Quick-install of the PowerHA Full System Flashcopy Manager 5.1

Thursday, April 27, 2023

Christian Aasland
aasland@us.ibm.com

IBM Technology Expert Labs

Overview

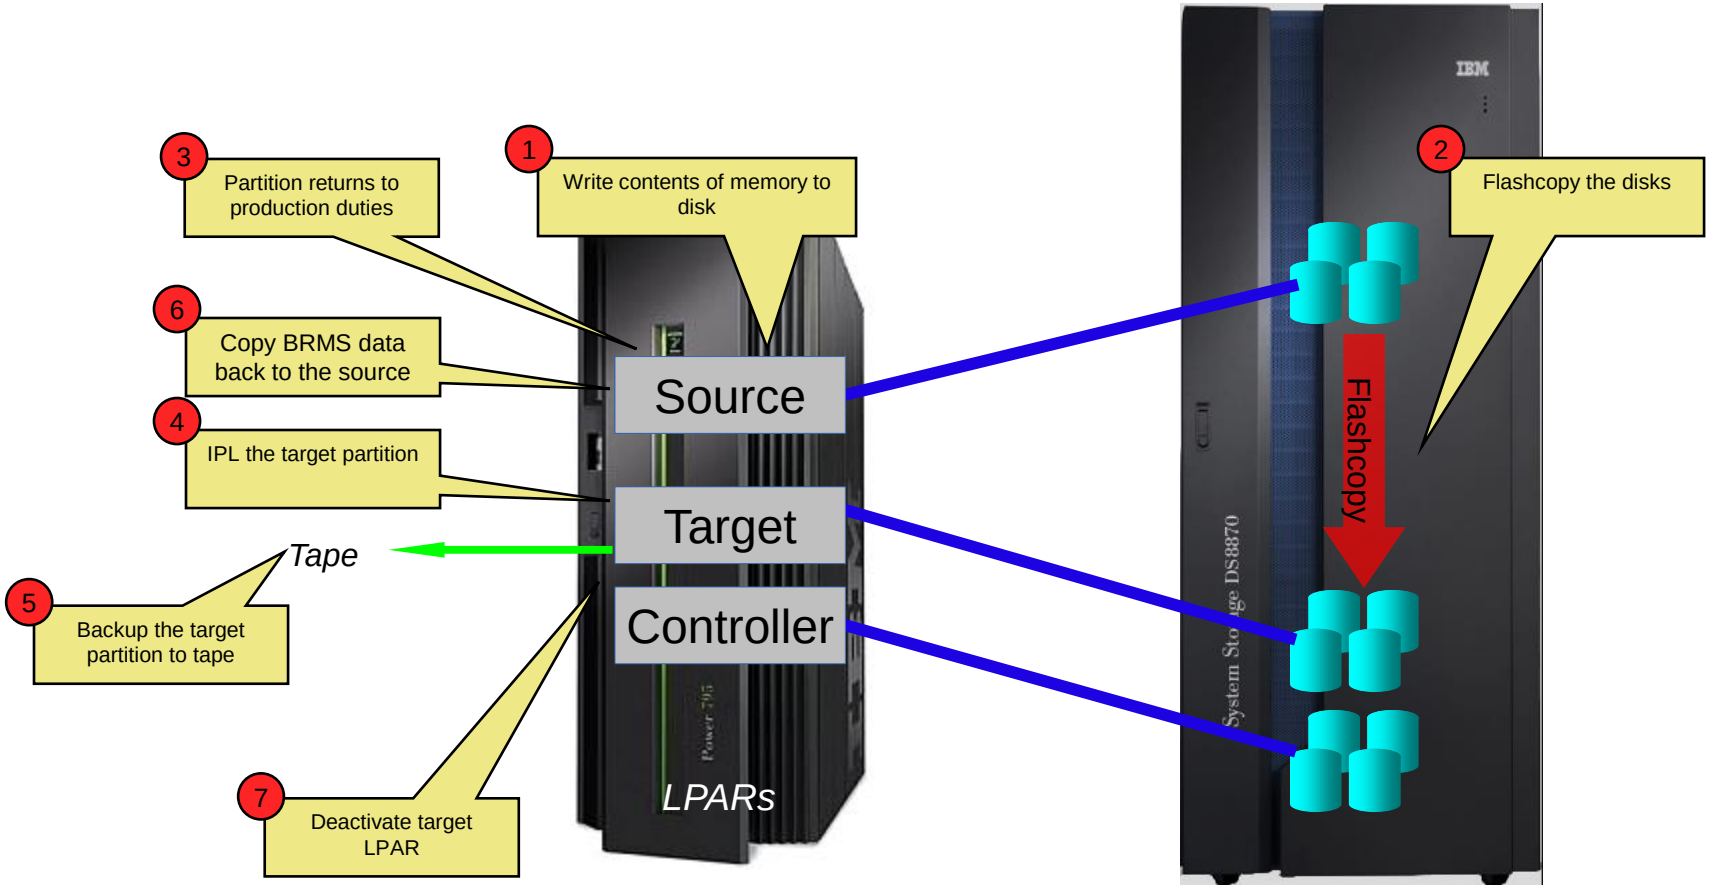
What the heck is this document for?

IBM Technology
Expert Labs

- This is a quick-install guide for configuring the Full System Flashcopy Manager for the following storage products:
  - SVC family (FlashSystems, Storwize)
  - DS8K family
  - IBM PowerVS [Cloud]
- Customers can have it, but it is designed to be performed by a Lab Services consultant
- It does not explain details or how to handle errors or special/complex situations
- Primary documentation is the FSFC Manager Webpage:
  - **http://ibm.biz/FSFCManager**

Overview of Full System Flash Copy concepts

IBM Technology
Expert Labs



Flashcopy at DR site

IBM Technology
Expert Labs

It is possible to perform the flashcopy at the DR site.

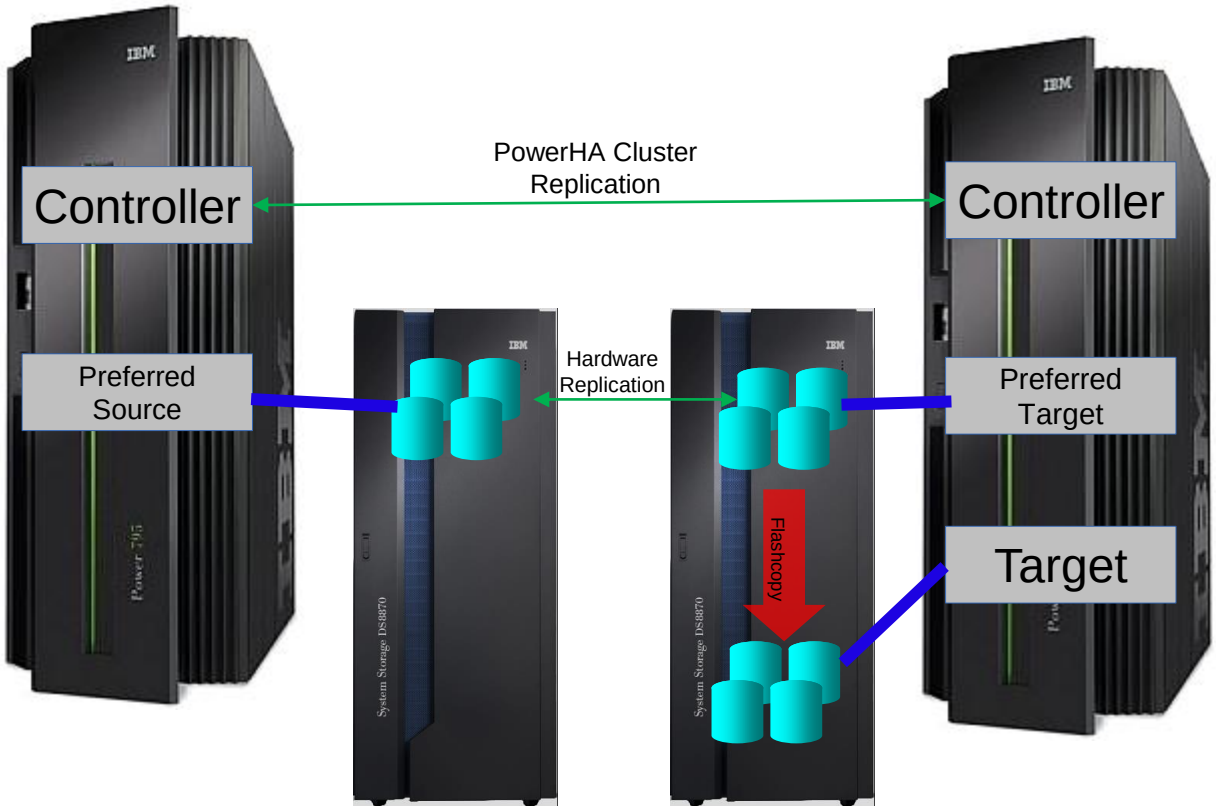
The toolkit will manage the hardware replication so that the DR site can create a flashcopy for backup purposes.

This is supported for:

- DS8K GMIR
- SVC GMCV and MMIR

This is *not* supported for:

- PowerVS
- DS8K MMIR
- SVC GMIR



Shared Flash Copy LPAR

IBM Technology
Expert Labs

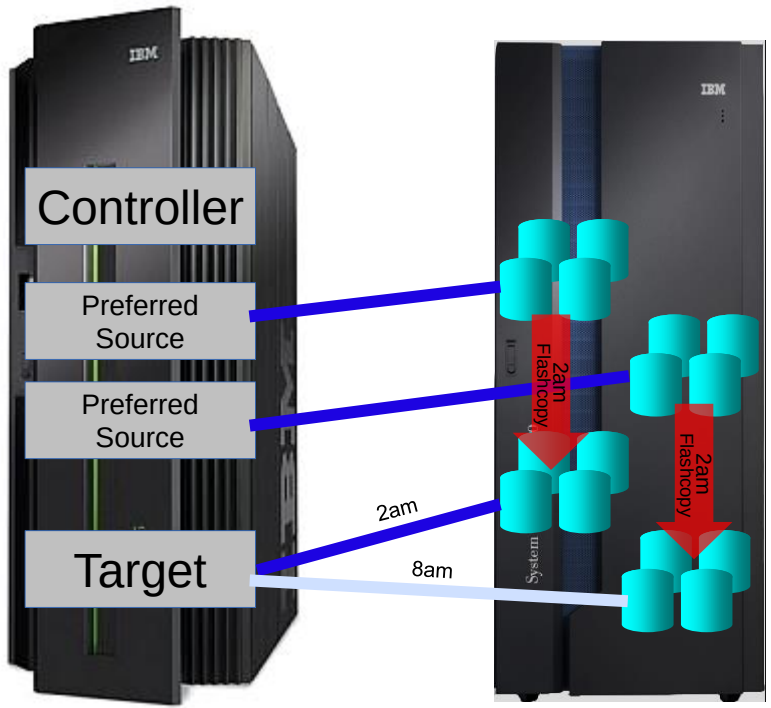
The controlling LPAR can manage the host connections of the Backup LPAR to its disks. This allows one backup LPAR to sequentially service the backups of multiple production LPARs, reducing the footprint of the total solution.

Our toolkit's controlling LPAR can coordinate the flashcopy processes among multiple production LPARs. This includes when to perform the flashcopy and managing the locks of multiple processes when they share resources (LPARs, disks, etc).

For example, both flashcopies can occur at 2am.

Then the toolkit will attach the target LPAR to the first flashcopy disks and run it's backup. When that finishes, the toolkit will attach the target LPAR to the second flashcopy disks, IPL and run backups from that.

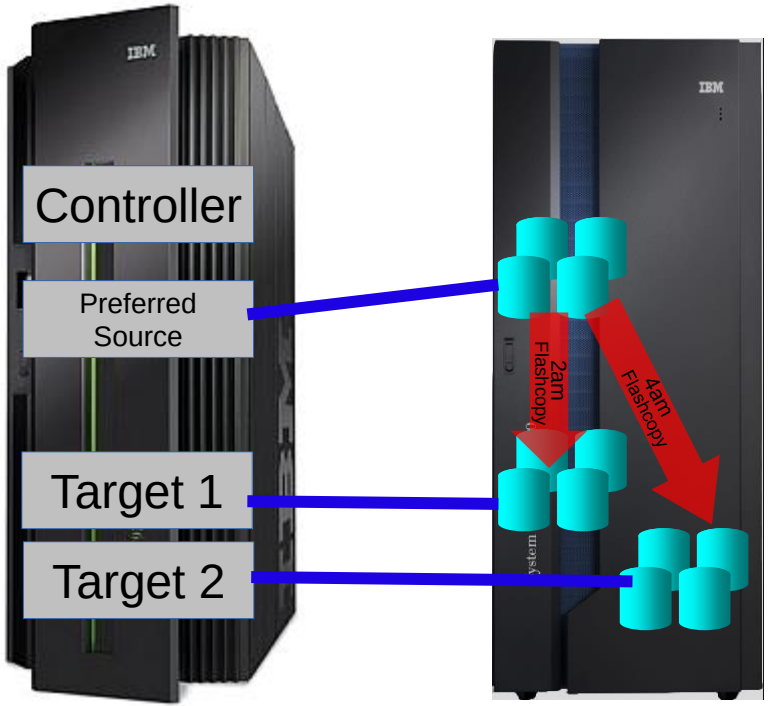
The number of production LPARs sharing a target LPAR is limited by how long the backups take.



Multi-Flash

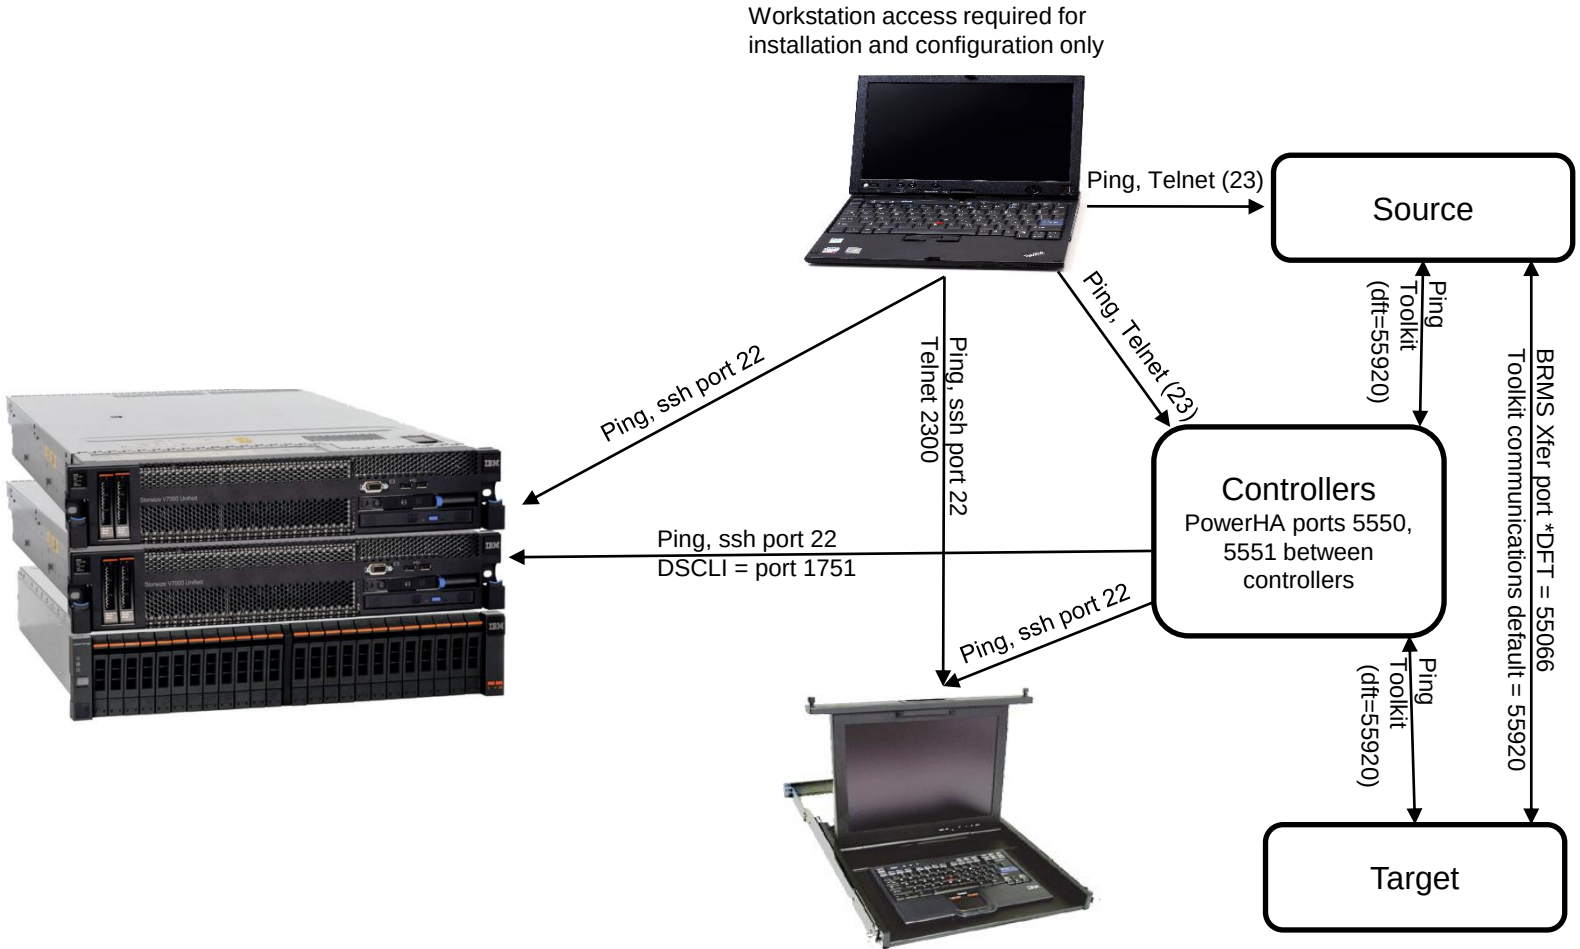
When one production LPAR hosts multiple applications which quiesce at different times, or an application that has both pre-batch and post-batch processing, our toolkit can manage concurrent flashcopy operations. In these scenarios each backup LPAR will typically backup only a portion of the data, i.e. the data associated with a specific application.

Note that a quiesce or memory flush affects the entire production LPAR, not just one application.



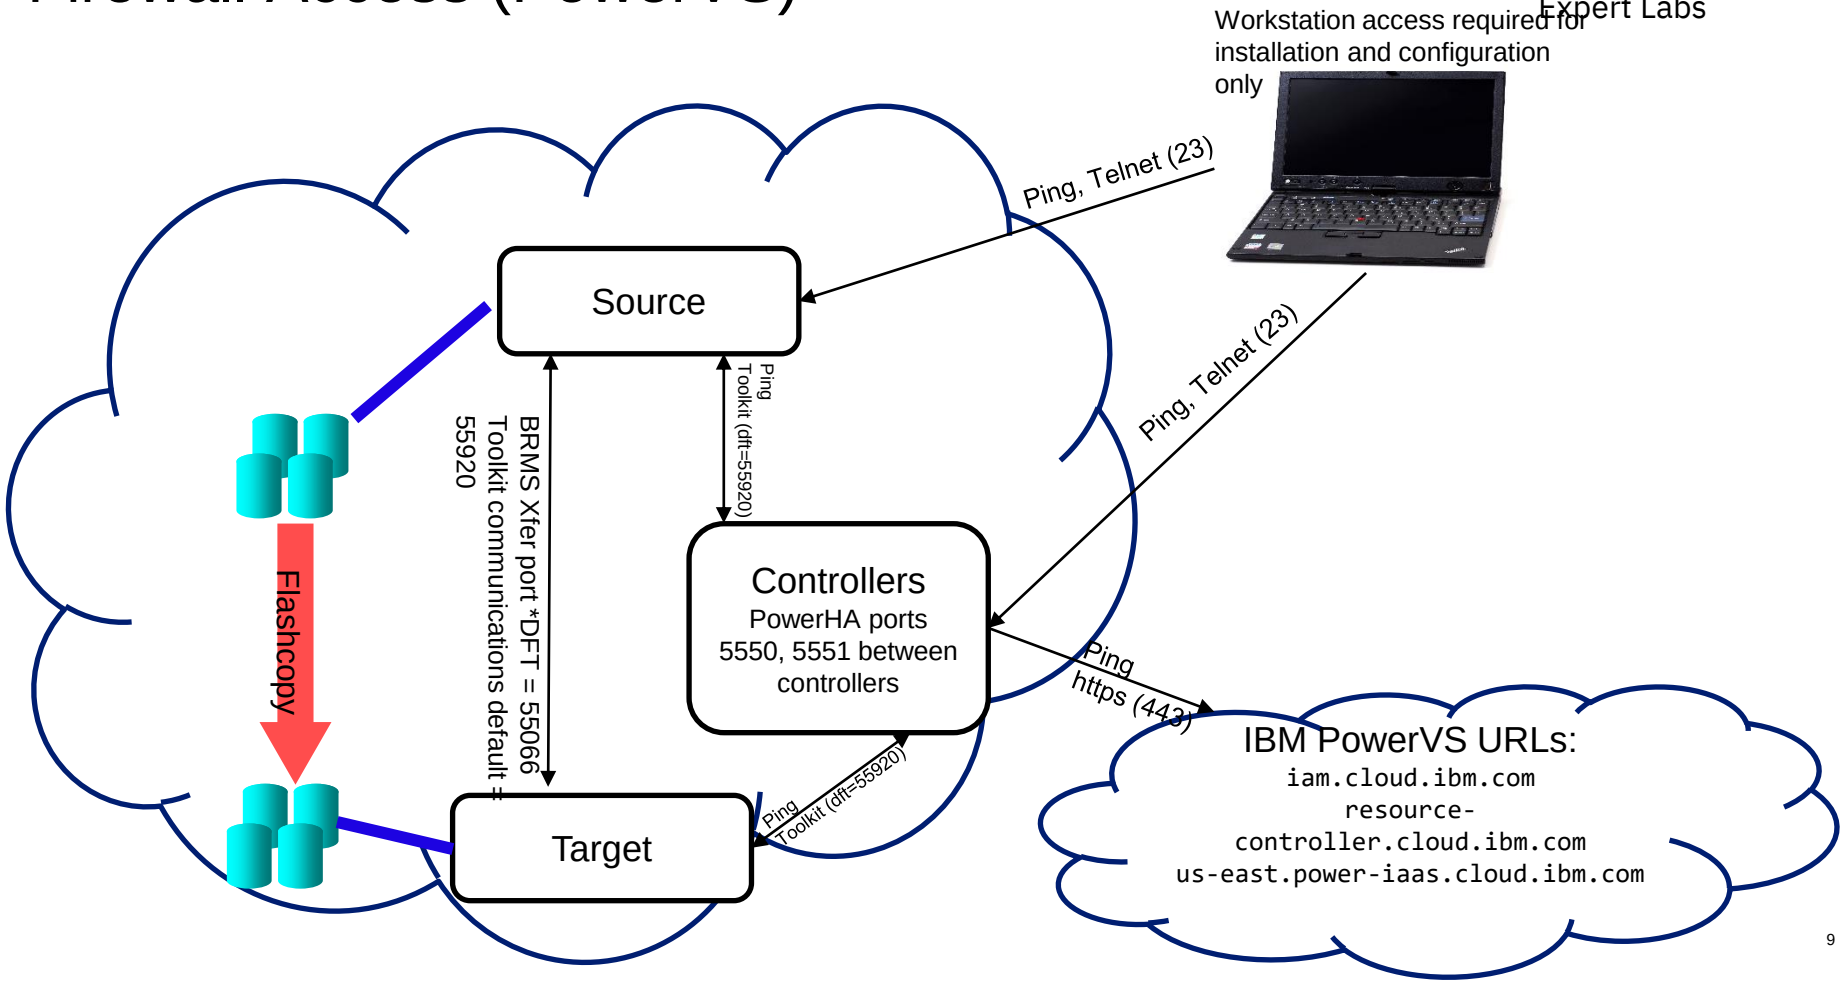
Firewall Access (on-prem)

IBM Technology
Expert Labs



Firewall Access (PowerVS)

IBM Technology Expert Labs



SVC setup prior to our engagement

IBM Technology
Expert Labs

- Configure the storage unit for Primary, Secondary and Controlling LPAR.
  - Firmware level 7.5.0.3 or newer
    - If using FS9100 with GMCV and the change volumes are in a data reduction pool (DRP), the SVC must be at firmware level 8.2.1.1 or higher
  - Create or select user profile
    - Must be assigned to CopyOperator (or better) user group
    - If changing host connections, must be Administrator
  - LUNs
    - For source and target LPARs
  - Host connections
  - Licenses (Replication, Thin-provision, etc)
  - If using replication:
    - Partnerships
      - We can remotely help you set this up (also ensures you have communication between the SVC's before we arrive)
    - Start replication
      - Replication should be completed before we're onsite so that won't have to wait for it to catch up

DS8K setup prior to our engagement

IBM Technology
Expert Labs

- Create a user profile on the DS8K
  - Can be other than QLPAR, make a member of the admin group
  - Remember the password, set to not expire
    - chpass –expire 0
- Configure the storage unit for Primary, Secondary and Controlling LPAR.
  - Recent firmware level
    - Install DSCLI on the IBM i from the DS8K CD
    - Bundle 87.10.91.0 or newer (required for creating GMIR D-Copy)
  - Create fixed block volumes (requires ranks, arrays, extent pools, space efficient repositories, etc)
    - For source and target LPARs
  - Volume groups, ports and host connections
  - Licenses (Replication, Space Efficient, etc)
  - PPRC Paths
    - We can remotely help you set this up (also ensures you have communication between the DS's before we arrive)
  - Start replication
    - Replication should be completed before we're onsite so that won't have to wait for it to catch up

Cloud setup prior to our engagement

- Create the Cloud environment including
  - One or two persistent controlling PVM instances (IBM i)
    - Access to the PowerVS APIs (i.e. iam.cloud.ibm.com etc)
  - Production PVM instances
    - Network access (IP addresses etc)
    - Storage with OS loaded and configured
    - BRMS (optional)
  - Flashcopy PVM instances
    - Network access (IP addresses etc)
    - Backup device connectivity
  - Serial numbers for all the instances
    - DSPSYSVAL QSRLNBR
    - Include potential LPM serial numbers, if known
- Service ID
  - Access to the resources (instances, storage, etc)
- API Key (the API Key must be retained when created)

HMC Configuration

- Create a user on the LPAR HMCs
  - Any user name will do (as long as you remember it)
  - Password is required
  - Hmcsuperadmin with AllSystemResources
- Additional considerations (these are enabled by default):
  - Enable remote command execution
  - Enable ssh through the HMC’s firewall

Restoring toolkit library, setup on **Production** LPARs

IBM Technology Expert Labs

- Place the toolkit savefile in QGPL (FTP, scp etc)
- Restore the toolkit library:
  - RSTLIB SAVLIB(QZRDHASM) DEV(*SAVF) SAVF(QZRDHASM51)
    - The ‘51' refers to the release and may change
  - ADDLIBLE QZRDHASM
- Run the setup program
  - SETUPFSFC NODEROLE(*SRC) ACSCODE('??')
    - Press PF4 and specify the line description, TCPIP interface and subnet mask to create on the controller for the target to use
  - The port number is used for toolkit communications from the controllers, *DFT is 55920
  - The line description and IP interfaces will be created
  - Will create user profile QLPAR without a password, initialize files etc.
- If additional line descriptions and IP addresses are needed, for example for iSCSI VTL’s, create those manually
- If the target LPAR is on a different serial number:
  - A license key for the target LPAR must be entered.
  - Use ADDPRDACS on the Production LPAR to enter the serial number and license for the target LPAR.

Enter the controller information on the **Production** LPARs

IBM Technology Expert Labs

- If using multiple controllers, set up the toolkit so STRFSFLASH can be issued on the production LPAR and connect to the first available controller.
- Use WRKSTRPRSC *CMN and enter the controller information:

```
                      Work with Communications Startup Resources

Type options, press Enter.
  1=Add   2=Change   4=Remove

Opt  Usage  IP Interface     Line Desc   Hardware Resource Location      Port
 _   _____  _______________
 _   *CTL1  1.2.3.4          N/A         PRIMARY CONTROLLER              *DFT
 _   *CTL2  1.2.3.5          N/A         SECONDARY CONTROLLER            *DFT
```

- STRFSFLASH CTLR(*AUTO) will use this information to connect to the first available controller.
- STRFSFLASH can still be run from the controller with CTLR(*LOCAL)

Modifying the Startup Program on **Production** LPARs

IBM Technology Expert Labs

- Modify startup program on each node to prevent QSTRUPPGM from running on the target.
  - Not necessary if using CFGSTRPSRC (for Full System Replication)
  - This is optional but adds a layer to safety.
  - QZRDHASM/RUNLPARCMD SRLN(xxxxxxx) LPAR(xx) CMD(CALL + PGM(QZRDHASM/QZRDENDSBS))
    MONMSG MSGID(CPF0000)
    - At the very beginning of the startup program
    - Specify the target LPAR serial and LPAR numbers
    - Review QZRDHASM/QCLSRC QZRDENDSBS for changes
    - Include MONMSG CPF0000 after RUNLPARCMD

- Modify startup program on each node to start the subsystem:
  - Not necessary if using CFGSTRPSRC (for Full System Replication) (CFGSTRPRSC will start the subsystem)
  - After IP and QSYSWRK start, before applications,
  - STRSBS QZRDHASM/QZRDFSR
    MONMSG MSGID(CPF0000)

Creating the cluster on the **controllers**

IBM Technology
Expert Labs

- If there is only one controller, you must create a single-node cluster. Perform the following steps on the single node only.
- If multiple controllers are to be configured, issue these messages on all of them:
  - STRTCPSVR *INETD
  - CHGTCPSVR *INETD AUTOSTART(*YES)
  - CHGNETA ALWADDCLU(*ANY)
- On the Master controller
  - CRTCLU CLUSTER(FSFC) START(*YES) DEVDMN(*GEN)
    - PF4, fill in Primary and Secondary Controlling node names and IP addresses
- On Auxiliary controller:
  - WRKCLU, validate cluster is started

Restoring toolkit library, setup on both **Controllers**

IBM Technology
Expert Labs

- Place the toolkit savefile in QGPL (FTP, scp etc)
- Restore the toolkit library:
  - RSTLIB SAVLIB(QZRDHASM) DEV(*SAVF) SAVF(QZRDHASM51)
    - The ‘51' refers to the release and may change
  - ADDLIBLE QZRDHASM
- Run the setup program
  - SETUPFSFC NODEROLE(*CTL) PORT(*DFT) ACSCODE('??')
  - The port is used to receive communications from the production LPARs, *DFT is 55920
  - Will create user profile QLPAR without a password, initialize files etc.

```
      Set up IBM Pwr HA tools - FSFC (SETUPFSFC)

Type choices, press Enter.

Node role  . . . . . . . . . . . . > *CTL          *CTL, *PRD
FSFC communications port . . . .   *DFT          1-65535, *SAME, *DFT
Toolkit access code  . . . . . .   12345
```

Update the startup program on the **controllers**

IBM Technology
Expert Labs

- Modify the startup program (after IP has been started) on each controller to:
  - Start the subsystem if any process will be initiated from the production LPAR:
    - STRSBS QZRDHASM/QZRDFSR
  - Start the cluster if there are multiple nodes using the DDD:
    - STRCLUNOD CLUSTER(*) NODE(*ALL)
      - **This requires *IOSYSCFG so QSTRUPJD should specify a profile like QLPAR so after compiling the startup program issue this command:**
        - **CHGJOBD JOBD(QSTRUPJD) USER(QLPAR)**

Download the Java Secure Channel code (on the **Controllers**)

- Not necessary for PowerVS Operations
- Download Java Secure Channel to /QIBM/qzrdhasm/ssh from
  - http://sourceforge.net/projects/jsch/files/jsch.jar/0.1.55/jsch-0.1.55.jar/download
  - Use the latest version, ensure the file /QIBM/Qzrdhasm/ssh/jsch.jar links to what you downloaded.
- The Java Secure Channel is an open-source implementation of ssh
- Because it is open-source, IBM Legal requires that you download it yourself (i.e. we can't bundle it with our toolkit)
- Download to desktop, FTP to both IBM i controllers, place it into directory /QIBM/qzrdhasm/ssh/

```
ftp> bin
200 Representation type is binary IMAGE.
ftp> put jsch-0.1.55.jar /QIBM/qzrdhasm/ssh/jsch-0.1.55.jar
local: jsch-0.1.55.jar remote: /QIBM/qzrdhasm/ssh/jsch-0.1.55.jar
227 Entering Passive Mode (9,5,168,177,167,46).
150-NAMEFMT set to 1.
150 Sending file to /QIBM/qzrdhasm/ssh/jsch-0.1.55.jar
226 File transfer completed successfully.
249282 bytes sent in 0.742 secs (336.12 Kbytes/sec)
ftp>
```

Create the credentials on either **controller**

IBM Technology
Expert Labs

- FSFC uses userid/password to log into the HMCs, DS8Ks and SVCs. Use WRKCSECRDL or ADDCSECRDE to manage these credentials.
- The ‘Role’ should be *USER if the host is not a CSM server
- Enter the IP address, user ID, password and a description of the host for:
  - SVCs
  - DS8Ks
  - HMCs
- This information is encrypted and placed into the device data domain and is kept consistent on both of the controllers.
- WRKCSECRDL uses PowerHA to keep the controllers in sync
- Use option 6 to validate the credentials

```
                              Work with CSE Credentials List

Type options, press Enter.
  1=Add   2=Change   4=Remove

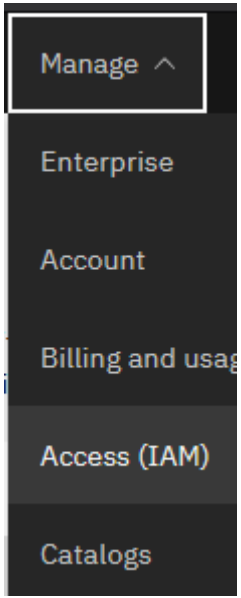
Opt     IP Address          Role        User ID              Description

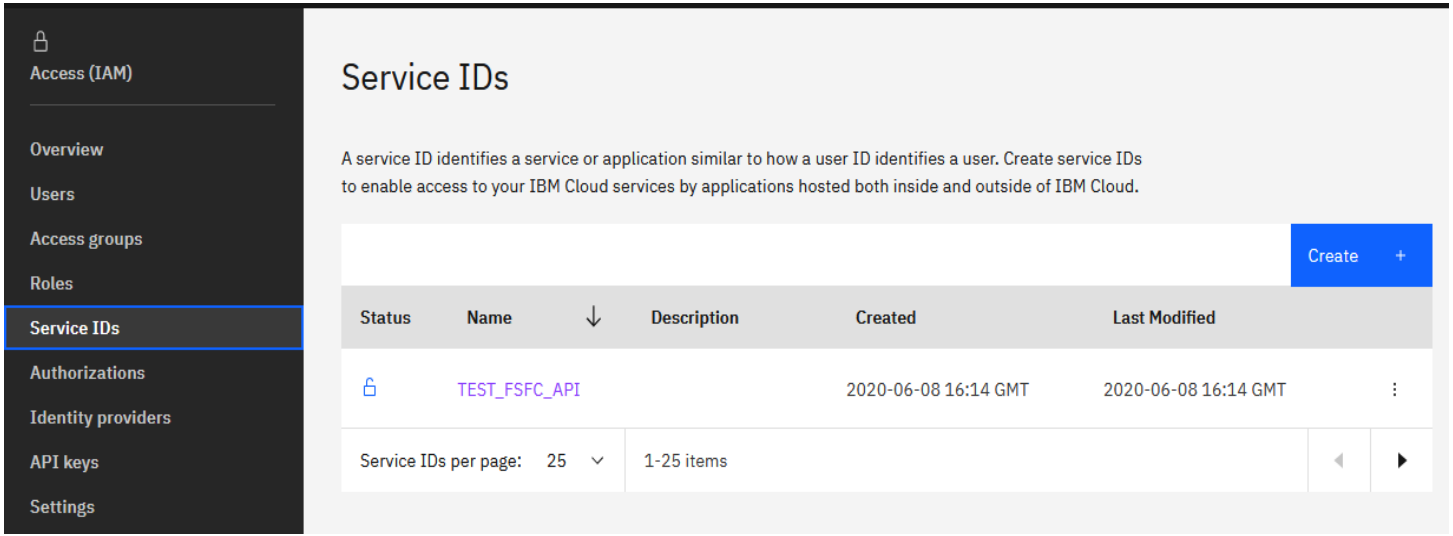
        9.5.95.139          *USER       qlpar                CTCHAHMC2
        9.5.167.58          *USER       qlpar                IBM.2107-75XA511
```

Create or identify a Cloud Service ID

IBM Technology
Expert Labs

- FSFC uses an API Key to authenticate cloud resource usage.
  - An API Key is associated with a Service ID. Use the Cloud IAM web GUI to create or identify a service ID.

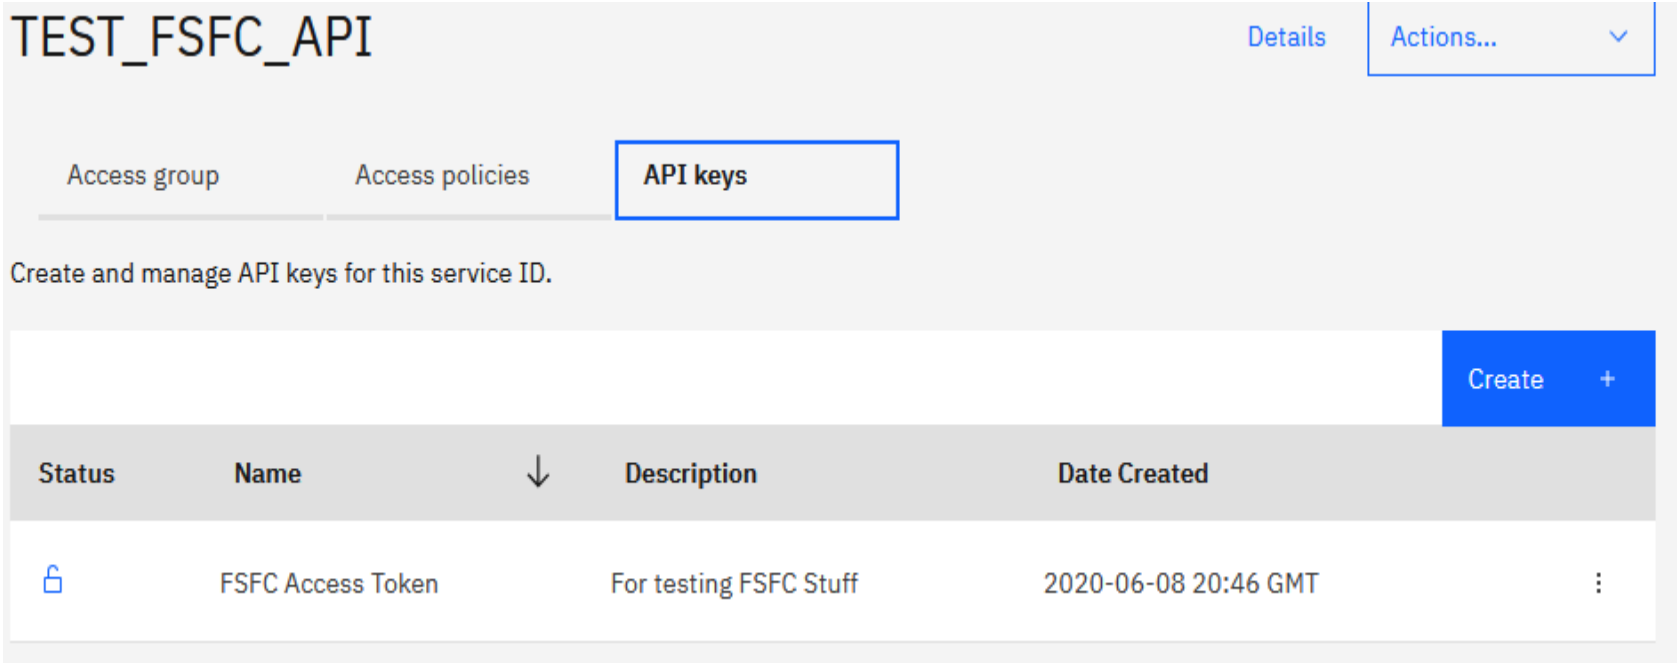




Create Service ID API Key

IBM Technology
Expert Labs

- After identifying the Service ID identify or create an API Key
  - When the API Key is created it will be displayed or downloaded in a file.
    - You *must* record this API Key as there will not be an opportunity to retrieve it later. If you have a Service ID but no API Key then create a new key.



Enter the API Key into WRKCSECRDL

IBM Technology
Expert Labs

- Use the command WRKCSECRDL TYPE(*CLOUD) to work with Cloud credentials.
  - Use option 1 to add a new set of credentials. Give the credentials a name which will later be used to refer to this cloud instance.
  - The API Key can be entered but not extracted. It is stored in an encrypted space.
  - The URNs and URLs will depend on the specific cloud implementation.
    - The team which set up your PowerVS cloud account may have this information
  - For Cloud Instance ID enter *SELECT and the API will provide a list based on the resources the API Key is authorized to.

```
                                Add Cloud Credential Entry (ADDCLDCRDE)

Add Cloud Credential Entry (ADDCLDCRDE)

 Type choices, press Enter.

 Key name . . . . . . . . . . . . > fsfckey       Character value
 IAM Identity Services URL  . . .   iam.cloud.ibm.com

 Resource controller URL  . . . .   resource-controller.cloud.ibm.com

 API Key  . . . . . . . . . . . .   Your API KEY goes here

 URN Endpoint . . . . . . . . . .   us-east.power-iaas.cloud.ibm.com

 Cloud Instance ID  . . . . . . .   *SELECT

 Description  . . . . . . . . . .   What does the smell of Purple sound like?
```

Storage Selector

IBM Technology
Expert Labs

SVC Environment Configuration

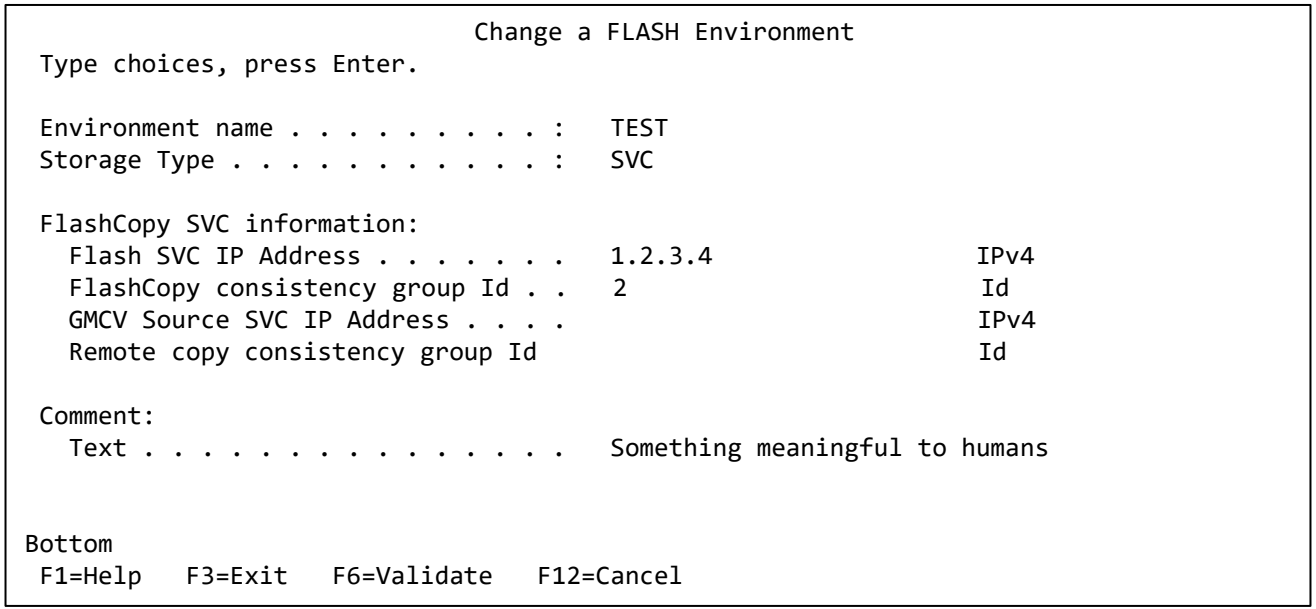
DS8K Environment Configuration

Cloud Environment Configuration

Create the SVC environments on the **controller**

IBM Technology
Expert Labs

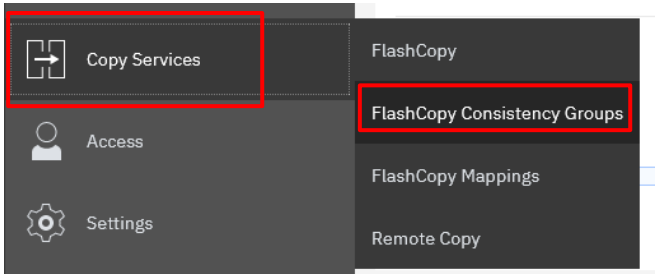
- An FSFC Environment describes the storage to the toolkit. Use WRKCSE to manage the environments.
  - Option 1 creates a new environment
  - Enter *NONE when prompted for ASP Copy Descriptions
- The environments are stored in the device data domain and is kept in sync with both controllers.
- On the SVC, flashcopy consistency groups define background copy rates, full or incremental etc. The toolkit just manages the consistency groups.

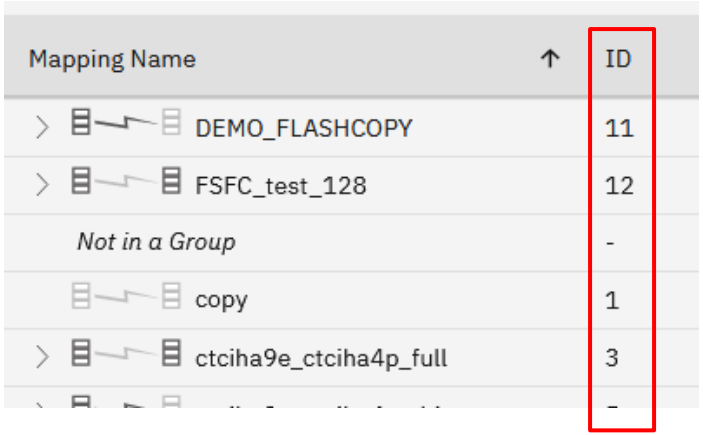


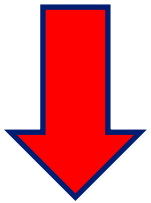
Finding the Flashcopy consistency group Id

IBM Technology
Expert Labs

- The environment requires the Flashcopy consistency group Id.
- To find it, view the flash copy consistency groups and enable the Id column







[Click here to continue with CSE Data]

Create the DS environments on the controller

IBM Technology
Expert Labs

- An FSFC Environment describes the storage to the toolkit. Use WRKCSE to manage the environments.
  - Option 1 creates a new environment
- The environments are stored in the device data domain and is kept in sync with both controllers.
- Enter the requested information then PAGE DOWN

```
Change a FLASH Environment
Type choices, press Enter.

Environment name . . . . . :   TEST
Storage Type . . . . . :   DS8K

FlashCopy Power HA, ASP information:
  Device name  . . . . . .   *SYSTEM                  *SYSTEM, Name
  Source Copy Description  . . . . .   *NONE          *NONE, Name
  Target Copy Description  . . . . .   *NONE          *NONE, Name

FlashCopy DS unit information:
  Device . . . . . .   IBM.1234-1234565         Name

                                        More . . .
```

Enter the DS information

IBM Technology
Expert Labs

- Enter the flashcopy details
- Enter the DS unit details
- If the IP address isn't in WRKCSECRDL yet, pressing enter will take you there to add it.

```
Change a FLASH Environment
Type choices, press Enter.

FlashCopy IASP Manager options:
  Full FlashCopy . . . . . .   *NO                    *YES, *NO
  Resync FlashCopy . . . . . .   *NO                  *YES, *NO
  Multi incremental resync . . . . .   *YES           *YES, *NO
  Space Efficient FlashCopy  . . . .   *NO            *YES, *NO
  Target PPRC  . . . . . .   *NO                      *YES, *NO
  GMIR D-Copy target flash . . . . .   *NO             *YES, *NO

DS unit SMC information:
  Flash hmc1 . . . . . .                             IPv4
  Flash hmc2 . . . . . .                             IPv4
  Port . . . . . .   1751                            1750, 1751

Comment:
  Text . . . . . .

Press Enter to add DS8K credentials for 1.2.3.4, press F12 to cancel.
```

Enter the DS information

- Enter the volume details

```
Add, Change or Delete Volumes

  Environment  . :   TEST                  Source device  :   IBM.123
  Type . . . . . :   FLASH                 Target device  :   IBM.123
  Volume sets  . :   0

Type Volume options; 1=Add, 2=Change, 4=Delete, press Enter.
             Source          Flash
  Opt      Volumes          Volumes
   1       0100             0200
```

Enter the DS information – host connections

IBM Technology
Expert Labs

- From WRKCSE, use option 16 to manage the target LPAR host connections
- Note the use of F4 to prompt for hosts, and F6 to import LUNs

```
                                    Work with Host Connections

Create Copy Services Environment (CSE) Data on either **Controller**

IBM Technology Expert Labs

- The CSE Data describes the non-storage elements of an environment.
- This data is also stored in CRG's. The toolkit will create the CRG. It will always remain inactive when viewed in WRKCLU opt 9.
- CRTCSEDTA, CHGCSEDTA, DLTCSEDTA and DSPCSEDTA can be used to work with this information.
  - Stored in the CRG so the data is synchronized between the controllers
- WRKCSEDTA displays all the data created.

```
                      Work with CSE Data

Type options, press Enter.
  1=Create   2=Change   3=Copy   4=Delete   5=Display

                       CRG
Opt     CSE Data       type       Text

        FSR9M2         FSR        FSR from 9M to 9O
        HA8FSR2        FSR        DS8K FSR from HA8FSR1 to HA8FSR2
        FSFC9J9K       FSFC

F1=Help    F3=Exit    F4=Prompt    F6=Query HMC    F12=Cancel
```

Memory flush method on either **Controller**

IBM Technology
Expert Labs

- Start with *FRCWRT

```
                          Change Full System FlashCopy CSE Data

Supply all required values, press Enter.

Source LPAR IP address . . . .   1.2.3.4          IPv4 address
Source host alias  . . . . . .   PROD             Name
Target host alias  . . . . . .   FC               Name

Method to flush memory . . . .   *FRCWRT          *QUIESCE, *FRCWRT, *IPL,
                                                    *NONE

                                                                      More...
F1=Help    F3=Exit    F4=Prompt    F6=Query HMC    F12=Cancel
```

HMC LPAR inforomation on either **Controller**

IBM Technology
Expert Labs

- If the source or target LPARs participate in LPM or LUN switches, specify *SEARCH on the HMC Managed System Name parameter.
- If this is a PowerVS Cloud environment specify *CLOUDENV on the Primary HMC IP parameter and leave the rest blank.
- Note that you can prompt on the system, LPAR and Profile names using F6
- Do not specify BRMS integration (yet)

```
                                  Create Full System FlashCopy CSE Data

Supply all required values, press Enter.

Target LPAR Information:
  Primary HMC IP . . . . . .    1.2.3.4           IPv4 address
  Secondary HMC IP . . . . . .                    IPv4 address
  HMC managed system . . . . .  *SEARCH
  HMC LPAR name  . . . . . .    lparName
  HMC Profile name . . . . . .  lparProfile
  Shutdown target before
    FlashCopy  . . . . . .      *YES              *YES, *NO
  Restart target after
    FlashCopy  . . . . . .      *YES              *YES, *NO, *INQ, *FRCINQ,
                                                   *PAUSE, *COPIED

```

Communications information on either **Controller**

IBM Technology
Expert Labs

- If it is available, enter:
  - Target LPAR IO Card location code, line description and IP interfaces (include iSCSI interfaces)
    - Use *LPAR- to have toolkit resolve type-model-serial-id on the target, i.e. *LPAR-C2-T1
  - Routing details

```
                                Change Full System FlashCopy CSE Data

Supply all required values, press Enter.

Target Comm Interfaces:

  IO card location code  . . .   *LPAR-C2-T1
                                                *NONE, identifier
  Line description . . . . . .   FSFCLINE       line name, *VIRTUALIP
  IP interface . . . . . . . .   9.5.34.90      IPv4 address

      + for more values  . . .

Target LPAR Default Route:
  Binding interface  . . . . .   *NOCHANGE      IPv4 address
  Next hop . . . . . . . . . .                  IPv4 address
```

Backup device information on either **Controller**

IBM Technology
Expert Labs

- If the Flash Copy (target) LPAR is going to use a VTL via iSCSI it needs to know the new initiators for the target LPAR to use.
- Any existing source initiators are removed when the LPAR/VM UUID changes, i.e. when:
  - Flash Copied
  - Replicated and switched
  - Restored on new hardware
  - The IQN information is not saved (not even *SAVCFG)
  - The new initiators for the target to use.
- Add the existing tape device description name and the serial number

```
                                        Change Full System FlashCopy CSE Data

Supply all required values, press Enter.

Target LPAR iSCSI Information:
  Device IP address  . . . . .   19.5.34.65        *NONE, IP address
  Device port number . . . . .   *DFT              *DFT, 0-65535
  Device IQN . . . . . . . . .   vtl-tgt-for-fclparname

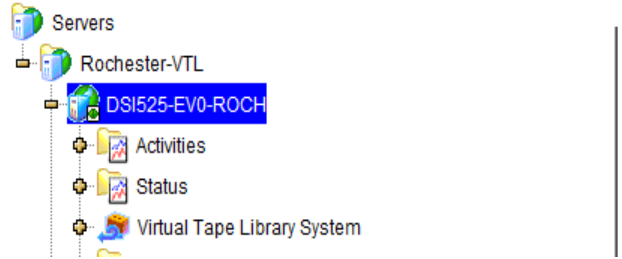
  Client IQN . . . . . . . . .   iqn.1924-02.com.ibm:ibmi.fclparname-i0

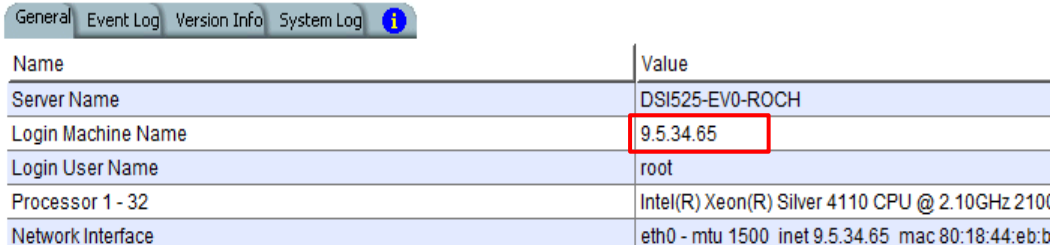
Target LPAR Device Setup:
  Backup device description      VTL_PS_DEV        *NONE, device name
  Device serial number . . . .   YTC634303828
      + for more values  . . .
```

Finding the iSCSI information

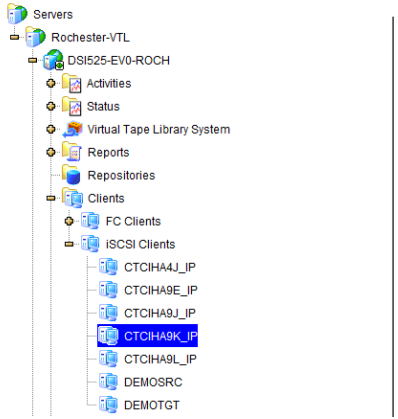
IBM Technology
Expert Labs

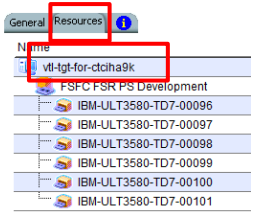
- Where to find the IQN's in the VTL Console

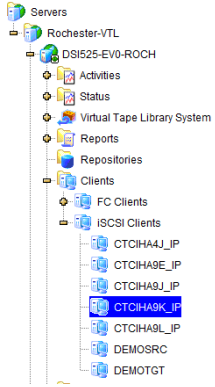


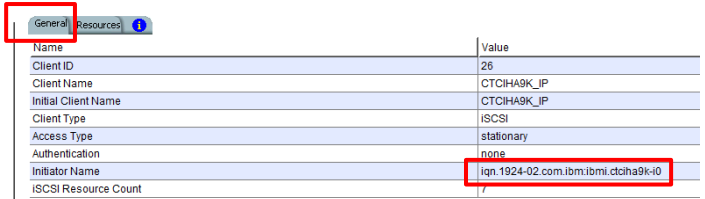


Client IQN:









Entering backup information on either **Controller**

IBM Technology
Expert Labs

- No backup command (yet)
- “Wait for ENDFSFLASH” set to *YES
- Target keylock position set to *MANUAL if not a Cloud environment
  - Cloud environments must use the system value QIPLTYPE

```
                                    Change Full System FlashCopy CSE Data

Supply all required values, press Enter.

Target LPAR backup command #1    *NONE

      + for more values  . . .

Wait for ENDFSFLASH  . . . . .   *YES             *YES, *NO
FlashCopy Exit program . . . .   *NONE            *NONE, program name
  Library  . . . . . . . . . .                    library name
Hold scheduled jobs  . . . . .   *YES             *YES, *NO
Target keylock position  . . .   *MANUAL          *PANEL, *AUTO, *MANUAL
Stop target after backups  . .   *NO              *YES, *NO, *RMV
Source lock wait time out  . .   3600            300 - 108000 (seconds)
Target lock wait time out  . .   86400           300 - 108000 (seconds)

Auto start cluster . . . . . .   *YES             *YES, *NO
Message Queue  . . . . . . . .   *SYSOPR          name, *SYSOPR
  Library  . . . . . . . . . .                    library name
                                                                    More...
F1=Help   F3=Exit   F4=Prompt   F6=Query HMC   F12=Cancel
```

Save the Copy Services Environment (CSE) Data on both **Controllers**

IBM Technology Expert Labs

- The command SAVDDD will put all the DDD and CRG information into an IFS directly.
  - SAVDDD *GEN
    - Will save to /QIBM/QZRDHASM/QZ_DDDBKU_<timestamp>
- BRMS *LINK will save /QIBM/QZRDHASM
  - Consider the following two control group exits prior to *LINK:
    - RMVDIR DIR('/QIBM/QZRDHASM/QZ_DDDBKU_*') SUBTREE(*ALL)
    - SAVDD
- In the even of a restore, create the directory and issue RSTDDD
- Add the restore command to the end of the recovery report. It should be done after re-establishing the cluster and DDD.

Test the configuration on either **Controller**

IBM Technology
Expert Labs

- Use CHKFSFLASH to verify communications configurations first
- Resolve issues until it is successful

```
CHKFSFLASH CSEDTA(FSFC9M9P1)
Acquired lock on LPAR CTCIHA9M.
Validating flashcopy consistency group 8
Validating flashcopy mappings
Consistency group 8 validated.
Successfully performed local verifications.
Performing Full System FlashCopy verifications on CTCIHA9M.
Released lock on LPAR CTCIHA9M.
Log file used : /QIBM/Qzrdhasm/fsfc/FSFC9M9P1/ctl.log.
CHKFSFLASH validation for FSFC9M9P1 completed successfully.
```

Before you test the Flash Copy

IBM Technology
Expert Labs

- On the production LPAR, do QCTL and QSYSWRK have prestart or autostart jobs?
  - DSPSBSD SBSD(QSYS/QCTL) options 3 and 10
  - DSPSBSD SBSD(QSYS/QSYSWRK) options 3 and 10
  - If YES then you'll need to use the exit program QZRDIAFFEX
    - Remove them at *QUIESCE and add them back at *POSTFLASH (include MONMSG CPF0000)
      - RMVAJE SBSD(QSYS/QCTL) JOB(jobname)
      - RMVPJE
      - ADDAJE SBSD(QSYS/QCTL) JOB(jobname) JOBD(job description)
      - ADDPJE
    - Add them to the BRMS Recovery report (we'll do this later when we edit QO1AUSRRCY)
    - Update the CSE Data to call the exit program
- If this is a Cloud environment, ensure the target will IPL in manual mode the first time:
  - CHGSYSVAL QIPLTYPE VALUE('1')
- Did you add RUNLPARCMD to the startup program?
- On the target LPAR, do any comm adapters (virtual and physical) have the same slot numbers (Cxx) as the comm adapters on the source LPAR?
  - If yes, move them to other slots
  - This will prevent the OS from using them with the existing line descriptions.

Test the configuration on either **Controller**

IBM Technology
Expert Labs

- Did you read the previous slide?
- Use STRFSFLASH to perform a flashcopy
- The target will IPL into manual mode
- Sign on to the target LPAR console
- Continue to IPL the LPAR to restricted state.
- When you've got a command line, verify the startup program is QZRDHASM/QZRDIASTRP
  - DSPSYSVAL QSTRUPPGM
- Continue the IPL
  - STRSBS QCTL
- Get the information needed for the communications interface
  - DSPHDWRSC *CMN
  - Get the location code
- Get the information needed for the tape devices
  - DSPHDWRSC *STG
  - Get the serial number
- On the target, execute command QZRDHASM/ENDFSFLASH to finish the process
- On the production LPAR change, if a cloud environment: CHGSYSVAL QIPLTYPE VALUE('0')

Update the communication information on either **Controller**

IBM Technology Expert Labs

- Using CHGCSEDTA, update:
  - Communications interface location code
    - *LPAR will results type, model, serial and virtual bus on the target
    - Cxx = slot number xx
  - Line description
  - IP Address

```
Change Full System FlashCopy CSE Data

Supply all required values, press Enter.

Target Comm Interfaces:

  Identifier Type  . . . . .   *LOC              *SRLN, *LOC, *NONE
  IO card identifier . . . .   *LPAR-C2-T1

  Line Description . . . . .   FSFCLINE          line name, *VIRTUALIP
  IO card IP interface . . .   9.5.167.93        IPv4 address

      + for more values  . .

Target LPAR default route:
  Binding interface  . . . .   *NOCHANGE         IPv4 address
  Next hop . . . . . . . . .                     IPv4 address
```

Update the backup devices on either **Controller**

IBM Technology
Expert Labs

- Using CHGCSEDTA, update:
  - Device descriptions that the backups will use
  - Serial numbers of the devices
    - If using logical libraries, use the tape drive serial numbers

```
Change Full System FlashCopy CSE Data

Supply all required values, press Enter.

Target LPAR Device Setup:

  Backup device description    TS3400PROD        *NONE, device name
  Device serial number . . .   78-78F1101

      + for more values  . .
```

Update the BRMS information on either **Controller**: BRMS

IBM Technology Expert Labs

- Using CHGCSEDTA, update:
  - BRMS Integration = *YES
  - Change the defaults if necessary
- Custom SYSBAS Timestamp is recommended if incremental backups are performed on the FlashCopy LPAR
  - BRMS Advanced Feature is required to use Custom SYSBAS Timestamp

```
Use BRMS integration . . . . .   *YES              *YES, *NO
BRMS information:
  BRMS transfer method . . . .   *ALL              *ALL, *CHGONLY
  BRMS transfer port . . . . .   *DFT              *DFT, 1024-65535
  Encrypt BRMS transfer  . . .   *NO               *YES, *NO
  Custom SYSBAS Timestamp  . .   *NONE             *NONE, *BOTH, *QSYS *IFS
  Lock BRMS  . . . . . . . . .   *SRCONLY          *BOTH, *NO, *SRCONLY,
                                                    *TGTONLY
  Lock type  . . . . . . . . .   *FCNUSG          *ALL, *FCNUSG, *HOLD
  Base media class . . . . . .   *NONE             class, *NONE
  Base media class suffix  . .   *NONE             suffix, *NONE
  Restricted media class(es)     *NONE             *NONE, class
      + for more values  . . .
```

Update the configuration on either **Controller**: BRMS

IBM Technology Expert Labs

- Specify a BRMS command
  - If SBMJOB(*YES) then specify a job description that ensures it will run (i.e. if QBATCH isn't started don't send it to QBATCH)
    - JOBD(QLPARJOBD) sends it to job queue QSYSNOMAX which sends to QSYSWRK
    - The command is called from QSTRUPJD which usually runs under QPGMR.

```
Target LPAR backup command      STRBKUBRM CTLGRP(BACKUPS) SBMJOB(*YES or *CTLSBS)
```

- Prompting (F4) is available on the command

  But … it is prompted on the local (controlling) LPAR, not where the command will run (on the source LPAR). Select a default control group (like *BKUGRP) then change it to the desired control group after pressing enter.

- At 7.5 BRMS changed the functional usage to be more restrictive. As a result, QPGMR does not have the authority to run BRMS commands. Therefore, one of the following must be done:
  - On the source LPAR, issue `SETUSRBRM USER(QPGMR) USAGE(*ADMIN)`
  - Change the 'Target LPAR backup command' to:

```
SBMJOB CMD(STRBKUBRM CTLGRP(BACKUPS) SBMJOB(*YES or *CTLSBS)) JOB(BRMBACKUP) JOBQ(QSYS/QSYSNOMAX)
USER(QLPAR)
```

Update the configuration on either **Controller**: Keylock

IBM Technology Expert Labs

- Using CHGCSEDTA, update:
  - Target keylock position = *AUTO
- Note: This parameter is not available in Cloud environments

```
 Change Full System FlashCopy CSE Data

Supply all required values, press Enter.

Wait for ENDFSFLASH  . . . .   *YES             *YES, *NO
FlashCopy Exit program . . .   *NONE
  Library  . . . . . . . . .     *LIBL          *LIBL, library
Hold scheduled jobs  . . . .   *YES             *YES, *NO
Target keylock position  . .   *AUTO            *PANEL, *AUTO, *MANUAL
Stop target after backups      *NO              *YES, *NO, *RMV

Request type . . . . . . . .   0                Number

BRMS Changes on the **Source** LPAR - Subsystems

IBM Technology Expert Labs

- If processing subsystems, subsystems should NOT be set to start
  - WRKCTLGBRM, Opt 9

```
                                  Subsystems to Process

Use . . . . . . . . . . :  *BKU
Control group . . . . . :  SAVSYSALL

Type choices, press Enter.
                                    End
  Seq    Subsystem     Library      Option     Delay       Restart

   10    *ALL          *ALL         *CNTRLD    30          *NO
```

BRMS Changes on the **Source** LPAR - Attributes

IBM Technology
Expert Labs

- Do not run STRMNTBRM or manage servers after control group
  - WRKCTLGBRM, Opt 8, page down all the way
  - Editable on V7R4M0, use OpsNav or API's on prior releases

```
Additional Backup Policy Properties

Client backup policy . . . . . . . . . : SAVSYSALL

Type information, press Enter.

Allow activity overrides . . . . . . . . *YES        *NO, *YES
Allow retention overrides  . . . . . . . *YES        *NO, *YES
Additional management:
  TCP/IP servers . . . . . . . . . . . . . *NO        *NO, *END, *RESTART, *BOTH
  Lotus servers  . . . . . . . . . . . . . *NO        *NO, *END, *RESTART, *BOTH
  Integrated Windows servers . . . . . . . *NO        *NO, *VARYOFF, *VARYON ...
  Guest partitions . . . . . . . . . . . . *NO        *NO, *VARYOFF, *VARYON ...
Unmount user-defined file systems  . . . *NO        *NO, *YES
Run maintenance after backup . . . . . . *NO        *NO, *YES
```

Modify BRMS recovery report user-added steps

IBM Technology Expert Labs

- Insert custom message into the recovery reports to change system settings to start IP etc.
  - STRSEU SRCFILE(QUSRBRM/QO1AUSRRCY) SRCMBR(STEP014)
  - Insert the following text:

```
If restoring configuration settings from a FSFC backup, run the following commands:
CHGSYSVAL SYSVAL(QSTRUPPGM) VALUE('QSTRUP    QSYS      ')
CHGLINETH LIND(ETHLINE) ONLINE(*YES)
CHGTCPIFC INTNETADR('1.2.3.4') AUTOSTART(*YES)
CHGIPLA STRTCP(*YES)  ← skip this if also using FSR
Check the job scheduler entries
```

- Modify the recovery report creation to include the user info
  - Add the parameter USRRCYINF(*ADD)
  - If STRMNTBRM is used to generate the reports
    - Modify the STRMNTBRM call with PRTRCYRPT(*NONE)
    - Add STRRCYBRM USRRCYINF(*ADD) to the job scheduler, to run 15 minutes (or so) after STRMNTBRM
  - Consider using the Flashcopy Exit Program
    - WRKMBRPDM QZRDHASM/QCLSRC member QZRDIAFFEX
      - Copy the source files to utility libraries
      - Compile a blank program for the controller, and one that calls STRMNTBRM and STRRCYBRM at exit *FINISH on the source

Create an exit program to run BRMS Maintenance and generate reports

- On the source:
  - Copy the source from QZRDHASM/QCLSRC member QZRDIAFFEX to your tools library.
  - WRKMBRPDM to edit it. At the *FINISH section add this code:

```
IF COND(%SST(&EXTRAS 1 8) *EQ '*SUCCESS') THEN(DO)
  STRMNTBRM PRTRCYRPT(*NONE)
  STRRCYBRM  USRRCYINF(*ADD)
ENDDO
```

  - Compile the program
- On the Controller create an empty version of that program:

```
CRTCLPGM PGM(QGPL/QZRDIAFFEX) SRCFILE(QZRDHASM/QCLSRC) SRCMBR(QZRDIAFFEX)
```

- Use WRKCSEDTA opt 2 and set the exit program name

Test the configuration on either **Controller**

IBM Technology
Expert Labs

- Use CHKFSFLASH to verify communications configurations first
- Resolve issues until it is successful

```
CHKFSFLASH CSEDTA(FSFC9M9P1)
Acquired lock on LPAR CTCIHA9M.
Validating flashcopy consistency group 8
Validating flashcopy mappings
Consistency group 8 validated.
Successfully performed local verifications.
Performing Full System FlashCopy verifications on CTCIHA9M.
Released lock on LPAR CTCIHA9M.
Log file used : /QIBM/Qzrdhasm/fsfc/FSFC9M9P1/ctl.log.
CHKFSFLASH validation for FSFC9M9P1 completed successfully.
```

Test the configuration on either **Controller**

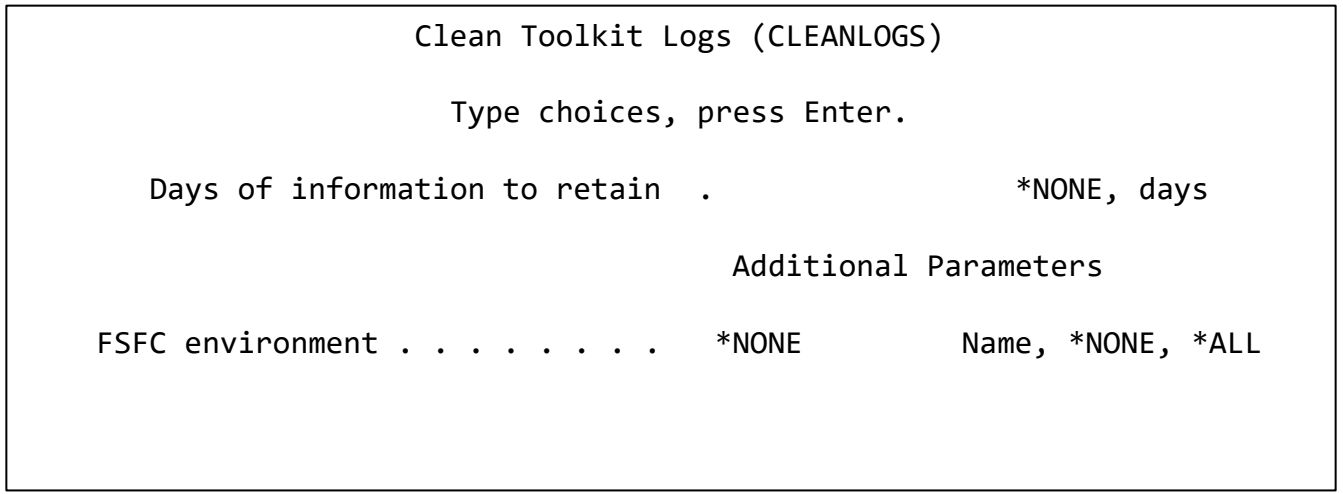
IBM Technology
Expert Labs

- Use STRFSFLASH to perform a flashcopy
- Flashcopy target LPAR IPL etc will occur
- If this is a SAVSYS backup then the HMC SRC will be A900 3C70 while in Batch Restricted State
- After backups, BRMS will be transferred to the source LPAR
  - If not, check /tmp/qzrdiash.log on the target
- On the source LPAR, verify backups are complete
  - DSPLOGBRM
  - WRKMEDIBRM
  - BRMS Recovery reports
    - Look for the customer recovery steps after RSTCFG.
    - This is usually step 14 – if not, find the correct step and move the text in member QUSRBRM/QO1AUSRRCY STEP014 to the correct member.

Schedule Log Cleanup on all **Controlling** LPARs

IBM Technology
Expert Labs

- CLEANLOGS will prune toolkit logs to save on space
  - Tell it how many days of log entries to retain
  - `ADDJOBSCDE JOB(CLEANLOGS) FRQ(*WEEKLY) CMD(QZRDHASM/CLEANLOGS RETAIN(120)) SCDDATE(*NONE) SCDDAY(*ALL) SCDTIME('22:30')`



How to reset after failure

- Failures can happen, you need to know how to set things back to normal.
- To abandon the backups:
  - On the target: QZRDHASM/ENDFSFLASH *FAILBKU
  - On the source: QZRDHASM/ENDFSFLASH *RSTFCNUSG
- PowerVS Volumes-clones can be displayed, canceled and deleted with these commands:
  - DSPCLDCLNL
  - CNLCLDCLN
  - DLTCLDCLN
  - WRKCLDVOL
- The toolkit webpage contains additional recovery steps

Where can I find the logs for troubleshooting?

IBM Technology
Expert Labs

- Logs are in the following place:
  - /QIBM/Qzrdhasm/qzrdhasm.log
  - /QIBM/Qzrdhasm/fsfc/<CSE Data name>/*
  - /QIBM/Qzrdhasm/qzrdhasm.log.bak
  - /QIBM/Qzrdhasm/java.logs/*
  - /QIBM/Qzrdhasm/joblogs/*
- DMPINF ENV(*ALL) EXTDLOGS(*YES) will grab all these files and put them in a zip file.
  - Specify the failing job information on Job Name:

```
                        Dump ICSM Information (DMPINF)

Type choices, press Enter.

Environment name . . . . . .   *ALL          Name, *ALL
Type . . . . . .   *ALL          *ALL, *FLASH, *GMIR, *LUN...
Extended logging . . . . . .   *YES          *YES, *NO
Job name . . . . . .   *NONE         Name, *CURRENT, *NONE, *LAST
  User . . . . . .                   Name
  Number . . . . . .                 000000-999999
Days of logs to keep . . . . . .   90           days, *NONE, *NOMAX
```

Contacting support if you have problems

IBM Technology
Expert Labs

- Support for the FSFC Toolkit is to customers who meet the following criteria:
  - Current System i Software Maintenance Agreement
  - Current FSFC Toolkit Software Maintenance Agreement
- For non-urgent issues or questions contact the consultant who installed the Toolkit. To reach a Toolkit developer for non-urgent issues and questions, or to report a bug, send an email to iessspt@us.ibm.com
