct path. For details, see the *User's Guide*.

EEWOJ0101W Warning, options file *options_file* cannot be read.

Explanation: See message.

System action: The job throttler tried to read the extended agent specific options file, but an error occurred during reading.

Operator response: Ensure that the content of the file is not corrupted.

EEWOJ0102W Warning, options file *options_file* is not readable.

Explanation: See message.

System action: The job throttler tried to read the extended agent specific options file, but the file permissions do not allow reading.

Operator response: Ensure that the file has reading permissions set.

EEWOJ0103W Warning, unknown command line argument *argument*.

Explanation: See message.

System action: The job throttler cannot recognize the specified command line parameter.

Operator response: Specify a valid command line parameter.

EEWOJ0104W Warning, the value *value* set for THROTTLING_INTERVAL is not an integer. The default value *default* is used.

Explanation: See message.

System action: None.

Operator response: Specify a valid integer value.

EEWOJ0105W Warning, unable to get job properties for job "*jobname*" ("*jobID*").

Explanation: See message.

System action: The job throttler tried to read the properties of the intercepted job, but an error occurred.

Operator response: Ensure that the connection to the SAP system is up and running.

EEWOJ0106W Warning, unable to get job properties for job "*jobname*" ("*jobID*"), which is progenitor of job "*jobname*" ("*jobID*").

Explanation: See message.

System action: The job throttler tried to read the properties of the progenitor job, but an error occurred.

Operator response: Ensure that the connection to the SAP system is up and running.

EEWOJ0107W Warning, job "*jobname*" ("*jobID*") no longer exists, it could have been manually or programmatically deleted.

Explanation: See message.

System action: The job throttler tried to either release a job or check its status, but the job no longer exists on the SAP system.

Operator response: Check if the job was manually deleted.

EEWOJT0108W Warning, unable to release job
"jobname" ("jobID").

Explanation: See message.

System action: The job throttler tried to release the job, but an error occurred. The job could have been released manually or deleted.

Operator response: None.

EEWOJT0109W Warning, unable to locate logging configuration file "log_conf_file".

Explanation: See message.

System action: The job throttler tried to load the file that contains the logging configuration, but the file could not be found.

Operator response: Ensure that the logging file is located in the correct path. For details, see the *User's Guide*.

EEWOJT0110W Warning, errors when reading
JT_MTE.xml file.

Explanation: See message.

System action: No data is sent from job throttling to CCMS.

Operator response: Make sure that the file JT_MTE.xml is located in the correct path. For details, see the *User's Guide*.

EEWOJT0111W Warning, the RFC connection failed.
RFC error "error", RFC error group
"error_group", RFC error message
"error_msg".

Explanation: The RFC connection between the job throttler and the SAP system failed.

System action: The job throttler tries the operation again.

Operator response: Verify if the connection between the job throttler and the SAP system is up and running. For details about the problem, look at the job throttler trace file.

EEWOJT0200E Error, options file *options_file* **not found.**

Explanation: See message.

System action: The job throttler tried to open the global options file, but the file could not be found.

Operator response: Ensure that the required options

file exists and is located in the correct path. For details, see the *User's Guide*.

EEWOJT0201E Error, options file *options_file* **cannot be read.**

Explanation: See message.

System action: The job throttler tried to read the global options file, but an error occurred during reading.

Operator response: Ensure that the content of the file is not corrupted.

EEWOJT0202E Error, properties file *properties_file* **is not readable.**

Explanation: See message.

System action: The job throttler tried to read the global options file, but the file permissions do not allow reading.

Operator response: Ensure that the file has reading permissions set.

EEWOJT0203E Error, task not provided as command line parameter.

Explanation: See message.

System action: The job throttler could not parse the task command line parameter.

Operator response: Specify a task as command line parameter.

EEWOJT0204E Error, extended agent workstation name not provided as command line parameter.

Explanation: See message.

System action: The job throttler could not parse the SAP CPU command line parameter.

Operator response: Specify a workstation name as command line parameter.

EEWOJT0205E Error, command file *command_file* **is a directory, not a text file.**

Explanation: See message.

System action: The job throttler could not read the specified command file, because it is a directory not a file.

Operator response: Specify a valid command file.

EEWOJT0206E Error, command file *command_file* cannot be read.

Explanation: See message.

System action: The job throttler could not read the command file because file permissions do not allow reading.

Operator response: Ensure that the file has reading permissions set.

EEWOJT0207E Error, another job throttler is already running against the same SAP system. Foreign job throttler registration is: Client ID="*client*", Name="*name*", Host="*hostname*", UID="*uniqueID*"

Explanation: See message.

System action: The job throttler stops.

Operator response: Identify the foreign job throttler instance by its registration data. If appropriate, stop the foreign job throttler and restart the job throttler you want.

EEWOJT0209E Error, the password format is not valid.

Explanation: See message.

System action: The job throttler tried to read the SAP password, but the password format is invalid. The job throttler stops.

Operator response: Encrypt your password again using *enigma*, *pwdcrypt*, or the Option Editor.

EEWOJT0210E Error, job throttler unregistration failed on the SAP system. Client ID="*client*", Name="*name*", Host="*hostname*", UID="*uniqueID*"

Explanation: See message.

System action: The job throttler stops.

Operator response: See the troubleshooting chapter of the *User's Guide* for details about how to identify and delete persistent and invalid job throttler registrations on the SAP system.

EEWOJT0211E Error, another job interception collector is already running against the same SAP system. Foreign interception collector registration is: Client ID="*client*", Name="*name*", Host="*hostname*", UID="*uniqueID*"

Explanation: See message.

System action: The job throttler stops.

Operator response: Stop using the job interception

collector while running the job throttler.

EEWOJT0212E Error, the RFC connection to the remote SAP system failed. RFC error key="*error_key*", RFC error group="*error_group*", RFC error message="*error_msg*"

Explanation: See message.

System action: The job throttler stops.

Operator response: To resolve the problem:

- Ensure that the client ID, R/3 user ID, and password specified in the options file are correct.
- Check with the SAP system administrator that the specified R/3 instance is running on the host.

Run the job throttler again.

EEWOJT0213E Error, the required options are not specified either in the global or in the local options file.

Explanation: The action being performed by the job throttler requires one or more specific options to be set in the global or local options file. For details about the options required by the job throttler, see the *User's Guide*.

System action: The job throttler stops.

Operator response: To determine the options required for the action you want to perform, see the *User's Guide*. Modify the global or local options file (or both) accordingly. Run the job throttler again.

EEWOJT0214E Error, the function module *function_name* cannot be found on the SAP system.

Explanation: The action being performed by the job throttler requires that the specified function module is installed on the SAP system. For details about the software prerequisites to use the job throttler, see the *User's Guide*.

System action: The job throttler stops.

Operator response: To determine the software prerequisites for the action you want to perform, see the *User's Guide*. Install either the SAP transports or SAP support packages, as required, and run the job throttler again.

Chapter 243. Oracle access method messages - P

This section lists *error* and *warning* messages that might be issued by the Oracle E-Business Suite access method processes.

EEWP0046 - EEWPD0410

EEWP0046E An error has occurred while launching the back-end processes.

Explanation: See message.

System action: The agent stops.

Operator response: Check the log for associated messages. Try to identify and fix the problem, and restart the agent. If the problem persists, contact IBM Software Support for assistance.

EEWP0049I The Tivoli Workload Scheduler for Oracle extended agent has terminated. The return code is *return_code*

Explanation: See message.

System action: The extended agent stops.

Operator response: If the return code is 0, the agent has completed all its activities successfully.

If the return code is nonzero, look in the log for preceding messages that give more information. Fix the problem and restart the agent. If the problem persists, contact IBM Software Support for assistance.

EEWP0050E An error has occurred in the Oracle application. Oracle messages can be found in the Tivoli Workload Scheduler log. Some messages might also be found in the Oracle log file.

Explanation: See message.

System action: The extended agent stops.

Operator response: Check in the Tivoli Workload Scheduler log and in the Oracle log file named `sqlnet.log` for associated messages. You might need to contact the Oracle application administrator. Fix the problem and restart the agent.

EEWP0101W *back-end_program_name* - You are using an unencrypted password.

Explanation: The indicated back-end program has found an unencrypted password in the options file. This might be a violation of the security rules at your workplace.

System action: The program continues.

Operator response: If you intended to leave the password unencrypted, take no action.

If you do not want to use unencrypted passwords, stop the agent, use the **enigma** utility to encrypt the password, copy and paste the encrypted password into the options file, save the options file, and retry the operation.

EEWPD0410E MCMTJ - An error occurred while the agent was stopping the Oracle job.

Explanation: An error occurred while the MCMTJ back-end process was trying to stop the Oracle job.

System action: The agent stops.

Operator response: You might want to ask the Oracle administrator to stop the Oracle job manually. Check in the logs for associated messages that might explain why the stop did not work. Fix any problems. If the Oracle job has not yet been stopped, retry the operation. If the problem persists, contact IBM Software Support for assistance.

Chapter 244. Applications installer messages - EEWAI

This section lists *error* and *warning* messages that might be issued by the Application installer processes.

EEWAI001 - EEWAI017

EEWAI001E {0} is a required parameter.

Explanation: See message.

Operator response: Specify a value for the required parameter.

EEWAI002E {0} is not an existing file.

Explanation: See message.

Operator response: Select an existing file.

EEWAI003E {0} does not contain the psjoar.jar file.

Explanation: See message.

Operator response: Select an existing psjoar.jar file.

EEWAI004E At least one feature must be selected.

Explanation: See message.

Operator response: Select a feature.

EEWAI005E No Tivoli Workload Automation instances were found on this system. The installation process cannot proceed.

Explanation: See message.

Operator response: Install a Tivoli Workload Automation instance on the running system.

EEWAI006E You cannot perform any actions on the selected instance. Select a different instance.

Explanation: See message.

Operator response: Select a different Tivoli Workload Automation instance and perform the action again.

EEWAI007E You are performing the installation on a workstation that does not have enough disk space.

Explanation: See message.

Operator response: Free some disk space and retry the operation. For more information about the disk

space requirements, see the Planning and Installation Guide.

EEWAI008E The path you specified does not contain a valid installation of Tivoli Workload Scheduler.

Explanation: See message.

Operator response: Specify a path that contains a valid installation of Tivoli Workload Scheduler and launch the installation again.

EEWAI009E Operating system not supported.

Explanation: See message.

Operator response: Run the installation on a supported operating system.

EEWAI010E The backup of previous Tivoli Workload Scheduler for Applications installation files failed.

Explanation: See message.

Operator response: Check the disk space or write access on the specified backup directory.

EEWAI011E Unable to install the plug-in.

Explanation: See message.

Operator response: The installation process is unable to copy plug-in files on the target system.

EEWAI012E Unable to uninstall the plug-ins.

Explanation: See message.

Operator response: The installation process is unable to remove plug-in files from the target system.

EEWAI013E The installation process is unable to save the updates for the Tivoli Workload Scheduler registry file.

Explanation: See message.

Operator response: The installation process cannot save the updates for the Tivoli Workload Automation registry file. Verify that the Tivoli Workload

EEWAI014E • EEWAI017E

Automation registry file is present and that it has the write access.

EEWAI014E The installation process is unable to install the selected plug-in on the Tivoli Workload Scheduler instance because the Java extension is not installed.

Explanation: See message.

Operator response: Install the Java extension on the selected instance of Tivoli Workload Scheduler.

EEWAI015E The installation process is unable to remove the old version of Tivoli Workload Scheduler for Applications instance.

Explanation: See message.

Operator response: Remove manually the old version of Tivoli Workload Scheduler for Applications instance.

EEWAI016E The installation process is unable to install the plug-ins on the Tivoli Workload Scheduler instance Tivoli Workload Scheduler or Tivoli Workload Scheduler for z/OS Connector version earlier than 8.6.0.1.

Explanation: See message.

Operator response: Select a later version of Tivoli Workload Scheduler instance of Tivoli Workload Scheduler or Tivoli Workload Scheduler for z/OS Connector to install the plug-ins.

EEWAI017E You are performing the installation on a workstation that does not have enough temporary disk space.

Explanation: See message.

Operator response: Free some disk space on temporary file system and retry the operation. For more information about the disk space requirements, see the Planning and Installation Guide.

Chapter 245. Plug-in installer messages - EEWAI

This section lists *error* and *warning* messages that might be issued by the Plug-in installer method processes.

EEWAI500 - EEWAI522

EEWAI500E {0} is a required parameter.

Explanation: See message.

Operator response: Specify a value for the required parameter.

EEWAI501E {0} is not an existing file.

Explanation: See message.

Operator response: Select an existing file.

EEWAI502E {0} is not a zip file.

Explanation: See message.

Operator response: Select an existing plug-in file.

EEWAI503E {0} does not contain the plugin.xml file.

Explanation: See message.

Operator response: Select a valid plug-in file.

EEWAI504E No Tivoli Workload Automation instances were found on this system. The installation process cannot proceed.

Explanation: See message.

Operator response: Install a Tivoli Workload Automation instance on the running system.

EEWAI505E You cannot perform any actions on the selected instance. Select a different instance.

Explanation: See message.

Operator response: Select a different Tivoli Workload Automation instance and perform the action again.

EEWAI506E You are performing the installation on a workstation that does not have enough disk space.

Explanation: See message.

Operator response: Free some disk space and retry the operation. For more information about the disk

space requirements, see the Planning and Installation Guide.

EEWAI507E The path you specified does not contain a valid installation of Tivoli Workload Scheduler.

Explanation: See message.

Operator response: Specify a path that contains a valid installation of Tivoli Workload Scheduler and launch the installation again.

EEWAI508E Operating system not supported.

Explanation: See message.

Operator response: Run the installation on a supported operating system.

EEWAI509E {0} contains a plugin.xml file with syntax errors.

Explanation: See message.

Operator response: Select a valid plugin.xml file.

EEWAI510E {0} contains a plugin.xml file with files that do not exist in it.

Explanation: See message.

Operator response: Ask the administrator for a zip file containing the required files for the plug-in.

EEWAI511E You did not select any plug-in. Select at least one plug-in.

Explanation: See message.

Operator response: Select at least one plug-in and proceed with the installation.

EEWAI512E A later version of the selected plug-in is already installed on this instance.

Explanation: See message.

Operator response: Install a later version of the plug-in.

EEWAI513E {0} must contain at least one jar file.

Explanation: See message.

Operator response: The zip file you are installing does not contain the required jar file or the jar file is not located in the correct path. Ask the administrator for a zip file containing the jar file.

EEWAI514E You cannot install the selected plug-in using the plug-in installer version {0}.

Explanation: See message.

Operator response: Install a later version of the plug-in installer and start the installation again.

EEWAI515E The license Files: {0} is missing in the selected plug-in.

Explanation: See message.

Operator response: The zip file you are installing does not contain the required licenses or the licenses are not located in the correct path. Ask the administrator for a zip file containing the licenses.

EEWAI516E In the response file the ACTION_TYPE value is incorrect. You can specify only DEPLOY or UNDEPLOY.

Explanation: See message.

Operator response: In the response file, set the ACTION_TYPE value to DEPLOY or UNDEPLOY

EEWAI517E In the response file, the LICENSE_ACCEPTED value is set to false and the installation cannot proceed.

Explanation: See message.

Operator response: In the response file, set the LICENSE_ACCEPTED value to true.

EEWAI518E The installation process is unable to save the updates for the Tivoli Workload Automation registry file.

Explanation: See message.

Operator response: The installation process cannot save the updates for the Tivoli Workload Automation registry file. Verify that the Tivoli Workload Automation registry file is present and that it has the write access.

EEWAI519E The installation process is unable to update the config.ini file.

Explanation: See message.

Operator response: The installation process cannot save the updates for the config.ini file. Verify if the file is present or it has the writing access rights.

EEWAI520E Cannot copy plug-in files on the target system.

Explanation: See message.

Operator response: The installation process is unable to copy plug-in files on the target system.

EEWAI521E The installation process is unable to install the selected plug-ins on the Tivoli Workload Scheduler instance because the Java extension is not installed.

Explanation: See message.

Operator response: Install the Java extension on the selected instance of Tivoli Workload Scheduler.

EEWAI522E One or more problems occur in deleting from instance {0} the following files {1}

Explanation: See message.

Operator response: The listed files could not exist or cannot be deleted.

Chapter 246. PeopleSoft access method messages - HTWGT

This section lists *error* and *warning* messages that might be issued by the PeopleSoft access method processes.

These messages are from Tivoli Workload Scheduler for Visualized Data Centers, which has a product code of HTW. The subcomponent code is GT.

Note: The PeopleSoft access method also issues messages that are part of Tivoli Workload Scheduler for Applications, see Chapter 241, "PeopleSoft access method messages - N," on page 1541.

HTWGT0001 - HTWGT0025

HTWGT0001E An internal error has occurred. The program cannot initialize the option source class "*option_source_class*" required to read the global or local options file.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

HTWGT0002E An internal error has occurred. The program cannot find the option source class "*option_source_class*" required to read the global or local options file.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

HTWGT0003W The value of the specified option "*option*" is not valid.

Explanation: See message.

System action: The program proceeds. The default value for the computer where the access method is running is used.

Operator response: If the default value is not correct, cancel the job and resubmit it, supplying a valid value for the option.

See also: The *User's Guide* for a description of the valid values for the option.

HTWGT0005E The program cannot read the file "*file*".

Explanation: See message.

System action: The program cannot proceed.

Operator response: Verify the following:

- The file exists and the name of the file is correct.
- You have the correct permissions to access the file.
- The file is not corrupt.

When you have fixed the problem, retry the operation.

HTWGT0006E The job definition task string has not been specified.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Resubmit the job, specifying the job definition task string.

See also: *User's Guide* for the syntax of the job definition.

HTWGT0007W The specified option "*option*" has been supplied without the required value.

Explanation: See message.

System action: The program proceeds, using the default value.

Operator response: If the default value is not correct, cancel the job and resubmit it, supplying a valid value for the option.

See also: The *User's Guide* for a description of the valid values for the option.

HTWGT0008W The specified option "*option*" has been supplied more than once, with different values.

Explanation: This message occurs if an option has

been supplied in more than one of the following:

- Job definition
- Local options
- Global options

System action: The program proceeds, using the value according to the following hierarchy:

1. Job Definition
2. Local options
3. Global options

Operator response: If the default value is not correct, cancel the job and resubmit it, supplying a valid value for the option.

See also: The *User's Guide* for a description of the valid values for the option.

HTWGT0009E The file "file" does not exist.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Check whether the file has been deleted, moved, or renamed. If the file is the local or global options file, re-create, move, or rename it to the correct name.

See also: See the *User's Guide* for details of the path and name of the options files.

HTWGT0010E The file "file" cannot be read.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Check whether the file has been corrupted by attempting to read it. Ensure that no process has locked it or is writing to it. Resolve the problem and retry the operation.

HTWGT0011E An I/O error occurred when reading from file "file".

Explanation: See message.

System action: The program cannot proceed.

Operator response: Verify the following:

- The file exists and the name of the file is correct.
- You have the correct permissions to access the file.
- The file is not corrupt.
- That no process has locked it or is writing to it.

Resolve the problem and retry the operation.

HTWGT0012E The program is trying to open the file called "name" but the object with that name is not a file.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

HTWGT0013E An internal error has occurred. The program cannot initialize the class "class".

Explanation: See message.

System action: The program cannot proceed.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

HTWGT0014E An internal error has occurred. The program is not authorized to initialize the class "class".

Explanation: See message.

System action: The program cannot proceed.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

HTWGT0015E An internal error has occurred. The program cannot find the class "class".

Explanation: See message.

System action: The program cannot proceed.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

HTWGT0016W A non-valid option line has been detected in the options file "options_file". The line "non-valid_option_line" is ignored.

Explanation: See message.

System action: The program proceeds, ignoring the non-valid line and the option it contains.

Operator response: If the job needs the option in the ignored line, cancel the job, edit the option file, supplying a valid option line, and resubmit the command.

HTWGT0017E An internal error has occurred. The program cannot open the logger class "class".

Explanation: See message.

System action: The program cannot proceed.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

HTWGT0018E The task "task" you specified cannot be run.

Explanation: This agent only supports job submissions. You have tried to run it to perform a different task, which is not allowed.

System action: The program cannot proceed.

Operator response: Either rerun the program to submit a job, or choose a different agent.

HTWGT0019E An internal error has occurred. The program cannot find the Tivoli Workload Scheduler root directory "install_directory".

Explanation: See message.

System action: The program cannot proceed.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

HTWGT0020E An internal error has occurred. The Tivoli Workload Scheduler root directory "install_directory" you specified is not a directory.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

HTWGT0021E An internal error has occurred. The program cannot read the Tivoli Workload Scheduler root directory "install_directory".

Explanation: See message.

System action: The program cannot proceed.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

HTWGT0022E An error was encountered while initializing the options. The job will be terminated.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Retry the operation. If the problem persists, contact IBM Software Support for assistance.

HTWGT0023W The value "option_value" you specified for the option "option" is not valid.

Explanation: See message.

System action: The program cannot proceed.

Operator response: Change the value for the option and retry the operation.

See also: The *User's Guide* for a description of the valid values for the option.

HTWGT0025W A non-valid option has been detected in the job definition task string. The option "non-valid_option" is ignored.

Explanation: See message.

System action: The program proceeds, ignoring the non-valid option.

Operator response: If the job needs the ignored option, cancel the job and resubmit the command, specifying the indicated option correctly.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any equivalent agreement between us.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

Trademarks

IBM, the IBM logo, and `ibm.com`[®] are trademarks or registered trademarks of International Business Machines Corporation in the United States, other countries, or both. If these and other IBM trademarked terms are marked on their first occurrence in this information with a trademark symbol ([®] or [™]), these symbols indicate U.S. registered or common law trademarks owned by IBM at the time this information was published. Such trademarks may also be registered or common law trademarks in other countries. A current list of IBM trademarks is available on the Web at "Copyright and trademark information" at <http://www.ibm.com/legal/copytrade.shtml>.

Adobe, the Adobe logo, PostScript, and the PostScript logo are either registered trademarks or trademarks of Adobe Systems Incorporated in the United States, and/or other countries.

Intel, Intel logo, Intel Inside, Intel Inside logo, Intel Centrino, Intel Centrino logo, Celeron, Intel Xeon, Intel SpeedStep, Itanium, and Pentium are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

ITIL is a registered trademark, and a registered community trademark of The Minister for the Cabinet Office, and is registered in the U.S. Patent and Trademark Office

UNIX is a registered trademark of The Open Group in the United States and other countries.

Java™ and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.
