### IBM Power Systems, AIX and Oracle Database 10g & 11.2.0.3 Performance Considerations

### Introduction

This document is intended to provide information, suggestions and website links to assist with IBM Power Systems running in an Oracle Database 10g and 11g environment. The primary focus is AIX with Oracle Database versions 10.2.0.4 and 11gR2 with POWER7 & POWER8 systems. Power Systems concerns can be minimized by following standard practices which applies to all POWER server generations. The document also includes some information related to Oracle Real Application Clusters (RAC).

Table 1: Suggested Power and Oracle considerations

### Oracle DB 11gR2 Standard Practices for IBM AIX

This section is a summary of standard practices for standalone Oracle DB 11gR2 instances on IBM AIX 6.1, AIX 7.1 and Power Systems. With the exception of references to Symmetric Multi-threading, quad-threaded mode (SMT4), all of the standard practices apply to POWER6 as well. While the primary focus is on standalone Oracle 11gR2 with filesystem-based storage, standalone Automatic Storage Management (ASM) is also addressed. These standard practices apply to Oracle DB 10.2.0.4 as well, and where they differ from those for Oracle DB 11gR2, patches specific to Oracle DB 10.2.0.4 are noted.

Detailed instructions for installing and configuring Oracle 11gR2 RAC with ASM are provided in <u>Release Notes: Oracle Real Application Cluster 11g Release 2 (11gR2) On IBM AIX</u>, available from Oracle. The details of ASM installation and configuration in the document are mostly applicable to standalone ASM as well.

The following pages discuss memory, CPU, I/O, network, and miscellaneous settings. In addition, we list the AIX APARs required for Oracle 11gR2, the Oracle patches for 11gR2 on AIX 6.1 and 7.1, the Oracle patches for 10.2.0.4 and 11gR2, as well as recent suggestions and open issues.

#### Memory

Specifications for kernel settings and Oracle large page usage are:

#### **Kernel Settings**

Kernel settings are listed in Table 2. These are commonly suggested values.

| Parameter        | Proposed<br>Value | AIX 6.1<br>Default | AIX 6.1<br>Restricted | AIX 7.1<br>Default | AIX 7.1<br>Restricted |
|------------------|-------------------|--------------------|-----------------------|--------------------|-----------------------|
| minperm%         | 3                 | 3                  | No                    | 3                  | No                    |
| maxperm%         | 90                | 90                 | Yes                   | 90                 | Yes                   |
| maxclient%       | 90                | 90                 | Yes                   | 90                 | Yes                   |
| strict_maxclient | 1                 | 1                  | Yes                   | 1                  | Yes                   |
| strict_maxperm   | 0                 | 0                  | Yes                   | 0                  | Yes                   |
| lru_file_repage  | 0                 | 0                  | Yes                   | N/A                | N/A                   |

| 10   | 10   | Yes   | 10   | Yes  |
|------|--|---|--|--|
| 960  | 960  | No  | 960  | No   |
| 1088 | 1088   | No  | 1088   | No   |
| 1    | 1  | Yes   | 1  | Yes  |
| 1    | 1  | Yes   | 1  | Yes  |
| 0    | 0  | No  | 0  | No   |
| 0    | 0  | No  | 0  | No   |
| 0    | 0  | No  | 0  | No   |
| 90   | 80   | No  | 90   | No   |
| 1*   | 0  | No  | 1  | No   |
|      | 960<br>1088<br>1<br>1<br>1<br>0<br>0<br>0<br>0<br>90 | 960         960           1088         1088           1         1           1         1           0         0           0         0           90         80 | 960         960         No           1088         1088         No           1         1         Yes           1         1         Yes           0         0         No           0         0         No           90         80         No | 960         960         No         960           1088         1088         No         1088           1         1         Yes         1           1         1         Yes         1           0         0         No         0           0         0         No         0           90         80         No         90 |

Table 2 Kernel settings for Oracle

\* The default value of 1 for esid\_allocator enables terabyte segment aliasing, reducing addressing lookasides. This value may be set to 1 in AIX 6.1 and is suggested for Oracle.

In general, AIX support suggests AIX 7.1 defaults for Oracle.

Three noticeable changes from AIX 6.1 to AIX 7.1 are:

- The elimination of the lru file repage tunable
- The default value of 90 for maxpin%, increased from 80% in AIX 6.1

### **Oracle Large Page Usage**

Spécifications for Oracle large page usage are:

- AIX 6.1 and 7.1 support three or four page sizes, depending on the hardware: 4 KB (default), 64 KB (medium), 16 MB (large), and 16 GB(huge). All four page sizes are supported by Power Systems from POWER5+ firmware level 240-202 onward.
  - Page sizes 64 KB and 16 MB have been shown to benefit Oracle performance by reducing kernel lookaside processing to resolve virtual to physical addresses. Oracle 11g uses 64 KB pages for dataspaces by default.

### • LOCK\_SGA = FALSE

- This is the default. This means that the SGA is not pinned in memory.
- AIX performance support generally suggests not to pin SGA.
- Automatic Memory Management (AMM) will use 64 KB pages for SGA if memory is available.
- This is the suggested value, since it has been found that 64 KB pages yield nearly the same performance benefit as 16 MB pages and require no special management.
- Oracle 10.2.0.4 with Oracle patch 7226548 will also use 64 KB pages for the SGA.

### • LOCK\_SGA = TRUE

• AIX parameters to enable pinned memory and 16 MB large pages:

vmo -p -o v\_pinshm=1 (allows pinned memory—requires reboot) vmo -p -o lgpg\_size=16777216 -o lgpg\_regions=number\_of\_large\_pages where number\_of\_large\_pages=INT[SGA size -1)/16MB)]+1

• Capabilities required to allow Oracle to use 16 MB large pages (implement as root):

#chuser capabilities=CAP\_BYPASS\_RAC\_VMM,CAP\_PROPAGATE Oracle MOS Reference: How to enable Large Page Feature on AIX-Based Systems (Doc ID 372157.1)

- AMM can be used with pinned 16 MB pages, provided the formula for calculating the number of large pages (above) is modified to number of large pages=memory\_max\_target+1.
- With Oracle 10.2.0.4, patch 7226548 is also required in order to use 16 MB pinned pages.
- 64 KB Size
  - Using 64 KB pages for data, text, and stack regions (applies to Oracle 10.2.0.4 as well)
  - 64 KB page size for data, text, and stack regions is useful in environments with a large (for example. 64 KB+) SGA and many online transaction processing (OLTP) users. For smaller Oracle instances, 4 KB is sufficient for data, text, and stack.
  - 64 KB page use for data, text, and stack is implemented separately from 64 KB pages for the SGA, and is done by means of an environment variable exported on behalf of the Oracle user. AME by default uses 4k page size.
  - \$ export LDR\_CNTRL=DATAPSIZE=64K@TEXTPSIZE=64K@STACKPSIZE=64K oracle

### CPU

CPU specifications are:

- Symmetric multi-threading (SMT) mode: POWER7 supports SMT4, and this is the AIX default. AIX/Oracle performance support encourages starting with the default.
- Virtual processor folding: This is a feature of Power Systems in which unused virtual processors are taken offline until the demand requires that they be activated. The default is to allow virtual processor folding, and this should not be altered without consulting AIX support. **Processor folding = On**
- Specific to POWER7 SMT4: Certain Oracle 11G parameters, including DB\_WRITER\_PROCESSES and PARALLEL\_MAX\_SERVERS, are partly derived from CPU\_COUNT, and CPU\_COUNT is equal by default to the number of logical CPUs. CPU\_COUNT automatically adjusts to changes in virtual processor count and to SMT mode, up to three times the value on startup. Note that, when migrating from single-threaded platforms to Power Systems, or from POWER5 or POWER6 to POWER7 with SMT4, the value of CPU\_COUNT will also increase, affecting DB\_WRITER\_PROCESSES, PARALLEL\_MAX\_SERVERS, and other dependent parameters. Queries that are sensitive to a degree of parallelism might change behavior as a result of migration to POWER7. We suggest reviewing the PARALLEL\_MAX\_SERVERS parameter after migration, but to set DB\_WRITER PROCESSES to default.

### **I/O**

I/O specifications are:

- If ASM is not used, max interpolicy striping (also known as *pp spreading* or *poor man's striping*, is suggested when logical volumes are created. To get the most benefit from spreading physical partitions across the LUNs, use a small physical partition size, for example, 32 MB or 64 MB.
- Async I/O is used even with Concurrent I/O (CIO)
  - With AIX 6.1 and 7.1, start with the asynchronous I/O defaults. With AIX 6.1, there is a new implementation of AIO. AIO kernel extensions are loaded at system boot (always loaded), AIO servers stay active as long as there are service requests, and the number of AIO servers is dynamically increased or reduced based on demand of the workload. The aio\_server\_inactivity parameter defines after how many seconds idle time an AIO server will exit. AIO tunables are now based on logical CPU count, and hence it is usually not necessary to tune minservers, maxservers, and maxreqs as in the past.
  - Note that in AIX 6.1, there are two tunables for minservers and maxservers, aio\_minservers/aio\_maxservers for legacy threads, and posix\_aio\_minservers/posix\_aio\_maxservers for posix threads. Oracle uses legacy threads.
  - Only increase aio\_maxservers or posix\_aio\_maxservers with ioo -p -o (the default is 30 per logical CPU) if pstat -a | fgrep aio or ps -k | fgrep aio show that you are continually using maxservers.
  - Oracle parameter (init.ora)

• disk\_asynch\_io = TRUE (default value)

### • Buffered file I/O on JFS2

- The default filesystemio\_options=ASYNC
- In this case all data spaces, redo log file systems, and control file systems are using the kernel buffers rather than writing directly to disk.
- In this case, it does not matter whether redo log file systems and control file systems are 512 b or 4 KB block size file systems.
- Oracle on AIX/Power best performance is, however, usually achieved using CIO (though there are exceptions).
- Concurrent I/O (CIO) on JFS2
  - Set the Oracle parameter filesystemio\_options=SETALL, or mount the filesystems (other than dump devices; may be required in older AIX /Oracle levels) with the CIO option. It is not necessary to both SETALL and mount filesystems with the CIO option, although no harm is done either way. Metalink note: 272520.1 indicate that mounting with CIO is needed, while IBM believes it is not needed. IBM is working with Oracle to fix the metalink note.
  - If using CIO with SETALL, CIO mount or both, you *must* create separate file systems for redo logs and control files (or a single filesystem for both), with an agblksize of 512 rather than the default 4 KB.
  - The ioo parameters aio\_fsfastpath and posix\_aio\_fsfastpath accelerate CIO. It is enabled by default in AIX 6.1 and 7.1.
  - AIX 6.1, JFS2 with 11.2.0.2 and higher Bug notice: Bug 9310972 - ENHANCEMENT: INTRODUCING O\_CIOR FLAG WHEN OPENING DATAFILES IN AIX 6.1. With AIX 6.1, IBM introduced a new open flag O\_CIOR which is same as O\_CIO, but this allows subsequent open calls without CIO. The advantage of this enhancement is that other applications like cp, dd, cpio, dbv can access database files in read only mode without having to open them with CIO.

Starting with Oracle 11.2.0.2 when AIX 6.1 is detected, Oracle will use O\_CIOR option to open a file on JFS2.Therefore you should no longer mount the filesystems with mount option "-o cio".

- IBM mount advice for database files:
  - Data files: Use CIO filesystemio\_options=SETALL, and default agblksize (4k); mount with no options.
  - Redo logs: Create with agblksize of 512 and mount with no options. With SETALL, IBM is doing direct I/O for Redo logs.
  - Control files: Create with agblksize of 512 and mount with no options. With SETALL, IBM is doing direct I/O for control files.
  - Archive logs: Mount -o rbrw . Do not use CIO; use the jfs2 rbrw option

- Dumps: Mount –o rbrw
- The mount option noatime, suggested for Oracle 10g binaries, fixed in 11.2.0.2. Please reference "The Recent suggestions and open issues" section below for more information.
- IOO tunables j2\_nBufferPerPagerDevice and j2\_dynamicBufferPreallocation:
  - Do not change these unless there is a high delta in vmstat –v external pager filesystem I/Os blocked with no fsbuf. If this value is high, first increase j2\_dynamicBufferPreallocation from 16 (16k slabs) to 32; monitor. If increasing this does not help, then consider raising the value of j2nBufferPerPagerDevice which is the starting value for dynamic buffer allocation.
  - See help pages for information about these parameters. Do not change AIX 6.1 or 7/1 restricted tunables without the advice from IBM AIX support. In AIX 6.1, j2\_nBufferPerPagerDevice is a restricted tunable, while j2\_dynamicBufferPreallocation is not.
  - Here are some default values for three ioo parameters:
    - j2\_dynamicBufferPreallocation=128
    - numfsbufs=1024 (legacy jfs)
    - maxpgahead=16 (legacy jfs)
- ASM considerations for standalone Oracle 11gR2:
  - For identifying, renaming, and securing ASM raw devices, see <u>Managing Raw</u> <u>Disks in AIX to use with Oracle Automatic Storage Management (ASM)</u>.
  - ASM will use asynchronous I/O by default, so filesystemio\_options=ASYNC (default) is appropriate.
  - For clustered ASM (e.g. RAC) configurations, SCSI reservation must be disabled on all ASM hdisk and hdiskpower devices (e.g. reserve\_policy=no\_reserve). The standalone use of ASM, hdisks and hdiskpower devices does not need to have SCSI) reservation disabled.
  - The following initialization parameters need to be adjusted for ASM:
    - Add 16 to the value of processes
    - Add an additional 600 KB to the value of large pool size
    - Add to shared pool size the aggregate of the values returned by these queries:
      - SELECT SUM(bytes)/(1024\*1024\*1024) FROM V\$DATAFILE;
      - SELECT SUM(bytes)/(1024\*1024\*1024) FROM V\$LOGFILE a, V\$LOG b WHERE a.group#=b.group#;
      - SELECT SUM(bytes)/(1024\*1024\*1024) FROM V\$TEMPFILE WHERE status='ONLINE';
    - For disk groups using external redundancy, every 100 GB of space needs 1 MB of extra shared pool, plus 2 MB
    - For disk groups using normal redundancy, every 50 GB of space needs 1 MB of extra shared pool, plus 4 MB

- For disk groups using high redundancy, every 33 GB of space needs 1 MB of extra shared pool, plus 6 MB
- Source: <u>http://docs.oracle.com/cd/E18283\_01/server.112/e16102/asminst.htm#CHDB</u> <u>BIBF</u>

### Network

This section outlines the minimum values applicable to network configurations.

### **Kernel configurations**

These values are generally suggested for Oracle, and can be considered as starting points (pls

note all udp settings are specific for RAC):

- sb\_max >= 1MB (1048576) and must be greater than maximum tpc or udp send or recvspace (if you are using RAC and very large udp\_recvspace, you might need to increase sb max)
- tcp sendspace = 262144
- tcp\_recvspace = 262144
- udp\_sendspace = db\_block\_size \* db\_file\_multiblock\_read\_count
- udp recvspace= 10 \* (udp sendspace)
- rfc1323 = 1 (see <u>Recent suggestions and open issues</u>)
- Ephemerals (non-defaults suggested for a large number of connecting hosts or a high degree of parallel query; also to avoid install-time warnings)
  - tcp ephemeral low=9000
  - tcp ephemeral high=65500
  - udp ephemeral low=9000
  - udp ephemeral high=65500

Jumbo frames are Ethernet frames larger than the standard maximum transmission unit (MTU) size of 1500 bytes. They can be up to 9000 bytes. They are used to reduce the number of frames to transmit a given volume of network traffic, but they only work if enabled on every *hop* in the network infrastructure. Jumbo frames help to reduce network and CPU overheads.

### **Miscellaneous Specifications**

### AIXTHREAD\_SCOPE=S (set in Oracle profile)

#### ulimits (smit chuser or edit /etc/security/limits to create a stanza for Oracle)

• -1 (unlimited) for everything except core

#### Maximum number of PROCESSES allowed per user (smit chgsys)

- maxuproc >= 2048; 16 KB is a commonly suggested value for Oracle Environment variables
- LDR\_CNTRL=DATAPSIZE=64K@TEXTPSIZE=64K@STACKPSIZE=64K \$ORACLE\_HOME/bin/oracle. (preferred approach)
- There is an option to ldedit the Oracle binaries so they use 64 KB pages directly. Note that whenever a patch is applied or an Oracle relink is performed, this ledit will have to be performed again.
- # ldedit --btextpsize=64k --bdatapsize=64k --bstackpsize=64k \$ORACLE\_HOME/bin/oracle.
- AME by default will use 4k page size instead of 64k page size. The use of 4KB page size may impact performance. AME certification on 11gR2 versions was done with 4kpage size.

### **Disk and Adapter Resources**

- Hdisk lsattr –El hdisk<>
  - Queue depth might vary among default of 8, 16, 20, and 24, depending on the storage vendor. A queue depth of 2 on SAN devices usually indicates a driver mismatch, but is the default for some Hitachi HDS on AIX and should be increased to 8 as a starting point. Queue wait and queue overflow detected through iostat –Dl might indicate a need to increase queue depth.
  - max\_transfer might need to be adjusted upward depending on the largest I/O requested by Oracle
    - A typical starting point for Oracle on AIX is 0x100000
  - As of AIX 5.3, the optimal setting for LTG size is dynamically calculated during the varyonvg process and does not need to be manually set. The varyonvg '-M' parameter should not be used as it will over-ride the dynamically calculated LTG size. It is recommended that all hdisks within a given VG have the same 'max\_transfer' (and other attribute) values. In order to change hdisk attribute values, any associated filesystems should be unmounted and the VG varied off.
- FC Adapter lsattr –El fcs<> and fcstat -e
  - max\_xfer\_size should be increased from default 1MB to 2MB. The default adapter DMA memory size is 16 MB which increases to 128 MB when a non default max\_xfer\_size is used. Larger DMA size can be important for performance with many concurrent large block I/Os.
  - num\_cmd\_elems might need to be increased if fcstat -e reports a persistent nonzero value for *No Command Resource Count*. Please verify with your storage provider possible limits and recommended storage best practices before changing num\_cmd\_elems.
  - If fcstat –e reports a persistent, non-zero value for *No DMA Resource Count* contact support.

### Live Partition Mobility (LPM)

 Oracle Miscount timer - default of 30 seconds can be extended to 60 seconds if required

- Use of Dedicated Adapter recommended instead of SEA
- Network bandwidth if minimal can cause restrictions
- LPM with RAC Reference on IBM Techdocs WP102094
- IBM PowerVM Virtualization Introduction and Configuration SG 24-7940

### Performance

### Potential Oracle Database Performance Issue – Oracle Table'x\$ksmsp'

#### Issue:

"If customers are using any query that accesses the table: 'x\$ksmsp' they should disable such queries..

Oracle provides the use of x\$ksmsp to allow customers to give a listing of the RAM heap to see how; free space is allocated within the shared pool, the sizes of available chunks on the freelist for the shared pool and RAM.

Unfortunately, this leads to a myriad of issues including; system hangs, heap issues (locking) etc in production systems and selecting from x\$ksmsp on a production system is to be avoided.

This basically does the following for each subheap in the pool, it will:

1) Grab the shared pool latch for that subheap

2) Walk through ALL chunks of memory in that subheap calling back to ksmspc to extract information about the chunk of memory

3) Release the shared pool latch for that subheap.

Even on a minimal sized shared pool this means you are holding the shared pool latch for a significant amount of time which then blocks anyone needing to perform any shared pool memory operation that requires that latch."

#### **Precautions:**

1) It is NOT recommended to run queries on X\$KSMSP when the database instance is under load.

2) Performance of the database will be impacted, especially currently with very large SGAs.

3) Bug 14020215 was filed for ORA-600 errors and unplanned outages running queries directly on X\$KSMSP.

4) There is a view, X\$KSMSP\_NWEX, in later versions of 11g that is safer to use for investigation of memory usage.

5) Oracle STRONGLY recommends you not run these queries unless specifically requested by Oracle Support to do so.

#### **Recommend:**

Suggest checking via a crontab entry running a query against a variety of X\$ tables - eliminating any query against the x\$ksmsp resolves such latch contention issues.

#### Standalone Database and RAC Miscellaneous Tips and Reference

Troubleshooting Oracle RAC Tips

- Collect and review 'Last Gasp' file <u>http://www.oracle.com/technetwork/database/rac-aix-system-stability-131022.pdf</u> (pg 7)
- Review CRS Logs for events with timestamps
- OSWatcher network
- AWR Report
- RDA collects Oracle logs

### Performance

- Oracle Redo Logs and Control Files placement on separate file systems
- Apply N-Apply Bundle Patch or 11.2.0.4 (includes Bundle Patch)
- OCSSD Bin Process & Thread Priority

#### Oracle Timers

- Network Heartbeat 1 per/sec with 30 sec default timeout
- CSS Voting Disk Heartbeat 1per/sec 27 sec default timeout
- AIX Driver read/write 30 Second timeout
- Oracle Miscount value default 30 sec, used 60 sec for LPM large lpar's successfully then changed back to 30 sec
- Oracle CRS OCSSD default 200 seconds is timeout value
- Note: ORAchk replaces the popular RACcheck tool (Doc ID 1268927.2 in MOS)

### AIX fixes for Oracle 10gR2 and 11gR2

Some of the common AIX fixes for Oracle 10g and 11g follow. The APAR number will be unique to the specific AIX TL level with the most current TL level providing a rollup of the earlier TL & SP levels. The APAR's listed may apply to either Oracle dbase version. If an APAR is not listed for a TL, then the fix is already included in that TL, or that TL is not vulnerable to the problem. The minimum recommended AIX levels currently are: AIX 6.1 TL09 (terminal release) and AIX 7.1 TL03. Please see the appendix for older TL APAR information.

| AIX 6.1 TL08 & TL09   | TL08          | APAR    | TL09 | APAR    |  |

Quick Reference to Patch Numbers for Database PSU, SPU(CPU), Bundle Patches and Patchsets (Doc ID 1454618.1)

### Recommended N-Apply Bundle #3 for AIX 11.2.0.3. with critical fixes (Patch 20165285)

Last Updated Jan 21, 2015 Release Oracle 11.2.0.3.9 Platform IBM AIX on POWER Systems (64-bit) Recommended for Oracle Database 11.2.0.3.0

The following prerequisite patches should be installed in the order shown before installing this patch.

1 17540582 DATABASE PATCH SET UPDATE 11.2.0.3.9 (INCLUDES CPUJAN2014) 1 19121548 DATABASE PATCH SET UPDATE 11.2.0.3.12 (INCLUDES CPUOCT2014)

### **Recent suggestions and open issues**

- Hardware prefetch: The POWER7 chip has the ability to recognize streaming memory access patterns with a unit stride or stride N, and initiate the dcbt, or dcbtst prefetch instructions automatically. It controls how aggressive the hardware will prefetch (that is, how many cache lines will be prefetched for a given reference), and is controlled by the Data Streams Control Register (DSCR). For Oracle and JAVA workloads, due to irregular memory accesses, it has sometimes been found beneficial to disable hardware streaming memory prefetch. Aggressive prefetching can inhibit performance because the prefetched lines might not be referenced. The workaround is to turn off Hardware Prefetch using dscrctl -b -n -s 1. The AIX Active System Optimizer (ASO) has the capability to automatically/dynamically tune Hardware Prefetch. (as of AIX 7.1 TL2 SP1 and AIX 6.1 TL8 SP1).
- Large segment aliasing allows each memory segment lookaside buffer to address up to 1 TB of memory, reducing segment lookaside buffer faults and improving memory access. This is enabled by default on AIX 7.1, and is enabled using vmo -p -o esid\_allocator=1 in AIX 6.1. A recently discovered problem with Oracle 11gR2 and large segment aliasing concerning a related tunable, shm\_1tb\_unsh\_enable is currently being addressed. This problem is specific to Oracle 11.2.0.3 on AIX 6.1 and AIX 7.1 and is addressed in <u>Bug 13877328</u>.
- noatime file system mount option: The Oracle/AIX bug (9548634: IBM/AIX: EXPENSIVE GETCWD() CALLS FROM SNLFNCDIR() ) which necessitated the mount option has been fixed in 11.2.0.2. The current suggestion is to use the noatime mount option for the file system hosting the Oracle binaries only, and only on Oracle database versions 10.2.0.x and 11.1.0.x.
- rfc1323=1 is a long-standing network tuning suggestion for Oracle on AIX, although the default remains 0 (in global "no" parameter list) in AIX 6.1 and 7.1. A network retransmission latency issue has recently been discovered when rfc1323=1 on AIX 6.1 TL6 and APAR IV00755 is also present. Our recommendation is to use rfc1323=1 (Oracle recommendation), but to ensure that "IV13121: TCP RETRANSMIT PROCESSING IS VERY SLOW 12/05/30 PTF PECHANGE" (or equivalent) is applied. rfc1323 is default for the ISNO values set by the interface device driver, for VETH and 10Gbit it is enabled (and for NFS enabled by default).

### **Additional Information**

This Technical Note was authored by Wolfgang Tertel, IBM. For more information on this Technical Note, please send your questions to the IBM Oracle International Competency Center at **ibmoracle@us.ibm.com**.

### 11g to 12c Upgrade

Heavy paging observed after upgrading DB 11.2.0.3.4 and AIX 6100-09-01-1341 to DB 12.1.0.1 and AIX 7100-03-03-1415. Both Oracle and IBM Support have arrived at the same conclusion that additional memory is recommended or the workload rebalanced to reduce paging which impacted system performance.
