2. For a list of the Kubernetes pods started by the deployment, see the Results section in [Deploying the Analytics subsystem](#).
3. If you have now installed all subsystems, continue to [Post-deployment steps](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Deploying the Developer Portal

You create a Developer Portal node by deploying the Developer Portal OVA template. After you deploy the Developer Portal OVA template, you can install the Developer Portal.

---

### Before you begin

Before you deploy:

- Review the [Deployment requirements on VMware](#).
- Review the [API Connect configuration on VMware](#).
- Review [What's new for v10 installation](#)
- For information on deploying a cluster, see [Configuring API Connect subsystems in a cluster](#)
- If you are upgrading from a previous version, see [Upgrading API Connect](#).

Note:

Ensure that your kernel or Kubernetes node has the value of its `inotify` watches set high enough so that the Developer Portal can monitor and maintain the files for each Developer Portal site. If set too low, the Developer Portal containers might fail to start or go into a `non-ready` state when this limit is reached. If you have many Developer Portal sites, or if your sites contain a lot of content, for example, many custom modules and themes, then a larger number of `inotify` watches are required. You can start with a value of 65,000, but for large deployments, this value might need to go up as high as 1,000,000. The Developer Portal containers take `inotify` watches only when they need them. The full number is not reserved or held, so it is acceptable to set this value high.

---

### About this task

You must deploy the Developer Portal OVA template to create each Developer Portal node that you want in your cloud. Each node has a separate CLI password account that is required to log in through a Secure Shell (SSH) to complete specific administrative actions for only that node.

Important deployment information for Developer Portal:

- You must deploy the Developer Portal OVA template by using a version of the VMware vSphere Client that supports the SHA-512 Cryptographic Hash Algorithm.
- The Developer Portal node is initially configured with a default password of `7iron-hide`, with the user name of `admin`. For security reasons, change the default password by completing one of the following actions:
  - During deployment, if the feature is available in your VMware instance, enter a new password. If you specify a password during deployment, the password for the Developer Portal command line interface (CLI) is modified. Use the new password when you log into the CLI. You cannot modify the admin user name for the CLI.
  - After deployment, log in to the CLI for each virtual appliance and run the command to change the default password for that specific node. The CLI command is `passwd`.

Note that this console uses a US keyboard configuration, in which the `@` symbol can be in a different place to other keyboard configurations. If you are not using a US keyboard, ensure that you typed the password correctly.

- Only static IP addresses that are specified during the `apicup` project configuration before the installation of the OVAs are supported.
- To enable effective high availability for your Portal service, you need a latency that is less than 50ms between all OVAs to avoid the risk of performance degradation. Servers with uniform specifications are required, as any write actions occur at the speed of the slowest OVA, as the write actions are synchronous across the cluster of OVAs. It is recommended that there are three servers in each cluster of OVAs for the high availability configuration. The three servers can be situated in the same data center, or across three data centers to ensure the best availability. However, you can configure high availability with two data centers.

---

### Procedure

Complete the following steps in order:

Note: The following steps apply to VMware only. Depending on the VMware version that you are using, some of the steps might vary. For example, you might not be able to change the user name and password during deployment.

1. Specify configuration settings for the Developer Portal subsystem and create an ISO. See [Configuring the Developer Portal subsystem](#)
2. Deploy the subsystem OVA into an appliance VM. See [Deploying the Developer Portal subsystem OVA file](#).
3. Verify the deployment. See [Verifying deployment of the Developer Portal subsystem](#)
4. Optional: Define multiple Developer Portal endpoints. See [Defining multiple portal endpoints for a VMware environment](#)

---

### What to do next

If you want to deploy an API Connect Analytics OVA file, continue with [Deploying the Analytics subsystem](#).

If you did not specify a new password during deployment in VMware, then after deployment, log in to the command-line interface (CLI) for each appliance and run the command `passwd` to change the password.

- [Configuring the Developer Portal subsystem](#)  
Specify configuration properties for your Developer Portal subsystem, and create an ISO.
- [Deploying the Developer Portal subsystem OVA file](#)  
After you have specified configuration settings and created an ISO, deploy the subsystem OVA into an appliance VM.
- [Verifying deployment of the Developer Portal subsystem](#)  
Verify that deployment of the Developer Portal OVA file succeeded.
- [Configuring two NICs on the Developer Portal](#)  
Configure the Developer Portal to use two network interface cards.
- [Specifying a range of allowable client IP addresses for Developer Portal](#)  
Specify the range of client IP addresses to be allowed in a deployment of the Developer Portal
- [Defining multiple portal endpoints for a VMware environment](#)  
Multiple public facing endpoints (portal-www) can be defined for the Developer Portal.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring the Developer Portal subsystem

Specify configuration properties for your Developer Portal subsystem, and create an ISO.

### Before you begin

Review the requirements and important deployment information for Developer Portal. See [Deploying the Developer Portal](#).

### About this task

Use the `apicup` installation utility to specify configuration settings for your Developer Portal subsystem.

### Procedure

1. Ensure that you obtained the distribution file and have a project directory, as described in [First steps for deploying in a VMware environment](#).
2. Change to the project directory.

```
cd myProject
```

3. Create a portal subsystem.

```
apicup subsys create port portal
```

Where:

- `port` is the name of the Developer Portal server that you are creating. You can assign it any name, as long as the identifier consists of lowercase alphanumeric characters or '-', with no spaces, starts with an alphabetic character, and ends with an alphanumeric character.
- `portal` indicates that you want it to create a Developer Portal microservice.

Note: Unless you are installing a two data center deployment, leave `multi-site-ha-enabled` as false, and ignore `multi-site-ha-mode`, `replication-peer-fqdn`, `site-name`, and the `portal-replication` endpoint, as these options are all related to that feature. For more information, see [Installing a two data center deployment](#).

The `apiconnect-up-v10.yml` file that is in that directory is updated to add the portal-related entries.

Tip: At any time, you can view the current developer portal subsystem values in the `apiconnect-up-v10.yml` by running the `apicup get port` command:

```
apicup subsys get port
```

If you have not yet configured the subsystem, the command might return errors. Also, if you have not updated the value, a default value is listed, if there is one that is available.

After configuration is complete, you can view output similar to the following sample:

#### Appliance settings

```
=====
```

```
Name Value
```

```
Description
```

```
----
```

```
-----
```

#### additional-cloud-init-file

```
(Optional) Path to additional cloud-init yml file
```

```
data-device sdb
```

```
VM disk device (usually `sdb` for SCSI or `vdb` for VirtIO)
```

#### default-password

```
$6$rounds=4096$vtcqpAVK$dzqrOeYP33WTvTug38Q4Rld518TmdQgezzTnkX/PfwkzTiZ2S0CqNRrIS4b08tOc4p.OEg4BtzBe/r8RAk.gw/
```

```
(Optional) Console login password for `apicadm` user, password must be pre-hashed
```

```
dns-servers [192.168.1.201]
```

```
List of DNS servers
```

#### extra-values-file

```
(Optional) Path to additional configuration yml file
```

```
k8s-pod-network 172.16.0.0/16
```

```
(Optional) CIDR for pods within the appliance
```

```
k8s-service-network 172.17.0.0/16
```

```
(Optional) CIDR for services within the appliance
```

```
public-iface eth0
```

```
Device for API/UI traffic (Eg: eth0)
```

```
search-domain [subnet1.example.com]
```

```
List for DNS search domains
```

```
ssh-keyfiles [/home/vsphere/.ssh/id_rsa.pub]
```

```
List of SSH public keys files
```

```
traffic-iface eth0
```

```
Device for cluster traffic (Eg: eth0)
```

#### Subsystem settings

```
=====
```

```
Name Value
```

```
Description
```

```
----
```

```
-----
```

```

deployment-profile          n1xc2.m8
Deployment profile (n1xc2.m16/n3xc4.m16) for analytics, (n1xc4.m16/n3xc4.m16) for management, (n1xc2.m8/n3xc4.m8) for
portal
license-use                 nonproduction
License use (production/nonproduction)
multi-site-ha-enabled      false
Multi site HA enabled
multi-site-ha-mode         active
Multi site HA mode (active/passive)
replication-peer-fqdn
Replication peer fully qualified name (replication endpoint of active mode site)
site-name
Site name, used in k8s resource names

```

**Endpoints**  
=====

| Name                                                                | Value                  |
|---------------------------------------------------------------------|------------------------|
| portal-admin                                                        | portal-api.example.com |
| FQDN of Portal admin endpoint                                       |                        |
| portal-replication                                                  |                        |
| FQDN of Portal replication endpoint, only required if HA is enabled |                        |
| portal-www                                                          | portal-www.example.com |
| FQDN of Portal web endpoint                                         |                        |

4. For production environments, specify `deployment-profile`.

```
apicup subsys set port deployment-profile=n3xc4.m8
```

The `deployment-profile` parameter indicates that you are deploying in high availability (HA) mode for a production environment. To specify a development profile, for use in development and testing, specify `deployment-profile=n1xc2.m8`. For more information, see [Requirements for initial deployment on VMware](#).

5. Specify the license version you purchased.

```
apicup subsys set port
license-use=<license_type>
```

The `license_type` must be either `production` or `nonproduction`. If not specified, the default value is `nonproduction`.

6. Optional: Configure scheduled backups of the subsystem. This step is optional but is recommended. Refer to the instructions in [Backing up and restoring the Developer Portal](#).

7. Optional: Configure your logging.

Logging can be configured at a later time, but you must enable it before installation to capture the log events from the installation.

- Complete the procedure at [Configuring remote logging for a VMware deployment](#).
- Enter the following command to create the log file:

```
apicup subsys set port additional-cloud-init-file=config_file.yml
```

8. Enter the following commands to update the `apiconnect-up-v10.yml` with the information for your environment:

- Use `apicup` to set your endpoints.  
You can use wildcard aliases or host aliases with your endpoints.  
Optionally, you can specify all endpoints with one `apicup` command.

Note: You cannot specify the underscore character "\_" in domain names that are used in endpoints. See [API Connect configuration on VMware](#). The endpoints must be unique hostnames which both point to the IP address of the OVA (single node deployment), or to the IP of a load balancer configured in front of the OVA nodes. See examples in the sample output in step 3.

| Setting      | Endpoint host description                                                                                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| portal-admin | This is the <i>unique_hostname</i> for communication between your Cloud Manager and API Manager, and your Developer Portal. The values for the portal-admin and portal-www must be different.<br><br><code>apicup subsys set port portal-admin=<i>unique_hostname</i>.domain</code>                                                                       |
| portal-www   | This is the <i>unique_hostname</i> for the Developer Portal Internet site that is created for the Developer Portal. Multiple portal-www endpoints may be configured, as described here: <a href="#">Defining multiple portal endpoints for a VMware environment</a> .<br><br><code>apicup subsys set port portal-www=<i>unique_hostname</i>.domain</code> |

- Set your search domain. Multiple search domains should be separated by commas.

```
apicup subsys set port search-domain=your_search_domain
```

Where `your_search_domain` is the domain of your servers, entered in all lowercase. Setting this value ensures that your searches also append these values, which are based on your company's DNS resolution, at the end of the search value. A sample search domain is `mycompany.example.com`.

Ensure that the value for `your_search_domain` is resolved in the system's `/etc/resolv.conf` file to avoid "502" errors when accessing the Cloud Manager web site. For example:

```
# Generated by resolvconf
search your_search_domain ibm.com other.domain.com
```

- Set your domain name servers (DNS).

Supply the IP addresses of the DNS servers for your network. Use a comma to separate multiple server addresses.

```
apicup subsys set port dns-servers=ip_address_of_dns_server[,ip_address_of_another_dns_server_if_necessary]
```

DNS entries may not be changed on a cluster after the initial installation.

9. Set a Public key.

```
apicup subsys set port ssh-keyfiles=path_to_public_ssh_keyfile
```

Setting this key enables you to use **ssh** with this key to log in to the virtual machine to check the status of the installation. You will perform this check in [Verifying deployment of the Developer Portal subsystem](#).

10. You can set a hashed password that you enter to log in to your Developer Portal server for the first time.
  - a. **Important:** Review the requirements for creating and using a hashed password. See [Setting and using a hashed default password](#).
  - b. If you do not have a password hashing utility, install one.

| Operating system    | Command                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ubuntu, Debian, OSX | If the <b>mkpasswd</b> command utility is not available, download and install it. (You can also use a different password hashing utility.) On OSX, use the command: <b>gem install mkpasswd</b> . |
| Windows, Red Hat    | If necessary, a password hashing utility for the Windows operating system, like OpenSSL                                                                                                           |

- c. Create a hashed password

| Operating system    | Command                                                                                                                                                                                                        |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ubuntu, Debian, OSX | <b>mkpasswd --method=sha-512 --rounds=4096 password</b>                                                                                                                                                        |
| Windows, Red Hat    | For example, using OpenSSL: <b>openssl passwd -1 password</b> . Note that you might need to add your password hashing utility to your path; for example, on Windows:<br><b>set PATH=c:\cygwin64\bin;%PATH%</b> |

- d. Set the hashed password for your subsystem:

```
apicup subsys set port default-password="hashed_password"
```

Notes:

- The password is hashed. If it is in plain text, you cannot log into the VMWare console.
- Note that the password can only be used to login through the VMware console. You cannot use it to SSH into the Appliance as an alternative to using the **ssh-keyfiles**.
- On Linux or OSX, use single quotes around *hashed\_password*. For Windows, use double quotes.
- If you are using a non-English keyboard, understand the limitations with using the remote VMware console. See [Requirements for initial deployment on VMWare](#).

11. Optional: If the default IP ranges for the API Connect Kubernetes pod and the service networks conflict with IP addresses that must be used by other processes in your deployment, modify the API Connect values.

You can change the IP ranges of the Kubernetes pod and the service networks from the default values of 172.16.0.0/16 and 172.17.0.0/16, respectively. In the case that a /16 subnet overlaps with existing IPs on the network, a Classless Inter-Domain Routing (CIDR) as small as /22 is acceptable. You can modify these ranges during initial installation and configuration only. You cannot modify them once an appliance has been deployed. See [API Connect configuration on VMWare](#).

- a. Update the IP range for the Kubernetes pod

```
apicup subsys set port k8s-pod-network='new_pod_range'
```

Where *new\_pod\_range* is the new value for the range.

- b. Update the IP range for Service networks.

```
apicup subsys set port k8s-service-network='new_service_range'
```

Where *new\_service\_range* is the new value for the range.

12. Add your hosts.

```
apicup hosts create port hostname.domainname hd_password
```

Where the following are true:

- *hostname.domainname* is the fully qualified name of the server where you are hosting your Developer Portal, including the domain information.
- *hd\_password* is the password of the Linux Unified Key Setup uses to encrypt the storage for your Developer Portal. This password is hashed when it is stored on the server or in the ISO. Note that the password is base64 encoded when stored in **apiconnect-up-v10.yml**. Repeat this command for each host that you want to add.

Note: Host names and DNS entries may not be changed on a cluster after the initial installation.

13. Create your interfaces.

```
apicup iface create port hostname.domainname physical_network_id host_ip_address/subnet_mask gateway_ip_address
```

Where *physical\_network\_id* is the network interface ID of your physical server. The value is most often **eth0**. The value can also be **ethx**, where **x** is a number identifier.

The format is similar to this example: **apicup iface create port myHostname.domain eth0 192.0.2.1/255.255.1.1 192.0.2.1**

Note: You can optionally configure a second network interface (NIC) card for use with Developer Portal. In this scenario, one NIC is used for internal traffic between the Portal and APIM, and the second is used as a public interface. If you are creating multiple network interfaces, each one must be on a different subnet with a different gateway. For information on configuring two NICs for Developer Portal, see [Configuring two NICs on the Developer Portal](#).

14. Optional: You can specify a range of allowable client IP addresses.

You can optionally restrict which IP addresses can access any of the ingresses by creating an allowlist annotation, which then will only allow the specified IP addresses to access the ingress and will deny all other source IP addresses. See [Specifying a range of allowable client IP addresses for Developer Portal](#).

Note: One usage of this restriction is the scenario where you split traffic between your private and public networks in 2 NIC configuration.

15. Optional: Use **apicup** to view the configured hosts:

```
apicup hosts list port
apimdev0232.hursley.ibm.com
```

| Device | IP/Mask                   | Gateway   |
|--------|---------------------------|-----------|
| eth0   | 1.2.152.232/255.255.254.0 | 1.2.152.1 |

Note: If you are configuring a two data center deployment, continue with the installation instructions in [Installing a two data center deployment](#).

16. Leave `multi-site-ha-enabled` set to `false`.
17. Optional: Verify that the configuration settings are valid.

```
apicup subsys get port --validate
```

The output lists each setting and adds a check mark after the value once the value is validated. If the setting lacks a check mark and indicates an invalid value, reconfigure the setting. See the following sample output.

```
Appliance settings
=====
Name                               Value

✓

Endpoints
=====
Name                               Value
----                               -
portal-admin                       portal-api.example.com ✓
portal-replication
✓
portal-www                         portal-www.example.com ✓
```

18. Create your ISO file.

```
apicup subsys install port --out portplan-out
```

The `--out` parameter and value are required. In this example, the ISO file is created in the `myProject/portplan-out` directory.

If the system cannot find the path to your software that creates ISO files, create a path setting to that software by running a command similar to the following command:

| Operating system | Command                                                        |
|------------------|----------------------------------------------------------------|
| OSX and Linux    | <code>export PATH=\$PATH:/Users/your_path/</code>              |
| Windows          | <code>set PATH="c:\Program Files (x86)\cdrtools";%PATH%</code> |

19. Next, use the ISO to deploy the subsystem OVA. Continue with [Deploying the Developer Portal subsystem OVA file](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Deploying the Developer Portal subsystem OVA file

After you have specified configuration settings and created an ISO, deploy the subsystem OVA into an appliance VM.

## Before you begin

You must have completed the configuration of the project file entries for the Developer Portal subsystem, in [Configuring the Developer Portal subsystem](#).

## Procedure

1. Log into the VMWare vSphere Web Client.
2. Using the VSphere Navigator, navigate to the directory where you are deploying the OVA file.
3. Right-click the directory and select Deploy OVF Template.
4. Complete the Deploy OVF Template wizard.
  - a. Select the Portal subsystem .OVA file template by navigating to the location where you downloaded the file in [First steps for deploying in a VMware environment](#).
  - b. Enter a name and location for your file.
  - c. Select a resource for your template.
  - d. Review the details for your template.
  - e. Select the size of your configuration.
  - f. Select the storage settings.

Note that the number of Central Processing Units, RAM, and size of disk that you need for the Developer Portal varies depending on the number of sites that are hosted and the number of concurrent users you expect your site to have:

Table 1. Developer Portal hardware requirements

| Number of sites | Number of concurrent users | Number of CPUs | Amount of RAM (GB) | Data Disk Size (GB)++ |
|-----------------|----------------------------|----------------|--------------------|-----------------------|
| 1               | 1                          | 2**            | 4                  | 50                    |
| 20              | 5                          | 4              | 16                 | 70                    |
| 100             | 20                         | 8              | 32                 | 100                   |
| 100             | 100                        | 16             | 64                 | 500                   |

Important:

- ++The data disk size is extra to the main disk of the OVA. The main disk of the OVA is sized at 100GB, and should not be changed. Therefore, the total disk size of the OVA is 100GB plus the data disk size. The default data disk size is 200GB. If you want to select a different value, then you need to do this by using the OVF Tool, or the VMware GUI, before you power on the VM. Note that certain versions of the VMware GUI may not allow you to resize the data disk, and in this case you should use the OVF Tool.
- \*\*The requirement of 2 CPUs is suitable only for proof-of-concept work, and non-high availability deployments. For example, this configuration is suitable for the demo mode of the apicup installation, which is set by using the command `apicup subsys set port deployment-profile=n1xc2.m8`.
- It's not recommended to have more than 100 sites per Developer Portal service. Note that it's not necessary to have a Portal site for every Catalog, for example Catalogs that are only for API Developers don't need a Portal site, as the APIs can be tested by using credentials from the API Manager. If more than 100 sites are required, you should configure additional Developer Portal services; see [Registering a Portal service](#).

- g. Select the networks.
- h. Customize the Template, if necessary.
- i. Review the details to ensure that they are correct.
- j. Select Finish to deploy the virtual machine.

Note: Do not change the OVA hardware version, even if the VMware UI shows a Compatibility range that includes other versions. See [Requirements for initial deployment on VMware](#).

The template creation appears in your Recent Tasks list.

5. Select the Storage tab in the Navigator.
6. Navigate to your datastore.
7. Upload your ISO file.
  - a. Select the Navigate to the datastore file browser icon in the icon menu.
  - b. Select the Upload a file to the Datastore icon in the icon menu.
  - c. Navigate to the ISO file that you created in your project.  
It is the myProject/portplan-out
  - d. Upload the ISO file to the datastore.
8. Leave the datastore by selecting the VMs and Templates icon in the Navigator.
9. Locate and select your virtual machine.
10. Select the Configure tab in the main window.
11. Select Edit....
  - a. On the Virtual Hardware tab, select CD/DVD Drive 1.
  - b. For the Client Device, select Datastore ISO File.
  - c. Find and select your datastore in the Datastores category.
  - d. Find and select your ISO file in the Contents category.
  - e. Select OK to commit your selection and exit the Select File window.
  - f. Ensure that the Connect At Power On check box is selected.

Tip:

- Expand the CD/DVD drive 1 entry to view the details and the complete Connect At Power On label.
- Note that VMware related issues with ISO mounting at boot may occur if Connect At Power On

- g. Select OK to commit your selection and close the window.

12. Start the virtual machine by selecting the play button on the icon bar.

The installation might take several minutes to complete, depending on the availability of the system and the download speed.

13. Continue with [Verifying deployment of the Developer Portal subsystem](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Verifying deployment of the Developer Portal subsystem

Verify that deployment of the Developer Portal OVA file succeeded.

### Before you begin

You must have completed [Deploying the Developer Portal subsystem OVA file](#).

### About this task

After you configure an ISO and deploy it with the Developer Portal subsystem OVA, as described in [Deploying the Developer Portal subsystem OVA file](#), verify that the subsystem installed correctly and is functional.

### Procedure

1. Log in to the virtual machine by using an SSH tool to check the status of the installation:
  - a. Enter the following command to connect to *port* using SSH:

```
ssh ip_address -l apicadm
```

You are logging in with the default ID of *apicadm*, which is the API Connect ID that has administrator privileges.

- b. Select Yes to continue connecting.  
Your host names are automatically added to your list of hosts.
- c. Run the **apic status** command to verify that the installation completed and the system is running correctly.  
The command output for a correctly running Developer Portal system is similar to the following lines:

```
$ sudo apic status
INFO[0000] Log level: info

Cluster members:
- testsrv1251.subnet1.example.com (1.2.3.4)
  Type: BOOTSTRAP MASTER
  Install stage: DONE
  Upgrade stage: NONE
  Docker status:
    Systemd unit: running
  Kubernetes status:
    Systemd unit: running
    Kubelet version: testsrv1251 (4.4.0-137-generic) [Kubelet v1.10.6, Proxy v1.10.6]
  Etcd status: pod etcd-testsrv1251 in namespace kube-system has status Running
  Addons: calico, dns, helm, kube-proxy, metrics-server, nginx-ingress,
Etcd cluster state:

| Running     | kube-system | etcd-testsrv1251                                       | 1/1   |
| Running     | kube-system | ingress-nginx-ingress-controller-dsnxw                 | 1/1   |
| Running     | kube-system | ingress-nginx-ingress-default-backend-6f58fb5f56-ldx7t | 1/1   |
| Running     | kube-system | kube-apiserver-testsrv1251                             | 1/1   |
| Running     | kube-system | kube-apiserver-proxy-testsrv1251                       | 1/1   |
| Running     | kube-system | kube-controller-manager-testsrv1251                    | 1/1   |
| Running     | kube-system | kube-proxy-4pp8v                                       | 1/1   |

|         |             |             |                                 |     |
|---------|-------------|-------------|---------------------------------|-----|
| Running | testsrv1251 | kube-system | kube-scheduler-testsrv1251      | 1/1 |
| Running | testsrv1251 | kube-system | metrics-server-6fbfb84cdd-hkztz | 1/1 |
| Running | testsrv1251 | kube-system | tiller-deploy-84f4c8bb78-v6k95  | 1/1 |

- Optional: Define multiple Developer Portal endpoints. See [Defining multiple portal endpoints for a VMware environment](#).
- If you have now installed all subsystems, continue to [Post-deployment steps](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring two NICs on the Developer Portal

Configure the Developer Portal to use two network interface cards.

### About this task

When deploying the Developer Portal, you can optionally separate network traffic such that the portal has network interface in your private network, where the communications to the APIM manager take places, and another network interface in your public network, where the end users can access the Portal web sites.

You can do this by using the iface on eth0 for your traffic and defining an extra iface definition (eth1) for your public interface. Do this as part of the initial configuration of the Developer Portal. Note the following requirements:

- iface eth0 and eth1 must have different subnets. This means that you cannot test the configuration by using two IP addresses on the same subnet, due to the routing table produced by the OVA at bootstrap.
- The hostname of the machine must be reachable via eth0 and you must use eth0 as the traffic (private interface) and eth1 as the public interface.

### Procedure

- Verify that you have created a first interface, by following the instructions in [Step 13 of Configuring the Developer Portal subsystem](#).
- Use `apicup` to add an extra iface definition as follows for your public interface:

```
apicup iface create test-stack-portal test0094.test.example.com eth1 1.2.3.232/255.255.254.0 1.2.3.1
```

- Set the hostname of your portal-www ingress to the hostname that is associated with the IP address given on `eth1`.

```
apicup subsys set my-portal portal-www portal.myhost0232.company.com
```

- When configuring the second NIC during initial installation, return to [Step 14 of Configuring the Developer Portal subsystem](#). Follow the remaining steps in the configuration instructions, and then create the Portal OVA and deploy it as usual.

Notes:

- If you are creating multiple network interfaces, each one must be on a different subnet with a different gateway.
- Before powering on the Portal, use the VMware GUI to add a second network card to the VM, with the correct settings for your public network.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Specifying a range of allowable client IP addresses for Developer Portal

Specify the range of client IP addresses to be allowed in a deployment of the Developer Portal

### About this task

Use an extra-values-file, which serves as a portal CR override, to provide an allowable addresses annotation.

### Procedure

In your `apicup` project, create a file called `pt1-extra-values.yaml` with the necessary content. For example:

```
spec:
  portalUIEndpoint:
    annotations:
      ingress.kubernetes.io/whitelist-source-range: 1.2.88.0/24
```

In this example, `1.2.88.0/24` is the acceptable range of client IP addresses.

Note: Depending on your network configuration for the forwarding of client IP addresses, you might need to run several test iterations to work out which client IP addresses to include in the list.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining multiple portal endpoints for a VMware environment

Multiple public facing endpoints (portal-www) can be defined for the Developer Portal.

### About this task

You can override the single endpoint definition for portal-WWW, and the associated portal-www-ingress TLS certificate, to support multiple portal-www endpoints.

For information about the endpoints for the Developer Portal, see [Configuring the Developer Portal subsystem](#).

### Procedure

1. Create an `ingress-issuer`, ssh into one appliance node, change to root by using `sudo -i`, then create a file `ingress-issuer.yaml` with the content:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: ingress-ca
spec:
  secretName: ingress-ca
  commonName: "ingress-ca"
  usages:
  - digital signature
  - key encipherment
  - cert sign
  isCA: true
  issuerRef:
    name: selfsigning-issuer
    kind: Issuer
---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: ingress-issuer
spec:
  ca:
    secretName: ingress-ca
```

Run `kubectl apply -f ingress-issuer.yaml`.

Note: Instead of creating an `ingress-issuer`, you can replace that step, and not use `cert-manager`, by creating `portal-web-host1`, `portal-web-host2`, and `portal-web-host3`, so that they contain certificates for the respective endpoints. In this case, the `ptl-extra-values.yaml` would not contain reference to `cert-manager`:

```
spec:
  portalUIEndpoint:
    hosts:
      - name: ptl.host1.example.com
        secretName: portal-web-host1
      - name: ptl.host2.example.com
        secretName: portal-web-host2
      - name: ptl.host3.example.com
        secretName: portal-web-host3
```

To create the certificates for each `portal-www` endpoint, complete the following steps:

- a. If you are using self-signed certificates, create the TLS secrets for each `portal-www` endpoint by generating the certificates. The following example shows how to generate certificates for each `portal-www` endpoint by using OpenSSL:

```
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout ptl.host1-tls.key -out ptl.host1-tls.crt -subj
"/CN=ptl.host1.example.com"
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout ptl.host2-tls.key -out ptl.host2-tls.crt -subj
"/CN=ptl.host2.example.com"
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout ptl.host3-tls.key -out ptl.host3-tls.crt -subj
"/CN=ptl.host3.example.com"
```

- b. Store the SSL certificates in a secret. Firstly, copy the certificates to the Portal virtual machine, for example:

```
scp ptl.host1-tls.key ptl.host1-tls.crt ptl.host2-tls.key ptl.host2-tls.crt ptl.host3-tls.key ptl.host3-tls.crt
apicadm@portal-vm-address
```

Then, access the virtual machine by using SSH, and store the SSL certificates in a secret, for example:

```
create secret tls portal-web-host1 --key ptl.host1-tls.key --cert ptl.host1-tls.crt
sudo kubectl --kubeconfig /etc/kubernetes/admin.conf create secret tls portal-web-host2 --key ptl.host2-tls.key --
cert ptl.host2-tls.crt
sudo kubectl --kubeconfig /etc/kubernetes/admin.conf create secret tls portal-web-host3 --key ptl.host3-tls.key --
cert ptl.host3-tls.crt
```

2. In your `apicup` project, create a file called `ptl-extra-values.yaml` with the content:

```
spec:
  portalUIEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: ptl.host1.example.com
        secretName: portal-web-host1
      - name: ptl.host2.example.com
        secretName: portal-web-host2
      - name: ptl.host3.example.com
        secretName: portal-web-host3
```

Run the commands:

```
apicup subsys set <ptl_subsys> extra-values-file <path-to-ptl-extra-values-yaml-file>
apicup subsys install <ptl_subsys>
```

3. You should see the change on your appliance:

```
root@ptl:~# kubectl get ingress
NAME                                HOSTS                                ADDRESS    PORTS    AGE
ptl-portal-director                 api.ptl.example.com                80, 443   25m
ptl-portal-web                       ptl.host1.example.com,ptl.host2.example.com,ptl.host3.example.com 80, 443   25m
```

## Results

You have defined multiple Developer Portal endpoints for a VMware environment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Deploying DataPower Gateway

API Connect uses IBM® DataPower® Gateway to provide the gateway service.

The instructions in this section describe how to deploy IBM DataPower Gateway from files obtained from [Passport Advantage®](#), and apply to the following API Connect scenarios:

- API Connect deployments for the VMware environment
- API Connect deployments for Kubernetes, with a DataPower Gateway in a *non-Kubernetes* environment.

For these scenarios, continue with [Installing DataPower Gateway](#).

Note: Do not use these instructions if you are deploying API Connect deployments for Kubernetes, with DataPower Gateway in a *Kubernetes* environment. In this case, you can use DataPower Gateway files that are packaged with API Connect, on the API Connect section of Fix Central, and configured by using the API Connect Install Assist (`apicup`) commands. Follow the instructions in [Obtaining product files](#).

- [Installing DataPower Gateway](#)  
Install and configure IBM DataPower Gateway in a non-Kubernetes environment for use with API Connect.
- [Configuring DataPower Gateway for API Connect](#)  
You can configure the IBM DataPower Gateway to prepare for a registration with the API Connect Management server.
- [Sample configuration for multiple peering objects on gateway services external to Kubernetes](#)  
Sample for reconfiguring the API Connect domain configuration for your gateway services to include multiple peering objects.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing DataPower Gateway

Install and configure IBM® DataPower® Gateway in a non-Kubernetes environment for use with API Connect.

### Before you begin

Do not use these instructions for either of the following deployment scenarios:

- Both API Connect and DataPower Gateway in a Kubernetes environment.  
In this scenario, use the instructions in [Obtaining product files](#).
- An existing DataPower Gateway in a non-Kubernetes environment, and you want to install a newer Fix Pack.  
In this scenario, complete an *upgrade* rather than a new installation. See [Upgrading DataPower Gateway Service](#).

To review the installation and configuration scenarios, see [Deploying DataPower Gateway](#).

## Procedure

---

1. Ensure that DataPower Gateway firmware version you plan to install is compatible with the API Connect Management server version.

Note:

For API Connect Version 10.x, DataPower and API Connect releases must be within one release of each other. For example, API Connect v10.0.n runs with DataPower Gateway 10.0.n, v10.0.n-1, or v10.0.n+1.

However, before you install, best practice is to review the latest compatibility support for your version of API Connect. To view compatibility support, follow the instructions in [IBM API Connect Version 10 software product compatibility requirements](#) to access API Connect information on the Software Product Compatibility Reports website. Once you access information for your version of API Connect, select Supported Software > Integration Middleware, and view the list of compatible DataPower Gateway versions.

2. Obtain your DataPower files from IBM [Passport Advantage](#).

Note that the DataPower files from [Passport Advantage](#) have entitled services for API Connect users.

See also [Download the firmware image from Passport Advantage](#).

3. Follow the DataPower Gateway installation information:

Note: Set the timezone to UTC on all DataPower installations for use with API Connect.

- For gateways on physical appliances, see [DataPower Gateway Installation](#)
- For virtual gateways, see [Virtual DataPower Gateways](#).

Note: For troubleshooting help with DataPower operator v1.2.0 deployments, see <https://ibm.github.io/datapower-operator-doc/troubleshooting/operator-upgrades/#1.2.0>.

4. Continue with [Configuring DataPower Gateway for API Connect](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring DataPower Gateway for API Connect

You can configure the IBM® DataPower® Gateway to prepare for a registration with the API Connect Management server.

### About this task

---

API Connect and DataPower supports two different types of gateway configurations. The DataPower Gateway (v5 compatible) provides the same support as the gateway support that was available with API Connect version 5.x. The DataPower API Gateway is an enhanced gateway that is performance-focused. See [API Connect gateway types](#) for more information about the differences between the gateway types.

Continue with the instructions for the type of Gateway Service you are configuring:

- [Configuring DataPower API Gateway](#)  
Configure the DataPower API Gateway to prepare for registration with the API Connect Management server.
- [Configuring DataPower Gateway \(v5 compatible\)](#)  
You can configure the DataPower Gateway (v5 compatible) to prepare for a registration with the API Connect Management server.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring DataPower API Gateway

Configure the DataPower® API Gateway to prepare for registration with the API Connect Management server.

### Before you begin

---

- These instructions are for DataPower API Gateway deployments in a non-Kubernetes environment. Do not use these instructions if you installed API Connect on Kubernetes, with your DataPower API Gateway Service also in the Kubernetes environment. To review deployment scenarios, see [Deploying DataPower Gateway](#).
- Ensure you have installed a version of DataPower API Gateway that is compatible with the version of the API Connect Management server. See [Installing DataPower Gateway](#).
- A shared certificate and private key is used for securing the communication between the API Connect Management server and the gateway. See [Generating keys and certificates](#) in the DataPower Gateway IBM documentation for instructions on how to create them with the DataPower tools.
- Ensure that the time zone for the DataPower API Gateway is set to UTC.

### About this task

---

- These instructions provide the basic steps for configuring a gateway service with a single gateway server. The lowest-level configuration objects are created first, then used in other configuration objects.
- Adding gateways to configure a peering environment is similar to creating the first gateway, and is recommended for resiliency in a production environment. A minimum of three gateway servers in a gateway service is recommended for high availability. See [Gateway peering](#) for more information about configuring

additional gateways for peering. See [Providing gateway service for API Connect](#) in the DataPower Gateways IBM Knowledge Center content for more details about the DataPower settings and procedures.

## Procedure

---

To configure a DataPower API Gateway to communicate with API Connect, complete the following steps:

Note: Use these instructions only for DataPower API Gateway . If you are configuring DataPower Gateway (v5 compatible) see [Configuring DataPower Gateway \(v5 compatible\)](#).

1. Open the DataPower WebGUI interface.  
Most of the configuration procedure is done in the DataPower WebGUI interface, not in the Blueprint Console.
2. Optional: Enable the XML management interface in the default domain.  
The XML management interface is optional for DataPower API Gateway. If enabled, this interface allows you to send status and configuration requests to the DataPower appliance through a standard SOAP interface, using SOAP messages.
  - a. Search for XML management interface in the navigation search bar, and select it.
  - b. Set the Administrative state to enabled.
  - c. You can specify a different port number if you do not want to use the default of **5550**.
  - d. Select Apply to make the changes
  - e. Save changes to the default domain by selecting Save Configuration.
3. Optional: Enable the REST management interface in the default domain.  
The REST management interface is required if you want to enable to the Trace feature in the assembly Test tab in the API Manager.
  - a. Search for REST management interface in the navigation search bar, and select it.
  - b. Set the Administrative state to enabled.
  - c. You can specify a different port number if you do not want to use the default of **5554**.
  - d. Select Apply to make the changes
  - e. Save changes to the default domain by selecting Save Configuration.
4. Create an application domain.  
This domain receives your traffic.
  - a. Search for Application domain in the navigation search bar, and select it.
  - b. Select Add to create the application domain.
  - c. Enter a unique name for your domain.
  - d. Ensure that enabled is selected for the Administrative state.
  - e. Ensure that the default domain is listed in the Visible application domain list.
  - f. Select Apply.
  - g. Change to your new application domain by selecting Domain in the menu bar, and selecting the domain that you created.
  - h. Select Save changes and switch domains.  
All of the remaining steps on the DataPower gateway must be done in the application domain that you created.
  - i. Save changes to the domain by selecting Save Configuration.
5. Ensure that your deployment includes an NTP server to synchronize time between each of the DataPower Gateways.  
See [Managing the NTP service](#).
6. Ensure that you have set a unique **System Identifier** for each v10 DataPower gateway. See [Initializing the DataPower Gateway](#).
7. Create a self-signed certificate and private key to be used to protect the traffic between the management server and the API gateway service process. You can generate a certificate and private key using DataPower or by using other tools, such as **OpenSSL**. See [Generating keys and certificates](#) in the DataPower Gateway IBM documentation for instructions on how to create a crypto key with the DataPower tools.
8. Upload your private crypto key file to the domain.
  - a. Search for Crypto key in the navigation search bar, and select it.
  - b. Select Add to create a key object.
  - c. Create a unique name for the key object in the Name field.
  - d. Select Upload...
  - e. Browse for the key file (which must be a .pem or .p12 file) and select it.
  - f. If you want to rename it, enter a new name for the file.
  - g. Select Upload to move it to the server in the cert:// folder.
  - h. Select Apply to save the changes.
9. Upload your crypto certificate file to the domain.  
Note: If your certificate is signed by an Intermediate CA, you must include the entire chain in a single key file (either .pem or .p12) for uploading.
  - a. Search for Crypto certificate in the navigation search bar, and select it.
  - b. Select Add to create a certificate object.
  - c. Create a unique name for the certificate object in the Name field.
  - d. Select Upload...
  - e. Browse for the key file (which must be a .pem or .p12 file) and select it.
  - f. If you want to rename it, enter a new name for the file.
  - g. Select Upload to move it to the server in the cert:// folder.
  - h. Select Apply to save the changes.
10. Associate the Crypto key with the Crypto certificate by setting the Identification credential.
  - a. Search for Crypto Identification Credentials in the navigation search bar, and select it.
  - b. Select Add.
  - c. Enter a name for your credential.
  - d. Ensure that the Administrative state has a value of enabled.
  - e. In the Crypto Key field, select the name of the key object that you created from the drop-down menu.
  - f. In the Certificate object field, select the name of the certificate object that you created from the drop-down menu.
  - g. Select Apply to commit your changes.
11. Create your TLS Client profile.
  - a. Search for TLS Client profile in the navigation search bar, and select it.
  - b. Select Add to create a client profile.
  - c. Create a unique name for the profile in the Name field.
  - d. Select your Identification credential from the drop-down list.
  - e. Ensure that the value of Validate server certificate is set to off.

- f. Ensure that the value of Use SNI is set to on.
  - g. Select Apply to save the changes.
12. Create your TLS Server profile.
- a. Search for TLS Server Profile in the navigation search bar, and select it.
  - b. Select Add to create a server profile.
  - c. Create a unique name for the profile in the Name field.
  - d. Select your Identification credential from the drop-down list.
  - e. Ensure that the value of Request client authentication is set to off.  
Disabling the request for client authentication for the TLS client profile and the validation of server certificates for the TLS server profile disables security for the ease of configuring the gateway. To enable the secure communication using mutual TLS between IBM API Connect and Gateway, see [Binding a TLS server profile to a gateway service](#).
  - f. Select Apply to save the changes.
13. Define a configuration sequence.  
The configuration sequence specifies how DataPower implements the APIs that are defined in API Connect.
- a. Search for Configuration sequence in the navigation search bar, and select it.
  - b. Select Add.
  - c. Enter a name for your configuration sequence.  
The name `apic-config` is not allowed because it is already used internally.
  - d. Ensure that the Administrative state has a value of enabled.
  - e. Ensure that the value in the Location profiles field is set to local:///.  
This is the default value, so you might not need to change it.
  - f. Select the Access profile.  
For instructions on creating access profiles, see [Configuring the access profile for a configuration sequence](#) in the DataPower Gateway Knowledge Center.
  - g. Change the value of the Configuration execution interval field to 3000.  
The other fields can retain their default settings.
  - h. Select Apply to commit your changes.
14. Configure your gateway peering object for the API Connect Gateway Service.  
This step is required when you set up a peer group of gateways, even if there is only a single gateway server in the gateway service.
- a. Search for Gateway peering in the navigation search bar, and select it.
  - b. Select Add.
  - c. Enter a unique name for your gateway peering object.
  - d. Ensure that the Administrative state has a value of enabled.
  - e. Select a local address for the communications among the members of the peer group.
  - f. Select a local port for the communication.  
You can use the default value of 16380.
  - g. Select a monitor port for the communication.  
You can use the default value of 26380.
  - h. Because this procedure uses only one gateway, ensure that Peer group mode is not selected.
  - i. Clear the Enable TLS check box. TLS is not needed for a single peer.
  - j. Set the Persistence location value to **Memory** for either physical DataPower appliance or virtual DataPower appliance.
  - k. Select Apply to commit your changes.
15. Configure your gateway peering object for rate limit information.
- a. Search for Gateway peering in the navigation search bar, and select it.
  - b. Select Add.
  - c. Enter a unique name for your gateway peering object.
  - d. Ensure that the Administrative state has a value of enabled.
  - e. Select a local address for the communications among the members of the peer group.
  - f. Select a local port for the communication.  
Use a unique port, different than the ports used for communication by other gateway peering objects.
  - g. Select a monitor port for the communication.  
Use a unique port, different than the ports used for monitoring by other gateway peering objects.
  - h. Because this procedure uses only one gateway, ensure that Peer group mode is not selected.
  - i. Clear the Enable TLS check box. TLS is not needed for a single peer.
  - j. Set the Persistence location value to **Memory** for either physical DataPower appliance or virtual DataPower appliance.
  - k. Select Apply to commit your changes.
16. Optional: If you are using the [ratelimit module](#) described in the DataPower documentation, configure your gateway peering object for GatewayScript rate limiting information.
- a. Search for Gateway peering in the navigation search bar, and select it.
  - b. Select Add.
  - c. Enter a unique name for your gateway peering object.
  - d. Ensure that the Administrative state has a value of enabled.
  - e. Select a local address for the communications among the members of the peer group.
  - f. Select a local port for the communication.  
Use a unique port, different than the ports used for communication by other gateway peering objects.
  - g. Select a monitor port for the communication.  
Use a unique port, different than the ports used for monitoring by other gateway peering objects.
  - h. Because this procedure uses only one gateway, ensure that Peer group mode is not selected.
  - i. Clear the Enable TLS check box. TLS is not needed for a single peer.
  - j. Set the Persistence location value to **Memory** for either physical DataPower appliance or virtual DataPower appliance.
  - k. Select Apply to commit your changes.
17. Configure your gateway peering object for subscription information.
- a. Search for Gateway peering in the navigation search bar, and select it.
  - b. Select Add.
  - c. Enter a unique name for your gateway peering object.
  - d. Ensure that the Administrative state has a value of enabled.
  - e. Select a local address for the communications among the members of the peer group.
  - f. Select a local port for the communication.

- Use a unique port, different than the ports used for communication by other gateway peering objects.
  - g. Select a monitor port for the communication.
    - Use a unique port, different than the ports used for monitoring by other gateway peering objects.
  - h. Because this procedure uses only one gateway, ensure that Peer group mode is not selected.
  - i. Clear the Enable TLS check box. TLS is not needed for a single peer.
  - j. Set the Persistence location value to **Memory** for either physical DataPower appliance or virtual DataPower appliance.
  - k. Select Apply to commit your changes.
18. Configure the gateway peering object for the API probe.
- In order for API Connect to receive trace data in the Test tab's debugger, the DataPower API Gateway must be configured to support the API probe.
- a. Search for Gateway peering in the navigation search bar, and select it.
  - b. Select Add.
  - c. Enter a unique name for your gateway peering object.
  - d. Ensure that the Administrative state has a value of enabled.
  - e. Select a local address for the communications among the members of the peer group.
  - f. Select a local port for the communication.
    - Use a unique port, different than the ports used for communication by other gateway peering objects.
  - g. Select a monitor port for the communication.
    - Use a unique port, different than the ports used for monitoring by other gateway peering objects.
  - h. Because this procedure uses only one gateway, ensure that Peer group mode is not selected.
  - i. Clear the Enable TLS check box. TLS is not needed for a single peer.
  - j. Set the Persistence location value to **Memory** for either physical DataPower appliance or virtual DataPower appliance.
  - k. Select Apply to commit your changes.
19. Configure the gateway peering manager.
- a. Search for Gateway Peering Manager in the navigation search bar, and select it.
  - b. Set the Administrative state to enabled.
  - c. In the pull-down menu next to API Connect Gateway Service, select the gateway peering object configured in Step 14 for the API Connect Gateway Service.
  - d. In the pull-down menu next to Rate Limit, select the gateway peering object configured in Step 15 for rate limit information.
  - e. In the pull-down menu next to Subscription, select the gateway peering object configured in Step 17 for subscription.
  - f. In the pull-down menu next to API Probe, select the gateway peering object that you configured in Step 18 for the API probe.
  - g. If you are using the [ratelimit module](#) described in the DataPower documentation, then for Gateway rate limiting, select the gateway peering object that you configured in Step 16 for rate limit information.
  - h. Select Apply to commit your changes.
20. Configure the API probe settings object.
- a. Search for API probe settings in the navigation search bar, and select it.
  - b. Set the Administrative state to enabled.
  - c. Set the maximum number of records to 1000.
  - d. Set the expiration to 60 minutes.
  - e. In the pull-down menu next to Gateway Peering, select the gateway peering object that you configured in Step 18 for the API probe.
  - f. Select Apply to commit your changes.
21. Set the API Connect Gateway service to define the communication interface with the API Connect Management server and for API transactions.
- a. Search for API Connect Gateway service in the navigation search bar, and select it.
  - b. Ensure that the Administrative state is set to enabled.
  - c. In the Local address field, enter the IP address of the DataPower gateway to which you want the traffic from the API Connect Management server to be sent.
  - d. Specify a value for Local port. You can use the default value of 3000, or specify a different port value.
 

Note: The Local port specifies the port through which API Connect connects to manage the API Connect Gateway Service. Use this port when you configure a Gateway Service on API Connect. Beyond this port, the gateway service uses two additional consecutive ports after the defined local port to bind to a loopback address. Therefore, you must ensure that there are no conflicts on all three consecutive ports that start from the defined local port.
  - e. In the TLS client field drop-down list, select the name of the TLS client profile that you created.
  - f. In the TLS server field drop-down list, select the name of the TLS server profile that you created.
  - g. In the API gateway address field, enter the IP address for the DataPower gateway to which you want the API traffic sent.
  - h. Use the default port value of 9443 for the API gateway port.
 

If the port is not being used by another service, you can also change it to port 443 if you want API transactions to be sent to the default port for HTTPS.
  - i. For DataPower API Gateway, set the Gateway Peering to **(none)**.
 

When no gateway peering object is configured for the DataPower API Gateway, the peering configuration defined in the Gateway Peering Manager configuration is used.
  - j. Select whether you want the DataPower Gateway (v5 compatible) or the DataPower API Gateway.
 

When the option is selected, it enables the registration of a DataPower Gateway (v5 compatible) gateway. Clear it to enable a DataPower API Gateway.
22. Register the gateway service in the API Connect Cloud Manager console:
- a. Open the API Connect Cloud Manager console.
  - b. Navigate to Configure Topology.
  - c. Select Register Service.
  - d. Select DataPower API Gateway for the DataPower API Gateway.
  - e. Add a title, name, and summary for the gateway connection.
  - f. Optional: Configure the OAuth Shared Secret.
 

This setting allows OAuth tokens to be shared across multiple gateway services.
  - g. Enter one of the following values in the API Invocation Endpoint field:
    - IP address of the load balancer for the API transactions
    - IP address or host name of one of the gateways

For example: `https://192.0.2.0:9443/`
  - h. Enter the one of the following values in the Management Endpoint field:
    - IP address of the load balancer for the management server traffic set to port 3000
    - IP address or hostname of one of the gateways

For example: `https://192.0.2.0:3000/`
23. Select the default TLS Client Profile
24. Optional: Configure Server Name Indication (SNI) profiles.
- SNI profiles allow different TLS certificates to be used for API transaction requests from different host names.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring DataPower Gateway (v5 compatible)

You can configure the DataPower® Gateway (v5 compatible) to prepare for a registration with the API Connect Management server.

### Before you begin

---

- These instructions are for DataPower API Gateway deployments in a non-Kubernetes environment. Do not use these instructions if you installed API Connect on Kubernetes, with your DataPower API Gateway Service also in the Kubernetes environment. To review deployment scenarios, see [Deploying DataPower Gateway](#).
- Ensure you have installed a version of DataPower API Gateway that is compatible with the version of the API Connect Management server. See [Installing DataPower Gateway](#).
- A shared certificate and private key is used for securing the communication between the API Connect Management server and the gateway. See [Generating keys and certificates](#) in the DataPower Gateway IBM documentation for instructions on how to create them with the DataPower tools.
- Ensure that the time zone for the DataPower API Gateway is set to UTC.

### About this task

---

- These instructions provide the basic steps for configuring a gateway service with a single gateway server. The lowest-level configuration objects are created first, then used in other configuration objects.
- Adding gateways to configure a peering environment is similar to creating the first gateway, and is recommended for resiliency in a production environment. A minimum of three gateway servers in a gateway service is recommended for high availability. See [Gateway peering](#) for more information about configuring additional gateways for peering. See [Providing gateway service for API Connect](#) in the DataPower Gateways IBM Knowledge Center content for more details about the DataPower settings and procedures.

### Procedure

---

To configure a DataPower gateway to communicate with API Connect, complete the following steps:

Note: Use these instructions only for DataPower Gateway (v5 compatible). If you are configuring DataPower API Gateway, see [Configuring DataPower API Gateway](#).

1. Open the DataPower WebGUI interface.  
Most of the configuration procedure is done in the DataPower WebGUI interface, not in the Blueprint Console.
2. Enable the XML management interface in the **default** domain, if required. The XML management interface is required for DataPower Gateway (v5 compatible). The XML management interface is optional for DataPower API Gateway.
  - a. Search for **XML management interface** in the navigation search bar, and select it.
  - b. Set the Administrative state to enabled.
  - c. You can specify a different port number if you do not want to use the default of **5550**.
  - d. Select Apply to make the changes
  - e. Save changes to the default domain by selecting Save Configuration.
3. Create an application domain.  
This domain receives your traffic.
  - a. Search for Application domain in the navigation search bar, and select it.
  - b. Select Add to create the application domain.
  - c. Enter a unique name for your domain.
  - d. Ensure that enabled is selected for the Administrative state.
  - e. Ensure that the default domain is listed in the Visible application domain list.
  - f. Select Apply.
  - g. Change to your new application domain by selecting Domain in the menu bar, and selecting the domain that you created.
  - h. Select Save changes and switch domains.  
All of the remaining steps on the DataPower gateway must be done in the application domain that you created.
  - i. Save changes to the domain by selecting Save Configuration.
4. For the DataPower Gateway (v5 compatible) only: Enable statistics in the domain you created for **API Connect**.
  - a. Search for and select Statistics settings in the navigation search.
  - b. Select enabled for the Administrative state.
  - c. Select Apply.
5. Ensure that your deployment includes an NTP server to synchronize time between each of the DataPower Gateways.  
See [Managing the NTP service](#).
6. Ensure that you have set a unique **System Identifier** for each v10 DataPower gateway. See [Initializing the DataPower Gateway](#).
7. Create a self-signed certificate and private key to be used to protect the traffic between the management server and the API gateway service process. You can generate a certificate and private key using DataPower or by using other tools, such as **OpenSSL**. See [Generating keys and certificates](#) in the DataPower Gateway IBM documentation for instructions on how to create a crypto key with the DataPower tools.
8. Upload your private crypto key file to the domain.
  - a. Search for Crypto key in the navigation search bar, and select it.
  - b. Select Add to create a key object.
  - c. Create a unique name for the key object in the Name field.
  - d. Select Upload....
  - e. Browse for the key file (which must be a .pem or .p12 file) and select it.
  - f. If you want to rename it, enter a new name for the file.
  - g. Select Upload to move it to the server in the cert:// folder.
  - h. Select Apply to save the changes.
9. Upload your crypto certificate file to the domain.  
Note: If your certificate is signed by an Intermediate CA, you must include the entire chain in a single key file (either .pem or .p12) for uploading.
  - a. Search for Crypto certificate in the navigation search bar, and select it.

- b. Select Add to create a certificate object.
  - c. Create a unique name for the certificate object in the Name field.
  - d. Select Upload....
  - e. Browse for the key file (which must be a .pem or .p12 file) and select it.
  - f. If you want to rename it, enter a new name for the file.
  - g. Select Upload to move it to the server in the cert:// folder.
  - h. Select Apply to save the changes.
10. Associate the Crypto key with the Crypto certificate by setting the Identification credential.
    - a. Search for Crypto Identification Credentials in the navigation search bar, and select it.
    - b. Select Add.
    - c. Enter a name for your credential.
    - d. Ensure that the Administrative state has a value of enabled.
    - e. In the Crypto Key field, select the name of the key object that you created from the drop-down menu.
    - f. In the Certificate object field, select the name of the certificate object that you created from the drop-down menu.
    - g. Select Apply to commit your changes.
  11. Create your TLS Client profile.
    - a. Search for TLS Client profile in the navigation search bar, and select it.
    - b. Select Add to create a client profile.
    - c. Create a unique name for the profile in the Name field.
    - d. Select your Identification credential from the drop-down list.
    - e. Ensure that the value of Validate server certificate is set to off.
    - f. Ensure that the value of Use SNI is set to on.
    - g. Select Apply to save the changes.
  12. Create your TLS Server profile.
    - a. Search for TLS Server Profile in the navigation search bar, and select it.
    - b. Select Add to create a server profile.
    - c. Create a unique name for the profile in the Name field.
    - d. Select your Identification credential from the drop-down list.
    - e. Ensure that the value of Request client authentication is set to off.  
Disabling the request for client authentication for the TLS client profile and the validation of server certificates for the TLS server profile disables security for the ease of configuring the gateway. To enable the secure communication using mutual TLS between IBM API Connect and Gateway, see [Binding a TLS server profile to a gateway service](#).
    - f. Select Apply to save the changes.
  13. Configure your gateway peering object for the API Connect Gateway Service.  
This step is required when you set up a peer group of gateways, even if there is only a single gateway server in the gateway service.
    - a. Search for Gateway peering in the navigation search bar, and select it.
    - b. Select Add.
    - c. Enter a unique name for your gateway peering object.
    - d. Ensure that the Administrative state has a value of enabled.
    - e. Select a local address for the communications among the members of the peer group.
    - f. Select a local port for the communication.  
You can use the default value of 16380.
    - g. Select a monitor port for the communication.  
You can use the default value of 26380.
    - h. Because this procedure uses only one gateway, ensure that Peer group mode is not selected.
    - i. Clear the Enable TLS check box. TLS is not needed for a single peer.
    - j. Set the Persistence location value to **Memory** for either physical DataPower appliance or virtual DataPower appliance.
    - k. Select Apply to commit your changes.
  14. Set the API Connect Gateway service to define the communication interface with the API Connect Management server and for API transactions.
    - a. Search for API Connect Gateway service in the navigation search bar, and select it.
    - b. Ensure that the Administrative state is set to enabled.
    - c. In the Local address field, enter the IP address of the DataPower gateway to which you want the traffic from the API Connect Management server to be sent.
    - d. Use the default port value of 3000 for the Local port.
    - e. In the TLS client field drop-down list, select the name of the TLS client profile that you created.
    - f. In the TLS server field drop-down list, select the name of the TLS server profile that you created.
    - g. In the API gateway address field, enter the IP address for the DataPower gateway to which you want the API traffic sent.
    - h. Use the default port value of 9443 for the API gateway port.  
If the port is not being used by another service, you can also change it to port 443 if you want API transactions to be sent to the default port for HTTPS.
    - i. For DataPower Gateway (v5 compatible), select the gateway peering object that you created in Step [13](#).
    - j. Select whether you want the DataPower Gateway (v5 compatible) or the DataPower API Gateway.  
When the option is selected, it enables the registration of a DataPower Gateway (v5 compatible) gateway.
  15. Register the gateway service in the API Connect Cloud Manager console:
    - a. Open the API Connect Cloud Manager console.
    - b. Navigate to Configure Topology.
    - c. Select Register Service.
    - d. Select DataPower Gateway (v5 compatible) for the gateway that was available in version 5.
    - e. Add a title, name, and summary for the gateway connection.
    - f. Optional: Configure the OAuth Shared Secret.  
This setting allows OAuth tokens to be shared across multiple gateway services.
    - g. Enter one of the following values in the API Invocation Endpoint field:
      - IP address of the load balancer for the API transactions
      - IP address or host name of one of the gateways
 For example: `https://192.0.2.0:9443/`
    - h. Enter the one of the following values in the Management Endpoint field:
      - IP address of the load balancer for the management server traffic set to port 3000
      - IP address or hostname of one of the gateways
 For example: `https://192.0.2.0:3000/`
  16. Select the default TLS Client Profile
  17. Optional: Configure Server Name Indication (SNI) profiles.

SNI profiles allow different TLS certificates to be used for API transaction requests from different host names.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Sample configuration for multiple peering objects on gateway services external to Kubernetes

Sample for reconfiguring the API Connect domain configuration for your gateway services to include multiple peering objects.

- This reference shows how to configure API Connect domain configuration with gateway-peering configuration. To review domain configuration settings, see [Configuring DataPower Gateway for API Connect](#).
- This sample applies only to gateway services that are deployed external to Kubernetes, on either a physical or virtual appliance. This sample does not apply to gateway services that are deployed on Kubernetes.

The following examples show sample configuration for 3 different gateways, listed here with sample IP addresses of 1.1.1.1, 2.2.2.2, and 3.3.3.3. Note the following:

- The priority should be set differently on each of the three gateways. Set the lowest priority for the gateway that will run as primary.
- **persistence** should be set to **memory** for all configured peering objects.
- Optionally, add SSL configuration.

Configuration on gateway 1 (1.1.1.1)

```
top; configure terminal;

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Post-deployment steps

When all subsystems are deployed, use the admin account to access the Cloud Manager administrative console and begin configuration. Optionally, take VMware snapshots of the VMs.

## About this task

When you have deployed all required API Connect components, and all subsystems are running, complete the following:

## Procedure

1. If you have not previously accessed the Cloud Manager, verify you can access the API Connect Cloud Manager. Enter the URL in your browser. The syntax is `https://<hostname.domain>/admin`. For example:

```
https://cloud-admin-ui.testsrv0231.subnet1.example.com/admin
```

The first time that you access the Cloud Manager user interface, you enter `admin` for the user name and `7iron-hide` for the password. You will be prompted to change the Cloud Administrator password and email address. See [Accessing the Cloud Manager user interface](#).

2. Define your API Connect configuration by using the API Connect Cloud Manager. See [Cloud Manager configuration checklist](#).
3. Optional: Take a Virtual Machine (VM) snapshot of all your VMs; see [Using VM snapshots for infrastructure backup and disaster recovery](#) for details. This action does require a brief outage while all of the VMs in the subsystem cluster are shut down - do not take snapshots of running VMs, as they might not restore successfully. VM snapshots can offer a faster recovery when compared to redeploying OVA's and restoring from normal backups. Important: VM snapshots are not an alternative to the standard API Connect backups. You should have completed an API Connect backup of each subsystem when verifying initial deployment, as advised in:
  - [Verify installation of the management subsystem](#)
  - [Verifying deployment of the Developer Portal subsystem](#)
  - [Verifying deployment of the Analytics subsystem](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading API Connect

Upgrade API Connect on VMware to a newer version.

After reviewing the overview, use the procedures in this section to upgrade API Connect on VMware.

Note:

- For upgrading from v5, see [Migrating a Version 5 deployment](#).
- For information about how to maintain a two data center deployment, including upgrade considerations, see [Maintaining a two data center deployment](#).
- **Upgrade considerations on VMware**  
Before upgrading API Connect on VMware, ensure that your deployment meets all the upgrade requirements.
- **Upgrading to the latest release on VMware**  
You can upgrade API Connect on VMware.
- **Upgrading DataPower Gateway Service**  
Use these instructions when upgrading DataPower Gateway Service in a non-Kubernetes environment, during upgrade of API Connect.
- **Enabling Analytics after upgrading**  
After the upgrade successfully completes, enable the Analytics message queue and restart Analytics data collection.
- **Troubleshooting upgrades on VMware**  
Review the following troubleshooting guidance if you encounter a problem while upgrading API Connect on VMware.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Upgrade considerations on VMware

Before upgrading API Connect on VMware, ensure that your deployment meets all the upgrade requirements.

Contents:

- [Supported upgrade paths](#)
- [Upgrade requirements](#)
- [Disable Analytics data collection before upgrading](#)
- [Disable the Analytics message queue feature before upgrading](#)
- [Requirement: Validating an API definition file with the API Dev Tools Swagger Parser](#)
- [Limitation: x-ibm-gateway-cors-allow-credentials-when-no-cors-policy API property is deprecated](#)

## Supported upgrade paths

Restriction: A direct upgrade from any version of 10.0.4.x to API Connect 10.0.6.0 or later is not supported. You must upgrade to 10.0.5.x as an interim step before upgrading to 10.0.6.0.

Table 1. Supported upgrade paths

| Upgrade from:                                                                                                                                                                                                                                                                                  | How to upgrade to 10.0.4.0-ifix3:                         |

This procedure is required to upgrade the management database and to deploy VMs with Ubuntu 20.4.</li> <li><a href="#">Upgrading to the latest release on VMware</a></li> </ol> |

## Upgrade requirements

- The instructions for upgrading apply to the *latest* version of the API Connect continuous delivery (CD) stream. Ensure that you are upgrading to the latest version. For information on the available versions, see [What's New in the latest release](#).
- Before starting the upgrade, verify that API Connection deployment is fully operational. See [Checking cluster health on VMware](#). This step is optional because a health check will be run automatically as part of the `apicup subsys install` command. Note that you might still want to run the health check when preparing for the upgrade, to ensure the health of the backup image you must create prior to running `apicup subsys install`.
- When upgrading API Connect, complete a manual backup of the management database and Portal subsystem just prior to starting the upgrade. Note that this backup is in addition to any scheduled backups that you have configured. The manual backup ensures that any data changes that occurred after the most recent scheduled backup are captured. For details on creating a backup, see [Backing up and restoring the management subsystem](#) and [Backing up and restoring the Developer Portal](#). If upgrading from a long term support release, such as 10.0.1.2-ifix2-eus, see [Backing up and restoring \(10.0.1.1 or later\)](#).

- Backup the Postgres images on one of the Management Server VMs following the steps below:

```
SSH to one of the Management Server VMs:
ssh <ip_address of management vm> -l apicadm
Sudo to root:
sudo -i
```

Run the following commands:

```
postgres_operator=$(kubectl get pod -l app.kubernetes.io/name=postgres-operator -o name)

docker pull `kubectl get $postgres_operator -o jsonpath='{.spec.containers[].env[?(@.name=="RELATED_IMAGE_PGO_RMDATA")].value}'`
docker save `kubectl get $postgres_operator -o jsonpath='{.spec.containers[].env[?(@.name=="RELATED_IMAGE_PGO_RMDATA")].value}'` -o rmdata.tar
docker save `kubectl get $postgres_operator -o jsonpath='{.spec.containers[].env[?(@.name=="RELATED_IMAGE_PGO_BACKREST_REPO")].value}'` -o backrestrepo.tar
docker save `kubectl get $postgres_operator -o jsonpath='{.spec.containers[].env[?(@.name=="RELATED_IMAGE_CRUNCHY_PGBOUNCER")].value}'` -o pgbouncer.tar
docker save `kubectl get $postgres_operator -o jsonpath='{.spec.containers[].env[?(@.name=="RELATED_IMAGE_CRUNCHY_POSTGRES_HA")].value}'` -o postgres-ha.tar

postgres_pod=$(kubectl get pod -l role=master -o name)
docker save `kubectl get $postgres_pod -o jsonpath='{.spec.initContainers[].image}'` -o k8s-init.tar
```

- Ensure that port 9178 is open between the Analytics, Management, and Portal subsystems and the system running `apicup`. An i/o timeout error can occur if the firewall rejects traffic to the appliance. Make sure port 9178 is open and try again. Example error message:

```
apicup subsys install test-analytics upgrade_analytics_lts_v10.0.1.0.tgz
INFO[0000] Preparing update
INFO[0010] Sending update packet to cluster (connected to testsrv0192.subnet1.example.com)
Error: failed to install the subsystem: unable to open file send stream:
rpc error: code = Unavailable desc = all SubConns are in TransientFailure,
latest connection error: connection error:
desc = "transport: Error while dialing dial tcp 1.2.3.4:9178: i/o timeout"
```

- If not already set up, send your deployment logs to a remote server. The upgrade process terminates pods, and the logs will be lost if not stored remotely. To send your deployment logs to a remote server, see [Configuring remote logging for a VMware deployment](#).
- Download the Install Assist (`apicup`) installer from the same URL where you download your API Connect version. You must use the latest Install Assist package with the latest product version.
- The original project directory created with the `apicup` installer during the initial product installation (for example, `myProject`) is required to both restore the database and to upgrade your deployment. You cannot restore the database or perform an upgrade without the initial project directory because it contains pertinent information about the cluster. A good practice is to back up the original project directory to a location from which it can always be retrieved.
- If the upgrade is initiated from the original project directory, the certificates are automatically copied into the upgraded version. The original project directory contains the `apiconnect-up-v10.yml` file. An upgrade using the same project directory as the one used for installation will transfer the `encryption-secret` and all other certificates for the project to the upgraded version.
- All external traffic to the management server must be blocked during the upgrade of the management subsystem. This restriction applies to traffic from all sources via the user interfaces (Cloud Manager, API Manager), CLI, and REST API. The Cloud Manager and API Manager UIs cannot be used during the upgrade of the management subsystem. The Developer Portal also cannot be used to create, update, or delete any applications, subscriptions, memberships, or consumer organizations during the time.
- The upgrade order for subsystems is important. Upgrade the subsystems in the following order: (1) Management, (2) Portal, (3) Analytics, (4) Gateway. Management must be upgraded first. Gateway must be upgraded after Management because upgrading the Management service before the Gateway ensures that any new policies and capabilities will be available to a previously registered Gateway service.
- When maintaining API Connect, do not use `kubectl exec` commands to access API Connect pods unless advised by IBM. Do not make any changes on the deployed VMs unless documented here or otherwise advised by IBM. Attempting to manually update packages, adding new users, or installing new software will likely cause problems. Operating system updates are handled by API Connect fix packs.

## Disable Analytics data collection before upgrading

Temporarily [stop the Analytics data collection](#) to avoid losing event data during the upgrade. After the upgrade is complete, you can [start Analytics data collection](#) again.

## Disable the Analytics message queue feature before upgrading

If you enabled the analytics message queue feature, you must disable it before upgrading. You can re-enable the message queue feature after the profile change is complete.

To disable the message queue:

1. Edit the `analytics-extra-value.yaml` file.
2. Locate the `mq` subsection and change the `enabled` setting to `false`.

```
mq:
  enabled: false
```

3. Apply the change:

```
apicup subsys install <subsystem_name>
```

## Validating an API definition file with the API Dev Tools Swagger Parser

From IBM® API Connect Version 10.0.3.0 or later, SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 documents that form API definition files are now validated at stage or publish time by the API Dev Tools Swagger Parser. Before upgrading, you should ensure that your existing API definition files are parsable and considered valid by the Swagger Parser tool. Note that any API definitions that are already staged or published are not impacted, but would undergo Swagger Parser validation again should they be re-staged or re-published in the future.

You can use either of the following techniques to ensure that existing API definition files are parsable and considered valid by the Swagger Parser:

- Download and install the `swagger-parser-cli` tool (see <https://www.npmjs.com/package/swagger-cli>). This tool includes a `validate` command that can validate local API definition files against the SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 schemas, in both JSON and YAML formats.
- Use the browser-based Swagger Parser Validator available at <https://apitools.dev/swagger-parser/online/>; this accepts a URL to existing files available online, or can accept text copied and pasted into the tool, in both JSON and YAML formats. It can likewise validate against the SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 schemas.

Note: Staging or publishing an API in API Connect results in additional syntactic validation of IBM extensions to SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0, as well as semantic validation to make sure that policies and other resources that the API refers to are valid within the context of the staging or publishing operation. Any errors associated with this additional validation will not be caught by the local or online Swagger Parser tool, nor will they be caught by the `apic validate` toolkit CLI command.

The Swagger Parser tool will report an invalid OpenAPI document. For example, if a document is missing a mandatory section such as `info` or `paths`, the following error is reported:

```
[object Object] is not a valid Swagger API definition
```

If a required property is missing from a given section, a specific error is reported. For example, if the `info` section is missing the required `version` property, the following error is reported:

```
Swagger schema validation failed.
Missing required property: version at #/info
```

```
JSON_OBJECT_VALIDATION_FAILED
```

Additionally, if the document contains any local references (that is, values of `$ref` properties) that do not resolve to an existing reference within the document (known as de-referencing), this is also be flagged as an error. For example, if a document contains the following as a reference:

```
schema:
  $ref: '#/definitions/Pet'
```

then the definition of `Pet` (that is, `#/definitions/Pet`) **must** exist in the same document, at the given path (`definitions` section in this example), similar to the following:

```
definitions:
  Pet:
    type: object
    required:
    - name
    properties:
      id:
        type: integer
        format: int64
```

If the local reference is not found within the document, the following de-referencing error is reported:

```
Token "Pet" does not exist.
```

## x-ibm-gateway-cors-allow-credentials-when-no-cors-policy API property is deprecated

In v2018, when cross-origin resource sharing (CORS) is enabled for an API, every response to a CORS request contains the header:

```
Access-Control-Allow-Credentials: true
```

Inclusion of Access-Control-Allow-Credentials (ACAC) does not provide optimal security, so starting with v2018.4.1.17, an API property can be set to prevent this header from being returned:

**Name:** `x-ibm-gateway-cors-allow-credentials-when-no-cors-policy`  
**Collection:** `*`  
**Value (string):** `off`

The **Collection** property refers to a specific Catalog to which a property value applies. The "\*" value means the value applies to all catalogs. You can either specify \* or a Catalog (collection) name.

The property can also be set by using the DataPower CLI:

```
api-definition myAPI
  property x-ibm-gateway-cors-allow-credentials-when-no-cors-policy * off
exit
```

Important: The value of this property must be exactly the string `off` (case-sensitive) in order to remove the header.

It is only possible to turn off this header, or leave it on, for an entire API. In order to have more control, such as returning the header for some origins and not others, you must upgrade to v10 and use the CORS policy feature. For more info, see:

- [Enabling CORS support for an API](#)
- OpenAPI 3.0 editor: [Setting API properties](#)
- OpenAPI 2.0 editor: [Setting API properties](#)

In API Connect 10.0.3.0 or later, the `x-ibm-gateway-cors-allow-credentials-when-no-cors-policy` property works, but only for API definitions which do NOT contain a cors-policy. You cannot define both this property and a CORS Policy on the same API definition.

**This property is deprecated in v10:** a warning will be written to the log for every CORS request received by an API whose definition contains this property.

For v10, the recommended way to ensure the ACAC header does not appear in CORS responses is to add a CORS policy to the API definition. In v10, any API definition which has a cors-policy defined will NOT return the ACAC header by default. Note that it is possible in the CORS policy rules to explicitly return the ACAC header for some or all origins.

If you move your configuration from Version 2018 to 10.0.3.0 or later, and have this custom property defined in your API definitions, you will not see any change in behavior, other than new warnings in the log. This property will remove the ACAC header for any API definition where it appears.

Note: To upgrade from 2018 to 10.0.4.0-ifix3, you must first upgrade to 10.0.1.2-ifix2-eus, and then upgrade to 10.0.4.0-ifix3.

If, when you move your configuration from Version 2018 to Version 10, you want to have the ACAC header present in the CORS responses, you can leave the API definitions as-is (without the new property defined) and the ACAC header will be returned, as long as a cors-policy is not added to the API definition. Note also that even with a CORS policy defined for an API, the ACAC header can be returned if desired by explicitly allowing it in the rules of the CORS policy.

Note that the `x-ibm-gateway-cors-allow-credentials-when-no-cors-policy` property in an API definition:

- Will cause a commit-time error in v10 if a cors-policy is also present in the same API definition
- Will NOT work in v10 or v2018 to turn ON the ACAC header; it can ONLY be used to turn OFF the header. Explanation:
  - In v2018, ACAC is on by default
  - In v10, without cors-policy, ACAC is on by default
  - In v10, with cors-policy, ACAC can be turned on for specific origins via rules in cors-policy

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading to the latest release on VMware

You can upgrade API Connect on VMware.

### Before you begin

- Before starting an upgrade, review the supported upgrade paths from prior versions: [Upgrade considerations on VMware](#).
- Enable keep-alive in your SSH configuration to avoid problems during the upgrade. For information, consult the documentation for your version of SSH.
- The Gateway subsystem remains available during the upgrade of the Management, Portal, and Analytics subsystems.

### About this task

You can upgrade the Management subsystem, Developer Portal subsystem, and Analytics subsystem.

For the optional components API Connect Toolkit and API Connect Local Test Environment, you do not need to upgrade. For these components, install the new version of each after you upgrade the subsystems.

Important notes:

- When installing the new files, be sure to use the new `apicup` installer.
- The upgrade order for subsystems is important. Upgrade the subsystems in the following order: (1) Management, (2) Portal, (3) Analytics, (4) Gateway. Management must be upgraded first. Gateway must be upgraded after Management because upgrading the Management service before the Gateway ensures that any new policies and capabilities will be available to a previously registered Gateway service.
- When you run the install, the program sends the compressed tar file, which contains the upgrade images, to all cluster members. The compressed tar file is about 2 GB, and transfer can take some time. When the install command exits, the compressed tar file has arrived at each member. The upgrade process is now underway, and might continue for some time depending on factors such as the size of your deployment, your network speed, etc.
- The `apicup subsys install` command automatically runs `apicup health-check` prior to attempting the upgrade. An error is displayed if a problem is found that will prevent successful upgrade.

**Version 10.0.4.0 and later:** When troubleshooting a problem with an upgrade, you can optionally suppress the health check. See [Skipping health check when re-running upgrade](#).

- **Version 10.0.4.0 and later - Known issue:**The certificate manager was upgraded in API Connect version 10.0.4.0. If you are upgrading from a version earlier than 10.0.4.0, then after you trigger the upgrade from the `apim`, `lur`, and `taskmanager` pods will be in a CrashLoopBackoff state due to Postgres requiring a certificate refresh. Correct the problem by completing the following steps:

1. SSH into the server:

- a. Run the following command to connect as the API Connect administrator, replacing `ip_address` with the appropriate IP address:

```
ssh ip_address -l apicadm
```

- b. When prompted, select Yes to continue connecting.

- c. When you are connected, run the following command to receive the necessary permissions for working directly on the appliance:

```
sudo -i
```

2. Run the following command to delete the Postgres pods, which refreshes the new certificate:

```
kubectl get pod --no-headers=true | grep postgres | grep -v backup | awk '{print $1}' | xargs kubectl delete pod
```

Important: Upon successful completion of each subsystem upgrade, restart as required:

1. For each subsystem, the upgrade process automatically runs `apicup health-check` upon completion of the upgrade. When `apicup health-check` gives a message that reboot is required for a server, SSH onto that server and check the subsystem custom resource status:

```
kubectl get <name_of_cr>
```

For example:

```
kubectl get managementCluster
```

If both `READY` is `True` and the `RECONCILED VERSION` shows the version you are upgrading to, then reboot that server.

2. During the upgrade, repeat this action for each subsystem when the message from `apicup subsys health-check` that says reboot is required for a server. However, if the health check command states that a reboot is required for the Portal subsystem, you must ensure that all of the Portal sites have been upgraded first before performing the reboot. See the instructions in Step 9 for details.

## Procedure

---

1. Complete the prerequisites:

- a. Ensure that your deployment meets the upgrade requirements. See [Upgrade considerations on VMware](#).
- b. Verify the API Connect deployment is healthy and fully operational. See [Checking cluster health on VMware](#).
- c. Remove any stale upgrade files:

```
apic clean-upgrade-files
```

- d. Verify sufficient free disk space.

For each appliance node that you are planning to upgrade:

- i. SSH into the appliance, and switch to user `root`.
- ii. Check disk space in `/data/secure`:

```
df -h /data/secure
```

Make sure the disk usage shown is below 70%. If it is not, add disk capacity. See [Adding disk space to a VMware appliance](#).

- iii. Check free disk space in `/`:

```
df -h /
```

Make sure usage is below 70%. If it is not, consider deleting or offloading older `/var/log/syslog*` files.

- e. Complete a manual backup of the API Connect subsystems. See the instructions for your scenario: .

- Upgrade from 10.0.1.2-eus and all of its ifixes: [Backing up and restoring \(10.0.1.1-eus or later\)](#).
- Upgrade from 10.0.2.0-eus or later: [Backing up and restoring on VMware](#)

Note:

- Do not start an upgrade if a backup is scheduled to run within a few hours.
- Do not perform maintenance tasks such as rotating key-certificates, restoring from a backup, or starting a new backup, at any time while the upgrade process is running.

2. Run the pre-upgrade health check:

- a. Run the health check on the Management subsystem:

- i. SSH into the server:

1. Run the following command to connect as the API Connect administrator, replacing `ip_address` with the appropriate IP address:

```
ssh ip_address -l apicadm
```

2. When prompted, select Yes to continue connecting.

3. When you are connected, run the following command to receive the necessary permissions for working directly on the appliance:

```
sudo -i
```

- ii. Verify that the `apicops` utility is installed.

- iii. Run the version check and verify that there are no errors:

```
apicops version:pre-upgrade
```

- iv. Run the appliance health check and verify that there are no errors:

```
apicops appliance-checks:appliance-pre-upgrade
```

- b. Run the health check on the Portal subsystem:
  - i. SSH into the server.
  - ii. Verify that the `apicops` utility is installed.
  - iii. Run the following command to check the system status, and verify that there are no errors:

```
apicops upgrade:check-subsystem-status
```

- iv. Run the appliance health check and verify that there are no errors:

```
apicops appliance-checks:appliance-pre-upgrade
```

- c. Run the health check on the Analytics subsystem:
  - i. SSH into the server.
  - ii. Verify that the `apicops` utility is installed.
  - iii. Run the following command to check the system status, and verify that there are no errors:

```
apicops upgrade:check-subsystem-status
```

- iv. Run the appliance health check and verify that there are no errors:

```
apicops appliance-checks:appliance-pre-upgrade
```

3. Optional: Take a Virtual Machine (VM) snapshot of all your VMs; see [Using VM snapshots for infrastructure backup and disaster recovery](#) for details. This action does require a brief outage while all of the VMs in the subsystem cluster are shut down - do not take snapshots of running VMs, as they might not restore successfully. VM snapshots can offer a faster recovery when compared to redeploying OVA's and restoring from normal backups. Important: VM snapshots are not an alternative to the standard API Connect backups that are described in the previous steps. You must complete the API Connect backups in order to use the API Connect restore feature.

4. Obtain the API Connect files:

You can access the latest files from [IBM Fix Central](#) by searching for the API Connect product and your installed version.

The following files are used during upgrade on VMware:

IBM® API Connect <version> Management Upgrade File for VMware  
Management subsystem files for upgrade  
IBM® API Connect <version> Developer Portal Upgrade File for VMware  
Developer Portal subsystem files for upgrade  
IBM® API Connect <version> Analytics Upgrade File for VMware  
Analytics subsystem files for upgrade  
IBM® API Connect <version> Install Assist for <operating\_system\_type>  
The apicup installation utility. Required for all installations on VMware.

The following files are not used during upgrade, but can be installed as new installations used to replace prior versions

IBM® API Connect <version> Toolkit for <operating\_system\_type>  
Toolkit command line utility. Packaged standalone, or with API Designer or Loopback:

- IBM® API Connect <version> Toolkit for <operating\_system\_type>
- IBM® API Connect <version> Toolkit with Loopback for <operating\_system\_type>
- IBM® API Connect <version> Toolkit Designer with Loopback for <operating\_system\_type>

Not required during initial installation. After installation, you can download directly from the Cloud Manager UI and API Manager UI. See [Installing the toolkit](#).

IBM® API Connect <version> Local Test Environment  
Optional test environment. See [Testing an API with the Local Test Environment](#)  
IBM® API Connect <version> Security Signature Bundle File  
Checksum files that you can use to verify the integrity of your downloads.

5. Verify that the subsystem upgrade files are not corrupted.
  - a. Run the following command separately for the Management, the Developer Portal, and the Analytics upgrade files:

- Mac or Linux:

```
sha256sum <upgrade-file-name>
```

Example:

```
sha256sum upgrade_management_v10.0.4.0-ifix3
```

- Windows:

```
C:\> certUtil -hashfile C:\<upgrade-file-name> SHA256
```

Example:

```
C:\> certUtil -hashfile C:\upgrade_management_v10.0.4.0-ifix2 SHA256
```

- b. Compare the result with the checksum values to verify that the files are not corrupted.  
If the checksum does not match the value for the corresponding version and subsystem, then the upgrade file is corrupted. Delete it and download a new copy of the upgrade file. The following list shows the checksum values for the current release. If you are upgrading to an older release, see [Checksum values for earlier releases](#).

Checksum values for 10.0.4.0-ifix3:

```
v10.0.4.0-ifix3 analytics : db742d6c01a8d2f147c7c455a93395d92cc97255b847f5699fff07cd9808fd19  
v10.0.4.0-ifix3 management : 8f23cd4f295362ec64ecfc29d0a7c9d67f1f09d3893b6707b0b3075c88f54a6a  
v10.0.4.0-ifix3 portal : 7f5e29e5c1f3fb17e4b719d421a02b50d9052e3b9afeb66450bdb8a773c2b48
```

6. If necessary, download from the same Fix Pack page any Control Plane files that are needed.

Control Plane files provide support for specific Kubernetes versions. The **IBM® API Connect <version> Management Upgrade File for VMware** file contains the latest Control Plane file. An upgrade from the most recent API Connect version to the current version does not need a separate Control Plane file. However, when upgrading from older versions of API Connect, you must install one or more control plane files to ensure that all current Kubernetes versions are supported.

Consult the following table to see if your deployment needs one or more separate Control Plane files.

Table 1. Control Plane files needed for upgrade

| Version to upgrade from                                                                                                                                                                                                          | Instructions for upgrading to 10.0.4.0-ifix3             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <ul style="list-style-type: none"> <li>10.0.4.0-ifix2</li> <li>10.0.4.0-ifix1</li> <li>10.0.4.0</li> </ul>                                                                                                                       | No control plane file is needed.                         |
| <ul style="list-style-type: none"> <li>10.0.3.0-ifix1</li> <li>10.0.3.0</li> </ul>                                                                                                                                               | No control plane file is needed.                         |
| <ul style="list-style-type: none"> <li>10.0.2.0-ifix2</li> <li>10.0.2.0-ifix1</li> <li>10.0.2.0</li> </ul>                                                                                                                       | Download <code>appliance-control-plane-1.21.x.tgz</code> |
| <ul style="list-style-type: none"> <li>10.0.1.5-ifix4-eus</li> <li>10.0.1.5-ifix3-eus</li> <li>10.0.1.5-ifix2-eus</li> <li>10.0.1.5-ifix1-eus</li> <li>10.0.1.5-eus</li> <li>10.0.1.4-eus</li> <li>10.0.1.4-ifix1-eus</li> </ul> | No control plane file is needed.                         |
| <ul style="list-style-type: none"> <li>10.0.1.2-ifix2-eus</li> <li>10.0.1.2-ifix1-eus</li> <li>10.0.1.2-eus</li> </ul>                                                                                                           | Download <code>appliance-control-plane-1.21.x.tgz</code> |

7. Install the installation utility.

- Locate the apicup installation utility file for your operating system, and place it in your project directory
- Rename the file for your OS type to `apicup`. Note that the instructions in this documentation refer to `apicup`.
- OSX and Linux® only: Make the apicup file an executable file by entering `chmod +x apicup`.
- Set your path to the location of your apicup file.

|               |                                                   |
|---------------|---------------------------------------------------|
| OSX and Linux | <code>export PATH=\$PATH:/Users/your_path/</code> |
| Windows       | <code>set PATH=c:\your_path;%PATH%</code>         |

- From within your project directory, specify the API Connect license:

```
apicup licenses accept <License_ID>
```

The `<License_ID>` is specific to the API Connect Program Name you purchased. To view the supported license IDs, see [API Connect licenses](#).

8. Upgrade the management subsystem:

- Perform the upgrade on the management subsystem:
  - Install the management subsystem files.

```
apicup subsys install <subsystem_name> <subsystem_upgrade_tar_archive>
```

- Verify that the upgrade was successful.

```
apicup subsys health-check <subsys_name>
```

If `apicup` returns an error, see: [Postgres pods fail to start after upgrade](#)

- Reboot the subsystem when the health check command displays a message instructing you to do so. See [Reboot steps](#).
- After reboot for the management cluster, if a stancluster pod does not return to 1/1 **Running** status, see [Workaround for non-ready stancluster pods after upgrade](#).

- Use `apicops` to validate the certificates.

For information on the `apicops` tool, see [The API Connect operations tool: apicops](#).

- Run the following command:

```
apicops upgrade:stale-certs -n <namespace>
```

- Delete any stale certificates that are managed by cert-manager.

If a certificate failed the validation and it is managed by cert-manager, you can delete the stale certificate secret, and let cert-manager regenerate it. Run the following command:

```
kubectl delete secret <stale-secret> -n <namespace>
```

- Restart the corresponding so that it can pick up the new secret.

To determine which pod to restart, see the following topics:

- [List of external certificates](#)
- [List of internal certificates](#)

9. Upgrade the Portal subsystem.

- Install the Portal subsystem files:

```
apicup subsys install <subsystem_name> <subsystem_upgrade_tar_archive>
```

- Verify that the upgrade was successful.

```
apicup subsys health-check <subsys_name>
```

Important: If the health check command states that a reboot is required, you must ensure that all Portal sites have been upgraded first before performing the reboot. To check that the Portal sites have upgraded, inspect the `platform` and `state` values for each site. The sites should all be in **INSTALLED** state, and have `platform` equal to the new platform that you can identify with `platforms: list`. Note that there will be two platforms present in the list while the

site upgrades are happening. There should be only one **platform** after they have completed. Use the commands in Step [9.c](#) to list the sites, and then reboot.

If **apicup** returns an error, see [Upgrading a 3 node profile to IBM API Connect 10.0.3.0 or later might result in some portal-db/www pods being stuck in the Pending state](#).

c. Ensure that the Portal sites were upgraded:

i. Use the toolkit **apic** to obtain the portal service id and endpoint:

```
apic portal-services:get -o admin -s <management_server_endpoint> \  
--availability-zone availability-zone-default <portal-service-name> \  
--output - --format json
```

ii. List the sites:

```
apic --mode portaladmin sites:list -s <management_server_endpoint> \  
--portal_service_id <portal_service_id_from_above_command> \  
--portal_service_endpoint <portal_service_endpoint_from_above_command> \  
--format json
```

Any sites currently upgrading will be listed as **UPGRADING**. Once all sites have finished upgrading they should have the **INSTALLED** status and the new platform version listed.

See also: [apic sites:list](#) and [Using the sites commands](#).

iii. After all sites are in **INSTALLED** state and have the new platform listed, run:

```
apic --mode portaladmin platforms:list -s <management_server_endpoint> \  
--portal_service_id <portal_service_id_from_above_command> \  
--portal_service_endpoint <portal_service_endpoint_from_above_command> \  
--format json
```

The new version of the platform should be the only platform listed.

See also: [apic platforms:list](#) and [Using the platforms commands](#).

d. Reboot the subsystem when the health check command displays a message instructing you to do so. See [Reboot steps](#).

10. Upgrade the Analytics subsystem

a. Install the Analytics subsystem files:

```
apicup subsys install <subsystem_name> <subsystem_upgrade_tar_archive>
```

b. Verify that the upgrade was successful.

```
apicup subsys health-check <subsys_name>
```

c. Reboot the subsystem when the health check command displays a message instructing you to do so. See [Reboot steps](#).

11. Complete a manual backup of the API Connect subsystems. See [Backing up and restoring on VMware](#).

12. Optional: Take a Virtual Machine (VM) snapshot of all your VMs; see [Using VM snapshots for infrastructure backup and disaster recovery](#) for details. This action requires a brief outage while all of the VMs in the subsystem cluster are shut down - do not take snapshots of running VMs, as they might not restore successfully.

13. Complete disaster preparation steps, to ensure recovery of API Connect from a disaster event. See [Preparing for a disaster](#).

## What to do next

When you have upgraded all of the API Connect subsystems, upgrade your DataPower Gateway Service. See [Upgrading DataPower Gateway Service](#).

- [Checksum values for earlier releases](#)

If you are upgrading to an earlier version than 10.0.4.0-ifix3, use the corresponding checksum values to verify your downloaded upgrade files.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Checksum values for earlier releases

If you are upgrading to an earlier version than 10.0.4.0-ifix3, use the corresponding checksum values to verify your downloaded upgrade files.

---

## Upgrading DataPower Gateway Service

Use these instructions when upgrading DataPower Gateway Service in a non-Kubernetes environment, during upgrade of API Connect.

### Before you begin

---

Ensure you have completed the upgrade of the API Connect subsystems (Management service, Developer Portal, Analytics) before upgrading DataPower Gateway. Upgrading the Management service before the DataPower Gateway ensures that any new policies and capabilities will be available to a previously registered Gateway service.

To review API Connect upgrade on VMware, see [Upgrading Gateway subsystem on native Kubernetes](#).

### About this task

---

- The DataPower Gateway Service in a non-Kubernetes environment can be on either a physical appliance or in a virtual DataPower deployment.
- The upgrade of DataPower Gateway Service in a non-Kubernetes environment, for use in API Connect deployments in a VMware environment, does not use the API Connect Install Assist program (**apicup**). Use DataPower Gateway instructions in the following steps.

**Note:** To upgrade the DataPower Gateway Service in a *Kubernetes* environment, do not use the following procedure. Instead, see [Upgrading Gateway subsystem to v10.0.2.0](#).

### Procedure

---

1. Ensure that DataPower Gateway firmware version you plan to install is compatible with the API Connect Management server version.

**Note:**

For API Connect Version 10.x, DataPower and API Connect releases must be within one release of each other. For example, API Connect v10.0.n runs with DataPower Gateway 10.0.n, v10.0.n-1, or v10.0.n+1.

However, before you install, best practice is to review the latest compatibility support for your version of API Connect. To view compatibility support, follow the instructions in [IBM API Connect Version 10 software product compatibility requirements](#) to access API Connect information on the Software Product Compatibility Reports website. Once you access information for your version of API Connect, select Supported Software, Integration Middleware, and view the list of compatible DataPower Gateway versions.

2. When upgrading a high-availability cluster, ensure that you meet the requirements:
  - Gateways must be updated one at a time.
  - Before starting the upgrade, a single gateway must be running as primary for all gateway-peering definitions.
  - When upgrading multiple gateways, the primary gateway must be upgraded last.

To determine which gateway is running as primary, use either the **show**

**gateway-peering-status** command in the DataPower CLI, or use the Gateway Peering Status display in the WebGUI in the API Connect application domain. To move the primary to the DataPower on which you're currently working, you can issue the **gateway-peering-switch-primary <peering-object-name>** command.

3. Ensure that your deployment includes an NTP server to synchronize time between each of the DataPower Gateways. See [Managing the NTP service](#).
4. Ensure that you have set a unique **System Identifier** for each v10 DataPower gateway. See [Initializing the DataPower Gateway](#).
5. Follow the upgrade instructions on the DataPower Gateway documentation. See [Installation operations](#).

**Note:**

- If upgrading a cluster (high-availability) deployment, ensure that you have identified which gateway is running a primary in gateway-peering definitions, and that you upgrade that gateway last.
- For troubleshooting help with DataPower operator v1.2.0 deployments, see <https://ibm.github.io/datapower-operator-doc/troubleshooting/operator-upgrades/#1.2.0>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Enabling Analytics after upgrading

After the upgrade successfully completes, enable the Analytics message queue and restart Analytics data collection.

### Procedure

---

1. If you disabled the Analytics message queue before upgrading, enable it now by completing the following steps:
  - a. Edit the analytics-extra-value.yaml file.
  - b. Locate the `mq` section and change the `enabled` setting to `true`.
  - c. Apply the change by running the following command:

```
apicup subsys install <subsystem_name>
```

2. [Start Analytics data collection.](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting upgrades on VMware

Review the following troubleshooting guidance if you encounter a problem while upgrading API Connect on VMware.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

Topics:

- [Postgres pods fail to start after upgrade](#)
- [Upgrading a 3 node profile to IBM API Connect 10.0.3.0 or later might result in some portal-db/www pods being stuck in the Pending state](#)
- [Workaround for non-ready stancluster pods after upgrade](#)
- [Issues when installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal](#)

## Postgres pods fail to start after upgrade

Note: This topic applies only to upgrading the management subsystem from v10.0.2.0 or later to a newer version of v10.0.x. This problem does not occur when upgrading from v10.0.1.2-ifix2 to v10.0.3.0 or later.

When upgrading the management subsystem from v10.0.2.0 or later, as part of [Upgrading to the latest release on VMware](#), you might encounter an error message when checking the subsystem health upon completion of the upgrade. For example:

```
apic health-check
INFO[0000] Log level: info
FATA[0006] Cluster not in good health:
ManagementCluster (current ha mode: active) is not ready | State: 15/16 Phase: Pending
```

To troubleshoot when a message like this occurs:

1. Check the state of postgres pods:

```
kubectl get pods | grep postgres
```

For example:

```
root@apimdev1146:~# kubectl get pods | grep postgres
fxpk-management-fd8b0b1f-postgres-577594c7f-k54pk          0/1      Init:CrashLoopBackOff   17      22h
fxpk-management-fd8b0b1f-postgres-backrest-shared-repo-7fctp88w  1/1      Running                 2       22h
fxpk-management-fd8b0b1f-postgres-elbx-698f445649-rlc2g    0/1      Init:CrashLoopBackOff   16      22h
fxpk-management-fd8b0b1f-postgres-pgbouncer-64f57b7cc7-52bk8  1/1      Running                 2       22h
fxpk-management-fd8b0b1f-postgres-pgbouncer-64f57b7cc7-jjjvb  1/1      Running                 1       22h
fxpk-management-fd8b0b1f-postgres-pgbouncer-64f57b7cc7-qp4zh  1/1      Running                 2       22h
fxpk-management-fd8b0b1f-postgres-stanza-create-6pt6c      0/1      Completed              0       22h
fxpk-management-fd8b0b1f-postgres-ubba-79ccdd5cc6-kj4zx    0/1      Init:CrashLoopBackOff   17      22h
postgres-operator-85fb96db4b-gk8k8                        4/4      Running                 8       22h
```

2. If any pods show `Init:CrashLoopBackOff` status, restart the pods. To force a restart, delete the pods:

```
kubectl delete pod <name_of_postgres_pod>
```

For example:

```
kubectl delete pod fxpk-management-fd8b0b1f-postgres-577594c7f-k54pk
kubectl delete pod fxpk-management-fd8b0b1f-postgres-elbx-698f445649-rlc2g
kubectl delete pod fxpk-management-fd8b0b1f-postgres-ubba-79ccdd5cc6-kj4zx
```

When pods are deleted, the deployment automatically restarts them.

3. Re-run the health check. For example:

```
apicup subsys health-check <subsys_name>
```

4. When health check is successful, return to the next upgrade step in [Upgrading to the latest release on VMware](#).

## Upgrading a 3 node profile to IBM API Connect 10.0.3.0 or later might result in some portal-db/www pods being stuck in the Pending state

IBM® API Connect 10.0.3.0 introduces the pod anti-affinity required rule, meaning that in a 3 node profile deployment, all 3 db and www pods can run only if there are at least 3 running worker nodes. This rule can cause some upgrades to version 10.0.3.0 or later to become stuck in the **Pending** state, in which case some extra steps are needed during the upgrade to workaround the issue. See the following example for detailed information about the issue, and how to continue with the upgrade.

Important: You must have a backup of your current deployment before starting the upgrade.

To run the commands that are needed to workaround this issue, you must log in to the virtual machine portal subsystem by using an SSH tool.

1. Run the following command to log in as `apicadm`, which is the API Connect ID that has administrator privileges:

```
ssh portal_ip_address -l apicadm
```

Where `portal_ip_address` is the IP address of the portal subsystem.

2. Then get a root shell by running the following command:

```
sudo -i
```

In the following example, the VMware stack has 3 VMs (worker nodes):

```
$ kubectl get nodes
NAME                STATUS    ROLES    AGE   VERSION
apimdev0103         Ready    worker   42m   v1.20.0
apimdev0129         Ready    worker   45m   v1.20.0
apimdev1066         Ready    worker   39m   v1.20.0
```

The pods have been scheduled across only 2 of the 3 worker nodes due to a transient problem with `apimdev1066`, as shown in the following pod list. Pods without persistent storage, such as `nginx-X`, can be rescheduled to `apimdev1066` as soon as they are restarted, but any pods with persistent local storage, such as `db-X` and `www-X`, have to be rescheduled onto the same worker node as that is where their files live.

```
$ kubectl get po -o wide
NAME                READY    STATUS    RESTARTS   AGE   IP                NODE                NOMINATED NODE
READINESS GATES
ejs-portal-nginx-84f57ffd8c-hbf66  1/1     Running   0           5m12s  888.16.109.208   apimdev0103        <none>         <none>
ejs-portal-nginx-84f57ffd8c-mvq96  1/1     Running   0           5m12s  888.16.142.215   apimdev0129        <none>         <none>
ejs-portal-nginx-84f57ffd8c-vmptl  1/1     Running   0           5m12s  888.16.142.214   apimdev0129        <none>         <none>
ejs-portal-sitel-db-0              2/2     Running   0           4m39s  888.16.109.209   apimdev0103        <none>         <none>
ejs-portal-sitel-db-1              2/2     Running   0           6m37s  888.16.109.206   apimdev0103        <none>         <none>

ejs-portal-sitel-ww-0              2/2     Running   0           9m51s  888.16.109.210   apimdev0103        <none>         <none>
ejs-portal-sitel-ww-1              2/2     Running   0           12m   888.16.142.213   apimdev0129        <none>         <none>
ejs-portal-sitel-ww-2              0/2     Pending   0           111s  <none>           <none>           <none>         <none>
ibm-apiconnect-75b47f9f87-p25dd    1/1     Running   0           10m   888.16.109.207   apimdev0103        <none>         <none>
```

The pod list shows that `db-2` has restarted, and has been rescheduled to `apimdev0129` as there were no other db pods running on that node. However, `db-1` and `ww-2` are both stuck in **Pending** state, as there is already a pod of the same type running on the worker node that is hosting the local storage that they are bound to. If you run a `describe` command of either pod you will see the following output:

```
Events:
Type     Reason          Age          From          Message
----     -
Warning  FailedScheduling  10s (x4 over 2m59s)  default-scheduler  0/3 nodes are available: 1 node(s) didn't match pod affinity/anti-affinity, 1 node(s) didn't match pod anti-affinity rules, 2 node(s) had volume node affinity conflict.
```

To resolve this situation you need to delete the PVCs for each pod, and then delete the pod itself, so that Kubernetes will regenerate the PVCs and schedule the pod on the worker node that does not have the anti-affinity conflict.

Therefore, for the `db-1` pod the following commands must be run:

```
$ kubectl get pvc | grep ejs-portal-sitel-db-1
db-ejs-portal-sitel-db-1      Bound    local-pv-fa445e30    250Gi    RWO          local-storage    15m
dblogs-ejs-portal-sitel-db-1  Bound    local-pv-d57910e7    250Gi    RWO          local-storage    15m
```

```
$ kubectl delete pvc db-ejs-portal-sitel-db-1 dblogs-ejs-portal-sitel-db-1
persistentvolumeclaim "db-ejs-portal-sitel-db-1" deleted
persistentvolumeclaim "dblogs-ejs-portal-sitel-db-1" deleted
```

```
$ kubectl delete po ejs-portal-sitel-db-1
pod "ejs-portal-sitel-db-1" deleted
```

For the `ww-2` pod the following commands must be run:

```
$ kubectl get pvc | grep ejs-portal-sitel-ww-2
admin-ejs-portal-sitel-ww-2  Bound    local-pv-48799536    245Gi    RWO          local-storage    51m
backup-ejs-portal-sitel-ww-2  Bound    local-pv-a93f5607    245Gi    RWO          local-storage    51m
web-ejs-portal-sitel-ww-2    Bound    local-pv-facd4489    245Gi    RWO          local-storage    51m
```

```
$ kubectl delete pvc admin-ejs-portal-sitel-ww-2 backup-ejs-portal-sitel-ww-2 web-ejs-portal-sitel-ww-2
persistentvolumeclaim "admin-ejs-portal-sitel-ww-2" deleted
persistentvolumeclaim "backup-ejs-portal-sitel-ww-2" deleted
```

```
persistentvolumeclaim "web-ejs-portal-sitel-www-2" deleted
```

```
$ kubectl delete po ejs-portal-sitel-www-2
pod "ejs-portal-sitel-www-2" deleted
```

If the PVC has `persistentVolumeReclaimPolicy: Delete` set on it, as is the case for the OVA deployments, then no cleanup is necessary as the old data will have been deleted on the worker node that is no longer running the `db-1` and `www-2` pods.

Kubernetes can now reschedule the pods. All pods with persistent storage are now spread across the available worker nodes, and the pods whose PVCs were deleted will get a full copy of the data from the existing running pods. The following pod list is now observed in our example:

```
$ kubectl get po -o wide
NAME                                READY   STATUS    RESTARTS   AGE   IP              NODE              NOMINATED NODE

```

## Workaround for non-ready stancluster pods after upgrade

After upgrading from 10.0.1.2 to 10.0.3.0 or later on VMware, one of the management `stancluster` pods may remain in non-ready state after rebooting the VM the pod is running on.

The output of `kubectl get pods` will look similar to the following for the affected pod:

```
management-stancluster-1           0/1     Running   1           40m
```

Pods in a ready state show a status similar to the following:

```
management-stancluster-2           1/1     Running   1           40m
management-stancluster-3           1/1     Running   1           40m
```

The 0/1 status does not affect the outcome of the upgrade or the operation of the stancluster. However you should delete the affected pod after the upgrade is complete.

To delete the affected pod:

1. SSH into the appliance VM.
2. Run:

```
kubectl delete pod <stancluster pod>
```

The nats-streaming-operator will automatically re-create the deleted pod.

3. Verify that the pod has returned to status 1/1  
`Running`.

```
kubectl get pod | grep <stancluster pod>
```

## Issues when installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal

From IBM API Connect 10.0.3.0, the Developer Portal is based on the Drupal 9 content management system. If you want to install Drupal 8 custom modules or sub-themes into the Drupal 9 based Developer Portal, you must ensure that they are compatible with Drupal 9, including any custom code that they contain, and not using any deprecated APIs, for example. There are tools available for checking your custom code, such as [drupal check](#) on GitHub, which checks Drupal code for deprecations.

For example, any Developer Portal sites that contain modules or sub-themes that don't contain a Drupal 9 version declaration will fail to upgrade, and errors like the following output will be seen in the `admin` logs:

```
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: emeraldgreen
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for emeraldgreen
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Found themes incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: /tmp/restore_site.355ec8 is NOT
Drupal 9 compatible
...
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Found modules incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: sitel.com is NOT Drupal 9
compatible
```

To fix version compatibility errors, all custom modules and sub-themes should declare a `core_version_requirement` key in their `*.info.yml` file that indicates Drupal 9 compatibility. For example:

```
name: Example module
type: module
description: Purely an example
core: 8.x
core_version_requirement: '^8 || ^9'
package: Example module

# Information added by Drupal.org packaging script on 2020-05-31
version: '8.x-1.3'
project: 'example_module'
datestamp: 1590905415
```

This example specifies that the module is compatible with all versions of Drupal 8 and 9. For more information, see [Let Drupal know about your module with an .info.yml file](#) on the drupal.org website.

If you have a backup of a site that you need to restore, and are getting the version compatibility error, but the module or theme `*.info.yml` file cannot be changed easily, then you have two options. Either:

- Add an environment variable into the portal CR for the `www` pod of the `admin` container stating `SKIP_D9_COMPAT_CHECK: "true"`. However, if you choose this method, you must be positive that all of the custom modules and themes for your sites are Drupal 9 compatible, as otherwise the sites may end up inaccessible after the upgrade or restore.
  1. On VMware, create an extra values file to contain the environment variable, as follows:

```
spec:
  template:
    - containers:
      - env:
        - name: SKIP_D9_COMPAT_CHECK
          value: "true"
        name: admin
      name: www
```

2. Save the file as `d9compat.yaml`, and run the following command:

```
apicup subsys set <portal_subsystem_name> extra-values-file d9compat.yaml
```

3. Then, update the portal VMware with the updated setting by running the following command:

```
apicup subsys install <portal_subsystem_name>
```

Or:

- Extract the site backup, edit the relevant files inside it, and then tar the backup file again. Note that this procedure will overwrite the original backup file, so ensure that you keep a separate copy of the original file before you start the extraction. For example:
  1. `mkdir /tmp/backup`
  2. `cd /tmp/backup`
  3. `tar xfz path_to_backup.tar.gz`
  4. Edit the custom module and theme files to make them Drupal 9 compatible, and add the correct `core_version_requirement` setting.
  5. `rm -f path_to_backup.tar.gz`
  6. `tar cfz path_to_backup.tar.gz`
  7. `cd /`
  8. `rm -rf /tmp/backup`

## Skipping health check when re-running upgrade

The `apicup subsys install` command automatically runs `apicup health-check` prior to attempting the upgrade. An error is displayed if a problem is found that will prevent successful upgrade.

In some scenarios, if you encounter an upgrade failure, an attempt to rerun `apicup subsys install` is blocked by errors found by `apicup health-check`. Even when you have fixed the error (such as reconfiguration of an incorrect upgrade CR), the failed upgrade can continue to cause the health check to fail.

You can workaround the problem by adding the `--skip-health-check` flag to suppress the health check:

```
apicup subsys install <subsystem_name> --skip-health-check
```

In this case, use of `--skip-health-check` allows the upgrade to rerun successfully.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Maintaining API Connect

You can use utilities to complete maintenance tasks such as backup, restore, and certificate management in a VMware environment.

Note: When maintaining API Connect, do not use `kubectl exec` commands to access API Connect pods unless advised by IBM.

Do not make any changes on the deployed VMs unless documented here or otherwise advised by IBM. Attempting to manually update packages, adding new users, or installing new software will likely cause problems. Operating system updates are handled by API Connect fix packs.

Troubleshoot your deployment on VMware.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Advanced installation on VMware

Optionally install additional software.

See:

- [Installing a two data center deployment](#)  
Additional installation instructions explaining how to deploy a two data center disaster recovery deployment on VMware.
- [Installing the IBM License Metric Tool on VMware](#)  
The IBM License Metric Tool (ILMT) helps you determine whether your IBM® API Connect deployment is compliant with licensing requirements.
- [Installing the toolkit](#)
- [Installing the Automated API behavior testing application](#)  
Install the Automated API behavior testing application in your IBM API Connect deployment on VMware.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Installing a two data center deployment

Additional installation instructions explaining how to deploy a two data center disaster recovery deployment on VMware.

### Before you begin

Ensure that you understand the concepts of a two data center disaster recovery deployment in API Connect. For more information, see [A two data center deployment strategy on VMware](#).

Review the information in [Requirements for initial deployment on VMware](#) and, if appropriate, [What's new for v10 installation from previous versions](#).

Familiarize yourself with the instructions in [First steps for deploying in a VMware environment](#). You will need to complete these instructions in conjunction with the additional steps in this topic that are specific to installing a two data center disaster recovery deployment.

### About this task

Installing API Connect as a two data center disaster recovery (DR) deployment is very similar to a single installation, as the deployment in each data center is effectively an instance of the same API Connect deployment. The following endpoints must be the same on both data centers:

Management subsystem endpoints

- `platform-api`
- `consumer-api`
- `cloud-admin-ui`
- `api-manager-ui`

Portal subsystem endpoints

- `portal-admin`

- `portal-www`

For more information about how to set the endpoints, see [Configuring the management subsystem](#) and [Configuring the Developer Portal subsystem](#). The main difference is that the deployments for both the API Manager and the Developer Portal subsystems must include `multi-site-ha` settings. These settings are added to the deployment by using `apicup` commands, as shown in the installation instruction sections later in this topic.

A two data center DR deployment is created by deploying two API Manager subsystems, and two Developer Portal subsystems, in the same APICUP project. By default, two data center DR is not enabled.

The `multi-site-ha` settings are described in the following table.

Table 1. The `multi-site-ha` settings

| Setting                             | Description                                                                                                                                                                                                                                                                                 |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>multi-site-ha-enabled</code>  | Indicates whether two data center DR deployment is enabled. Set to <code>true</code> to enable two data center DR. Set to <code>false</code> to disable two data center DR. The default value is <code>false</code> .                                                                       |
| <code>multi-site-ha-mode</code>     | The state of the data center in the context of the two data center deployment. Valid values are: <ul style="list-style-type: none"> <li>• <code>active</code> - indicates the primary data center</li> <li>• <code>passive</code> - indicates the standby data center</li> </ul>            |
| <code>management-replication</code> | Required only for the Management subsystem. The external ingress name for the Management subsystem in the current data center in the two data center deployment. The name is a unique fully qualified hostname that the other data center uses to communicate with the current data center. |
| <code>portal-replication</code>     | Required only for the Portal subsystem. The external ingress name for the Portal subsystem in the current data center in the two data center deployment. The name is a unique fully qualified hostname that the other data center uses to communicate with the current data center.         |
| <code>replication-peer-fqdn</code>  | The ingress hostname for the other data center in the two data center deployment. This information is required so that the two data centers can communicate with each other.                                                                                                                |

The `siteName` property is a unique descriptive name for the Portal subsystem, and the Management subsystem, in each data center, for example `dallas` on data center 1, and `raleigh` on data center 2. You must set different a `siteName` on the active data center, to the one set on the passive data center. This name is used in the hostnames, and so can contain only `a-z` and `0-9` characters. Note that you can set a `siteName` in the `ManagementCluster` or `PortalCluster` CR only when the subsystems are first deployed, and you cannot change the name after deployment. If you don't set a `siteName` at first deployment, an automated `siteName` is created for you. For example, if you are converting an existing single Management cluster to a two data center Management cluster by adding the multi-site HA values, you will not be able to configure a `siteName` for the existing Management cluster.

To install a two data center disaster recovery deployment, you must follow the instructions in [Deploying the Management subsystem](#) and [Deploying the Developer Portal](#) to configure the OVA templates, as well as setting the multi-site HA values that are detailed here, before then installing the subsystems. Some examples of complete subsystem value settings are shown in the [Example](#) section.

Important:

- You must use a single APICUP project for all subsystems. Multiple projects will result in multiple certificate chains that will not match.
- The original project directory created with APICUP during the initial product installation (for example, `myProject`) is required to both restore the database and to upgrade your deployment. You cannot restore the database or perform an upgrade without the initial project directory, because it contains pertinent information about the cluster. Note that the endpoints and certificates cannot change; the same endpoints and certificates will be used in the restored or upgraded system. Best practice is to back up the original project directory to a location from where it can always be retrieved.
- Ideally you should use one project directory across both data centers as a single source of truth for your two data center deployment. However, if network access is limited, you can copy the original project directory across to the second data centre, but you must ensure that the copied project directory does not diverge from the original, or critical functionality will be impacted.
- Endpoints for the components cannot change between deployments. However, the endpoints for the VMware hosts can be modified for the new deployment.
- Note that the subsystem name of the management and portal services must consist of lowercase alphanumeric characters or '-', with no spaces, start with an alphabetic character, and end with an alphanumeric character.

See the following instructions for information about how to configure a two data center DR deployment:

- [Installing to an active data center](#)
- [Installing to a passive data center](#)
- [Converting a single data center deployment to two data centers](#)
- [Validating your two data center deployment](#)

## Procedure

### • Installing to an active data center

The following example shows how to configure the multi-site HA settings for deploying to an active data center (DC). In this instance we are deploying to a local data center called `dallas` (DC1), that has a remote data center called `raleigh` (DC2).

1. Complete the steps in [Configuring the management subsystem](#) up to and including Step 14 to create a Management subsystem in Dallas (DC1).
2. Configure the multi-site HA values to set Dallas to be active for the API Manager service on DC1.

Run the following commands:

```
apicup subsys set mgmt_dallas multi-site-ha-enabled=true
apicup subsys set mgmt_dallas multi-site-ha-mode=active
apicup certs set mgmt_dallas management-replication-ingress --clear
apicup subsys set mgmt_dallas management-replication=mgrreplicationdallas.cluster1.example.com
apicup subsys set mgmt_dallas replication-peer-fqdn=mgrreplicationraleigh.cluster2.example.com
apicup subsys set mgmt_dallas site-name=dallas
```

where

- `mgmt_dallas` is the name of the management service that you are configuring.
- `mgrreplicationdallas.cluster1.example.com` is the ingress hostname for the current data center in the two data center deployment.
- `mgrreplicationraleigh.cluster2.example.com` is the ingress hostname for the other data center in the two data center deployment.

- `dallas` is the name of the site in the current data center.
3. Complete the remainder of the Steps in [Configuring the management subsystem](#) from Step 15, to verify that the configuration settings are valid, create your ISO file, and deploy the OVF template.
  4. Complete the steps in [Configuring the Developer Portal subsystem](#) up to and including Step 15 to create a Portal subsystem in Dallas (DC1).
  5. Configure the multi-site HA values to set Dallas to be active for the Developer Portal service on DC1.

Run the following commands:

```
apicup subsys set port_dallas multi-site-ha-enabled=true
apicup subsys set port_dallas multi-site-ha-mode=active
apicup certs set port_dallas portal-replication-ingress --clear
apicup subsys set port_dallas portal-replication=ptlreplicationdallas.cluster1.example.com
apicup subsys set port_dallas replication-peer-fqdn=ptlreplicationraleigh.cluster2.example.com
apicup subsys set port_dallas site-name=dallas
```

where

- `port_dallas` is the name of the Portal service that you are configuring.
  - `ptlreplicationdallas.cluster1.example.com` is the ingress hostname for the current data center in the two data center deployment.
  - `ptlreplicationraleigh.cluster2.example.com` is the ingress hostname for the other data center in the two data center deployment.
  - `dallas` is the name of the site in the current data center.
6. Complete the remainder of the Steps in [Configuring the Developer Portal subsystem](#) from Step 17, to verify that the configuration settings are valid, create your ISO file, and deploy the OVF template.
  7. Log in to the virtual machine subsystems on DC1 by using an SSH tool, and check the status of the installation by running the `apic status` command.
  8. Set your dynamic router to direct all traffic to DC1.  
This includes setting the four endpoints for the API Manager cluster, and the two endpoints for the Developer Portal cluster.

#### • Installing to a passive data center

The following example shows how to set the multi-site HA values for the remote data center called `raleigh` (DC2), which is being installed as the passive, standby location.

Important: Remember to use the same APICUP project directory as for the active data center. If you cannot use the same project directory, you must ensure that the copied project directory hasn't diverged from the original, or critical functionality will be impacted.

1. Complete the steps in [Configuring the management subsystem](#) up to and including Step 14 to create a Management subsystem in Raleigh (DC2).
2. Configure the multi-site HA values to set Raleigh to be passive for the API Manager service on DC2.

Run the following commands:

```
apicup subsys set mgmt_raleigh multi-site-ha-enabled=true
apicup subsys set mgmt_raleigh multi-site-ha-mode=passive
apicup certs set mgmt_raleigh management-replication-ingress --clear
apicup subsys set mgmt_raleigh management-replication=mgrreplicationraleigh.cluster2.example.com
apicup subsys set mgmt_raleigh replication-peer-fqdn=mgrreplicationdallas.cluster1.example.com
apicup subsys set mgmt_raleigh site-name=raleigh
```

where

- `mgmt_raleigh` is the name of the management service that you are configuring.
  - `mgrreplicationraleigh.cluster2.example.com` is the ingress hostname for the current data center in the two data center deployment.
  - `mgrreplicationdallas.cluster1.example.com` is the ingress hostname for the other data center in the two data center deployment.
  - `raleigh` is the name of the site in the current data center.
3. Set the encryption key manually for Raleigh (DC2) by copying it from Dallas (DC1).

Run the following commands:

```
apicup certs get mgmt_dallas encryption-secret -t key > mgmt-encryption-secret
apicup certs set mgmt_raleigh encryption-secret mgmt-encryption-secret
```

4. Check that the management encryption key is set the same on both DC1 and DC2.

Run the following commands, and verify that the outputs match:

```
apicup certs get mgmt_dallas encryption-secret -t key
apicup certs get mgmt_raleigh encryption-secret -t key
```

5. Complete the remainder of the Steps in [Configuring the management subsystem](#) from Step 15, to verify that the configuration settings are valid, create your ISO file, and deploy the OVF template.
6. Complete the steps in [Configuring the Developer Portal subsystem](#) up to and including Step 15 to create a Portal subsystem in Raleigh (DC2).
7. Configure the multi-site HA values to set Raleigh to be passive for the Developer Portal service on DC2.

Run the following commands:

```
apicup subsys set port_raleigh multi-site-ha-enabled=true
apicup subsys set port_raleigh multi-site-ha-mode=passive
apicup certs set port_raleigh portal-replication-ingress --clear
apicup subsys set port_raleigh portal-replication=ptlreplicationraleigh.cluster2.example.com
apicup subsys set port_raleigh replication-peer-fqdn=ptlreplicationdallas.cluster1.example.com
apicup subsys set port_raleigh site-name=raleigh
```

where

- `port_raleigh` is the name of the Portal service that you are configuring.

- `ptlreplicationraleigh.cluster2.example.com` is the ingress hostname for the current data center in the two data center deployment.
  - `ptlreplicationdallas.cluster1.example.com` is the ingress hostname for the other data center in the two data center deployment.
  - `raleigh` is the name of the site in the current data center.
8. Copy the encryption key for the Portal service on DC1 over to the Portal service on DC2.  
Run the following command to get the encryption key for the Portal service on DC1, and put it into a file that is called `port-encryption-secret`:

```
apicup certs get port_dallas encryption-secret -t key > port-encryption-secret
```

Run the following command to use the `port-encryption-secret` file to set the same encryption key on DC2:

```
apicup certs set port_raleigh encryption-secret port-encryption-secret
```

Where `port_dallas` is the name of the Portal service on DC1, and `port_raleigh` is the name of the Portal service on DC2.

To check that the encryption key is set the same on both DC1 and DC2, you can run the following commands and verify that the outputs match:

```
apicup certs get port_dallas encryption-secret -t key
```

```
apicup certs get port_raleigh encryption-secret -t key
```

9. Complete the remainder of the Steps in [Configuring the Developer Portal subsystem](#) from Step 17, to verify that the configuration settings are valid, create your ISO file, and deploy the OVF template.
10. Log in to the virtual machine subsystems on DC2 by using an SSH tool, and check the status of the installation by running the `apic status` command.

#### • Converting a single data center deployment to two data centers

When converting a single data center deployment into a two data center deployment, it is best practice to use the existing data center as the active one, and add a new passive data center elsewhere. This practice ensures that the data is retained.

Remember:

- o Both data centers must have the same `portal-admin` and `portal-www` endpoints.
- o You cannot configure a `site-name` for the existing Management or Portal cluster, because the `site-name` property can be configured only at first deployment.
- o The API Manager and Developer Portal ingress endpoint values cannot be changed after the system has been deployed. When you convert a single data center deployment into a two data center deployment, the ingress endpoint values from the single data center deployment will now be the new global ingress endpoints for the new two center deployment. They can then be routed to either DC1 or DC2.

The following example shows how to update the multi-site HA values for making the existing data center called `dallas` (DC1) active, and for setting the new remote data center called `raleigh` (DC2) as passive.

1. Configure the multi-site HA values to set Dallas to be active for the API Manager service on DC1.

Run the following commands:

```
apicup subsys set mgmt_dallas multi-site-ha-enabled=true
```

```
apicup subsys set mgmt_dallas multi-site-ha-mode=active
```

```
apicup certs set mgmt_dallas management-replication-ingress --clear
```

```
apicup subsys set mgmt_dallas management-replication=mgrreplicationdallas.cluster1.example.com
```

```
apicup subsys set mgmt_dallas replication-peer-fqdn=mgrreplicationraleigh.cluster2.example.com
```

where

- `mgmt_dallas` is the name of the management service that you are configuring.
- `mgrreplicationdallas.cluster1.example.com` is the ingress hostname for the current data center in the two data center deployment.
- `mgrreplicationraleigh.cluster2.example.com` is the ingress hostname for the other data center in the two data center deployment.

Note: As the API Manager service already exists, you cannot set the `site-name` property.

2. Configure the multi-site HA values to set Dallas to be active for the Developer Portal service on DC1.

Run the following commands:

```
apicup subsys set port_dallas multi-site-ha-enabled=true
```

```
apicup subsys set port_dallas multi-site-ha-mode=active
```

```
apicup certs set port_dallas portal-replication-ingress --clear
```

```
apicup subsys set port_dallas portal-replication=ptlreplicationdallas.cluster1.example.com
```

```
apicup subsys set port_dallas replication-peer-fqdn=ptlreplicationraleigh.cluster2.example.com
```

where

- `port_dallas` is the name of the Portal service that you are configuring.
- `ptlreplicationdallas.cluster1.example.com` is the ingress hostname for the current data center in the two data center deployment.
- `ptlreplicationraleigh.cluster2.example.com` is the ingress hostname for the other data center in the two data center deployment.

Note: As the Developer Portal service already exists, you cannot set the `site-name` property.

3. Run `apicup` to update the settings in each subsystem, for example:

```
apicup subsys install service_name
```

where `service_name` is the name of the management or portal service that you want to update, for example `mgmt_dallas`.

4. Log in to the virtual machine subsystems on DC1 by using an SSH tool, and check the status of the installation by running the `apic status` command.
5. Add the new DC, Raleigh (DC2) by completing the steps in [Configuring the management subsystem](#) up to and including Step 14 to create a Management subsystem in Raleigh (DC2).

Note:

- Remember to use the same APICUP project directory as for the active data center.
- Remember to set the same `portal-admin` and `portal-www` endpoints as for DC1.

6. Configure the multi-site HA values to set Raleigh to be passive for the API Manager service on DC2.

Run the following commands:

```
apicup subsys set mgmt_raleigh multi-site-ha-enabled=true
```

```
apicup subsys set mgmt_raleigh multi-site-ha-mode=passive
```

```

apicup certs set mgmt_raleigh management-replication-ingress --clear
apicup subsys set mgmt_raleigh management-replication=mgrreplicationraleigh.cluster2.example.com
apicup subsys set mgmt_raleigh replication-peer-fqdn=mgrreplicationdallas.cluster1.example.com
apicup subsys set mgmt_raleigh site-name=raleigh

```

where

- `mgmt_raleigh` is the name of the management service that you are configuring.
- `mgrreplicationraleigh.cluster2.example.com` is the ingress hostname for the current data center in the two data center deployment.
- `mgrreplicationdallas.cluster1.example.com` is the ingress hostname for the other data center in the two data center deployment.
- `raleigh` is the name of the site in the current data center.

Note: As this is a new deployment of the API Manager service, you can set the `site-name` property.

7. Set the encryption key manually for Raleigh (DC2) by copying it from Dallas (DC1).

Run the following commands:

```

apicup certs get mgmt_dallas encryption-secret -t key > mgmt-encryption-secret
apicup certs set mgmt_raleigh encryption-secret mgmt-encryption-secret

```

8. Check that the management encryption key is set the same on both DC1 and DC2.

Run the following commands, and verify that the outputs match:

```

apicup certs get mgmt_dallas encryption-secret -t key
apicup certs get mgmt_raleigh encryption-secret -t key

```

9. Complete the remainder of the Steps in [Configuring the management subsystem](#) from Step 15, to verify that the configuration settings are valid, create your ISO file, and deploy the OVF template.

10. Complete the steps in [Configuring the Developer Portal subsystem](#) up to and including Step 15 to create a Portal subsystem in Raleigh (DC2).

11. Configure the multi-site HA values to set Raleigh to be passive for the Developer Portal service on DC2.

Run the following commands:

```

apicup subsys set port_raleigh multi-site-ha-enabled=true
apicup subsys set port_raleigh multi-site-ha-mode=passive
apicup certs set port_raleigh portal-replication-ingress --clear
apicup subsys set port_raleigh portal-replication=ptlreplicationraleigh.cluster2.example.com
apicup subsys set port_raleigh replication-peer-fqdn=ptlreplicationdallas.cluster1.example.com
apicup subsys set port_raleigh site-name=raleigh

```

where

- `port_raleigh` is the name of the Portal service that you are configuring.
- `ptlreplicationraleigh.cluster2.example.com` is the ingress hostname for the current data center in the two data center deployment.
- `ptlreplicationdallas.cluster1.example.com` is the ingress hostname for the other data center in the two data center deployment.
- `raleigh` is the name of the site in the current data center.

12. Run the following command to generate the default Portal certificates on the passive site:

```

apicup certs generate port_raleigh

```

13. Copy the encryption key for the Portal service on DC1 over to the Portal service on DC2.

Run the following command to get the encryption key for the Portal service on DC1, and put it into a file that is called `port-encryption-secret`:

```

apicup certs get port_dallas encryption-secret -t key > port-encryption-secret

```

Run the following command to use the `port-encryption-secret` file to set the same encryption key on DC2:

```

apicup certs set port_raleigh encryption-secret port-encryption-secret

```

Where `port_dallas` is the name of the Portal service on DC1, and `port_raleigh` is the name of the Portal service on DC2.

To check that the encryption key is set the same on both DC1 and DC2, you can run the following commands and verify that the outputs match:

```

apicup certs get port_dallas encryption-secret -t key
apicup certs get port_raleigh encryption-secret -t key

```

14. Complete the remainder of the Steps in [Configuring the Developer Portal subsystem](#) from Step 17, to verify that the configuration settings are valid, create your ISO file, and deploy the OVF template.

15. Log in to the virtual machine subsystems on DC2 by using an SSH tool, and check the status of the installation by running the `apic status` command.

16. Set your dynamic router to direct all traffic to DC1.

This includes setting the four endpoints for the API Manager cluster, and the two endpoints for the Developer Portal cluster.

#### • Validating your two data center deployment

To validate that your two data center deployment is working, execute a test failover, and confirm that all of the expected data is present and correct on the newly active site. See [Failure handling of a two data center deployment](#) for details.

## Example

Example of the management subsystem values that you can view by running the `apicup subsys get mgmt_name` command. For example:

```

apicup subsys get mgmt_dallas

```

```

Appliance settings
=====

```

| Name | Value |
|------|-------|
|------|-------|

```

Description
-----

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Installing the IBM License Metric Tool on VMware

The IBM License Metric Tool (ILMT) helps you determine whether your IBM® API Connect deployment is compliant with licensing requirements.

## About this task

ILMT provides useful features for managing virtualized environments and measuring license utilization. ILMT discovers the software that is installed in your infrastructure, helps you to analyze the consumption data, and allows you to generate audit reports. Each report provides you with different information about your infrastructure, for example the computer groups, software installations, and the content of your software catalog.

By default, every ILMT audit report presents data from the previous 90 days. You can customize the type and amount of information displayed in a report by using filters, and save your personal settings for future use. You can also export the reports to .csv or .pdf format, and schedule report emails so that specified recipients are notified when important events occur.

For more information about ILMT, see the [IBM License Metric Tool](#) documentation.

Note: The following instructions describe the ILMT installation for API Connect deployments in a VMware environment, and apply to the Management, Developer Portal, and Analytics OVAs.

## Procedure

---

To download the BigFix Agent for the Ubuntu operating system, complete the following steps:

1. Navigate to <http://support.bigfix.com/bes/release/> and then follow the link to the latest release; for example: <http://support.bigfix.com/bes/release/9.5/patch11/>.
2. In the Agent section of the table, click the Download link corresponding to the following release:
  - Operating System: Ubuntu
  - Version: 16
  - Architecture: x86\_64

In this example, the direct download link is: <http://software.bigfix.com/download/bes/95/BESAgent-9.5.11.191-ubuntu10.amd64.deb>

Upload the BigFix Agent package to each OVA server, as follows:

3. Upload the BigFix Agent .deb package to each running OVA server. Following is an example of the command for uploading the file that was downloaded in Step 2:

```
scp BESAgent-9.5.11.191-ubuntu10.amd64.deb apicadm@<OVA_Hostname>:~
```

The generic command is:

```
scp <BigFix_Agent_Package_File_Path> apicadm@<OVA_Hostname>:~
```

The BigFix Agent .deb package will be uploaded to `/home/apicadm`.

Install the BigFix client on each OVA server, as follows:

4. Log in, with a secure shell connection, to the server as the `apicadm` user.
5. Become root by entering `sudo -s`.
6. Follow [IBM Bigfix installation instructions Ubuntu](#) to install the .deb package.

## What to do next

---

Ensure that TCP/IP port 52311 is open on your firewall.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Installing the toolkit

---

You can install the toolkit that provides CLI commands, and the API Designer user interface, for IBM® API Connect.

### About this task

---

The toolkit is provided as executable files, so no actual installation is necessary, you just need to download the required compressed file and extract the contents.

There are two toolkit options available:

- CLI: provides a command line environment for working with IBM API Connect.
- CLI + LoopBack + Designer: provides a command line environment for working with IBM API Connect, including LoopBack® support, and the API Designer application.

To install the toolkit, download the compressed file that is appropriate for your chosen toolkit option and platform, then extract the contents to a chosen location on your local machine. The compressed file contains an executable file for running CLI commands and, if you choose the CLI + LoopBack + Designer option, an executable file for launching the API Designer application.

You can download the toolkit from one of the following locations:

- From IBM Fix Central.
- From the Cloud Manager or API Manager user interface.

## Procedure

---

To install and run the toolkit, complete the following steps:

1. Download the toolkit compressed file.
  - To download the toolkit from IBM Fix Central, complete the following steps:
    - Open the [IBM Fix Central site](#) in your browser.
    - In the Product selector field, enter `API Connect`, then select IBM API Connect from the drop down list.
    - Select your Installed Version and click Continue. If you do not know your installed IBM API Connect version, contact your administrator.
    - In the Text field, enter `toolkit`, then click Continue.
    - Select the toolkit file that you want to download.
    - Click Continue, then follow the instructions to complete the download operation.
  - To download the toolkit from Cloud Manager or API Manager user interface, complete the following steps:
    - Open the Cloud Manager or API Manager user interface.
    - On the welcome page, click the Download Toolkit tile. The two toolkit options are listed.
    - Click your platform alongside either the CLI option or the CLI + LoopBack + Designer option as required, then save the associated compressed file to your local file system.
    - To download the API Designer credentials (Client ID and Client Secret), click Download alongside API Designer Credentials, then save the `designer_credentials.json` file to your local file system. A command is provided for installing the credentials, as described in detail in step [6](#).

- To download the toolkit credentials (Client ID and Client Secret), click Download alongside Credential, then save the credentials.json file to your local file system. A command is provided for installing the credentials, as described in detail in step 5.
  - Close the Install API Connect Toolkit window.
2. Extract the contents of the toolkit compressed file to a folder of your choice.  
The contents of the file depend on the your chosen toolkit option and platform, as follows:
    - The apic-slim or apic-slim.exe file is the CLI for IBM API Connect.
    - The apic or apic.exe file is the CLI for IBM API Connect including LoopBack support.  
Tip: If you are using the CLI option, then if you rename the apic-slim file to apic, or the apic-slim.exe file to apic.exe, you can run the CLI commands exactly as documented, copy and paste sample commands from the documentation, and use any command scripts as-is if you later move to the CLI + LoopBack + Designer option.
    - The api\_designer-*platform* file is the API Designer user interface application for the specified platform.
  3. Optional: Delete the `$HOME/.apiconnect/node_clis` directory.  
You need to do this only if you replaced a version of `apic` or `apic.exe` and are using the `apic lb4` command. You need to delete the directory `get apic` to unpack the new loopback.

On Windows, `$HOME` is defined by environment `USERPROFILE`.

#### 4. Run the CLI.

- For the Mac OSX or Linux® platforms, complete the following steps:
  - Open a terminal instance and navigate to the folder where you extracted the contents of the toolkit compressed file.
  - Make the CLI file an executable file by entering the following command:

```
chmod +x download_name
```

Where *download\_name* is the name of the toolkit file that you downloaded, either `apic` or `apic-slim`.

- Run CLI commands as follows:

```
./apic command_name_and_parameters
```

or

```
./apic-slim command_name_and_parameters
```

For details of the CLI commands, see [apic](#).

- For the Windows platform, complete the following steps:
  - Open a command prompt and navigate to the folder where you extracted the contents of the toolkit compressed file.
  - Run CLI commands as follows:

```
apic command_name_and_parameters
```

or

```
apic-slim command_name_and_parameters
```

For details of the CLI commands, see [apic](#).

Tip: Add the folder location of your CLI file to your `PATH` variable so that you can run CLI commands from anywhere in your file system.

#### 5. Install the toolkit credentials.

If you do not install the toolkit credentials that are provided for download, as detailed previously in the [toolkit credentials download instructions](#), API Connect uses a default set of credentials that are identical for all deployments. However, the downloaded credentials were generated during the deployment of your API Connect system and are unique to your installation. To install the credentials into your local toolkit, run the following command:

```
apic client-creds:set toolkit_credentials_file_path/credentials.json
```

where *credentials\_file\_path* is the location to which you downloaded the toolkit credentials JSON file. After you have run this command, your toolkit uses these new credentials to authenticate with the management server.

Note: At any one time, you can use only one set of toolkit credentials for login to a management server from the toolkit CLI. If you want to log in to a different management server you must install the toolkit credentials from that management server.

To revert to the default toolkit credentials for all login operations from the toolkit CLI, use the following command:

```
apic client-creds:clear
```

For increased security, an administrator can remove the default credentials from the management server by completing the following steps:

- a. Log in to the management server as an administrator; see [Logging in to a management server](#).
- b. Delete the default credentials by running the following commands:

```
apic registrations:delete toolkit --server mgmt_endpoint_url
apic registrations:delete consumer-toolkit --server mgmt_endpoint_url
```

#### 6. Install the API Designer credentials.

If you do not install the API Designer credentials that are provided for download, as detailed previously in the [API Designer credentials download instructions](#), API Connect uses a default set of credentials that are identical for all deployments. However, the downloaded credentials were generated during the deployment of your API Connect system and are unique to your installation. To install the custom credentials into your local API Designer, set the `APIC_DESIGNER_CREDENTIALS` environment variable to the credentials download location, using the mechanism appropriate for your operating system.

After you have set the `APIC_DESIGNER_CREDENTIALS` environment variable, your API Designer uses the new credentials to authenticate with the management server.

- Windows:
 

If you are using Windows, create an environment variable using one of the following methods:

  - Create a permanent environment variable so that you can start API Designer from any location on your computer:
    - Open the Environment Variables page: Click Start, Settings, System and in the "Related Settings" section of the page, click Advanced System Settings.
    - On the Advanced tab of the System Properties dialog box, click Environment Variables.
    - In the "User variables" section, click New and create an environment variables with the following settings:
      - Variable: `APIC_DESIGNER_CREDENTIALS`

- Value: `<designer_credentials_file_path>\designer_credentials.json` where `<designer_credentials_file_path>` is the location where you stored the `designer_credentials.json` file.
- Click OK to save the new environment variable, and then exit the dialog box.
- If you don't have the required permissions to create a permanent environment variable, you can create a temporary one that will only be used while you are running the API Designer application. The following steps must be performed every time you start API Designer:
  - Open the Windows command prompt.
  - Run the following command to set the temporary environment variable:

```
set APIC_DESIGNER_CREDENTIALS=<designer_credentials_file_path>\designer_credentials.json
```

where `<designer_credentials_file_path>` is the location where you stored the `designer_credentials.json` file.

Note: Leave the command prompt open for the next step. You must set the temporary variable and start the API Designer within the same Windows command session.

- Now run the following command to start API Designer:

```
C:\>"Program Files\API Designer\API Designer.exe"
```

By default, API Designer is installed in the `C:\Program Files\API Designer` folder as shown in the example. If you installed it into a different location, use your own location in the command. Note that the path and file name are enclosed in quotation marks because they contain spaces.

- Mac:

If you are using Mac OS X, create an environment variable using one of the following methods:

- Run the following command to set the global environment variable:

```
launchctl setenv APIC_DESIGNER_CREDENTIALS <designer_credentials_file_path>/designer_credentials.json
```

where `<designer_credentials_file_path>` is the location where you stored the API Designer credentials JSON file.

- Pass in the environment variable while starting API Designer from the command line. With this method, you must run the following command every time you start API Designer:

```
APIC_DESIGNER_CREDENTIALS=<designer_credentials_file_path>/designer_credentials.json open <designer_application_file_path>/'API Designer.app'
```

where:

- `<designer_credentials_file_path>` is the location to which you downloaded the API Designer credentials JSON file.
- `<designer_application_file_path>` is the location to which you downloaded and uncompressed the API Designer application.

7. Start the API Designer application from the location to where you stored the extracted file.

Note:

- To uninstall the API Designer application on a Windows platform with a non Administrator account, complete the following steps:
  - In Windows File Explorer, navigate to the `USER_HOME\AppData\Local\Programs\api-designer` folder.
  - Run the **Uninstall API Designer application** application. Do **not** use the **Add or remove programs** window.
- To uninstall the API Designer application on a Windows platform with an Administrator account, you can either run the **Uninstall API Designer application** application, or you can use the **Add or remove programs** window.

## Results

The IBM API Connect toolkit CLI and, if selected, the API Designer user interface application are installed on your local system.

For information on using the API Designer user interface, see [Developing your APIs and applications](#).

For information on using the toolkit CLI, see [Using the developer toolkit command-line tool](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing the Automated API behavior testing application

Install the Automated API behavior testing application in your IBM® API Connect deployment on VMware.

### About this task

Use the following steps to install the Automated API behavior testing application as part of your initial deployment, or to add it in later.

### Procedure

1. Run the following `apicup` commands to install or update your deployment with the the Automated API behavior testing application:

```
apicup subsys set mgmt test-and-monitor-enabled true
apicup certs set mgmt hub --clear
apicup certs set mgmt turnstile --clear
apicup subsys set mgmt hub hub-endpoint
apicup subsys set mgmt turnstile turnstile-endpoint
apicup subsys install mgmt
```

where:

- `mgmt` is the name of your Management server (which you are either installing or updating).
- `hub-endpoint` is an endpoint on the ingress subdomain for the API Connect stack; for example: `hub.testsrv0231.subnet1.example.com`.
- `turnstile-endpoint` is an endpoint on the ingress subdomain for the API Connect stack; for example: `turnstile.testsrv0231.subnet1.example.com`.

Attention: The hub and turnstile endpoints should be distinct and must not overlap with any of the 4 management endpoints.

2. Verify that the application deployed properly by completing the following steps:
  - a. Log in to API Manager.
  - b. On the Home page, click the Test APIs tile.
  - c. Verify that the Automated API behavior testing opens.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Advanced configuration on VMware

Perform configuration tasks on your API Connect deployment on VMware.

See:

- [Configuring API Connect subsystems in a cluster](#)  
This topic describes how to configure a cluster of API Connect subsystems (management server, analytics, and Developer Portal) with three VMs for each subsystem, for use with a load balancer, to support a high availability (HA) environment.
- [Testing a new configuration against a current cluster](#)  
You can use the `apicup` utility to test the validity of a new configuration before you install it.
- [Adding disk space to a VMware appliance](#)  
Increase disk space on the VMware appliance.
- [Add a node to a VMware cluster](#)  
Add a node to a VMware cluster when you want to scale the deployment.
- [Changing deployment profiles on VMware](#)  
You can change an API Connect installation to use different deployment profiles.
- [Appliance boot mode configuration](#)  
Configure the boot mode for the appliance VMs.
- [Running commands at boot with iso-ignored boot mode](#)  
When `iso-ignored` boot mode is configured, complete the following steps on each appliance that should run commands at boot.
- [Managing an appliance data disk](#)  
You can use `apic` commands to manage appliance data disks in your VMware deployment.
- [Adding a static route on a virtual machine](#)  
You can add a static route to the routing table when deploying API Connect on a VMware virtual machine.
- [Replica override for microservices on VMware](#)  
Modify the replica count for microservices by using template overrides for Custom Resources.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring API Connect subsystems in a cluster

This topic describes how to configure a cluster of API Connect subsystems (management server, analytics, and Developer Portal) with three VMs for each subsystem, for use with a load balancer, to support a high availability (HA) environment.

### Before you begin

To create a cluster of hosts for each API Connect subsystem, use `apicup` to create a subsystem with all the required parameters, and to add as many hosts as needed to the configuration file. The configuration file is a `.yaml` file in the project directory.

For each host of a subsystem added in the `.yaml` file, a separate ISO file is created for the cluster member VM. Note that the ISO files for each VM must stay attached during the whole lifetime of the VM.

In an API Connect cluster in a VMware environment, the first three nodes are master nodes. Additional nodes are worker nodes.

Note: To add a new host to an existing cluster, you can create the host, regenerate the ISO and attach it to the new virtual machine, and it will automatically join the cluster.

To use these instructions, you should first review:

- [Requirements for initial deployment on VMware](#)
- [Load balancer configuration in a VMware deployment](#)
- [Deployment overview for endpoints and certificates](#)
- [Firewall requirements on VMware](#)
- [Firewall enabled ports for clustered OVA deployments](#)
- Important: For best performance it is recommended that the network latency between any 2 nodes be as low as possible. Do not configure nodes from the same subsystem cluster across multiple data centers with a high latency network. A high latency network is one that experiences more than 30ms latency between nodes.

## About this task

This page presents a concise step-by-step flow, with sample commands, for the configuration of each subsystem. As you step through the flow, you might want to refer back to the detailed configuration steps for each subsystem. The detailed instructions provide additional considerations for each step, and include optional configuration tasks for backups, logging, message queues (analytics), and password hashing. Each of the subsystem pages describe how to use the VMware console to deploy the ISOs that you create here.

Detailed configuration steps:

- [Deploying the Management subsystem](#)
- [Deploying the Analytics subsystem](#)
- [Deploying the Developer Portal](#)

The example commands uses the following values for DNS server, internet gateway, host names and IP addresses:

| Component               | Host names and IP addresses                                  |
|-------------------------|--------------------------------------------------------------|
| DNS Name Server         | IP: 192.168.1.1                                              |
| Internet gateway        | IP: 192.168.1.2                                              |
| Manager on VM1          | Hostname: manager1.sample.example.com<br>IP: 192.168.1.101   |
| Manager on VM2          | Hostname: manager2.sample.example.com<br>IP: 192.168.1.102   |
| Manager on VM3          | Hostname: manager3.sample.example.com<br>IP: 192.168.1.103   |
| Analytics on VM4        | Hostname: analytics1.sample.example.com<br>IP: 192.168.1.104 |
| Analytics on VM5        | Hostname: analytics2.sample.example.com<br>IP: 192.168.1.105 |
| Analytics on VM6        | Hostname: analytics3.sample.example.com<br>IP: 192.168.1.106 |
| Developer Portal on VM7 | Hostname: portal1.sample.example.com<br>IP: 192.168.1.107    |
| Developer Portal on VM8 | Hostname: portal2.sample.example.com<br>IP: 192.168.1.108    |
| Developer Portal on VM9 | Hostname: portal3.sample.example.com<br>IP: 192.168.1.109    |

## Procedure

### 1. Create the Management subsystems

#### a. Create the Management subsystem.

```
apicup subsys create mgmt management
```

#### b. Set deployment-profile to n3xc4.m16.

```
apicup subsys set mgmt deployment-profile=n3xc4.m16
```

If you omit this step, the deployment-profile defaults to n1xc4.16, which is for non-HA environments, and will not support three instances of the subsystem in one cluster.

#### c. Specify the license version you purchased.

```
apicup subsys set mgmt  
license-use=<license_type>
```

The *license\_type* must be either **production** or **nonproduction**. If not specified, the default value is **nonproduction**.

#### d. Set management endpoints

Endpoints can point to VM host names, but in cluster deployments typically point to a load balancer. The load balancer distributes requests over the 3 VMs. The following values point to a sample load balancer URL.

| Component                      | Command                                                                 |
|--------------------------------|-------------------------------------------------------------------------|
| Management REST API URL        | apicup subsys set mgmt platform-api platform-api.sample.example.com     |
| Consumer (Portal) REST API URL | apicup subsys set mgmt consumer-api consumer-api.sample.example.com     |
| Cloud Manager UI               | apicup subsys set mgmt cloud-admin-ui cloud-admin-ui.sample.example.com |
| API Manager UI                 | apicup subsys set mgmt api-manager-ui api-manager-ui.sample.example.com |

#### e. Set the search domain for the VM.

```
apicup subsys set mgmt search-domain sample.example.com
```

#### f. Set the DNS Name Server for the VM to look up endpoints.

```
apicup subsys set mgmt dns-servers 192.168.1.1
```

#### g. Set a Public Keyfile.

This is the public key of the user account that you want to use to **ssh** from, to the appliance.

```
apicup subsys set mgmt ssh-keyfiles "id_rsa.pub"
```

#### h. Create the hosts for the subsystem.

You must specify a password to use to encrypt the disks that the appliance uses. Replace the example password in the previous example with a strong password that meets your security requirements.

```
apicup hosts create mgmt manager1.sample.example.com password123  
apicup hosts create mgmt manager2.sample.example.com password123
```

```
apicup hosts create mgmt manager3.sample.example.com password123
```

- i. Set the network interface. Note that the last parameter is the Internet Gateway.

```
apicup iface create mgmt manager1.sample.example.com eth0 192.168.1.101/255.255.255.0 192.168.1.2
apicup iface create mgmt manager2.sample.example.com eth0 192.168.1.102/255.255.255.0 192.168.1.2
apicup iface create mgmt manager3.sample.example.com eth0 192.168.1.103/255.255.255.0 192.168.1.2
```

- j. Set the network traffic interfaces.

```
apicup subsys set mgmt traffic-iface eth0
apicup subsys set mgmt public-iface eth0
```

- k. Verify the host configuration.

```
apicup hosts list mgmt
```

Note: This command might return the following messages, which you can ignore:

```
* host is missing traffic interface
* host is missing public interface
```

- l. Set a hashed password to access the appliance VM through the VMware Remote Console. Use an operating system utility to create a hashed password, and then use `apicup` to set the hashed password for your subsystem:

```
apicup subsys set mgmt default-password='$1$aTD7uXAO$kNoMAefjGKBwMFiu.8ctr0'
```

**Important:** Review the requirements for creating and using a hashed password. See [Setting and using a hashed default password](#).

- m. Validate the installation.

```
apicup subsys get mgmt --validate
```

- n. Create an ISO file in a plan folder. For example, `mgmtplan-out`.

```
apicup subsys install mgmt --out mgmtplan-out
```

If you have multiple nodes listed for the hosts, when you run the `--out` command, it creates an ISO for each node. When deploying the nodes from VMware, each node gets its own ISO file attached.

- o. To deploy the management ISOs on VMware, see [Deploying the management subsystem OVA file](#).

## 2. Create the analytics subsystems

- a. Create the subsystem:

```
apicup subsys create analyt analytics
```

- b. Set deployment-profile to `n3xc4.m16`.

```
apicup subsys set analyt deployment-profile=n3xc4.m16
```

If you omit this step, the deployment-profile defaults to `n1xc2.16`, which is for non-HA environments, and will not support three instances of the subsystem in one cluster.

- c. Specify the license version you purchased.

```
apicup subsys set analyt
license-use=<license_type>
```

The `license_type` must be either `production` or `nonproduction`. If not specified, the default value is `nonproduction`.

- d. Set analytics endpoints

Endpoints can point to VM host names, but in cluster deployments typically point to a load balancer. The load balancer distributes requests over the 3 VMs. The following values point to a sample load balancer URL.

| Component           | Command                                                                                          |
|---------------------|--------------------------------------------------------------------------------------------------|
| analytics-ingestion | <code>apicup subsys set analyt analytics-ingestion=analytics-ingestion.sample.example.com</code> |
| analytics-client    | <code>apicup subsys set analyt analytics-client=analytics-client.sample.example.com</code>       |

- e. Set the search domain for the VM.

```
apicup subsys set analyt search-domain sample.example.com
```

- f. Set the DNS Name server for the VM to look up endpoints.

```
apicup subsys set analyt dns-servers 192.168.1.1
```

- g. Set a Public Keyfile.

This is the public key of the user account that you want to use to `ssh` from, to the appliance

```
apicup subsys set analyt ssh-keyfiles "id_rsa.pub"
```

- h. Set a hashed password to access the appliance VM through the VMware Remote Console. Use an operating system utility to create a hashed password, and then use `apicup` to set the hashed password for your subsystem:

```
apicup subsys set analyt default-password='$1$aTD7uXAO$kNoMAefjGKBwMFiu.8ctr0'
```

**Important:** Review the requirements for creating and using a hashed password. See [Setting and using a hashed default password](#).

- i. Create the hosts for the subsystem. You must specify a password to use to encrypt the disks that the appliance uses. Replace the example password in the following password with a strong password that meets your security requirements.

```
apicup hosts create analyt analytics1.sample.example.com password123
apicup hosts create analyt analytics2.sample.example.com password123
apicup hosts create analyt analytics3.sample.example.com password123
```

- j. Set the network interface.

Note that the last parameter is the Internet Gateway.

```
apicup iface create analyt analytics1.sample.example.com eth0 192.168.1.104/255.255.255.0 192.168.1.2
apicup iface create analyt analytics2.sample.example.com eth0 192.168.1.105/255.255.255.0 192.168.1.2
apicup iface create analyt analytics3.sample.example.com eth0 192.168.1.106/255.255.255.0 192.168.1.2
```

k. Check the host configuration for problems.

```
apicup hosts list analyt
```

l. Validate the installation.

```
apicup subsys get analyt --validate
```

m. Create an ISO file in a plan folder. For example, `analytplan-out`.

```
apicup subsys install analyt --out analytplan-out
```

If you have multiple nodes listed for the hosts, when you run the `--out` command, it creates an ISO for each node. When deploying the nodes from VMware, each node gets its own ISO file attached.

n. To deploy the ISOs, see [Deploying the Analytics subsystem OVA file](#).

3. Create the portal subsystems

a. Create the portal.

```
apicup subsys create port portal
```

b. For production environments, set deployment-profile to `n3xc4.m8`.

```
apicup subsys set port deployment-profile=n3xc4.m8
```

If you omit this step, the deployment-profile defaults to `n1xc4.m8`, which is for non-HA environments, and will not support three instances of the subsystem in one cluster.

c. Specify the license version you purchased.

```
apicup subsys set port
license-use=<license_type>
```

The `license_type` must be either `production` or `nonproduction`. If not specified, the default value is `nonproduction`.

d. Set the portal endpoints.

Endpoints can point to VM host names, but in cluster deployments typically point to a load balancer. The load balancer distributes requests over the 3 VMs. The following values point to a sample load balancer URL.

| Component    | Command                                                                          |
|--------------|----------------------------------------------------------------------------------|
| portal-admin | <code>apicup subsys set port portal-admin=portal-admin.sample.example.com</code> |
| portal-www   | <code>apicup subsys set port portal-www=portal-www.sample.example.com</code>     |

e. Set the search domain for the VM.

```
apicup subsys set port search-domain sample.example.com
```

f. Set the DNS Name server for the VM to look up endpoints.

```
apicup subsys set port dns-servers 192.168.1.1
```

g. Set a Public Keyfile.

This is the public key of the user account that you want to use to `ssh` from, to the appliance

```
apicup subsys set port ssh-keyfiles "id_rsa.pub"
```

h. Set a hashed password to access the appliance VM through the VMware Remote Console. Use an operating system utility to create a hashed password, and then use `apicup` to set the hashed password for your subsystem:

```
apicup subsys set port default-password='$1$aTD7uXAO$kNoMAefjGKBwMFiu.8ctr0'
```

**Important:** Review the requirements for creating and using a hashed password. See [Setting and using a hashed default password](#).

i. Create the hosts for the subsystem. You must specify a password to use to encrypt the disks that the appliance uses.

```
apicup hosts create port portal1.sample.example.com password123
apicup hosts create port portal2.sample.example.com password123
apicup hosts create port portal3.sample.example.com password123
```

Replace the example password in the previous example with a strong password that meets your security requirements.

j. Set the network interface.

Note that the last parameter is the Internet Gateway.

```
apicup iface create port portal1.sample.example.com eth0 192.168.1.107/255.255.255.0 192.168.1.2
apicup iface create port portal2.sample.example.com eth0 192.168.1.108/255.255.255.0 192.168.1.2
apicup iface create port portal3.sample.example.com eth0 192.168.1.109/255.255.255.0 192.168.1.2
```

k. Check the host configuration for problems.

```
apicup hosts list port
```

l. Validate the installation.

```
apicup subsys get port --validate
```

m. Create an ISO file in a plan folder. For example, `portplan-out`.

```
apicup subsys install port --out portplan-out
```

If you have multiple nodes listed for the hosts, when you run the `--out` command, it creates an ISO for each node. When deploying the nodes from VMware, each node gets its own ISO file attached.

n. To deploy the ISOs, see [Deploying the Developer Portal subsystem OVA file](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Testing a new configuration against a current cluster

You can use the `apicup` utility to test the validity of a new configuration before you install it.

The `apicup` utility is used to set configuration properties for subsystems on API Connect on VMware appliances. The utility can be used for installation, upgrade, and maintenance activities such as backup and restore.

The usage pattern is to set values for each parameter you need for a subsystem, and then deploy the new values with the `apicup subsys install` command.

You can use the `--dry-run` option to test the validity of your values prior to deploying them to an existing cluster:

```
apicup subsys install <subsystem_name> --dry-run
```

Important: You cannot use `apicup subsys install <SUBSYS> --dry-run` for a fresh install or an upgrade. The `--dry-run` feature is for testing proposed configuration changes on an existing cluster.

For example, if you want to configure S3 backups for you management subsystem, the command flow is:

1. Follow the instructions for configuring S3 backups [Reconfiguring backup settings for the management subsystem](#) by issuing the required `apicup subsys set` commands:

```
apicup subsys set mgmt <setting>=<value>
apicup subsys set mgmt <second_setting>=<value>
apicup subsys set mgmt <third_setting>=<value>
.
.
```

2. Do a dry run of the install command:

```
apicup subsys install mgmt --dry-run
```

Example message on success:

```
managementcluster.management.apiconnect.ibm.com/management configured (server dry run)
```

Example message on failure:

```
Error: Failed to execute dry-run:....
```

The error message also contains details about the error.

3. When dry run returns success, deploy:

```
apicup subsys install mgmt
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding disk space to a VMware appliance

Increase disk space on the VMware appliance.

### About this task

For multi-node deployment of the appliance, only one VM at a time should have its disk space augmented. The subsystem should be in good health before proceeding to the next node. Health of the subsystem can be checked with `apicup subsys health-check <subsystem-name>`.

Restriction:

The increased disk capacity of a VMware appliance won't be reflected in the storage size of the PVCs that are hosted on the appliance, as those PVCs are immutable. This restriction doesn't impact the Portal and Analytics subsystems, as the PVC storage size isn't used to enforce any disk usage limit, so the subsystems can use all of the additional disk space. However, for the Management subsystem the PVC storage size is used in the database storage utilization computation, and that might trigger disk usage warnings.

The most common reason for the Management subsystem database to run out of disk space, is due to Write Ahead Log (WAL) file accumulation in relation to an incorrectly configured backup, or an unavailable backup server. If this type of condition arises, adding disk space might help with the health of the appliance control plane, but it won't increase the disk space that's available to the database, so you must resolve the WAL file accumulation condition. If the disk space that's available to the

Management database must be increased, you should carry out a disaster recovery operation of the Management subsystem, using a larger data disk size for the new installation, so that adding disk space after the install won't be needed.

## Procedure

---

1. Shutdown the virtual machine, either by issuing a shutdown command as root from the VM, or by using the VMware console or command line interface. For example, use the VMware console user interface and click the red rectangle.
2. Use either the VMware console or command line interface to add a new device to the VM, of type Hard Disk and of the desired size to be added to the appliance. For example, on the VMware console:
  - a. Click Edit settings.
  - b. Click Add new device. From the drop-down menu, select Hard Disk.
  - c. Enter size in GB and click OK.
3. Use either the VMware console or the command line interface to power on the VM. As the VM starts it should detect the newly added disk and use it to augment the available capacity for the /data/secure mount point.
4. Optionally you may verify that a new disk `sdc` was added (or `sdd` if you already added one disk, and so on). Log in to the server and observe the new disk. For example:

```
root@apimdev1139:~# lsblk
NAME                MAJ:MIN RM  SIZE RO TYPE  MOUNTPOINT
sda                  8:0    0  100G  0 disk
├─sda1                8:1    0   99.9G  0 part /
├─sda14               8:14   0    4M    0 part
└─sda15               8:15   0   106M  0 part /boot/efi
sdb                  8:16   0   250G  0 disk
├─apicconnect-data  252:0   0   260G  0 lvm
└─apicSecureDisk    252:1   0   260G  0 crypt /data/secure
sdc                  8:32   0    10G  0 disk
├─apicconnect-data  252:0   0   260G  0 lvm
└─apicSecureDisk    252:1   0   260G  0 crypt /data/secure
sr0                 11:0    1    44K  0 rom
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Add a node to a VMware cluster

Add a node to a VMware cluster when you want to scale the deployment.

### About this task

---

Complete each of the following tasks:

## Procedure

---

1. [Adding a node to a VMware cluster for management subsystem](#)
  2. [Adding a node to a VMware cluster for Developer Portal subsystem](#)
  3. [Adding a node to a VMware cluster for Analytics subsystem](#)
- [Adding a node to a VMware cluster for management subsystem](#)  
When scaling your deployment, you can add a node to an existing VMware cluster. Use this topic to add a node for a management subsystem.
  - [Adding a node to a VMware cluster for Developer Portal subsystem](#)  
When scaling your deployment, you can add a node to an existing VMware cluster. Use this topic to add a node for a Portal
  - [Adding a node to a VMware cluster for Analytics subsystem](#)  
When scaling your deployment, you can add a node to an existing VMware cluster. Use this topic to add a node for an Analytics subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding a node to a VMware cluster for management subsystem

When scaling your deployment, you can add a node to an existing VMware cluster. Use this topic to add a node for a management subsystem.

### About this task

---

These instructions assume you have an appliance installed with a single node and a development profile.

To support switching to a production profile, use the following steps to add a minimum of 2 more nodes by setting up hosts and ifaces.

## Procedure

1. Add your hosts.

```
apicup hosts create mgmt hostname.domainname hd_password
```

Where the following are true:

- `hostname.domainname` is the fully qualified name of the server where you are hosting your Management service, including the domain information.
- `hd_password` is the password that the Linux Unified Key Setup uses to encrypt the storage for your Management service. This password is hashed when it is stored on the server or in the ISO. Note that the password is base64 encoded when stored in `apiconnect-up-v10.yml`.

Repeat this command for each host that you want to add.

Note: Host names and DNS entries may not be changed on a cluster after the initial installation.

2. Create your interfaces.

```
apicup iface create mgmt hostname.domainname physical_network_id host_ip_address/subnet_mask network_gateway_ip_address
```

Where `physical_network_id` is the network interface ID of your physical server. The value is most often `eth0`. The value can also be `ethx`, where `x` is a number identifier.

The format is similar to this example: `apicup iface create mgmt myHostname.domain eth0 192.0.2.10/255.255.255.0 192.0.2.1`.

Note: The `network_gateway_ip_address` is the network gateway (not a DataPower Gateway). If you are creating multiple network interfaces, each one must be on a different subnet with a different gateway.

3. Optional: Use `apicup` to view the configured hosts:

```
apicup hosts list mgmt
testsrv0231.subnet1.example.com
  Device IP/Mask Gateway
  eth0   1.2.152.231/255.255.254.0 1.2.152.1
```

Note: This command might return the following messages, which you can ignore:

```
* host is missing traffic interface
* host is missing public interface
```

4. Optional: Verify that the configuration settings are valid.

```
apicup subsys get mgmt --validate
```

The output lists each setting and adds a check mark after the value once the value is validated. If the setting lacks a check mark and indicates an invalid value, reconfigure the setting.

5. Create your ISO file.

```
apicup subsys install mgmt --out mgmtplan2-out
```

The `--out` parameter and value are required.

Note: Use a directory name that is *different* than the directory name you used on fresh install for `--out` when generating new ISOs. The installer checks for the existence of the directory name.

The command creates all 3 ISO. In this example, the ISO file is created in the `myProject/mgmtplan2-out` directory. The original installation example used `mgmtplan-out`.

6. Generate ISOs for the new nodes:

- Deploy the two new VM nodes using the new ISOs. The existing node can remain as is. You do not need to redeploy or reboot existing nodes.
- Continue with [Deploying the management subsystem OVA file](#).

7. After some time a cluster of 3 nodes is formed. Use `apicup subsys`

`health-check` to verify that the addition of new nodes to the cluster was successful.

Important: Do not change the deployment profile until the new nodes have been added to the cluster and `apicup subsys health-check` is successful.

8. You can add additional nodes. For example, to add a fourth node:

Note: Any nodes added to a cluster with 3 nodes or more are added as worker nodes.

- a. Add one more host and interface. Repeat Step 1 through Step 4.
- b. Generate an ISO file. Be sure to use a different name for the directory name. For example:

```
apicup subsys install mgmt --out mgmt3-out
```

- c. Deploy a new VM node using the fourth ISO. See [Deploying the management subsystem OVA file](#).

After a while the Kubernetes cluster shows with a fourth node of type `worker`.

9. To switch profiles, continue with Step 1.b in [Changing deployment profiles on VMware](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding a node to a VMware cluster for Developer Portal subsystem

When scaling your deployment, you can add a node to an existing VMware cluster. Use this topic to add a node for a Portal

## About this task

These instructions assume you have an appliance installed with a single node and a development profile.

To support switching to a production profile, use the following steps to add a minimum of 2 more nodes by setting up hosts and ifaces.

## Procedure

1. Add your hosts.

```
apicup hosts create port hostname.domainname hd_password
```

Where the following are true:

- `hostname.domainname` is the fully qualified name of the server where you are hosting your Developer Portal, including the domain information.
  - `hd_password` is the password of the Linux Unified Key Setup uses to encrypt the storage for your Developer Portal. This password is hashed when it is stored on the server or in the ISO. Note that the password is base64 encoded when stored in `apiconnect-up-v10.yml`.
- Repeat this command for each host that you want to add.

Note: Host names and DNS entries may not be changed on a cluster after the initial installation.

2. Create your interfaces.

```
apicup iface create port hostname.domainname physical_network_id host_ip_address/subnet_mask gateway_ip_address
```

Where `physical_network_id` is the network interface ID of your physical server. The value is most often `eth0`. The value can also be `ethx`, where `x` is a number identifier.

The format is similar to this example: `apicup iface create port myHostname.domain eth0 192.0.2.1/255.255.1.1 192.0.2.1`

Note: You can optionally configure a second network interface (NIC) card for use with Developer Portal. In this scenario, one NIC is used for internal traffic between the Portal and APIM, and the second is used as a public interface. If you are creating multiple network interfaces, each one must be on a different subnet with a different gateway. For information on configuring two NICs for Developer Portal, see [Configuring two NICs on the Developer Portal](#).

3. Optional: You can specify a range of allowable client IP addresses.

You can optionally restrict which IP addresses can access any of the ingresses by creating an allowlist annotation, which then will only allow the specified IP addresses to access the ingress and will deny all other source IP addresses. See [Specifying a range of allowable client IP addresses for Developer Portal](#).

Note: One usage of this restriction is the scenario where you split traffic between your private and public networks in 2 NIC configuration.

4. Optional: Use `apicup` to view the configured hosts:

```
apicup hosts list port
apimdev0232.hursley.ibm.com
Device IP/Mask Gateway
eth0 1.2.152.232/255.255.254.0 1.2.152.1
```

5. Leave `multi-site-ha-enabled` set to `false`.

6. Optional: Verify that the configuration settings are valid.

```
apicup subsys get port --validate
```

The output lists each setting and adds a check mark after the value once the value is validated. If the setting lacks a check mark and indicates an invalid value, reconfigure the setting.

7. Create your ISO file.

```
apicup subsys install port --out portplan2
```

The `--out` parameter and value are required. In this example, the ISO file is created in the `myProject/portplan_new-out` directory.

Note: Use a directory name that is *different* than the directory name you used on fresh install for `--out` when generating new ISOs. The installer checks for the existence of the directory name.

8. Generate ISOs for the new nodes:

- Deploy only the ISOs of the new nodes. The existing nodes can remain as is. You do not need to redeploy or reboot existing nodes.
- Continue with [Deploying the Developer Portal subsystem OVA file](#).

9. After some time a cluster of 3 nodes is formed. Use `apicup subsys`

`health-check` to verify that the addition of new nodes to the cluster was successful.

Important: Do not change the deployment profile until the new nodes have been added to the cluster and `apicup subsys health-check` is successful.

10. You can add additional nodes. For example, to add a fourth node:

Note: Any nodes added to a cluster with 3 nodes or more are added as worker nodes.

- a. Add one more host and interface. Repeat Step [1](#) through Step [6](#).
- b. Generate an ISO file. Be sure to use a different name for the directory name. For example:

```
apicup subsys install port --out portplan3
```

- c. Deploy a new VM node using the fourth ISO. See [Deploying the Developer Portal subsystem OVA file](#).

After a while the Kubernetes cluster shows with a fourth node of type `worker`.

11. To switch profiles, continue with Step [2.b](#) in [Changing deployment profiles on VMware](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Adding a node to a VMware cluster for Analytics subsystem

When scaling your deployment, you can add a node to an existing VMware cluster. Use this topic to add a node for an Analytics subsystem.

## About this task

---

These instructions assume you have an appliance installed with a single node and a development profile.

To support switching to a production profile, use the following steps to add a minimum of 2 more nodes by setting up hosts and ifaces.

## Procedure

---

1. Add your hosts.

```
apicup hosts create analyt hostname.domainname hd_password
```

Where the following are true:

- `hostname.domainname` is the fully qualified name of the server where you are hosting your Analytics service, including the domain information.
- `hd_password` is the password of the Linux Unified Key Setup uses to encrypt the storage for your Analytics service. This password is hashed when it is stored on the server or in the ISO. Note that the password is base64 encoded when stored in `apiconnect-up-v10.yml`.

Repeat this command for each host that you want to add.

Note: Host names and DNS entries may not be changed on a cluster after the initial installation.

2. Create your interfaces.

```
apicup iface create analyt hostname.domainname physical_network_id host_ip_address/subnet_mask gateway_ip_address
```

Where `physical_network_id` is the network interface ID of your physical server. The value is most often `eth0`. The value can also be `ethx`, where `x` is a number identifier.

The format is similar to this example: `apicup iface create analyt myHostname.domain eth0 192.0.0.1/255.255.1.1 192.0.2.1`

3. Optional: Use `apicup` to view the configured hosts:

```
apicup hosts list analyt
testsrv0233.subnet1.example.com
  Device  IP/Mask  Gateway
  eth0    1.2.152.233/255.255.254.0  1.2.152.1
```

4. Verify that the configuration settings are valid.

```
apicup subsys get analyt --validate
```

The output lists each setting and adds a check mark after the value once the value is validated. If the setting lacks a check mark and indicates an invalid value, reconfigure the setting.

5. If you configured additional deployment options in an extra-values file, run the following command to make the file available during installation:

```
apicup subsys set analyt extra-values-file path/analytics-extra-values.yaml
```

where `analytics-extra-values.yaml` is the name of the file containing your deployment settings.

6. Create your ISO file.

```
apicup subsys install analyt --out analytplan2-out
```

Note: Use a directory name that is *different* than the directory name you used on fresh install for `--out` when generating new ISOs. The installer checks for the existence of the directory name.

The `--out` parameter and value are required. In this example, the ISO file is created in the `myProject/analytplan_new-out/node-config` directory.

7. Generate ISOs for the new nodes:

- Deploy only the ISOs of the new nodes. The existing nodes can remain as is. You do not need to redeploy or reboot existing nodes.
- Continue with [Deploying the Analytics subsystem OVA file](#).

8. After some time a cluster of 3 nodes is formed. Use `apicup subsys`

```
health-check
```

 to verify that the addition of new nodes to the cluster was successful.

Important: Do not change the deployment profile until the new nodes have been added to the cluster and `apicup subsys health-check` is successful.

9. You can add additional nodes. For example, to add a fourth node:

Note: Any nodes added to a cluster with 3 nodes or more are added as worker nodes.

- a. Add one more host and interface. Repeat Step 1 through Step 5.
- b. Generate an ISO file. Be sure to use a different name for the directory name. For example:

```
apicup subsys install analyt --out analytplan3-out
```

- c. Deploy a new VM node using the fourth ISO. See [Deploying the Analytics subsystem OVA file](#).

After a while the Kubernetes cluster shows with a fourth node of type `worker`.

10. To switch profiles, continue with Step 3.c in [Changing deployment profiles on VMware](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

# Changing deployment profiles on VMware

You can change an API Connect installation to use different deployment profiles.

## About this task

---

After you complete initial installation of the API Connect subsystems, you can switch to another of the deployment profiles that are supported for the subsystem.

Important considerations:

- If you are changing from a development profile to a production profile, ensure that you have production profile hardware (3 nodes).
- While it is possible to use a development profile installation in a production deployment, it is not recommended.
  - For the management subsystem and the portal subsystem, the development profiles do not provide the failover resiliency nor the downtime guarantee that is needed to maintain high availability (HA) production deployments.
  - For the analytics subsystem, the development deployment option was designed to have a small impact on your hardware and as such it will not scale, and it will not perform as well as the production profile.
- Based on the resources configured for each microservice in the profile, there might be downtime during the profile change.
- If you enabled the analytics message queue feature, you must disable it before changing to another deployment profile. You can re-enable the message queue feature after the profile change is complete.

To disable the message queue:

1. Edit the analytics-extra-value.yaml file.
2. Locate the `mq` subsection and change the `enabled` setting to `false`.

```
mq:
  enabled: false
```

3. Apply the change:

```
apicup subsys install <subsystem_name>
```

To re-enable the message queue:

1. Edit the analytics-extra-value.yaml file.
2. Locate the `mq` subsection and change the `enabled` setting to `true`.
3. Apply the change:

```
apicup subsys install <subsystem_name>
```

Supported profiles:

Management subsystem

- Development profile

```
profile: n1xc4.m16
```

Describes a hardware profile of 1 node, 4 cores, and 16 GB memory. Deploys a subsystem with the scale of one; a single node, non-HA subsystem. Recommended for development and testing.

- Production profile

```
profile: n3xc4.m16
```

Describes a hardware profile of 3 nodes, 4 cores, and 16 GB memory. Deploys in HA mode for a production environment. Not supported for fewer than three nodes.

Portal subsystem

- Development profiles deploy a subsystem with the scale of one; a single node, non-HA subsystem. Development profiles are recommended for development or testing.
- Production profiles deploys in HA mode for a production environment. Not supported for fewer than three nodes.

- Development profile

```
profile: n1xc8.m16
```

Describes a hardware profile of 1 node, 8 cores, and 16 GB memory

- Development profile (reduced CPU)

```
profile: n1xc4.m16
```

Describes a hardware profile of 1 node, 4 cores, and 16 GB memory. For use when the deployment environment has limited CPU resources.

- Development profile (reduced CPU and Memory)

```
profile: n1xc2.m8
```

Describes a hardware profile of 1 node, 2 cores, and 8 GB memory. For use when the deployment environment has limited CPU and Memory resources.

- Production profile

```
profile: n3xc8.m16
```

Describes a hardware profile of 3 nodes, 8 cores, and 16 GB memory.

- Production profile (reduced CPU and Memory)

**profile: n3xc4.m8**

Describes a hardware profile of 3 nodes, 4 cores, and 8 GB memory. For use when the deployment environment has limited CPU and Memory resources.

Analytics subsystem

- Development profile

**n1xc2.m16**

Describes a hardware profile of 1 node, 2 cores, and 16 GB memory. Deploys a single-node, non-HA, non-scalable Analytics solution. The development profile is only recommend for development and test environments.

- Production profile

**n3xc4.m16**

Describes a hardware profile of 3 nodes, 4 cores, and 16 GB memory. Deploys a three-node, HA, scalable Analytics solution. The production profile requires at least 3 nodes to work properly, and is the recommended option for production environments.

## Procedure

- **Switching from a development profile to a production profile**

1. Management subsystem:

- Add a node. See: [Adding a node to a VMware cluster for management subsystem](#)
- Configure the project to the desired production profile:

```
apicup subsys set <subsystem_name> deployment-profile=<prod-profile>
```

c. Use the new profile

```
apicup subsys install <subsystem_name>
```

d. Changing deployment profile changes the number of replicas according to the deployment profile specifications. If you adds more nodes than 3, and you want more replicas, additional specific steps are needed to scale up the replicas.

2. Portal subsystem:

- Add a node. See: [Adding a node to a VMware cluster for Developer Portal subsystem](#)
- Configure the project to the desired production profile:

```
apicup subsys set <subsystem_name> deployment-profile=<prod-profile>
```

c. Use the new profile

```
apicup subsys install <subsystem_name>
```

3. Analytics subsystem:

- To avoid data loss for analytics, it is recommended that data collection be stopped while the profile switch is in progress. See [Stopping Analytics data collection](#).
- Add a node. See: [Adding a node to a VMware cluster for Analytics subsystem](#)
- Configure the project to the desired production profile:

```
apicup subsys set <subsystem_name> deployment-profile=<prod-profile>
```

d. Use the new profile.

```
apicup subsys install <subsystem_name>
```

e. Restart analytics data collection as explained in the topic, [Restarting Analytics pods and data collection](#).

- **Switching from production profile to development profile**

1. Analytics only: To avoid data loss for analytics, it is recommended that data collection be stopped while the profile switch is in progress. See [Stopping Analytics data collection](#).

2. For each subsystem:

- Configure the project to the desired production profile:

```
apicup subsys set <subsystem_name> deployment-profile=<dev-profile>
```

b. Use the new profile:

```
apicup subsys install <subsystem_name>
```

3. Analytics only: Restart analytics data collection as explained in the topic, [Restarting Analytics pods and data collection](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Appliance boot mode configuration

Configure the boot mode for the appliance VMs.

By default every appliance node requires the presence of an ISO file attached at boot.

**Version 10.0.4.0 or later:** You can configure individual VMs so that they can be booted and rebooted without an ISO being attached. Each appliance VM (node) is configured individually.

You can:

- [Check the current boot mode of an appliance](#)
- [Configure an appliance for iso-ignored boot mode](#)
- [Configure an appliance for iso-required boot mode](#)
- [Revert back to iso-required boot mode by booting the appliance in rescue mode](#)

## Check the current boot mode of an appliance

---

The default boot mode for all appliances is `iso-required`. To check the current boot mode:

1. Connect to the target appliance via SSH then switch to the root user:

```
ssh apicadm@{ova appliance hostname}
sudo -i
```

2. Use `apic boot-mode` to check the current boot mode of the appliance. For example:

```
root@ip-192-168-122-241:~# apic boot-mode
INFO[0000] Log level: info
INFO[0000] current boot mode is: iso-required
```

## Configure an appliance for iso-ignored boot mode

---

An appliance can be configured to use the `iso-ignored` boot mode instead of the default `iso-required`. Prerequisite: The appliance must have first booted with its configuration ISO attached and in `iso-required` boot mode (default) before the boot mode can be changed to `iso-ignored`.

You can configure an appliance to use the `iso-ignored` boot mode instead of the default `iso-required`.

**Prerequisite:** The appliance must have first booted with its configuration ISO attached and in `iso-required` boot mode (default), before you can change the boot mode to `iso-ignored`.

Note: If you added a static route to the routing table, as documented in [Adding a static route on a virtual machine](#), and if you are relying on a `bootcmd` from the ISO, then using the `iso-ignored` boot mode causes the `bootcmd` section being ignored or ineffective.

1. Connect to the target appliance via SSH then switch to the root user:

```
ssh apicadm@{ova appliance hostname}
sudo -i
```

2. Edit the file `/etc/default/grub.d/50-cloudimg-settings.cfg` to ensure that the `GRUB_TIMEOUT` and `GRUB_RECORDFAIL_TIMEOUT` are set to the value 5. Then run the command `update-grub`. For example:

```
root@ip-192-168-122-241:~# update-grub
Sourcing file `/etc/default/grub'
Sourcing file `/etc/default/grub.d/50-cloudimg-settings.cfg'
Sourcing file `/etc/default/grub.d/init-select.cfg'
Generating grub configuration file ...
Found linux image: /boot/vmlinuz-5.4.0-84-generic
Found initrd image: /boot/initrd.img-5.4.0-84-generic
done
```

3. Set the appliance boot mode to `iso-ignored` with the command `apic boot-mode iso-ignored`. For example:

```
root@ip-192-168-122-241:~# apic boot-mode iso-ignored
INFO[0000] Log level: info
INFO[0000] current boot mode is: iso-ignored
```

4. Shutdown the VM, and remove the CD/DVD device from the VM configuration through VSphere.

For any subsequent boot of the appliance while it remains in `iso-ignored` boot mode, any ISO file attached will be ignored, and the boot will proceed as normal, whether an ISO file is attached or not.

Warning: If the appliance was booted in `iso-ignored` boot mode, it is possible to change its boot mode to `iso-required`. However, as stated in the prerequisites, it is not possible to immediately switch back to `iso-ignored`, and the next boot of the appliance must happen with the configuration ISO attached and boot mode `iso-required`.

## Configure an appliance for iso-required boot mode

---

The mode `iso-required` is the default boot mode for all appliances. If the appliance boot mode was changed to `iso-ignored` you can revert back to `iso-required` boot mode.

Warning:

If the appliance was booted in `iso-ignored` boot mode, it is possible to change its boot mode to `iso-required`. However, you cannot immediately switch back to `iso-ignored`, and the next boot of the appliance must happen with the configuration ISO attached and boot mode `iso-required`. After the appliance is booted with ISO attached in `iso-required` boot mode, the boot mode can then be switched to `iso-ignored` if needed.

1. Connect to the target appliance via SSH then switch to the root user:

```
ssh apicadm@{ova appliance hostname}
sudo -i
```

2. Set the appliance boot mode to `iso-required` with the command `apic boot-mode iso-required`. For example:

```
root@ip-192-168-122-241:~# apic boot-mode iso-required
INFO[0000] Log level: info
INFO[0000] current boot mode is: iso-required
```

Important: For any subsequent boot of the appliance while it remains in `iso-required` boot mode, the configuration ISO file must be connected at boot and for every boot.

## Revert back to `iso-required` boot mode by booting the appliance in rescue mode

When an appliance is configured with the `iso-ignored` boot mode, the boot sequence ignores any attached ISO. This means that it is not possible to influence the appliance configuration during its boot. In case the appliance is not booting properly and the boot mode needs to be reverted back to `iso-required`, proceed as follows:

1. Access to the VMware console for the Appliance, and after causing it to reboot, bring up a console to the appliance. You can give focus to the window by clicking the mouse into it. Press the `Esc` key to access the Linux grub boot menu. For example:

```
GNU GRUB version 2.04

*Ubuntu
Advanced options for Ubuntu
```

2. Press `e` and navigate using arrow keys to the line starting with `linux` to append `systemd.unit=rescue.target`

```
GNU GRUB version 2.04
.
.
insmod part_gpt
insmod ext2
if [ x$feature_platform_search_hint = xy ]; then
  search --no-floppy --fs-uuid --set=root e46dalb8-55ao-4df9-842e-\
8d80c3a22ffc
else
  search --no-floppy --fs-uuid --set=root e46dalb8-55ao-4df9-842e-8\
d80c3a22ffc
fi
linux /boot/vmlinuz-5.4.0-84-generic root=LABEL=cloudimg-roc\
tfs ro console=tty1 console=ttyS0 net.ifnames=0 biosdevname=0 systemd.unit\
=rescue.target
initrd /boot/initrd.img-5.4.0-84-generic
```

3. Press `Ctrl+x` to boot.
4. Press `Enter` to enter maintenance mode. Run the commands:

```
rm -f /etc/cloud/cloud-init.disabled

and

echo -n "iso-required" > /usr/local/lib/appliance-config/boot-mode

[ 3.442687] systemd[1]: Mounted Kernel Debug Filesystem

root@ip-192-168-122-241:~#
```

5. Reboot the appliance with correct configuration ISO attached.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Running commands at boot with `iso-ignored` boot mode

When `iso-ignored` boot mode is configured, complete the following steps on each appliance that should run commands at boot.

## About this task

If you configured the appliance to boot in `iso-ignored` mode as documented in [Appliance boot mode configuration](#), the `bootcmd` lines will be ignored. For each appliance node that should run commands at boot, complete the following steps.

## Procedure

1. SSH into the appliance as root.
2. Create the `/usr/local/bin/appliance-boot-commands.sh` script to be executed at boot; for example:

```
cat << EOF > /usr/local/bin/appliance-boot-commands.sh
#!/bin/bash

ip route add 172.27.218.0/24 via 192.168.122.1 dev eth0
ip route add 172.26.203.0/24 via 192.168.122.1 dev eth0
EOF
```

This step takes the same example, and essentially achieves the same result, as the procedure in [Adding a static route on a virtual machine](#).

3. Make the script executable by running the following command:

```
chmod +x /usr/local/bin/appliance-boot-commands.sh
```

4. Create the following systemd service file `/lib/systemd/system/appliance-boot-commands.service`:

```
cat << EOF > /lib/systemd/system/appliance-boot-commands.service
[Unit]
After=network-online.target

[Service]
Type=oneshot
ExecStart=/usr/local/bin/appliance-boot-commands.sh
RemainAfterExit=false
StandardOutput=journal

[Install]
WantedBy=multi-user.target
EOF
```

5. Enable the systemd service by running the following command:

```
systemctl enable appliance-boot-commands
```

Upon subsequent boots, the `/usr/local/bin/appliance-boot-command.sh` script will be executed.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Managing an appliance data disk

You can use `apic` commands to manage appliance data disks in your VMware deployment.

The API Connect deployment on VMware uses 2 partitions. The first contains the base operating system, while the second is encrypted so that any customer data that is stored on disk uses the encrypted volume. Encryption is done with Linux Unified Key Setup (LUKS) disk encryption.

During installation of each API Connect subsystem, you specify a password `HD-PASSWD` when configuring the host:

```
apicup hosts create <SUBSYS> <HOSTNAME> <HD-PASSWD>
```

If you want to force a restart of processes, without requiring a full restart of the virtual machine, you can use the command `apic lock` to stop the Kubernetes node on the virtual machine and lock the secured storage. When you are ready to restart processes, you can use `apic unlock` to restart the Kubernetes node. The command `apic unlock` uses the password to unlock the partition so that files can be read from it and written to it. The unlock command also starts the `apic` daemon, also known as the `appliance-manager` service.

You can check that status of this service with:

```
sudo systemctl status appliance-manager
```

One `appliance-manager` daemon runs on each node, where it manages the Kubernetes cluster, processes update and upgrade requests, and gathers logs.

| apic command         | Description                                               |
|----------------------|-----------------------------------------------------------|
| <code>lock</code>    | Shut down appliance services and lock the secured storage |
| <code>logs</code>    | Retrieve logs from all nodes in the cluster               |
| <code>status</code>  | Report on cluster status                                  |
| <code>unlock</code>  | Unlock the secure storage and start the appliance         |
| <code>version</code> | Get the API Connect appliance base version                |

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding a static route on a virtual machine

You can add a static route to the routing table when deploying API Connect on a VMware virtual machine.

### About this task

---

Add commands to your additional `cloud-init` file. You can do this for the Management, Analytics, and Portal subsystems.

### Procedure

---

1. Specify an additional cloud-init file:

```
apicup subsys set <subsys> additional-cloud-init-file <path-to-cloud-init-file>
```

2. Add lines to your cloud-init file.

Syntax:

```
bootcmd:  
- ip route add <destination>/<mask> via <gateway> dev eth<n>
```

Example:

```
bootcmd:  
- ip route add 172.27.218.0/24 via 172.27.218.1 dev eth1  
- ip route add 172.26.203.0/24 via 172.27.218.1 dev eth1
```

3. Regenerate the ISO file.

```
apicup subsys install <subsys> --out <plan-directory>
```

4. Restart the ISO, and ensure that the node(s) have this updated ISO attached at startup.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Replica override for microservices on VMware

Modify the replica count for microservices by using template overrides for Custom Resources.

When API Connect is deployed, the deployment profile you select drives the number of replicas to be used for most deployment. For development profiles, typically specified by `n1x` . . . , the replica count is 1. For production profiles, typically specified by `n3x` . . . , replica count is 3.

You can override the replica count for individual deployments by using template overrides.

- Template overrides are a piece of yaml that should be added to the Kubernetes custom resource. The examples provided in this topic show only that the `template:` element should be under the main `spec:` element of a CR. The rest of the CR is not shown.
- When applying overrides for Appliance deployments (virtual machines), the yaml sample provided as example must be added in an extra-values-file for the subsystem. To view an example of documenting a template override for an Appliance, see [Setting rate limits for public APIs on the management service](#)

---

## Management subsystem

For a Management CR in Kubernetes or OpenShift, the following override specifies 5 replicas for the `apim` deployment:

```
spec:  
  template:  
    - name: apim  
      replicaCount: 5
```

You can also configure replicate count through a similar template override for:

- `juhu`
- `ldap`
- `lur`

---

## Analytics subsystem

The Analytics microservices that can be scaled using template override are:

- `client`
- `ingestion`
- `mq-kafka`
- `mq-zk`

- `mtls-gw`
- `storage-coord`
- `storage-data`
- `storage-master`

Note that this microservice cannot be scaled below 2 replicas when using a 3 node (production) deployment profile. Also, when using this **unique** storage type, you must have at least 1 replica available for the 3 storage roles (coord, data and master).

- `storage-shared`

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Advanced configuration for management subsystem

Specify advanced configuration for the management subsystem.

Note: VMware deployments include subsystem settings that cannot be reconfigured without a complete deployment. For example, for the Management Service these settings include hosts, endpoints, interfaces (`public-iface`, `traffic-iface`), IP ranges of the Kubernetes pod and the service networks (`k8s-pod-network`, `k8s-service-network`). Before reconfiguring, review the installation instructions for your subsystem to determine which settings are optional during initial installation and thus able to be updated later.

See:

- [Setting rate limits for public APIs on the management service](#)  
Describes the procedure for setting a rate limit for public APIs on the management service. Rate limits provide protection from DDoS (distributed denial of service) attacks.
- [Configuring maximum size of client requests to the Management subsystem on VMware](#)  
You can configure the maximum allowed size of the client request body for requests made to the Management subsystem.
- [Configuring monetization on VMware](#)  
You can optionally configure monetization in API Connect on a VMware virtual machine by enabling the billing microservice.
- [Configuring use of an external NTP server](#)  
You can optionally configure an external NTP server for use by API Connect when deploying on a VMware virtual machine.
- [Overriding resources for Postgres components on VMware](#)  
In 10.0.4.0 and greater, you can optionally override the CPU and Memory resources used by postgres database components.
- [Enabling UI feature flags on VMware](#)  
Use a template override to update the installation CR with settings that control UI features.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Setting rate limits for public APIs on the management service

Describes the procedure for setting a rate limit for public APIs on the management service. Rate limits provide protection from DDoS (distributed denial of service) attacks.

### Before you begin

Note: This article refers to third-party software that IBM does not control. As such, the software may change and this information may become outdated. These instructions assume you have the kubectl command-line tool installed. For more information, see <https://kubernetes.io>.

### About this task

Rate limits can be set for public APIs on the management service. Rate limits on APIs help provide protection from DDoS (distributed denial of service) attacks. Without a rate limit, API calls from public APIs are unlimited.

The rate limit configuration requires that the header contains the actual client IP address. Any load balancer or proxy (for example, HAProxy) that is installed in front of the management service must be configured to pass the actual client IP address.

This procedure must be performed on a running API Connect deployment.

Rate limits are calculated as requests per seconds per client.

Note: If the rate limit has been reached on the management subsystem, the client will get an HTTP error: **429 Too Many Requests**.

### Procedure

- Set a rate limit:
  1. Add the following entries to the extra-values-file:

```
spec:
  template:
    - name: juhu
      containers:
        - name: juhu
          env:
            - name: RATE_LIMIT_PER_CLIENT
              value: "10"
            - name: LIMIT_REQUEST_OPTION
              value: "burst=10 nodelay"
```

In this example, the first option sets the rate to 10 requests per second (10r/s). The second option allows 10 requests boosted without delay within < 1 second. You can customize as needed.

The `rateLimitPerClient` property sets `rate`, and `limitRequestOption` sets `[burst=number] [nodelay | delay=number]` in the following nginx configuration:

```
limit_req zone=key zone=name:size rate=rate;
limit_req zone=name [burst=number] [nodelay | delay=number];
```

Note that `zone` has been pre-defined and can't be configured. For more details, see the nginx doc [http://nginx.org/en/docs/http/nginx\\_limit\\_req\\_module.html](http://nginx.org/en/docs/http/nginx_limit_req_module.html).

2. Save the extra-values file with a filename of your choice, but it must have a .yaml or .yml extension.
3. Use `apicup` to update the VMware `extra-values-file` attribute to point to the new or updated management subsystem extra-values file:

```
apicup subsys set <mgmt_subsystem_name> extra-values-file <extra_values_file_path_and_name>
```

Where:

- `<mgmt_subsystem_name>` is the name of the management subsystem that you are configuring.
- `<extra_values_file_path_and_name>` is the fully qualified path and name of your extra-values file.

For example:

```
apicup subsys set ds10-management extra-values-file /workspace/v10012/my_extra_values.yaml
```

4. Verify that the configuration settings are valid in the `apiconnect-up-v10.yaml` by running the following command:

```
apicup subsys get <mgmt_subsystem_name> --validate
```

The output lists each setting and adds a check mark after the value once the value is validated. If the setting lacks a check mark and indicates an invalid value, reconfigure the setting.

5. Run `apicup` to update the settings in the deployed Management subsystem.

```
apicup subsys install <management-subsystem>
```

6. Enter the following command to connect to the management subsystem using SSH:

```
ssh ip_address -l apicadm
```

You are logging in with the default ID of `apicadm`, which is the API Connect ID that has administrator privileges.

7. Select Yes to continue connecting, and once connected:

```
sudo -i
```

8. Validate that the juhu pod has restarted by listing the pods:

```
kubectl get pods grep juhu
```

9. Check the AGE column to ensure a new juhu pod has started.
10. If the older juhu pod is still running, delete it with the following command:

```
kubectl delete pods <old-juhu-pod>
```

- Disable a rate limit:

1. Remove the values from the extra-values-file.
2. Run `apicup` to update the settings in the deployed Management subsystem.

```
apicup subsys install <management-subsystem>
```

3. Enter the following command to connect to the management subsystem using SSH:

```
ssh ip_address -l apicadm
```

You are logging in with the default ID of `apicadm`, which is the API Connect ID that has administrator privileges.

4. Select Yes to continue connecting, and once connected:

```
sudo -i
```

5. Validate that the juhu pod has restarted by listing the pods:

```
kubectl get pods grep juhu
```

6. Check the AGE column to ensure a new juhu pod has started.
7. If the older juhu pod is still running, delete it with the following command:

```
kubectl delete pods <old-juhu-pod>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring maximum size of client requests to the Management subsystem on VMware

You can configure the maximum allowed size of the client request body for requests made to the Management subsystem.

### About this task

---

The default maximum size is 8 megabytes. You can increase this value.

Increasing the setting can be useful if you get errors when using the CLI to import a large API. Example error:

```
HTTP/1.1 413 Request Entity Too Large
```

Note:

- These instructions apply only to VMware installations. For Kubernetes installations, see [Configuring maximum size of client requests to the Management subsystem](#).
- These instructions use an extra-values file. This file can be used to define CR overrides. Note that extra-values files for a CR can contain more than one override. If you already use an extra-values file, you can add the new override to it.
- All of the commands must be run in the `apicup` management project directory.

### Procedure

---

1. Create, or edit if one already exists, a management subsystem extra-values file in the `apicup` management project directory, and enter the following configuration details:

```
spec:
  template:
    - name: juhu
      containers:
        - name: juhu
          env:
            - name: CLIENT_MAX_BODY_SIZE
              value: "12m"
```

2. Save the extra-values file with a filename of your choice, but it must have a `.yaml` or `.yml` extension.
3. Use `apicup` to update the VMware `extra-values-file` attribute to point to the new or updated management subsystem extra-values file:

```
apicup subsys set <mgmt_subsystem_name> extra-values-file <extra_values_file_path_and_name>
```

Where:

- `<mgmt_subsystem_name>` is the name of the management subsystem that you are configuring.
- `<extra_values_file_path_and_name>` is the fully qualified path and name of your extra-values file.

For example:

```
apicup subsys set ds10-management extra-values-file /workspace/v10011/my_extra_values.yaml
```

4. Verify that the configuration settings are valid in the `apiconnect-up.yaml` by running the following command:

```
apicup subsys get <mgmt_subsystem_name> --validate
```

The output lists each setting and adds a check mark after the value once the value is validated. If the setting lacks a check mark and indicates an invalid value, reconfigure the setting.

5. Update the management VMware with the updated setting.

```
apicup subsys install <mgmt_subsystem_name>
```

6. Monitor the health-check output until the management subsystem is healthy by running the following command:

```
apicup subsys health-check <mgmt_subsystem_name>
```

If one or more of the health criteria are not met, the command stops processing and displays a message with the failure, and exits with a status of `1`. The following output is an example of unhealthy output while the install is running:

```
Error: Cluster not in good health:
ManagementCluster (current ha mode: active) is not ready | State: 15/17 Phase: Pending
ManagementCluster (current ha mode: active) is not ready | State: 15/17 Phase: Pending
```

When all of the health criteria are successfully met, the command displays no output, and exits with a status of `0`.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring monetization on VMware

You can optionally configure monetization in API Connect on a VMware virtual machine by enabling the billing microservice.

## Before you begin

Important: If the optional billing microservice is enabled, you must increase the memory for the API Manager for VMware component by 0.5 GB.

## About this task

API Connect includes a subscription billing microservice that allows API providers to define pricing plans in their API Products, and monetize their API offerings. If a Product contains a pricing plan, API Consumers must enter their payment information into the Developer Portal before they can subscribe to that plan. API Connect supports integration with Stripe Subscription Billing, an independent cloud service that manages monetized product plans, customers, their payment information, and their subscription history, in order to generate monthly invoices and charge customers automatically. With this integration, Stripe serves as both the subscription billing system and the payment processing system.

Note:

- These instructions apply only to VMware installations. For Kubernetes installations, see [Configuring monetization on Kubernetes](#).
- To use Stripe as your credit card processing vendor, you must have port 443 open to HTTPS communication between the Stripe API and your Developer Portal management and the Management cluster servers. See [Firewall requirements on Kubernetes](#) and [Firewall requirements on VMware](#) for more information about this requirement.
- Provider organizations cannot add any billing integrations until the billing microservice is enabled.
- After provider organizations have added billing integrations, the billing microservice must not be disabled.
- All of the commands must be run in the `apicup` management project directory.

To enable or disable the billing microservice, you must configure a management subsystem extra-values file. See the following instructions:

- [Enabling the billing microservice](#)
- [Disabling the billing microservice](#)

## Procedure

### • Enabling the billing microservice

1. Create, or edit if one already exists, a management subsystem extra-values file in the `apicup` management project directory, and enter the following configuration details:

```
spec:
  billing:
    enabled: true
```

2. Save the extra-values file with a filename of your choice, but it must have a `.yaml` or `.yml` extension.
3. Update the VMware `extra-values-file` attribute to point to the new or updated management subsystem extra-values file. Run the following `apicup` command to insert the location of the extra-values file:

```
apicup subsys set <mgmt_subsystem_name> extra-values-file <extra_values_file_path_and_name>
```

Where:

- `<mgmt_subsystem_name>` is the name of the management subsystem that you are configuring.
- `<extra_values_file_path_and_name>` is the fully qualified path and name of your extra-values file.

For example:

```
apicup subsys set ds10-management extra-values-file /workspace/v10011/monetization.yaml
```

4. Verify that the configuration settings are valid in the `apiconnect-up.yaml` by running the following command:

```
apicup subsys get <mgmt_subsystem_name> --validate
```

The output lists each setting and adds a check mark after the value once the value is validated. If the setting lacks a check mark and indicates an invalid value, reconfigure the setting.

5. Update the management VMware with the updated billing value. Install the new setting for the billing microservice by running the following command:

```
apicup subsys install <mgmt_subsystem_name> --debug
```

Including the `--debug` option enables the debug output for the command.

6. Monitor the health-check output until the management subsystem is healthy by running the following command:

```
apicup subsys health-check <mgmt_subsystem_name>
```

If one or more of the health criteria are not met, the command stops processing and displays a message with the failure, and exits with a status of `1`. The following output is an example of unhealthy output while the install is running:

```
Error: Cluster not in good health:
ManagementCluster (current ha mode: active) is not ready | State: 15/17 Phase: Pending
ManagementCluster (current ha mode: active) is not ready | State: 15/17 Phase: Pending
```

When all of the health criteria are successfully met, the command displays no output, and exits with a status of `0`.

The billing microservice is now enabled, and provider organization owners can create billing integration resources for API providers in the API Manager UI. For more information, see [Monetizing your Products](#).

### • Disabling the billing microservice

Important: After provider organizations have added billing integrations, the billing microservice must not be disabled.

1. Edit the management subsystem extra-values file in the `apicup` management project directory, and change the `enabled` configuration option to `false`:

```
spec:
  billing:
```

```
enabled: false
```

2. Save the changed extra-values file.
3. Verify that the configuration settings are valid in the apiconnect-up.yaml by running the following command:

```
apicup subsys get <mgmt_subsystem_name> --validate
```

The output lists each setting and adds a check mark after the value once the value is validated. If the setting lacks a check mark and indicates an invalid value, reconfigure the setting.

4. Update the management VMware with the altered billing value.  
Install the updated setting for the billing microservice by running the following command:

```
apicup subsys install <mgmt_subsystem_name> --debug
```

Including the `--debug` option enables the debug output for the command.

5. Monitor the health-check output until the management subsystem is healthy by running the following command:

```
apicup subsys health-check <mgmt_subsystem_name>
```

If one or more of the health criteria are not met, the command stops processing and displays a message with the failure, and exits with a status of `1`. The following output is an example of unhealthy output while the install is running:

```
Error: Cluster not in good health:
ManagementCluster (current ha mode: active) is not ready | State: 15/17 Phase: Pending
ManagementCluster (current ha mode: active) is not ready | State: 15/17 Phase: Pending
```

When all of the health criteria are successfully met, the command displays no output, and exits with a status of `0`.  
The billing microservice is now disabled.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring use of an external NTP server

You can optionally configure an external NTP server for use by API Connect when deploying on a VMware virtual machine.

### About this task

Secure communication between API Connect subsystems relies on the system time being in sync on all hosts. For example, time stamps are checked to ensure that certificates are valid. When API Connect is deployed behind a firewall that blocks access to the internet, the API Connect subsystems cannot by default access a Network Time Protocol (NTP) server.

You can use an additional cloud-init file to manually specify an NTP server for use by the subsystems. Complete the following steps.

### Procedure

1. Create the cloud-init file extra values file, and enter the configuration details that you want to overwrite. For example:

```
ntp:
  enabled: true
  ntp_client: systemd-timesyncd
  servers:
    - time.google.com
```

2. Use `apicup` to specify the cloud-init file.  
Syntax:

```
apicup subsys set <subsys> additional-cloud-init-file <path-to-cloud-init-file>
```

Example:

```
apicup subsys set mgmt additional-cloud-init-file myCloudInitFile.yaml
```

3. Install the subsystem. Note that the output directory must be empty:

```
apicup subsys install mgmt --out mgmtplan-out
```

4. Deploy the VMware image (.ova) with the ISO file that is generated.  
To review the deployment steps, see [Deploying the Management subsystem](#).

5. Verify that the correct NTP server is being used:

```
journalctl -u systemd-timesyncd
```

Example output for the NTP server that was set in Step [1](#):

```
Nov 05 21:09:24 h-apicdev-4 systemd[1]: Starting Network Time Synchronization...
Nov 05 21:09:24 h-apicdev-4 systemd[1]: Started Network Time Synchronization.
Nov 05 21:09:24 h-apicdev-4 systemd-timesyncd[1697]: Synchronized to time server 216.239.35.8:123 (time.google.com).
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Overriding resources for Postgres components on VMware

In 10.0.4.0 and greater, you can optionally override the CPU and Memory resources used by postgres database components.

### About this task

There are three postgres components:

- `postgres`
- `pgBouncer`
- `pgBackRest`

The default resources used in `postgrespgBouncer` and `pgBackRest` components are:

Table 1. Postgres component default resources

| Resource       | Postgres DB | pgBouncer | pgBackRest |
|----------------|-------------|-----------|------------|
| Memory Request | 512Mi       | 24Mi      | 48Mi       |
| Memory Limit   | 8Gi         | 128Mi     | 128Mi      |
| CPU Request    | 600m        | 80m       | 80m        |
| CPU Limit      | 1500m       | 200m      | 200m       |

### Procedure

To override resources, complete the following procedure

1. Create an extra-values yaml file, or add values to an existing extra-values file.
  - Ensure that you specify the name of the container for the resource you want to override. Names:
    - `postgres`
    - `pgBouncer`
    - `pgBackRest`
  - You can override multiple postgres components in parallel. Adding one container section under `mgmt-pgcluster` template.
  - You can override just a single value, such as CPU limit.

Examples:

- Example yaml, to replace all `postgres` resources:

```
spec:
  template:
  - name: mgmt-pgcluster
    containers:
    - name: postgres
      resources:
        requests:
          cpu: 1500m
          memory: 8Gi
        limits:
          cpu: 600m
          memory: 512Mi
```

- Example yaml, to replace all `pgBouncer` resources:

```
spec:
  template:
  - name: mgmt-pgcluster
    containers:
    - name: pgBouncer
      resources:
        requests:
          cpu: 200m
          memory: 128Mi
        limits:
          cpu: 300m
          memory: 256Mi
```

- Example yaml, to replace CPU limit of `postgres` database:

```
spec:
  template:
  - name: mgmt-pgcluster
    containers:
    - name: postgres
      resources:
```

```
limits:
  cpu: 1000m
```

- Example yaml, to replace CPU limits of `postgres` database and `pgBouncer`:

```
spec:
  template:
    - name: mgmt-pgcluster
      containers:
        - name: postgres
          resources:
            limits:
              cpu: 1000m
        - name: pgBouncer
          resources:
            limits:
              cpu: 1000m
```

2. Set the extra values file:

```
apicup subsys set <SUBSYSTEM_NAME> extra-values-file=<PATH_TO_EXTRA_VALUES_FILE>
```

3. Apply the overrides:

```
apicup subsys install <SUBSYSTEM_NAME>
```

4. Check health of cluster:

```
apicup subsys health-check <SUBSYSTEM_NAME>
```

## Results

The postgres components will restart with updated values.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Enabling UI feature flags on VMware

Use a template override to update the installation CR with settings that control UI features.

### About this task

You can add a template override to the Management subsystem CR and use it to control whether specific features are available in the UI. Some features can be optionally disabled by users (by disabling them in the browser) provided you have enabled the feature for the cluster as a whole. Table 1 describes the available feature flags.

Table 1. Flags and settings for controlling UI features

| Feature ID                                | Default Value     | Partial Override For       | Description                                                                                            |
|-------------------------------------------|-------------------|----------------------------|--------------------------------------------------------------------------------------------------------|
| <code>ffAdvancedPublish</code>            | <code>true</code> |                            | Enable advanced publish option (deprecated)                                                            |
| <code>allOmniSearch</code>                | <code>true</code> |                            | Enables OmniSearch for all lists. This flag is used in conjunction with other flags.                   |
| <code>draftsOmniSearch</code>             | <code>true</code> | <code>allOmniSearch</code> | Enable OmniSearch for drafts list                                                                      |
| <code>catalogProductsOmniSearch</code>    | <code>true</code> | <code>allOmniSearch</code> | Enable OmniSearch for catalog                                                                          |
| <code>orgsOmniSearch</code>               | <code>true</code> | <code>allOmniSearch</code> | Enable OmniSearch for org lists                                                                        |
| <code>appsOmniSearch</code>               | <code>true</code> | <code>allOmniSearch</code> | Enable OmniSearch for apps                                                                             |
| <code>subscriptionsOmniSearch</code>      | <code>true</code> | <code>allOmniSearch</code> | Enable OmniSearch for subscriptions, if disabled, subscription lists will be removed from catalog list |
| <code>requestedApprovalsOmniSearch</code> | <code>true</code> | <code>allOmniSearch</code> | Enable OmniSearch for requested approvals                                                              |
| <code>approvalTasksOmniSearch</code>      | <code>true</code> | <code>allOmniSearch</code> | Enable OmniSearch for approvals                                                                        |
| <code>productApisOmniSearch</code>        | <code>true</code> | <code>allOmniSearch</code> | Enable OmniSearch for apis within products                                                             |
| <code>membersOmniSearch</code>            | <code>true</code> | <code>allOmniSearch</code> | Enable OmniSearch for member lists                                                                     |

## Procedure

1. Add the template override to the `management-extra-values.yaml` file.
2. In the file, append the feature-flag definition to the end of the `spec:` section, making sure to adhere to the spacing used in the file. The following example enables the OmniSearch feature on all possible UI pages.

```
spec:
  template:
    - name: ui
      containers:
        - name: ui
          env:
            - name: APIC_UI_FEATURES
              value: allOmniSearch=always
```

`APIC_UI_FEATURES` is a URL-encoded string. Each parameter is formed as `featureId=$featureValue`, and you can list multiple parameters with the `&` delimiter (`featureId=$featureValue&featureId=$featureValue`).

Use the `featureId` values from Table 1. For each feature, specify one of the following `featureValue` settings:

- **true** - On by default, but can be overridden by the user, for their browser alone
- **false** - Off by default, but can be overridden by the user, for their browser alone
- **never** - Off regardless of browser setting, disabled in feature flag page
- **always** - On regardless of browser setting, disabled in feature flag page

3. Save the file.

4. Run the following command to update the deployment:

```
apicup subsys set <management_subsystem> extra-values-file <path_to_management-extra-values.yaml_file>
```

The cluster is updated to enable or disable features as specified.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Backing up and restoring on VMware

Backup and restore API Connect on VMware.

Note: For information about how to maintain a two data center deployment, including backup and restore considerations, see [Maintaining a two data center deployment](#).

- [Backing up and restoring the management subsystem](#)  
You can back up and restore your Management subsystem in your VMware environment.
- [Backing up and restoring the Developer Portal](#)  
You can backup and restore a Developer Portal in a VMware environment.
- [Backing up and restoring the Analytics database on VMware](#)  
The IBM® API Connect Analytics database can be backed up and restored from an S3 repository. S3 compatible object storage is required; for example, IBM Cloud Object Storage.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Backing up and restoring the management subsystem

You can back up and restore your Management subsystem in your VMware environment.

### About this task

- You use the `apicup` utility to configure backup settings for the management subsystem.
- Database backups can be used to restore the database for disaster recovery.
- Backups can be scheduled or generated manually (on-demand). You can then list what backups are available and then use one to restore your Management subsystem if required.
- Postgres replica pods depend on a successful completed backup. If backup configuration is not correct, replica pods won't come up.
- Restoring a backup restores the registration credentials (`client_ID`, `client_secret`) that were in use at the time that the selected backup was created. For information on the registration credentials, see [Changing the registration client id and client secret for applications](#).

Note: You must backup both the Management and Portal subsystems at the same time, to ensure synchronicity across the services.

Types of backups supported:

- Cloud-based S3 storage
  - IBM Cloud Object Storage
  - AWS S3
  - **v10.0.2.0 or later:** Any custom S3, such as minIO
- SFTP
- Local Backups
- [Configuring backup settings during initial installation of the management subsystem](#)  
You can use the `apicup` utility to configure backup settings during initial installation of the management subsystem
- [Verify configuration for s3 backup](#)  
Verify that the configuration for s3 backups succeeded.
- [Reconfiguring backup settings for the management subsystem](#)  
You can use the `apicup` utility to add or reconfigure backup settings for the management subsystem, after completion of initial installation.
- [Backing up the management subsystem](#)  
Use `apicup` to create a manual backup of the management subsystem
- [Restoring the management subsystem](#)  
Use `apicup` to list backups and restore a selected backup of the management subsystem

- [Troubleshooting management subsystem backups on VMware](#)  
You can troubleshoot failures of the management subsystem backups.
- [Workaround for scheduling and retaining local backups on management subsystem on VMware](#)  
Use an extra-values file to schedule local backups and set retention parameters for the management subsystem on VMware deployments.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring backup settings during initial installation of the management subsystem

You can use the `apicup` utility to configure backup settings during initial installation of the management subsystem

### Before you begin

Review [Backing up and restoring the management subsystem](#).

Note: You must backup both the Management and Portal subsystems at the same time, to ensure synchronicity across the services.

### About this task

- During an initial installation, use these steps to configure the backup settings prior to creating the initial management ISO.
- You can configure scheduled backups, or generate manual (on-demand) backups.
- Changing backup settings results in database downtime, unless `database-backup-protocol=sftp`.
- Backup to S3 providers of type `custom` is supported in v10.0.2.0 or greater. For `custom` S3, provide values for `database-backup-certs` and `database-backup-s3-uri-style`.
- In Version 10.0.3.0 or later, OpenSSH key authentication for SFTP is supported.

Important: For S3 backups of the management subsystem, do not use retention features provided by Cloud-based S3 storage providers. Use of such features can result in periodic deletion of archived backups, which can cause backup corruptions which can cause database restores to fail.

### Procedure

1. Use `apicup` to specify backup settings:

- For most settings, use `apicup subsys:`

```
apicup subsys set <subsystem_name> <setting>=<value>
```

- When configuring ssh-key authentication for SFTP, use `apicup certs`

```
apicup certs set <subsystem_name> database-backup-auth-ssh-key <ssh-key-file-path>
```

Table 1. Configuration settings for backup of management subsystem

| Parameter                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>database-backup-protocol</code>  | <p>The type of the backup. Supported types:</p> <ul style="list-style-type: none"> <li>• <code>objstore</code></li> </ul> <pre>apicup subsys set mgmt database-backup-protocol=objstore</pre> <ul style="list-style-type: none"> <li>• <code>sftp</code></li> </ul> <pre>apicup subsys set mgmt database-backup-protocol=sftp</pre> <p>The default value is <code>sftp</code>.</p> <ul style="list-style-type: none"> <li>• <code>local</code> - Local storage backups</li> </ul> <pre>apicup subsys set mgmt database-backup-protocol=local</pre> <p>Note:</p> <ul style="list-style-type: none"> <li>• The public certificate on the S3 storage provider must be signed by a known certificate authority that is trusted by API Connect. Use of an untrusted authority can cause the following error during backup upload: <code>x509: certificate signed by unknown authority</code>.</li> </ul> |
| <code>database-backup-auth-pass</code> | <p>The password for the server specified in <code>database-backup-host</code>. If using object store, this would be the S3 Secret Access Key parameter. The password will be stored in Base64 encoded format.</p> <p>For example:</p> <pre>apicup subsys set mgmt database-backup-auth-pass '&lt;password&gt;'</pre> <p>Note that you cannot use the <code>`</code> sign to assign the password to <code>database-backup-auth-pass</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>database-backup-auth-user</code> | <p>The username for the server specified in <code>database-backup-host</code>. | Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database-backup-certs               | <p><b>v10.0.2.0 or later</b><br/>Custom certificate. Used only when <code>s3Provider</code> is set to <code>custom</code>. Most of the custom S3 providers are created based on custom CA certificate.</p> <p>This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be <code>ca.crt</code> and value should be base64 encoded value of CA certificate.</p> <p>The API Connect management subsystem validates the custom S3 certificate against the customer-provided CA certificate.</p> <p>Sample bash script to create the Kubernetes secret:</p> <pre>cat &gt;customs3ca.yaml &lt;&lt;EOF apiVersion: v1 data:   ca.crt: \$(base64 &lt;path-to-ca-certificate&gt;   tr -d '\n' ) kind: Secret metadata:   name: custom-server-ca   type: generic EOF  kubectl apply -f customs3ca.yaml -n &lt;namespace&gt;</pre> <p>For example:</p> <pre>apicup subsys set mgmt database-backup-certs=my-custom-s3-ca-cert</pre> |
| database-backup-s3-uri-style        | <p><b>v10.0.2.0 or later</b><br/>Valid values: <code>host</code> and <code>path</code>. Default value: <code>host</code></p> <p>Only allowed if <code>s3Provider</code> is set to <code>custom</code>.</p> <p>Some custom S3 providers require URI style to be set to <code>path</code>. For example, minIO supports both <code>host</code> and <code>path</code> style setup. You can create a minIO S3 server to only accept <code>path</code> style client communications.</p> <p><b>Important:</b> Contact your custom S3 administrator before configuring this field. If not properly configured, upstream custom S3 can reject connections from the client, such as API Connect management subsystem.</p> <pre>apicup subsys set mgmt database-backup-s3-uri-style='&lt;host path&gt;'</pre>                                                                                                                                                                                             |
| database-backup-repo-retention-full | <p><b>v10.0.3.0 or later:</b> The number of full S3 or local backups to retain. Not supported for sftp.</p> <p>When the next full backup successfully completes, and the specified number of retained backups is reached, the oldest full backup is deleted. All incremental backups and archives associated with the oldest full backup also expire. Incremental backups are not counted for this setting.</p> <p>Applies to both manual backups and scheduled backups.</p> <p>Minimum value: 1</p> <p>Maximum value: 9999999</p> <p>Default: none</p> <p>Important: There is known limitation that prevents the use of <code>apicup</code> to set the backup repo retention values when using local backups. See <a href="#">Workaround for scheduling and retaining local backups on management subsystem on VMware</a>.</p>                                                                                                                                                                |

2. Verify that your settings are valid:

- To view all subsystem settings except `database-backup-auth-ssh-key`:

```
apicup subsys get <subsystem_name> --validate
```

- To view `database-backup-auth-ssh-key`:

```
apicup certs get <subsystem_name> database-backup-auth-ssh-key --type key
```

3. Return to the instructions for installing the management subsystem: [Deploying the Management subsystem](#).

Note that the configuration settings for backups will be installed when you run `apicup subsys install <subsystem_name>` after all configuration settings are complete.

4. **S3 backups only:** After you complete the deployment of the Management subsystem in the previous step, continue to [Verify configuration for s3 backup](#).

<sup>1</sup> PuTTY style keys can be converted to OpenSSH by using the PuTTY Key Generator (PuTTYgen) application; see <https://www.puttygen.com/>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Verify configuration for s3 backup

Verify that the configuration for s3 backups succeeded.

## About this task

When you configure Management subsystem backups, the operator runs a `stanza-create` job. This job creates the stanza (Postgres cluster configuration) on the upstream S3 server, which is used for backup and archive procedures. The job also brings up the necessary pod.

## Procedure

1. SSH into the management appliance.
2. Check the status of the `stanza-create` job:

```
kubectl get jobs -n <namespace> | grep stanza
```

- On success:

- The `stanza-create` job status is 1/1:

```
kubectl get jobs | grep stanza
m1-b722e361-postgres-stanza-create      1/1      5s      127m
```

- The `stanza-create` job shows `status: "True"` and `type: Complete`:

```
kubectl get job m1-b722e361-postgres-stanza-create -o yaml
```

```
status:
  completionTime: "2021-04-13T18:38:50Z"
  conditions:
  - lastProbeTime: "2021-04-13T18:38:50Z"
    lastTransitionTime: "2021-04-13T18:38:50Z"
    status: "True"
    type: Complete
  startTime: "2021-04-13T18:38:45Z"
  succeeded: 1
```

- The `stanza-create` pod is in `Completed` state:

```
kubectl get pods | grep stanza
m1-b722e361-postgres-stanza-create-q4fvp 0/1      Completed 0      127m
```

- Exec into the pod:

```
kubectl exec -it <backrest-shared-repo-pod> -- bash
```

- The `pgbackrest` command returns the S3 contents in valid JSON:

```
pgbackrest info --output json --repo1-type s3
```

```
"backup":{"held":false}}, "message":"ok"}]] [pgbackrest@m1-b722e361-postgres-backrest-shared-repo-69cdfd5-rs882 /
```

- On failure:

- `stanza-create` pods fail, and job status is 0/1:

```
kubectl get jobs | grep stanza
m1-3bfe12ac-postgres-stanza-create      0/1      32m      32m
```

- Listing all pods brought up by `stanza-create` job shows multiple pods because a job tries `backoffLimit` times to complete the job. By default, there will be 7 pods in error state:

```
kubectl get pods | grep stanza
m1-3bfe12ac-postgres-stanza-create-726z4 0/1      Error      0      11m
m1-3bfe12ac-postgres-stanza-create-9vq4n 0/1      Error      0      22m
m1-3bfe12ac-postgres-stanza-create-gbtgb 0/1      Error      0      30m
m1-3bfe12ac-postgres-stanza-create-gl5g5 0/1      Error      0      17m
m1-3bfe12ac-postgres-stanza-create-q8qhw 0/1      Error      0      26m
m1-3bfe12ac-postgres-stanza-create-t84zs 0/1      Error      0      8m54s
m1-3bfe12ac-postgres-stanza-create-z8tfs 0/1      Error      0      12m
```

Note: In some cases, the pods are cleaned by Kubernetes and the logs of these pods can be lost.

- Pod log errors show a reason for the failure. For example, when a hostname is not valid:

```
kubectl logs m1-3bfe12ac-postgres-stanza-create-gbtgb
```

```
time="2021-04-13T20:01:19Z" level=info msg="pgo-backrest starts"
time="2021-04-13T20:01:19Z" level=info msg="debug flag set to false"
time="2021-04-13T20:01:19Z" level=info msg="backrest stanza-create command requested"
time="2021-04-13T20:01:19Z" level=info msg="s3 flag enabled for backrest command"
time="2021-04-13T20:01:19Z" level=info msg="command to execute is [pgbackrest stanza-create --db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --repo1-type=s3]"
time="2021-04-13T20:01:19Z" level=info msg="command is pgbackrest stanza-create --db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --repo1-type=s3 "
time="2021-04-13T20:05:21Z" level=error msg="command terminated with exit code 49"
time="2021-04-13T20:05:21Z" level=info msg="output=[]"
```

- Job status is set to `type: Failed` and `status: "True"`, with `reason: BackoffLimitExceeded`:

```
kubectl get job m1-3bfe12ac-postgres-stanza-create -o yaml
```

```
status:
  conditions:
  - lastProbeTime: "2021-04-13T20:28:03Z"
    lastTransitionTime: "2021-04-13T20:28:03Z"
```

```

message: Job has reached the specified backoff limit
reason: BackoffLimitExceeded
status: "True"
type: Failed
failed: 7
startTime: "2021-04-13T20:01:18Z"

```

- If pod logs are lost, you can execute a command inside the `backrest-shared-repo` pod:
  - Obtain the `backrest-shared-repo` pod name:

```
kubectl get pods -n <namespace> | grep backrest-shared-repo
```

For example:

```
kubectl get pods | grep backrest-shared-repo
m1-eb8edc18-postgres-backrest-shared-repo-98dd46cc6-tw195 1/1 Running
```

- Exec into the pod:

```
kubectl exec -it <backrest-shared-repo-pod> -- bash
```

- Run:

```
pgbackrest info --output json --repo1-type s3
```

For example, for invalid hostname:

```
ERROR: [049]: unable to get address for 'test1-v10-backup.s3.exampleaws.com': [-2] Name or service not knownCopy
```

The exact **ERROR**: will vary depending on the misconfiguration. Common errors:

```

Invalid access key
Invalid access key secret
Invalid bucket region
Invalid bucket or folder path

```

- To fix the incorrect settings, see [Reconfiguring backup settings for the management subsystem](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Reconfiguring backup settings for the management subsystem

You can use the `apicup` utility to add or reconfigure backup settings for the management subsystem, after completion of initial installation.

### About this task

- After initial installation, use these steps to add or reconfigure the backup settings.
- When you add or reconfigure backups after completion of the initial installation, the steps are the same as configuring during the initial installation, with the addition of using `apicup` to install (activate) the new settings immediately after adjusting the settings. During initial configuration, you typically wait to use `apicup` to activate settings until all other subsystem settings (unrelated to backup) are complete.
- You can add or reconfigure scheduled backups, or generate manual (on-demand) backups.
- Changing backup settings results in database downtime, unless `database-backup-protocol=sftp`.

Note: You must backup both the Management and Portal subsystems at the same time, to ensure synchronicity across the services.

### Procedure

1. Use `apicup` to specify backup settings:

```
apicup subsys set <subsystem_name> <setting>=<value>
```

Table 1. Configuration settings for backup of management subsystem

| Parameter | Description |
|-----------|-------------|
|-----------|-------------|

| Parameter                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <code>database-backup-schedule</code>     | <p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> <li>• <code>*****</code></li> <li>• <code>-----</code></li> <li>• <code>     </code></li> <li>• <code>     +-----</code> day of week (0 - 6) (Sunday=0)</li> <li>• <code>    +-----</code> month (1 - 12)</li> <li>• <code>    +-----</code> day of month (1 - 31)</li> <li>• <code>  +-----</code> hour (0 - 23)</li> <li>• <code>+-----</code> min (0 - 59)</li> </ul> <p>The backup schedule defaults to <code>0 0 * * *</code>. This means a backup is run every day at midnight and minute zero.</p> <p>The timezone for backups is UTC.</p> <p>When you configure a host, if you do not specify a value for <code>database-backup-schedule</code>, the default backup schedule is automatically set. Note that the default backup schedule is not set, and scheduled backups not enabled, until host configuration is completed.</p> <pre>apicup subsys set mgmt database-backup-schedule="0 0 * * *"</pre> |
| <code>backup-certs</code>                 | <p><b>Optional.</b> Backup certificates to use for TLS communication between API Connect and the backup server. Supported for custom s3 backups only. Use this setting when you have set <code>database-backup-s3provider=custom</code></p> <p>For example:</p> <pre>apicup subsys set mgmt backup-certs=&lt;certificate_name&gt;</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>database-backup-s3-uri-style</code> | <p><b>Optional:</b> Specifies whether the URI is in the form of <code>host</code> or <code>path</code>. Used only with custom s3providers. Use this setting when you have set <code>database-backup-s3provider=custom</code>.</p> <pre>apicup subsys set mgmt database-backup-s3-uri-style='&lt;host path&gt;'</pre> <p>Supported values:</p> <ul style="list-style-type: none"> <li>• <code>host</code></li> <li>• <code>path</code></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Note: To view all subsystem settings for the management subsystem:

```
apicup subsys get <subsystem_name> --validate
```

2. Apply the settings:

```
apicup subsys install <subsystem_name>
```

Note: The `apicup subsys install` command automatically runs `apicup health-check` prior to installing the new configuration. An error is displayed if a problem is found that will prevent successful reconfiguration.

In some scenarios, after you fix the problem, the health check might continue to fail. In this case, you can use the `--skip-health-check` flag to suppress the automatic health check:

```
apicup subsys install <subsystem_name> --skip-health-check
```

3. Ensure that the changes were applied successfully:

```
apicup subsys health-check <subsystem_name>
```

<sup>1</sup> PuTTY style keys can be converted to OpenSSH by using the PuTTY Key Generator (PuTTYgen) application; see <https://www.puttygen.com/>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Backing up the management subsystem

Use `apicup` to create a manual backup of the management subsystem

### Before you begin

You must have configured backups for the subsystem. See [Configuring backup settings during initial installation of the management subsystem](#)

### About this task

Use this task to create an on-demand, or manual, backup of the management system.

To set up scheduled backups, see the `schedule` option in [Configuring backup settings during initial installation of the management subsystem](#).

### Procedure

1. Ensure that there are no Management subsystem backups in Running state before creating a new Management backup.
2. Ensure your system is healthy:

```
apicup subsys health-check [subsystem_name]
```

When successful, the command returns silently with an exit code of 0.

3. Make sure that the management cluster status is Running and the READY condition displays the same value before and after the "/>. SSH into the appliance and run `kubect1`:

```
kubect1 get mgmt
NAME   READY   STATUS    VERSION   RECONCILED VERSION   AGE
mgmt   16/16   Running   10.0.2.0   10.0.2.0               19h
```

Note: Be sure **READY** status is **16/16**. If you have just configured or reconfigured the backup settings, there is a period of time when the postgres pods are taken offline and brought back up with the new configuration. During this time, the `kubect1 get mgmt` command will show **11/11** instead of **16/16**. If you start a backup before the Management cluster is on **16/16**, the backup attempt might stall indefinitely.

4. Create a backup:

```
apicup subsys backup [subsystem_name] [flags]
```

Decide which of the two types of manual backups you want to do:

- **full**: backs up the entire Management subsystem database.

```
apicup subsys backup management --type full
```

- **incr**: backs up any data that has not been backed up since the last **full** or **incr** backup.

```
apicup subsys backup management --type incr
```

To view additional flags, use

```
-h:
```

```
./apicup subsys backup management -h
Backup management subsystem
Usage:
  backup SUBSYS [flags]Flags:
  --debug          Enable debug logging
  -h, --help      help for backup
  --type string   Type of backup to take ['incr' (backup data starting from last backup), 'full' (complete backup)] (default "full")
  --wait          Wait for the operation to complete or fail.
  --wait-timeout duration Command timeout in seconds. (default 40s)
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Restoring the management subsystem

Use `apicup` to list backups and restore a selected backup of the management subsystem

### Before you begin

- If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. The backups of the Management and Portal must be taken at the same time to ensure that the Portal sites are consistent with Management database.
- When restoring, the Gateway and all deployed subsystems (Management, Analytics, and Developer Portal) must be at the same version level.
- Restoring the Management Service requires database downtime and is a destructive process that deletes current data and copies backup data. During the restoration process, external traffic must be stopped.
- In a Disaster Recovery scenario, do not log in to the administration UI or attempt to configure or change any settings prior to restoring the backup. Restore the backup immediately after installing the subsystem.
- To restore the management database, you must use the original project directory that was created with `apicup` during the initial product installation. You cannot restore the database without the initial project directory because it contains pertinent information about the cluster. The endpoints and certificates cannot change; the same endpoints and certificates will be used in the restored system. Successful restoration depends on use of a *single apicup* project for all subsystems, even those in a different cluster. Multiple projects will result in multiple certificate chains which will not match.
- Endpoints for the components cannot change between deployments. However, the endpoints for the VMware hosts can be modified for the new deployment.
- Map the DNS entries from the source cluster to the corresponding IP addresses on the target cluster. Record the DNS entries for each endpoint before starting the restore.
- When restoring the management database, the endpoints (on the new cluster which is the target for the restoration) have to be the same as those on the old cluster (the source of the backup).

### About this task

Restoring a backup restores the registration credentials (client\_ID, client\_secret) that were in use at the time that the selected backup was created. For information on the registration credentials, see [Changing the registration client\\_id and client\\_secret for applications](#).

Note: There is a known issue where sometimes a restore from the Management subsystem's SFTP backup succeeds but the data is not restored. If this happens, run the restore again.

### Procedure

1. To list the available backups:

```
apicup subsys list-backups [subsystem_name] [flags]
```

Example:

```
# apicup subsys list-backups mgmt
NAME          STATUS  ID          CLUSTER  TYPE  CR TYPE  AGE
management-3aa3bebf  Ready  20200929-152150F  management  full  record  10h
management-3c4ca8df  Ready  20200929-115520F  management  full  record  20h
management-5tbxj     Ready  20200929-224349F  management  full  create  17h
management-f10af337  Ready  20200925-133703F  management  full  record  5d2h
management-jtlcd     Ready  20200929-224349F  management  full  create  25h
management-zxjtz     Ready  20200929-224349F  management  full  create  28h
```

Optional flags:

```
./apicup subsys list-backups -h
List backups of the subsystem
Usage:
  apicup subsys list-backups SUBSYS [flags]
Flags:
  -h, --help                help for list-backups
  --timeout duration        Command timeout in seconds. (default 40s)
Global Flags:
  --accept-license          Accept the license for API Connect
  --debug                   Enable debug logging
```

Attention: You can restore the Management subsystem from any backup where the STATUS is Ready; however, you should avoid restoring to the initial system backup. During installation, the Management database is used for an initial system backup before certain database schema jobs are complete. Restoring to this backup will result in an unstable system.

2. To restore a selected backup:

```
apicup subsys restore [subsystem_name] --name <backup_name> [flags]
```

Example, where `management-zxjtz` is the value of `<backup_name>`, chosen from the backup NAMES listed by `apicup subsys list-backups` in Step 1:

```
apicup subsys restore mgmt --name management-zxjtz
```

Optional flags:

```
apicup subsys restore management -h
Restore management subsystem
Usage:
  restore SUBSYS_NAME [flags]
Flags:
  --debug                Enable debug logging
  -h, --help             help for restore
  --name string          Name of the backup to restore
  --pitr-target YYYY-MM-DD HH:MM:SS+Z Time to restore to in format YYYY-MM-DD HH:MM:SS+Z
  --wait                Wait for the operation to complete or fail.
  --wait-timeout duration Command timeout in seconds. (default 40s)
```

3. You can list your restores and their statuses.

```
apicup subsys list-restores [subsystem_name] [flags]
```

To view the optional flags, use `-h`:

```
apicup subsys list-restores -h
List restores of the subsystem
Usage:
  apicup subsys list-restores SUBSYS [flags]
Flags:
  -h, --help                help for list-restores
  --timeout duration        Command timeout in seconds. (default 40s)
Global Flags:
  --accept-license          Accept the license for API Connect
  --debug                   Enable debug logging
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting management subsystem backups on VMware

You can troubleshoot failures of the management subsystem backups.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

See:

- [Troubleshooting resiliency issues](#)  
Resolve resiliency issues with API Connect management system backups.

- [Troubleshooting stanza-create job for S3 backup configuration](#)  
Troubleshoot configuration of s3 backups when the stanza-create job fails.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting resiliency issues

Resolve resiliency issues with API Connect management system backups.

### pgbackrest-shared-repo resiliency problems

If the Kubernetes node hosting pgbackrest-shared-repo pod is down and the PVC attached to the pod has strict zone requirements (for example, in AWS or other clouds) or if the storage class is set to `local-storage`, then pgbackrest-shared-repo pod will not get rescheduled to another Kubernetes node.

As a result, there is a single point of failure and the following conditions might occur:

- Backups of the management database fails
- Disk space fills with accumulated Postgres wal (Write-Ahead Logging) files

To avoid this problem, monitor the disk usage: [Monitoring Postgres disk usage on VMware](#).

When the Kubernetes node comes back up, the pod is scheduled and all the processes should resume properly.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting stanza-create job for S3 backup configuration

Troubleshoot configuration of s3 backups when the stanza-create job fails.

When you configure Management subsystem backups for s3 providers, the operator runs a `stanza-create` job. This job creates the stanza (Postgres cluster configuration) on the upstream S3 server, which is used for backup and archive procedures. The job also brings up the necessary pod.

SSH into the appliance VM, and check the status of the `stanza-create` job:

```
kubectl get jobs -n <namespace> | grep stanza
```

On failure:

- `stanza-create` pods fail, and job status is 0/1:

```
kubectl get jobs | grep stanza
m1-3bfe12ac-postgres-stanza-create      0/1      32m      32m
```

- Listing all pods brought up by `stanza-create` job shows multiple pods because a job tries `backoffLimit` times to complete the job. By default, there will be 7 pods in error state:

```
kubectl get pods | grep stanza
m1-3bfe12ac-postgres-stanza-create-726z4      0/1      Error    0      11m
m1-3bfe12ac-postgres-stanza-create-9vq4n      0/1      Error    0      22m
m1-3bfe12ac-postgres-stanza-create-gbtgb      0/1      Error    0      30m
m1-3bfe12ac-postgres-stanza-create-g15g5      0/1      Error    0      17m
m1-3bfe12ac-postgres-stanza-create-q8qhw      0/1      Error    0      26m
m1-3bfe12ac-postgres-stanza-create-t84zs      0/1      Error    0      8m54s
m1-3bfe12ac-postgres-stanza-create-z8tfs      0/1      Error    0      12m
```

Note: In some cases, the pods are cleaned by Kubernetes and the logs of these pods can be lost.

- Pod log errors show a reason for the failure. For example, when a hostname is not valid:

```
kubectl logs m1-3bfe12ac-postgres-stanza-create-gbtgb
time="2021-04-13T20:01:19Z" level=info msg="pgo-backrest starts"
time="2021-04-13T20:01:19Z" level=info msg="debug flag set to false"
time="2021-04-13T20:01:19Z" level=info msg="backrest stanza-create command requested"
time="2021-04-13T20:01:19Z" level=info msg="s3 flag enabled for backrest command"
time="2021-04-13T20:01:19Z" level=info msg="command to execute is [pgbackrest stanza-create --db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --repo1-type=s3]"
time="2021-04-13T20:01:19Z" level=info msg="command is pgbackrest stanza-create --db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --repo1-type=s3"
time="2021-04-13T20:05:21Z" level=error msg="command terminated with exit code 49"
time="2021-04-13T20:05:21Z" level=info msg="output=[]"
```

- Job status is set to `type: Failed` and `status: "True"`, with reason: `BackoffLimitExceeded`:

```
kubect1 get job m1-3bfe12ac-postgres-stanza-create -o yaml

status:
  conditions:
  - lastProbeTime: "2021-04-13T20:28:03Z"
    lastTransitionTime: "2021-04-13T20:28:03Z"
    message: Job has reached the specified backoff limit
    reason: BackoffLimitExceeded
    status: "True"
    type: Failed
    failed: 7
  startTime: "2021-04-13T20:01:18Z"
```

- If pod logs are lost, you can execute a command inside the `backrest-shared-repo` pod:
  1. Obtain the `backrest-shared-repo` pod name:

```
kubect1 get pods -n <namespace> | grep backrest-shared-repo
```

For example:

```
kubect1 get pods | grep backrest-shared-repo
m1-eb8edc18-postgres-backrest-shared-repo-98dd46cc6-tw195 1/1 Running
```

2. Exec into the pod:

```
kubect1 exec -it <backrest-shared-repo-pod> -- bash
```

3. Run:

```
pgbackrest info --output json --repo1-type s3
```

For example, for invalid hostname:

```
ERROR: [049]: unable to get address for 'test1-v10-backup.s3.exampleaws.com': [-2] Name or service not knownCopy
```

The exact **ERROR**: will vary depending on the misconfiguration. Common errors:

- Invalid access key
- Invalid access key secret
- Invalid bucket region
- Invalid bucket or folder path

- To fix the incorrect settings, see [Reconfiguring backup settings for the management subsystem](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Workaround for scheduling and retaining local backups on management subsystem on VMware

Use an extra-values file to schedule local backups and set retention parameters for the management subsystem on VMware deployments.

### About this task

You cannot use the `apicup` utility to specify the schedule or the retention parameters for local backups for the management subsystem on VMware. You can use an extra-values file to workaround this limitation.

### Procedure

1. Create, or edit if one already exists, a subsystem extra-values file in the `apicup` management project directory, and enter the following configuration details:

```
spec:
  databaseBackup:
    schedule: <value>
    repoRetentionFull: <value>
```

The `schedule` field specifies when backups are run. The `repoRetentionFull` property specifies the number of backups to retain. For more information, see [Configuring backup settings during initial installation of the management subsystem](#)

2. Save the extra-values file with a filename of your choice, but it must have a `.yaml` or `.yml` extension.
3. Use `apicup` to update the VMware `extra-values-file` attribute to point to the new or updated management subsystem extra-values file:

```
apicup subsys set <mgmt_subsystem_name> extra-values-file <extra_values_file_path_and_name>
```

Where:

- `<mgmt_subsystem_name>` is the name of the subsystem that you are configuring.
- `<extra_values_file_path_and_name>` is the fully qualified path and name of your extra-values file.

For example:

```
apicup subsys set ds10-management extra-values-file /workspace/v10011/my_extra_values.yaml
```

4. Verify that the configuration settings are valid in the apiconnect-up.yaml by running the following command:

```
apicup subsys get <mgmt_subsystem_name> --validate
```

The output lists each setting and adds a check mark after the value once the value is validated. If the setting lacks a check mark and indicates an invalid value, reconfigure the setting.

5. Update the management VMware with the updated setting.

```
apicup subsys install <subsystem_name>
```

6. Monitor the health-check output until the management subsystem is healthy by running the following command:

```
apicup subsys health-check <mgmt_subsystem_name>
```

When all of the health criteria are successfully met, the command displays no output, and exits with a status of 0.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Backing up and restoring the Developer Portal

You can backup and restore a Developer Portal in a VMware environment.

### About this task

---

It is strongly recommended that you configure the backup parameters for your portal service during installation. If you did not do so when you installed API Connect in your runtime environment, you must configure the backups for the Developer Portal before performing an upgrade. These backups can then be used to restore the Developer Portal if required. When your Developer Portal subsystem is running, you can also make on-demand backups by using the command line.

Note:

- You must backup both the Management and Portal subsystems at the same time, to ensure synchronicity across the services.
- When restoring, the Gateway and all deployed subsystems (Management, Analytics, and Developer Portal) must be at the same version level.

The default Developer Portal backup schedule is once every 24 hours, but the schedule can be changed in the backup settings. The Developer Portal saves all system and site backups locally, and also saves them remotely based on the configured SFTP and s3 settings.

The local backups are automatically maintained so that the latest three backups of each site and of the system are kept, and older backups are removed. This maintenance means that the Developer Portal retains the latest three backups for each site and for the system however old they are, but there is no deletion of the old backups on the remote server. If a site is deleted, then all of the local backups for that site are also deleted, as otherwise the backup volume might become full of old site backups. For remote backups, you can configure a retention policy on your remote server to remove the old backup files as required.

- To complete a backup and restore of your Portal Subsystem, you must use apicup to configure the backup settings.
- Backups can be scheduled or generated manually (on-demand).
- You can then list the available backups are available and select one to restore your Portal Subsystem when necessary.
- Supported backup types:
  - Cloud-based S3 storage
    - IBM Cloud Object Storage
    - AWS S3
  - SFTP
- [Configuring backup settings for the Developer Portal subsystem](#)  
You can use the `apicup` utility to configure backup settings for the Developer Portal subsystem
- [Backing up the Developer Portal subsystem](#)  
After you have configured backup settings, you can use `apicup` to create a manual backup of the Developer Portal.
- [Restoring the Developer Portal subsystem](#)  
You can use `apicup` to restore the Developer Portal subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring backup settings for the Developer Portal subsystem

You can use the `apicup` utility to configure backup settings for the Developer Portal subsystem

### Before you begin

---

Review [Backing up and restoring the Developer Portal](#).

## About this task

- During an initial installation, use these steps to configure the backup settings prior to creating the initial management ISO.
- You can configure scheduled backups, or generate manual (on-demand) backups.
- **Version 10.0.3.0 or later:** OpenSSH key authentication for SFTP is supported.

The default Developer Portal backup schedule is once every 24 hours, but the schedule can be changed in the backup settings. The Developer Portal saves all system and site backups locally, and also saves them remotely based on the configured SFTP and s3 settings.

The local backups are automatically maintained so that the latest three backups of each site and of the system are kept, and older backups are removed. This maintenance means that the Developer Portal retains the latest three backups for each site and for the system however old they are, but there is no deletion of the old backups on the remote server. If a site is deleted, then all of the local backups for that site are also deleted, as otherwise the backup volume might become full of old site backups. For remote backups, you can configure a retention policy on your remote server to remove the old backup files as required.

## Procedure

1. Open your API Connect installation project directory.
2. Run the following commands to set the location and timing of your backups:

```
apicup subsys set <subsystem_name> <setting>=<value>

apicup subsys set pt1 site-backup-host=mybackuphost.com
apicup subsys set pt1 site-backup-port=22
apicup subsys set pt1 site-backup-auth-user=mybackupauthusername
apicup subsys set pt1 site-backup-auth-pass=mybackupauthpassword
apicup subsys set pt1 site-backup-path=/site-backups
apicup subsys set pt1 site-backup-protocol=sftp
apicup subsys set pt1 site-backup-certs=<custom-s3-server-CA-cert>
apicup subsys set pt1 site-backup-s3-uri-style=<host-or-path>
apicup subsys set pt1 site-backup-schedule="0 2 * * *"
apicup subsys set pt1 site-priority-list=portal.a1.example.com/test-1/spacecatalog,portal.a1.example.com/test-4/cat3,portal.a1.example.com/test-3/cat1
```

Use `apicup certs` instead of `apicup subsys` to configure ssh-key authentication for SFTP:

```
apicup certs set pt1 site-backup-auth-ssh-key <ssh-key-file-path>
```

The backup parameters are detailed in the following table.

Table 1. Portal backup parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| site-backup-host         | <p>The fully qualified domain name of the backup server, in lowercase only.</p> <ul style="list-style-type: none"> <li>• For <code>objstore</code> type backup, specify the S3 endpoint with the corresponding S3 region in the format <code>&lt;S3endpoint&gt;</code>, or with an optional S3 region in the format <code>&lt;S3endpoint&gt;/&lt;S3region&gt;</code>.</li> </ul> <pre>apicup subsys set pt1 site-backup-host=s3.eu-gb.cloud-object-storage.appdomain.cloud</pre> <ul style="list-style-type: none"> <li>• For <code>sftp</code> type, the SFTP server hostname</li> </ul> <pre>apicup subsys set pt1 site-backup-host=my.sftp.backup.domain.example.com</pre> |
| site-backup-port         | <p>The port for the protocol to connect to the <code>site-backup-host</code>. Defaults to 22 if not explicitly set. The backup port is not required for object storage but if specified, is typically port 443.</p> <pre>apicup subsys set pt1 site-backup-port=22</pre>                                                                                                                                                                                                                                                                                                                                                                                                      |
| site-backup-auth-user    | <p>The user name for the server specified in <code>site-backup-host</code>. If using object storage, the user name is the S3 Secret Key ID.</p> <pre>apicup subsys set pt1 site-backup-auth-user=&lt;user_name&gt;</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| site-backup-auth-pass    | <p>The password for the server specified in <code>site-backup-host</code>. If using object storage, the password is the S3 Secret Access Key parameter. The password is stored in Base64 encoded format, and must not be edited directly in the <code>apiconnect-up.yml</code> file.</p> <pre>apicup subsys set pt1 site-backup-auth-pass=password</pre>                                                                                                                                                                                                                                                                                                                      |
| site-backup-auth-ssh-key | <p><b>Version 10.0.3.0 or later:</b> OpenSSH key for database backups by using SFTP.</p> <p>Important:</p> <ul style="list-style-type: none"> <li>• Use <code>apicup certs</code> to set this value. Do not use <code>apicup subsys</code>.</li> <li>• Only OpenSSH keys are supported.<sup>1</sup></li> </ul> <pre>apicup certs set pt1 site-backup-auth-ssh-key=&lt;ssh-key-file-path&gt;</pre>                                                                                                                                                                                                                                                                             |
| site-backup-path         | <p>The location of where the backups are stored:</p> <ul style="list-style-type: none"> <li>• S3 - the name of your S3 bucket to store backup data, optionally followed by a <code>/</code> and then any subdirectories inside the bucket. Valid examples: <pre>bucket bucket/path bucket/lots/of/paths</pre> <p>Example:</p> <pre>apicup subsys set pt1 site-backup-path=apic-backup</pre> </li> <li>• SFTP - the full absolute path of the folder on the SFTP server, beginning with <code>/</code>. <pre>apicup subsys set pt1 site-backup-path=&lt;/folder&gt;</pre> </li> </ul>                                                                                          |

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| site-backup-protocol     | <p>The protocol that is used to communicate with your remote backup endpoint. Specify one of the following values:</p> <ul style="list-style-type: none"> <li><code>sftp</code> - for secure file transfer protocol</li> <li><code>local</code> - for local storage</li> <li><code>objstore</code> - for S3 compatible object storage</li> </ul> <p>Starting with v10.0.3.0, the default protocol is <code>local</code> (earlier releases used <code>sftp</code> as the default). For example:</p> <pre>apicup subsys set ptl site-backup-protocol=local</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| site-backup-certs        | <p>The name of a custom certificate that contains your upstream custom S3 CA certificate. Supported beginning with 10.0.2.</p> <p>This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be <code>ca.crt</code> and the value is the base64-encoded value of the CA certificate.</p> <p>If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Portal subsystem already trusts the server certificate. You can test this by configuring the Portal backup to your S3/object-store server without providing the CA certificate.</p> <p>If you do need to provide the CA certificate then you must provide the entire chain in the <code>ca.crt</code> member of the secret, as follows:</p> <pre>intermediate-certificate-1 intermediate-certificate-2 . intermediate-certificate-n root-certificate</pre> <p>Where the first certificate in the <code>ca.crt</code> member (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the <code>ca.crt</code> member is the issuer of the preceding certificate. The root certificate in the <code>ca.crt</code> member must be self-signed.</p> <p>If there are no intermediate certificates involved, then the <code>ca.crt</code> member contains only the root certificate.</p> <p>The following sample bash script creates a Kubernetes secret:</p> <pre>cat &gt;customs3ca.yaml &lt;&lt;EOF apiVersion: v1 data:   ca.crt: \$(base64 &lt;path-to-ca-certificate&gt;   tr -d '\n' ) kind: Secret metadata:   name: custom-server-ca type: generic EOF</pre> <pre>kubectl apply -f customs3ca.yaml -n &lt;namespace&gt;</pre> |
| site-backup-s3-uri-style | <p>Optional. Indicates whether URIs to your S3 backup should use specify a host or a path value. When not specified, defaults to <code>host</code>. Supported beginning with 10.0.2.</p> <p>Valid values: <code>host</code> and <code>path</code>.</p> <p>Some custom S3 providers require URI style to be set to <code>path</code>. For example, MinIO supports both <code>host</code> and <code>path</code> style setup. You can create a MinIO S3 server to only accept <code>path</code> style client communications.</p> <p><b>Important:</b> Contact your custom S3 administrator before configuring this field. If not properly configured, an upstream custom S3 can reject connections from the client, such as the API Connect Management subsystem.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| site-backup-schedule     | <p>The schedule for how often automatic Portal backups are run. The format for the schedule is any valid cron string, as follows:</p> <pre>* * * * * - - - - -                   +----- day of week (0 - 6) (Sunday=0)       +----- month (1 - 12)     +----- day of month (1 - 31)   +----- hour (0 - 23) +----- min (0 - 59)</pre> <p>For example: <code>30 22 * * 1</code> performs backups at 10:30 pm on Mondays.<br/>The default backup schedule is <code>0 2 * * *</code> (runs every day at 2 am).</p> <p>The timezone for backups is UTC.</p> <pre>apicup subsys set ptl site-backup-schedule="0 2 * * *"</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| site-priority-list       | <p>Optional list of prioritized sites to restore. Default: empty.</p> <pre>apicup subsys set &lt;portal-subsystem-name&gt; site-priority-list &lt;comma-separated-list-of-sites&gt;</pre> <p>For example:</p> <pre>apicup subsys set ptl site-priority-list portal.a1.example.com/e2etest-1/spacecatalog,portal.a1.example.com/e2etest-4/cat3,portal.a1.example.com/e2etest-3/cat1</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

3. At any time you can view the current Portal subsystem values:

- For most values:

```
apicup subsys get ptl
```

where `ptl` is the name that you assigned to your Portal service. The output from this command lists all of the subsystem settings, including backup, and indicates whether there are any errors. You must fix any errors before continuing.

- For ssh-key authentication for SFTP:

```
apicup certs get ptl site-backup-auth-ssh-key
```

4. Activate the backup settings by running the following command:

```
apicup subsys install pt1
```

where `pt1` is the name that you assigned to your Portal service.

Note: The `apicup subsys install` command automatically runs `apicup health-check` prior to installing the new configuration. An error is displayed if a problem is found that will prevent successful reconfiguration.

In some scenarios, after you fix the problem, the health check might continue to fail. In this case, you can use the `--skip-health-check` flag to suppress the automatic health check:

```
apicup subsys install <subsystem_name> --skip-health-check
```

5. Validate the installation with the new backup parameters by running the following command:

```
apicup subsys get pt1 --validate
```

where `pt1` is the name that you assigned to your Portal service. The output from this command lists all of the subsystem settings, including backup, and indicates whether the values are valid or invalid. You must correct any invalid values before continuing.

6. Ensure that the changes were applied successfully:

```
apicup subsys health-check <subsystem_name>
```

<sup>1</sup> PuTTY style keys can be converted to OpenSSH by using the PuTTY Key Generator (PuTTYgen) application; see <https://www.puttygen.com/>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Backing up the Developer Portal subsystem

After you have configured backup settings, you can use `apicup` to create a manual backup of the Developer Portal.

### About this task

---

You can make on-demand backups of your Developer Portal system, sites, and complete service, by running the following `apicup` commands in your API Connect installation project directory.

The default Developer Portal backup schedule is once every 24 hours, but the schedule can be changed in the backup settings. The Developer Portal saves all system and site backups locally, and also saves them remotely based on the configured SFTP and s3 settings.

The local backups are automatically maintained so that the latest three backups of each site and of the system are kept, and older backups are removed. This maintenance means that the Developer Portal retains the latest three backups for each site and for the system however old they are, but there is no deletion of the old backups on the remote server. If a site is deleted, then all of the local backups for that site are also deleted, as otherwise the backup volume might become full of old site backups. For remote backups, you can configure a retention policy on your remote server to remove the old backup files as required.

### Procedure

---

1. Ensure your system is healthy:

```
apicup subsys health-check [subsystem_name]
```

When successful, the command returns silently with an exit code of 0.

2. Create a backup:

```
apicup subsys backup [subsystem_name] [flags]
```

- To backup the Portal system configuration (and not the sites), run the following command:

```
apicup subsys backup pt1 --type system
```

- To backup a specific Portal site or all sites, run the following command:

```
apicup subsys backup pt1 --type site --site-name arg
```

where `arg` is a specific site UUID or URL, or to backup all sites use the argument `installed`.

- To backup the entire Portal service (the system and all installed sites), run the following command:

```
apicup subsys backup pt1
```

Where `pt1` is the name that you assigned to your Portal service.

Note: To restore a Developer Portal service, you need backups of both the Portal system and the installed sites.

To view additional flags, use `-h`:

```
apicup subsys backup portal -h
Backup portal subsystem
```

Usage:

```
backup SUBSYS [flags]
```

Flags:

```
--comment string  Comment to add to the backup CR before creation
--debug           Enable debug logging
```

```

-h, --help                help for backup
--site-name string        Site to restore to the remote server if TYPE=site. Accepts site uuid/url or 'installed' to
backup all installed sites.
--type string             Type of backup to take ['system' (backup Portal System), 'site' (backup Portal Site),
'all' (complete backup)] (default "all")
--wait                    Wait for the operation to complete or fail.
--wait-timeout duration  Command timeout in seconds. (default 40s)

```

3. To view the available backups and their status:

```
apicup subsys list-backups [subsystem_name] [flags]
```

Optional flags:

```

./apicup subsys list-backups -h
List backups of the subsystem
Usage:
  apicup subsys list-backups SUBSYS [flags]
Flags:
  -h, --help                help for list-backups
  --timeout duration        Command timeout in seconds. (default 40s)
Global Flags:
  --accept-license          Accept the license for API Connect
  --debug                   Enable debug logging

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Restoring the Developer Portal subsystem

You can use `apicup` to restore the Developer Portal subsystem.

### About this task

You can restore your Developer Portal service by using the backups that exist on your remote server, by running the following `apicup` commands in your API Connect installation project directory. Note that before you can run these commands, you must have configured your remote backup server details, and have valid backups of both the Portal system and the installed sites. See [Configuring backup settings for the Developer Portal subsystem](#) and [Backing up the Developer Portal subsystem](#).

Note:

- If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. The backups of the Management and Portal must be taken at the same time to ensure that the Portal sites are consistent with Management database.
- Restoration requires a functioning Developer Portal. In a disaster recovery scenario, you might need to reinstall the Developer Portal subsystem before you can restore the backed-up data. For disaster recovery, see [Recovering the Developer Portal subsystem on VMware](#).

### Procedure

1. To view the available backups and their status:

```
apicup subsys list-backups subsystem_name [flags]
```

Optional flags:

```

./apicup subsys list-backups -h
List backups of the subsystem
Usage:
  apicup subsys list-backups SUBSYS [flags]
Flags:
  -h, --help                help for list-backups
  --timeout duration        Command timeout in seconds. (default 40s)
Global Flags:
  --accept-license          Accept the license for API Connect
  --debug                   Enable debug logging

```

2. Review which restore actions will be performed

To see what restore actions are performed when the `apicup subsys restore` `ptl` command is run, you can use the following command:

```
apicup subsys restore ptl --dry-run --timestamp [now|YYYYMMDD.HHMMSS]
```

where `--timestamp` can be `now`, so the latest backup file that is available is used. Or you can specify a timestamp in the format of `YYYYMMDD.HHMMSS` to retrieve the nearest backup file to a specified time, searching backwards from the timestamp given.

Note:

- From IBM® API Connect Version 10.0.3.0, the timestamp format changed to `YYYYMMDD.HHMMSS`. For Version 10.0.2.0 and earlier, the timestamp format is `YYYY-MM-DD HH:MM:SS`.
- With the `--dry-run` option, the utility runs through the restore steps without executing them. You can use this option to see if the restore from the selected backup will succeed.

The `--dry-run` option starts with the following output message:

```
Starting restore...please check later for completion status of restore
PortalRestore is Running
```

To view the results of the dry-run, you can either look in the portal restore CR for a message of completion (or failure) or you can get a high-level status by entering:

```
apicup subsys list-restores <subsys_name>
```

Status values can be: **Ready**, **Completed**, **Failed** or **Running**.

3. Run the following command, and attach any flags as appropriate.

```
apicup subsys restore [SUBSYS_NAME] [flags]
```

- To restore your Portal service, run the following command:

```
apicup subsys restore ptl --timestamp [now|YYYYMMDD.HHMMSS]
```

where `--timestamp` can be `now`, so the latest backup file that is available is used. Or you can specify a timestamp in the format of `YYYYMMDD.HHMMSS` to retrieve the nearest backup file to a specified time, searching backwards from the timestamp given. This command executes the portal restore process, which downloads the system backup and all of the site backups from the remote server, and installs them within the Portal stack. This process will then restore the system configuration from the found backup, and restore all of the sites. Note that if a backed up site is already installed on the current stack, then the site is reinstalled by using the backup (the site is overwritten by the backup). If there are multiple sites to restore, then these sites are queued for restoring. You can track the restoration process within the Portal `www admin` logs.

- By default the restore is a complete restore. You can optionally include `--type all` on the command line to specify a complete restore, but the flag is not required, as a complete restore is performed by default. Note that a complete restore supports only remote restores.

Note that the complete restore uses the `priorityList` configuration setting that you specified in [Configuring backup settings for the Developer Portal subsystem](#).

- To restore just the Portal system configuration, run the following command:

```
apicup subsys restore ptl --type system --system-name arg
```

where `arg` can be a `.tgz` name or also accepts `backup ID` if `TYPE=system` and `CR TYPE=record` from the `list-backups` command.

Note that if Portal system configuration information exists on the current stack, running this command will overwrite that configuration.

- To restore just the Portal sites, run the following command:

```
apicup subsys restore ptl --type site --site-name arg
```

where `arg` can be the site backup `tgz` file name or URL, to restore a particular site by using the specified backup ID (or the latest backup file found if using a URL). Or you can use the argument `all` to restore all of the Portal sites that have backup files on the remote server. Note that if any of the backed up sites are already installed on the current stack, then they are reinstalled by using the backup (the sites are overwritten by the backup).

```
apicup subsys restore portal -h
Restore portal subsystem
```

Usage:

```
restore SUBSYS [flags]
```

Flags:

|                                      |                                                                                                                                                                     |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>--debug</code>                 | Enable debug logging                                                                                                                                                |
| <code>--dry-run</code>               | Runs a dry run of the command, returning the actions that will be taken.                                                                                            |
| <code>-h, --help</code>              | help for restore                                                                                                                                                    |
| <code>--site-name string</code>      | File to restore site from which should exist on the pod's local filesystem or the remote server. Also accepts backup ID if TYPE=site and CR TYPE=record.            |
| <code>--system-name string</code>    | File to restore system from which should exist on the pod's local filesystem or the remote server. Also accepts backup ID if TYPE=system and CR TYPE=record.        |
| <code>--timestamp string</code>      | In 'YYYYMMDD.HHMMSS' format, specify a timestamp to retrieve the backup from. The nearest backup, searching backwards from this timestamp, is used. (default "now") |
| <code>--type string</code>           | Type of restore to take ['system' (restore Portal System), 'site' (restore Portal Site), 'all' (complete restore)] (default "all")                                  |
| <code>--wait</code>                  | Wait for the operation to complete or fail.                                                                                                                         |
| <code>--wait-timeout duration</code> | Command timeout in seconds. (default 40s)                                                                                                                           |

4. To view your restores and their statuses, run:

```
apicup subsys list-restores <subsys_name> <flags>
```

Help output:

```
apicup subsys list-restores -h
List restores of the subsystem
```

Usage:

```
apicup subsys list-restores SUBSYS [flags]
```

Flags:

|                                 |                                           |
|---------------------------------|-------------------------------------------|
| <code>-h, --help</code>         | help for list-restores                    |
| <code>--timeout duration</code> | Command timeout in seconds. (default 40s) |

Global Flags:

|                               |                                    |
|-------------------------------|------------------------------------|
| <code>--accept-license</code> | Accept the license for API Connect |
| <code>--debug</code>          | Enable debug logging               |

5. To list the Portal backup sites, use the Portal CLI command. See [Using the sites commands](#).

6. To list the Portal system sites, use the Portal CLI command. See [Using the platforms commands](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Backing up and restoring the Analytics database on VMware

The IBM® API Connect Analytics database can be backed up and restored from an S3 repository. S3 compatible object storage is required; for example, IBM Cloud Object Storage.

## About this task

Begin by configuring your backup configuration, which optionally includes a schedule if you want to automate your backups. You can run backups manually as needed. To restore a backup, review the set of available backups, and then restore the selected backup.

- [Configuring backup settings for Analytics](#)  
Use the `apicup` utility to configure backup settings for the Analytics database in your VMware environment.
- [Running a backup of the Analytics database](#)  
Initiate a backup of the IBM API Connect Analytics database on VMware.
- [Restoring the Analytics database](#)  
Restore a selected backup of the IBM API Connect Analytics database on VMware.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring backup settings for Analytics

Use the `apicup` utility to configure backup settings for the Analytics database in your VMware environment.

## About this task

The Analytics database can be backed up and restored from an S3 repository. S3-compatible object storage is required; for example, IBM Cloud Object Storage.

## Procedure

1. Use the `apicup` utility to configure the backup settings.  
Configure each setting by running the following command with the key and value from Table 1 that you want to apply:

```
apicup subsys set <analytics_subsystem> <key> <value>
```

Table 1 shows the supported backup settings with the default value (if any) and a description of each setting.

Table 1. Analytics backup settings

| Key                                     | Default value | Description                                                                                                                                                                                                                                                                                         |
|-----------------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>analytics-backup-auth-pass</code> |               | Server password for Analytics backups.                                                                                                                                                                                                                                                              |
| <code>analytics-backup-auth-user</code> |               | Server user name for Analytics backups.                                                                                                                                                                                                                                                             |
| <code>analytics-backup-host</code>      |               | The S3 endpoint with the corresponding S3 region in the format:<br><code>s3.s3region.s3domain</code><br>For example:<br><code>s3.eu-gb.cloud-object-storage.appdomain.cloud</code><br>Attention: A path style host value (formatted as <code>S3endpoint/S3region</code> ) is not supported for AWS. |

| Key                                                  | Default value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>analytics-backup-certs</code>                  |               | <p>The name of a custom certificate that contains your upstream custom S3 CA certificate. Supported beginning with 10.0.2. This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be <code>ca.crt</code> and the value is the base64-encoded value of the CA certificate.</p> <p>If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Portal subsystem already trusts the server certificate. You can test this by configuring the Portal backup to your S3/object-store server without providing the CA certificate.</p> <p>If you do need to provide the CA certificate then you must provide the entire chain in the <code>ca.crt</code> member of the secret, as follows:</p> <pre>intermediate-certificate-1 intermediate-certificate-2 . . intermediate-certificate-n root-certificate</pre> <p>Where the first certificate in the <code>ca.crt</code> member (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the <code>ca.crt</code> member is the issuer of the preceding certificate. The root certificate in the <code>ca.crt</code> member must be self-signed.</p> <p>If there are no intermediate certificates involved, then the <code>ca.crt</code> member contains only the root certificate.</p> <p>The following sample bash script creates a Kubernetes secret:</p> <pre>cat &gt;customs3ca.yaml &lt;&lt;EOF apiVersion: v1 data:   ca.crt: \$(base64 &lt;path-to-ca-certificate&gt;   tr -d '\n' ) kind: Secret metadata:   name: custom-server-ca type: generic EOF  kubectl apply -f customs3ca.yaml -n &lt;namespace&gt;</pre> |
| <code>analytics-backup-path</code>                   |               | A combination of the S3 bucket and the base path within the bucket, using the format: <code>bucket_name/path</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>analytics-backup-chunk-size</code>             | 1GB           | (Optional) Specifies how large files are stored. Large files can be stored as chunks when the snapshot is created. This setting specifies the size of the chunks as GB, MB, or KB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>analytics-backup-schedule</code>               | 0 2 ***       | (Optional) Determines how often backups will be invoked automatically. The format for the schedule is any valid <code>cron</code> string. The timezone for backups is UTC. Backing up once a day is probably sufficient; remember that the more frequently you run backups, the more storage space you need.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>analytics-enable-compression</code>            | true          | (Optional) Determines whether metadata files are stored in compressed format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>analytics-enable-server-side-encryption</code> | false         | (Optional) Determines whether files are encrypted. When set to true, files are encrypted on the server side using AES256.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

2. Validate the backup settings by running the following command:

```
apicup subsys get <analytics_subsystem> --validate
```

3. Apply the backup settings to the Analytics subsystem by reinstalling with the following command:

```
apicup subsys install <analytics_subsystem>
```

Note: The `apicup subsys install` command automatically runs `apicup health-check` prior to installing the new configuration. An error is displayed if a problem is found that will prevent successful reconfiguration.

In some scenarios, after you fix the problem, the health check might continue to fail. In this case, you can use the `--skip-health-check` flag to suppress the automatic health check:

```
apicup subsys install <subsystem_name> --skip-health-check
```

4. Verify that the backup settings were successfully applied by running the following command:

```
apicup subsys health-check <analytics_subsystem>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Running a backup of the Analytics database

Initiate a backup of the IBM® API Connect Analytics database on VMware.

### About this task

## Procedure

---

1. Perform a health check of your Analytics system by running the following command:

```
apicup subsys health-check <analytics_subsystem>
```

If successful, the command returns silently with exit code 0.

2. Start the backup by running the following command and including the appropriate flags:

```
apicup subsys backup <analytics_subsystem>
```

View the list of supported flags by running the `backup` command with the `-h` (help) flag, as shown in the following example:

```
apicup subsys backup analytics -h
Backup analytics subsystem
```

```
Usage:
  backup SUBSYS [flags]
```

Flags:

```
--comment string      Comment to add to the backup CR before creation
--debug               Enable debug logging
-h, --help            help for backup
--ignore-unavailable If false, the backup will fail if an index is missing. If true, missing indices will be
skipped and the backup will continue.
--indices strings     Indice(s) you'd like to backup (all/apievents/ui/config). It can be set to any combination
of indice(s) (eg. ui or config,apievents) (default [all])
--wait                Wait for the operation to complete or fail.
--wait-timeout duration Command timeout in seconds. (default 40s)
```

3. Optionally view a list of available backups, and the status of each, by running the following command:

```
apicup subsys list-backups <analytics_subsystem>
```

View the list of supported flags by running the `list-backups` command with the `-h` (help) flag, as shown in the following example:

```
apicup subsys list-backups -h
List backups of the subsystem
```

```
Usage:
  apicup subsys list-backups SUBSYS [flags]
```

Flags:

```
-h, --help            help for list-backups
--timeout duration    Command timeout in seconds. (default 40s)
```

Global Flags:

```
--accept-license      Accept the license for API Connect
--debug               Enable debug logging
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Restoring the Analytics database

Restore a selected backup of the IBM® API Connect Analytics database on VMware.

### About this task

---

Use the `apicup` utility to view the list of available backups for the Analytics database, and then restore a selected backup.

## Procedure

---

1. Retrieve a list of available backups, and the status of each, by running the following command:

```
apicup subsys list-backups <analytics_subsystem>
```

View the list of supported flags by running the `list-backups` command with the `-h` (help) flag, as shown in the following example:

```
apicup subsys list-backups -h
List backups of the subsystem
```

```
Usage:
  apicup subsys list-backups SUBSYS [flags]
```

Flags:

```
-h, --help            help for list-backups
--timeout duration    Command timeout in seconds. (default 40s)
```

Global Flags:

```
--accept-license      Accept the license for API Connect
--debug               Enable debug logging
```

The response includes the unique ID of each backup. Note the ID of the backup that you want to restore, so you can use it in the next step.

2. Restore a backup by running the following command with the appropriate flags:

```
apicup subsys restore <analytics_subsystem>
```

Use the `--id string` flag to specify which backup you want to restore.

View the complete list of supported flags by running the `restore` command with the `-h` (help) flag, as shown in the following example:

```
apicup subsys restore analytics -h
Restore analytics subsystem
```

Usage:

```
restore SUBSYS [flags]
```

Flags:

```
--debug      Enable debug logging
-h, --help    help for restore
--id string   ID of the backup to restore
--ignore-unavailable If false, the restore will fail if an index is missing. If true, missing indices will be
skipped and the restore will continue.
--indices strings Indice(s) you'd like to restore (all/apievents/ui/config). It can be set to any
combination of indice(s) (eg. ui or config,apievents) (default [all])
--override    If set to true, then the restore operation will override existing indices.
--wait        Wait for the operation to complete or fail.
--wait-timeout duration Command timeout in seconds. (default 40s)
```

Note: By default, the `--override` parameter is set to `false` to prevent you from accidentally replacing existing indices. If `--override` is set to `false` and you specify indices that already exist in the database that you are restoring, then the restore fails. The failure prevents you from accidentally replacing or losing data that exists in the current database.

3. Optionally view a list of available restores, and the status of each, by running the following command:

```
apicup subsys list-restores <analytics_subsystem>
```

View the list of supported flags by running the `list-restores` command with the `-h` (help) flag, as shown in the following example:

```
apicup subsys list-restores -h
List restores of the subsystem
```

Usage:

```
apicup subsys list-restores SUBSYS [flags]
```

Flags:

```
-h, --help      help for list-restores
--timeout duration Command timeout in seconds. (default 40s)
```

Global Flags:

```
--accept-license Accept the license for API Connect
--debug           Enable debug logging
```

Important:

For deployment profiles with fewer than 3 storage nodes, the restore process is never marked as **Complete**. The storage cluster status is expected to be yellow and to have more than 0 unassigned shards. In this situation, the restore process is likely to be complete when there are 0 initializing shards.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Disaster recovery

Prepare for disaster events and recover API Connect on VMware if a disaster event occurs.

You must complete preparation steps prior to a disaster in order to recover API Connect on VMware.

Note: For information about how to maintain a two data center deployment, including failover and recovery procedures, see [Maintaining a two data center deployment](#).

- [Preparing for a disaster](#)  
Prepare your API Connect deployment for disaster recovery in a VMware environment.
- [Recovering from a disaster](#)  
Recover the API Connect subsystems on VMware.
- [Using VM snapshots for infrastructure backup and disaster recovery](#)  
You can use VM snapshots to backup and restore the infrastructure used by API Connect on VMware, and also for infrastructure disaster recovery.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Preparing for a disaster

Prepare your API Connect deployment for disaster recovery in a VMware environment.

Important: Successful disaster recovery of API Connect depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery.

- [Preparing the management subsystem for disaster recovery on VMware](#)  
Prepare a Management subsystem for disaster recovery by taking specific steps before and after the installation of the subsystem.
- [Preparing the Developer Portal subsystem for disaster recovery on VMware](#)  
Prepare a Developer Portal subsystem for disaster recovery by taking specific steps immediately after the installation of the subsystem.
- [Preparing the Analytics subsystem for disaster recovery on VMware](#)  
Prepare the API Connect Analytics subsystem for disaster recovery in a VMware environment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Preparing the management subsystem for disaster recovery on VMware

Prepare a Management subsystem for disaster recovery by taking specific steps before and after the installation of the subsystem.

### About this task

---

- This task must be performed before any disaster event occurs, and also prior to the installation of a replacement Management subsystem during the recovery process. Best practice is to complete these steps immediately after initial configuration of a management subsystem during your original v10 deployment.
- Any **local** backups are presumed to have been lost in the disaster scenario and are non-recoverable in this procedure.

Important: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

### Procedure

---

1. Make sure that you have a backup that can be used in case of a disaster event:
  - For backup configuration, see [Configuring backup settings during initial installation of the management subsystem](#).
  - If scheduled backups were configured during backup configuration, you should have access to a backup on the specified cloud storage.
  - You can perform a manual backup at any time. See [Backing up the management subsystem](#).
2. Optional: Take a Virtual Machine (VM) snapshot of all your VMs; see [Using VM snapshots for infrastructure backup and disaster recovery](#) for details. This action does require a brief outage while all of the VMs in the subsystem cluster are shut down - do not take snapshots of running VMs, as they might not restore successfully. VM snapshots can offer a faster recovery when compared to redeploying OVA's and restoring from normal backups. Important: VM snapshots are not an alternative to the standard API Connect backups. You must complete the API Connect backups in order to use the API Connect restore feature.

### What to do next

---

You should now complete the preparation steps for the Developer Portal subsystem; see [Preparing the Developer Portal subsystem for disaster recovery on VMware](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Preparing the Developer Portal subsystem for disaster recovery on VMware

Prepare a Developer Portal subsystem for disaster recovery by taking specific steps immediately after the installation of the subsystem.

### About this task

---

- Perform this task before any disaster event occurs, and also prior to the installation of a replacement Developer Portal subsystem for the recovery process.
- Best practice is to complete these steps immediately after initial configuration of a Developer Portal subsystem during your original v10 deployment.
- Any **local** backups are presumed to have been lost in the disaster scenario and are non-recoverable in this procedure.
- Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. For information about preparing the Management subsystem, see [Preparing the management subsystem for disaster recovery on VMware](#).  
If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

### Procedure

---

1. Before the initial installation, configure the Developer Portal subsystem for database backups. See [Configuring backup settings for the Developer Portal subsystem](#).

2. Ensure you create a backup:
  - You can perform a manual backup at any time. See [Backing up the Developer Portal subsystem](#).
  - If you configure scheduled backups as part of [Configuring backup settings for the Developer Portal subsystem](#), backups to the specified cloud storage take place at the configured time.
3. Ensure that you have a backup of the original project directory, stored in a location from where it can always be retrieved.

The original project directory created with APICUP during the initial product installation (for example, myProject), is required to both restore the database and to upgrade your deployment. You cannot restore the database or perform an upgrade without the initial project directory because it contains pertinent information about the cluster. Note that the endpoints and certificates cannot change; the same endpoints and certificates will be used in the restored or upgraded system.
4. Optional: Take a Virtual Machine (VM) snapshot of all your VMs; see [Using VM snapshots for infrastructure backup and disaster recovery](#) for details. This action does require a brief outage while all of the VMs in the subsystem cluster are shut down - do not take snapshots of running VMs, as they might not restore successfully. VM snapshots can offer a faster recovery when compared to redeploying OVAs and restoring from normal backups.

Important: VM snapshots are not an alternative to the standard Developer Portal backups that are described in the previous steps, and which must be taken in all circumstances.

## What to do next

---

To restore the Developer Portal on VMware after a disaster, see [Recovering the Developer Portal subsystem on VMware](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Preparing the Analytics subsystem for disaster recovery on VMware

Prepare the API Connect Analytics subsystem for disaster recovery in a VMware environment.

### About this task

---

Preparing for disaster recovery involves backing up data and making a local copy of the Custom Resource (CR) that was used for installing the Analytics subsystem.

### Procedure

---

1. [Perform a backup of the Analytics database](#).

Scheduling automatic backups ensures that a recovery includes recent updates. For more information on configuring backups, see [Configuring backup settings for Analytics](#).
2. Make a copy of the AnalyticsCluster CR (custom resource).
  - a. Connect to the Analytics subsystem using ssh:

```
ssh IP_address -l apicadm
```
  - b. Get the credentials:

```
sudo -i
```
  - c. Find the Analytics cluster's name by running the following command and looking for the value in the **NAME** column:

```
kubectl get AnalyticsCluster
```

The response looks like the following example:

| NAME           | READY | STATUS  | VERSION  | RECONCILED    | VERSION | AGE |
|----------------|-------|---------|----------|---------------|---------|-----|
| gj01-analytics | 6/6   | Running | 10.0.2.0 | 10.0.2.0-1402 | 22h     |     |

In this example the cluster's name is **gj01-analytics**.
  - d. Get the YAML that describes the Analytics cluster, and save it in a file using the following command:

Use the name of the AnalyticsCluster that you obtained in the previous step.

```
kubectl get AnalyticsCluster gj01-analytics -o yaml > gj01-analytics.yaml
```
  - e. Save the file locally.
3. Optional: Take a Virtual Machine (VM) snapshot of all your VMs; see [Using VM snapshots for infrastructure backup and disaster recovery](#) for details. This action does require a brief outage while all of the VMs in the subsystem cluster are shut down - do not take snapshots of running VMs, as they might not restore successfully. VM snapshots can offer a faster recovery when compared to redeploying OVAs and restoring from normal backups.

Important: VM snapshots are not an alternative to the standard API Connect backups that are described in the previous step. You must complete API Connect backups in order to use the API Connect restore feature.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

Recover the API Connect Analytics subsystem in a VMware environment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Recovering the management subsystem on VMware

Recover the management subsystem from backups after a disaster event.

### Before you begin

To successfully recover the management subsystem, you must have previously completed the steps in [Preparing the management subsystem for disaster recovery on VMware](#).

You must use the same project directory that you used for your original deployment, or a restore of your project directory backup, to ensure that configuration and secret information is transferred to the replacement deployment.

In a clustered deployment, if any one VM is corrupted then all of the VMs in the cluster must be redeployed. You cannot replace just a single corrupted VM in a cluster.

**Important:** Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

### Procedure

1. Determine which backup to restore from.
  - a. Obtain a list of the available backups for your backup type:
    - s3 backups
      - For IBM's Cloud Object Storage, you can check currently stored backups in the COS console. Select Buckets > Objects. See the Object Names displayed on the `<cos_name>/backup/db` panel. For example:

```
20200605-105429F
20200605-100008F
20200605-11040F
```
      - For Amazon's AWS, you can check currently stored backups in the S3 console For example, under Amazon S3 > `cluster_name` > old cluster > backup > db:

```
20200606-144315F
20200606-145011F
```
    - SFTP backups  
View the SFTP backups available on your remote storage site:

```
-rw-r--r--  1 root   root    13092333 Aug 26 08:56 20200826-154646F.tgz
-rw-r--r--  1 root   root    18703758 Aug 26 09:10 20200826-160010F.tgz
-rw-r--r--  1 root   root    24318561 Aug 26 09:21 20200826-161301F.tgz
```
  - b. Select the backup ID of the backup you want to restore. For example, in the sample SFTP backup list, for the Aug 26 09:21 backup, the backup ID is **20200826-161301F**.  
Each filename contains the date, time, and type of the backup stored. The format of the backup ID is **YYYYMMDD-HHMMSS<F|I>**. Full backups are denoted with a suffix **F** on the ID. Incremental backups are denoted with a suffix **I** on the ID. For incremental backups, ensure each incremental backup has its prior full backup also present in storage. You can check this by examining the ID `<prior-backup-id>_<backup-id>`.

Note:

During the disaster recovery process, the S3 configuration detail of the older management system is used, but the older management system must be in offline mode. The old subsystem must be offline because you cannot have two management systems simultaneously using the same s3 bucket name in the database backup configurations.

2. Make sure you know the management database cluster name. You can get this name from the original management subsystem CR.

If you are not able to recover the original management subsystem CR, you can obtain the name from your backup configuration. Use the following steps applicable to your backup type:

| Backup type | How to obtain database cluster name |
|-------------|-------------------------------------|
|-------------|-------------------------------------|

| Backup type | How to obtain database cluster name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| S3          | <p>a. Open your IBM Cloud Object Storage or AWS S3 console and proceed to the bucket location where the old Management subsystem backups are located.</p> <p>b. Download <code>backup/db/&lt;backup-id&gt;/pg_data/postgresql.conf.gz</code>. Open <code>postgresql.conf</code> to view the database cluster name:</p> <ul style="list-style-type: none"> <li>IBM Cloud Object Storage <pre>cluster_name = 'm1-a6287572-postgres'</pre> <ul style="list-style-type: none"> <li>m1 - Management subsystem name</li> <li>a6287572 - site name</li> </ul> </li> <li>AWS S3 <pre>cluster_name = 'm1-c91dc0b9-postgres'</pre> <ul style="list-style-type: none"> <li>m1 - Management subsystem name</li> <li>c91dc0b9 - site name</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                      |
| SFTP        | <p>a. Recover the Management database cluster name and siteName by examining the SFTP backup tar. Download or move the SFTP backup tar file and decompress (untar) it.</p> <p>b. Open <code>&lt;management-subsystem-name&gt;-&lt;siteName&gt;-postgres-backrest-shared-repo/backup/db/&lt;backup-id&gt;/pg_data/postgresql.conf.gz</code> which contains the management subsystem name and siteName. For example:</p> <pre># Do not edit this file manually! # It will be overwritten by Patroni! include 'postgresql.base.conf'  archive_command = 'source /opt/cpm/bin/pgbackrest/pgbackrest-set-env.sh &amp;&amp; pgbackrest archive-push "%p"' archive_mode = 'True' archive_timeout = '60' autovacuum_vacuum_cost_limit = '1000' autovacuum_vacuum_scale_factor = '0.01' cluster_name = 'm1-f785a3e3-postgres'</pre> <p>In this example:</p> <ul style="list-style-type: none"> <li><code>cluster_name</code> has both the management subsystem name and siteName</li> <li>m1 - Management subsystem name</li> <li>f785a3e3 - site name</li> </ul> |

- Use your prior existing project directory, or a restore of your project directory backup, to install the Management subsystem:
  - Create your ISO files

```
apicup subsys install mgmt --out mgmtplan-out
```

The `--out` parameter and value are required.

In this example, the ISO file is created in the `myProject/mgmtplan-out` directory.

Note: If your original ISO files are still available, and you haven't upgraded from the original installation, you can reuse your original files. However, if you have upgraded your original deployment, you must create your ISO files by using the version of `apicup` that corresponds to the latest release of API Connect that you deployed.

- Deploy the files into the replacement VMs. See [Deploying the management subsystem OVA file](#).
- Verify the deployment. See [Verify installation of the management subsystem](#).

Important:

For S3, the recovery remains in an intermediate state until the restore is complete, and Postgres wal files might cause serious disk issues. To avoid this possibility, continue immediately with the next step.

Note that if you delay completion of the restore:

- Health check might fail. In this case, you can still proceed to the next step and perform a restore.
- Postgres wal files might cause problems by consuming all disk space. In this case, you must either:
  - Re-install the system, prepare again for disaster recovery, and perform the restore.
  - Or increase disk space so that the system returns to a stable state, and then proceed with the restore.

- Once your Management subsystem is ready, confirm the backup ID noted in Step 1 is present on the sftp or s3 server.
- After a few moments, confirm there is a `ManagementBackup` of type `record` and its backup ID matches with the backup ID noted in Step 1. You can list the management backups using:

```
apicup subsys list-backups <subsystem_name>
```

For example:

| NAME              | STATUS | ID               | CLUSTER                      | SUBSYSTEM  | TYPE | CR TYPE | AGE |
|-------------------|--------|------------------|------------------------------|------------|------|---------|-----|
| mgmt-backup-8hqgg | Ready  | 20200826-161301F | management-82b290a2-postgres | management | full | record  | 40s |

- Perform a Management Restore using the name of the backup CR that has the ID you want to restore. For example, for ID `20200826-161301F` the backup CR name is `mgmt-backup-8hqgg`.

For instructions on how to restore, see [Restoring the management subsystem](#).

Once the Management Restore has completed and the database is running again, the data of the old Management subsystem will be successfully restored onto the new Management subsystem. Manual and scheduled backups should perform as normal once again.

## What to do next

You should now complete the recovery steps for the Developer Portal subsystem on VMware, see [Recovering the Developer Portal subsystem on VMware](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Recovering the Developer Portal subsystem on VMware

Recover the Developer Portal on VMware.

## Before you begin

Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. If you must recover a deployment due to a disaster, you must first complete [Recovering the management subsystem on VMware](#), and then immediately recover the Developer Portal.

Recovery of the Portal subsystem is also dependent on prior completion of the preparation steps: [Preparing the Developer Portal subsystem for disaster recovery on VMware](#)

## About this task

- In a disaster recovery scenario, an installation of a new Developer Portal subsystem is required.
- In a clustered deployment, if any one VM is corrupted then all of the VMs in the cluster must be redeployed. You cannot replace just a single corrupted VM in a cluster.
- You must use the same project directory that you used for your original Portal deployment, or a restore of your project directory backup, to ensure that configuration and secret information is transferred to the replacement deployment. The `apiconnect-up-v10.yaml` file contains Portal configuration.

Use the following steps to recover the data from your previous Developer Portal subsystem.

## Procedure

1. Use your prior existing project directory, or a restore of your project directory backup, to install the replacement Portal subsystem:
  - a. Create your ISO files.

```
apicup subsys install portal-subsystem-name --out mgmtplan-out
```

The `--out` parameter and value are required.

In this example, the ISO file is created in the `myProject/portal-subsystem-nameplan-out` directory.

Note: If your original ISO files are still available, and you haven't upgraded from the original installation, you can reuse your original files. However, if you have upgraded your original deployment, you must create your ISO files by using the version of `apicup` that corresponds to the latest release of API Connect that you deployed.

- b. Deploy the files into the replacement VMs. See [Deploying the Developer Portal subsystem OVA file](#).
  - c. Verify the deployment. See [Verifying deployment of the Developer Portal subsystem](#).
2. View the available backups and their status:

```
apicup subsys list-backups [subsystem_name] [flags]
```

Optional flags:

```
./apicup subsys list-backups -h
List backups of the subsystem
Usage:
  apicup subsys list-backups SUBSYS [flags]
Flags:
  -h, --help                help for list-backups
  --timeout duration        Command timeout in seconds. (default 40s)
Global Flags:
  --accept-license         Accept the license for API Connect
  --debug                  Enable debug logging
```

3. Perform a Developer Portal restore.  
Run the following command, and attach any flags as appropriate.

```
apicup subsys restore [SUBSYS_NAME] [flags]
```

- To restore your Portal service, run the following command:

```
apicup subsys restore ptl --timestamp [now|YYYYMMDD.HHMMSS]
```

where `--timestamp` can be `now`, so the latest backup file that is available is used. Or you can specify a timestamp in the format of `YYYYMMDD.HHMMSS` to retrieve the nearest backup file to a specified time, searching backwards from the timestamp given. This command executes the portal restore process, which downloads the system backup and all of the site backups from the remote server, and installs them within the Portal stack. This process will then restore the system configuration from the found backup, and restore all of the sites. Note that if a backed up site is already installed on the current stack, then the site is reinstalled by using the backup (the site is overwritten by the backup). If there are multiple sites to restore, then these sites are queued for restoring. You can track the restoration process within the Portal `www admin` logs.

Note: From IBM® API Connect Version 10.0.3.0, the timestamp format changed to `YYYYMMDD.HHMMSS`. For Version 10.0.2.0 and earlier, the timestamp format is `YYYY-MM-DD`

`HH:MM:SS`.

- For a disaster recovery scenario, it is advised that you restore all sites and systems. By default the restore is a complete restore. You can optionally include `-type all` on the command line to specify a complete restore, but the flag is not required, as a complete restore is performed by default. Note that the complete restore uses the `priorityList` configuration setting that you specified in [Configuring backup settings for the Developer Portal subsystem](#).

- For more information, see [Restoring the Developer Portal subsystem](#)

## Results

When the Developer Portal restore CR is marked as **Ready**, the Disaster recovery is complete for the Developer Portal.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Recovering the Analytics subsystem on VMware

Recover the API Connect Analytics subsystem in a VMware environment.

### About this task

Recovering the Analytics subsystem involves deploying a new installation of the Analytics subsystem, updating it with a saved copy of the Custom Resource (CR) that was originally used for installing Analytics, and then restoring the Analytics database from a back-up copy.

You must use the same project directory that you used for your original deployment, or a restore of your project directory backup, to ensure that configuration and secret information is transferred to the replacement deployment.

In a clustered deployment, if any one VM is corrupted then all of the VMs in the cluster must be redeployed. You cannot replace just a single corrupted VM in a cluster.

### Procedure

1. Deploy the Analytics subsystem as explained in [Installing the Analytics subsystem](#).
2. Confirm that you can run kubectl commands against the Kubernetes cluster in the Analytics node:
  - a. Connect to the Analytics subsystem using ssh:

```
ssh IP_address -l apicadm
```

- b. Get the credentials:

```
sudo -i
```

- c. List the nodes:

```
root@apimdev1194:~# kubectl get nodes
```

The response looks like the following example:

| NAME        | STATUS | ROLES  | AGE | VERSION |
|-------------|--------|--------|-----|---------|
| apimdev1194 | Ready  | master | 29h | v1.17.9 |

3. Restore the Analytics data from a back up, as explained in [Restoring the Analytics database](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using VM snapshots for infrastructure backup and disaster recovery

You can use VM snapshots to backup and restore the infrastructure used by API Connect on VMware, and also for infrastructure disaster recovery.

Backup and restore procedures for the databases used by IBM API Connect on VMware are described in [Backing up and restoring on VMware](#). The procedures back up all of the state required by API Connect but do not include the underlying infrastructure software or other internal state.

In some scenarios, you may want to perform backups and disaster recovery at an infrastructure layer. You can do this by taking snapshots of the virtual machines or underlying storage volumes, providing that you follow the constraints described here.

Note that performing backups at the infrastructure layer differs from the standard approach in that not only is the database state backed up, but also the precise state of the software. This approach can be useful, for example, when testing upgrades of production systems.

VM snapshots should not be used as an alternative to taking normal backups. Ideal times to take VM snapshots are after initial install and configuration, and before and after upgrades. In the event of a disaster, reverting to the last snapshot taken and then restoring the standard daily backup can be faster than redeploying OVA's and restoring the backup.

- Requirements for taking a consistent backup of an API connect system at the infrastructure level
  - An API Connect system can be approximated by the following diagram:

Table 1. API Connect Installation

- 3 Management Nodes
- 3 Portal Nodes
- 3 Analytics Nodes
- 3 Gateways
- Each of these components has a load balancer with its own IP address. The load balancers all sit on a single VM. The cluster is installed and configured on 13 VMs in VMware. In this example, the system was populated with data and APIs. These should first be tested to ensure that all published APIs respond as expected. Once this is done, use vSphere UI to complete the following steps:
  1. Power off VMs
 

To power off the VMs in sync, schedule a “shutdown guest OS” such that all the VMs shutdown at the same time. Although the shutdown does not occur at exactly the same instant, this does allow the shutdown for every machine to be as close in time as possible.
  2. Take snapshots
 

Take snapshots of each VM after shutdown. Using the scheduling feature in the UI, schedule a snapshot of all the VMs at the same instant. If cloning should adversely affect the system in any way then the original VMs can be reverted back to these snapshots.
  3. Clone VMs
 

Use the clone feature of the UI to create a clone of each VM. This VM should sit in the same resource pool as the original cluster. This is simply an exact copy of the disks of the original machine. The clones and originals are in no way coupled.
  4. Power on clones
 

Schedule the power-on for each clone VM such that all the clone VMs power on simultaneously. Once this is done, test the cluster to ensure that the APIs respond as expected. For the example cluster topology shown earlier on this page, it can take a couple of hours after power-on for all the APIs to respond as expected.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Disabling the Analytics subsystem on VMware

Disable the Analytics subsystem by shutting down the VM that hosts it.

### Before you begin

Disabling the Analytics subsystem stops the collection and storage of data as well as making the subsystem unavailable. If you just want to pause data collection without disabling the entire subsystem (for example, while renewing certificates), see [Stopping Analytics data collection](#).

### About this task

When you disable Analytics, there will be no data in either the API Manager Dashboards or third-party offloads.

### Procedure

1. Back up your Analytics data as explained in [Backing up and restoring the Analytics database on VMware](#).
2. Disable shard allocation for storage.
 

Disabling shard allocation is optional, but is recommended because it prevents new shards from being created for replication when a node is unavailable, and helps avoid corruption issues in full system restarts.

- a. Connect to the virtual machine as the API Connect administrator by completing the following steps:
  - i. Run the following command to connect as the API Connect administrator, replacing **ip\_address** with the appropriate IP address:

```
ssh ip_address -l apicadm
```

- ii. When prompted, select Yes to continue connecting.
- iii. When you are connected, run the following command to receive the necessary permissions for working directly on the appliance:

```
sudo -i
```

- b. Disable shard allocation for storage by running the following command:

```
kubectl -n namespace exec -it storage-master|shared_pod -- curl_es _cluster/settings -XPUT -d '{"persistent":{"cluster.routing.allocation.enable":"none"}}'
```

where:

- **namespace** is the namespace where the Analytics subsystem is installed.
- **storage-master|shared\_pod** is the name of any storage-master or storage-shared pod. You can get the name of your storage pods by running the following command and substituting in the namespace where Analytics is installed:

```
kubectl -n namespace get po
```

When you disable shard allocation, the response looks like the following example:

```
{"acknowledged":true,"persistent":{"cluster":{"routing":{"allocation":{"enable":"none"}}},"transient":{}}
```

Leave the connection open for the next step.

3. Perform a synced flush of storage.

Flushing the storage is optional, but is recommended because it helps to avoid losing the data that was not yet written to disk. This step flushes all current index operations synchronously and attempts to write everything that is in flux to disk. Perform a synced flush of storage by running the following command:

```
kubectl -n namespace exec -it storage-master|shared_pod -- curl_es _flush/synced -XPOST
```

When you flush storage, the response looks like the following example:

```
{ "shards": {"total": 33, "successful": 13, "failed": 0}, ".export-status": {"total": 1, "successful": 1, "failed": 0}, ".apic-config": {"total": 1, "successful": 1, "failed": 0}, ".kibana-6": {"total": 1, "successful": 1, "failed": 0}, "apic-api-2020.06.19-000002": {"total": 15, "successful": 5, "failed": 0}, "apic-api-2020.06.18-1": {"total": 15, "successful": 5, "failed": 0}}
```

The operation often fails, and it is safe to rerun it multiple times until it passes and there are all "failed" counts are zero. If it continues to fail after running multiple attempts over the span of a couple minutes, you can proceed to the next step.

#### 4. Shut down the Analytics VMs.

You can shut down the VMs using one of the following methods:

- Use the VMware console
- `ssh` into the images and run the `shutdown` command

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Maintaining a two data center deployment

How to maintain a two data center disaster recovery (DR) deployment on VMware, including information about normal operation, failure handling, and recovery.

The following information explains how the data flows between the two API Connect subsystems, the API Manager and the Developer Portal, when the two data center DR deployment is running in normal operational mode. Both subsystems have a different internal topology and operate in a slightly different way, and therefore are described separately.

For a general overview of how endpoints and the traffic between ingresses flow in API Connect, see [Deployment overview for endpoints and certificates](#).

Ensure that you understand the concepts of a two data center disaster recovery deployment in API Connect. For more information, see [A two data center deployment strategy on VMware](#).

## Normal operation for the API Manager

In normal operation each data center contains an API Manager service which includes one primary database pod, and some (usually two) secondary pods. As well as the cluster replication that occurs within the data center from the primary to the secondary pods, there is also a Publish/Subscribe logical replication of changes from the active data center to the passive one, as shown in the following diagram.

### API Manager data flows

The following data flows exist to and from the API Manager.

- Data traffic from the API Manager to the DataPower® gateway director to publish APIs to the gateway via webhooks, as well as to update the gateway with consumer subscriptions, credentials, and so on. This connection does not use mutual TLS (mTLS) by default, but it can be enabled; see [TLS profiles overview](#) for more information.
- Data traffic from the API Manager to the Developer Portal director endpoint. This traffic contains both REST calls to create and delete Portal sites, and also webhook traffic to send the Portal updated data when changes are made in API Manager. This connection is secured by mTLS.
- Incoming data traffic to the consumer API endpoint of the API Manager, in order to carry out consumer actions such as login authentication, create a new application, subscribe to a product, and so on. These calls could come from the Portal, or from direct REST calls made by a consumer or a custom application.
- Incoming data traffic to the platform API endpoint of the API Manager. These calls could come from the Portal, the gateway, and possibly from custom applications.

- Incoming web UI data traffic to the Cloud and Manager UI endpoints of the API Manager.

## Normal operation for the Developer Portal

An API Connect deployment can have multiple Developer Portal services, each of which can be deployed to the primary data center, or the secondary data center, or to both. Obviously if the Developer Portal service is only deployed to a single data center, there is no disaster recovery strategy. So, on the assumption that the Portal service is deployed to both data centers, then there will be multiple Portal pods in each data center. The ideal configuration is to have two or three Portal pods in each data center; any more than three and the costs of data replication outweigh any benefits in additional load handling.

The Developer Portal cluster replication has two components: a database and a filesystem. These components are independent, and both replicate in a star model whereby each pod replicates changes to every other pod. The database also has the added advantage of supporting segment replication, which can be used to optimize the replication across data centers. However, the filesystem replication, which uses CSync2, does not currently support segments.

As all Developer Portal pods are active primary servers, there is no need to be concerned if any writes occur in the passive data center. If any traffic does get routed to the passive data center, this traffic is replicated back to the active data center, and data consistency is maintained.

The following diagram gives an overview of the normal operation for the Developer Portal.

### Developer Portal data flows

The following data flows exist to and from the Developer Portal.

- Data traffic from the API Manager to the Developer Portal director endpoint. This traffic contains both REST calls to create and delete Portal sites, and also webhook traffic to send the Portal updated data when changes are made in API Manager. This connection is secured by mTLS.
- Data traffic from the Developer Portal to the consumer API endpoint of the API Manager, in order to carry out consumer actions such as login authentication, create a new application, subscribe to a product, and so on.
- Data traffic from the Developer Portal to the Analytics client endpoint, in order to display the Portal consumer analytics. However, if there is more than one analytics service in use on a Catalog, then Portal consumer analytics is automatically disabled.
- There is no data traffic from the Developer Portal to the DataPower Gateway, or vice versa.
- Incoming web UI data traffic to the Developer Portal on the Portal UI endpoint. This data is user traffic from the browsers of Developer Portal consumers.
- All calls between the API Manager and the Developer Portal (in either direction), must go via a dynamic router in order to allow for either service to have independent failover between the data centers.

## Backup and restore considerations for a two data center deployment

Points to consider when backing up and restoring a two data center disaster recovery (DR) deployment on VMware.

Full instructions about backing up and restoring your API Connect deployment are contained in the following topics:

- [Backing up the management subsystem](#)
- [Restoring the management subsystem](#)
- [Backing up and restoring the Developer Portal](#)

Follow the steps in these topics to back up and restore your two data center DR deployment. However, there are some additional considerations to bear in mind if you have a two data center DR deployment, and these considerations are listed in the [General considerations](#) section that follows.

For general information about two data center disaster recovery in API Connect, see [A two data center deployment strategy on VMware](#).

---

## General considerations

- Best practice is to take regular, scheduled backups of the subsystems in the primary (active) data center, as this is the data center that contains the most valid data.
- The subsystems in the secondary (passive) data center should be backed up only when key updates are made, for example when first deploying a passive data center, and then again before and after applying fix packs. This ensures that all of the endpoints in the deployment remain consistent.
- If a subsystem or entire data center needs to be restored, the data will be retrieved from the backups of the subsystems in the active data center.
- If a passive data center fails, you can either restore before you enable the multi-site HA setting on that site. Or, restore your passive data center, then trigger a re-sync of the databases.

Important: If the passive data center is offline for more than 24 hours, there can be issues with the disk space on the active data center so you must revert your deployment to a single data center topology. To revert to a single data center topology, you must change the `multi-site-ha-enabled` setting to `false` on the active data center. When the passive site has been redeployed, the `multi-site-ha-enabled` setting can be reapplied to the active site.

- You can trigger the passive data center to re-sync its databases with the active data center by disabling the multi-site HA setting of the passive data center, and then enabling the multi-site HA setting again. This action triggers a re-sync with the active data center, to ensure that the passive data center contains the latest data. On VMware, this involves the following steps:

1. Run `apicup` to change the `multi-site-ha-enabled` property to `false` on the passive data center, for example:

```
apicup subsys set service_name multi-site-ha-enabled=false
```

where `service_name` is the name of the management or portal service that you want to disable, for example `mgmt_dc2`.

2. Run `apicup` to update the settings in the deployed passive subsystem, for example:

```
apicup subsys install service_name
```

3. Run `apicup` to change the `multi-site-ha-enabled` property back to `true` on the passive data center, for example:

```
apicup subsys set service_name multi-site-ha-enabled=true
```

4. Run `apicup` to update the settings in the deployed passive subsystem again, for example:

```
apicup subsys install service_name
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Failure handling of a two data center deployment

How to detect failures, and perform service failover, in a two data center disaster recovery deployment on VMware.

---

## Before you begin

Ensure that you understand the concepts of a two data center disaster recovery deployment in API Connect. For more information, see [A two data center deployment strategy on VMware](#).

## About this task

Failure handling comprises of two main concepts; failure detection, and failover of services.

Failure detection is about detecting that a failure has happened, and then alerting the relevant administrator for them to take action. Failure detection is different from system monitoring. Failure detection checks are run often and fast (for example, every 5 seconds). As such they are normally more limited in what they check. In API Connect, failure checks detect only whether the database and web server are online, and nothing more. Whereas monitoring checks typically are run less frequently, but are more likely to check for things like CPU, memory, and disk space usage. The results of these checks can then be recorded to perform historical trend analysis to spot memory leaks for example.

If a failure is detected, it's then important to make sure that the cluster or service is definitely offline. So, for example, if data center one (DC1) appears to have an outage, and the plan is to failover to data center two (DC2), then it's important to make sure that the pods in DC1 really are offline. If the DC1 pods are actually still running, then they might continue to send data to DC2, which would lead DC2 to think it wasn't the active deployment, and then that could lead to split-brain. A fast way to ensure that the cluster or service really is offline, is to drop the network link to those pods in your VMware infrastructure, and then delete them.

The failure detection endpoint must be location specific and must be exempt from any traffic routing, so that it's possible to explicitly check the health of each data center regardless of how traffic is being routed.

You can failover a specific service, for example `portal_service_1`, or all of the services that are running in a particular data center. The following sections describe how failover is achieved.

The operational states of an API Manager service:

| Operational state                   | Description                                                                                       |
|-------------------------------------|---------------------------------------------------------------------------------------------------|
| <code>progressing to active</code>  | Pods are progressing to the active state, but none are capable of serving traffic.                |
| <code>active</code>                 | All of the pods are ready and in the correct disaster recovery state for the active data center.  |
| <code>progressing to passive</code> | Pods are progressing to the passive state, but none are capable of serving traffic.               |
| <code>passive</code>                | All of the pods are ready and in the correct disaster recovery state for the passive data center. |

The operational states of a Developer Portal service:

| Operational state                                       | Description                                                                                           |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <code>progressing to active</code>                      | Pods are progressing to the active state, but none are capable of serving traffic.                    |
| <code>progressing to active (ready for traffic)</code>  | At least one pod of each type is ready for traffic. The dynamic router can be linked to this service. |
| <code>active</code>                                     | All of the pods are ready and in the correct disaster recovery state for the active data center.      |
| <code>progressing to passive</code>                     | Pods are progressing to the passive state, but none are capable of serving traffic.                   |
| <code>progressing to passive (ready for traffic)</code> | At least one pod of each type is ready for traffic.                                                   |
| <code>passive</code>                                    | All of the pods are ready and in the correct disaster recovery state for the passive data center.     |
| <code>progressing to down</code>                        | Pods are moving from passive state to down.                                                           |
| <code>down</code>                                       | The multi-site HA mode is deleted from the passive data center.                                       |

You can run the following command to check the operational state of a service:

```
kubect1 describe ServiceName
```

Where `ServiceName` is the name of the API Manager or Developer Portal service.

Important:

- If the active data center is offline, do not change the `multi-site-ha-enabled` setting to `false` on the passive data center, as this action deletes all the data from the databases. If you want to revert to a single data center topology, you must change the `multi-site-ha-enabled` setting to `false` on the active data center, and then redeploy the passive data center. If the active data center is offline, you must first change the passive data center to be active, and then change the `multi-site-ha-enabled` setting to `false` on the now active data center.
- If the passive data center is offline for more than 24 hours, there can be issues with the disk space on the active data center so you must revert your deployment to a single data center topology. To revert to a single data center topology, you must change the `multi-site-ha-enabled` setting to `false` on the active data center. When the passive site has been redeployed, the `multi-site-ha-enabled` setting can be reapplied to the active site.

## Procedure

### • API Manager service failover

To initiate a failover from DC1 to DC2 you first must set DC1 to passive, before making the passive data center active. This action is needed to prevent split-brain, as there cannot be two active services or clusters at the same time. If the failover is being done because the current active data center has had a complete outage, then you should ensure that the network links to that data center are dropped in your VMware infrastructure, in order to avoid the potential for split-brain occurring. The offline data center must be set to passive before the network links are restored. The following instructions show how to failover DC1 to DC2 for the API Manager service.

1. Set DC1 (in this example, located in Dallas) to be passive.

Run `apicup` to change the `multi-site-ha-mode` property to `passive` on the Dallas data center, for example:

```
apicup subsys set mgmt_dallas multi-site-ha-mode=passive
```

where

- `mgmt_dallas` is the name of the management service on DC1.

Note: If DC1 is completely down, and you cannot set it to be passive at this point, you must ensure that the network links to DC1 are removed before continuing to set DC2 to be active. You must then not restore the network links to DC1 until you can set DC1 to be passive.

2. Run `apicup` to update the settings on DC1, for example:

```
apicup subsys install mgmt_dallas
```

3. Log in to the virtual machine management subsystem on DC1 by using an SSH tool, and run the following command to check that the API Manager service is ready for traffic:

```
kubect1 describe ServiceName
```

The service is ready for traffic when the `Ha mode` part of the `Status` object is set to `passive`. For example:

```
Status:
...
Ha mode: passive
...
```

- Set DC2 (in this example, located in Raleigh) to be active.  
Run `apicup` to change the `multi-site-ha-mode` property to `active` on the Raleigh data center, for example:

```
apicup subsys set mgmt_raleigh multi-site-ha-mode=active
```

where

- `mgmt_raleigh` is the name of the management service on DC2.

- Run `apicup` to update the settings on the services on DC2.  
For example:

```
apicup subsys install mgmt_raleigh
```

- Update your dynamic router to redirect all traffic to DC2 instead of DC1. Note that until the DC2 site becomes `active`, the UIs might not be operational.
- Log in to the virtual machine management subsystem on DC2 by using an SSH tool, and run the following command to check that the API Manager service is ready for traffic:

```
kubectl describe ServiceName
```

The service is ready for traffic when the `Ha mode` part of the `Status` object is set to `active`. For example:

```
Status:
...
Ha mode: active
...
```

#### • Developer Portal service failover

To initiate a failover for the Developer Portal from DC1 to DC2 you first must ensure that the existing DC1 is passive, before making the passive data center active, in order to prevent split-brain. The following instructions show how to failover DC1 to DC2 for the Developer Portal service. You must repeat these steps for each Developer Portal service that you want to failover.

Note:

- Switching a Developer Portal service to passive mode instantly restarts all of its `portal-db` and `portal-www` pods at the same time. Therefore, if you don't have an active Developer Portal service that is online, there will be an outage of the Developer Portal web sites until the passive data center is ready to accept traffic.
- If you want to monitor the failover process, you can run the following command to check the status of the Portal pods in the `PortalService` CR file:

```
kubectl describe ServiceName
```

For more details about the status information in a `PortalCluster` CR file, see the [Example](#) section.

- Do not edit the `PortalService` CR file during the failover process.
- Set DC1 (in this example, located in Dallas) to be passive.  
Run `apicup` to change the `multi-site-ha-mode` property to `passive` on the Dallas data center, for example:

```
apicup subsys set port_dallas multi-site-ha-mode=passive
```

where

- `port_dallas` is the name of the Portal service on DC1.

Note: If DC1 is completely down, and you cannot set it to be passive at this point, you must ensure that the network links to DC1 are removed before continuing to set DC2 to be active. You must then not restore the network links to DC1 until you can set DC1 to be passive.

- Run `apicup` to update the settings on DC1, for example:

```
apicup subsys install port_dallas --skip-health-check
```

Important: You must not wait for the active DC `Status` to become `passive`, before failing over the passive DC to become `active`. You should change the DC1 `multi-site-ha-mode` to `passive`, and then run the `kubectl describe ServiceName` command, and as soon as the `haMode` is set to `progressing to passive`, you must change DC2 to be `active`.

- Set DC2 (in this example, located in Raleigh) to be active.  
Run `apicup` to change the `multi-site-ha-mode` property to `active` on the Raleigh data center, for example:

```
apicup subsys set port_raleigh multi-site-ha-mode=active
```

where

- `port_raleigh` is the name of the Portal service on DC2.

- Run `apicup` to update the settings on the services on DC2.  
For example:

```
apicup subsys install port_raleigh --skip-health-check
```

- Update your dynamic router to redirect all traffic to DC2 instead of DC1.
- Log in to the virtual machine management subsystem on DC2 by using an SSH tool, and run the following command to check that the Developer Portal service is ready for traffic:

```
kubectl describe ServiceName
```

The service is ready for traffic when the `haMode` part of the `Status` object is set to `active`. For example:

```
Status:
...
haMode: active
...
```

#### • Entire data center failover

To failover an entire datacenter, follow the previous steps to failover the API Manager service, followed by the steps to failover each Developer Portal service in that data center.

How long it takes to complete the failover varies, and depends on hardware speed, network latency, and the size of the databases. However, here are some approximate timings:

For API Manager:

- **passive to active** approximately 5 minutes
- **active to passive** approximately 15 minutes

For Developer Portal:

- **passive to active** 15 - 40 minutes
- **active to passive** approximately 10 minutes

## Example

Example of the status section of a `PortalCluster` CR file for an active data center that you can view by running the `kubectl describe PortalService` command:

```
status:
  conditions:
  - lastTransitionTime: "2020-04-27T08:00:25Z"
    message: 4/6
    status: "False"
    type: Ready
  customImages: true
  dbCASecret: portal-db-ca
  encryptionSecret: ptl-encryption-key
  endpoints:
    portal-director: https://api.portal.ha-demo.cloud/
    portal-web: https://portal.ha-demo.cloud/
    replication: https://ptl-replication.cvs.apic-2ha-dallas-144307-xxxx14539d6e75f74e950db7077951d4-0000.us-
south.containers.appdomain.cloud/
  localMultiSiteHAPeerConfigHash: UM9VtuWDdp/328n0oCl/GQGFzy34o1V9sH2OyXxKMHw=
  haMode: progressing to active (ready for traffic)
  microServiceSecurity: custom
  multiSiteHA:
    dbPodScale: 3
    remoteSiteDeploymentName: portal
    remoteSiteName: frankfurt
    replicationPeer: https://ptl-replication.cvs.apic-2ha-frankfur-683198-xxxx14539d6e75f74e950db7077951d4-0000.eu-
de.containers.appdomain.cloud/
    wwwPodScale: 3
  phase: 0
  serviceCASecret: portal-ca
  serviceClientSecret: portal-client
  serviceServerSecret: portal-server
  services:
    db: portal-dallas-db
    db-remote: portal-frankfurt-db
    nginx: portal-nginx
    tunnel: portal-tunnel
    www: portal-dallas-www
    www-remote: portal-frankfurt-www
  versions:
    available:
      channels:
      - name: "10"
      - name: "10.0"
      - name: 10.0.0
      - name: 10.0.0.0
      versions:
      - name: 10.0.0.0-1038
    reconciled: 10.0.0.0-1038
```

Meaning of the `haMode` for the active data center:

- **active** - this is the active data center, or the only data center, and all pods are ready and accepting traffic.
- **progressing to active** - this is the active data center, or the only data center, and there are no pods ready yet.
- **progressing to active (ready for traffic)** - this is the active data center, or the only data center, and there is at least one pod of each type, www, db, and nginx, ready, so the data center is accepting traffic.

Example of the status section of a `PortalCluster` CR file for a passive data center that you can view by running the `kubectl describe PortalService` command:

```
status:
  conditions:
  - lastTransitionTime: "2020-04-21T10:54:54Z"
    message: 6/6
    status: "True"
    type: Ready
  customImages: true

replicationPeer: https://ptl-replication.cvs.apic-2ha-dallas-144307-xxxx14539d6e75f74e950db7077951d4-0000.us-
south.containers.appdomain.cloud/
wwwPodScale: 3
phase: 0
serviceCASecret: portal-ca
serviceClientSecret: portal-client
serviceServerSecret: portal-server
services:
  db: portal-frankfurt-db
  db-remote: portal-dallas-db
  nginx: portal-nginx
  tunnel: portal-tunnel
  www: portal-frankfurt-www
  www-remote: portal-dallas-www
versions:
  available:
    channels:
      - name: "10"
      - name: "10.0"
      - name: 10.0.0
      - name: 10.0.0.0
    versions:
      - name: 10.0.0.0-1038
  reconciled: 10.0.0.0-1038
```

Meaning of the **haMode** for the passive data center:

- **passive** - this is the passive data center, and all pods are ready and accepting traffic.
- **progressing to passive** - this is the passive data center, and there are no pods ready yet.
- **progressing to passive (ready for traffic)** - this is the passive data center, and there is at least one pod of each type, www, db, and nginx, ready, so the data center is accepting traffic.

## What to do next

---

As soon as a failure on a data center has been resolved, the failed data center should be brought back online and re-linked to the currently active data center in order to maintain the highest availability; see [Recovering from a failover of a two data center deployment](#) for more information.

# Recovering from a failover of a two data center deployment

How to recover a two data center disaster recovery deployment on VMware.

## Before you begin

---

Ensure that you understand the concepts of a two data center disaster recovery deployment in API Connect. For more information, see [A two data center deployment strategy on VMware](#).

## About this task

---

After a failure has been resolved, the failed data center can be brought back online and re-linked to the currently active data center. It's important to do this as soon as possible, in order to reinstate disaster recovery. Otherwise, if another failure occurred before the failed data center is brought back online, there could be a complete outage.

The failed data center can be brought back online as the new active primary data center, or it can be brought back as a passive secondary data center and the currently active data center kept as the primary one. This decision will be based on your own company policies about recovering from a failure.

The amount of data that is sent when recovering from a failover, will depend on how long the outage lasted, and how much activity there was during that period.

Important:

- If the active data center is offline, do not change the **multi-site-ha-enabled** setting to **false** on the passive data center, as this action deletes all the data from the databases. If you want to revert to a single data center topology, you must change the **multi-site-ha-enabled** setting to **false** on the active data

center, and then redeploy the passive data center. If the active data center is offline, you must first change the passive data center to be active, and then change the `multi-site-ha-enabled` setting to `false` on the now active data center.

- If the passive data center is offline for more than 24 hours, there can be issues with the disk space on the active data center so you must revert your deployment to a single data center topology. To revert to a single data center topology, you must change the `multi-site-ha-enabled` setting to `false` on the active data center. When the passive site has been redeployed, the `multi-site-ha-enabled` setting can be reapplied to the active site.

## Procedure

### • Recovering from an API Manager failover

The following instructions show how to bring data center one (DC1) back as the primary (**active**) data center, and assume that DC1 is now online and in the passive state. If you prefer, you can keep DC1 as the secondary data center, and leave data center two (DC2) as the primary (**active**) data center.

1. Set DC2 (in this example, located in Raleigh) to be passive.

Run `apicup` to change the `multi-site-ha-mode` property to `passive` on the Raleigh data center, for example:

```
apicup subsys set mgmt_raleigh multi-site-ha-mode=passive
```

where

- `mgmt_raleigh` is the name of the management service on DC2.

2. Run `apicup` to update the settings on DC2, for example:

```
apicup subsys install mgmt_raleigh
```

3. Log in to the virtual machine management subsystem on DC2 by using an SSH tool, and run the following command to check that the API Manager service is ready for traffic:

```
kubectl describe ServiceName
```

The service is ready for traffic when the `Ha mode` part of the `Status` object is set to `passive`. For example:

```
Status:
...
Ha mode:           passive
...
```

You must also ensure that the database in DC2 has replicated over completely before proceeding.

4. Set DC1 (in this example, located in Dallas) to be active.

Run `apicup` to change the `multi-site-ha-mode` property to `active` on the Dallas data center, for example:

```
apicup subsys set mgmt_dallas multi-site-ha-mode=active
```

where

- `mgmt_dallas` is the name of the management service on DC1.

5. Run `apicup` to update the settings on DC1.

For example:

```
apicup subsys install mgmt_dallas
```

6. Update the dynamic router to redirect all traffic to DC1 instead of DC2. Note that until the DC1 site becomes **active**, the UIs might not be operational.
7. Log in to the virtual machine management subsystem on DC1 by using an SSH tool, and run the following command to check that the API Manager service is ready for traffic:

```
kubectl describe ServiceName
```

The service is ready for traffic when the `Ha mode` part of the `Status` object is set to `active`. For example:

```
Status:
...
Ha mode:           active
...
```

### • Recovering from a Developer Portal failover

When recovering from a Developer Portal failover, how much data is sent from the now passive data center (in this example, DC2) back to the newly recovered active data center (in this example, DC1) varies depending on how much time has passed and how many changes have been made in the meantime.

If possible, the Portal sends an Incremental State Transfer (IST), which is a replay of the transactions that have happened since the failed data center, DC1, became unreachable. The IST can grow to be up to 3 GB in size. If the IST grows larger than 3 GB, then the Portal sends a State Snapshot Transfer (SST) instead, which is basically a full copy of the whole database. How long this process takes depends on how many Portal sites there are, how much content in each of those sites, how active they are (as in number of transactions), and how fast the network speed is between the data centers. However, it is likely to take in the range 5 - 60 minutes.

You can check whether the Developer Portal servers are in sync by running the `status` command in the `portal-www` pod admin container. If all servers show as **primary**, then they are in sync and traffic can be directed wherever needed. For information about running the status command, see [Verifying deployment of the Developer Portal subsystem](#).

Note:

- If you want to monitor the recovery process, you can log in to the virtual machine Portal subsystem by using an SSH tool, and run the following command to check the status of the Portal pods in the `PortalService` CR file:

```
kubectl describe ServiceName
```

For more details about the status information in a `PortalCluster` CR file, see the [Example](#) section.

- Do not edit the `PortalService` CR file during the recovery process.

The following instructions show how to bring DC1 back as the active primary data center, and switch DC2 to be the passive secondary data center. Again, you can keep DC2 as the active primary data center if you prefer, and leave DC1 to be passive.

1. Set DC2 (in this example, located in Raleigh) to be passive.

Run `apicup` to change the `multi-site-ha-mode` property to `passive` on the Raleigh data center, for example:

```
apicup subsys set port_raleigh multi-site-ha-mode=passive
```

where

- `port_raleigh` is the name of the Portal service on DC2.

2. Run `apicup` to update the settings on the services on DC2.

For example:

```
apicup subsys install port_raleigh --skip-health-check
```

Important: You must not wait for the active DC `Status` to become `passive`, before changing the passive DC to become `active`. You should change the DC2 `multi-site-ha-mode` to `passive`, and then run the `kubect1 describe ServiceName` command, and as soon as the `haMode` is set to `progressing` to `passive`, you must change DC1 to be `active`.

3. Set DC1 (in this example, located in Dallas) to be active.

Run `apicup` to change the `multi-site-ha-mode` property to `active` on the Dallas data center, for example:

```
apicup subsys set port_dallas multi-site-ha-mode=active
```

where

- `port_dallas` is the name of the Portal service on DC1.

4. Run `apicup` to update the settings on the services on DC1.

For example:

```
apicup subsys install port_dallas --skip-health-check
```

5. Update the dynamic router to redirect all traffic to DC1 instead of DC2.

6. Log in to the virtual machine Portal subsystem on DC1 by using an SSH tool, and run the following command to check that the Developer Portal service is ready for traffic:

```
kubect1 describe ServiceName
```

The service is ready for traffic when the `Ha mode` part of the `Status` object is set to `active`. For example:

```
Status:
...
Ha mode: active
...
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Removing a two data center deployment

You can remove your two data center disaster recovery deployment on VMware.

## Before you begin

Ensure that you understand the concepts of a two data center disaster recovery deployment in API Connect. For more information, see [A two data center deployment strategy on VMware](#).

## About this task

If you decide to remove your two data center disaster recovery (DR) deployment, you go from two data centers to one. The active data center remains as the only working system. The passive one loses all data as part of the process.

Warning: If the active data center is offline, do not remove the multi-site HA CR section from the passive data center, as this action deletes all the data from the databases. As part of the installation, you configured the `multi-site-ha` settings on each data center, as described in the following table:

Table 1. The `multi-site-ha` settings

| Setting                            | Description                                                                                                                                                                                                                                                                   |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>multi-site-ha-enabled</code> | Indicates whether two data center DR deployment is enabled. Set to <code>true</code> to enable two data center DR. Set to <code>false</code> to disable two data center DR. The default value is <code>false</code> .                                                         |
| <code>multi-site-ha-mode</code>    | The state of the data center in the context of the two data center deployment. Valid values are: <ul style="list-style-type: none"><li>• <code>active</code> - indicates the primary data center</li><li>• <code>passive</code> - indicates the standby data center</li></ul> |

| Setting                             | Description                                                                                                                                                                                                                                                                                 |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>management-replication</code> | Required only for the Management subsystem. The external ingress name for the Management subsystem in the current data center in the two data center deployment. The name is a unique fully qualified hostname that the other data center uses to communicate with the current data center. |
| <code>portal-replication</code>     | Required only for the Portal subsystem. The external ingress name for the Portal subsystem in the current data center in the two data center deployment. The name is a unique fully qualified hostname that the other data center uses to communicate with the current data center.         |
| <code>replication-peer-fqdn</code>  | The ingress hostname for the other data center in the two data center deployment. This information is required so that the two data centers can communicate with each other.                                                                                                                |

If you want to revert to a single data center topology, or temporarily remove the passive data center from DR, you must disable the `multi-site-ha` configuration on the active data center, and then remove the passive data center. If the active data center is offline, you must first change the passive data center to be active, and then disable the `multi-site-ha` configuration on the now active data center.

## Procedure

- Disable the `multi-site-ha` configuration on the Management subsystem of the active data center. For example:

```
apicup subsys set mgmt multi-site-ha-enabled=false
apicup subsys install mgmt
```

- Disable the `multi-site-ha` configuration on the Portal subsystem of the active data center. For example:

```
apicup subsys set ptl multi-site-ha-enabled=false
apicup subsys install ptl
```

- You can now power off and shut down your passive data center.

## Upgrading a two data center deployment

How to upgrade a two data center disaster recovery (DR) deployment on VMware.

Full instructions about how to upgrade your API Connect deployment are contained in the following topic:

- [Upgrading API Connect](#)

However, there are some important additional instructions if you have a two data center DR deployment; see the following sections:

- [Key points when upgrading a two data center DR deployment](#)
- [How to upgrade when one data center is down](#)

For general information about two data center disaster recovery in API Connect, see [A two data center deployment strategy on VMware](#).

## Key points when upgrading a two data center DR deployment

Both data centers must be using the same version of API Connect, including down to the specific fix pack and iFix level, as appropriate. Each data center is effectively an identical deployment instance, so they must be kept on identical code level bases. Therefore, both data centers must be upgraded in the same maintenance window.

You must upgrade each subsystem in a specific order, upgrading it on the **passive** (standby) data center first, and then upgrading it on the **active** (primary) data center. This ordering of the upgrade is important, as the replication between the primary and the standby subsystems might fail if the **passive** subsystem is older than the **active** subsystem. Use the following instructions to upgrade your subsystems, paying particular attention to the detailed instructions for the Management subsystem. Note:

- DO NOT reboot any of the virtual machines until the end of the upgrade, even if you're instructed to do so by the `apicup subsys health-check` during the upgrade process.
- To run the `kubect1` commands, you need to SSH into the appropriate subsystem.

1. The Management subsystem cluster:

- a. Run a health check on both clusters to ensure the deployment is in a good state. For example:

```
apicup subsys health-check <mgmt_cluster>
```

- b. Determine the current version and license of API Connect (the version that you are upgrading from).

You will need to specify the correct version number and license in the next step. To get the current version, `ssh` into a subsystem and run the following command:

## apic version

In the response, the –

**subsystem-<subsystem-name>** statement displays the installed version. In the following example, the response indicates that the installed version is 10.0.2.0:

```
root@ip-192-168-122-240:~# apic version
INFO[0000] Log level: info
Control plane: 1.20.0
Appliance base 3.0.0
GitCommitSha:10.0.1.2
Packages:
- appliance-base:3.0.0
- appliance-runtime-3.0.0:1.0.0
- subsystem-management:1:10.0.2.0
```

To get the current license, run the following command:

```
apicup licenses list
```

In the response, the **ID** statement displays the installed license, for example:

```
Accepted licenses:
ID: <source_license>
Product Version: <source_version>
URL: <license_url>
```

Note that there may be multiple accepted licenses, but you must refer only to the **<source\_license>** that aligns with the **<source\_version>** of your system (that is the **<source\_version>** that matches the version that you obtained by running **apic version**).

- c. Create an **extra-values.yaml** file in a directory that **apicup** can access, and add the **source\_version** and **source\_license** settings for the current API Connect version that you just determined (or add the snippet to an existing file if you have one); for example:

```
spec:
  version: "<source_version>"
  license:
    license: <source_license>
  imageRegistry: 127.0.0.1:8675/<source_version>
```

You must ensure that the product version and license match the current source version.

Important: If you are upgrading from a version of 10.0.1.x, add "-eus" to the end of all references to that version number as in **10.0.1.4-eus**; for example:

```
spec:
  version: "10.0.1.4-eus"
```

The "-eus" applies to versions of 10.0.1.x only; if you are upgrading from a version of 10.0.x, do not add the "-eus".

- d. Using the new **apicup** binary, run the following command to set the **extra-values** in the project folder for both the **active** and **passive** clusters:

```
apicup subsys set <mgmt> extra-values-file=<extra-values-file-path>
```

If you want to validate your **<extra-values-file-path>**, and the settings, before proceeding, you can run the following command:

```
apicup subsys get <mgmt> --validate
```

- e. If necessary, download to your local machine from the Fix Pack page any Control Plane files that are needed.

Control Plane files provide support for specific Kubernetes versions. An upgrade from the most recent API Connect version to the current version does not need a separate Control Plane file. However, when upgrading from older versions of API Connect, you must install one or more control plane files to ensure that all current Kubernetes versions are supported. Consult the following table to see if your deployment needs one or more separate Control Plane files.

Table 1. Control Plane files needed for upgrade

| Version to upgrade from                                                                                                                                                                                                  | Instructions for upgrading to 10.0.4.0-ifix3       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <ul style="list-style-type: none"><li>10.0.4.0-ifix2</li><li>10.0.4.0-ifix1</li><li>10.0.4.0</li></ul>                                                                                                                   | No control plane file is needed.                   |
| <ul style="list-style-type: none"><li>10.0.3.0-ifix1</li><li>10.0.3.0</li></ul>                                                                                                                                          | No control plane file is needed.                   |
| <ul style="list-style-type: none"><li>10.0.2.0-ifix2</li><li>10.0.2.0-ifix1</li><li>10.0.2.0</li></ul>                                                                                                                   | Download <b>appliance-control-plane-1.21.x.tgz</b> |
| <ul style="list-style-type: none"><li>10.0.1.5-ifix4-eus</li><li>10.0.1.5-ifix3-eus</li><li>10.0.1.5-ifix2-eus</li><li>10.0.1.5-ifix1-eus</li><li>10.0.1.5-eus</li><li>10.0.1.4-eus</li><li>10.0.1.4-ifix1-eus</li></ul> | No control plane file is needed.                   |
| <ul style="list-style-type: none"><li>10.0.1.2-ifix2-eus</li><li>10.0.1.2-ifix1-eus</li><li>10.0.1.2-eus</li></ul>                                                                                                       | Download <b>appliance-control-plane-1.21.x.tgz</b> |

- f. If you are upgrading from a source version that is earlier than 10.0.4.0 or 10.0.1.4-eus, you must save the images of that source version from the local docker registry at **/var/lib/apiconnect-subsystem/registry/<source\_version>** to a secure location that won't be overwritten, for example, the root directory. Back up the images on both the **active** and **passive** clusters: first SSH into the management subsystem, and then run the following command:

```
cp /var/lib/apiconnect-subsystem/registry/<source_version> <secure-file-path>
```

- g. Now upgrade both the **active** and **passive** clusters to the latest version in parallel, with the new setting. For example:

```
apicup subsys install mgmt mgmt_upgrade_tar_archive
```

Note: If any Control Plane files are needed for your upgrade, you must append the files to the `install` command.

- h. For both clusters, wait for the Management subsystem status to become **Running**. Note that the new operator should reconcile the old version operand, and this may take some time. For example:

```
kubectl get mgmt -n mgmt_cluster
NAME      READY   STATUS    VERSION   RECONCILED VERSION AGE
management 16/16   Running  10.0.2.0  10.0.2.0-100 5h2m
```

The **RECONCILED**

**VERSION/VERSION** should be the *source\_version* that you retrieved in Step [1.b](#), and then will be updated to the target version in Step [1.g](#).

Note: If you are upgrading from a source version that is earlier than 10.0.4.0 or 10.0.1.4-ifix1-eus, some pods on the **active** or **passive** data center will have a status of **imagePullBackoff**, because the source version images were overwritten by the target version images. You must move the source version images back to the directory `/var/lib/apiconnect-subsystem/registry/<source_version>` where they were saved originally, and run the following command:

```
systemctl restart appliance-manager
```

This command will restart the local docker registry to pick up the source version images. However, if some pods remain in the **imagePullBackoff** state, it's because the image path is incorrect. To correct the image path, run the following commands:

- `kubectl edit deploy <deploy>` - Run this command on every deployment of pods that have the **imagePullBackoff** state, and change the image path to the source version.
- `kubectl edit pod <stancluster-pod>` - Run this command directly on the `<stancluster-pod>` and change the image path to the source version.

- i. Disable the multi-site HA configuration on the **passive** Management subsystem. For example:

```
apicup subsys set passive_mgmt_cluster multi-site-ha-enabled=false
```

- j. Run `apicup` to update the settings. For example:

```
apicup subsys install passive_mgmt_cluster
```

As soon as the multi-site HA configuration is disabled, the **passive** Management subsystem converts itself to an independent cluster where you can see all the microservices. Run a health check to ensure the deployment is in a good state, for example:

```
apicup subsys health-check mgmt_cluster
```

- k. Wait for the Management subsystem status to become **Running** on the **passive** Management subsystem. For example:

```
kubectl get mgmt -n passive_mgmt_cluster
NAME      READY   STATUS    VERSION   RECONCILED VERSION AGE
management 16/16   Running  10.0.2.0  10.0.2.0-100 5h2m
```

Note: If you are upgrading from a source version that is earlier than 10.0.4.0 or 10.0.1.4-eus, some pods on the data center will have a status of **imagePullBackoff**, because the source version images were overwritten by the target version images. See the previous [Note](#) for the instructions on how to correct the pod status.

- l. Disable the multi-site HA configuration on the **active** Management subsystem. For example:

```
apicup subsys set active_mgmt_cluster multi-site-ha-enabled=false
```

- m. Run `apicup` to update the settings. For example:

```
apicup subsys install active_mgmt_cluster
```

As soon as the multi-site HA configuration is disabled, the **active** Management subsystem converts itself to an independent cluster where you can see all the microservices.

- n. Wait for the Management subsystem status to become **Running** on the **active** Management subsystem. For example:

```
kubectl get mgmt -n active_mgmt_cluster
NAME      READY   STATUS    VERSION   RECONCILED VERSION AGE
management 16/16   Running  10.0.2.0  10.0.2.0-100 5h2m
```

The **RECONCILED**

**VERSION/VERSION** should be the *source\_version* that you retrieved in Step [1.b](#), and then will be updated to the target version in Step [1.g](#).

At this point you have two independent Management clusters.

- o. Remove the `spec: version` snippet from the `extra-values.yaml` file that you added in Step [1.c](#):

```
spec:
  version: "<source_version>"
  license:
    license: <source_license>
```

Alternatively, if there are no additional settings in the `extra-values.yaml` file that you want to keep, you can run the following command to unset the file:

```
apicup subsys set mgmt extra-values-file=
```

- p. Using the updated `apicup` binary, run the `install` command on both the **active** and **passive** clusters (can be run in parallel). For example:

```
apicup subsys install mgmt
```

- q. For both clusters, wait for the Management subsystem status to become **Running**. For example:

```
kubectl get mgmt -n mgmt_cluster
NAME      READY   STATUS    VERSION   RECONCILED VERSION AGE
management 16/16   Running  10.0.3.0  10.0.3.0-2807 5h46m
```

The **RECONCILED VERSION/VERSION** now displays the target version that you upgraded to.

- r. Run a health check on both clusters to ensure that the upgrade completed. For example:

```
apicup subsys health-check mgmt_cluster
```

s. Now, enable the multi-site HA configuration on the previously **active** Management subsystem. For example:

```
apicup subsys set active_mgmt_cluster multi-site-ha-enabled=true
```

t. Run **apicup** to update the settings. For example:

```
apicup subsys install active_mgmt_cluster
```

u. Wait for the Management subsystem status to become **Running** on the **active** Management subsystem. For example:

```
kubectl get mgmt -n active_mgmt_cluster
NAME      READY   STATUS    VERSION   RECONCILED VERSION   AGE
management 17/17   Running   10.0.3.0  10.0.3.0-2807        5h56m
```

The **RECONCILED VERSION/VERSION** now displays the target version that you upgraded to.

v. Enable the multi-site HA configuration on the previously **passive** Management subsystem. For example:

```
apicup subsys set passive_mgmt_cluster multi-site-ha-enabled=true
```

w. Run **apicup** to update the settings. For example:

```
apicup subsys install passive_mgmt_cluster
```

x. Wait for the Management subsystem status to become **Running** on the **passive** Management subsystem. For example:

```
kubectl get mgmt -n passive_mgmt_cluster
NAME      READY   STATUS    VERSION   RECONCILED VERSION   AGE
management 7/7     Running   10.0.3.0  10.0.3.0-2807        5h46m
```

You should see a limited set of microservices on the **passive** Management subsystem, for example **7/7**.

y. Run the following command on the **active** Management subsystem to check that the API Manager service is ready for traffic:

```
kubectl describe ServiceName
```

The service is ready for traffic when the **Ha mode** part of the **Status** object is set to **active**. For example:

```
Status:
...
Ha mode:                active
...
```

Note:

- It will take time for the **passive** site to sync with the **active** site.
- You can now run the **apicup subsys health-check** on the Management subsystem, and reboot if instructed to do so.

2. The Gateway subsystem cluster.

3. The Portal subsystem cluster; **passive** followed by **active**.

Note: If you upgrade from before Version 10.0.1.1 to Version 10.0.1.1 or later, you must upgrade the passive and active sites in parallel. This method means that both sites are down and then they restart their pods at the new versions in parallel so that they can cluster together. If you do not upgrade the passive and active sites in parallel, you might need to pass the **--skip-health-check** flag to **apicup** to do the second site. This flag might be needed because of an incompatibility between pods from before Version 10.0.1.1, and pods of Version 10.0.1.1, and later.

4. The Analytics subsystem cluster.

You must verify that each subsystem has been updated successfully on both the **passive** and the **active** data centers before upgrading the next subsystem.

The Developer Portal upgrade takes place in two stages. Firstly, the system is upgraded, which updates the internal deployment scripts, packages, and so on. Then, as soon as the system upgrade is complete, the individual Portal sites are upgraded to the new level of the Portal UI code. This second stage, the Portal site upgrades, doesn't start until the first stage is complete and all of the pods (in both data centers) have been upgraded to the new version. The upgrade of the sites then starts automatically, a few at a time, spread across both data centers to allow the upgrade to run in parallel.

## How to upgrade when one data center is down

In this scenario, one data centre is down and you have to failover to the other data center in your deployment. So, you are now running a two data center deployment, but only one data center is online and is in active mode. However, a critical fix must be applied before you can recover the failed data center. In this instance, you must apply the upgrade to the remaining active data center. Then, when you are ready to bring the failed data center back online, you must first disable the multi-site HA setting from the failed data center, and then enable the multi-site HA setting again and make that data center passive. This action triggers a re-sync with the active data center, and ensures that the passive data center contains the latest data.

Note: If one data center is completely down, and you cannot set it to be passive, you must ensure that the network links to that data center are removed before continuing to set your other data center to be active. You must then not restore the network links to the failed data center until you can set it to be passive.

On VMware, this involves the following steps:

1. Run **apicup** to change the **multi-site-ha-enabled** property to **false** on the failed data center, for example:

```
apicup subsys set service_name multi-site-ha-enabled=false
```

where **service\_name** is the name of the management or portal service that you want to disable, for example **mgmt\_dc1**.

2. Run **apicup** to update the settings in the subsystem, for example:

```
apicup subsys install service_name
```

3. Run the following commands to change the **multi-site-ha-enabled** property back to **true** and to set the **mode** to **passive** on the failed data center, for example:

```
apicup subsys set service_name multi-site-ha-enabled=true
```

```
apicup subsys set service_name multi-site-ha-mode=passive
```

4. Run **apicup** to update the settings in the subsystem again, for example:

`apicup subsys install service_name`

## Checking cluster health on VMware

You can use `apicup` to check the health of the API Connect clusters in your VMware deployment.

The `health-check` command checks a number of criteria to determine the health of their cluster. When all criteria are successfully met, the command displays no output, and exits with a status of 0. When one or more criteria are not met, the command stops processing and displays a message with the failure and exits with a status of 1.

The command takes no arguments. The only option is the `--verbose` flag. If `--verbose` is set the command prints all checks that were performed.

The `health-check` is run against the namespace that is specified in `apiconnect-up.yaml`.

The health check is run on the specified subsystem.

The command verifies that for the specified subsystem:

- The `apicup` version matches the API Connect release version.
- All cluster members are running the same API Connect release version.
- All cluster members have a deployment status of `Done`.
- Docker is running.
- `kubelet` is running
- All Kubernetes-defined nodes are running.
- The Kubernetes Control Plane pods are running:
  - `etcd/kube-apiserver`
  - `kube-system.kube-controller`
  - `kube-scheduler`
  - `kube-apiserver-proxy`
- The add-on Kubernetes Deployments are fulfilled:
  - `coredns`
  - `metrics-server`
- The add-on Kubernetes DaemonSets are fulfilled:
  - `calico-node`
  - `ingress-nginx-ingress-controller`
  - `kube-proxy`

Syntax:

Usage:

```
apicup subsys health-check <SUBSYS> [flags]
```

Flags:

```
-h, --help                help for health-check
--kubeconfig string      (optional) absolute path to the kubeconfig file (default "/Users/<username>/<username>.kube/config")
-v, --verbose            Verbose output
```

Global Flags:

```
--accept-license  Accept the license for API Connect
--debug           Enable debug logging
```

Example usage, for a subsystem named `mgmt`:

```
../apicup subsys health-check mgmt
```

Note:

- The command flag `--kubeconfig string` does not apply to deployments on VMware.
- In a multi-node OVA cluster, the `apicup subsys health-check` command does not return status information if a majority of the nodes are down. To obtain status information, start more nodes. Status is returned only when a quorum is achieved.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Monitoring Postgres disk usage on VMware

Monitor disk usage by the Postgres database in the management subsystem, when deployed on VMware.

Postgres Database is the core database used in Management Subsystem. It is important to monitor the Postgres disk usage.

In v10.0.3.0 and greater, the APICoconnect operator tracks the current disk usage of the Postgres components, and regularly updates `apic health-check` command.

APICoconnect operator regularly updates the `ManagementCluster` instance status which is reflected in the `apic health-check` command.

`apic health-check` command reports WARNING state when disk utilization reaches 50%.

`apic health-check` command reports ERROR state when disk utilization reaches 70% and Postgres is brought down.

See:

- [Management Cluster disk stats](#)
- [Warning condition is populated at 50% usage](#)
- [Error condition is populated at 70% usage](#)

---

## Management Cluster disk stats

The `ManagementCluster` instance has `.status.postgresDataStats` where the operator prints the current disk usage of Postgres components. Use `kubectl` to view the status.

To use `kubectl`, first ssh into the appliance as `root`.

```
kubectl get mgmt m1 -o json | jq .status.postgresDataStats
[
  {
    "instanceName": "m1-ed60c42d-postgres",

    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-cimo",
    "pvcType": "PostgreSQL",
    "pvcUsed": 59994112,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-cimo",
    "podName": "m1-ed60c42d-postgres-cimo-5769868b75-5z7ln",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-cimo-wal",
    "pvcType": "WAL",
    "pvcUsed": 201334784,
    "pvcUsedPercentage": 0
  }
]

```

## Warning condition is populated at 50% usage

When one of the Postgres components occupy 50% usage, the operator marks the overall status of the **ManagementCluster** to **Warning** with an appropriate warning message, which is included in the output from `apic health-check` command.

The warning condition explains why the warning condition was set.

To use `apic`, first ssh into the appliance as `root`.

```
apic health-check
```

```

FATA[0007] Cluster not in good health:
ManagementCluster is not Ready or Complete | State: 17/17 Phase:
Warning Message: Current WAL disk usage of nihar-stac-3955b42d-sitel-postgres is 51 percent.
DATABASE SHUTDOWN starts at 70 percent utilization. Please contact IBM Support immediately

```

If you encounter the warning, contact IBM support to fix the root cause.

## Error condition is populated at 70% usage

An error condition is populated when the operator brings down Postgres because it is using 70% of available disk space. Postgres is brought down to avoid problems, such as disk corruption, that can occur if the disk becomes completely filled.

To use `apic`, first ssh into the appliance as `root`.

```
apic health-check
```

```

FATA[0011] Cluster not in good health:
ManagementCluster is not Ready or Complete | State: 17/17 Phase:
Error Message: Current WAL disk usage of nihar-stac-3955b42d-sitel-postgres is more than 70 percent,
initiating DATABASE SHUTDOWN

```

If you encounter the error, contact IBM support to fix the root cause.

Important:

On VMware, because the entire disk is allocated to the worker node, in some cases before the operator reacts to 70% usage, , Kubernetes itself can face disk pressure and starts evicting pods. In these cases, increase the disk allocated to worker node in order to stabilize the worker node. See [Adding disk space to a VMware appliance](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Obtaining simple health check data of Developer Portal sites by using a REST API call

Call a simple health check API from your external load balancer to dynamically determine whether a specific Developer Portal site in a cluster is working. This API call can be used by a load balancer to help determine where to route traffic.

## About this task

You can use the site health REST API to determine whether a particular Developer Portal site is running. The site health API returns the current system time of the site if both the database and web server are running. This API is fast and puts no load on the system, so it is ideal for use with load balancers to help them determine where to route traffic.

## Procedure

To call the site health REST API, append `/health` to the end of your Developer Portal site URL in your web browser, as follows:

```
site_url/health
```

Where `site_url` is the URL of the Developer Portal site that you want to check.

If both the database and web server of the site are running, the web browser returns the current system time. For example:

```
1511367695
```

If either the database or the web server of the site is not running, the web browser returns an error that the site can't be reached.

If you do get an error from the `/health` endpoint, refer to the [must gather logs page](#) and obtain the `portal-www` web logs, so that you can see more information on the error.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Monitoring the network with SNMP

Presents a table of OID trees that you can poll using SNMP Get.

Simple Network Management Protocol (SNMP) collects information from network devices, such as servers, printers, hubs, switches, and routers on an Internet Protocol (IP). SNMP employs addresses for network devices using a hierarchical numbering system called Object Identifiers (OID). The following table provides OID addresses for polling in SNMP to monitor API Connect servers.

Note:

- Only SNMP v2 and SNMP v3 are supported. However, it is not recommended to enable SNMP v2. Instead, configure SNMPv3 as shown in [Configuring SNMPv3](#), and then enable it as shown in [Enabling SNMP](#).
- If the server has two or more network interfaces, the SNMP request is sent only to the first network interface.
- SNMP is disabled by default for all hosts.
- This information applies to API Connect deployments in VMware environments. It does not apply to Kubernetes deployments.

Each entry in the table represents many individual items. Use `snmpwalk` or another SNMP polling utility to see the complete list. You can poll the following OID trees:

Table 1. Default SNMPv2 configuration

| OID                  | SNMP Name                     | Notes                                                                                                                                                          |
|----------------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| .1.3.6.1.2.1.1       | SNMPv2-MIB::system            |                                                                                                                                                                |
| .1.3.6.1.2.1.2       | IF-MIB::interfaces            |                                                                                                                                                                |

| .1.3.6.1.4.1.2021.11 | UCD-SNMP-MIB::systemStats     |                                                                                                                                                                |

## Configuring SNMPv3

From an OVA shell prompt as root edit the file `/etc/snmp/snmpd.conf` so that its content is:

```
createUser readOnlyUser SHA authpassphrase AES privpassphrase
rouser readOnlyUser
agentAddress udp:161,udp6:[::1]:161
```

- Replace `authpassphrase` with the passphrase to be used for authentication,
- Replace `privpassphrase` with the passphrase to be used for privacy (encryption) of the communications.

## Enabling SNMP

It is not recommended to start SNMP without first configuring it for SNMPv3. See [Configuring SNMPv3](#).

Enable SNMP on each individual OVA node with the following commands from an OVA shell prompt as root:

```
systemctl start snmpd
systemctl enable snmpd
```

Sample output:

```
root@mgmt:~# systemctl start snmpd
root@mgmt:~# systemctl enable snmpd
snmpd.service is not a native service, redirecting to systemd-sysv-install
Executing /lib/systemd/systemd-sysv-install enable snmpd
insserv: warning: current start runlevel(s) (empty) of script `snmpd' overrides LSB defaults (2 3 4 5).
insserv: warning: current stop runlevel(s) (0 1 2 3 4 5 6) of script `snmpd' overrides LSB defaults (0 1 6).
```

## Disabling SNMP

---

Disable SNMP on each individual OVA node with the following commands from an OVA shell prompt as root:

```
systemctl stop snmpd
systemctl disable snmpd
```

Sample output:

```
root@mgmt:~# systemctl stop snmpd
root@mgmt:~# systemctl disable snmpd
snmpd.service is not a native service, redirecting to systemd-sysv-install
Executing /lib/systemd/systemd-sysv-install disable snmpd
insserv: warning: current start runlevel(s) (empty) of script `snmpd' overrides LSB defaults (2 3 4 5).
insserv: warning: current stop runlevel(s) (0 1 2 3 4 5 6) of script `snmpd' overrides LSB defaults (0 1 6).
```

## Checking SNMP status

---

Check whether SNMP is enabled on each individual OVA node with the following commands from an OVA shell prompt:

```
systemctl status snmpd
```

Sample output when SNMP is enabled and running:

```
apicadm@mgmt:~$ systemctl status snmpd
snmpd.service - LSB: SNMP agents
Loaded: loaded (/etc/init.d/snmpd; bad; vendor preset: enabled)
Active: active (running) since Wed 2019-02-06 03:53:02 UTC; 2 days ago
Docs: man:systemd-sysv-generator(8)
Tasks: 1
Memory: 6.0M
CPU: 3min 1.641s
CGroup: /system.slice/snmpd.service
└─1366 /usr/sbin/snmpd -Lsd -Lf /dev/null -u snmp -g snmp -I -smux mteTrigger mteTriggerConf -p /run/snmpd.pid
...
```

Sample output when SNMP is stopped and disabled:

```
root@mgmt:~# systemctl status snmpd
snmpd.service - LSB: SNMP agents
Loaded: loaded (/etc/init.d/snmpd; bad; vendor preset: enabled)
Active: inactive (dead)
Docs: man:systemd-sysv-generator(8)
...
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Logging

Configure logging for your deployment on VMware.

See:

- [Configuring remote logging for a VMware deployment](#)  
Appliance-based (OVA) deployments use Syslog for collecting logs. Logs must be collected for both running and terminated containers and processes. Logging collection is required for IBM Support to assist with troubleshooting.
- [Workaround to enable log rotation](#)  
Use this workaround to enable log rotation for rsyslog.
- [Gathering logs for a VMware environment](#)  
The `generate_postmortem.sh` script gathers all logs for troubleshooting and diagnostics.
- [Changing logging levels](#)  
You can enable logging for entry and exit trace and for large payloads for apim-v2 pods.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Configuring remote logging for a VMware deployment

Appliance-based (OVA) deployments use Syslog for collecting logs. Logs must be collected for both running and terminated containers and processes. Logging collection is required for IBM Support to assist with troubleshooting.

## About this task

For appliance-based deployments using OVA, rsyslog is used to collect log files.

There are three options for collecting logs:

- Set the rsyslog configuration at boot up (this is the best practice in order to preserve settings when rebooting)
- Set the rsyslog configuration post-boot up
- Gather logs from a running system

Important: Version 10.0.3.0 and earlier: You must manually enable log rotation. See [Workaround to enable log rotation](#).

For more information about rsyslog, see: <https://www.rsyslog.com/doc/v8-stable/configuration/index.html>

## Procedure

Log collection from the Syslog collectors is accomplished using the rsyslog module included in the cloudinit application. Cloud-init is an open source package used for injecting configurations during boot up. It is included with the appliance-based (OVA) installation. Cloud-init uses a configuration file, for example, `config_file.yaml`, to configure logging and other customizations. The complete list of configuration customizations that can be made with cloud-init is documented in <https://cloudinit.readthedocs.io/en/latest/topics/modules.html>. Follow these steps to configure logging at boot up:

1. Enter the rsyslog configuration in the `config_file.yaml` file.
  - a. Following is an example of the options for rsyslog in `config_file.yaml`:

```
rsyslog:
  remotes:
    syslog_server1: "192.168.1.1:514"
    syslog_server2: "10.0.4.1:601"
```

where:

- **remotes** are key pairs specifying the remote Syslog collectors from which you want to collect logs. Each key is the name for an rsyslog remote entry. Each value holds the remote IP address and port for the Syslog collector.
- **syslog\_serverX** are Syslog collectors (514 = TCP, 601=UDP)  
Note that @ or @@ notation are also needed in the rsyslog config section to specify UDP or TCP.

Note:

A number of Appliance containers such as the `kube-apiserver` log by default to `stderr`, which is interpreted by rsyslog as a high severity message. To avoid having non-error log entries be presented as errors in rsyslog, it is recommend to configure a format that defaults the severity of the message to info level, and rely on further parsing of the log messages to highlight higher severity messages. Example configuration:

```
rsyslog:
  configs:
    - "*. * @192.168.1.187;myformat"
    - filename: 00-myformat.conf
      content: |
        template(name="myformat" type="string"
          string="<%.myprio%> %TIMESTAMP:::date-rfc3339% %HOSTNAME% %syslogtag% %msg:::sp-if-no-1st-sp%msg%")

        set $.myseverity = 6;
        set $.myprio = 20*8+$.myseverity;
```

where the logs would be forwarded to the server `192.168.1.187` using the format `myformat`. Further scanning of the log lines could be defined in the logging infrastructure to highlight the higher severity log entries by, for example, scanning for occurrences of `Error/Err/ERROR`.

- b. Enter the following command to configure log collection at boot up before starting installation:

```
apicup subsys set mgmt additional-cloud-init-file config_file.yaml
```

Refer to the rsyslog documentation for more information. See <https://www.rsyslog.com/doc/v8-stable/configuration/index.html>

2. To collect logs post boot up, follow these steps:
  - a. `ssh` into each VM and change directories to `etc/rsyslog.d`.
  - b. Create a new `.conf` file, for example, `<new>-cloud-config.conf`.
  - c. Restart rsyslog with the following command: `systemctl restart rsyslog`
3. To gather logs from a running system, enter the following command:

```
sudo apic logs
```

The `apic logs` command collects the following information for the current VM:

- Logs for all containers (including terminated ones)
- Everything from `journalctl`
- All system service logs

The information is stored locally on the current VM. Entries are culled based upon age for a maximum size of 2 GB (compressed).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Workaround to enable log rotation

Use this workaround to enable log rotation for rsyslog.

### Version 10.0.3 or earlier

For API Connect v10.0.3 or earlier on VMware, there is a known limitation in which prevents the log rotation feature from working correctly. The limitation can cause syslog to grow very large and consume all available disk space. In some cases, this can cause the node to go down.

To workaround this problem, use the following instructions to delete or move the syslog and fix log rotation:

1. SSH into the appliance as root.
2. If the existing syslog file is problematic, remove it:
  - a. Change directory to `/var/log`.
  - b. Delete the syslog file.  
Alternatively, if you need to retain the contents of the log file, move it to a location out of the VM.

3. Enable hourly log rotation:

a. Run:

```
sed -i 's/invoke-rc.d\ rsyslog rotate\ >\ \dev\ \null\killall\ -HUP\ rsyslogd/g' /etc/logrotate.d/rsyslog
```

b. Run:

```
sed -i 's/AccuracySec=12h/AccuracySec=1us/g; s/daily/hourly/gi' /lib/systemd/system/logrotate.timer
```

c. Run

```
systemctl daemon-reload
```

To review configuration steps for logging, see [Configuring remote logging for a VMware deployment](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Gathering logs for a VMware environment

The `generate_postmortem.sh` script gathers all logs for troubleshooting and diagnostics.

### Before you begin

You can download the `generate_postmortem.sh` script directly to the OVA. If the OVA does not have internet access, first download the script to another machine and then transfer it to the OVA.

### About this task

When contacting IBM Support, several logs are required to assist in troubleshooting or diagnostics. The `generate_postmortem.sh` script gathers all the required logs using a single shell script.

### Procedure

1. Connect to the target appliance via SSH then switch to the `root user` with the following commands:

```
ssh apicadm@{ova appliance hostname}
sudo -i
```

2. Download the `generate_postmortem.sh` script. Enter the following command:

```
curl -s -o generate_postmortem.sh https://raw.githubusercontent.com/ibm-apiconnect/v10-postmortem/master/generate_postmortem.sh
```

3. Add execute permissions to the `generate_postmortem.sh` script. Enter the following command:

```
chmod +x generate_postmortem.sh
```

4. Run the postmortem tool using the following command:

```
./generate_postmortem.sh --ova --pull-appliance-logs
```

5. (Optional) Currently, log generation is supported for Portal and Management subsystems. Specify either management or portal, or all subsystems. Enter the following arguments:

```
Portal: ./generate_postmortem.sh --ova --diagnostic-portal --pull-appliance-logs
Management: ./generate_postmortem.sh --ova --diagnostic-manager --pull-appliance-logs
```

6. (Optional) If there are errors when running the `generate_postmortem.sh` script, enter the following command:

```
./generate_postmortem.sh --ova --debug &>debug.log
```

For more documentation on the script, see <https://github.com/ibm-apiconnect/v10-postmortem>.

Note: Offboarding the logs to an external server is the recommended best practice for long term storage of log data. See [Configuring remote logging for a VMware deployment](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Changing logging levels

You can enable logging for entry and exit trace and for large payloads for apim-v2 pods.

### About this task

For apim-v2 pods, the default logging settings do not include entry and exit trace and logging of large payloads.

Logging of large payloads is typically needed if you are logging `apim:webhookPayload` or other processes that log large variables.

You can also set the debug level without needing to restart the pods.

You can enable the settings through either the APIM deployment YAML file, the toolkit, or the REST APIs. Note, you must use the toolkit or REST API to set the debug level without restarting the pods.

### Procedure

- Updating the settings in the APIM deployment YAML file

Note: This action causes a pod restart.

- The DEBUG variable works the same as prior releases.

```
- env:
  - name: DEBUG
    value:
audit,bhendi:error,bhendi:probe,bhendi:flags,apim:server,apim:error,apim:routes:*,apim:routesc:*,apim:oidc,apim:oidc:*
```

To enable entry and exit trace, add `trace:*` to the start of the debug string:

```
- env:
  - name: DEBUG
    value: trace:*,audit,bhendi:error,bhendi:probe,bhendi:flags,bhendi:webhookAudit,bhendi:cassandra-
transactions,apim:server,apim:error,apim:routes:*,apim:routesc:*,apim:oidc,apim:oidc:*,apim:taskmanager:info
```

- To enable large object logging:

```
- env:
  - name: VELOX_LOG_FULL_PAYLOAD
    value: "true"
```

- Updating the settings by using the toolkit

Note: This action does not cause a pod restart. Also, this action is for a single APIM pod environment only.

```
apic log-spec:get
apic log-spec:update LOG_SPEC_FILE
```

Where the spec file contains:

```
{"specification": "apim:routes:log_spec,audit,bhendi:error,apim:server,apim:error", "large_objects": true}
```

- Updating the settings by using the REST API

Note: This action does not cause a pod restart. Also, this action is for a single APIM pod environment only.

```
GET /cloud/api/log-spec
PUT /cloud/api/log-spec
```

For example, to set debug level and large objects logging:

```
curl -k https://172.16.140.212:3003/api/cloud/log-spec -X PUT -H "Authorization: Bearer $BEARER"
-H "Accept: application/json" -d '{"specification":
"apim:routes:log_spec,audit,bhendi:error,apim:server,apim:error", "large_objects": true}'
-H "Content-Type: application/json"
```

The command responds with:

```
{
  "specification": "apim:routes:log_spec,audit,bhendi:error,apim:server,apim:error",
  "large_objects": true,
  "message": "Successfully changed the log specification on all apim-v2 pods. Success on IP(s): 172.16.140.212,"
```

```
172.16.140.213"
}
```

Note: The response might include the following warning, which can be ignored:

```
WARNING: Could not change the log specification on all apim-v2 pods. Success on IP(s): 4.5.6.7 Failed on IP(s): 1.2.3.4
```

To view the REST APIs for logging, go to [API Connect REST APIs](#), and select IBM API Connect Platform - Cloud Management API 2.0.0 reference\_...\_Resource: Log Spec.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Troubleshooting

Troubleshoot your deployment on VMware.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from. See:

- [Running a filesystem check on a VMware root partition](#)  
You can run a filesystem check on the appliance root filesystem at boot time.
- [Troubleshooting the management database](#)  
You can troubleshoot the API Connect management database
- [Increasing the PostgreSQL archive timeout on VMware](#)  
Increase change the `archive_timeout` to 3600 (seconds) so that accumulated wal files do not cause a disk-space issue during a network outage.
- [Dynamically re-registering and reconfiguring a Gateway service in a VMware deployment](#)  
In API Connect, Gateway services do not persist their configuration settings by default. Instead, the master configuration is stored on the Management server and the *Dynamic Reregistration and Reconfiguration* (DRR) mechanism resynchronizes configuration data when needed. The DRR process is used when proper High Availability/Disaster Recovery (HA/DR) is not configured, or if a manual resynchronization is required.
- [Troubleshooting Analytics on VMware](#)  
If your API Connect Analytics subsystem encounters problems, review the following topics for help resolving the issue.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Running a filesystem check on a VMware root partition

You can run a filesystem check on the appliance root filesystem at boot time.

---

### About this task

If the appliance root filesystem is mounted read-only because it is corrupt, use the following steps to run `fsck` on root partition:

---

### Procedure

1. Access to the VMware console for the Appliance, and after causing it to reboot, make sure to bring up a console to the appliance (as needed to give focus to the window by clicking the mouse into it), and press the `Esc` key repeatedly.  
You will see a boot screen similar to the following:

```
GNU GRUB v2.02
.
.
- Ubuntu
- Advanced options for Ubuntu
.
.
Press Enter to boot the selected OS, 'e' to edit the commands
before booting or 'c' for a command-line
```

2. Press `e` to edit the commands before booting, and add the lines `fsck.mode=force` and `fsck.repair=yes`.  
For example, the boot screen contents resemble:

```
GNU GRUB v2.02
.
.
set params 'Ubuntu'
fsck.mode=force
fsck.repair=yes
```

```
Press Ctrl-x or F10 to boot
```

3. Press F10 to boot.
4. The following command should show that **fsck** was run recently:

```
root@ip-230:~# sudo tune2fs -l /dev/sda1 | grep "Last checked"
Last checked:      Wed Jul  1 19:32:25 2020
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting the management database

You can troubleshoot the API Connect management database

### Database Replica Pods stuck in Unknown or Pending state

In certain scenarios, a postgres replica pod may not recover to a healthy state when a restore completes, a node outage occurs, or after a fresh install or upgrade. In these cases, a postgres pod remains in a **Unknown** or a **Pending** state after a number of minutes. The pod fail to get into a **Running** state.

This situation occurs when the replicas do not initialize properly. You can use the `patronictl reinit` command to reinitialize the replica. Note that this command syncs the replica's volume data from the current Primary pod.

Use the following steps to get the pod back into a working state:

1. SSH into the appliance as `root`.
2. Exec onto the failing pod:

```
kubectl exec -it <postgres_replica_pod_name> -n <namespace> -- bash
```

3. List the cluster members:

```
patronictl list
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+---+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | start failed | | unknown |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+---+-----+
```

In the example shown above `fxpk-management-01191b80-postgres-586f899fdf-6s25b` is not in running state.

Note the `clusterName` and `replicaName` which are not up:

- `clusterName` - `fxpk-management-01191b80-postgres`
- `replicaName` - `fxpk-management-01191b80-postgres-586f899fdf-6s25b`

4. Run:

```
patronictl reinit <clusterName> <replicaName-which-is-not-running>
```

Example:

```
patronictl reinit fxpk-management-01191b80-postgres fxpk-management-01191b80-postgres-586f899fdf-6s25b
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+---+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | start failed | | unknown |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+---+-----+
Are you sure you want to reinitialize members fxpk-management-01191b80-postgres-586f899fdf-6s25b? [y/N]: y
Success: reinitialize for member fxpk-management-01191b80-postgres-586f899fdf-6s25b
```

5. Run `patronictl list` again.

You may also observe that the replica is on a different Timeline (TL) and possibly have a Lag in MB. It may take a few minutes for the pod to switch onto the same TL as the others and the Lag should slowly go to 0.

For example:

```
bash-4.2$ patronictl list
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+---+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | running | 1 | 23360 |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+---+-----+
```

6. The pod that previously was in an **Unknown** or **Pending** state or (0/1) **Running** state is now in (1/1) **Running** state.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Increasing the PostgreSQL `archive_timeout` on VMware

Increase change the `archive_timeout` to 3600 (seconds) so that accumulated wal files do not cause a disk-space issue during a network outage.

### About this task

PostgreSQL sends its wal archives to the backup location (S3 or local PVC) whenever the configured `archive_timeout` period elapses. By default, the `archive_timeout` is set to 60 seconds. During a network outage, the files cannot be transferred and instead accumulate on the current server, and could cause a disk-space issue. Increasing the `archive_timeout` value helps to mitigate this issue by creating archive files less frequently.

For information on tracking the Postgres disk space, see [Monitoring Postgres disk usage on VMware](#).

Complete the following steps to increase the PostgreSQL `archive_timeout` value.

### Procedure

- SSH into the server by completing the following steps:
  - Run the following command to connect as the API Connect administrator, replacing `ip_address` with the appropriate IP address:

```
ssh ip_address -l apicadm
```
  - When prompted, select Yes to continue connecting.
  - When you are connected, run the following command to receive the necessary permissions for working directly on the appliance:

```
sudo -i
```
- Get the name of the `pgha` config map by running the following command:

```
kubectl -n <namespace> get cm -l pgha-config='true'
```

The response looks like the following example:

| NAME                                            | DATA | AGE |
|-------------------------------------------------|------|-----|
| apis-prod-d18f3f0-0d18f3f0-postgres-pgha-config | 5    | 22d |

3. Edit the config map by running the following command:

```
kubectl -n <namespace> edit configmap <config-map-name>
```

In the command, replace `<config-map-name>` with the `NAME` returned in step 1.

4. Change the `archive_timeout` value to 3600.  
The value must be an integer, and represents the number of seconds that must elapse before the archive file is generated.
5. Save the file and exit the editor.  
The configuration is updated automatically; archives will be generated and pushed every 3600 seconds.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Dynamically re-registering and reconfiguring a Gateway service in a VMware deployment

In API Connect, Gateway services do not persist their configuration settings by default. Instead, the master configuration is stored on the Management server and the *Dynamic Reregistration and Reconfiguration* (DRR) mechanism resynchronizes configuration data when needed. The DRR process is used when proper High Availability/Disaster Recovery (HA/DR) is not configured, or if a manual resynchronization is required.

If a Gateway service is not configured properly for resiliency and is restarted, the gateways in the Gateway service will lose the configuration from the Management server. Configuration data from the Management server is maintained on the gateway service according to the gateway peering configuration on the gateways.

### Preventing the loss of configuration data

For high availability in production environments, use a minimum of three gateways in the Gateway service. In non-production environments, if a single gateway is used, then availability can be improved by ensuring the persistence setting on the gateway peering configuration is set to `local://` or `RAID`; these settings apply to virtual and physical appliances only.

### Forcing re-population of the configuration data

To repopulate the configuration data, complete the steps in the following section to trigger an outage-less DRR.

## Triggering an outage-less DRR

---

To force a Dynamic Reregistration and Reconfiguration across a peer group from within the gateway service without requiring a restart, complete the following steps using the CLI. This process flushes the primary peering object configured for the apic-gw-service. This task can only be performed with CLI, and requires the default admin ID for running the `diag` command.

1. Use `ssh` to connect to gateway service.

2. Switch to the API Connect application:

```
switch <APIC_APP_DOMAIN>
```

3. Show the current gateway-peering-status:

```
show gateway-peering-status
```

4. If the server to which the ssh connection was made is not primary for the apic-gw-service gateway-peering object, force this server to become primary:

```
config; gateway-peering-switch-primary <gateway-peering-name-for-apic-gw-service>;
```

5. Flush the apic-gw-service gateway-peering object:

```
diag; gateway-peering-flush <gateway-peering-name-for-apic-gw-service>; exit
```

6. Disable and then re-enable the apic-gw-service object for every member of the gateway service:

```
config; apic-gw-service; admin-state disabled; exit
apic-gw-service; admin-state enabled; exit; exit
```

7. Confirm that the apic-gw-service was flushed and is now waiting for gateway service registration:

Look in the debug log target for the apic-gw-service, located in `logtemp:///` and check for a message similar to the following example:

```
20200618T232339.332Z [0x88e000d7][apic-gw-service][notice]
apic-gw-service(default): tid(2653): Waiting for gateway service registration.
```

The DRR will be triggered by the next arrival of a webhook event. The Management server sends a heartbeat to the gateway at five-minute intervals, prompting the gateway to check whether it has lost its configuration and if so, trigger a DRR. In addition, if the Management server has previously marked a Catalog or cloud as being unavailable for a particular gateway service, a successful heartbeat triggers synchronization for that Catalog or cloud on that gateway service.

8. (Optional) Force a BAU webhook event to be sent from API Manager to trigger the DRR:

If you do not want to wait for the Management server to send a heartbeat, you can trigger the DRR manually by completing the following steps:

- Open the API Manager.
- Open the Catalog.
- Click Settings, Edit.
- Update the Summary field with some text so that it is modified.
- Click Save.

When the event is received, the DRR is initiated.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Troubleshooting Analytics on VMware

If your API Connect Analytics subsystem encounters problems, review the following topics for help resolving the issue.

- [Analytics start-up issues on VMware](#)  
If you receive an error starting the Analytics service after installing, upgrading, or recovering from a catastrophic failure of IBM® API Connect on VMware, you might be able to resolve it by completing this task.
- [Analytics offload issues on VMware](#)  
If your Analytics offload fails, you can perform checks to help determine the cause. Common causes for an offload failure are connection or security-related issues.
- [Empty Analytics display on VMware](#)  
If your API Connect analytics data doesn't display in the Analytics dashboard, complete the following steps to determine the cause of the problem.
- [Analytics running out of disk space on VMware](#)  
If your Analytics data is taking up too much disk space, complete the following steps to resolve the problem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Analytics start-up issues on VMware

If you receive an error starting the Analytics service after installing, upgrading, or recovering from a catastrophic failure of IBM® API Connect on VMware, you might be able to resolve it by completing this task.

# Uh oh! An error has occurred

In rare cases, the Kibana index can fail and the following message displays:

This error typically indicates that the index was corrupted. Complete the following steps to verify the problem and delete the corrupted index.

1. SSH into the server:
  - a. Run the following command to connect as the API Connect administrator, replacing **ip\_address** with the appropriate IP address:

```
ssh ip_address -l apicadm
```
  - b. When prompted, select Yes to continue connecting.
  - c. When you are connected, run the following command to receive the necessary permissions for working directly on the appliance:

```
sudo -i
```

2. Get the names of a storage-coordinating pod and a client pod:

Determine the names of one of the deployment's storage-coordinating pods (called **analytics-storage-coordinating-pod** in the steps that follow) and one of the client pods (called **analytics-client-pod** in the steps). To see the pod names, run the following command:

```
kubectl get pods
```

In the following sample output, a storage-coordination pod is named **r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-btpeq** and a client pod is named **r70eaa1a0f2-analytics-client-68c499d5f9-7g7vm**:

| NAME                                                       | READY | STATUS    | RESTARTS | AGE |
|------------------------------------------------------------|-------|-----------|----------|-----|
| r70eaa1a0f2-analytics-client-68c499d5f9-7g7vm              | 1/1   | Running   | 0        | 37m |
| r70eaa1a0f2-analytics-client-68c499d5f9-hjx22              | 1/1   | Running   | 0        | 82m |
| r70eaa1a0f2-analytics-cronjobs-retention-1559698200-7tjjh  | 0/1   | Completed | 0        | 18h |

| r70eaa1a0f2-analytics-ingestion-7f5d748759-5cgrs           | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-ingestion-7f5d748759-wjvkd           | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-mls-gw-6988bd8cbf-g88p5              | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-mls-gw-6988bd8cbf-xczvb              | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-operator-747f75c4f-7965r             | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-btpeq | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-sr9mg | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-t8djr | 1/1   | Running   | 0        | 82m |
| r70eaa1a0f2-analytics-storage-data-0                       | 1/1   | Running   | 0        | 70m |
| r70eaa1a0f2-analytics-storage-data-1                       | 1/1   | Running   | 0        | 76m |
| r70eaa1a0f2-analytics-storage-data-2                       | 1/1   | Running   | 0        | 80m |
| r70eaa1a0f2-analytics-storage-master-0                     | 1/1   | Running   | 0        | 72m |
| r70eaa1a0f2-analytics-storage-master-1                     | 1/1   | Running   | 0        | 75m |
| r70eaa1a0f2-analytics-storage-master-2                     | 1/1   | Running   | 0        | 80m |

3. Verify that you have both the **.kibana** and **.kibana-6** indexes by running the following command:

```
kubectl exec -it analytics-storage-coordinating-pod -- curl_es /_cat/indices?v
```

In the **index** column of the response, look for **.kibana** and **.kibana-6**:

| health | status | index                      | uuid                    | pri | rep | docs.count | docs.deleted | store.size | pri.store.size |
|--------|--------|----------------------------|-------------------------|-----|-----|------------|--------------|------------|----------------|
| green  | open   | .kibana-6                  | SNVaGwpzTKZ21VvWa3-g    | 1   | 2   | 39         | 0            | 239.1kb    | 79.7kb         |
| green  | open   | .kibana                    | 9ACzHCcZLlKtR1km0tE5A   | 1   | 2   | 1          | 0            | 9.3kb      | 3.1kb          |
| green  | open   | .apic-config               | WLMq7241STFVYRj1Ep3Vp1Q | 1   | 2   | 1          | 0            | 14.6kb     | 4.8kb          |
| green  | open   | .export-status             | Z1h3BNn-T4GFwPmHnBDS3w  | 1   | 2   | 0          | 0            | 573b       | 191b           |
| green  | open   | apic-api-2019.06.05-000002 | 4uvi5GRVRIWQ-lsum1-Krg  | 5   | 2   | 148889     | 0            | 350.2mb    | 116.8mb        |
| green  | open   | apic-api-2019.06.04-1      | UMCBp1uYQeKH6uBSJgRdGQ  | 5   | 2   | 8000       | 0            | 24.7mb     | 8.2mb          |

If the response includes both indexes, it indicates a problem with the index creation. Proceed to the next step.

Note: If you received the "Uh oh! An error has occurred" page and the response to this command only includes the **.kibana-6** index, then something else is wrong with the cluster and you should contact IBM Support for assistance.

4. Set the **.kibana** index to be read-and-write enabled by running the following command, replacing **analytics-storage-coordinating-pod** with the name of the storage-coordinating pod that you determined at the beginning of this task:

```
kubectl exec -it analytics-storage-coordinating-pod -- curl_es -XPUT .kibana/_settings -d '{"index.blocks.write":false}'
```

When you see the following response: `{"acknowledged": true}`, continue to the next step.

Note: If you see a different response, make sure the request was correct and try again. If the command still does not work, then something else is wrong with the cluster and you should contact IBM Support for assistance.

5. Delete the **.kibana-6** index by running the following command:

```
kubectl exec -it analytics-storage-coordinating-pod -- curl_es -XDELETE .kibana-6
```

When you see the following response: `{"acknowledged": true}` to indicate that the deletion was successful, continue to the next step.

Note: If you see a different response, then the index was not deleted. Make sure the request was correct and try again. If the delete operation still fails, then something else is wrong with the cluster and you should contact IBM Support for assistance.

6. Restart a single analytics client pod by running the following command and replacing **analytics-client-pod** with the name of the pod (which you determined at the beginning of this task):

```
kubectl delete pod analytics-client-pod
```

Sample response: pod "analytics-client-pod" deleted

Wait for the response to ensure that the pod was successfully deleted. Then wait a few minutes for a new pod to start automatically. To check the status of the pods, run the following command:

```
kubectl get pods
```

7. Navigate to the Analytics page and refresh to verify that the dashboard now displays correctly.

8. (Optional) If you have a backup of `ui` or `.kibana-6`, you can restore it now as explained in [Restoring the Analytics database](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Analytics offload issues on VMware

If your Analytics offload fails, you can perform checks to help determine the cause. Common causes for an offload failure are connection or security-related issues.

When you save the configuration files, their syntax is first validated to verify that it can be applied. However, this does not confirm that other parts of your analytics collection ecosystem are trouble-free, for example, that your endpoints are running, or that the TLS certificates are validated. Errors in these areas may also result in no data output.

To verify issues you will need to examine the logs for one of your Kubernetes analytics ingestion pods. (Note that it may take a few minutes for the pods to pick up changes in the configuration files after edits are applied.)

For information on obtaining logs, refer to [Configuring remote logging for a VMware deployment](#) and [Configuring logging for a Kubernetes deployment](#).

Following are some common checks you can make to troubleshoot the offload:

- Verify that the specified URL or the host and port values for the target system are accurate.
- Verify that the server or cluster of servers in the target system are running and reachable. If applicable, also verify that the connection problems are not caused by firewall settings.
- If you are using Transport Layer Security (TLS) to establish a private and secure communication channel to the target system, investigate whether the issue is caused by SSL certificate errors; for example, untrusted server certificates, certificates that have expired or are not yet valid, or missing intermediate (or chain) certificates. For more information on using TLS, see [Creating a TLS profile](#).
- If offloading to an Elasticsearch or Kafka target, verify that your configuration settings are valid; for example, the user credentials for authenticating to Elasticsearch or the Kafka topic name.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Empty Analytics display on VMware

If your API Connect analytics data doesn't display in the Analytics dashboard, complete the following steps to determine the cause of the problem.

### Procedure

---

1. SSH into the server:

a. Run the following command to connect as the API Connect administrator, replacing `ip_address` with the appropriate IP address:

```
ssh ip_address -l apicadm
```

b. When prompted, select Yes to continue connecting.

c. When you are connected, run the following command to receive the necessary permissions for working directly on the appliance:

```
sudo -i
```

2. Run the following command to check the logs of the `mtls-gw` pod:

```
kubectl logs analyt-mtls-gw-7665f5d445-4cx4n -n <APIC_namespace>
```

The response looks like the following example:

```
10.254.6.1 - - [22/Sep/2021:18:05:54 +0000] "POST /x2020/v1/apievent/_bulk HTTP/1.1" 200 2 "-" 2841 0.072 0.070
```

a. Check the response for any `_bulk` request coming from the gateway, as shown in the example.

If there are no `_bulk` requests, then the problem is with the gateway and the `wsm-agent`, which is not sending bulk requests to the Analytics server.

b. If you see the `_bulk` request, then check the return code in the response.

If `_bulk` requests are processed successfully you will see a return code 200 (as in the example), which indicates that the bulk request has been ingested.

c. If it is any other return code, check the ingestion pod logs for any errors, which will indicate any issues during ingestion:

```
oc logs analyt-ingestion-78d7cff7f7-6pktd
```

3. If everything with the data flow looks fine, and if you are unable to see analytics data, then check the health of Analytics by executing into one of the storage pods:

```
kubectl exec -it <storage_pod> -- bash  
  
d.bash-4.4$ curl_es _cluster/health?pretty=1
```

For example:

```
{  
  "cluster_name" : "apic-analytics-cluster",  
  "status": "yellow",  
  "timed_out": false,  
  "number_of_nodes": 3,  
  "number_of_data_nodes": 1,  
  "active_primary_shards": 258,  
  "active_shards": 258,  
  "relocating_shards": 0,  
  "initializing_shards": 0,  
  "unassigned_shards": 510,  
  "delayed_unassigned_shards": 0,  
  "number_of_pending_tasks": 0,  
  "number_of_in_flight_fetch": 0,  
  "task_max_waiting_in_queue_millis": 0,  
  "active_shards_percent_as_number": 33.59375  
}
```

a. Check the status of the cluster (red, yellow, green) in the response.  
In the example, the status is set to yellow.

- Green indicates all indices are fine.
- Yellow indicates there are some unassigned shards, which might still be replicating.
- Red indicates there is a problem with one or more of the indices.

b. Run the following command to get a list of indices:

```
bash-4.4$ curl_es _cat/indices?v
```

c. In the list, find the red indices.

d. Delete each red index by running the following command:

```
bash-4.4$ curl_es -XDELETE <index_name>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Analytics running out of disk space on VMware

If your Analytics data is taking up too much disk space, complete the following steps to resolve the problem.

### About this task

---

Analytics indices taking up too much space

### Procedure

---

1. SSH into the server:

a. Run the following command to connect as the API Connect administrator, replacing *ip\_address* with the appropriate IP address:

```
ssh ip_address -l apicadm
```

b. When prompted, select Yes to continue connecting.

c. When you are connected, run the following command to receive the necessary permissions for working directly on the appliance:

```
sudo -i
```

2. Run the following command to display the indices:

```
curl_es _cat/indices?v
```

3. Find the old and large indices that can be deleted, and delete each index using the following command:

```
curl_es -XDELETE <index_name>
```

4. Reduce the retention period from the Cloud manager:

- Open Cloud Manager and click Topology, Analytics Service, Advanced analytics configuration, Storage.
- Locate the Oldest Api Call Data Kept field and set it to the lowest feasible value.

5. Verify that the index is rotating as scheduled.

- Open Cloud Manager and click Topology, Analytics Service, Advanced analytics configuration, Storage.
- Click Index Roll Over, Max age and Max Documents.  
Check the rotation time and number of documents.

6. Verify that the retention and rollover jobs are running properly.

Run the following command to check the age of the job and the logs, to see whether there is any issue:

```
kubectl get jobs
```

The output looks like the following example:

| NAME                           | COMPLETIONS | DURATION | AGE |
|--------------------------------|-------------|----------|-----|
| analyt-cj-retention-1632965400 | 1/1         | 17s      | 21h |
| analyt-cj-rollover-1633040100  | 1/1         | 10s      | 15m |

7. Apply a filter to reduce the index size by excluding large fields, such as `response_body`, from being saved in the index. For example:

```
filter {
  if "apicapievent" in [tags] {
    mutate {
      remove_field => ["response_body"]
    }
  }
}
```

For information on creating filters for Analytics data, see [Modifying your analytics data](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Migrating a Version 5 deployment

Use the Migration Utility to automate the migration of a v5 deployment to a v10 deployment.

### Supported versions

---

- You can migrate API Connect Version 5.0.8.7 or later point release to API Connect Version 10.0.2.0 or later point release. If your Version 5 system is older than the minimum, you must first upgrade it to the minimum version.
- You can migrate API Connect Version 5.0.8.7 or later point release to a Cloud Pak for Integration version 2021.4 or later. The version of Cloud Pak for Integration must use API Connect Version 10.0.4.0 or later.
- The migration utility version must match the API Connect and DataPower version. Observe the following Version 10 API Connect requirements:
  - For Kubernetes, the installation operator version must match the API Connect version.
  - For VMware, the `apicup` utility version must match the API Connect version.

### Obtaining the API Connect Migration Utility

---

Download the API Connect Migration Utility (AMU) from IBM Fix Central. For a link to the latest files on Fix Central, see [What's new in the latest release](#).

- [Migration overview](#)  
The migration process provides tools to extract v5 data, arrange it for v10 formats, and load it onto a v10 system.
- [Migration steps](#)  
Plan the migration, install a new v10 deployment, and move data from v5 to v10.
- [Converting APIs to DataPower API Gateway](#)
- [Migration mapping files](#)  
You can use mapping files to map the name of a v5 object to a corresponding v10 object that has a different name.
- [Migrating OAuth Providers and OAuth secured APIs](#)  
You can migrate v5 OAuth Providers and OAuth secured APIs to your v10 API Connect deployment.
- [Migrating custom policies](#)  
The migration utility migrates API Connect Version 5 user-defined custom policies to API Connect Version 10. After migration, the v5 custom policies run on a v5-compatible DataPower Gateway or the DataPower API Gateway. Custom policies can be migrated to API Gateway with limitations.
- [Migrating gateway extensions](#)  
Use the appropriate procedure for migrating extensions to either a v10 DataPower® Gateway (v5 compatible) or a v10 DataPower API Gateway.
- [Migration considerations](#)  
You can optimize the migration process by reviewing the migration considerations and taking any actions that apply to your deployment.
- [Migration troubleshooting](#)  
If you run migration and observe error messages in your log output, you can take troubleshooting steps, and run the migration again.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Migration overview

The migration process provides tools to extract v5 data, arrange it for v10 formats, and load it onto a v10 system.

Important: The migration utility allows migration from v5 to a v10 v5-compatible gateway or v10 API Gateway. References to conversion of v5-compatible artifacts to v10 API Gateway refer to the v5-compatible artifacts that were initially from a v5 environment and were unpacked by the migration utility.

The migration model is centered around using tooling to bring the contents of Version 5 catalogs onto a Version 10 deployment that is set up to import them. The tooling migrates provider organization configuration information, including APIs, Catalogs, Products, Consumers, subscriptions, user registries and more.

You use a v5 extract command to gather the v5 data, and then use a migration unpack command to convert the data into Version 10 format. This extraction will generate a `c1oud` directory where your v5 data will be represented as YAML files. By viewing the contents of the `c1oud` folder, you can see which structures, such as provider organizations, are needed to support your catalog.

The model recognizes that not all v5 data is applicable to a new Version 10 deployment. To optimize your v10 deployment, you may use a text editor to remove unneeded or obsolete v5 configurations from the converted file. When you install and configure your v10 management server, you manually create those structures. You can then use migration tooling to load the v5 data into the prepared v10 system.

During the migration process you can keep your existing v5 system active while you install and configure a parallel (side-by-side) v10 system. You must have system administrator privileges to complete a migration. You should be familiar with IBM API Connect Version 5 architecture and requirements, and with the deployment configuration that you want to migrate.

The migration process supports migrating v5 data to both v10 DataPower Gateway (v5-compatible) and v10 DataPower® API Gateway.

The following sections in this topic review each step in the migration process. See also [Migration considerations](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Migration steps

Plan the migration, install a new v10 deployment, and move data from v5 to v10.

---

### About this task

At the highest level, the migration steps are:

- Plan your migration.
- Install and configure a v10 system to best meet current needs and integrate v5 data.
- Backup your v5 data and migrate the data to your new v10 deployment.

---

### Procedure

Complete the following steps:

1. Plan your migration:
  - Read [Migration overview](#).
  - Ensure you have supported versions of the software. See [Supported versions](#).
  - Plan your new v10 deployment. When moving from v5 to v10, use the opportunity to review your topology, user registries, provider organizations, etc. You might want to look at the existing data on the v5 system, and do some cleanup before running the extract. This will help ensure only objects that are required in v10 are migrated over.
  - If you are migrating to DataPower API Gateway, migrate a proof-of-concept deployment before migrating your entire v5 backup. Migrate 10 to 20 of your most commonly used v5 APIs and test them to determine which migration utility settings you may need to convert your APIs to DataPower API Gateway.

2. Install and configure a v10 system.

Install and deploy v10 with usage of the incoming v5 data in mind. Before you push your v5 data to v10, your v10 system must be up and running, with gateway services, provider organizations, user registries, etc, ready to receive the data.

- For the v10 deployment, install the API Connect subsystems. Use the normal installation and configuration processes as shown in the documentation:
  - [Installing and maintaining IBM API Connect](#)
  - [Configuring and managing your server environment](#)

Important:

Verify that you completed the following steps as part of deploying your v10 environment:

- Ensure that you create the same number of API Managers as on the v5 deployment.
- Use the Cloud Manager to configure topology. See [Defining your topology](#).
- If your v10 topology uses identical names and quantities of gateway services as v5, the migration utility automatically maps configuration information. If your v10 configuration uses different names or a different number, you must manually map the v5 gateway services to v10 gateway services. You will be guided to map gateway services in a later step. To review the mapping requirement, see [Mapping a gateway service](#).
- Review Gateway types and configurations:

API Connect v10 supports two types of gateway services: DataPower Gateway (v5-compatible) and DataPower API Gateway. The DataPower API Gateway type is not supported for API Connect v5. When you register your gateway service on your v10 system, you must select the gateway service type. If you select API Gateway, your migration process must include a step to convert (port) the v5 API Definitions from the DataPower Gateway (v5-compatible) format to the DataPower API Gateway format. The migration utility provides an option to do the porting. Command line instructions are provided in a later step.

If migrating to datapower-api-gateway, confirm xml-manager is enabled in default domain of all gateways.

To review gateway types and configuration, see [API Connect gateway types](#) and [Registering a gateway service](#).

- Create the provider organizations. If your v10 configuration for provider organizations uses different names or a different quantity, you must manually map the v5 provider organizations to v10 provider organizations. You will be guided to map provider organizations in a later step. To review the mapping requirement, see [Mapping a provider organization](#).
- When migrating catalog spaces in a provider organization that uses a local user registry (LUR), ensure that the LUR is configured with the visibility setting of either **Public** or **Custom**. If set to Custom, ensure that the provider organization is selected. For information on configuring visibility, see [Setting visibility for a](#)

- [user registry](#).
  - Configure user registries such as LDAP, as needed to match the user registries used for v5 users.
  - The migration process includes migration of users. Configuration of users into API Connect includes sending email to users to set up their accounts. The recommended way to do this during an automated migration is to set up a temporary SMTP server. One open source option for SMTP is MailHog. See <https://github.com/mailhog/MailHog>. When the migration process is complete, be sure to replace your temporary SMTP server with the permanent SMTP server for your API Connect v10 deployment.
  - Create the Portal services that you want to use with the Catalogs that you plan to migrate. You will configure the catalogs to the Portals after the migration data is pushed to the v10 system.
3. Backup your v5 data and migrate the data to your new v10 deployment.
    - a. Download the migration utility. See [Obtaining the API Connect Migration Utility](#).
    - b. Determine if your v5 system contain catalogs that user a Portal Delegated User Registry (PDUR).
 

Use of the PDUR was optional in v5. Migration of systems that use PDUR is very similar to migration of systems that do not use PDUR, however a few additional steps are needed. If you are not sure if your v5 catalogs use PDUR, check your v5 registry settings. See [Selecting the Portal Delegated User Registry](#).
    - c. Continue with instructions that apply to your deployment:
      - [Migration steps with PDUR](#)
      - [Migration steps without PDUR](#)
- [Migration steps with PDUR](#)  
Complete the following steps to migrate from v5 to v10 when your v5 catalogs use Portal Delegated User Registries (PDUR).
  - [Migration steps without PDUR](#)  
Complete the following steps to migrate from v5 to v10 when your v5 catalogs do not use Portal Delegated User Registries (PDUR).
  - [Logging in to a management server with an OIDC registry](#)  
Logging in with an OIDC registry involves several steps, in which you obtain a temporary token and pass it to the toolkit to ensure it can communicate securely with the management server.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Migration steps with PDUR

Complete the following steps to migrate from v5 to v10 when your v5 catalogs use Portal Delegated User Registries (PDUR).

### Before you begin

Important: If your v5 deployment does **not** use Portal Delegated User Registry (PDUR), do not use these instructions. See [Migration steps without PDUR](#).

- Ensure you planned your migration, obtained the migration utility, and installed a v10 deployment, as described in [Migration steps](#)
- Review [Migration considerations](#).
- Ensure you have system administrator privileges.
- To use `apicm` to convert the API definitions, you must have Node version 14.20.0 (or greater) installed.

### About this task

Tip:

To achieve a smooth and successful migration, we recommend these best practices:

- Before you push your v5 data to v10, your v10 system must be up and running, with gateway services, provider organizations, user registries, etc, ready to receive the data.
- Plan to do several test iterations of migration. You can use the `--dry-run` option to do iterations of the migration push, to test for any errors or warnings to address before the actual data push.
- Use the `apicm <command> --help` command to review the command options and their purpose. To see the list of commands you can run: `apicm help`.
- Complete all the steps in this topic in the order listed, unless the step is marked optional and does not apply to your scenario. You can push provider orgs as many times as needed.

The migration of v5 catalogs that use PDUR to a v10 deployment contains all of the steps for migration a non-PDUR v5 deployment to a v10 deployment (as described in [Migration steps without PDUR](#)) plus additional steps that are needed to migrate Portal Delegated User Registry data.

In IBM API Connect Version 5, when Portal Delegated User Registry (PDUR) was selected for a Catalog, the user management was delegated from the management server to the Developer Portal. The site administrator within the Portal site then performed the configuration. The management server recorded that the delegation had taken place, and stored a record of the users which existed in the catalog. However, the management service maintained no information about the configuration of the specific registries or how users mapped to them.

PDUR in IBM API Connect v5 was highly configurable. A single Portal site (catalog) could be configured to use multiple different registry types or different registries of the same type. Details of this configuration, and which users map to which registry, is all stored in the Portal.

However, IBM API Connect Version 10 and later supports new registries, and no longer needs the PDUR. Instead, functionally equivalent registries can be configured in v10 and used. To migrate the PDUR user registries and users from v5 to v10, we must gather configuration information from both the management server and the Portal node.

PDUR supported 4 different types of user registries. The following table shows the mapping of these types to the v10 equivalents:

Table 1. Mapping of Registry types

| v5 PDUR Registry          | v10 Equivalent Registry   |
|---------------------------|---------------------------|
| LDAP                      | LDAP                      |
| OIDC                      | OIDC                      |
| HybridAuth                | OIDC                      |
| Local User Registry (LUR) | Local User Registry (LUR) |

In this scenario, if you want to migrate users from an IBM API Connect V5 Developer Portal to an IBM API Connect v10 Developer Portal, you must export the user information that is stored in the Developer Portal local database. This information can then be used by the migration tooling to migrate the PDUR user registry. You complete this action after you have exported the v5 configuration database for the management server.

## Procedure

- Log in to the command line interface of the v5 appliance. Use the following command to create a tar.gz export of the v5 configuration database and place it on an **sftp** server:

```
config dbextract sftp <host_name> user <user_name> file <path/name>
```

- Specify a name of your choice for the compressed file to contain the dbextract. For example, `v5mgmt_data.tgz`.
- If you are not familiar with the v5 appliance CLI, see [The Command Line Interface](#). For information on `config dbextract`, see [Configuration commands](#).

- Log in to Developer Portal CLI to export Portal Delegated User Registry user information for all of the sites on a Developer Portal server. Use the following command to create a `*.tgz` file:

```
pdur_user_export
```

The status of the export is displayed. For example:

```
admin@apimxxx123:~$ pdur_user_export
portal123.company.com/api-provider/production: Exporting pdur users
portal123.company.com/api-provider/preprod: Exporting pdur users
portal123.company.com/api-provider/uat: Exporting pdur users
portal123.company.com/api-provider/development: Skipping as not a pdur enabled site
portal123.company.com/api-provider/sandbox: Skipping as not a pdur enabled site
~/pdurexport ~
5c20b903e4b0485cbbd81775.5c20bf43e4b0485cbbd81795.json
5c20b903e4b0485cbbd81775.5c2cddb4e4b0485cbbd818a0.json
5c20b903e4b0485cbbd81775.5c335211e4b0485cbbd8196e.json
~
Output can be found in /home/admin/pdurexport.tgz
```

Results:

- When the command completes, you can see the output `*pdurexport.tgz` in `/home/admin/pdurexport.tgz`.
  - This compressed file contains all of the JSON user-mapping files for that server. Each `.json` file contains a list of all of the PDUR user information that is stored in the Developer Portal local database. The naming convention used for the individual user-mapping files is `<provider_org_id>.<catalog_id>.json`.
  - The user information for all of the user registration methods that are used in the specific Developer Portal are included in the same file. For example, local user registry, LDAP user registry, third-party authentication, OpenID Connect, and any custom user registration method.
  - If a site doesn't contain any PDUR data, that site is skipped. The example output shows that there was one provider organization on the server, and that organization had five Developer Portal sites, three of which contained PDUR user information. The PDUR user information for all of the sites on the server is exported into a `pdurexport.tgz` file.
- Optional: Setup a temporary SMTP server.  
During migration, if subscription approval is needed to enable an application to subscribe to a plan, notifications are sent to all users, within the organization, who have subscription approval permission. In some cases, this results in a large number of emails. To avoid the sending of these emails, set up a temporary email server prior to running the migration, and use it to collect all notifications rather than sending them to users' email accounts.

If subscription approvals are not needed during your migration, you can skip this step.

- Optional: If necessary, set up a temporary LDAP server. This can be needed if you are temporarily behind a firewall.
  - Install a server:

```
git clone https://github.com/veo-labs/ldap-server-mock
npm install
```

- Creating the configuration files:

- `ldap-server-mock-conf.json`

```
{
  "port": 3004,
  "userLoginAttribute": "cn",
  "searchBase": "dc=test",
  "searchFilter": "(&(objectclass=person)(cn={username}))"
}
```

- `users.json`

```
[
  {
    "dn": "cn=user,dc=test",
    "cn": "user-login"
  }
]
```

- Run the LDAP server:

```
node server.js --conf=./ldap-server-mock-conf.json --database=./users.json
```

- Modifying a current LDAP provider.

The following file is a dummy user registry file that maps to a read-only test server. The fields in bold font (**admin\_dn** and **endpoint**) have been changed to fit the dummy server configuration. Change these on all user registries that need to be fixed.

```
api_version: 2.0.0
configuration:
  admin_dn: cn=user,dc=test
  admin_password: xxxx
  authenticated_bind: "true"
  authentication_method: search_dn
  bind_prefix: ""
  bind_suffix: ""
  protocol_version: "3"
  search_dn_base: ""
  search_dn_filter_prefix: (examplelegacyuid=
  search_dn_filter_suffix: )
  search_dn_scope: sub
endpoint:
  endpoint: ldap://172.20.20.11:3004
  tls_client_profile_url: idurl://...\..\..\admin-org\tls-client-profiles\tls-profile-for-ldap-1.0.0.yml
integration_url: file://...\..\..\integrations\user_registry\ldap.yml
metadata:
  v5_id: xxxxxxx40cf2fc09a9ba0d6c
  v5_scope: '["api"]'
  v5_type: ldap
name: xxxxxxxxxxxxxxxx
title: xxxxxxxxxxxxxxxxxxxxxxxx
type: user_registry
```

5. Unpack both the v5 management data backup and the PDUR tar file.

Important: Migration on Windows 10

Windows has path length limits that can interfere with large extracts. It is recommended that you keep the initial path for migration on Windows as short as possible. The AMU must be run in a command window with administrative privileges on Windows. Running from a Linux VM on your Windows system may be a better option for doing migration.

- Copy the v5 extract tar file (**<v5mgmt\_data>.tgz**) and the PDUR extract file (**pdurexport.tgz**) from the sftp server to the location where you have v10 migration utility installed.
- Run **apicm archive:unpack** command from the directory where you downloaded the v5 extract file. When you invoke **apicm** for the first time, you are prompted to accept the license. Accept the license to continue.

You can optionally limit the unpack to only specific provider orgs. See [Table 2](#).

```
./apicm archive:unpack <v5_extract_file>.tgz pdurexport.tgz
```

Table 2. **apicm archive:unpack** command options

| Parameters                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>&lt;v5_extract_file&gt;</b> | Can be compressed file (.tgz, tar.gz) or uncompressed file (.tar). Use any file name of your choosing. Example:<br><b>v5_DBextract_data.tgz</b>                                                                                                                                                                                                                                                                                                                                                    |
| <b>pdurexport.tgz</b>          | The Portal Delegated User Registry export file generated by the <b>pdur_user_export</b> utility. Example:<br><b>pdurexport.tgz</b>                                                                                                                                                                                                                                                                                                                                                                 |
| <b>--provider-orgs</b>         | One or more provider orgs to unpack. This flag is optional. Use it when you want to unpack only specific provider orgs rather than the entire archive. Example:<br><br><b>./apicm archive:unpack v5_DBextract_data.tgz pdurexport.tgz --provider-orgs=&lt;pOrg1_name&gt;</b><br><br>Use a comma-separated list to specify multiple provider orgs:<br><br><b>./apicm archive:unpack v5_archive_data.tgz pdurexport.tgz --provider-orgs=&lt;pOrg1_name&gt;,&lt;pOrg2_name&gt;,&lt;pOrg3_name&gt;</b> |

Note:

- You can avoid the license prompt by adding **--accept-license** to the command line.
- The unpack command ensures that catalog names and API properties contain only valid characters. Any invalid characters are mapped to '-'. See [Parity between Version 5 and Version 10](#).
- The unpack command issues warning messages for APIs and Products that fail validation against the OpenAPI specification. See the limitations section in [Migration considerations](#).
- For troubleshooting tips, see [Migration troubleshooting](#)
- The unpack command might return error messages related to PDUR, such as:

```
ERRO[3414] PDUR backup data for IDP PortalDelegatedIdentityProvider-123b81fbe4b06de411580e2e
(123b81fbe4b06de411580e2f) not provided: not found
ERRO[3414] PDUR backup data for IDP PortalDelegatedIdentityProvider-123b820de4b06de411580e32
(123b820ee4b06de411580e33) not provided: not found
```

The error means that when the migration utility unpacked **pdurexport.tgz**, it could not find all the specified Portal user registries. To resolve the errors, re-run **pdur\_user\_export** and re-run the unpack..

When the command completes, the data is unpacked to the **/cloud** directory. The **/cloud** directory is located in the same directory as **apicm**, and populated with yaml files representing the configuration objects in the export. The unpack processes produce output in the format required for v10 configuration.

Note: The unpack directory must be named **/cloud**. Do not rename the directory.

Example output in **/cloud** for provider-org:

```
├── provider-orgs
│   └── pOrg1
│       ├── catalogs
│       │   └── catalog1
│       │   └── ...
```

```

6. If the v5 Developer Portal used LDAP, HybridAuth, or OIDC (such as social login through Google, GitHub, or Slack) user registries, you must manually configure them in v10 before using `apicm archive:push` to migrate PDUR. See the following instructions for your registry type:

- LDAP

- Manually configure LDAP

The user registries which are required in the target v10 system are described in the `user-registry.yml` file. Where possible the configuration for the v10 registries is complete in these files. However, for LDAP the configuration of the registry is not possible due to differences in the way the v5 Portal (Drupal) and v10 API Manager (`apim`) specify user registry configuration.

For LDAP with v10, create a user registry manually, using the same LDAP server and configuration as used with v5. Where it is possible, the v5 configuration is provided as helpful information in the `metadata.v5_config` property. To view the v10 configuration instructions, see [Configuring an LDAP user registry](#).

For example: An `ldap.tar.gz` file, when unpacked, creates the following directory hierarchy, for an LDAP directory **example**:

```

└─ user-registries
  └─ example-5c38556de4b0c5f69db90ee0
    └─ user-registry.yml
    └─ users
      └─ testuser1.yml
      └─ testuser2.yml

```

You can create an LDAP user registry for the PDUR by either modifying `user-registry.yml` or by creating the registry in the UI:

- Modify the `user-registries/example-5c38556de4b0c5f69db90ee0/user-registry.yml` file directly and add the required LDAP fields based on the extracted info provided in the metadata. Remove the metadata after you are done. The modification of `user-registry.yml` is preferred over using the UI. This method enables any APIs that depend on the user registry to be satisfied when the migration command `apicm archive:push` is run in Step [10](#).
  - Create the registry in the UI. The creation of the registry in the UI requires more manual setup of the organization and catalog. In addition, you must provide a mapping file to map from the `example-5c38556de4b0c5f69db90ee0` to the ID of the registry that was created manually.
- Create a mapping file entry for the LDAP user registry. In the `/cloud` directory, go to `provider-org/<provider-org>/user-registry/<PDUR_LDAP_User_registry>` and create a mapping file to tell migration utility the name of the migration endpoint for the LDAP user registry used with v5 PDUR:

```

user-registry:
  name: <pdur-ldap-v10-name>

```

To determine which name to use for the v10 LDAP registry, go to the management user interface, click on **Resources** -> **User Registries** then use **Name** not **Title**.

For more information on how to create mapping files, see [Migration mapping files](#).

- OIDC
  - Manually configure OIDC
    - Note that v10 supports OAuth 2.0 but does not support OAuth 1.0. Deployments, such as Twitter, which use OAuth 1.0 with APIC version 5, can not use OAuth 1.0 when migrating to v10.
    - Automatic migration is not supported for the OIDC user registries which you use in your v5 Portal. Thus if you are using OIDC OAuth 2.0, e.g., Google, GitHub, or Slack, please complete the following manual steps.
    - The OIDC data from the Portal Delegated User registry does not contain the `client_id` and `client_secret` that are needed to migrate a user registry automatically. You must obtain the data and update the user registry manually if you are using `client_id` and `client_secret`.

On the Version 10 system:

- Edit `user-registry.yml`. For example, for GitHub:  
`cloud/provider-orgs/test-user1-org1/user-registries/git-hub-5c5xyz6ee4b0c5f69db94xxxx-a339/user-registry.yml`

```
api_version: 2.0.0
configuration:
  client_id: ""
  client_secret: ""
  authorization_endpoint: https://github.com/login/oauth/authorize
  provider_type: github
  token_endpoint:
    endpoint: https://github.com/login/oauth/access_token
integration_url: file://../../../../integrations/user_registry/oidc.yml
metadata:
  v5_id: 5c5xyz6ee4b0c5f69db94xxxx
  name: git-hub-5c5xyz6ee4b0c5f69db94xxxx-a339
  registry_type: oidc
  title: GitHub
  type: user_registry
```

- Insert the values for `client_id` and `client_secret`. Once the client id and client secrets have been updated in the `user-registry.yml` file just described, the `apicm archive:push` can be successfully executed.

Upon creation and configuration of the Developer Portal, you can log in by using, as in this example, an account such as a GitHub account.

To verify that the manual configuration succeeded, view the log file for entries for the users after you run `apim archive:push` in Step [10](#).

- Example success message:

```
INFO[0012] User registry git-hub-5c5xyz6ee4b0c5f69db94xxxx-a339 created
INFO[0013] User test-user1-4d48 created
```

- Example error message:

```
ERRO[0010] unable to create User registry git-hub-5c5xyz6ee4b0c5f69db94xxxx-a339
ERRO[0010] git-hub-5c5xyz6ee4b0c5f69db94xxxx-a339: The properties client_id, client_secret are required.
```

- Create a mapping file entry for the OIDC user registry.  
In the `/cloud` directory, go to `provider-org/<provider-org>/user-registry/<PDUR_OIDC_User_registry>` and create a mapping file to tell migration utility the name of the migration endpoint for the OIDC user registry used with v5 PDUR:

```
user-registry:
  name: <pdur-OIDC-v10-name>
```

For more information on how to create mapping files, see [Migration mapping files](#).

#### 7. Optional: Remove unneeded configuration objects.

Inspect the set of configuration objects and their attributes, and remove the ones that are not needed. In many cases, some of the configuration objects present in the v5 system are not needed in the new v10 environment. For example, there is no value in preserving inactive users, obsolete apps, obsolete consumer organizations, and so on.

When deleting objects, make sure that you do not delete objects that have other dependent objects, such as products with subscriptions on them or users that are active. If you delete a consumer organization make sure you also delete all apps and subscriptions associated with that consumer org. Be aware of any groups that include these consumer orgs or visibility settings that include the consumer orgs.

#### 8. Map v5 object names to v10 object names.

Most deployments adjust the names or quantities of gateway services, provider organizations, and user registries when setting up a new environment for v10. Be sure to specify any changed v10 destinations for the v5 data in a migration mapping file so that the migration utility can automatically move the data.

Complete the following, as needed. You can skip the steps for any objects that are unchanged from v5 to v10.

- [What is a mapping file?](#)
- [Mapping a gateway service](#)
- [Mapping a provider organization](#)

#### 9. Optional: If your v10 deployment uses a **DataPower API Gateway**, convert the v5 API definitions to v10 DataPower® API Gateway.

To convert API definitions using the default migration configuration, use the following syntax.

```
./apicm archive:port-to-apigw <path>
```

Important: Ensure that the DataPower Gateway version that you are using with your API Connect v10 deployment is compatible with the version of the migration utility that you are using. For details, see the version compatibility information in [Configuring and managing your server environment](#).

Important: If you are running the migration utility in Windows, Administrator privileges are required to complete this step.

Table 3. Parameter for archive:port-to-apigw

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <path>    | <p>Specify the unpacked <code>ccloud</code> directory as input:</p> <pre>./apicm archive:port-to-apigw /ccloud</pre> <p>By specifying <code>/ccloud</code>, <code>apicm</code> ports all artifacts within the directory, including APIs, Products, OAuth providers, custom policies, subscriptions and so on. Running a subsequent <code>archive:push</code> pushes all the artifacts to API Gateway.</p> <p>Running <code>archive:port-to-apigw</code> on any subdirectory within the unpacked <code>/ccloud</code> directory could leave the directory in an inconsistent state, and cause the subsequent <code>archive:push</code> of artifacts to API Gateway to fail. Custom policies and OAuth providers are not migrated if a directory other than <code>/ccloud</code> is specified.</p> <p>Note: However, if you decide to rewrite one API at a time, to migrate them to API Gateway, you can use:</p> <pre>./apicm archive:port-to-apigw &lt;path&gt;</pre> <p>where <code>&lt;path&gt;</code> is a single API file, or a directory that contains only APIs or Products.</p> <p>In this case, you cannot use <code>archive:push</code> to push artifacts to API Gateway. All the ported APIs and Products must be pushed (or imported) into API Manager by either the toolkit or UI.</p> |

Usage notes:

- The conversion produces a draft output YAML file. Review the entire draft output YAML file for conformance, performance, and errors. Review the log files for messages about any manual actions that might be needed. For more information, see [Reviewing APIs converted to DataPower API Gateway](#).
  - By default, all changes that the migration utility makes when rewriting APIs are logged as comments within the API YAML file. You can use the `enable-api-logging` parameter to disable logging of these changes.
- ```
./apicm archive:port-to-apigw <folder> --enable-api-logging=false
```
- You can also specify migration configuration parameters using either a YAML configuration file or from the command line, but not both. For information about configuration options and DataPower requirements for certain configuration parameters, see [Configuring migration options for DataPower API Gateway](#).
  - Multiple runs of `./apicm archive:port-to-apigw` on the same `/ccloud` folder will skip artifacts that have already been converted to DataPower® API Gateway.
  - If your v10 deployment uses DataPower MultiProtocol Gateway (v5-compatible) you do not need to convert the API definitions.
10. Use `apicm` commands to push the Cloud Manager admin organization data onto your v10 Management Server.
- a. Log in to the Cloud Manager on the destination v10 Management Server as an Owner of the admin organization:
- Important: You must be logged in as an Owner of the admin organization to be able to migrate Cloud Manager admin organization data.

- Syntax:

```
./apicm login --server <cloud_manager_endpoint> --realm admin/identity_provider --username admin --password admin_password
```

- Example on API Connect v10 standalone

```
./apicm login --server cloud-admin-ui.mgmt.dev.apic10-stack.example.test --realm admin/default-idp-1 --username admin --password 'myadminpassword'
```

- Example on Cloud Pak for Integration

```
./apicm login --server cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod --realm admin/default-idp-1 --username admin --password 'XXXXXXXXXXXX'
```

The values to supply for the login parameters depend on whether your management server is deployed on API Connect v10 standalone or as part of Cloud Pak for Integration. See [Table 4](#) to review how to obtain each parameter.

Note: If you want to login using an OIDC user registry, see [Logging in to a management server with an OIDC registry](#).

Table 4. `apicm login` command parameters

Parameters	Description
------------	-------------

Parameters	Description						
<pre>--server &lt;cloud_manager_endpoint&gt;</pre>	<p>The endpoint on the management server for communication with the Cloud Manager user interface.</p> <p>v10 standalone Example:</p> <pre>cloud-admin-ui.mgmt.dev.apic10-stack.example.test</pre> <p>The endpoint was specified when the management subsystem was installed. View the <code>apiconnect_api</code> definition in the <code>apiconnect-up.yml</code> file in the API Connect v10 installation project directory that you created for initial deployment of v10. Examples:</p> <ul style="list-style-type: none"> <li>VMware: see the <code>cloud-admin-ui</code> endpoint in <a href="#">Deployment overview for endpoints and certificates</a>.</li> <li>Kubernetes: see the <code>admin</code> endpoint in <a href="#">Deployment overview for endpoints and certificates</a>.</li> </ul> <p>Cloud Pak for Integration Syntax:</p> <pre>&lt;cpd-APIC_namespace.your-company.domain.com&gt;/integration/apis/&lt;APIC_namespace&gt;/&lt;APIC_instance&gt;</pre> <p>Example:</p> <pre>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod</pre> <p>where <code>e2e</code> is <code>&lt;APIC_namespace&gt;</code> and <code>prod</code> is <code>&lt;APIC_instance&gt;</code>.</p> <p>Note: How to obtain the server parameter on Cloud Pak for Integration Use the Platform Navigator UI to determine the parameter. Note that you cannot get the endpoint by using <code>oc get routes</code> because Zen modifies the route internally.</p> <ol style="list-style-type: none"> <li>Locate the Platform UI panel with entries for the deployment. Identify the row that has a Type column entry with the description <code>API management administration</code></li> <li>To display the endpoint, hover over the entry in the Name column for that row. For example, hover over the <code>prod</code> entry, as shown in bold font, and the <code>URL</code> displays at the bottom of the panel.</li> </ol> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td><b>prod</b></td> <td>API management administration</td> </tr> <tr> <td>prod</td> <td>API management</td> </tr> </tbody> </table> <pre>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod/admin</pre> <ol style="list-style-type: none"> <li>Remove the trailing <code>/admin</code> from the endpoint, to obtain the parameter for the login command:</li> </ol> <pre>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod</pre>	Name	Type	<b>prod</b>	API management administration	prod	API management
Name	Type						
<b>prod</b>	API management administration						
prod	API management						
<pre>--realm admin/default-idp-1</pre>	<p>The <code>apicm login</code> example shows the expected <code>--realm</code> parameter values for a default API Connection administration organization. The default user is <code>admin</code> and the identity provider is <code>default-idp-1</code>. You can determine which identity provider to use in the <code>--realm</code> parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):</p> <pre>apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm</pre> <p>For example:</p> <pre>apic identity-providers:list --scope admin --server myserver.com --fields title,realm total_results: 2 results: - title: Cloud Manager User Registry   realm: admin/default-idp-1 - title: Corporate LDAP user registry   realm: admin/corporate-ldap</pre> <p>The <code>title</code> value should enable you to determine which identity provider to use; you can then copy the corresponding <code>--realm</code> parameter directly from the displayed <code>realm</code> value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is <code>default-idp-1</code>.</p>						
<pre>--username admin</pre>	<p>Administrative user with permissions to modify API Connect admin-org. The default user is <code>admin</code>.</p>						
<pre>--password myadminpassword</pre>	<p>Administrative user password. <b>Cloud Pak for Integration:</b> When you installed with the top-level CR for CP4I, the password was auto-generated. To obtain the password, see step 3 in <a href="#">Installing API Connect</a>.</p>						

b. Run `/apicm archive:push` to migrate data for the Cloud Manager administrative org (admin-org).

- Syntax

```
./apicm archive:push <cloud_manager_endpoint> <path_to_admin_org> [optional flags]
```

- Example for v10:

```
./apicm archive:push cloud-admin-ui.mgmt.dev.apic10-stack.example.test cloud/admin-org
```

- Example for Cloud Pak for Integration:

```
./apicm archive:push cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod cloud/admin-org
```

See [Table 5](#) to review how to obtain each parameter.

Tip: First run the command with the optional flag `--dry-run` to test for errors or warnings. Review the command parameters, examples and guidance that follow before you run it.

Table 5. `apicm archive:push` command parameters for admin org

Parameters	Description
<code>&lt;cloud_manager_endpoint&gt;</code>	<p>The endpoint on the management server for communication with the Cloud Manager user interface.</p> <p>v10 standalone Example:</p> <pre>cloud-admin-ui.mgmt.dev.apic10-stack.example.test</pre> <p>The endpoint was specified when the management subsystem was installed. View the <code>apiconnect_api</code> definition in the <code>apiconnect-up.yml</code> file in the API Connect v10 installation project directory that you created for initial deployment of v10. Examples:</p> <ul style="list-style-type: none"> <li>VMware: see the <code>cloud-admin-ui</code> endpoint in <a href="#">Deployment overview for endpoints and certificates</a>.</li> <li>Kubernetes: see the <code>admin</code> endpoint in <a href="#">Deployment overview for endpoints and certificates</a>.</li> </ul> <p>Cloud Pak for Integration Syntax:</p> <pre>&lt;cpd-APIC_namespace.your-company.domain.com&gt;/integration/apis/&lt;APIC_namespace&gt;/&lt;APIC_instance&gt;</pre> <p>Example:</p> <pre>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod</pre> <p>where <code>e2e</code> is <code>&lt;APIC_namespace&gt;</code> and <code>prod</code> is <code>&lt;APIC_instance&gt;</code>.</p> <p>See <a href="#">How to obtain the server parameter for Cloud Pak for Integration</a>.</p>
<code>&lt;path_to_admin_org&gt;</code>	Must be <code>cloud/admin-org</code> .
<code>--dry-run</code>	<p>Optional flag. You can test the Admin org migration output first view by using the <code>--dry-run</code> option.</p> <pre>./apicm archive:push &lt;cloud_manager_endpoint&gt; &lt;path_to_admin_org&gt; --dry-run</pre> <p>This option creates a project directory similar to <code>cloud</code>, titled <code>.workdir-&lt;apim_admin_server&gt;</code> where you can view how the data will be loaded into your new system. The option also displays the objects that will fail due to existing already or missing dependencies. Use this option to view the resolved URLs for where the data will be loaded, without creating resources on the new system. See <a href="#">apicm command line help</a>.</p>
<code>--apigw-only</code>	<p>Optional flag. Use when migrating to a DataPower API Gateway. For example:</p> <pre>./apicm archive:push &lt;cloud_manager_endpoint&gt; &lt;path_to_admin_org&gt; --apigw-only</pre>

Important: Usage notes:

- Run `./apicm archive:push` in the same directory where you ran `apicm archive:unpack`.
- If you run migration and observe error messages in your log output, you can take troubleshooting steps, and run the migration again. See [Migration troubleshooting](#).
- The `apicm` login obtains a token that expires after eight hours. If the token expires while `apicm archive:push` is running, `apicm` generates errors due to lack of the necessary access permissions. In this case, log in again and re-run `apicm archive:push`. The token is refreshed every time you log in. See also [Token expiration](#) in [Migration troubleshooting](#).
- An alternative method of viewing endpoints is to run `kubectl get ingress` and get the values from the output. For example, see the values in **bold** in the following sample output:

```
r7c221d8a33-apic-portal-director    api.portal.dev.apic10-stack.example.test    80, 443    21h
r7c221d8a33-apic-portal-web        portal.dev.apic10-stack.example.test        80, 443    21h
re314d70920-apiconnect-api         platform.mgmt.dev.apic10-stack.example.test 80, 443    22h
re314d70920-apiconnect-apim-ui     apim.mgmt.dev.apic10-stack.example.test     80, 443    22h
re314d70920-apiconnect-cm-ui       cloud.mgmt.dev.apic10-stack.example.test    80, 443    22h
re314d70920-apiconnect-consumer-api consumer.mgmt.dev.apic10-stack.example.test 80, 443    22h
rfe867a858b-dynamic-gateway-service service.gw.dev.apic10-stack.example.test    80, 443    21h
rfe867a858b-dynamic-gateway-service-gw api.gw.dev.apic10-stack.example.test        80, 443    21h
rfff5043330-analytics-client      ac.dev.apic10-stack.example.test           80, 443    21h
rfff5043330-analytics-ingestion   ai.dev.apic10-stack.example.test            80, 443    21h
```

#### 11. Migrate the API Manager provider organizations.

- If you have not already done so, create the provider organizations on your API Connect v10 deployment.
- Use `apicm` to log in to the API Manager user interface as an Owner of the provider organization that you want to migrate. If you want to login using an OIDC user registry, see [Logging in to a management server with an OIDC registry](#).

Important: You cannot migrate a provider organization while you are logged in with the Cloud Manager admin organization. You must be logged in as an Owner of the provider organization to be able to migrate that organization's data.

- Syntax:

```
./apicm login --server <api-manager-ui-endpoint> --realm provider/identity_provider --username org_owner --password org_password
```
- Example for API Connect v10:

```
./apicm login --server api-manager-ui.dev.apic10-stack.example.test --realm provider/default-idp-2 --username org_owner1@example.com --password myorgpassword
```
- Example for Cloud Pak for Integration:

```
./apicm login -server cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod --realm provider/default-idp-2 --username org_owner1@example.com --password myorgpassword
```

Table 6. `apicm login` parameters for logging in to provider orgs on API Connect v10 standalone

Parameters	Description
<pre>--server &lt;api- manager-ui- endpoint&gt;</pre>	<p>API Manager URL endpoint on the management server for communication with the API Manager user interface.</p> <p>API Connect v10 standalone</p> <p>For example:</p> <pre>api-manager-ui.dev.apic10-stack.example.test</pre> <p>The endpoint was specified when the management subsystem was installed. To verify your endpoint setting you can:</p> <ul style="list-style-type: none"> <li>View the <code>apiconnect-apim-ui</code> definition in the <code>apiconnect-up.yml</code> file in the API Connect v10 installation project directory.</li> <li>In the Cloud Manager UI, select Settings &gt; Endpoints and view <b>API Manager URL</b>.</li> </ul> <p>Cloud Pak for Integration</p> <p>Syntax (line-break is for table formatting only; your value will not include a line-break):</p> <pre>&lt;cpd-APIC_namespace.your-company.domain.com&gt;/integration/apis /&lt;APIC_namespace&gt;/&lt;APIC_instance&gt;</pre> <p>Example:</p> <pre>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod</pre> <p>where <code>e2e</code> is <code>&lt;APIC_namespace&gt;</code> and <code>prod</code> is <code>&lt;APIC_instance&gt;</code>.</p> <p>See <a href="#">How to obtain the server parameter for Cloud Pak for Integration</a>.</p>
<pre>--realm provider/ide ntity_provid er</pre>	<p>The <code>apicm login</code> example shows the expected <code>realm</code> parameter values for a default API Connection provider organization. The default user is <code>provider</code> and the identity provider is <code>default-idp-2</code>.</p> <p>You can determine which identity provider to use in the <code>--realm</code> parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):</p> <pre>apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm</pre> <p>For example:</p> <pre>apic identity-providers:list --scope provider --server myserver.com --fields title,realm total_results: 2 results: - title: Cloud Manager User Registry   realm: provider/default-idp-2 - title: Corporate LDAP user registry   realm: provider/corporate-ldap</pre> <p>The <code>title</code> value should enable you to determine which identity provider to use; you can then copy the corresponding <code>--realm</code> parameter directly from the displayed <code>realm</code> value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is <code>default-idp-2</code>.</p>
<pre>--username &lt;org_owner&gt;</pre>	<p>A user with permissions to modify the provider organization. Typically this is the owner of the organization.</p>
<pre>--password &lt;org_owner_p assword&gt;</pre>	<p>Organization owner password.</p>

c. Run `/apicm archive:push` to migrate data for the Provider organization.

- Syntax:

```
./apicm archive:push <api-manager-ui-endpoint> cloud/provider-orgs/<pOrg_name> [optional flags]
```

- Example on v10:

```
./apicm archive:push api-manager-ui.mgmt.dev.apic10-stack.example.test cloud/provider-orgs/production_Org
```

- Example on Cloud Pak for Integration

```
./apicm archive:push cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod cloud/provider-
orgs/production_Org
```

See [Table 7](#) to review how to obtain each parameter.

Tip: First run the command with the optional flag `--dry-run` to test for errors or warnings.

Table 7. `apicm archive:push` command parameters for Provider orgs

Parameters	Description
------------	-------------

Parameters	Description
<code>&lt;api-manager-ui-endpoint&gt;</code>	<p>API Manager URL endpoint on the management server for communication with the API Manager user interface.</p> <p>API Connect v10 standalone For example:</p> <pre>api-manager-ui.dev.apic10-stack.example.test</pre> <p>The endpoint was specified when the management subsystem was installed. To verify your endpoint setting you can:</p> <ul style="list-style-type: none"> <li>View the <code>apiconnect_api</code> definition in the <code>apiconnect-up.yml</code> file in the API Connect v10 installation project directory.</li> <li>In the Cloud Manager UI, select Settings_&gt; Endpoints and view <b>API Manager URL</b>.</li> </ul> <p>Cloud Pak for Integration Syntax (line-break is for table formatting only, your value will not include a line-break).</p> <pre>&lt;cpd-APIC_namespace.your-company.domain.com&gt;/integration/apis/APIC_namespace/&lt;APIC_instance&gt;</pre> <p>Example:</p> <pre>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod</pre> <p>where <code>e2e</code> is <code>&lt;APIC_namespace&gt;</code> and <code>prod</code> is <code>&lt;APIC_instance&gt;</code>.</p> <p>See <a href="#">How to obtain the server parameter for Cloud Pak for Integration</a>.</p>
<code>cloud/provider-orgs/&lt;pOrg_name&gt;</code>	<p>The location of your Provider org within the <code>/cloud</code> file hierarchy you created when you ran <code>apicm archive:unpack</code>.</p> <pre>cloud/provider-orgs/production_Org</pre>
<code>--catalogs=&lt;name&gt;</code>	<p>Optionally, you can push data for only specified Catalogs if you don't want to push the entire Provider organization. Use this flag to specify the name of the Catalog you want to push:</p> <pre>./apicm archive:push &lt;api-manager-ui-endpoint&gt; cloud/provider-orgs/&lt;pOrg_name&gt; --catalogs=&lt;catalog_name&gt;</pre> <p>Note: Type the command on a single line. When a catalog is mapped, specify the mapped new catalog name.</p> <p>To specify multiple catalogs, use a comma-separated list:</p> <pre>./apicm archive:push &lt;api-manager-ui-endpoint&gt; cloud/provider-orgs/&lt;pOrg_name&gt; --catalogs=&lt;catalog_name1,catalog_name2,catalog_name3&gt;</pre> <p>Note: Type the command on a single line.</p>
<code>--dry-run</code>	<p>You can test the Provider org migration output first view by using the <code>--dry-run</code> option. This will create a project directory similar to <code>cloud</code>, titled <code>.workdir-&lt;apim_admin_server&gt;</code> where you can view how the data will be loaded into your new system. The option also displays the objects that will fail due to existing already or missing dependencies. Use this option to view the resolved URLs for where the data will be loaded, without creating resources on the new system. See <a href="#">apicm command line help</a>.</p> <pre>./apicm archive:push &lt;api-manager-ui-endpoint&gt; cloud/provider-orgs/&lt;pOrg_name&gt; --dry-run</pre> <p>Note: Type the command on a single line.</p>
<code>--no-drafts</code>	<p>Do not push any Draft APIs or Products. Draft objects are objects that have not been published.</p> <pre>./apicm archive:push &lt;cloud_manager_endpoint&gt; &lt;path_to_provider_org&gt; --no-drafts</pre> <p>Note: Type the command on a single line. This option can be used with or without <code>--catalogs=a,b,c</code>.</p>
<code>--overwrite</code>	<p>When this option is used, draft products, draft APIs, published products and their APIs, and OAuth Providers that are already on the v10 system will be overwritten. When this option is not used these artifacts will be skipped.</p>

Important: Usage notes

- Run `/apicm archive:push` in the same directory where you ran `apicm archive:unpack`.
- If you run migration and observe error messages in your log output, you can take troubleshooting steps, and run the migration again. See [Migration troubleshooting](#).
- The `apicm` login obtains a token that expires after eight hours. If the token expires while `apicm archive:push` is running, `apicm` generates errors due to lack of the necessary access permissions. In this case, log in again and re-run `apicm archive:push`. The token is refreshed every time you log in. See also [Token expiration in Migration troubleshooting](#)
- An alternative method of viewing endpoints is to run `kubectl get ingress` and get the values from the output. See [kubectl example](#).

12. When migration finishes, complete the following steps:

- If a user in a Local User Registry is owner of a Consumer Organization, the user must reset their password.
- If applicable, reapply any customized configurations from your v5 deployment. See [Customizations to recreate](#).
- Optional: If necessary, switch the provider organization ownership to the identity that owned it in v5.  
This step might be necessary if you created and migrated the provider organization using a different identity (such as administrative account) than the user identity of the v5 provider org. Note that the UI does not provide this function, but you can use the API `/orgs/{org}/transfer-owner` to switch ownership.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Migration steps without PDUR

Complete the following steps to migrate from v5 to v10 when your v5 catalogs do not use Portal Delegated User Registries (PDUR).

---

## Before you begin

Important: Do not use these instructions if your v5 catalogs use Portal Delegated User Registry. Instead, see [Migration steps with PDUR](#).

- Ensure you planned your migration, obtained the migration utility, and installed a v10 deployment, as described in [Migration steps](#)
- Review [Migration considerations](#).
- Ensure you have system administrator privileges.
- To use `apicm` to convert the API definitions, you must have Node version 14.20.0 (or greater) installed.

---

## About this task

Use the `apicm` utility to migrate your API Connect v5 data to a new API Connect v10 installation.

Tip:

To achieve a smooth and successful migration, we recommend these best practices:

- Before you push your v5 data to v10, your v10 system must be up and running, with gateway services, provider organizations, user registries, etc, ready to receive the data.
- Plan to do several test iterations of migration. You can use the `--dry-run` option to do iterations of the migration push, to test for any errors or warnings to address before the actual data push.
- Use the `apicm <command> --help` command to review the command options and their purpose. To see the list of commands you can run: `apicm help`.
- Complete all the steps in this topic in the order listed, unless the step is marked optional and does not apply to your scenario. You can push provider orgs as many times as needed.

---

## Procedure

1. Log in to the command line interface of the v5 appliance. Use the following command to create a tar.gz export of the v5 configuration database and place it on an `sftp` server:

```
config dbextract sftp <host_name> user <user_name> file <path/name>
```

- Specify a name of your choice for the compressed file to contain the dbextract. For example, `v5mgmt_data.tgz`.
- If you are not familiar with the v5 appliance CLI, see [The Command Line Interface](#). For information on `config dbextract`, see [Configuration commands](#).

2. Optional: Setup a temporary SMTP server.

During migration, if subscription approval is needed to enable an application to subscribe to a plan, notifications are sent to all users, within the organization, who have subscription approval permission. In some cases, this results in a large number of emails. To avoid the sending of these emails, set up a temporary email server prior to running the migration, and use it to collect all notifications rather than sending them to users' email accounts.

If subscription approvals are not needed during your migration, you can skip this step.

3. Optional: If necessary, set up a temporary LDAP server. This can be needed if you are temporarily behind a firewall.
  - a. Install a server:

```
git clone https://github.com/veo-labs/ldap-server-mock
npm install
```

- b. Creating the configuration files:

- `ldap-server-mock-conf.json`

```
{
  "port": 3004,
  "userLoginAttribute": "cn",
  "searchBase": "dc=test",
  "searchFilter": "(&(objectclass=person)(cn={username}))"
}
```

- `users.json`

```
[
  {
    "dn": "cn=user,dc=test",
    "cn": "user-login"
  }
]
```

- c. Run the LDAP server:

```
node server.js --conf=./ldap-server-mock-conf.json --database=./users.json
```

- d. Modifying a current LDAP provider.

The following file is a dummy user registry file that maps to a read-only test server. The fields in bold font (`admin_dn` and `endpoint`) have been changed to fit the dummy server configuration. Change these on all user registries that need to be fixed.

```
api_version: 2.0.0
configuration:
  admin_dn: cn=user,dc=test
  admin_password: xxxx
  authenticated_bind: "true"
```

```

authentication_method: search_dn
bind_prefix: ""
bind_suffix: ""
protocol_version: "3"
search_dn_base: ""
search_dn_filter_prefix: (examplelegacyuid=
search_dn_filter_suffix: )
search_dn_scope: sub
endpoint:
  endpoint: ldap://172.20.20.11:3004
  tls_client_profile_url: idurl://...\\admin-org\tls-client-profiles\tls-profile-for-ldap-1.0.0.yml
integration_url: file://...\\integrations\user_registry\ldap.yml
metadata:
  v5_id: xxxxxx40cf2fc09a9ba0d6c
  v5_scope: '["api"]'
  v5_type: ldap
name: xxxxxxxxxxxxxxxx
title: xxxxxxxxxxxxxxxxxxxxxxxx
type: user_registry

```

4. Unpack the V5 configuration data onto the local filesystem.

Important: Migration on Windows 10

Windows has path length limits that can interfere with large extracts. It is recommended that you keep the initial path for migration on Windows as short as possible. The AMU must be run in a command window with administrative privileges on Windows. Running from a Linux VM on your Windows system may be a better option for doing migration.

- Copy the v5 extract tar file from the sftp server to the location where you have v10 migration utility installed.
- Run `apicm archive:unpack` command from the directory where you downloaded the v5 extract file.

```
./apicm archive:unpack <v5_extract_file>.tgz
```

When you invoke `apicm` for the first time, you are prompted to accept the license. Accept the license to continue.

You can optionally limit the unpack to only specific provider orgs. See [Table 1](#).

Table 1. `apicm archive:unpack` command options

Parameters	Description
<code>&lt;v5_extract_file&gt;</code>	Can be compressed file (.tgz, tar.gz) or uncompressed file (.tar). Use any file name of your choosing. Example: <code>./apicm archive:unpack v5_DBextract_data.tgz</code>
<code>--provider-orgs</code>	One or more provider orgs to unpack. This flag is optional. Use it when you want to unpack only specific provider orgs rather than the entire archive. Example: <code>./apicm archive:unpack v5_DBextract_data.tgz --provider-orgs=&lt;pOrg1_name&gt;</code> Use a comma-separated list to specify multiple provider orgs: <code>./apicm archive:unpack v5_archive_data.tgz --provider-orgs=&lt;pOrg1_name&gt;,&lt;pOrg2_name&gt;,&lt;pOrg3_name&gt;</code>

Note:

- Important:** Any Warnings or Errors that occur during `archive:unpack` should be investigated for remediation. See [Migration troubleshooting](#)
- You can avoid the license prompt by adding `--accept-license` to the command line.
- The unpack command ensures that catalog names and API properties contain only valid characters. Any invalid characters are mapped to '-'. See [Parity between Version 5 and Version 10](#).
- The unpack command issues warning messages for APIs and Products that fail validation against the OpenAPI specification. See the limitations section in [Migration considerations](#).
- For troubleshooting tips, see [Migration troubleshooting](#)
- The unpack command might return error messages related to PDUR, such as:

```

ERRO[3414] PDUR backup data for IDP PortalDelegatedIdentityProvider-123b81f8e4b06de411580e2e
(123b81f8e4b06de411580e2f) not provided: not found
ERRO[3414] PDUR backup data for IDP PortalDelegatedIdentityProvider-123b820de4b06de411580e32
(123b820ee4b06de411580e33) not provided: not found

```

If you are not migrating PDUR backup data, and your command did not include a `<pdur_user_export>.tgz`, the error indicates that you do in fact have a PDUR registry, and that you should have included a PDUR backup. Follow the migration instructions in [Migration steps with PDUR](#).

When the command completes, the data is unpacked to the `/cloud` directory. The `/cloud` directory is located in the same directory as `apicm`, and populated with yaml files representing the configuration objects in the export. The unpack processes produce output in the format required for v10 configuration.

Note: The unpack directory must be named `/cloud`. Do not rename the directory.

Example output in `/cloud` for `admin-org`:

```

cloud
├── admin-org

```

5. Remove unneeded configuration objects.

Inspect the set of configuration objects and their attributes, and remove the ones that are not needed. In many cases, some of the configuration objects present in the v5 system are not needed in the new v10 environment. For example, there is no value in preserving inactive users, obsolete apps, obsolete consumer organizations, and so on.

When deleting objects, make sure that you do not delete objects that have other dependent objects, such as products with subscriptions on them or users that are active. If you delete a consumer organization make sure you also delete all apps and subscriptions associated with that consumer org. Be aware of any groups that include these consumer orgs or visibility settings that include the consumer orgs.

6. Map v5 object names to v10 object names.

Most deployments adjust the names or quantities of gateway services, provider organizations, and user registries when setting up a new environment for v10. Be sure to specify any changed v10 destinations for the v5 data in a migration mapping file so that the migration utility can automatically move the data.

Complete the following, as needed. You can skip the steps for any objects that are unchanged from v5 to v10.

- a. [What is a mapping file?](#)
- b. [Mapping a gateway service](#)
- c. [Mapping a provider organization](#)

7. Optional: If your v10 deployment uses a **DataPower API Gateway**, convert the v5 API definitions to v10 DataPower® API Gateway. To convert API definitions using the default migration configuration, use the following syntax.

```
./apicm archive:port-to-apigw <path>
```

Important: Ensure that the DataPower Gateway version that you are using with your API Connect v10 deployment is compatible with the version of the migration utility that you are using. For details, see the version compatibility information in [Configuring and managing your server environment](#).  
Important: If you are running the migration utility in Windows, Administrator privileges are required to complete this step.

Table 2. Parameter for archive:port-to-apigw

Parameter	Description
<path>	<p>Specify the unpacked <code>cloud</code> directory as input:</p> <pre>./apicm archive:port-to-apigw /cloud</pre> <p>By specifying <code>/cloud</code>, <code>apicm</code> ports all artifacts within the directory, including APIs, Products, OAuth providers, custom policies, subscriptions and so on. Running a subsequent <code>archive:push</code> pushes all the artifacts to API Gateway.</p> <p>Running <code>archive:port-to-apigw</code> on any subdirectory within the unpacked <code>/cloud</code> directory could leave the directory in an inconsistent state, and cause the subsequent <code>archive:push</code> of artifacts to API Gateway to fail. Custom policies and OAuth providers are not migrated if a directory other than <code>/cloud</code> is specified.</p> <p>Note: However, if you decide to rewrite one API at a time, to migrate them to API Gateway, you can use:</p> <pre>./apicm archive:port-to-apigw &lt;path&gt;</pre> <p>where <code>&lt;path&gt;</code> is a single API file, or a directory that contains only APIs or Products. In this case, you cannot use <code>archive:push</code> to push artifacts to API Gateway. All the ported APIs and Products must be pushed (or imported) into API Manager by either the toolkit or UI.</p>

Usage notes:

- The conversion produces a draft output YAML file. Review the entire draft output YAML file for conformance, performance, and errors. Review the log files for messages about any manual actions that might be needed. For more information, see [Reviewing APIs converted to DataPower API Gateway](#).
- By default, all changes that the migration utility makes when rewriting APIs are logged as comments within the API YAML file. You can use the `enable-api-logging` parameter to disable logging of these changes.

```
./apicm archive:port-to-apigw <folder> --enable-api-logging=false
```

- You can also specify migration configuration parameters using either a YAML configuration file or from the command line, but not both. For information about configuration options and DataPower requirements for certain configuration parameters, see [Configuring migration options for DataPower API Gateway](#).
- Multiple runs of `./apicm archive:port-to-apigw` on the same `/cloud` folder will skip artifacts that have already been converted to DataPower® API Gateway.
- If your v10 deployment uses DataPower MultiProtocol Gateway (v5-compatible) you do not need to convert the API definitions.

8. Use `apicm` commands to push the Cloud Manager admin organization data onto your v10 Management Server.

a. Log in to the Cloud Manager on the destination v10 Management Server as an Owner of the admin organization:

Important: You must be logged in as an Owner of the admin organization to be able to migrate Cloud Manager admin organization data.

- Syntax:

```
./apicm login --server <cloud_manager_endpoint> --realm admin/identity_provider --username admin --password admin_password
```

- Example on API Connect v10 standalone

```
./apicm login --server cloud-admin-ui.mgmt.dev.apic10-stack.example.test --realm admin/default-idp-1 --username admin --password 'myadminpassword'
```

- Example on Cloud Pak for Integration

```
./apicm login --server cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod --realm admin/default-idp-1 --username admin --password 'XXXXXXXXXXXX'
```

The values to supply for the login parameters depend on whether your management server is deployed on API Connect v10 standalone or as part of Cloud Pak for Integration. See [Table 3](#) to review how to obtain each parameter.

Note: If you want to login using an OIDC user registry, see [Logging in to a management server with an OIDC registry](#).

Table 3. `apicm login` command parameters

Parameters	Description
------------	-------------

Parameters	Description						
<pre>--server &lt;cloud_manager_endpoint&gt;</pre>	<p>The endpoint on the management server for communication with the Cloud Manager user interface.</p> <p>v10 standalone Example:</p> <pre>cloud-admin-ui.mgmt.dev.apic10-stack.example.test</pre> <p>The endpoint was specified when the management subsystem was installed. View the <code>apiconnect_api</code> definition in the <code>apiconnect-up.yml</code> file in the API Connect v10 installation project directory that you created for initial deployment of v10. Examples:</p> <ul style="list-style-type: none"> <li>VMware: see the <code>cloud-admin-ui</code> endpoint in <a href="#">Deployment overview for endpoints and certificates</a>.</li> <li>Kubernetes: see the <code>admin</code> endpoint in <a href="#">Deployment overview for endpoints and certificates</a>.</li> </ul> <p>Cloud Pak for Integration Syntax:</p> <pre>&lt;cpd-APIC_namespace.your-company.domain.com&gt;/integration/apis/&lt;APIC_namespace&gt;/&lt;APIC_instance&gt;</pre> <p>Example:</p> <pre>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod</pre> <p>where <code>e2e</code> is <code>&lt;APIC_namespace&gt;</code> and <code>prod</code> is <code>&lt;APIC_instance&gt;</code>.</p> <p>Note: How to obtain the server parameter on Cloud Pak for Integration Use the Platform Navigator UI to determine the parameter. Note that you cannot get the endpoint by using <code>oc get routes</code> because Zen modifies the route internally.</p> <ol style="list-style-type: none"> <li>Locate the Platform UI panel with entries for the deployment. Identify the row that has a Type column entry with the description <b>API management administration</b></li> <li>To display the endpoint, hover over the entry in the Name column for that row. For example, hover over the <b>prod</b> entry, as shown in bold font, and the <b>URL</b> displays at the bottom of the panel.</li> </ol> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td><b>prod</b></td> <td>API management administration</td> </tr> <tr> <td>prod</td> <td>API management</td> </tr> </tbody> </table> <p><code>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod/admin</code></p> <ol style="list-style-type: none"> <li>Remove the trailing <code>/admin</code> from the endpoint, to obtain the parameter for the login command:</li> </ol> <pre>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod</pre>	Name	Type	<b>prod</b>	API management administration	prod	API management
Name	Type						
<b>prod</b>	API management administration						
prod	API management						
<pre>--realm admin/default-idp-1</pre>	<p>The <code>apicm login</code> example shows the expected <code>--realm</code> parameter values for a default API Connection administration organization. The default user is <code>admin</code> and the identity provider is <code>default-idp-1</code>. You can determine which identity provider to use in the <code>--realm</code> parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):</p> <pre>apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm</pre> <p>For example:</p> <pre>apic identity-providers:list --scope admin --server myserver.com --fields title,realm total_results: 2 results: - title: Cloud Manager User Registry   realm: admin/default-idp-1 - title: Corporate LDAP user registry   realm: admin/corporate-ldap</pre> <p>The <code>title</code> value should enable you to determine which identity provider to use; you can then copy the corresponding <code>--realm</code> parameter directly from the displayed <code>realm</code> value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is <code>default-idp-1</code>.</p>						
<pre>--username admin</pre>	<p>Administrative user with permissions to modify API Connect admin-org. The default user is <code>admin</code>.</p>						
<pre>--password myadminpassword</pre>	<p>Administrative user password. <b>Cloud Pak for Integration:</b> When you installed with the top-level CR for CP4I, the password was auto-generated. To obtain the password, see step 3 in <a href="#">Installing API Connect</a>:</p>						

b. Run `/apicm archive:push` to migrate data for the Cloud Manager administrative org (admin-org).

- Syntax

```
./apicm archive:push <cloud_manager_endpoint> <path_to_admin_org> [optional flags]
```

- Example for v10:

```
./apicm archive:push cloud-admin-ui.mgmt.dev.apic10-stack.example.test cloud/admin-org
```

- Example for Cloud Pak for Integration:

```
./apicm archive:push cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod cloud/admin-org
```

See [Table 4](#) to review how to obtain each parameter.

Tip: First run the command with the optional flag `--dry-run` to test for errors or warnings. Review the command parameters, examples and guidance that follow before you run it.

Table 4. `apicm archive:push` command parameters for admin org

Parameters	Description
<code>&lt;cloud_manager_endpoint&gt;</code>	<p>The endpoint on the management server for communication with the Cloud Manager user interface.</p> <p>v10 standalone Example:</p> <pre>cloud-admin-ui.mgmt.dev.apic10-stack.example.test</pre> <p>The endpoint was specified when the management subsystem was installed. View the <code>apiconnect_api</code> definition in the <code>apiconnect-up.yml</code> file in the API Connect v10 installation project directory that you created for initial deployment of v10. Examples:</p> <ul style="list-style-type: none"> <li>VMware: see the <code>cloud-admin-ui</code> endpoint in <a href="#">Deployment overview for endpoints and certificates</a>.</li> <li>Kubernetes: see the <code>admin</code> endpoint in <a href="#">Deployment overview for endpoints and certificates</a>.</li> </ul> <p>Cloud Pak for Integration Syntax:</p> <pre>&lt;cpd-APIC_namespace.your-company.domain.com&gt;/integration/apis/&lt;APIC_namespace&gt;/&lt;APIC_instance&gt;</pre> <p>Example:</p> <pre>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod</pre> <p>where <code>e2e</code> is <code>&lt;APIC_namespace&gt;</code> and <code>prod</code> is <code>&lt;APIC_instance&gt;</code>.</p> <p>See <a href="#">How to obtain the server parameter for Cloud Pak for Integration</a>.</p>
<code>&lt;path_to_admin_org&gt;</code>	Must be <code>cloud/admin-org</code> .
<code>--dry-run</code>	<p>Optional flag. You can test the Admin org migration output first view by using the <code>--dry-run</code> option.</p> <pre>./apicm archive:push &lt;cloud_manager_endpoint&gt; &lt;path_to_admin_org&gt; --dry-run</pre> <p>This option creates a project directory similar to <code>cloud</code>, titled <code>.workdir-&lt;apim_admin_server&gt;</code> where you can view how the data will be loaded into your new system. The option also displays the objects that will fail due to existing already or missing dependencies. Use this option to view the resolved URLs for where the data will be loaded, without creating resources on the new system. See <a href="#">apicm command line help</a>.</p>
<code>--apigw-only</code>	<p>Optional flag. Use when migrating to a DataPower API Gateway. For example:</p> <pre>./apicm archive:push &lt;cloud_manager_endpoint&gt; &lt;path_to_admin_org&gt; --apigw-only</pre>

Important: Usage notes:

- Run `./apicm archive:push` in the same directory where you ran `apicm archive:unpack`.
- If you run migration and observe error messages in your log output, you can take troubleshooting steps, and run the migration again. See [Migration troubleshooting](#).
- The `apicm` login obtains a token that expires after eight hours. If the token expires while `apicm archive:push` is running, `apicm` generates errors due to lack of the necessary access permissions. In this case, log in again and re-run `apicm archive:push`. The token is refreshed every time you log in. See also [Token expiration](#) in [Migration troubleshooting](#).
- An alternative method of viewing endpoints is to run `kubectl get ingress` and get the values from the output. For example, see the values in **bold** in the following sample output:

```
r7c221d8a33-apic-portal-director    api.portal.dev.apic10-stack.example.test    80, 443    21h
r7c221d8a33-apic-portal-web        portal.dev.apic10-stack.example.test        80, 443    21h
re314d70920-apiconnect-api         platform.mgmt.dev.apic10-stack.example.test  80, 443    22h
re314d70920-apiconnect-apim-ui     apim.mgmt.dev.apic10-stack.example.test     80, 443    22h
re314d70920-apiconnect-cm-ui       cloud.mgmt.dev.apic10-stack.example.test    80, 443    22h
re314d70920-apiconnect-consumer-api consumer.mgmt.dev.apic10-stack.example.test  80, 443    22h
rfe867a858b-dynamic-gateway-service service.gw.dev.apic10-stack.example.test    80, 443    21h
rfe867a858b-dynamic-gateway-service-gw api.gw.dev.apic10-stack.example.test        80, 443    21h
rfff5043330-analytics-client      ac.dev.apic10-stack.example.test           80, 443    21h
rfff5043330-analytics-ingestion   ai.dev.apic10-stack.example.test           80, 443    21h
```

#### 9. Migrate the API Manager provider organizations.

- If you have not already done so, create the provider organizations on your API Connect v10 deployment.
- Use `apicm` to log in to the API Manager user interface as an Owner of the provider organization that you want to migrate. If you want to login using an OIDC user registry, see [Logging in to a management server with an OIDC registry](#).

Important: You cannot migrate a provider organization while you are logged in with the Cloud Manager admin organization. You must be logged in as an Owner of the provider organization to be able to migrate that organization's data.

- Syntax:

```
./apicm login --server <api-manager-ui-endpoint> --realm provider/identity_provider --username org_owner --password org_password
```
- Example for API Connect v10:

```
./apicm login --server api-manager-ui.dev.apic10-stack.example.test --realm provider/default-idp-2 --username org_owner1@example.com --password myorgpassword
```
- Example for Cloud Pak for Integration:

```
./apicm login -server cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod --realm provider/default-idp-2 --username org_owner1@example.com --password myorgpassword
```

Table 5. `apicm login` parameters for logging in to provider orgs on API Connect v10 standalone

Parameters	Description
<pre>--server &lt;api- manager-ui- endpoint&gt;</pre>	<p>API Manager URL endpoint on the management server for communication with the API Manager user interface.</p> <p>API Connect v10 standalone</p> <p>For example:</p> <pre>api-manager-ui.dev.apic10-stack.example.test</pre> <p>The endpoint was specified when the management subsystem was installed. To verify your endpoint setting you can:</p> <ul style="list-style-type: none"> <li>View the <code>apiconnect-apim-ui</code> definition in the <code>apiconnect-up.yml</code> file in the API Connect v10 installation project directory.</li> <li>In the Cloud Manager UI, select Settings &gt; Endpoints and view <b>API Manager URL</b>.</li> </ul> <p>Cloud Pak for Integration</p> <p>Syntax (line-break is for table formatting only; your value will not include a line-break):</p> <pre>&lt;cpd-APIC_namespace.your-company.domain.com&gt;/integration/apis /&lt;APIC_namespace&gt;/&lt;APIC_instance&gt;</pre> <p>Example:</p> <pre>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod</pre> <p>where <code>e2e</code> is <code>&lt;APIC_namespace&gt;</code> and <code>prod</code> is <code>&lt;APIC_instance&gt;</code>.</p> <p>See <a href="#">How to obtain the server parameter for Cloud Pak for Integration</a>.</p>
<pre>--realm provider/ide ntity_provid er</pre>	<p>The <code>apicm login</code> example shows the expected <code>realm</code> parameter values for a default API Connection provider organization. The default user is <code>provider</code> and the identity provider is <code>default-idp-2</code>.</p> <p>You can determine which identity provider to use in the <code>--realm</code> parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):</p> <pre>apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm</pre> <p>For example:</p> <pre>apic identity-providers:list --scope provider --server myserver.com --fields title,realm total_results: 2 results: - title: Cloud Manager User Registry   realm: provider/default-idp-2 - title: Corporate LDAP user registry   realm: provider/corporate-ldap</pre> <p>The <code>title</code> value should enable you to determine which identity provider to use; you can then copy the corresponding <code>--realm</code> parameter directly from the displayed <code>realm</code> value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is <code>default-idp-2</code>.</p>
<pre>--username &lt;org_owner&gt;</pre>	<p>A user with permissions to modify the provider organization. Typically this is the owner of the organization.</p>
<pre>--password &lt;org_owner_p assword&gt;</pre>	<p>Organization owner password.</p>

c. Run `/apicm archive:push` to migrate data for the Provider organization.

- Syntax:

```
./apicm archive:push <api-manager-ui-endpoint> cloud/provider-orgs/<pOrg_name> [optional flags]
```

- Example on v10:

```
./apicm archive:push api-manager-ui.mgmt.dev.apic10-stack.example.test cloud/provider-orgs/production_Org
```

- Example on Cloud Pak for Integration

```
./apicm archive:push cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod cloud/provider-
orgs/production_Org
```

See [Table 6](#) to review how to obtain each parameter.

Tip: First run the command with the optional flag `--dry-run` to test for errors or warnings.

Table 6. `apicm archive:push` command parameters for Provider orgs

Parameters	Description
------------	-------------

Parameters	Description
<code>&lt;api-manager-ui-endpoint&gt;</code>	<p>API Manager URL endpoint on the management server for communication with the API Manager user interface.</p> <p>API Connect v10 standalone For example:</p> <pre>api-manager-ui.dev.apic10-stack.example.test</pre> <p>The endpoint was specified when the management subsystem was installed. To verify your endpoint setting you can:</p> <ul style="list-style-type: none"> <li>View the <code>apiconnect_api</code> definition in the <code>apiconnect-up.yml</code> file in the API Connect v10 installation project directory.</li> <li>In the Cloud Manager UI, select Settings_&gt; Endpoints and view <b>API Manager URL</b>.</li> </ul> <p>Cloud Pak for Integration Syntax (line-break is for table formatting only, your value will not include a line-break).</p> <pre>&lt;cpd-APIC_namespace.your-company.domain.com&gt;/integration/apis/APIC_namespace/&lt;APIC_instance&gt;</pre> <p>Example:</p> <pre>cpd-e2e.apps.test1.cp.example.com/integration/apis/e2e/prod</pre> <p>where <code>e2e</code> is <code>&lt;APIC_namespace&gt;</code> and <code>prod</code> is <code>&lt;APIC_instance&gt;</code>.</p> <p>See <a href="#">How to obtain the server parameter for Cloud Pak for Integration</a>.</p>
<code>cloud/provider-orgs/&lt;pOrg_name&gt;</code>	<p>The location of your Provider org within the <code>/cloud</code> file hierarchy you created when you ran <code>apicm archive:unpack</code>.</p> <pre>cloud/provider-orgs/production_Org</pre>
<code>--catalogs=&lt;name&gt;</code>	<p>Optionally, you can push data for only specified Catalogs if you don't want to push the entire Provider organization. Use this flag to specify the name of the Catalog you want to push:</p> <pre>./apicm archive:push &lt;api-manager-ui-endpoint&gt; cloud/provider-orgs/&lt;pOrg_name&gt; --catalogs=&lt;catalog_name&gt;</pre> <p>Note: Type the command on a single line. When a catalog is mapped, specify the mapped new catalog name.</p> <p>To specify multiple catalogs, use a comma-separated list:</p> <pre>./apicm archive:push &lt;api-manager-ui-endpoint&gt; cloud/provider-orgs/&lt;pOrg_name&gt; --catalogs=&lt;catalog_name1,catalog_name2,catalog_name3&gt;</pre> <p>Note: Type the command on a single line.</p>
<code>--dry-run</code>	<p>You can test the Provider org migration output first view by using the <code>--dry-run</code> option. This will create a project directory similar to <code>cloud</code>, titled <code>.workdir-&lt;apim_admin_server&gt;</code> where you can view how the data will be loaded into your new system. The option also displays the objects that will fail due to existing already or missing dependencies. Use this option to view the resolved URLs for where the data will be loaded, without creating resources on the new system. See <a href="#">apicm command line help</a>.</p> <pre>./apicm archive:push &lt;api-manager-ui-endpoint&gt; cloud/provider-orgs/&lt;pOrg_name&gt; --dry-run</pre> <p>Note: Type the command on a single line.</p>
<code>--no-drafts</code>	<p>Do not push any Draft APIs or Products. Draft objects are objects that have not been published.</p> <pre>./apicm archive:push &lt;cloud_manager_endpoint&gt; &lt;path_to_provider_org&gt; --no-drafts</pre> <p>Note: Type the command on a single line. This option can be used with or without <code>--catalogs=a,b,c</code>.</p>
<code>--overwrite</code>	<p>When this option is used, draft products, draft APIs, published products and their APIs, and OAuth Providers that are already on the v10 system will be overwritten. When this option is not used these artifacts will be skipped.</p>

Important: Usage notes

- Run `/apicm archive:push` in the same directory where you ran `apicm archive:unpack`.
- If you run migration and observe error messages in your log output, you can take troubleshooting steps, and run the migration again. See [Migration troubleshooting](#).
- The `apicm` login obtains a token that expires after eight hours. If the token expires while `apicm archive:push` is running, `apicm` generates errors due to lack of the necessary access permissions. In this case, log in again and re-run `apicm archive:push`. The token is refreshed every time you log in. See also [Token expiration in Migration troubleshooting](#).
- An alternative method of viewing endpoints is to run `kubectl get ingress` and get the values from the output. See [kubectl example](#).

10. When migration finishes, complete the following steps:

- If a user in a Local User Registry is owner of a Consumer Organization, the user must reset their password.
- If applicable, reapply any customized configurations from your v5 deployment. See [Customizations to recreate](#).
- Optional: If necessary, switch the provider organization ownership to the identity that owned it in v5.  
This step might be necessary if you created and migrated the provider organization using a different identity (such as administrative account) than the user identity of the v5 provider org. Note that the UI does not provide this function, but you can use the API `/orgs/{org}/transfer-owner` to switch ownership.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Logging in to a management server with an OIDC registry

Logging in with an OIDC registry involves several steps, in which you obtain a temporary token and pass it to the toolkit to ensure it can communicate securely with the management server.

Attention: If you want to log in using a non-OIDC registry, see the login steps in [Migration steps without PDUR](#) or [Migration steps with PDUR](#). To log in, complete the following steps:

1. Enter the following command on the command line:

```
apicm login --server mgmt_endpoint_url --sso
```

where `mgmt_endpoint_url` is the endpoint URL. When you log in with a Cloud admin or Provider organization, specify one of the following URLs:

- platform API endpoint URL
- management API manager URL

These endpoint URLs are configured during the installation of API Connect, as described in [Installing the Management subsystem into a Kubernetes environment](#) and [Deploying the Management subsystem in a VMware environment](#). If you have access to the Cloud Manager user interface, you can view the configured endpoint URLs as described in [Viewing platform and UI endpoints](#), ignoring any segments at the end of the displayed URLs. If you are not sure of the endpoint URL, ask your administrator.

2. When the toolkit prompts for the context, type `provider`:

```
Context? provider
```

3. The server responds with the following message:

```
Please copy and paste the url https://mgmt_endpoint_url/auth/manager/sign-in/?from=TOOLKIT to a browser to start the authentication process.
Do you want to open the url in default browser? [y/n]: y
```

Take one of the following actions:

- If you want to use your default browser to log in to API Manager, type `y` and press Enter. The API Manager sign-in page opens in a new browser tab.
- If you don't use to use your default browser, type `n` and press Enter.
  - Copy the URL from the command window.
  - Open a browser, paste the URL, and press Enter. The API Manager sign-in page displays.

4. On the API Manager sign-in page, select the OIDC registry and then log in to API Connect. After you log in, API Connect displays the "You are authenticated!" message and provides a temporary token. Copy the token.
5. Return to the command window. Paste the token at the `API Key?` prompt and press Enter.

When the token is validated and you are successfully logged in to the toolkit, the following message displays:

```
Logged into mgmt_endpoint_url successfully
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Converting APIs to DataPower API Gateway

You can convert API Connect v5-compatible APIs to v10 DataPower® API Gateway.

### Before you begin

---

Use the migration utility command `apicm archive:port-to-apigw` to convert v5-compatible APIs to DataPower API Gateway. For instructions on installing the migration utility, see [Installing the migration utility](#).

You can convert your API definitions as part of the migration workflow, or as a separate task. Use these instructions to convert YAML source files separately. For instructions on converting APIs during migration, see [Migration steps without PDUR](#).

The following steps are required before converting v5-compatible APIs to DataPower API Gateway. For detailed instructions on all of these tasks, see [Migration steps without PDUR](#).

- Download the latest IBM API Connect® Migration Utility (AMU) from [IBM® Fix Central](#). The migration utility requires Installer Version 5.0.0 or later. However, if you intend to use it to convert APIs, use Installer Version 7.0.1 or later.
- Ensure that the AMU version that you are using is supported by your versions of DataPower API Gateway and API Connect. For more information, see [Configuring migration options for DataPower API Gateway](#).
- Converting APIs using the migration utility requires Node version 14.20.0. Ensure that you have that version installed.
- Run `archive:unpack` to unpack the V5 dbextract into v5-compatible artifacts.
- Map v5 object names to v10 object names. If the names are preserved exactly between the v5 and v10 environments, this step can be skipped. The gateway service must be mapped to a DataPower API Gateway. For more information, see [Migration mapping files](#).

For information about the differences between gateway types available in API Connect, see [API Connect gateway types](#).

## About this task

The migration utility command `apicm archive:port-to-apigw` provides assistance in converting v5-compatible APIs to DataPower API Gateway, rather than full migration. It generates an output API that is supported on API Gateway v10.

The conversion process annotates the YAML file and logs with information regarding the artifacts that it attempts to convert. For cases where additional information is available or further action is required, the YAML input file and logs contain links to documentation.

Because of differences between the programming models of v5-compatible APIs and DataPower API Gateway APIs, the command might not be able to convert all items. You might need to port these items to the API Gateway. In these cases, messages generated by the `apicm archive:port-to-apigw` command provide links to documentation that provides more details about changes you must make for these items to be compatible with DataPower API Gateway.

## Procedure

Run the conversion command from the directory where you downloaded the utility.

Command syntax:

```
./apicm archive:port-to-apigw path
```

The path is the full path to the YAML file or directory. You can specify to convert a single YAML file or the contents of an entire directory.

The migration utility produces an output YAML file with the results of the conversion process.

## What to do next

Review the output YAML file and make any necessary changes to ensure that your APIs are compatible with DataPower API Gateway. For more information, see [Reviewing APIs converted to DataPower API Gateway](#).

Push the converted YAML files to the v10 deployment. For details, see [Migration steps without PDUR](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring migration options for DataPower API Gateway

If you are converting APIs to DataPower API Gateway, you can accept the default migration configuration or specify configuration parameters.

You can specify migration configuration parameters using either a YAML configuration file or from the command line, but not both. The `config.yml` file must be located in the same directory as the migration utility. You can specify to use this file when the migration utility is invoked using the `apicm` command with the `port-to-apigw` option, as in the following example.

```
./apicm archive:port-to-apigw <path> --use-config-file=true
```

If use of the configuration file is not specified, the migration utility uses parameters specified on the command line. If no parameters are specified, then the default parameters are used.

Some of these `port-to-apigw` configuration parameters depend upon a specific DataPower implementation to function. See the information in the following table to ensure that you have the correct version of DataPower for the parameters you want to use.

Table 1. Migration configuration options

Parameter	Valid values	DataPower version required	Description
<code>chunked-uploads</code>	<code>true</code> / <code>false</code> The default value is <code>false</code> .	For <code>invoke_1.5.0</code> : 10.0.1.1+, 10.0.2.0+  For <code>invoke_2.0.0</code> : 10.0.0.0+	If an <code>invoke_1.5.0</code> or <code>proxy_1.5.0</code> policy exists in an assembly in the API, then set <code>chunked-uploads</code> to <code>true</code> to enable chunked encoding for HTTP 1.1 requests to the target server.  If an <code>invoke_2.0.0</code> policy exists in an assembly after the migration, then set <code>chunked-uploads</code> to <code>false</code> explicitly for the policy, as the default value for <code>chunked-uploads</code> in API Gateway is <code>true</code> .

Parameter	Valid values	DataPower version required	Description
<code>client-id-header-override</code>	String. The string cannot contain spaces. Follow the guidelines for <code>apiKey</code> <code>name</code> : No default value.	10.0.0.0+	Override the existing <code>X-IBM-Client_Id</code> name value with the new value. In API Gateway, <code>x-key-type</code> makes it possible to define custom naming for <code>client_id</code> and <code>client_secret</code> .  Example: <pre>--client-id-header-override="acme-foo"</pre> In this example, the <code>securityDefinitions</code> property is changed from: <pre>foo:   type: apiKey   name: X-IBM-Client-Id   in: header</pre> to the following: <pre>foo:   type: apiKey   name: acme-foo   in: header   x-key-type: client_id</pre> Calls to this API must supply <code>acme-foo</code> : <client-id> in the request header instead of the original <code>X-IBM-Client-Id</code> : <client-id>.
<code>client-id-query-override</code>	String. The string cannot contain spaces. Follow the guidelines for <code>apiKey</code> <code>name</code> : No default value.	10.0.0.0+	Override the existing <code>client_id</code> name value with the new value. In API Gateway, <code>x-key-type</code> makes it possible to define custom naming for <code>client_id</code> and <code>client_secret</code> .  Example: <pre>--client-id-query-override="acme-foo"</pre> In this example, the <code>securityDefinitions</code> property is changed from: <pre>foo:   type: apiKey   name: client_id   in: query</pre> to the following: <pre>foo:   type: apiKey   name: acme-foo   in: query   x-key-type: client_id</pre> Calls to this API must supply <code>?acme-foo=&lt;client-id&gt;</code> in the query parameter instead of the original <code>?client_id=&lt;client-id&gt;</code> .
<code>client-secret-header-override</code>	String. The string cannot contain spaces. Follow the guidelines for <code>apiKey</code> <code>name</code> : No default value.	10.0.0.0+	Override the existing <code>X-IBM-Client-Secret</code> name value with the new value. In API Gateway, <code>x-key-type</code> makes it possible to define custom naming for <code>client_id</code> and <code>client_secret</code> .  Example: <pre>--client-secret-header-override="acme-foo"</pre> In this example, the <code>securityDefinitions</code> property is changed from: <pre>foo:   type: apiKey   name: X-IBM-Client-Secret   in: header</pre> to the following: <pre>foo:   type: apiKey   name: acme-foo   in: header   x-key-type: client_secret</pre> Calls to this API must supply <code>acme-foo</code> : <client-secret> in the request header instead of the original <code>X-IBM-Client-Secret</code> : <client-secret>.

Parameter	Valid values	DataPower version required	Description
<b>client-secret-query-override</b>	String. The string cannot contain spaces. Follow the guidelines for <b>apiKey name</b> : No default value.	10.0.0.0+	Override the existing <b>client_secret</b> name value with the new value. In API Gateway, <b>x-key-type</b> makes it possible to define custom naming for <b>client_id</b> and <b>client_secret</b> .  Example: <pre>--client-secret-query-override="acme-foo"</pre> In this example, the <b>securityDefinitions</b> property is changed from: <pre>foo:   type: apiKey   name: client_secret   in: query</pre> to the following: <pre>foo:   type: apiKey   name: acme-foo   in: query   x-key-type: client_secret</pre> Calls to this API must supply <b>?acme-foo=&lt;client-secret&gt;</b> in the query parameter instead of the original <b>?client_secret=&lt;client-secret&gt;</b> .
<b>copy-id-headers-to-message</b>	<b>true / false</b> The default value is <b>false</b> .	10.0.1.1+, 10.0.2.0+	When set to <b>true</b> , the <b>client-id</b> header is copied from <b>request.headers</b> to <b>message.headers</b> to be passed to the backend server. Set this parameter to <b>true</b> if your invoke backend services expect the <b>client-id</b> to be passed through.
<b>custom-policies-scope</b>	<b>catalog / global</b> The default value is <b>catalog</b> .	10.0.0.0+	When set to <b>catalog</b> , the original v5 or v5-compatible catalog that contains the custom policy is staged for pushing to the target catalog and organization in API Gateway.  When set to <b>global</b> , the custom policy is staged for pushing to API Gateway and is visible to all organizations and catalogs within that gateway.  <b>archive:port-to-apigw</b> sets up the custom policies for pushing to API Gateway, but does not do the pushing. If <b>global</b> scope is used, <b>archive:push</b> of the admin organization will push all custom policies associated with the configured gateways. If <b>catalog</b> scope is used, then the <b>archive:push</b> of the admin organization will initialize the custom policies on the gateway. A subsequent <b>archive:push</b> of the provider organization is needed to advertise the custom policies in the catalogs contained within the provider organization.  Note: Potential conflicts between custom policies of the same name and version are resolved according to the following rules: <ul style="list-style-type: none"> <li>When set to <b>global</b> and two policies under the same gateway service have the same name, version, and md5 hash value, then the duplicates are discarded and a message is generated.</li> <li>When set to <b>global</b> and two policies under the same gateway service have the same name, version, and a differing md5 hash value, then global scope cannot be applied. Catalog scope is used and a warning is generated.</li> <li>When set to <b>catalog</b>, <b>&lt;orgname&gt;_&lt;catname&gt;_</b> is appended to the zip filename to maintain uniqueness.</li> </ul>
<b>deploy-policies</b>	Any combination of the following values: <b>gatewayscript_1.0.0</b> , <b>if_1.5.0</b> , <b>invoke_1.5.0</b> , <b>proxy_1.5.0</b> , <b>redact_1.5.0</b> , <b>switch_1.5.0</b> , <b>validate-usertoken_1.0.0</b> , <b>xslt_1.0.0</b> The default values are: <b>if_1.5.0</b> , <b>invoke_1.5.0</b> , <b>proxy_1.5.0</b> , <b>redact_1.5.0</b> , <b>switch_1.5.0</b> , <b>validate-usertoken_1.0.0</b> , <b>xslt_1.0.0</b>	For <b>invoke_1.5.0</b> , <b>proxy_1.5.0</b> , <b>gatewayscript_1.0.0</b> , and <b>xslt_1.0.0</b> : 10.0.0.0+  For <b>if_1.5.0</b> and <b>switch_1.5.0</b> : 10.0.1.1+, 10.0.2.0+  For <b>redact_1.5.0</b> : 10.0.3.0+  For <b>validate-usertoken_1.0.0</b> : 10.0.1.3+, 10.0.2.0+	Defines which backwards-compatible policies should be advertised by DataPower to API Manager.  Note: Any legacy policies that are specified in the <b>config.yml</b> file or by using the <b>apicm</b> command must also be specified by using <b>deploy-policies</b> . If these policies are not specified by using <b>deploy-policies</b> , an error is returned.
<b>emulate-v4-plan-rate-limit</b>	<b>true / false</b> The default value is <b>false</b> .	10.0.1.2+, 10.0.2.0+	Determines whether all APIs emulate the v4 plan rate limit. If set to <b>true</b> , then API operations do not share the rate limit. This setting matches the behavior of the <b>x-ibm-gateway-emulate-v4-plan-rate-limit</b> v5 option.
<b>enable-api-logging</b>	<b>true / false</b> The default value is <b>true</b> .	10.0.0.0+	Log all changes that the migration utility makes when rewriting APIs. These changes are logged as comments in the API YAML file.

Parameter	Valid values	DataPower version required	Description
<b>enforce-required-params</b>	<b>true / false</b> The default value is <b>false</b> .	10.0.1.1+, 10.0.2.0+	When set to <b>true</b> , required parameters are enforced, which is the default behavior in API Gateway. When set to <b>false</b> , required parameters are not enforced, even if the required parameter checkbox selected.
<b>gatewayscript-policy</b>	One of the following values: <b>gatewayscript_1.0.0</b> , <b>gatewayscript_2.0.0</b> The default value is <b>gatewayscript_2.0.0</b> .	10.0.0.0+	Defines which gatewayscript policy the migration utility uses when rewriting the API assembly.  <b>gatewayscript_1.0.0</b> : A user-defined policy created by the migration utility. This policy uses the v5 MPGW processing rule. Use <b>gatewayscript_1.0.0</b> if the gatewayscript policy is dependent on v5 MPGW capabilities, such as load balancer groups or XML Manager settings.  <b>gatewayscript_2.0.0</b> : The migration utility rewrites the existing API to gatewayscript 2.0.0. This policy supports the <b>header-metadata</b> module for compatibility with the DataPower® Gateway (v5 compatible).  Specifying <b>gatewayscript_2.0.0</b> can cause migration errors or run-time errors. Use <b>gatewayscript_2.0.0</b> if you are able to review and verify all changes made by the migration utility in the API YAML file.
<b>if-policy</b>	One of the following values: <b>if_1.5.0</b> , <b>switch_2.0.0</b> The default value is <b>if_1.5.0</b> .	For <b>if_1.5.0</b> : 10.0.1.1+, 10.0.2.0+  For <b>switch_2.0.0</b> : 10.0.0.0+	Defines which <b>if</b> policy the migration utility uses when rewriting the API assembly.  <b>if_1.5.0</b> : The migration utility rewrites the existing API to if 1.5.0.  <b>switch_2.0.0</b> : The migration utility rewrites the existing API to switch 2.0.0. Specifying <b>switch_2.0.0</b> can cause migration errors or run-time errors. Use <b>switch_2.0.0</b> if you are able to review and verify all changes made by the migration utility in the API YAML file.
<b>invoke-policy</b>	One of the following values: <b>invoke_1.5.0</b> , <b>invoke_2.0.0</b> The default value is <b>invoke_1.5.0</b> .	10.0.0.0+	Defines which invoke policy the migration utility uses when rewriting the API assembly.  <b>invoke_1.5.0</b> : The migration utility rewrites the existing API to invoke 1.5.0.  <b>invoke_2.0.0</b> : The migration utility rewrites the existing API to invoke 2.0.0. Specifying <b>invoke_2.0.0</b> can cause migration errors or run-time errors. Use <b>invoke_2.0.0</b> if you are able to review and verify all changes made by the migration utility in the API YAML file.
<b>no-rename</b>	<b>true / false</b> The default value is <b>false</b> .	10.0.0.0+	Defines whether to append the <b>-apigw</b> suffix to artifact file names or within artifacts. When set to <b>false</b> , the files are renamed using the <b>-apigw</b> suffix and the original unpacked v5c files are also overwritten with the ported API Gateway artifacts.  A <b>y/n</b> prompt appears when using this option. To bypass this prompt, use the <b>--accept-no-rename-deletion</b> option.
<b>no-retitle</b>	<b>true / false</b> The default value is <b>false</b> .	10.0.0.0+	Defines whether to append the <b>-apigw</b> suffix to the <b>title</b> of the migrated API, product, or OAuth provider. Set this option to <b>true</b> if you want the <b>title</b> of the migrated API, product, or OAuth provider to match the original <b>title</b> in the v5-compatible YAML file.  Note that the <b>x-ibm-name</b> of API Gateway APIs and products always includes the <b>-apigw</b> suffix. The <b>no-retitle</b> option applies only to the <b>title</b> .
<b>optimize-gws</b>	<b>true / false</b> The default value is <b>false</b> .	10.0.0.0+	When set to <b>true</b> , gatewayscript policies are modified to map v5 functions to API Gateway functions.  Setting <b>optimize-gws</b> to <b>true</b> is valid only for the <b>gatewayscript_2.0.0</b> policy. If it is set to <b>true</b> for <b>gatewayscript_1.0.0</b> , an error is generated.  Note: Setting <b>optimize-gws</b> to <b>true</b> can result in performance enhancements. However, the modifications to gatewayscript policies by the migration utility can cause problems. When using this setting, review all gatewayscript policy modifications after migration.
<b>proxy-policy</b>	One of the following values: <b>proxy_1.5.0</b> , <b>invoke_2.0.0</b> The default value is <b>proxy_1.5.0</b> .	10.0.0.0+	Defines which proxy policy the migration utility uses when rewriting the API assembly.  <b>proxy_1.5.0</b> : The migration utility rewrites the existing API to <b>proxy_1.5.0</b> .  <b>invoke_2.0.0</b> : The migration utility converts the proxy policy to invoke 2.0.0. Specifying <b>invoke_2.0.0</b> can cause migration errors or run-time errors. Use <b>invoke_2.0.0</b> if you are able to review and verify all changes made by the migration utility in the API YAML file.
<b>redact-policy</b>	One of the following values: <b>redact_1.5.0</b> , <b>redact_2.0.0</b> The default value is <b>redact_1.5.0</b> .	10.0.3.0+	Defines which redact policy the migration utility uses when rewriting the API assembly.  <b>redact_1.5.0</b> : The migration utility rewrites the existing API to <b>redact_1.5.0</b> .  <b>redact_2.0.0</b> : The migration utility rewrites the existing API to <b>redact_2.0.0</b> . Specifying <b>redact_2.0.0</b> can cause migration errors or run-time errors, including changes to what is redacted, particularly with redactions meant for JSON payloads. Use <b>redact_2.0.0</b> if you are able to review and verify all changes made by the migration utility in the API YAML file.
<b>repair-wsdl-apis</b>	<b>true / false</b> The default value is <b>true</b> .	10.0.1.1+, 10.0.2.0+	If an API ported from V5 is created from WSDL, the WSDL is read and checked for accuracy. If <b>repair-wsdl-apis</b> is set to <b>true</b> , then the API and WSDL are automatically repaired. For example, if the WSDL ZIP file contains unnecessary files, they are automatically removed if <b>repair-wsdl-apis</b> is <b>true</b> .
<b>return-v5-responses</b>	<b>true / false</b> The default value is <b>false</b> .	10.0.1.1+, 10.0.2.0+	When set to <b>true</b> , OAuth-related messages are printed in the v5 response format. When set to <b>false</b> , OAuth-related response messages are printed in API Gateway response format.
<b>switch-policy</b>	<b>switch_1.5.0</b> , <b>switch_2.0.0</b> The default value is <b>switch_1.5.0</b> .	For <b>switch_1.5.0</b> : 10.0.1.1+, 10.0.2.0+  For <b>switch_2.0.0</b> : 10.0.0.0+	Defines which switch policy the migration utility uses when rewriting the API assembly.  <b>switch_1.5.0</b> : The migration utility rewrites the existing API to switch 1.5.0.  <b>switch_2.0.0</b> : The migration utility rewrites the existing API to switch 2.0.0. Specifying <b>switch_2.0.0</b> can cause migration errors or run-time errors. Use <b>switch_2.0.0</b> if you are able to review and verify all changes made by the migration utility in the API YAML file.

Parameter	Valid values	DataPower version required	Description
<code>use-config-file</code>	<code>true / false</code> The default value is <code>false</code> .	10.0.0.0+	Use the <code>config.yml</code> file that is in the same directory as the <code>apicm</code> binary file that is being executed. If this file is used, configuration options cannot be set using the command line. The purpose of the config file is to specify the command inputs given on this page, but in an easy-to-read file format (YAML).
<code>v5-request-headers</code>	<code>true / false</code> The default value is <code>true</code> .	10.0.1.2+, 10.0.2.0+	When set to <code>true</code> , the following v5-compatible request headers are set: <code>Via</code> , <code>X-Global-Transaction-ID</code> , <code>X-Client-IP</code> . When set to <code>false</code> , these request headers are not set.
<code>validate-username-token-policy</code>	<code>validate-username-token_1.0.0</code> The default value is empty.	10.0.1.3+, 10.0.2.0+	Defines whether or not to use the <code>validate-username-token</code> v5 emulation policy when the migration utility rewrites the API assembly. When empty, the migration utility takes no action on the policy.
<code>xslt-policy</code>	One of the following values: <code>xslt_1.0.0</code> , <code>xslt_2.0.0</code> The default value is <code>xslt_1.0.0</code> .	10.0.0.0+	Defines which gatewayscript policy the migration utility uses when rewriting the API assembly.  <code>xslt_1.0.0</code> : A user-defined policy created by the migration utility. This policy uses the v5 MPGW processing rule. Use <code>xslt_1.0.0</code> if the xslt policy is dependent on v5 MPGW capabilities, such as load balancer groups or XML Manager settings.  <code>xslt_2.0.0</code> : The migration utility rewrites the existing API to xslt 2.0.0. Specifying <code>xslt_2.0.0</code> can cause migration errors or run-time errors. Use <code>xslt_2.0.0</code> if you are able to review and verify all changes made by the migration utility in the API YAML file.

## Example migration configurations

The following examples show configuration options using the `config.yml` file or the `apicm` command.

- The following example uses the `config.yml` file to specify the migration configuration.

```

deploy-policies:
- proxy_1.5.0
- redact_1.5.0
- invoke_1.5.0
- xslt_2.0.0
- gatewayscript_1.0.0
- switch_2.0.0
rewrite-apis:
  enable-api-logging: false
  proxy-policy: proxy_1.5.0
  redact-policy: redact_1.5.0
  invoke-policy: invoke_1.5.0
  xslt-policy: xslt_2.0.0
  gatewayscript-policy: gatewayscript_1.0.0
  if-policy: switch_2.0.0
  switch-policy: switch_2.0.0
  optimize-gws: false
  no-retitle: true

```

Use the `use-config-file` parameter when running the `apicm` command to specify that the `config.yml` file is used for migration configuration values.

```
./apicm archive:port-to-apigw <path> --use-config-file=true
```

- The following example uses the `apicm` command to specify the same settings as in the previous example.

```

./apicm archive:port-to-apigw <path> --deploy-
policies="proxy_1.5.0,redact_1.5.0,invoke_1.5.0,xslt_2.0.0,gatewayscript_1.0.0,switch_2.0.0" --enable-api-logging=false --
proxy-policy="proxy_1.5.0" --redact-policy="redact_1.5.0" --invoke-policy="invoke_1.5.0" --xslt-policy="xslt_2.0.0" --
gatewayscript-policy="gatewayscript_1.0.0" --if-policy="switch_2.0.0" --switch-policy="switch_2.0.0" --optimize-gws=true --
no-retitle=true

```

- The following example uses the `apicm` command to specify that the default migration configuration values are used.

```
./apicm archive:port-to-apigw <path>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Reviewing APIs converted to DataPower API Gateway

The migration utility command `apicm archive:port-to-apigw`, which assists in the conversion of v5 APIs for use with the v10 DataPower® API Gateway, provides draft output YAML files containing the results of the conversion process.

### Procedure

- Review the entire output YAML files for conformance, performance, and errors.  
The conversion process annotates the YAML file and logs with information regarding the artifacts that are converted. For cases where additional information is available or further action is required, the YAML file and logs contain links to documentation.
- Make any necessary changes to port APIs to DataPower API Gateway.

- [Messages generated during conversion of APIs to DataPower API Gateway](#)

Reference information about the messages generated by the migration utility command `apicm archive:port-to-apigw`.

- [Parse actions added to the API assembly after migration](#)

The migration utility command `apicm archive:port-to-apigw` adds parse actions to the API assembly depending on the policies specified in your migration configuration.

- [Fine-tuning APIs after migration](#)

After running the migration utility command `apicm archive:port-to-apigw`, review the converted APIs to determine if any of the changes made by the migration utility can be modified to enhance performance and usability.

- [Frequently asked questions about migrating to API Gateway](#)

Answers to some of the most frequently asked questions about migrating APIs to API Gateway.

**ACT01 Converted `activity-log` policy to API Gateway `activity-log` policy.**

### Explanation

An `activity-log` policy was found. The API Gateway activity log is not a policy and is provided in the base API configuration.

### Response

Review the activity log configuration to ensure that the activity logging is consistent with the v5 API.

### Severity

info

**ACT02 Removed `title` property from `activity-log` policy to conform to the API Gateway specification.**

#### Explanation

An `activity-log` policy was found. The API Gateway activity log is not a policy and is provided in the base API configuration.

#### Response

Review the activity log configuration to ensure that the activity logging is consistent with the v5 API.

#### Severity

info

**ACT03 Removed `version` property from `activity-log` policy to conform to the API Gateway specification.**

#### Explanation

An `activity-log` policy was found. The API Gateway activity log is not a policy and is provided in the base API configuration.

#### Response

Review the activity log configuration to ensure that the activity logging is consistent with the v5 API.

#### Severity

info

**ACT04 More than one `activity-log` policy was found. Only the first `activity-log` policy found will be used.**

#### Explanation

The first `activity-log` policy on the mainline assembly flow is used to populate the API `activity-log` settings. Any subsequent `activity-log` policy on the mainline assembly flow will be ignored.

#### Response

Review the v5 API to ensure that the desired activity log configuration will be used.

#### Severity

error

**ACT05 An `activity-log` policy was found within a conditional policy. Only the first `activity-log` policy found on the mainline assembly flow will be used. Review the `activity-log` settings for conformance.**

#### Explanation

Any `activity-log` policy found within a conditional policy such as an `operation-switch`, `switch`, or `if` policy will be ignored.

#### Response

Review the v5 API to ensure that the desired activity log configuration will be used.

#### Severity

error

**ACT08 Removed `description` property from `activity-log` policy to conform to the API Gateway specification.**

#### Explanation

See message text.

#### Severity

**API01** The specified API YAML input file is of gateway type `datapower-api-gateway`. This utility accepts only v5-compatible APIs of gateway type `datapower-gateway`.

#### Explanation

The input API YAML file must be of gateway type `datapower-gateway`. If the gateway type is `datapower-api-gateway`, the API does not need to be converted. Any other gateway type is not supported.

#### Response

Review your input file to confirm that it is v5 compatible.

#### Severity

error

**API02** Input API policy is already version 2.0.0. This version is reserved for API Gateway policies only. Skipping conversion of this policy.

#### Explanation

The input API YAML file must be of gateway type `datapower-gateway`. Every policy within that API must be version 1.0.0. Version 2.0.0 policies are reserved for the API Gateway, which should be included only in APIs with gateway type `datapower-api-gateway`. No conversion is performed for this policy.

**Severity**

error

**API03 Suffix `%s` appended to API `title` and `x-ibm-name`.**

**Explanation**

As the v5 and API Gateway policy can reside in the same API Manager, a suffix can be provided to ensure a unique name of the API Gateway version of the v5 API.

**Response**

Consider incrementing the API version to accommodate converting to the API Gateway.

**Severity**

info

**API04 Added missing `/` to the front of the basepath.**

**Explanation**

A v5 API with a `basepath` property value that does not start with a / will have the character / added at the beginning of the `basepath` property of the API Gateway.

**Severity**

info

**API05 Trailing slashes (`/`) removed from the basepath to conform to the API Gateway specification.**

**Explanation**

A v5 API with a `basepath` property value that is not a / but ends with the / character will have the ending / character removed in the `basepath` property of the API Gateway.

**Response**

Calls to the API might need to be updated to conform to the new basepath.

**Severity**

warn

**API06 Changed gateway type to `datapower-api-gateway`.**

**Explanation**

See message text.

**Severity**

info

**API07 Moved `assembly request` into `assembly execute`.**

**Explanation**

Older v5 APIs might include the `execute` property within an assembly `request` property. This `execute` property is moved to the API Gateway `assembly` property.

**Severity**

info

**API08 Moved `assembly implementation` into `assembly execute`.**

**Explanation**

Older v5 APIs might include the `execute` property within an assembly `implementation` property. This `execute` property is moved to the API Gateway `assembly` property.

**Severity**

info

**API09 Moved `assembly response` into `assembly execute`.**

**Explanation**

Older v5 APIs might have the `execute` property within an assembly `response` property. This `execute` property is moved to the API Gateway `assembly` property.

**Severity**

info

**API10 Removed `x-ibm-gateway-invoke-v4-nomap-emulation` API property and replaced it with a `gatewayscript` policy to conform to the API Gateway specification.**

#### Explanation

This v5 API property applies only to the `invoke` policy. In API Gateway, this property has been replaced by a `gatewayscript` policy that will modify the `invoke` policy response in a similar fashion.

#### Severity

warn

**API11 The API property `x-ibm-gateway-sourcecode-resolve-apic-variables` does not exist in the API Gateway. The property has been removed from the YAML file.**

#### Explanation

This v5 API property is not supported by the API gateway and has been removed. If the `x-ibm-gateway-map-resolve-apic-variables` property is not set, then the original value of this property will be set into the map option `mapResolveApicVariables` automatically.

#### Severity

error

**API12 The API property `x-ibm-gateway-reencode-request-params-slash` does not exist in the API Gateway. The property has been removed from the YAML file.**

#### Explanation

This v5 API property only applies to the `invoke` and `proxy` policies. In the API Gateway, the functionality of this property has been implemented as an option in the `invoke` policy.

This change was made for the following reasons.

- The option is now clearly visible in the `invoke` policy, making it easy to identify available options.
- Each use of the `invoke` policy can now have a different setting.

#### Severity

error

**API13 The API property `x-ibm-gateway-framework-legacy-json-encoding` does not exist in the API Gateway. The property has been removed from the YAML file.**

#### Explanation

The `x-ibm-gateway-framework-legacy-json-encoding` property is not supported by the API Gateway.

#### Severity

error

**API14 Converted v5-compatible policies to the API Gateway and updated policy versions to 2.0.0.**

#### Explanation

See message text.

#### Severity

info

**API15 The `x-ibm-gateway-api-enforce-response-limits` API property is enabled. Appended `parse` policy to the end of the assembly to parse the JSON response.**

#### Explanation

The v5 API property `x-ibm-gateway-api-enforce-response-limits` ensures that a JSON response payload is within the defined JSON parser limits. This functionality is emulated in API Gateway by adding a `parse` policy at the end of the assembly.

#### Severity

info

**API16 Removed the `x-ibm-gateway-api-enforce-response-limits` API property and replaced it with a `parse` policy to conform to the API Gateway specification.**

#### Explanation

The v5 API property `x-ibm-gateway-api-enforce-response-limits` ensures that a JSON response payload is within the defined JSON parser limits. This functionality is emulated in API Gateway by replacing it with a `parse` policy.

## Severity

info

**API17 Setting `x-ibm-soap` to `%s`.**

## Explanation

The v5 API path does not have a `x-ibm-soap` property with a `soap-action` child property, but the schema referenced by this path is for a SOAP document. The `x-ibm-soap` property is added with a child property of `soap-action` into this path of the API gateway. The `soap-action` property will be determined from the schema encountered.

## Severity

info

**API18 This `set-variable` policy is used to add the client identification header to the message headers for use by a subsequent `invoke` policy.**

## Explanation

Typically, the client identification header as defined by the security definition is `x-IBM-Client-Id`. This header will be removed from the message headers at the start of the API. A `set-variable` policy will add this header back into the message headers, as the v5 API specifies not to suppress this header from being sent by subsequent `invoke` policies.

## Severity

info

**API19 Skipping appending of a `parse` policy for the `x-ibm-gateway-api-enforce-response-limits` API property, as this `parse` policy already exists at the end of the assembly and contains the same `input` and `output` values.**

## Explanation

See message text.

## Severity

info

**API20 Added `parse` policy to the beginning of the assembly to parse incoming data.**

## Explanation

The v5-compatible implementation implicitly parses messages. However, by requiring explicit parsing for every assembly wherever parsing is required, the API Gateway provides greater control over when and how parsing is performed.

The `parse` policy is added in API Gateway for the following purposes.

- To explicitly control when parsing occurs.
- To determine which threat protection settings to apply to a parse.
- To determine which kinds of output to allow.
- To determine how to gather metadata from the parse.

By separating the parsing time from the processing time of the assembly, explicit parsing can also enhance performance.

API Gateway has no implicit parsing. The assembly must explicitly parse when parsing is desired, which ensures that the correct limits and input checks are done.

## Response

You should retain the added `parse` policy for any of the following reasons.

- You need non-well-formed XML or JSON documents to abort and call the `catch`.
- The data is still streaming and you need to keep a copy of the data for various reasons.
- You need to use the payload data with another policy.

If you do not need the `parse` policy, remove it. If you retain the `parse` policy, consider the following questions.

- Which threat protection settings do you want to enforce with this `parse` policy?
- Does the use of this `parse` policy remove the need for an additional `parse` policy?
- Do you want to use the metadata from the parse, such as document size and complexity?

## Severity

info

**API21 Moved catalog specific `x-ibm-gateway-\*` API Property: `%s` under catalog: `%s` to API level for further processing.**

## Explanation

`x-ibm-gateway` catalog-level properties are not supported in API Gateway. The properties have been moved to the top-level properties section in the API for further processing by the migration utility.

## Severity

info

**API22 Skipped adding `parse` policy since an adjacent parse of the same properties was already added.**

**Explanation**

The `invoke` policy might add a `parse` policy next to it in the assembly. If this `parse` policy is detected, another parse is not added because it would result in duplicate parses in the assembly. This prevention of duplicate parses applies only if both parses are found to have the same properties.

**Severity**

info

**API23 Removed redundant `parse` policy from end of the assembly.**

**Explanation**

The tool added a duplicate `parse` policy to the end of the assembly. The duplicate policy has been removed as it performs the same action as another `parse` policy in the assembly.

**Severity**

info

**API24 Removed redundant `parse` policy from the beginning of the assembly.**

**Explanation**

The tool added a duplicate `parse` policy to the beginning of the assembly. The duplicate policy has been removed as it performs the same action as another `parse` policy in the assembly.

**Severity**

info

**API25 Removed unsupported `name` property from the Swagger info property.**

**Explanation**

An empty `name` property under the `info` property is not supported in API Gateway. If an API is published with an empty `name` property, an error is generated. Therefore, the migration utility removes the empty `name` property if it is found.

**Severity**

info

**API26 Removed empty `description` property from the Swagger info property.**

**Explanation**

An empty `description` property is not supported in API Gateway. If an API is published with an empty `description` property, an error is generated. Therefore, the migration utility removes the empty `description` property if it is found.

**Severity**

info

**API27 Removed empty `security` property from the Swagger file.**

**Explanation**

An empty object `security` property is not supported in API Gateway. If an API is published with an empty object `security` property, an error is generated. Therefore, the migration utility removes the empty object `security` property if it is found.

**Severity**

info

**API28 Moved `%s` from API properties to this policy option `%s` and set to [%s].**

**Explanation**

In the API Gateway, the functionality of this property has been implemented as a policy option.

**Severity**

info

**API29 Preserved API Property `%s` in YAML.**

**Explanation**

The API property was preserved because there is a 1.0.0 or 1.5.0 policy that requires it.

### Severity

info

### API30 Removed API Property ` %s ` from YAML.

### Explanation

This property is obsolete and has been removed from the YAML file.

### Severity

info

### API31 The API property ` x-ibm-gateway-custom-policy-with-gws-action ` does not exist in the API Gateway. The property has been removed from the YAML file.

### Explanation

In v10, this property is not required to control the behavior of a custom policy that includes a GatewayScript action, as both `true` and `false` scenarios are handled as expected.

### Severity

error

### API32 The ` \$ref %s ` was not found in the swagger.

### Explanation

A `$ref` could not be dereferenced because the reference content was not found in the v5 YAML.

### Response

Review the v5 file to confirm that the `$ref` references are valid and exist in the YAML.

### Severity

warn

### API33 Found usage of inline parameters: ` %s ` in ` %s ` policy.

### Explanation

API Gateway does not support inline parameters in the GatewayScript 2.0.0 or XSLT 2.0.0 policies.

### Response

Modify the policy to use context variables instead of inline parameters. The following tables show examples of inline parameters in v5 and how they can be rewritten to use context variables in API Gateway.

Table 1. GatewayScript 2.0.0 examples

v5	API Gateway
If <code>test.data</code> is a variable: <code>\$(test.data)</code>	<code>context.get('test.data');</code>
If <code>test.body</code> is a message: <code>\$(test.body)</code>	<code>context.getMessage('test').body;</code>
<code>{test.example}</code>	<code>context.get('request.parameters.test.example')</code>

For more GatewayScript 2.0.0 examples, see [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway.](#)

Table 2. XSLT 2.0.0 example

v5	API Gateway
<code>\$(request.parameters.example)</code>	<code>apigw:get-variable('request.parameters.example')</code> Note: Be sure to use the <code>apigw</code> namespace.
<code>{example}</code>	<code>apigw:get-variable('request.parameters.example')</code>

For more XSLT 2.0.0 examples, see [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway.](#)

### Severity

error

### API34 Found ` x-ibm-gateway-\* ` catalog specific property: ` %s ` under catalog section: ` %s `, within an unpublished API.

### Explanation

The API was most likely found under the drafts folder of an organization. Because it is not published to a specific catalog, the migration utility cannot determine which API to apply the properties to.

### Response

Apply the `x-ibm-gateway-*` properties to the policies of the assembly manually before publishing.

### Severity

info

**API35 Found `x-ibm-gateway-\*` catalog specific property: `%s` under catalog section: `%s`. This API is published under catalog: `%s`**

### Explanation

The API is published to a specific catalog, and other catalog-specific `x-ibm-gateway-*` properties were found under other catalogs.

### Response

If you want to move this API to other catalogs, apply these properties manually to the policies in the assembly.

### Severity

info

**API36 `x-ibm-gateway-\*` API Property: `%s` found to have invalid value: `%s`.**

### Explanation

See message text.

### Response

Check the API to ensure that the API property has the correct value. For more information on the API property, see the appropriate section of the IBM API Connect Knowledge Center.

### Severity

error

**API37 JSON Schema contains an invalid reference.**

### Explanation

See message text.

### Response

Confirm that your schema definitions are valid. If you find errors, fix them.

### Severity

info

**API38 XSD generation ignoring references beyond limit set by property.**

### Explanation

XSD generation from JSON schema uses the `x-ibm-gateway-schema-definition-reference-limit` property value to determine how many recursions to go in circular references.

### Response

### Severity

info

**API39 An error occurred while generating the XSD for `%s` definition.**

### Explanation

See message text.

### Response

Confirm that your JSON schema is valid before continuing.

### Severity

warn

**API40 Skipping JSON Schema definition: `%s` with multiple roots or not intended for XML data.**

### Explanation

See message text.

## Severity

info

**API41 Set `chunked-uploads` value to `false` to emulate v5 behavior.**

## Explanation

For information about the Allow chunked uploads property in the Invoke policy, see [Invoke](#).

## Severity

info

**API42 Input option `chunked-uploads` set to `true`, which is the API Gateway `chunked-uploads` default. All invoke and proxy 1.5.0 and 2.0.0 policies will use this default value.**

## Explanation

For information about the Allow chunked uploads property in the Invoke policy, see [Invoke](#).

## Severity

info

**API43 Created `compatibility:` section for API-wide toggles set by migration utility.**

## Explanation

The migration utility generates a compatibility section that allows DataPower to read in custom settings to for compatibility between v5 and API Gateway.

## Severity

info

**API44 Set compatibility toggle `%s` to value: `%s`.**

## Explanation

See message text.

## Severity

info

**API45 Compatibility toggle: `%s` set to value: `%s`, which is the same as the API Gateway default.**

## Explanation

The migration utility input specified to set a compatibility toggle to a value that is already the default. Therefore, no change was made in the API as the default will automatically be used.

## Severity

info

**API46 Updated `securityDefinition`: `%s` with new name: `%s` as specified in toggle input: `%s`.**

## Explanation

See message text.

## Severity

info

**API47 `application-authentication` was found to be set, adding `application-authentication-source` and `custom-header-name` defaults.**

## Explanation

In v5, `application-authentication-source` does not exist. In API Gateway, it is a new option that must be set if authentication is set. Therefore, the migration utility automatically sets `application-authentication-source` to its most-compatible default, and as a result also sets `custom-header-name`. If `application-authentication` is not set in the v5 API, the migration utility does not set `application-authentication-source` and `custom-header-name`.

## Severity

info

**API48 `%s` found in API definition `%s`, changing the value to a string null.**

## Explanation

See message text.

### Severity

info

**API149 Changed `$(request.body*)` to `$(request.parsed_body*)` in: ``%s`` to use parsed copy of data.**

### Explanation

In the API Gateway, the `request.body` context is never parsed and cannot be evaluated. The parse policy added to the beginning of the assembly automatically copies `request.body` into `request.parsed_body` and parses that copy. The reference to `request.body` has been changed to use this new context.

### Severity

warn

**API151 Added missing path parameter definition for path ``%s`` operation ``%s`` parameter ``%s``.**

### Explanation

See message text.

### Severity

info

**API152 Added missing path parameter reference for path ``%s`` operation ``%s`` parameter ``%s``.**

### Explanation

See message text.

### Severity

info

**API153 A path parameter reference ``%s`` is not a path parameter.**

### Explanation

See message text.

### Severity

warn

**API154 A parameter reference ``%s`` is not defined.**

### Explanation

See message text.

### Severity

warn

**API155 Definition: `%s` is missing property 'Body' or 'properties', this is an invalid SOAP definition.**

### Explanation

The structure of the SOAP definition is invalid. For example, if the definition contains a SOAP fault that is not within the SOAP body, then the definition is invalid.

### Severity

error

**API156 Catalog specific API Property found without a corresponding default property: `%s` for catalog: `%s`, created empty string default property at the API level.**

### Explanation

See message text.

### Severity

info

**API157 Definition reference: `%s` is incorrect, and should be of form `'#/definitions/foo'`**

### Explanation

See message text.

### Response

For example, the following reference is invalid:

```
moreDetails:
  $ref: '#definitions/MoreDetails'
```

To make this a valid reference, use the following form:

```
moreDetails:
  $ref: '#/definitions/MoreDetails'
```

### Severity

warn

**API58 `securityDefinition` property encountered without a `security` property. An empty `security` property is added.**

### Explanation

See message text.

### Severity

info

**API59 The missing referenced definition `%s` was added to the swagger.**

### Explanation

See message text.

### Severity

info

**API60 The API property name `%s` is invalid and has been removed from the swagger.**

### Explanation

API properties with an invalid characters such as \$ and parentheses are ignored.

### Severity

info

**API61 Set buffering property to true.**

### Explanation

APIs will always have buffering enabled, as v5 did not support streaming.

### Severity

info

**API62 A query based security definition `%s` was present. A new security definition `%s` was created to match implicit v5 behavior.**

### Explanation

The security definitions in v5 for an API key that was specified as a query parameter were configured using the key names `client_id` and `client_secret`. However, this behavior implicitly provided the ability to also use query parameters `app_id` and `app_secret`. The specification of `app_id` and `app_secret` must be done explicitly in v10.

### Severity

info

**API63 A security set was created with security definition references `%s` to match implicit v5 behavior.**

### Explanation

The security definitions in v5 for an API key that was specified as a query parameter were configured using the key names `client_id` and `client_secret`. However, this behavior implicitly provided the ability to also use query parameters `app_id` and `app_secret`. The specification of `app_id` and `app_secret` must be done explicitly in v10.

### Severity

info

**API64 Suffix %s appended to API `x-ibm-name`.**

## Explanation

See message text.

## Severity

info

**API65 The referenced definition %s was changed to %s.**

## Explanation

The referenced definition contained a / character in the name and was not defined in the API. The / character has been removed to allow the API to publish during `archive:push`.

## Severity

info

**API66 Security has been removed as there are no associated security definitions.**

## Explanation

The API security is extraneous without associated security definitions.

## Severity

info

## Policies

---

- [GWS24](#)
- [GWS25](#)

**GWS02 This `gatewayscript`` policy was added before the newly converted `switch`` policy in the assembly to assist with the condition logic.**

#### Explanation

A conditional policy from a v5 API is converted to a `switch`` policy in the API Gateway. The v5 API uses GatewayScript for the `if`` and `switch`` policies, whereas the API Gateway condition syntax is JSONata based. These conditions have been moved into a `gatewayscript`` policy that will execute immediately before the `switch`` policy. The switch conditions will use results from the `gatewayscript`` policy to execute the correct assembly path.

#### Response

Review the changes to ensure that the `switch`` policy result will be consistent with the v5 API.

#### Severity

info

**GWS04 Found `gatewayscript`` policy. Porting might be required.**

#### Explanation

Review the `gatewayscript`` policy and make any necessary changes. The following list includes examples of some of the differences between `gatewayscript`` code in v5-compatible APIs and API Gateway.

- Calls that reference the `request.parameters`` context variable in v5-compatible APIs might not produce the same results in API Gateway. For example, consider the following call in a v5-compatible API.

```
apim.getvariable('request.parameters.org_name')
```

This call is not equivalent to the following call in an API Gateway API.

```
context.get('request.parameters.org_name')
```

The `context.get()` call in API Gateway supports multiple occurrences of the same parameter variable. Therefore, it returns structured JSON for retrieving parameters, as in the following example return.

```
"{\"locations\": [\"query\"], \"values\": [\"sandbox-test-org\"]}"
```

For this example, the `apim.getvariable` call should be changed to the following call in API Gateway.

```
((context.get('request.parameters.org_name') || {}).values || []).slice(-1)[0]
```

- Access to `header-metadata` is not supported in API Gateway. In some cases, the call can be edited to conform to the API Gateway specification. For example, the call `hm.current.remove("Accept-Encoding")`; can be replaced in API Gateway with `context.message.header.remove("message.headers.Accept-Encoding")` or `context.clear("message.headers.Accept-Encoding")`. However, if you are using `header-metadata` to set the response message header before the `proxy` policy, you must add a `gatewayscript` policy after the `invoke` policy to set the header on the response message.
- In v5 and in v10 API Gateway, `apim.getvariable()` returns an XML node set if an XML node set was set in the variable being retrieved. In v10 API Gateway, `context.get()` always returns an XML document, even if an xml node set was set in the variable. The API may require modification to work properly.
- In both v5 and v10 API Gateway, using the `apim.getvariable()` function on XML data returns an XML NodeList object. In v10 API Gateway, using the `context.get()` function on XML data returns an XML document. Consider this change before switching to `context.get()` using the `optimize-gws` migration configuration option, as API behavior may change as a result.

#### Severity

warn

### GWS05 Added `require('apim')` function to `gatewayscript` policy to conform to the API Gateway specification.

#### Explanation

See message text.

#### Response

Review the changes to ensure that the `gatewayscript` policy result will be consistent with the v5 API.

#### Severity

info

### GWS06 Found `require('header-metadata');` in the `gatewayscript` source.

#### Explanation

The `header-metadata` module is not supported in the API Gateway. All API context variables in the API Gateway are in the global context module. You can access the context variables directly using `context.set()` or `context.get()`.

For more information about using context variables in `gatewayscript` policies in API Gateway, see [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

#### Response

For better performance, either use the `--optimize-gws=true` toggle when running the migration utility, or use the context module for native API Gateway performance. For more information about `header-metadata`, see [Access to the headers object](#) in the IBM DataPower Gateways documentation.

#### Severity

info

### GWS07 Replaced `require('local:///isp/policy/apim.custom.js')` with `require('apim')` to conform to the API Gateway specification.

#### Explanation

The v5 `gatewayscript` compatibility module does not exist on the local file system in the API Gateway. The `require` function for this module was present in the `gatewayscript` code and has been changed for API Gateway compatibility.

#### Severity

info

### GWS08 Empty source `gatewayscript` found.

#### Explanation

See message text.

#### Response

Consider updating the empty `gatewayscript` policy or remove it from the assembly for better performance.

**Severity**

warn

**GWS09 Found `require('fs')` in the `gatewayscript` source.**

**Explanation**

The `fs` module is supported in the API Gateway. Some API Gateway configuration folders have restricted access.

**Severity**

info

**GWS10 Found `require('service-metadata')` in the `gatewayscript` source.**

**Explanation**

See message text.

**Response**

The Gatewayscript examples in the following table show how the service variables map to API Gateway metric functions. To obtain the metric data, use the `getMetricData()` API of the `context.metric` object in DataPower API Gateway, as in the following example.

```
var md = context.metric.getMetricData();
```

For more information about the `context.metric` object, see [context.metric object for API Gateway services](#) in the IBM DataPower Gateways documentation.

v5 MPGW service variable	Gatewayscript example	Description
<code>dp:variable('var://service/time-response-complete')</code>	<code>md.filter(n =&gt; n.type === 'assembly-invoke').slice(-1).endTime</code>	The end time of the last assembly-invoke metric data.
<code>dp:variable('var://service/time-elapsed')</code>	<code>md.slice(-1).endTime</code>	The end time of the last element in the metric data array.
<code>dp:variable('var://service/time-forwarded')</code>	<code>md.filter(n =&gt; n.type === 'assembly-invoke').slice(-1).requestTime</code>	The request time of the last assembly-invoke metric data.
<code>dp:variable('var://service/URL-out')</code>	<code>md.filter(n =&gt; n.type === 'assembly-invoke').slice(-1).targetURL</code>	The target URL of the last assembly-invoke metric data.
<code>dp:variable('var://service/mpgw/request-size')</code>	<code>md.filter(n =&gt; n.type === 'assembly-invoke').slice(-1).requestSize</code>	The request size of the last assembly-invoke metric data.
<code>dp:variable('var://service/mpgw/response-size')</code>	<code>md.filter(n =&gt; n.type === 'assembly-invoke').slice(-1).responseSize</code>	The response size of the last assembly-invoke metric data.

**Severity**

info

**GWS11 Found `require('mgmt')` in the `gatewayscript` source.**

**Explanation**

The `mgmt` module is not supported in the API Gateway.

**Response**

Remove use of the `mgmt` module from the source code.

**Severity**

error

**GWS12 Found `require('policy/policy-utility')` or `require('policy/policy-utility.js')` in the `gatewayscript` source.**

**Explanation**

`policy-utility` is a DataPower module that is not supported in the API Gateway.

**Response**

Remove use of the `policy-utility` module from the source code.

**Severity**

error

**GWS18 Found `gatewayscript` containing session function: `%s` and replaced with API Gateway native `%s`**

**Explanation**

See message text.

**Severity**

info

**GWS19 Invalid `gatewayscript` found. The gateway script could not be parsed due to `%s`**

**Explanation**

See message text.

**Severity**

warn

**GWS20 Found `gatewayscript` containing apim function: `%s`. No replacement was performed. The closest match is '%s', but it may not work in all situations.**

**Explanation**

See message text.

**Severity**

warn

**GWS21 Found `gatewayscript` containing session context function: `%s`. No replacement was performed. The closest match is '%s', but it may not work in all situations.**

**Explanation**

See message text.

**Severity**

warn

**GWS22 Found `gatewayscript` containing: `%s` and replaced with API Gateway equivalent context var of: `%s`**

**Explanation**

The following context variable names differ between v5 and v10 API Gateway. The migration utility replaces the v5 variable name with the equivalent v10 API Gateway variable name. For more information, see [API Connect context variables](#).

v5 context variable	v10 API Gateway context variable
env.path	api.catalog.path
env.name	api.catalog.name
client.app.type	client.app.lifecycle-state

**Severity**

info

**GWS23 Replaced `\\` with `\"` %d times to conform to the JavaScript syntax specification.**

**Explanation**

See message text.

**Severity**

info

**GWS24 Found gatewayscript policy containing api.document. Adding a gatewayscript policy to populate the api.document context.**

**Explanation**

The migration utility added a gatewayscript policy before the gatewayscript policy that contains `api.document`. The additional gatewayscript policy is required to populate the `api.document` context.

**Severity**

info

**GWS25 Replaced TLS Profile name `webapi-sslcli-mgmt` or `api-sslcli-all` with default TLS profile name `api-ssl-client-all` to conform to the API Gateway specification.**

**Explanation**

See message text.

**Severity**

info

- 

#### **INV01 Moved `x-ibm-gateway-decode-request-params` from API properties to each `invoke` policy.**

##### Explanation

This v5 API property only applies to the `invoke` and `proxy` policies. In API Gateway, the functionality of this property is implemented as an option in the `invoke` policy. This change was made for the following purposes.

- The option is now clearly visible in the `invoke` policy, making it easy to identify available options.
- Each use of the `invoke` policy can now have a different setting.

##### Severity

info

#### **INV02 Moved `x-ibm-gateway-invoke-keep-payload` from API properties to the `keep-payload` `invoke` property where applicable.**

##### Explanation

This v5 API property applies only to the `invoke` policy. In API Gateway, the functionality of this property is implemented as an option in the `invoke` policy. This change was made for the following purposes:

- The option is now clearly visible in the `invoke` policy, making it easy to identify available options.
- Each use of the `invoke` policy can now have a different setting.

##### Severity

warn

#### **INV03 Moved `x-ibm-gateway-queryparam-encode-plus-char` from API properties to each `invoke` policy.**

##### Explanation

This API property only applies to the Invoke policy. In API gateway, this property is an option in the Invoke policy. This change was made for the following purposes:

- The option is now clearly visible on the invoke policy, making it easy to identify available options.
- Each use of the invoke policy can now have a different setting.

##### Severity

info

#### **INV04 Added `parse` policy immediately after the `invoke` policy to parse the `invoke` output.**

##### Explanation

The `invoke` policy output context in the API Gateway is not parsed. For compatibility with the v5 API, the `invoke` policy output context will be explicitly parsed by a `parse` policy that has been added to execute immediately after the `invoke` policy.

##### Severity

info

#### **INV05 Removed `x-ibm-gateway-invoke-suppress-clientid` API property from the YAML file and replaced it with allowlists and blocklists to conform to the API Gateway specification.**

##### Explanation

This v5 API property applies only to the `invoke` policy. In API Gateway, the functionality of this property is implemented as an option in the `invoke` policy. This change was made for the following purposes:

- The option is now clearly visible in the `invoke` policy, making it easy to identify available options.
- Each use of the `invoke` policy can now have a different setting.

**Severity**

warn

**INV06 Found `invoke` policy. Converted to API Gateway `invoke` policy.**

**Explanation**

See message text.

**Severity**

info

**INV07 The API property `x-ibm-gateway-invoke-emulate-v4-soap-error` does not exist in the API Gateway.**

**Explanation**

A `x-ibm-gateway-invoke-emulate-v4-soap-error` property was found. This property does not exist in the API gateway.

**Response**

Remove the `x-ibm-gateway-invoke-emulate-v4-soap-error` property from the API.

**Severity**

error

**INV08 Incorrect timeout value of `%s` found in `%s` policy, updated to `60` seconds.**

**Explanation**

The `timeout` property of the v5 `invoke` policy is invalid. It must be a numeric data type. It has been set to the default value of `60`.

**Response**

Correct the timeout value if the default value does not satisfy the requirements of the policy.

**Severity**

info

**INV09 Renamed the `keepPayload` property in the `invoke` policy to `keep-payload`.**

**Explanation**

See message text.

**Severity**

info

**INV10 `X-IBM-Client-Id` HTTP header suppressed using header-control blacklist, as the `x-ibm-gateway-invoke-suppress-clientid` property is undefined or not set in the v5-compatible YAML input file.**

**Explanation**

The v5 default behavior was to not send the `X-IBM-Client-Id` HTTP header to the invoke target. The `x-ibm-gateway-invoke-suppress-clientid` is not provided, so the header will not be sent. The API Gateway accomplishes this behavior by adding the header to the `invoke` policy header-control blacklist.

**Severity**

info

**INV11 `X-IBM-Client-Id` HTTP header suppressed using header-control blacklist, as the `x-ibm-gateway-invoke-suppress-clientid` property is set to `true` in the v5-compatible YAML input file.**

**Explanation**

The v5 default behavior was to not send the `X-IBM-Client-Id` HTTP header to the invoke target. The `x-ibm-gateway-invoke-suppress-clientid` property is provided with a value of `true`, so the header will not be sent. The API Gateway accomplishes this behavior by adding the header to the `invoke` policy header-control blacklist.

**Severity**

info

**INV12 Removed `x-ibm-gateway-optimize-invoke` API property from the YAML file and converted the `invoke` policy to conform to the API Gateway specification.**

**Explanation**

This v5 API property is not supported by the API Gateway.

**Severity**

info

**INV13 Added `set-variable` policy to preserve `X-IBM-Client-Id` HTTP header before the `invoke` policy, as `x-ibm-gateway-invoke-suppress-clientid` is set to `false` in the v5c YAML input file.**

**Explanation**

By default in the API Gateway, the `x-IBM-Client-Id` HTTP header is not copied from the inbound request headers to the message context headers used by the `invoke` policy. This request header will be copied to the message context headers so that it will be available to be sent by the `invoke` policy.

**Severity**

warn

**INV14 Added `gatewayscript` policy for `x-ibm-gateway-invoke-v4-nomap-emulation` as the property is set to `true` in the v5-compatible YAML input file.**

**Explanation**

The v5 `invoke` policy used this property internally, but this behavior is not supported by the API Gateway `invoke` policy. A `gatewayscript` policy that implements the behavior of this v5 API property has been added to execute after the `invoke` policy.

**Severity**

info

**INV15 Invoke `keep-payload` property has been set to the value of the API property `x-ibm-gateway-invoke-keep-payload`.**

**Explanation**

Although not supported by the v5 UI, a `keep-payload` property in the `invoke` policy is always used if present to control this behavior. If not present in the policy, the API property is used instead. The policy property is not present, but the API property is present, therefore the `keep-payload` property in the API Gateway will use the v5 API property.

**Severity**

info

**INV16 Set `keep-payload` setting to `true`.**

**Explanation**

The `keep-payload` setting is set based on the following conditions:

- For an `invoke` policy that meets all of the following criteria, the `keep-payload` property is always set to `true`.
  - The policy is at the end of the assembly.
  - The API property `x-ibm-gateway-optimize-invoke` is not set to `false`.
  - The `invoke` policy does not contain a `stop-on-error` property.
- For an `invoke` policy that does not meet the above criteria, the `keep-payload property` is set to one of the following values, in order of precedence.
  - The value of `keepPayload` property, if it is set.
  - The value of the API property `x-ibm-gateway-invoke-keep-payload`, if it is set.
- For an `invoke` policy that meets none of the above criteria, the `keep-payload` property is not set at all.
- For a `proxy` policy, the `keep-payload` property is always set to `true` after it is converted to an `invoke` policy.

**Severity**

info

**INV17 Invoke policy set to `invoke_1.5.0`, converting `invoke` to `invoke_1.5.0`**

**Explanation**

See message text.

**Severity**

info

## INV18 Set `final-action` parameter on `invoke\_1.5.0`

### Explanation

If the `invoke_1.5.0` policy is last in the assembly, the migration utility adds the `final-action` parameter, which ensures that the policy sends output to the message context. If `invoke_1.5.0` is not last in the assembly, the policy adds a `parse` after the wrapper policy to parse the output.

### Severity

info

## JSON-to-XML policy messages

- [J2X01](#)
- [J2X02](#)

### J2X01 Added a `parse` policy to execute before the `json-to-xml` policy.

#### Explanation

A v5 `json-to-xml` policy must have the current API Gateway context parsed explicitly prior to execution. The `parse` policy has been added to execute before the `json-to-xml` policy.

#### Severity

info

### J2X02 Found `json-to-xml` policy and converted to API Gateway `json-to-xml`.

#### Explanation

See message text.

#### Severity

info

## JWT-Generate policy messages

- [JTG01](#)
- [JTG02](#)
- [JTG03](#)

### JTG01 JWE properties are missing in the `jwt-generate` policy, so encryption has been disabled.

#### Explanation

If `jwe-enc` or `jwe-alg` is specified, then at least one of `jwe-jwk` and `jwe-crypto` must also be specified.

#### Severity

warn

### JTG02 JWS property is missing in the `jwt-generate` policy, so signing has been disabled.

#### Explanation

If `jws-alg` is specified, at least one of `jws-jwk` or `jws-crypto` must also be specified. A private key must be specified, which can be either a JSON web key or a crypto object.

#### Severity

warn

### JTG03 Converted the `jwt-generate` policy to the API Gateway `jwt-generate` policy.

#### Explanation

See message text.

#### Severity

info

## LTPA-Generate policy messages

- [LTPA01](#)

### LTPA01 Found v5-compatible `ltpa-generate` policy. Because this policy does not exist in the API Gateway, it is unchanged.

#### Explanation

The `ltpa-generate` policy is not available in the API Gateway.

**Response**

Remove the `ltpa-generate` policy from the API.

**Severity**

error

**Map policy messages**

- [MAP01](#)
- [MAP02](#)
- [MAP03](#)
- [MAP04](#)
- [MAP05](#)

**MAP01 "Moved `%s` from API properties to each `map` policy as map option: `%s`."**

**Explanation**

This v5 API property applies only to the `map` policy. In API Gateway, the functionality of this property is implemented as an option in the `map` policy. This change was made for the following purposes.

- The option is now clearly visible on the `map` policy, making it easy to identify available options.
- Each use of the `map` policy can now have a different setting.

**Severity**

info

**MAP02 Replaced `%s` with `%s` to conform to the API Gateway syntax specification.**

**Explanation**

API Connect Version 5 treats a map value property with a string quoted with `\` or `\\` as the same, specifically as a double quote. This is not supported in the API Gateway. The `\\` is converted to a single `\`.

**Severity**

info

**MAP03 Converted `map` to API Gateway `map` for conformance."**

**Explanation**

See message text.

**Severity**

info

**MAP04 Set `map` option of `mapResolveApicVariables` to previous default of `true` for compatibility.**

**Explanation**

If a map policy is found to not have `mapResolveApicVariables` set, the option is set to true to maintain backwards compatibility.

**Severity**

info

**MAP05 Set `map` option of `mapParseXMLOutput` to `true` for compatibility.**

**Explanation**

This property is always set by the migration utility to maintain compatibility with v5. If XML data is output from the `map_2.0.0` policy, then the data is parsed before it reaches `<output>.body`.

**Severity**

info

**Proxy policy messages**

- [PRX14](#)
- [PRX15](#)

**PRX01 Found `proxy` policy and converted to API Gateway `invoke` policy, as `proxy` does not exist in the API Gateway.**

**Explanation**

A `proxy` policy was found. The policy was converted to an `invoke` policy in the API gateway.

**Response**

Review the changes to ensure that the `invoke` policy result will be consistent with the v5 API. Alternatively, you can specify that the migration utility convert `proxy` policies to `proxy_1.5.0`, which is a backward-compatible policy available in the API Gateway.

**Severity**

info

**PRX02 Removed `x-ibm-gateway-proxy-suppress-clientid` API property from the YAML file and replaced it with allowlists and blocklists to conform to the API Gateway specification.**

**Explanation**

This v5 API property applies only to the `proxy` policy. In the API Gateway, this property is represented by the header control and parameter control options in the `invoke` policy to either allow or restrict the `X-IBM-Client-Id` header or `client_id` parameter being sent to the backend server. This change was made for the following reasons.

- The option is now clearly visible in the `invoke` policy, making it easy to identify available options.
- Each use of the `invoke` policy can now have a different setting.

**Severity**

warn

**PRX03 Set policy `title` to `invoke` as this is now an `invoke` policy.**

**Explanation**

The functionality of the v5 `invoke` and `proxy` policies has been merged into the API Gateway `invoke` policy. The `title` property of the policy was changed to `invoke`.

**Severity**

info

**PRX04 Proxy: Changed `No-Cache` to lowercase `no-cache`.**

**Explanation**

See message text.

**Severity**

info

**PRX05 Proxy: Changed `Time-to-Live` to lowercase `time-to-live`.**

**Explanation**

See message text.

**Severity**

info

**PRX06 Proxy: Changed `Protocol-Based` to lowercase `protocol`.**

**Explanation**

See message text.

**Severity**

info

**PRX07 `client\_id` query parameter suppressed using parameter-control blocklist, as `x-ibm-gateway-proxy-suppress-clientid` is set to `true` in the v5-compatible YAML input file.**

**Explanation**

The v5 default behavior is to send the `client_id` query parameter to the proxy target. The `x-ibm-gateway-proxy-suppress-clientid` property was provided with a value of `true`, indicating not to send this query parameter. The API Gateway accomplishes this behavior by adding this query parameter name to the parameter-control blocklist of the policy.

**Severity**

info

**PRX08 `X-IBM-Client-Id` HTTP header suppressed using header-control blocklist, as `x-ibm-gateway-proxy-suppress-clientid` is set to `true` in the v5-compatible YAML input file.**

**Explanation**

The v5 default behavior was to not send the `X-IBM-Client-Id` HTTP header to the proxy target. The `x-ibm-gateway-proxy-suppress-clientid` property was provided with a value of `true`, indicating not to send this HTTP header. The API Gateway accomplishes this behavior by adding this header name to the header-control blocklist of the policy.

**Severity**

info

**PRX09 `X-IBM-Client-Id` HTTP header suppressed using header-control blocklist, as `x-ibm-gateway-proxy-suppress-clientid` is undefined or not set in the v5-compatible YAML input file.**

**Explanation**

The v5 default behavior was to not send the `X-IBM-Client-Id` HTTP header to the proxy target. The `x-ibm-gateway-proxy-suppress-clientid` property was not provided, indicating not to send this HTTP header. The API Gateway accomplishes this behavior by adding this header name to the header-control blocklist of the policy.

**Severity**

info

**PRX10 `client\_id` not suppressed in query parameter, as `x-ibm-gateway-proxy-suppress-clientid` is undefined or not set in the v5-compatible YAML input file.**

**Explanation**

The v5 default behavior was to send the `client_id` query parameter to the proxy target. The `x-ibm-gateway-proxy-suppress-clientid` property was not provided, indicating to send this query parameter. No API Gateway `invoke` policy configuration is required to emulate this behavior.

**Severity**

warn

**PRX11 `output` deleted as this policy is the last policy in the assembly flow.**

**Explanation**

The v5 `proxy` API can specify an output context that makes the `proxy` response available for subsequent policies, but that response was also made available as the API response, should a subsequent policy not update the message context. When the `proxy` policy is the last policy in the v5 assembly, this output is removed, which allows the API Gateway `invoke` response to be returned to the client.

**Severity**

info

**PRX12 Added `gatewayscript` policy to copy the proxy policy headers, status, and output to `message` context.**

**Explanation**

A v5 `proxy` policy that specifies an output response context name is not the last policy in the assembly flow. A `gatewayscript` policy has been added after the API Gateway `invoke` policy. The `gatewayscript` policy copies the contents of the response context to the message context to emulate v5 behavior.

**Severity**

warn

**PRX13 Added `set-variable` policy to preserve `X-IBM-Client-Id` HTTP header immediately before the proxy as `x-ibm-gateway-proxy-suppress-clientid` was set to `false` in the V5-compatible YAML input file.**

**Explanation**

By default in the API Gateway, the **X-IBM-Client-Id** HTTP header is not copied from the inbound request headers to the message context headers used by the **invoke** policy. This request header will be copied to the message context headers so that it will be available to be sent by the **invoke** policy.

#### Severity

info

### PRX14 Proxy policy set to `proxy\_1.5.0`, converting proxy to `proxy\_1.5.0`

#### Explanation

See message text.

#### Severity

info

### PRX15 Set `final-action` parameter on `proxy\_1.5.0`

#### Explanation

If the **proxy\_1.5.0** policy is last in the assembly, the migration utility adds the **final-action** parameter, which ensures that the policy sends output to the message context. If **proxy\_1.5.0** is not last in the assembly, the policy adds a parse after the wrapper policy to parse the output.

#### Severity

- [RE11](#)
- [RE12](#)
- [RE13](#)
- [RE14](#)

### RE01 This API Gateway `redact` policy is added to contain all v5-compatible `redact` paths targeted against the `request`.

#### Explanation

To redact the request body, an API Gateway **redact** policy is placed at the front of the assembly in order to redact incoming data. All redactions in v5c that are not found within a **switch**, **if**, or **operation-switch** component will be moved to this single **redact** policy.

#### Response

Review to confirm that this change meets the purpose of the API.

#### Severity

warn

### RE02 API Gateway `redact` policy added to contain all v5-compatible `redact` paths targeted against `response`, `logs`, and `all`.

#### Explanation

In the API Gateway, **response** and **logs** data must be redacted at the end of the assembly. This API Gateway **redact** policy was added to the end of the assembly to conform to the specification. If **logs** or **all** is the v5-compatible target for the **redact** policy, then a new **log** policy will be added in **gather-only** mode to populate the **log** API context.

The API Gateway emulates the v5-compatible redact on response and logs by adding a redact action at the end of the assembly to redact the response. All redactions in v5c that are not found inside of a **switch**, **if**, or **operation-switch** component will be moved to this single **redact** policy.

#### Response

Review to confirm that this change meets the purpose of the API.

#### Severity

warn

**RE03 Found v5-compatible `redact` policy. `action:path` pairs from this policy will be sorted into one or both leading and trailing API Gateway `redact` policies to conform to the API Gateway specification.**

**Explanation**

To emulate the v5 redact on `request` and `response`, some of the `redact` policies must be moved to either the end of the assembly or beginning of the assembly. This change is necessary because the `redact` policy now works directly on the API context, so it must be placed in a specific order so that it can redact data either before it enters the assembly or after it exits the assembly.

**Response**

Review the changes to ensure that the `redact` policy result will be consistent with the v5 API.

**Severity**

warn

**RE04 Found duplicate v5-compatible `redact` path of the same `redact` type. Duplicate item will not be added.**

**Explanation**

Because multiple redactions are consolidated into the leading or trailing `redact` policy, there might be some paths that are duplicates of current paths in the consolidated `redact` policy. These paths are not added as they are redundant.

**Response**

Review the changes to ensure that the `redact` policy result will be consistent with the v5 API.

**Severity**

warn

**RE05 Redaction on `request` was found in the v5-compatible YAML input file. Added first API Gateway `redact` policy to the front of the assembly after the `parse` policy to perform this redaction.**

**Explanation**

To redact the request body, an API Gateway `redact` policy is placed at the front of the assembly in order to redact incoming data. All redactions in v5c that are not found within a `switch`, `if`, or `operation-switch` component will be moved to this single `redact` policy.

**Response**

Review to confirm that this change meets the purpose of the API.

**Severity**

info

**RE06 Redact on `response`, `logs`, or `all` was found in the v5-compatible YAML input file. Added second API Gateway `redact` to the end of the assembly to perform this redaction. `log` policy also added if redact on `logs` or `all` was found.**

**Explanation**

In the API Gateway, `response` and `logs` data must be redacted at the end of the assembly. This API Gateway `redact` policy was added to the end of the assembly to conform to the specification. If `logs` or `all` is the v5-compatible target for the `redact` policy, then a new `log` policy will be added in `gather-only` mode to populate the `log` API context.

The API Gateway emulates the v5-compatible redact on response and logs by adding a redact action at the end of the assembly to redact the response. All redactions in v5c that are not found inside of a `switch`, `if`, or `operation-switch` component will be moved to this single `redact` policy.

**Response**

Review to confirm that this change meets the purpose of the API.

**Severity**

warn

**RE07 Potential JSON v5-compatible `redact` path detected.**

**Explanation**

A v5 `redact` path has been detected that is highly likely to be targeted against JSON data. It has been converted to a JSONata path because the `redact` policy in the API Gateway uses JSONata to specify `path`.

**Response**

Review to confirm that the path is meant for JSON data and it is formed properly.

**Severity**

warn

### **RE08 XML v5-compatible `redact` path detected. Converted to `redact` XPath: `%s` to JSONata: `%s`.**

#### **Explanation**

A v5-compatible `redact` path has been detected that is highly likely to be targeted against XML data. It has been converted to JSONata to meet the API Gateway specification. The `redact` policy in the API Gateway uses JSONata for `path`:

#### **Response**

Review to confirm that the path is meant for XML data and it is formed properly. Note that a malformed XPath may still publish on API Connect v10 API Gateway, but will fail subsequent API calls with a **404 API Not Found** error. The API Definition DataPower object will also be in the **[down]** state because of the invalid XPath. It is also possible for an invalid XPath to work on v5 but fail on API Gateway. For example, the XPath `/test/path/` is invalid because of the trailing slash. However, this XPath will work in v5, and fail with the above scenario in v10 API Gateway.

#### **Severity**

warn

### **RE09 Common `redact` XPath `%s` replaced with JSONata `%s` to adhere to the API Gateway `redact` specification.**

#### **Explanation**

The `redact` policy in API Gateway uses JSONata to specify the `path`:. All v5-compatible `redact` paths are converted to JSONata.

#### **Response**

Review to confirm that the changes conform to the purpose of the `redact` policy.

#### **Severity**

info

### **RE10 Invalid redact action: `%s` found.**

#### **Explanation**

A v5-compatible `redact` policy was found to contain an invalid `action` type. Valid types include `redact` or `remove`.

#### **Response**

Review the `action` type in the `redact` policy and update to either `redact` or `remove`.

#### **Severity**

error

### **RE11 Added `log` policy to populate the `log` API context, because a v5-compatible `redact` policy was found targeted against `logs` or `all`. An API Gateway `redact` policy will be appended after this policy to redact the outgoing `log` data.**

#### **Explanation**

The API Gateway specification requires a `log` policy in the assembly to populate the `log.request_body` and `log.response_body` context variables. After the `log` policy, the `redact` policy will then redact the contents of `log.request_body` and `log.response_body`.

#### **Severity**

warn

### **RE12 Added `parse` policy before `redact` policy to parse incoming data.**

#### **Explanation**

The incoming data must be parsed for the `redact` policy to work properly. For example, if the incoming data contains unparsed but well-formed XML data, the `redact` policy does nothing and the data passes through. With this added `parse` policy, the XML data is parsed properly and the redaction works as expected.

#### **Response**

Review the changes to ensure that the `redact` policy result will be consistent with the v5 API.

#### **Severity**

warn

### **RE13 Found v5-compatible `redact` policy inside of a `switch` policy. Converted all paths to JSONata.**

#### **Explanation**

If a v5-compatible `redact` policy is found within a `switch`, `if`, or `operation-switch` component, it will be left in place. If the redaction is on the response and there is an `invoke` policy at the end of the assembly, problems could arise.

**Response**

Review and confirm that this redaction conforms to the purpose of the API.

**Severity**

warn

**RE14 Invalid `redact` action found: path is empty.**

**Explanation**

The v5-compatible `redact` policy was found to have an empty path. This configuration is invalid

**Response**

To make the API functional, update the path in the `redact` policy.

**Severity**

error

**SV01 Found `set-variable` policy and converted to API Gateway `set-variable` policy.**

**Explanation**

See message text.

**Severity**

info

**SV02 Cannot recognize `set-variable` `action` `%s`. It must be `set`, `add`, or `clear` with a valid variable name.**

**Explanation**

The v5 `set-variable` policy contains an action that is not `set`, `add`, or `clear`. The API Gateway `set-variable` policy should be modified to use the correct settings.

**Severity**

error

**SV05 Required property `type` not found. Added `type` of `any` to conform to the API Gateway specification.**

**Explanation**

The v5 `set-variable` policy does not have a `type` property. The type is inherent in the data type of the value. The API Gateway includes this property, which is set to the data type of the value. In conditions where the data type would be determined at runtime (for example, with a variable substitution), the value is set to `any`.

**Response**

Consider changing the added `type` to a more specific `type`.

**Severity**

warn

**SV06 Required property `type` not found. Added `type` of `%s` to conform to the API Gateway specification, and it is consistent with the provided `value`.**

**Explanation**

See message text.

**Severity**

info

**SV07 The set-variable policy has no valid actions and has been removed from the assembly.**

**Explanation**

See message text.

**Severity**

info

**SW03 Found `switch` policy and converted to the API Gateway `switch` policy.**

**Explanation**

A `switch` policy from a v5 API is converted to an API Gateway `switch` policy. The v5 API uses GatewayScript syntax for conditions, whereas the API Gateway uses JSONata syntax. The conditions have been moved to a `gatewayscript` policy that will execute immediately before the `switch` policy. The `switch` conditions will use results from the `gatewayscript` policy to execute the correct assembly path.

**Response**

Review the changes to ensure that the `switch` policy result will be consistent with the v5 API.

**Severity**

info

**SW04 Found `if` policy and converted to API Gateway `switch` policy.**

**Explanation**

An `if` policy from a v5 API is converted to an API Gateway `switch` policy. The v5 API uses GatewayScript syntax for conditions, whereas the API Gateway uses JSONata syntax. The conditions have been moved to a `gatewayscript` policy that will execute immediately before the `switch` policy. The `switch` conditions will use results from the `gatewayscript` policy to execute the correct assembly path.

**Severity**

info

**SW05 Found `switch` condition: `%s` and converted it to JSONata: `%s` to conform to the API Gateway specification.**

**Explanation**

A v5 `switch` policy condition was converted directly into a JSONata condition. This condition does not require a `gatewayscript` policy that would be executed prior to the switch.

**Severity**

warn

**SW06 `switch` condition: `%s` could not be converted to JSONata. (Error code: `%d`).****Explanation**

Cannot convert an `if/switch` condition to JSONata. A GatewayScript policy will be added to handle the Switch logic instead. Changes are needed only if highest performance is desired. See the Response section for more details on performance. This message can appear for the following reasons.

Error code	Explanation
1	The auto-generated JSONata mapping file was not found.
2	The condition was not found in the auto-generated JSONata mapping file.
3	The condition resolved to empty.
4	An unknown error occurred

**Response**

To improve performance, review the condition in the v5 API and provide the JSONata for this condition.

If an `indexOf()` method is used to determine whether a substring is present in a value, consider using the `$contains()` JSONata string function. If `indexOf()` is used to get a substring before or after the match, consider using the `substringBefore()` or `$substringAfter()` JSONata string functions.

For more information about using JSONata to write switch conditions, see [Writing switch condition scripts - DataPower API Gateway](#).

**Severity**

warn

**SW07 `switch` condition: `%s` could not be converted to JSONata or handled by `gatewayscript`.****Explanation**

The `if/switch` condition cannot be converted to JSONata. This error can occur for the following reasons:

- A condition contains invalid Javascript.
- The condition contains multiple expressions.

**Response**

Review the contents of the condition and edit as necessary.

**Severity**

info

**VAL03 Found `definition: request` and replaced it with `validate-against: body-param`.**

**Explanation**

The **definition** property in the v5 **validate** policy contained a value of **request**. This value has been changed to a value of **body-param** in the **validate-against** property of the API Gateway **validate** policy.

**Severity**

info

**VAL04 Found `definition: response` and replaced it with `validate-against: response-param`.**

**Explanation**

The **definition** property of the v5 **validate** policy contained a value of **request**. This value has been changed to a value of **response-param** in the **validate-against`** property of the API Gateway **validate** policy.

**Severity**

info

**VAL05 Found `soap-env` `validate` definition and converted it to the API Gateway `xml-schema` property.**

**Explanation**

The **definition** property in the v5 **validate** policy references an OpenAPI definition. The definition referenced is for a SOAP document. This value has been changed to a value of **url** in the **validate-against`** property in the API Gateway **validate** policy. The **definition** property value has been moved to the **xml-schema** property.

**Severity**

info

**VAL06 Set `xml-validation-mode` to `soap-body`.**

**Explanation**

The **definition** property in the v5 **validate** policy references an OpenAPI definition. The definition referenced is for a SOAP document. This value has been changed to a value of **url** in the **validate-against`** property in the API Gateway **validate** policy. The **xml-validation-mode`** property value has been set to **soap-body`**.

**Severity**

info

**VAL07 Set `validate-against` to `%s`.**

**Explanation**

The **definition** property in the v5 **validate** policy references an OpenAPI definition. This value has been changed to conform to the API Gateway **validate`** policy property **validate-against`** with a value of **definition`** or **url`**.

**Severity**

info

**VAL08 Added `parse` policy before `validate` policy.**

**Explanation**

A v5 **validate`** policy that is configured to validate the current context payload against a schema definition must have the input of the current API Gateway context parsed explicitly prior to execution. The **parse`** policy has been added to execute before the **validate`** policy.

- [XSLT05](#)

**XSLT01 Replaced `apim.custom`, `apim.setvariable`, and `webapi-util` with `apim.custom.xsl` within `xsl import` and `xsl include` statements.**

**Explanation**

The v5 `xslt` policy code that contains an `xsl import` or `xsl include` of v5 framework stylesheets that were found in the local directory of the file system have been changed to use the v5-compatible stylesheet in the store directory of the file system.

**Severity**

info

**XSLT02 Added `parse` policy to execute before the `xslt` policy.**

**Explanation**

A v5 `xslt` policy that is configured to use the current context payload as input to the stylesheet must have the current API Gateway context parsed explicitly prior to execution. The `parse` policy has been added to execute before the `xslt` policy.

**Severity**

info

**XSLT03 Found `xslt` policy. Porting might be required.**

**Explanation**

Review the `xslt` policy and make any changes required for use in API Gateway.

## Response

If you want to use v5-compatible XSLT code in API Gateway, use the API Gateway extension elements and functions to ensure compatibility with API Gateway. Depending on the content of your code, you may need to make the following changes.

- Remove the `apim.setvariable-impl.xsl` stylesheet from the XSLT code. This stylesheet is not used in API Gateway. Instead, use the API Gateway extension functions to manipulate the assembly context.
- Use API Gateway extension elements to manipulate values in the assembly context. The following example uses the `apigw:set-header` extension element to set the value of the request header.

```
<apigw:set-header name="'request'" value="$request" />
```

- Use of `dp:variable` and `dp:set-variable` functions is not supported in API Gateway. These functions should be changed to `apim:getVariable` and `apim:setVariable`. Access to session, service, and system metadata is restricted.

For more information about the API Gateway extension elements and functions, see the IBM DataPower Gateway documentation.

## Parse actions added to the API assembly after migration

The migration utility command `apicm archive:port-to-apigw` adds parse actions to the API assembly depending on the policies specified in your migration configuration.

Review the API assembly to determine if any of the parse actions or other actions added by the migration utility can be removed. For more information, see [Fine-tuning APIs after migration](#).

Parse actions are added to the assembly according to the rules in the following tables.

Table 1. Parse actions added to the API assembly after conversion of policies to 1.0.0 or 2.0.0

Policy	Where the parse action is added
If a <b>POST</b> , <b>PUT</b> , <b>DELETE</b> , <b>OPTIONS</b> , or <b>PATCH</b> method is found	As the first action in the assembly
invoke 2.0.0	After the invoke action, except when invoke is the last action in the assembly.
json-to-xml 2.0.0	Before the json-to-xml action
proxy 2.0.0	After the proxy action
validate 2.0.0	Before the validate action
xml-to-json 2.0.0	Before the xml-to-json action
xslt 1.0.0 or 2.0.0	Before the xslt action

Table 2. Parse actions added to the API assembly after conversion of invoke and proxy policies to 1.5.0

Policy	Where the parse action is added
--------	---------------------------------

Policy	Where the parse action is added
invoke 1.5.0	<p>A parse action is added after the invoke if any of the following are true:</p> <ul style="list-style-type: none"> <li>• <code>stop-on-error</code> is specified</li> <li>• <code>final-action</code> is set to <code>false</code>. This is the default setting.</li> <li>• <code>x-ibm-gateway-optimize-invoke</code> is explicitly set to <code>false</code></li> </ul> <p>The parse action is added because there can be a subsequent use of the output.</p>
proxy 1.5.0	A parse action is added after the proxy if <code>final-action</code> is set to <code>false</code> .

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Fine-tuning APIs after migration

After running the migration utility command `apicm archive:port-to-apigw`, review the converted APIs to determine if any of the changes made by the migration utility can be modified to enhance performance and usability.

If the migration utility makes any of the following changes to your APIs, consider making the suggested changes.

- If the last policy in the assembly has output that is set to a variable that is not used afterward, remove the output set or the entire policy.
- Remove any unnecessary parse actions that the migration utility adds to the assembly. For information about the parse actions added by the migration utility, see [Parse actions added to the API assembly after migration](#).
- If the assembly contains redact policies, verify that these policies are necessary. Delete any unnecessary redact policies.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

What is `port-to-apigw`?

`port-to-apigw` is a command in the API Connect migration utility that converts all APIs, products, subscriptions, OAuth providers, and custom policies into v10 native API Gateway artifacts. These newly created artifacts live side-by-side with the original v5-compatible artifacts, and have `-apigw` appended to the end of the filename.

For more information, see [Converting APIs to DataPower API Gateway](#).

When is it necessary to run the `port-to-apigw` command, and how do I use it?

Run this command if you are migrating to a v10 native API Gateway. Follow the migration steps that are appropriate for your v5 environment. For instructions on running the `port-to-apigw` command, see [Migration steps](#). For information on configuring migration options, see [Configuring migration options for DataPower API Gateway](#). For other information to help you optimize migration, see [Migration considerations](#).

Additional information is available in the [API Connect Migration Utility \(AMU\) for Version 10 Technical Run Book](#).

Why is the `port-to-apigw` command needed for migrating to v10 API Gateway?

The required fields, properties, settings, and configuration in v10 native API Gateway differs from v5-compatible mode. The `port-to-apigw` step in the migration process is needed to convert the artifacts to conform to the changes.

What is the difference between these terms: "porting to API Gateway", `port-to-apigw`, and "migration"?

"Porting to API Gateway" describes what the `port-to-apigw` command does in the migration utility. "Migration" is the overall purpose of the migration utility. The `port-to-apigw` step is necessary for migrating to a v10 native API Gateway. Migration can be completed without the `port-to-apigw` step if you are migrating to a v10 deployment that uses only the v5-compatible DataPower Gateway.

What is v5 policy emulation and how does it work?

The v5 policy emulation layer allows both custom policies and the 1.0.x policies to run on the native v10 API Gateway. It is deployed automatically by the API Connect migration utility to the `local:///isp` folder of the DataPower appliance when a custom policy is found in the v5 backup, or if you specify a 1.0.x policy in

the policy option for the `port-to-apigw` command. The deployment is first staged by the `port-to-apigw` command, and pushed by the `archive:push` command. Follow the steps as outlined in [Migration steps](#). Note that 1.5.x policies do not use v5 policy emulation, and exist only as native wrappers to the 2.0.0 implementation.

What is the purpose of the policy parameter options in `port-to-apigw`?

Input options allow you to customize your migration. If you want to use the native policies, such as `invoke_2.0.0` instead of the default `invoke_1.5.0-compatible` option, you can select the appropriate option. However, using these options can result in migration errors that require manual changes to get your APIs up and running. If you want to be up and running quickly, it is best to use the default options for the input. The default options convert APIs in a way that is most backwards compatible with v5.

For more information about the migration configuration options, see [Configuring migration options for DataPower API Gateway](#). For explanations of errors and other messages generated during migration and suggestions for manual changes to APIs, see [Messages generated during conversion of APIs to DataPower API Gateway](#).

How do the v5 emulated policies `invoke_1.5.0`, `proxy_1.5.0`, `xslt_1.0.0`, and `gatewayscript_1.0.0` work?

When the push step of the migration utility is completed, these policies will exist on the DataPower Gateway as assembly function objects. The 1.0.x policies call the v5 policy emulation layer in order to function as if they were v5 policies. The 1.5.x policies are wrapper policies to the 2.0.0 implementation. They call the 2.0.0 policies and exist only as a compatibility layer between the original v5 policy and the new 2.0.0 policy.

What is the difference between the 1.5.0 and 2.0.0 versions of the `invoke` and `proxy` policies, and the 1.0.0 and 2.0.0 versions of the `gatewayscript` policy? Why isn't the 2.0.0 version the default version?

The 1.5.x policy implementations are native wrappers to the underlying 2.0.0 implementation. They exist only to create a compatibility layer between the v5 policy and the APiGW native policy. The `gatewayscript_1.0.0` policy uses v5 policy emulation to run as if it were on a v5 environment. The performance of the 1.0.x v5 emulation layer policies in API Gateway is the same or slightly better than the v5 and v5-compatible versions. The performance of 1.5.x policies is slightly slower than their corresponding 2.0.0 policies. You can inspect the 1.5.x wrapper implementation in Assembly Functions in DataPower Gateway.

Should I rewrite my Gatewayscript policies?

Most Gatewayscript policies do not require rewriting, as the native v10 API Gateway contains an enhanced compatibility layer that accepts most of the `apim` functions without modification. In most cases, Gatewayscript policies require rewriting when they contain any of the following:

- inline parameters
- `require('service-metadata')` and service variables associated with it
- `require('mgmt')`
- `require('fs')`
- OAuth context variables

What is the `optimize-gws` option?

The `optimize-gws` migration option converts certain v5 gatewayscript functions to the native API Gateway implementation. This setting is optional because the compatibility layer already handles processing of original v5 gatewayscript functions. If set to true, the migration utility makes the following conversions:

- `apim.getvariable()` is converted to `context.get()`
- `apim.setvariable()` is converted to `context.set()`
- `hm.current.remove()` is converted to `context.clear()`

What is the `gateway-extension.zip` file and how does it work?

After running the `port-to-apigw` command, a `gateway-extension.zip` file is located in the `cloud/admin-org/availability-zones/default-availability-zone/gateway-services/<gateway-service>` folder. This file is automatically generated by the migration utility during the processing of the `port-to-apigw` command. It contains a `manifest.json` file, and every custom policy under the gateway service that came from the v5 backup. The `manifest.json` file contains a list of custom policies to push, and backwards-compatible policies to advertise and make available for use by APIs. These backwards-compatible policies include `invoke_1.5.0`, `proxy_1.5.0`, `xslt_1.0.0`, and `gatewayscript_1.0.0`. During the `archive:push` steps of the migration process, this zip file is pushed to the API Manager as a gateway extension. For more information, see [Gateway extensions manifest](#).

How does the migration utility migrate custom policies?

Custom policies are migrated in multiple steps, depending on whether the `custom-policies-scope` option is set to `global` or `catalog`. Once custom policies are pushed to the DataPower Gateway, they use the v5 policy emulation layer that was unpacked into the `local:///isp` folder in order to run on the native v10 API Gateway.

When `port-to-apigw` is run, the following steps are performed depending on the `custom-policies-scope` setting.

- If `custom-policies-scope` is set to `global`, and there are no duplicate custom policies with differing implementations, the custom policies under each gateway service are bundled in a `gateway-extension.zip` file. This zip file contains a `manifest.json` file that describes the contents. The `gateway-extension.zip` file is copied to the `admin-org gateway-service` folder. These steps are performed automatically when `port-to-apigw` is run. Next, you must push the `admin-org` during the `archive:push` step, which pushes the `gateway-extension.zip` bundles (one per gateway) to the API Manager using an internal `APIC Toolkit gateway-extensions:create` call. The custom policies within the bundle are advertised on the API Manager. The custom policies and compatible legacy policies are shown in the policy pallet in the API Manager Assemble UI. These custom policies are also in the DataPower filesystem in the `local:///` folder. Note that if duplicate custom policies with the same name, version, and differing underlying implementation are found, the migration utility logs a message and automatically falls back to `catalog` scope to prevent the migration from failing.
- If `custom-policies-scope` is set to `catalog`, the custom policies under each gateway service are bundled in a `gateway-extension.zip` zip file. This zip file contains a `manifest.json` file that describes the contents. The `gateway-extension.zip` file is then copied to the `admin-org gateway-service folder`. The custom policy definition files under each catalog are copied into the `catalog-scoped-staging` folder, where their gateway type is set to `datapower-api-gateway`. Next, you must push the `admin-org` during the `archive:push` step, which pushes the `gateway-extension.zip` bundles (one per gateway) to the API Manager using an internal `APIC Toolkit gateway-extensions:create` call. Note that the custom policies and compatible legacy policies are not visible in the policy pallet in the UI. You can see the custom policies in the DataPower filesystem in the `local:///` folder. Before you can publish APIs that use these policies, you must push your `provider-orgs` during the `archive:push` step. The custom policy definitions as described earlier from the `catalog-scoped-staging` folder are then pushed to the API Manager automatically using an internal `APIC Toolkit policies:create` call. The APIs containing the newly migrated catalog-scoped custom policies are then published.

Note: The folders and zip files are created automatically, and you should not need to modify them. For instructions on the tasks you must perform, see [Migration steps](#).

Should I set the `custom-policies-scope` option to `global` or `catalog`?

Global scope custom policies are visible to every catalog and org on the gateway. Catalog scope custom policies are visible only to the catalog that they were migrated from. If you plan to migrate to v10 with the intention of custom policy availability the same as it is on v5, then use the default `catalog` setting. Why are my custom policies not showing up in the Assembly Editor policy palette?

See the following troubleshooting information: [Custom policies not appearing in the policy palette after migration](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Migration mapping files

You can use mapping files to map the name of a v5 object to a corresponding v10 object that has a different name.

The API Connect migration process allows you to make modifications to the configuration information after it has been extracted from the source v5 system and before it is uploaded to the target v10 system.

The names of some structures may not match exactly between v5 and v10. Since the names of some high-level objects may be intentionally different in the v10 environment, you can substitute values so that references to v5 object names (user registries, gateway services etc.) can be bound to the newly created objects in v10.

Note: If the names are preserved exactly between the v5 and v10 environments, you do not need to map any names.

- [What is a mapping file?](#)
- [Mapping a gateway service](#)
- [Mapping a migrated OAuth shared secret key](#)
- [Mapping SNI settings](#)
- [Mapping a provider organization](#)

---

## What is a mapping file?

What does a mapping file do?

Mapping files are simple yaml files that may be placed at any level in the directory structure produced by the `apicm archive:unpack` command where there is a yaml file describing a configuration object. A mapping file contains yaml `key: value` pairs that provide the values to apply in place of the original configuration values.

- You can use mapping files to override any values within the `.yaml` files.
- Common mappings can be specified in `mapping.yaml`.
- Server specific mappings can be provided in `mapping.<servername/ip>.yaml`. For example: `mapping.hostname.com.yaml` for `hostname.com` server.

What kinds of settings can I map?

You can override any values within a `.yaml` files. The most common mappings for v5 migrations are:

- Gateway service names
- Provider organization names
- User registry names

What does a mapping file contain?

A mapping entry consists of two or three lines:

- The first line of the mapping entry should be the file name you want to override, without the `.yaml` extension. For example, when overriding a value in `provider-org.yaml`, the first line of the mapping is `provider-org`.
- Additional lines have `key: value` pairs that override `key: value` pairs found in the main `.yaml` file. The most common usage is for overriding the name. To do this include the `name:` setting, followed by the new value for v10. For example, if you have a v5 provider organization `myv5porg`, and you want to map it to `myv10porg`, the second line is `name: myv10porg`.

```
provider-org:  
  name: myv10porg
```

- There are a few exceptions for some additional fields with special meaning in the mapping file for gateway services. See [Mapping a gateway service](#).

Where do I create mapping files

Examine the `/cloud` directory hierarchy that you created when you ran `apicm archive:unpack`. Locate the directory that has the `.yaml` file with the v5 value you want to overwrite. In that same directory, create a new file named `mapping.yaml`. For a detailed example, see the [Mapping tutorial](#).

---

## Mapping a gateway service

You can use a mapping file to tell the migration program the name of the target gateway service in v10 to use when migrating from v5 gateway service data to v10 gateway service data. You might want to map a v5 gateway service name to a v10 gateway service if the names do not match, or if the number of gateway services does not match.

Note: You can map a v5 gateway service to a v10 DataPower API Gateway. In this case, the mapping definition requires a `gateway-type` field. See the [Mapping tutorial](#). After you unpack the v5 data, you can find each of v5 gateway services in `cloud/admin-org/availability-zones/availability-zone-default/gateway-services/`.

For example, the following `cloud/admin-org/availability-zones/availability-zone-default/gateway-services/` hierarchy shows entries for three v5 gateways named: `gateway-2536`, `gateway-2537`, and `gateway-2538`.

Figure 1. Example admin-org with entries for three v5 gateway services

```

admin-org
├── availability-zones
│   ├── availability-zone-default
│   │   ├── availability-zone.yml
│   │   ├── gateway-services
│   │   │   ├── gateway-2536
│   │   │   │   ├── gateway-service.yml
│   │   │   │   ├── gateway-2537
│   │   │   │   ├── gateway-service.yml
│   │   │   │   ├── gateway-2538
│   │   │   │   └── gateway-service.yml

```

## Mapping a migrated OAuth shared secret key

Information about migrated OAuth shared secret keys is contained in your `gateway-service.yml` file. When you map a gateway to a new name, you must ensure that the OAuth shared secret key is associated with mapped gateway name.

Note: Make sure you only migrate one OAuth shared secret key per gateway service. You will get an error if you attempt to map more than one to the same gateway service.

1. Determine if your `gateway-service.yml` includes information for an OAuth Shared Secret Key (`oauth_shared_secret:`). For example:

```

api_version: 2.0.0
metadata:
  v5_created_at: 2018-12-01 17:43:03.065 +0000 UTC
  v5_created_by: admin
  v5_id: 5c02c827e4b0e816d3874747
  v5_updated_at: 2018-12-04 15:59:03.282 +0000 UTC
  v5_updated_by: admin
name: gw3-cf31
oauth_shared_secret: 0xF2DB3AE67A7988C06FF1EBA5C2B51F04ABC5D3D1192B4C994CA00C79FAB5ADAD
type: gateway_service

```

2. If `oauth_shared_secret:` is found, add `migrate_oauth_shared_secret:` `true` to the `mapping.yml`. For example:

```

gateway-service:
  name: gateway-10-1
  migrate_oauth_shared_secret: true

```

## Mapping SNI settings

You can include Server Name Indication (SNI) settings in the mapping file. When enabled, these settings, which include the host and TLS Server Profile pairs, are included in the migration of gateway services.

Note: You can migrate only one set of SNI settings for a v10 gateway service. If you are mapping multiple v5 gateway services to a single v10 gateway service, only the first set of SNI settings is migrated and warnings are generated for the additional mappings.

1. Determine whether your `gateway-service.yml` file contains SNI settings to migrate, as in the following example.

```

api_version: 2.0.0
gateway_service_type: datapower-gateway
metadata:
  v5_created_at: 2022-02-02 20:07:29.566 +0000 UTC
  v5_created_by: admin
  v5_id: 61fae481e4b0b16dad38691a
  v5_updated_at: 2022-02-02 20:07:29.566 +0000 UTC
  v5_updated_by: admin
name: gateway-service6-fabd
oauth_shared_secret: 0x014D004DC0A32EF091C17FEFCF10A621C36A92CE88BCE0F8FC2463B096D72D99
sni:
- host: internal.apic.ibm.com
  tls_server_profile_url: idurl://../../../../../../../../tls-server-profiles/gatewaytlsprofile-1.0.0.yml
- host: partner.apic.ibm.com
  tls_server_profile_url: idurl://../../../../../../../../tls-server-profiles/default-ssl-profile-1.0.0.yml
type: gateway_service

```

2. If SNI settings are found, add `migrate_sni: true` to the `mapping.yml`. For example:

```

gateway-service:
  name: gateway-10-1
  migrate_sni: true

```

## Mapping tutorial

You create and bring up a new gateway service in v10 called `gateway-10-1`. You want the data (e.g Catalogs) associated with the v5 gateway `gateway-2536` to be migrated to the v10 gateway named `gateway-10-1`.

1. Go to the `/cloud` hierarchy and locate the `gateway-2536/` directory.

```

├── gateway-services
│   └── gateway-2536
│       └── gateway-service.yml

```

2. Open the `gateway-service.yml` and verify that the `name:` entry specifies the v5 gateway service that you want to map.

```

api_version: 2.0.0
v5_id: 5c0icef4e45816d32290fb
name: gateway-2536
type: gateway-service

```

3. To map **name: gateway-2536** to a new value, use a text editor to create a **new** file named **mapping.yml**.
  - a. On a new line, enter **gateway-service:**.

How do I know what to enter on the first line?

Enter the name of the file that you are overriding, without the .yml suffix. In this case, you are overwriting gateway-service.yml, so you enter **gateway-service:**.

- b. On the next line, indent two spaces (as required for valid yaml), and enter **name:**  
**gateway-10-1**.

```

gateway-service:
  name: gateway-10-1

```

How do I know which name to use when mapping the v10 gateway-service?

In the v10 Cloud Manager UI, go to the Topology page. In the Default Availability Zones table, locate the Service column and click the gateway service entry. On the Edit DataPower Gateway Service page, in the Gateway Details section, locate the value in the **Name** field. Use this value.

Note: Do not use the value in the **Title** field. The value in the **Name** field is slugified to contain only characters that are supported in v10, and thus might differ from the value in the **Title** field.

- c. If the new v10 gateway service **gateway-10-1** is a DataPower API Gateway, add a third line to specify the gateway type:

```

gateway-service:
  name: gateway-10-1
  gateway-type: datapower-api-gateway

```

If the new v10 gateway service **gateway-10-1** is a v5-compatible gateway, do not specify **gateway-type**. When **gateway-type** is not specified, the mapping defaults to v5-compatible.

- d. The mapping is complete. Save the file in the same directory.

The following diagram shows the location of the new mapping.yml file in the **ccloud/** hierarchy for admin-org. Note that it is in the same directory as the gateway-service.yml file for the v5 service it applies to (**gateway-2536**).

Figure 2. Example admin-org with mapping.yml for gateway-2536 gateway service entry

When the mapping utility (**apicm archive:push**) runs, it automatically uses the new **name:** value found in mapping.yml to overwrite the v5 value found in gateway-service.yml. Note that the gateway service on v10 must be up and running

Do I have to edit the existing gateway-service.yml?

No, just create a new mapping.yml file and add it to the same directory as gateway-service.yml.

What if I want to map several v5 gateway-services to one v10 gateway-service?

If you have several v5 gateway services, and you want to map each of them to the same v10 gateway service, **gateway-10-1**, you can copy your newly edited **mapping.yml** into the directory for each gateway service. Under each gateway entry, place a copy of your new **mapping.yml**.

The following diagram shows the locations of the three copies of **mapping.yml** files (one each for **gateway-2536**, **gateway-2537**, and **gateway-2538**) in the **ccloud/** hierarchy for admin-org.

Figure 3. Example admin-org with mapping.yml files for three v5 gateway services

## Mapping a provider organization

The **apicm: archive:unpack** command produces a directory structure that includes a subdirectory for each provider organization in the original system. A provider organization named **onlinebanking** would be represented by a directory name **cloud/provider-orgs/onlinebanking**, containing a file named **provider-org.yml**:

```
api_version: 2.0.0
name: onlinebanking
org_type: provider
state: enabled
title: OnlineBanking
summary: migrated onlinebanking
metadata:
  v5_id: 5c0ebfdae4b007df531ffe40
...
```

To override the organization name (indicated by the `name` property), create a file named `mapping.yaml` in the same directory as the `provider-org.yaml` file, and include the new name to apply to the organization. Example `mapping.yaml`:

```
provider-org:
  name: digitalbanking
```

Here, the result of the override is to cause a provider organization named `digitalbanking` to be used as the target provider organization for the contents originally extracted from the `onlinebanking` organization.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Migrating OAuth Providers and OAuth secured APIs

You can migrate v5 OAuth Providers and OAuth secured APIs to your v10 API Connect deployment.

In v5 OAuth Providers are a specialized type of API that are published within products. In v10 OAuth Providers are first class objects that are directly published in the provider organization. This is applicable for both DataPower Gateway (v5-compatible) and DataPower API Gateway.

Also, v10 adds tight coupling between the API using OAuth and the OAuth provider object. Hence an API using OAuth security must link to the corresponding OAuth Provider object. For a review of how API Connect v10 uses OAuth Providers, see [OAuth Provider overview](#).

The API Connect Migration Utility (AMU) migrates all OAuth Provider APIs from v5 to the first-class OAuth provider objects on both DataPower Gateway (v5-compatible) and DataPower API Gateway.

In addition, the AMU uses logic to determine which OAuth provider is used by a given API and populates it in the newly added field `x-ibm-configuration` of API security definitions. If the AMU is unable to find a match between an API using OAuth and the OAuth provider, it prints out error messages. See [Error messages and warnings from archive:unpack](#).

- To ensure that APIs that use OAuth security definitions are mapped to the corresponding OAuth Provider APIs in v10, make sure that either the Authorization URL or the Token URL defined in OAuth Security Definitions of APIs that use OAuth correctly point to the base path of the OAuth Provider API. Note that the AMU uses logic to map Consumer APIs to Provider APIs, and adds `x-ibm-oauth-provider` in the OAuth Security Definition of the consumer API.
- To verify whether OAuth Provider APIs are migrated correctly, ensure that all the APIs that use OAuth Security Definition have the new field `x-ibm-oauth-provider` added. Check the value of that field and make sure it points to a correct OAuth Provider resource object that was created and configured in the catalog to which the API is published.
- As mentioned earlier, in v5 OAuth Providers are a specialized type of API that are published within products. In v10 OAuth Providers are instead first class objects that are directly published in the provider organization, and are not APIs that are published within products. Because of this, it is possible that you may have some v5 products that only contained OAuth Provider APIs. Since these products do not contain any Open API definitions in v10, they will not be published as all products in v10 must contain at least one Open API definition.

---

## Migrating OAuth token revocation information

In v5, token revocation could be enabled either using native token management system (TMS) or using external TMS. For migration to v10:

- Native TMS migration
  - DataPower Gateway (v5-compatible)  
If you had configured native token revocation, then you would have configured Quota enforcement peering group objects on v5 to synchronize between gateway servers. When migrating to v5-compatible, a QES peering group can contain QES peers from both v5 Multi-Protocol Gateway Service (MPGW) and v10 DataPower Gateway, so the revocation information is retained.

See the following steps to use the same QES on both v5 and v5-compatible:

1. Set up a v10 DataPower Gateway instance.
2. Cluster the v5 MPGW quota enforcement server with the v10 DataPower Gateway quota enforcement server.
  - a. In DataPower Gateway Web GUI, in default domain, navigate to `Objects > System Settings > Quota Enforcement Server`
  - b. Enable Peer group mode.
  - c. Populate IP address property with IP address.  
The IP address can be the IP address on any interface of the current appliance and must be accessible by other peers in the peer group.
  - d. Populate Peers with IP address of peers of the appliance in the peer group.  
The appliance connects to each peer in the order in which the peers are added in the list.
  - e. Apply to commit this configuration.
3. As a test, revoke a token on the v5 MPGW server.  
Revocation data will replicate to v10 DataPower Gateway quota enforcement server.
4. Migrate from v5 to v10.  
The v5 APIs are migrated to the v10 DataPower Gateway quota enforcement server.

- Send a request to the v10 DataPower Gateway quota enforcement server with previously revoked token, which should fail as expected. The expected failure indicates that the APIs were migrated and revocation data was replicated.

- DataPower® API Gateway

When migrating to API Gateway, QES is not used for native token management and revocation. A new set of objects called Gateway Peering objects are created on API Gateway. This means that any existing revocation information on QES is not available for API Gateway.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Migrating custom policies

The migration utility migrates API Connect Version 5 user-defined custom policies to API Connect Version 10. After migration, the v5 custom policies run on a v5-compatible DataPower Gateway or the DataPower API Gateway. Custom policies can be migrated to API Gateway with limitations.

---

## Overview of the custom policy file format

Review your custom policies in the `/ccloud` hierarchy that is created by the migration upack. The path to custom policies in the `/ccloud` hierarchy structure is:

```
provider-orgs -> <provider-org-name> -> catalogs -> <catalog-name> -> configured-gateway-services -> <gateway-name> -> policies
```

The following example from a `/ccloud` hierarchy shows custom policies for the catalog `policy-and-vendor-ext-test` listed under the gateway service `g-w-1-8f82`:

```
./provider-orgs/onlinebanking/catalogs/policy-and-vendor-ext-test/configured-gateway-services/  
├── g-w-1-8f82  
│   └── configured-gateway-service.yml  
│       └── policies  
│           ├── client-i-p-filter-policy-9d58-1.0.doc.yml  
│           ├── client-i-p-filter-policy-9d58-1.0.meta.yml  
│           ├── client-i-p-filter-policy-9d58-1.0.zip  
│           ├── client-i-p-filter-policy-9d58-2.0.doc.yml  
│           ├── client-i-p-filter-policy-9d58-2.0.meta.yml  
│           ├── client-i-p-filter-policy-9d58-2.0.zip  
│           ├── validate-auto-xsd-jsv-1.0.0.doc.yml  
│           ├── validate-auto-xsd-jsv-1.0.0.meta.yml  
│           ├── validate-auto-xsd-jsv-1.0.0.zip  
│           ├── validate-username-token-5.0.0.doc.yml  
│           ├── validate-username-token-5.0.0.meta.yml  
│           └── validate-username-token-5.0.0.zip
```

File naming legend:

- `*.doc.yml` - the policy definition files
- `*.meta.yml` - metadata used only by the migration utility.
- `*.zip` - the custom policy zip files

---

## Migrating custom policies to a v5-compatible gateway

A Version 5 custom policy definition is a zip file containing the yaml description of the policy (its name and configuration parameters) and the implementation zip of DataPower configuration that runs on the gateway. The zip file is pushed onto the gateway service used by any catalog that has APIs that make use of the policy. For more information on v5 custom policies, see [User-defined policies in API Connect](#).

The migration utility migrates both the zip file and the yaml description file. After migration, the v5 custom policies run on a v5-compatible DataPower Gateway. Note that the structure of the custom policy zip file is the same in v5-compatible gateway as in v5. The v5-compatible gateway runtime will run any custom policy that a v5 gateway runs.

---

## Migrating custom policies to API Gateway

**Important:** When migrating custom policies to v10 API Gateway, the v5-emulation layer is used to ease compatibility. For more information, see [v5 policy emulation limitations](#).

You can migrate v5 custom policies to API Gateway using the v5-emulation layer. The migration utility bundles custom policies and groups them by gateway service during the port step. During the push step, the custom policies are pushed to the Gateway Service with instructions for DataPower to enable the v5-emulation layer, along with any v5-emulated or wrapped policies that were specified during the port step, such as `invoke_1.5.0` or `gatewayscript_1.0.0`.

v5 policy emulation is deployed by the API Connect Gateway Service using a Gateway extensions manifest. For more information, see [Gateway extensions manifest](#).

**Note:** If porting to API Gateway using the `custom-policies-scope=catalog` parameter, and spaces are contained in the v5 backup, then any duplicate custom policies found will be discarded. The final remaining custom policy out of the duplicates when pushed using `archive:push` will be pushed to all spaces within the same catalog. This is the correct behavior of the v10 API migration utility. For more details about pushing custom policies at the catalog (space) scope, see [Importing a user-defined policy into a Catalog](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Migrating gateway extensions

Use the appropriate procedure for migrating extensions to either a v10 DataPower® Gateway (v5 compatible) or a v10 DataPower API Gateway.

---

### Migrating gateway extensions to a v10 DataPower Gateway (v5 compatible)

---

#### About this task

Follow these steps to migrate gateway extensions to a v10 DataPower Gateway (v5 compatible).

#### Procedure

Follow all migration utility steps to migrate to a v5-compatible DataPower Gateway. For instructions, see [Migration steps](#). The gateway extensions are automatically extracted as part of the `archive:unpack` step. No further manual steps are required.

#### Results

The v5 extension zip file is pushed to the DataPower Gateway (v5 compatible) service.  
Note: Only one gateway extension per gateway service can be used.

---

### Migrating gateway extensions to a v10 DataPower API Gateway

---

#### Before you begin

Note: When migrating v5 extensions to v10 API Gateway, the v5-emulation layer is used to ease compatibility for any pre-request or post-response global assemblies it contains. For more information, see [v5 policy emulation limitations](#).  
The following limitations apply to migrating gateway extensions to a v10 DataPower API Gateway.

- Post-request assemblies are not compatible with the API Gateway and cannot be migrated using this process. Pre-request, post-response, and post-error can be migrated using these steps.
- Any modifications to the DataPower v5 Multiprotocol Gateway cannot be migrated using these steps because the API Gateway does not use a Multiprotocol Gateway. The modifications will still be in the `gateway-extension.zip` that is pushed to API Manager, and the artifacts might still be imported to DataPower. These artifacts can be deleted from the DataPower appliance.
- Any load-balancer modifications cannot be migrated using these steps as the load-balancer DataPower object is not used in the same manner in the API Gateway. These artifacts can be deleted from the DataPower appliance.

#### About this task

You can migrate pre-request and post-response global assemblies contained within v5 extensions to API Gateway using the v5-emulation layer. The migration utility bundles the entire v5 extension file and groups them by gateway service during the `port` step. During the `push` step, the v5 extensions are pushed to the Gateway Service, and pre-hook and post-hook global assemblies are enabled using global policy files that were generated previously during the `port-to-apigw` step. DataPower object modifications or additions that are not v5 framework changes or load-balancer changes are also automatically imported during this step.

Global assemblies that are pre-request or post-response are utilized through the v5-emulation layer as an Assembly Function. They are referenced by the global policy files auto-generated by the migration utility during the `port-to-apigw` step.

#### Results

The `gateway-extension.zip` file is pushed to the DataPower API Gateway service.  
Note: Only one gateway extension per gateway service can be used at a time. However, the manifest extension allows a vector of multiple extensions contained within the single `gateway-extension.zip` that is pushed to the single gateway service.  
**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Migration considerations

You can optimize the migration process by reviewing the migration considerations and taking any actions that apply to your deployment.

Review the following information:

- [Limitations and workarounds](#)
- [Version 5 data that is not migrated](#)
- [Parity between Version 5 and Version 10](#)
- [Customizations to recreate](#)

---

### Limitations and workarounds

---

- For an **Admin organization**, you must be logged in as `admin` in order to migrate TLS profiles, OAuth providers, and user registries.
- The `apicm` login token expires after eight hours. If the token expires while `apicm archive:push` is running, `apicm` generates errors due to lack of the necessary access permissions. There are two workarounds:
  - Log in again and re-run `apicm archive:push`. The token is refreshed with each new login.
  - Extend the token expiration time by logging in again with an optional argument: `-expireHours=<number_of_hours>`. See [Token expiration](#).

- When migrating catalog spaces in a provider organization that uses a local user registry (LUR), ensure that the LUR is configured with the visibility setting of either **Public** or **Custom**. If set to Custom, ensure that the provider organization is selected. For information on configuring registries, see [Setting visibility for a user registry](#).
- Migration of v5 username token policy for authenticating the username token is not supported.
- Unable to publish, on v10, products that contain an API with a Swagger property using **regex** that includes "(?" in the characters for the pattern. You can expect to see an error message similar to the following:

```
(? The preceding token is not quantifiable
```

- The migration utility validates Products and APIs against the OpenAPI specification. The **archive:unpack** command issues warnings for any Product or API that fails validation. To resolve warnings, fix the Product or API and re-run the **unpack** command. Validation is not performed on draft Products and draft APIs. Example warning:

```
WARN[0019] Error validating product cloud/provider-orgs/onlinebanking/catalogs/test/products/clientipfilter-policy-test-api-1.0.0.yml:
Validation errors:
Error validating API cloud/provider-orgs/onlinebanking/catalogs/test/products/api123-1.0.0.api.yml
- Must validate one and only one schema (oneOf) (context: (root).securityDefinitions, line: 36, col: 3)
- securityDefinitions.authorizationUrl Does not match format 'uri' (context: (root).securityDefinitions.authorizationUrl, line: 0, col: 0)
```

- OAuth Provider APIs:
  - To ensure that APIs that use OAuth security definitions are mapped to the corresponding OAuth Provider APIs in v10, make sure that either the Authorization URL or the Token URL defined in OAuth Security Definitions of APIs that use OAuth correctly point to the base path of the OAuth Provider API. Note that the Migration tool uses that logic to map Consumer APIs to Provider APIs, and adds **x-ibm-oauth-provider** in the OAuth Security Definition of the consumer API.
  - To verify whether OAuth Provider APIs are migrated correctly, ensure that all the APIs that use OAuth Security Definition have the new field **x-ibm-oauth-provider** added. Check the value of that field and make sure it points to a correct OAuth Provider resource object that was created and configured in the catalog to which the API is published.
  - In v5 OAuth Providers are a specialized type of API that are published within products. In v10 OAuth Providers are first class objects that are directly published in the provider organization and are not APIs that are published within products. Because of this, it is possible that you may have some v5 products that only contained OAuth Provider APIs. Since these products do not contain any Open API definitions in v10, they will not be published as all products in v10 must contain at least one Open API definition.
- Automatic migration of vendor extensions is not supported. The v5 **dbextract** output includes the original content of vendor extensions, but this output is not automatically unpacked by the **apicm archive:unpack** command. You must use your original zip files when manually configuring vendor extensions in a v10 environment. Use the CLI to create the extensions you need. See the reference page for **apic extensions:create**: [apic extensions:create](#).
- Migration does not maintain the order of XML schema used by Map policy in API

When migrating an API with a Map policy which uses XML schema, such as for both input and output schema, the response of the API differs between v5 and v10 because the elements are presented in a different order. The results are functionally equivalent, but the change in order can be problematic if a schema validation is done against the XML and fails because the order of the elements changed.

For example, here are highest level map policy properties in v5:

```
- map:
  title: map
  inputs:
  outputs:
  actions:
```

The same properties in v10, after migration:

```
- map:
  actions:
  inputs:
  outputs:
  title: map
```

- Portal Delegated User Registry migration limitations
  - Automated migration is not supported for some v5 PDUR OIDC registries. You must manually supply the **client\_id** and **client\_secret**. See Step 6 in [Migration steps with PDUR](#).
  - LDAP User Registry - automated configuration of the registry is not supported. You can configure manually. See Step 6 in [Migration steps with PDUR](#).
- The SCIM (System for Cross-domain Identity Management) user registry type was supported in Version 4 but was deprecated for Version 5. The SCIM user registry type is not supported in v10. If data with a SCIM identity provider type is detected during migration of v5 data, the migration utility logs an error message:

```
WARN[0614] manual fix required for cloud/provider-orgs/apimteam/user-registries/scimcv/user-registry.yml:
The SCIM user registry type is no longer supported
```

Any v5 data with a SCIM identity provider type must be manually migrated. For v10, you can use OIDC with a backend user registry that supports SCIM. You must develop custom code to complete the data flow between the OIDC provider and your backend user registry. The API Connect built-in OIDC registry interacts with your OIDC provider.

- Roles limitations

Previously, in API Connect V5, it was possible to create a role (and associated permissions) at the organization level. This same role was inherited by the catalogs within this org. With the V5 inheritance model it was possible to modify the inherited role and add/remove permissions from it.

In API Connect v10 the inheritance model has changed. It is no longer possible to remove permissions from an inherited role. Because of this design change, it becomes difficult to perform a true 1-to-1 migration keeping the original parent-child relationships. For example, in V5 it was possible for an inherited role to contain less permissions than its parent role. This parent-child relationship is not allowed to exist for roles in API Connect v10.

In order to work-around this restriction, the parent-child relationship is purposely decoupled during migration. The child-level roles are treated as individual roles, separate from the original parent. However, the child-level roles cannot exist by themselves without a parent role. So, to satisfy this restriction a new artificial parent role is created for each of the children roles.

- Modifications made to default roles in v5 are not migrated to v10.

- If the v5 settings `server_name_indication` and `limit_renegotiation` are not specified, the value defaults to `true`. However if they are specified with value of `false` that value is changed to `true`. Thus the settings are always `true`.
- Custom policies and Version 5 emulated policies  
For custom policies and Version 5 emulated policies, such as the Invoke 1.5.0 policy, to be available for migrated API or OAuth provider assemblies, the Sandbox Catalog in the target provider organizations must have the associated DataPower® API Gateway service enabled; see [Creating and configuring Catalogs](#).
- Subscriptions on staged products are not be automatically migrated because in v10 staged products cannot have subscriptions on them. In order to save those subscriptions you must change the state of the product to either deprecated or published before doing the `archive:push`. You can do this either in v5 before running `dbextract`, or you can do it after the `dbextract` through mapping or editing of the product metadata and modifying the state of the product. If you have already pushed the staged product then you can publish the product in your v10 environment and rerun `archive:push` in order to migrate the subscriptions.
- The migration utility appends `-apigw` to the end of the `x-ibm-name` of APIs to maintain uniqueness from the original v5 artifacts. Therefore, custom backend services that rely on the `x-ibm-name` of the APIs to be matched must be updated to look for `-apigw` in the new API name. Alternatively, the custom backend service can be modified to strip `-apigw` from the API name.
- When migrating default catalog user registries, and migration has completed, you might see more than one catalog User Registry with the same title. Whenever a new catalog is created in v10, APIM creates a default catalog user registry. When migration takes place, the catalog user registry from v5 is migrated onto the v10 system. Both these registries end up with the same `title`. However they both have different `names`. As a result, they appear as separate user registries.

Example: If the catalog is called `test`:

- Name of user registry migrated from v5: `test-catalog`
- Name of default user registry created by APIM: `test-catalog-0`
- Title of both the user registries: `Test Catalog User Registry`

All the user data is successfully migrated onto the user registry coming in from v5. Currently you must manually update the catalog settings to use the user registry coming in from v5 as the default. You can then deselect the default user registry provided by APIM from the list of configured catalog user registries, if so desired.

If you manually create the catalog, and users already exist as a part of the default catalog user registry provided by APIM, then post migration the migrated v5 catalog user registry and the v10 default user registry can coexist, and any of them can be selected as default.

## Version 5 data that is not migrated

- APIs with LTPA policies are not migrated as this policy is not supported in v10.
- Configuration in v5 for gateway type `Microgateway` is not migrated because `Microgateway` is not supported in v10.
- Transient or conflicting configuration data is not migrated
  - Tasks that are still active are not included in the Version 5 backup. For example, lifecycle approvals or subscription approvals that have been requested but not granted.
  - Drafts on v5 that are local are not migrated. If you have draft APIs or draft products that you want migrated to v10, use `apic drafts:push` to upload them prior to starting migration. See [Working with drafts](#).
  - Pending invitees in user registries are not migrated.
  - Pending invitations for ownership of provider organization. Consumer organizations with pending ownership are migrated. If the Version 5 owner received an invitation for ownership but never accepted it, the owner identity is not migrated. This causes the organization to not be migrated. To avoid this issue, check for any unaccepted invitations prior to migration, and ensure they are accepted.
  - Conflicting user names within the same identity provider are not migrated.
  - Conflicting OAuth provider names or base paths. If the migration utility encounters conflicting names or base paths for OAuth providers, the provider is not migrated.
- OAuth Shared secret keys are not migrated unless you explicitly map them in the mapping.yml file for the gateway.
- Organizations without an active owner (user identity) are not migrated

On the Version 5 deployment, verify that the owners of provider organizations and consumer organizations are current user identities. If the user identities of the owners no longer exist the identities are not migrated. One effect of this is that if the original owner of the organization is an identity that was not migrated, the provider organization or consumer organization cannot be migrated.

- Version 5 Analytics data is not migrated

If you want to retain Version 5 analytics data, offload your Analytics prior to migrating to Version 10. Note that in Version 5 the analytics data is retained only for 90 days. For more information on Version 5 support for archiving Analytics data, see [Viewing and exporting analytics and API event data](#).

## Parity between Version 5 and Version 10

- The migration utility sluggifies the names and versions of some elements when moving from v5 to v10 to ensure that each element in v10 passed Open API schema validation and that each is uniquely named. For the names of API properties, Catalogs, Provider Orgs, Consumer Orgs, Spaces, and some other elements, any character other than `a-z`, `0-9`, or `-`, is converted to `-` and a unique suffix based on the checksum of the name or version is added. Uppercase letters are changed to lowercase, with `-` added between words. Leading `-` characters are removed, and multiple consecutive `-` characters are reduced to a single `-`. For versions of similar elements, the `.` (period) character is also allowed. Examples:

v5 name	Example migrated name on v10
<code>abc-def</code>	<code>abc-def</code> (no change)
<code>Abc</code>	<code>abc-a2c6</code>
<code>AbcDef</code>	<code>abc-def-dfc</code>
<code>abc_def</code>	<code>abc-def-c2bb</code>
<code>abc--def</code>	<code>abc-def-813d</code>
<code>-abc-def</code>	<code>abc-def-abb</code>
<code>ABC-DEF</code>	<code>abc-def-d1e</code>
v5 version	Example version on v10
<code>1.0.0</code>	<code>1.0.0</code> (no change)
<code>1.0_2</code>	<code>1.0-2-3933</code>
<code>1.0 2</code>	<code>1.0-2-913</code>
<code>1.0--2</code>	<code>1.0-2-5410</code>
<code>-1.0-2</code>	<code>1.0-2-26cf</code>

You can use `apicm sluggify <arg>` to view how a name or version will be sluggified:

```

$ ./apicm sluggify Abc
abc-a2c6
$ ./apicm sluggify -v 1.0_2
1.0-2-3933
$ ./apicm sluggify --version '1.0 2'
1.0-2-913

```

- Version 10 does not support Spaces within the Sandbox Catalog. Spaces in Sandbox Catalogs are not migrated from Version 5 to Version 10. The names of Spaces found in Version 5 Sandbox Catalogs are logged in the migration output log. You can use a mapping file to rename the Sandbox Catalogs in order to preserve Spaces.
- In v10, publish of an API will fail if `enforced` is set to `true`, and `phase` is set to either `Specified` or `Identified` instead of `Realized`. During migration the phase will be set to `Realized` in this case, so that the API can be successfully published.
- Enforcement of user subscription to an API is handled differently between v5 and v10. In v5, subscription to a product is **not** allowed in the following scenario: An API is created with `enforced` set to `false`. The API is associated with a product, the product is published, and a user attempts to subscribe to a Product or Plan from the Developer Portal. In v10, the subscription **is** allowed for this scenario. This change can affect migration because a v5 Product that could not be subscribed to in v5 can be subscribed to in v10. Note that the change in behavior for v10 accommodates the scenario where Products or Plans have multiple APIs, some of which are enforced and some of which are not enforced. The new behavior allows such Products or Plans to be subscribed to.
- In v10, the API Manager handles all authentication methods. This change eliminates the need for configuration of a catalog with a Portal Delegated User Registry (PDUR). See [Migration steps with PDUR](#).
- If OpenAPI `info.contact.email` contains more than one email address, only the first email is used by migration. If the email is not in valid RFC5322 email format then it is removed during migration.
- Provider-side applications  
In API Connect, registered applications are a fundamental concept representing an application identity known to the system. Applications have their own credential sets in the form of client ID and client secret pairs, and access to published API endpoints is governed by subscriptions associated with registered applications. Most commonly, registered applications are created by app developers belonging to a consumer organization in the context of a developer portal.

However, API Connect v5 also provides the ability for provider organizations to register and manage applications, independent of any consumer organization. Provider-owned apps behave in the same way as consumer-owned apps and carry credentials and subscriptions in exactly the same way. Customers use provider-owned applications for API testing or for cases where the app and API are owned and managed directly by the same team.

The API Connect v10.x platform API does not support the creation of provider-side apps, so migration of provider-side apps is only possible if they are converted to consumer-side apps. Each provider-side app is migrated as follows by the API Connect migration utility:

- An instance of the app including its credentials (sets of client ID and secret) is created in each catalog belonging to the provider organization.
- The app is owned by a consumer organization which is the existing Sandbox Test Organization (for the provider organization's automatically created sandbox catalog) or a consumer organization named `Catalog-name` Test Organization (for other catalogs).
- The consumer organization's owner is a user named `test-user`. This user name already exists in the context of a provider organization's automatically created sandbox catalog.
- The consumer organization's owning user belongs to a user registry named `catalog-name-test-org`.
- The subscriptions belonging to the original provider-side app are retained.

These definitions are added to the relevant locations subordinate to the `cloud/` directory that is produced by the `apicm archive:unpack` command. When an `apicm archive:push` is performed, the definitions are propagated to the target system as part of the overall configuration.

## Customizations to recreate

Version 5 provides methods to customize some configurations. After you complete the automated migration, manually reapply the following customizations.

- Customized email templates  
Customized email templates are not migrated from Version 5. You can customize email templates in Version 10 with greater flexibility and precision. See [Customizing email templates](#).
- Developer Portal customizations are not migrated to a new Drupal version  
For the Developer Portal, none of the customizations are migrated because the Version 10 Drupal 9 baseline differs greatly from the Version 5 Drupal 7 baseline. This means that custom portal themes, custom modules, custom fields, custom blocks, custom pages, and more, cannot be migrated. For more information, see [Migrating your Developer Portal from Version 5 to Version 10](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Migration troubleshooting

If you run migration and observe error messages in your log output, you can take troubleshooting steps, and run the migration again.

- [apicm command line help](#)
- [Log files for apicm](#)
- [Common errors](#)
- [Error messages and warnings from archive:unpack](#)
- [Error messages and warnings from archive:push](#)
- [Troubleshooting tips](#)
- [Failure to convert API definitions to API Gateway](#)
- [Custom policies not appearing in the policy palette after migration](#)

## apicm command line help

You can use command line help to review usage syntax for `apicm`. For example:

```
./apicm --help
API Connect Migration Utility (AMU)

Usage:
  apicm [command]

Available Commands:
  archive:apistatus  Generate stats about API use
  archive:automation  Generate summary of the data
  archive:gwstats    Generate stats about gatewayscript cmd use
  archive:port-to-apigw  Port artifacts to apigw
  archive:push       Push unpacked content to APICConnect server
  archive:unpack     Unpack a V5 management/portal archive
  help              Help about any command
  login             Log in to IBM API Connect
  sluggify          Sluggify a name or version string
  version           APICConnect migration toolkit version

Flags:
  --accept-license  Accept the license for API Connect
  -h, --help       Help for apicm
```

Use "`apicm [command] --help`" for more information about a command.

Example usage for more information about a command:

```
$ ./apicm archive:push --help
Push unpacked content to APICConnect server
```

```
Usage:
  apicm archive:push CLOUD_MANAGER_ENDPOINT/API_MANAGER_ENDPOINT ARTIFACT_PATH
```

Locate `CLOUD_MANAGER_ENDPOINT` and `API_MANAGER_ENDPOINT` in the `apiconnect-up.yml` file used during `apic` install [flags]

```
Flags:
  --apigw-only          Only attempt to push APIGW artifacts
  --catalog strings    Provide a comma separated list of catalogs to push (e.g. --catalogs=cat1,cat2)
  --dry-run            Prepare the working directory but do not push to server
  -h, --help           help for archive:push
  --no-drafts         No draft APIs or Products will be pushed to the server
  -f, --overwrite     Overwrite draft APIs and products, published APIs and products,
                      and OAuth providers if they exist on the server
  --saveDebugLog string[="default"]  Debug logs are saved by default to logs/debug/archive-push<timestamp>debug.log
  --saveErrorLog string[="default"]  This flag saves the file with a custom name (e.g. --saveDebugLog=debugLog.txt)
  --saveInfoLog string[="default"]  Error logs are saved by default to logs/archive-push<timestamp>error.log/
  --saveInfoLog string[="default"]  This flag saves the file with a custom name (e.g. --saveErrorLog=myLog.txt)
  --saveInfoLog string[="default"]  Info logs are saved by default to logs/archive-push<timestamp>info.log
  --saveInfoLog string[="default"]  This flag saves the file with a custom name (e.g. --saveInfoLog=myLog.txt)
```

```
Global flags:
  --accept-license  Accept the license for API Connect
```

## Log files for `apicm`

The `apicm` command creates log files that you can use to review messages produced by the `unpack` and `push` actions. All logs are saved in the `logs` directory. Unique files are saved for each run. All default log names can be overridden via the command line.

### Error log

Includes all warning and error level messages.

Error logs are saved by default to:

- `logs/archive-unpackerror.log/`
- `logs/archive-pusherror.log/`
- `logs/archive-port-to-apigwerror.log/`

You can optionally give the file a different name:

```
apicm --saveErrorLog= '<filename>'
```

For example:

```
apicm archive:unpack apic33-2020-02-19-1650.tar.gz --saveErrorLog= 'unpack.txt'
```

This command creates a file `unpack.txt` in the `logs` directory:

```
~/example/migration-cli/logs/unpack.txt
```

### Info Log

Includes all info, warning and error level messages.

Info logs are saved by default to:

- `logs/archive-unpackinfo.log/`
- `logs/archive-pushinfo.log/`
- `logs/archive-port-to-apigwinfo.log/`

You can optionally give the file a different name:

```
apicm --saveInfoLog= '<filename>'
```

For example:

```
apicm archive:unpack apic33-2020-02-19-1650.tar.gz --saveInfoLog= 'unpack_info.txt'
```

This will create a file `unpack_info.txt` in the logs directory:

```
~/example/migration-cli/logs/unpack_info.txt
```

Default path for info logs?

#### Debug Log

Includes all info, warning, error and debug level messages. If you encounter errors or limitations that are not documented on this page, access the debug log. Debug logs are saved by default to:

- `logs/debug/archive-unpackdebug.log`
- `logs/debug/archive-pushdebug.log`
- `logs/debug/archive-port-to-apigwdebug.log`

Contact your IBM representative for help with using the Debug log.

## Common errors

You can use the `--saveErrorLog` flag to specify that all the errors are saved in a file in `logs` folder, as described in [Saving the error log](#). Common errors:

- Long chain of error messages hours into a **push**:  
This scenario typically occurs due to expiration of an authentication token. To resolve this issue, either reauthenticate and or extend the token timeout. See [Token expiration](#).
- Unable to find User Registry when migrating (pushing) a provider-org:  
Occurs when the `admin-org` user registry artifacts are not shared prior to pushing provider organization artifacts. To resolve the issue, use the cloud admin account to change the visibility of the registry to `public`, and **push** the provider organization again.
- Unable to find `xxxx` when migrating (pushing) a provider organization:  
Occurs when `admin-org` artifacts are not pushed prior to pushing provider organization artifacts. Ensure that all of admin org data is pushed without errors, and then **push** your provider organization again.
- Unable to create an identity provider portal-delegated-identity-provider `xxxx` because the PDUR backup data is not provided.  
This error occurs if certain Portal delegated user registries are missing from the PDUR extract provided. If the missing user registries are not no longer used, they can be skipped. If they are still used, you must create a fresh backup of the PDUR.
- Unable to create product `xxxx`. The OpenAPI definition `<xyz>` requires the policy `<sample-policy>` that is not configured on the gateway-service `<sample-gateway>`:  
This error occurs when the specified policy is not configured on the gateway for the catalog that contains the product. To resolve this, you must configure, on the v5 system, the specified policy on the gateway for the catalog, and re-extract the data.
- Fixing API Errors  
Example:

```
WARN[2002-01-10T15:06:16-05:00] AMUUAU005W: product oauth-apis:1.0.0 requires updating before it can be pushed to a target system
Reason: product oauth-apis:1.0.0 includes content with validation errors:
Error validating API cloud/provider-orgs/onlinebanking/catalogs/oauthcatalog/products/api050-1.0.0.api.yml
- Must validate one and only one schema (oneOf) (context: (root).securityDefinitions, line: 35, col: 3)
- securityDefinitions.authorizationUrl Does not match format 'url' (context: (root).securityDefinitions.authorizationUrl, line: 0, col:0)
```

For example, where the issue is in the API:

```
securityDefinitions:
  ClientID:
    in: query
    name: client_id
    type: apiKey
  OAuthDef:
    authorizationUrl: ""
    description: ""
```

- v5 emulated policies and custom policies not deployed to gateway. Make sure the following was done during the migration steps:
  - xml-manager is enabled in default domain of all gateways
  - Mapping of gateways was done before the porting step
  - gateway-extension.zip shows up under `cloud/admin-org/availability-zones/availability-zone-default/gateway-services/<gw-name>/gateway-extension.zip`
  - Ensure push of admin-org is done after all of the above is verified
- Missing Subscriptions  
One of the causes for missing subscriptions could be that the products associated with those subscriptions have not been created successfully. Make sure to check the logs and see if there have been any errors during creation of those products. Please also note in these cases there would be no logs related to those missing subscriptions.

## Error messages and warnings from `archive:unpack`

"AMUUAU000E": "The migration tool failed to initialize."

The migration utility could not access files or directories needed to establish its working environment. Ensure that file permissions allow write access to the current working directory and that the cloud directory is empty or non-existent.

"AMUUAU001E": "The `{{.Type}} {{.Name}}` contains content that could not be unpacked and will not be included."

The migration utility is unable to read the API Connect v5 representation of an object in the migration archive. This content is skipped and will not appear in the unpacked migration data.

"AMUUAU002F": "The archive content at `{{.DocPath}}` cannot be read."

The migration utility is unable to read the internal contents of a collection in the API Connect v5 migration archive. This is likely to indicate a corrupt migration archive file. The archive:unpack operation cannot be completed.

"AMUUAU003E": "The portal delegated user registry file {{.File}} cannot be unpacked and will be skipped."

The migration utility is unable to read a PDUR archive. User information associated with this user registry will not be included in the unpacked migration contents.

"AMUUAU004E": "The archive content at {{.FilePath}} cannot be read and will not be unpacked."

The migration utility is unable to read the internal contents of an individual file in the API Connect v5 migration archive. This is likely to indicate a corrupt migration archive file. This content is skipped and will not appear in the unpacked migration data.

"AMUUAU005W": "{{.Type}} {{.Name}} requires updating before it can be pushed to a target system."

The migration utility has unpacked a configuration object for which modifications are required because the content is incorrect or missing information required by a target API Connect v10 system. The unpacked file must be updated by the user before it can be published successfully to the target system.

"AMUUAU006W": "The {{.Type}} {{.Name}} has been linked to OAuth provider {{.Provider}}. Please update the security definition {{.Security}} if another OAuth Provider should be used instead."

The migration utility has added a reference from an OAuth security definition in the named API to an OAuth provider resource. The migration utility uses the authorization URL, token URL and scope information where possible to determine which OAuth provider resource is to be used with each OAuth-secured API. In some cases, the migration utility cannot accurately determine which OAuth provider is intended for use with a particular API. The OAuth provider reference can be modified if needed by editing the security definition in the unpacked API file and changing the x-ibm-oauth-provider property value to match the intended OAuth provider resource. The reference value is a relative file path that identifies an unpacked OAuth provider resource.

"AMUUAU007W": "The {{.Type}} {{.NameVersion}} could not be linked to an OAuth provider. Please update the security definition {{.Security}} to select an OAuth provider."

The migration utility has been unable to add a reference from an OAuth security definition in the named API to an OAuth provider resource.

The migration utility uses the authorization URL, token URL and scope information where possible to determine which OAuth provider resource is to be used with each OAuth-secured API. In some cases, the migration utility cannot accurately determine which OAuth provider is intended for use with a particular API. The OAuth provider reference can be added by editing the security definition in the unpacked API file and setting the x-ibm-oauth-provider property value to match the intended OAuth provider resource. The reference value is a relative file path that identifies an unpacked OAuth provider resource.

"AMUUAU008W": "{{.Type}} {{.Name}} could not be introspected for OAuth provider API references."

The migration utility has attempted to determine which OAuth providers should be configured in support of an API product, but a reference to an OAuth provider API in the product cannot be correlated with an OAuth provider resource.

"AMUUAU009W": "{{.Type}} {{.Name}} contains invalid content that cannot be unpacked."

The migration utility has encountered an entry in the API Connect v5 migration archive that contains unexpected or corrupt data. This content is skipped and will not appear in the unpacked migration data.

"AMUUAU010E": "{{.Type}} {{.Name}} cannot be unpacked to the local filesystem."

The migration utility has attempted to unpack an entry in the API Connect v5 migration archive that could not be written to the local filesystem during the archive:unpack operation. This may be the result of a local file permissions problem, an unexpectedly long file name resulting from the unpack, or a shortage of space on the local filesystem.

"AMUUAU011E": "{{.Type}} {{.Name}} contains a {{.Target}} reference that cannot be resolved."

The migration utility has encountered a SOAP API entry in the API Connect v5 archive that refers to a WSDL definition that cannot be found in the archive. This entry will not be included in the unpacked content.

"AMUUAU012W": "The {{.Type}} {{.Name}} contains a {{.Target}} reference that cannot be resolved."

The migration utility has encountered an entry in the API Connect v5 archive that refers to another entry that cannot be found in the archive. This entry will not be included in the unpacked content.

"AMUUAU013E": "Portal delegated user registry information could not be loaded for user registry {{.Name}}."

The migration utility has encountered a portal delegated user registry definition in the API Connect v5 archive for which no PDUR file name has been provided as an argument to the archive:unpack command. The user registry contents will not be included in the unpacked content.

"AMUUAU014E": "The migration tool failed to load content for the admin organization."

The migration utility was unable to find the admin organization while unpacking provider organization information in the API Connect v5 archive. This is likely to result in further errors while unpacking the provider organization contents.

"AMUUAU015E": "The migration tool failed to load provider organization contents."

The migration utility was unable to find the load provider organization contents while unpacking the API Connect v5 archive. This message indicates an internal error with the migration utility.

"AMUUAU016E": "The {{.Type}} information belonging to organization {{.Org}} could not be unpacked."

The migration utility was unable to process the provider organization contents while unpacking the API Connect v5 archive. This message indicates an internal error with the migration utility.

"AMUUAU017W": "The settings update for {{.Type}} {{.Name}} could not be completed."

The migration utility was unable to update the settings for a configuration object while unpacking the API Connect v5 archive.

"AMUUAU018E": "Apps belonging to provider organization {{.Org}} could not be converted to consumer apps."

The migration utility was unable to convert registered applications belonging to the provider organization into applications in each catalog. The conversion occurs because the representation of applications differs between API Connect v5 and API Connect v10. This message indicates an internal error in the migration utility.

"AMUUAU019W": "User registry {{.UserRegistryName}} must be migrated to a different user registry type."

The migration utility has encountered a user registry in the API Connect v5 migration archive that is not directly supported in API Connect v10. User entries can be migrated if a mapping file is used to override the user registry name and refer to another user registry that has been created in the target API Connect v10 environment.

"AMUUAU020W": "User {{.User}} in portal delegated user registry {{.Registry}} is not associated with any OIDC provider and will be skipped."

The migration utility has encountered a user entry in the API Connect v5 migration archive that belongs to a portal delegated user registry but cannot be associated with any backing identity provider. This can occur if no PDUR export file has been provided, or if the user entry information is incomplete.

"AMUUAU021W": "The TLS profile {{.Name}} includes an unsupported protocol {{.Protocol}} that will not be included in the configuration."

The migration utility has encountered a TLS profile entry in the API Connect v5 migration archive that uses a protocol that is not supported in the API Connect v10 environment. This protocol will be omitted from the unpacked entry for the TLS profile.

"AMUUAU022W": "User {{.UserName}} ({{.ID}}) will need a password reset"

The migration utility has encountered a user entry in the API Connect v5 migration archive that is associated with a local user registry but does not have a password configured. The user entry will be migrated, but the user's password reset must be reset before logging in. This may occur when user registry mappings are used to migrate users to a local user registry from some other user registry type.

"AMUUAU023W": "Uniqueness of names cannot be guaranteed when using the --sluggify-no-checksum option during unpack"

he archive:unpack command has been invoked with an option that could in unusual cases result in duplicate names being used for different unpacked entries. This is likely only for names with near-identical spelling but differ only in their use of upper and lower case letters or symbols that are converted to a hyphen during the unpack process. If duplicate names appear for entries of the same type in the same context, further messages indicating problems with the duplicate will appear.

"AMUAU024E": "The stats summary could not be generated"

The migration utility was unable to produce information listing the total numbers of entries of different types that were unpacked from the API Connect v5 migration archive. This message indicates an internal error in the migration utility.

"AMUAU025W": "{{.Type}} {{.Name}} contains an invalid value that will be removed."

The migration utility has encountered an entry in the API Connect v5 migration archive that contains a value that is not valid for the property in which it appears. The invalid value is automatically removed. This can occur with values such as email or URL properties that contain values that do not match the required format.

"AMUAU026W": "{{.Type}} {{.Name}} contains an invalid value that will be replaced."

The migration utility has encountered an entry in the API Connect v5 migration archive that contains a value that is not valid for the property in which it appears. The invalid value is automatically corrected. This can occur with values such as email or URL properties that contain values that do not match the required format.

"AMUAU027W": "The product subscription {{.Name}} cannot be pushed to the target system."

The migration utility has encountered a subscription entry in the API Connect v5 migration archive that refers to a product that is in a state that does not allow subscriptions. The subscription is removed and will not appear in the unpacked data.

## Error messages and warnings from archive:push

"AMUAP001E": "The {{.Type}} {{.Name}} contains nested content that cannot be published."

The migration utility is unable to read or load nested configuration content during the archive:push operation. After the migration unpack has been completed, some configuration objects are comprised of a directory with one or more nested files. For example, information about catalogs in their unpacked form consists of a directory with a name matching the catalog name, and a nested catalog.yml and catalog-settings.yml file. This message indicates that one or more of these files cannot be opened or loaded.

"AMUAP002E": "The {{.Type}} {{.Name}} cannot be published."

The migration utility is unable to read or load configuration content during the archive:push operation. This message indicates that the file representing the named configuration object is unreadable or contains unexpected content.

"AMUAP003W": "Skipping mapping file {{.Name}}."

The migration utility found a mapping file (mapping.yml) with invalid contents. The archive:push operation proceeds as if this mapping file were not present.

"AMUAP004E": "The file {{.Filepath}} could not be loaded and will not be published."

The migration utility is unable to read or load configuration content during the archive:push operation. This message indicates that the file representing a configuration object cannot be read or loaded.

"AMUAP005E": "The file {{.Filepath}} contains references that could not be loaded and will not be published."

The migration utility is unable to read or load configuration content during the archive:push operation. This message indicates that the file representing a configuration object cannot be read or loaded.

"AMUAP006E": "Unable to update reference to {{.Path}} in file {{.File}}."

The migration utility is unable to resolve a reference in the named file to another configuration object. This message indicates that the content in the file refers to other objects that are not found in the unpacked content, or the referenced content is not of the expected format.

"AMUAP007E": "The {{.Type}} {{.Name}} cannot be published because of a missing prerequisite."

The migration utility is unable to publish the named object because it refers to another object that cannot be found in the target API Connect system. This message indicates that the object contains an incorrect reference, or that the referenced object has not been successfully created or has been deleted from the target system.

"AMUAP008W": "The update to the {{.Type}} {{.Name}} could not be verified and may not have been successful."

The archive:push operation has attempted to update an object in the target API Connect system, but the results of the update were not received or indicated an error. This can occur in the event of a network interruption or timeout between the migration utility and the target API Connect system. If this occurs, it is safe to retry the archive:push operation; the same update will be attempted.

"AMUAP009E": "The {{.Type}} {{.Name}} was not published because it could not be checked in the target system."

The migration utility has attempted to check the existence of an object in the target API Connect system, but the check did not complete successfully. The migration utility will not overwrite objects in the target system if it cannot successfully determine whether or not a conflict will occur.

"AMUAP010W": "The creation of the {{.Type}} {{.Name}} could not be verified and may not have been successful."

The migration utility has attempted to create an object in the target API Connect system, but the results of the creation were not received or indicated an error. This can occur in the event of a network interruption or timeout between the migration utility and the target API Connect system. If this occurs, it is safe to retry the archive:push operation; if the named object was created, then it will subsequently be skipped unless the overwrite option is used.

"AMUAP011W": "The deletion of the {{.Type}} {{.Name}} could not be verified and may not have been successful."

The migration utility has attempted to delete an object in the target API Connect system, but the results of the deletion were not received or indicated an error. This can occur in the event of a network interruption or timeout between the migration utility and the target API Connect system. If this occurs, it is safe to retry the archive:push operation.

"AMUAP012W": "The ownership transfer of the {{.Type}} {{.Name}} could not be verified and may not have been successful."

The migration utility has attempted to transfer ownership of an object in the target API Connect system, but the results of the ownership transfer were not received or indicated an error. This can occur in the event of a network interruption or timeout between the migration utility and the target API Connect system. If this occurs, it is safe to retry the archive:push operation.

"AMUAP013E": "The endpoint settings for catalog {{.Name}} could not be updated."

The migration utility has attempted to update the endpoint settings for a catalog in the target API Connect system, but the update was not successful. This can occur if the catalog settings refer to a gateway service for which the configuration cannot be found in the unpacked migration contents.

"AMUAP014E": "The {{.Type}} {{.NameVersion}} could not be {{.Action}} in the target system."

The migration utility has attempted to create or modify an object in the target API Connect system, but the target system returned an error. The reason associated with the message indicates the error returned by the server.

"AMUAP015E": "The gateway extension for the gateway service {{.Name}} could not be published."

The migration utility has attempted to publish a gateway extension zip to the target API Connect system, but the target system returned an error. The reason associated with the message indicates the error returned by the server.

"AMUAP016W": "The OAuth shared secret for the gateway service {{.Name}} could not be updated."

The migration utility has attempted to update the OAuth shared secret for a gateway service in the target API Connect system, but an OAuth shared secret was previously set. The migration utility will not overwrite an OAuth shared secret that has already been set.

"AMUAP017W": "The product {{.NameVersion}} could not be validated and may contain errors."

The migration utility has attempted to validate a product before publishing, but the validation operation did not complete successfully. If validation errors are present in the product file, then the publish to the target API Connect system will not be successful.

"AMUAP018W": "The product {{.NameVersion}} contains API {{.APIName}} that could not be validated and may contain errors."

The migration utility has attempted to validate the APIs in a product before publishing, but the validation operation did not complete successfully. If validation errors are present in the API file, then the publish to the target API Connect system will not be successful.

"AMUAP019W": "The product {{.NameVersion}} contains validation errors: {{.Errors}}"

The migration utility has validated the content of a product before publishing, and the validation revealed errors in the product file contents. The product cannot be published to the target API Connect system unless the validation errors in the product file are corrected.

"AMUAP020W": "The product {{.NameVersion}} contains an API {{.APINameVersion}} with validation errors: {{.Errors}}"

The migration utility has validated the content of a product and its associated APIs before publishing, and the validation revealed errors in the API file contents. The product cannot be published to the target API Connect system unless the validation errors in the API file are corrected.

"AMUAP021W": "The product {{.NameVersion}} contains API content that could not be updated."

The migration utility has attempted to update the state of an API in the named product, but the metadata file (\*.api.meta.yml) containing extra API attributes could not be read or contained unexpected content.

"AMUAP022W": "Subscription {{.Name}} will not be published."

The migration utility has encountered a subscription for which the subscribed product cannot be found. The subscription cannot be created in the target API Connect system.

"AMUAP023W": "The user registry {{.Name}} cannot be published."

The migration utility has encountered a user registry object that cannot be published to the target API Connect system. This can occur for user registry types that may appear in an API Connect v5 system but are not directly supported in API Connect v10. A mapping file in the unpacked user registry directory may be used to identify an alternative user registry into which user entries can be migrated.

"AMUAP024I": "Subscriptions for the product {{.NameVersion}} will not be published."

The migration utility has encountered a product that contains no subscribable APIs. This can occur when a product originating in API Connect v5 contains one or more OAuth provider APIs, and no REST or SOAP APIs. OAuth provider APIs are converted to OAuth provider resources by the archive:unpack operation, and do not appear as APIs in API Connect v10. OAuth provider instances in API Connect v10 use subscription information associated with the REST or SOAP APIs that refer to the OAuth provider in a security definition.

## Troubleshooting tips

- The migration utility may have issues when running across a VPN. The connection might fail if you use a corporate VPN to attempt to access an API Connect subsystem (API Manager UI) located behind an internet firewall. To workaround this problem, add the IP addresses of the API Connect management server and API manager to your local /etc/hosts.
- Token expiration: By default, the `apicm` login token expires after eight hours. If the token expires while `apicm archive:push` is running, `apicm` generates errors due to lack of the necessary access permissions. In this case, log in again and re-run `apicm archive:push`. (The token is refreshed every time you log in.) Optionally, you can extend the token expiration time when logging in as the admin user:

```
apicm login --expireHours=<number_of_hours>
```

The `expireHours` flag overrides the default authentication token expiration of 8 hours. Use this flag when pushing data sets that take longer than 8 hours to complete. Note that the revised value persists after the session ends. Best practice is to revert the value to the default (8 hours) after migration.

- If your prior migration created an incorrect artifact on v10, you may have to manually remove the artifact before re-running migration. If you use the `--overwrite` flag when running additional `archive:push` commands, existing OAuth Providers, draft products, draft APIs, and published products and their APIs will be overwritten.
- When you re-run migration, the utility will not recreate any artifacts that already exist on v10 unless the `--overwrite` flag is used for OAuth Providers, draft products, draft APIs, and published products and their APIs. If a collision occurs for other artifacts or if the `--overwrite` flag was not used, the older artifact takes priority. Also, the utility will not delete any artifacts from v10. Thus, you can re-run migration to cover any gaps in artifact creation on v10 without affecting existing artifacts.
- The steps you need to take depend on whether you need to change the v5 export data. For example, if you need to publish or replace a v5 API, you need to export the v5 data and run `unpack` again. If you do not need to change the v5 data, you can skip those steps.

Example 1: Re-using the v5 export data

For example, your v5 export data is accurate and current, but you migrated a consumer-org that is no longer needed on v10, and you mapped a catalog to an incorrect name. Complete the following steps:

1. Delete the incorrect artifacts from the v10 deployment /`cloud` directory. For this example, delete the unneeded consumer-org and the incorrectly named catalog.
2. Edit the contents of the /`cloud` directory as needed. For example, remove the unneeded consumer-org entry.
3. Edit your mapping entries as needed. For example, remap the catalog name.
4. Run `apicm archive:push <server> <project_directory>`.

Example 2: Revising v5 export data

In this example your v5 export data is not current because you want to publish or replace a v5 API and then migrate it to v10. Complete the following steps:

1. On v5, recreate the export data: `config dbextract sftp <host_name> user <user_name> file <path/name>`
2. On v10, delete the /`cloud` directory.
3. Run `apicm archive:unpack` to create the v10 hierarchy in /`cloud` directory.
4. Recreate any edits you made to the /`cloud` directory.
5. Recreate any mappings.
6. Run `apicm archive:push <server> <project_directory>`.

## Failure to convert API definitions to API Gateway

When you change gateway types from DataPower Gateway (v5-compatible) to DataPower API Gateway, you use `./apicm archive:port-to-apigw <path>` to convert API definitions to API Gateway format. The conversion requires Node version 14.20.0 or greater. If Node is not installed, this error is displayed:

```
ERRO[0000] Error getting node version: exec: "node": executable file not found in $PATH
```

If an unsupported version of Node is installed, an error is displayed as in the following example:

```
ERRO[0000] Node version installed must be >=14.20.0. Currently installed version: 4.9.1.
```

To resolve the error, install Node and re-run the command.

To view the conversion step, see [Migration steps without PDUR](#) or [Migration steps with PDUR](#). For information about the conversion, see [Reviewing APIs converted to DataPower API Gateway](#).

## Custom policies not appearing in the policy palette after migration

If you are migrating to v10.0.1.3 or earlier, or v10.0.2.0 or earlier, follow these steps to have custom policies appear in the policy palette in the API Manager Assembly UI.

1. Open `gateway-extension.zip` in the `cloud/admin-org/.../<gateway-service>` folder that is generated in `admin-org` after `port-to-apigw` is run.
2. Open the `manifest.json` file.
3. Edit the `manifest.json` file to specify the implementation files for the custom policies to push to the sandbox catalog.  
Add entries for the sandbox catalog for all provider-orgs using the format `<provider-org>_<catalog-name>`. The filename can remain the same for each respective provider-org, as it will be the same custom policy. Ensure that the actual file that the filename is pointing to in the .zip file exists. The same filename can be re-used multiple times in the `manifest.json` to add the sandbox entries for the custom policy. Only the `manifest.json` must be edited. You do not need to edit any of the .zip files in the `gateway-extension.zip` package.
4. Save the `manifest.json` file and zip it.
5. If the `archive:push` was already performed before step 1, then delete the `gateway-extension.zip` file from the gateway using the API Connect toolkit command `apic gateway-extensions:delete`.
6. Push `admin-org`, which pushes the updated `gateway-extension.zip` file.
7. Follow these steps to ensure that the API Manager advertises the custom policy that is being pushed.
  - a. In each of the provider orgs in the cloud folder, navigate to the `catalog-scoped-staging` folder and log in to the API Connect toolkit as a provider-org user.
  - b. Run this command on every .zip file that you want to appear in the policy palette in the v10 UI:  

```
apic policies:create -c sandbox --configured-gateway-service -o -s $API_SERVER_URL --scope catalog .zip
```The `gateway-service` name is under Topology. `$API_SERVER_URL` is the same one you use to log in to the API Connect toolkit. The custom policy zip filename will appear in the `catalog-scoped-staging` folder.
8. Navigate to the API Manager UI and check the assembly policy palette. The custom policies should now appear in the list. You do not need to push the provider orgs.

If you are migrating to v10.0.1.4 or later, v10.0.3.0 or later, follow these steps to have custom policies appear in the policy palette in the API Manager Assembly UI.

1. After the migration of `admin-org` and `provider-orgs` has completed, navigate to the API Manager UI.
2. While editing a draft API, click the gear icon next to the offline button. A pop-up should appear.
3. Select the target-catalog to publish the draft API to. The target-catalog must already have the custom policies pushed to it.
4. Select the Application to use for the API.
5. Click Save.
6. Navigate to the Assembly policy palette. The custom policies for that specific target-catalog should now appear. For more details about these steps, see [Specifying the testing preferences for an API](#).

When artifacts such as `provider org`, `space` or `catalog` are mapped, any warning or error messages for artifacts in subdirectories underneath those may have the location incorrect. The location will include the mapped artifact location instead of the original location.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Migrating v10 to another form factor

Migrate an API Connect v10 deployment from one form factor to another form factor.

- [v10 migration overview](#)  
Use migration scripts to migrate API Connect to another form factor, or to a different deployment on the same form factor.
- [v10 migration requirements](#)  
Ensure your deployment meets the migrations prerequisites and requirements.
- [v10 migration steps](#)  
Complete the steps that are required for your v10 migration path.
- [v10 migration troubleshooting](#)  
Troubleshoot problems with v10 migration.
- [Shutting down the Postgres database](#)  
Shut down the Postgres database to ensure no changes are made to the database during migration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## v10 migration overview

Use migration scripts to migrate API Connect to another form factor, or to a different deployment on the same form factor.

Scripts are run from a client machine which has access to the Kubernetes or OpenShift cluster. Scripts are supported on Linux and macOS.

It is recommended to review all the documentation before starting a v10 migration.

Overview topics:

- [Migration terminology used in this documentation](#)
- [Location of v10 migration scripts](#)
- [Supported v10 migration paths](#)
- [v10 migration planning](#)

## Migration terminology used in this documentation

This documentation uses the following terms for migrations:

- v10 migration

The term **v10 migration** includes:

1. Migration of a v10 API Connect deployment to a v10 API Connect deployment on a different platform.
2. Migration of a v10 API Connect deployment to a v10 API Connect deployment in a different cluster on the same platform.  
Applicable to native Kubernetes, OpenShift, and Cloud Pak for Integration.
3. Migration of a v10 API Connect deployment to a Cloud Pak for Integration deployment.
4. Migration of a Cloud Pak for Integration deployment to a Cloud Pak for Integration deployment on a different cluster.  
Note that Cloud Pak for Integration is deployed only on the OpenShift platform.

- Form Factor and Form Factor Migration.

The term **Form Factor** is used in v10 migration to characterize a cluster deployment on a particular platform.

Each of the migrations included in the definition for **v10 migration** is a movement of an existing v10 deployment to a different **Form Factor**.

The term **Form**

**Factor Migration** is another term for **v10 migration**. It refers to different software deployments. Usage of the term **form factor** in this documentation does not refer to any hardware form factors.

- Platform

The term **platform** is used to mean either native Kubernetes, VMware virtual machine, OpenShift Container Platform, or Cloud Pak for Integration.

- Migration

In the v10 API Connect documentation, the term **migration** is also used for scenarios for migrating from API Connect v5 to API Connect v10. Note that migrating from v5 to v10 is unrelated to moving a v10 deployment to a different form factor.

To view instructions for migrating from v5 to v10, see [Migrating a Version 5 deployment](#).

## Location of v10 migration scripts

You can obtain the scripts from Fix Central. Obtain the following package:

`apiconnect-operator-release-files_VERSION_NUMBER/helper_files/formFactorMigration`

To access the latest version, see the [What's new in the latest release](#) page. On that page, locate the Note: *You can access the latest files from <URL link>*. Select the <URL link> to go directly to the Announce page on Fix Central, where you can download files for the latest version of API Connect.

## Supported v10 migration paths

The supported migration paths cover two use cases:

- Migrating from a source system on one form factor to a target system on another form factor.
- Migrating from a source system on one form factor to a target system on the same form factor, when there is a change in hostnames.

Important: The API Connect version on the target system must match the API Connect version on the source system.

Table 1. Supported migration paths for API Connect v10

| Source deployment platform of API Connect v10 | Target deployment platform, based on API Connect v10                                       |
|---|--|
| Kubernetes                                    | Cloud Pak for Integration  |
| Kubernetes                                    | OpenShift Container Platform   |
| Kubernetes                                    | Kubernetes, when moving to a different v10 cluster, resulting in hostname changes          |
| VMware  | Cloud Pak for Integration  |
| VMware  | OpenShift Container Platform   |
| OpenShift Container Platform                  | Cloud Pak for Integration, using the same hostnames  |
| OpenShift Container Platform                  | Cloud Pak for Integration, moving to a different cluster, resulting in hostname changes    |
| OpenShift Container Platform                  | OpenShift Container Platform, moving to a different cluster, resulting in hostname changes |
| Cloud Pak for Integration                     | Cloud Pak for Integration, moving to a different cluster, resulting in hostname changes    |

## v10 migration planning

Consider the following information when planning a v10 migration:

- **Data migration**

There are two ways to migrate data:

- Perform complete migration of data:

Before starting migration steps on the target system, have the target system ready with the same or larger topology than what is present in the source system. This means the number of Gateways, Portals, and Analytics subsystems must be same or more than what is present in the source system. Start the migration process, map the endpoints between source and target systems, and complete the migration process. All data is migrated. The target system must be validated and tested.

If you do not want to migrate data for some subsystems on the source systems, skip those endpoints in the mapping. Then, after migration is complete, manually delete the data from Cloud Manager and the API Manager UI.

- o Perform migration in more than one step

In this scenario, at the time of migration the target API Connect target system does not have all the subsystems ready when compared to the total number of subsystems in the source system. Migration is run only for the Gateway and Portal subsystems which are available. At this point, the target system will still have some stale data related to the subsystems which are not migrated. You can then create additional subsystems (Gateways, Portals, or Analytics) on the target system, and run the necessary migration steps to complete the remaining migration process.

- If additional Gateways or Analytics are added after completing the initial migration, you must:
  1. Add the new Gateway and Analytics related endpoints in the mapping file.
  2. Register Gateways and Portals on the target system. Complete Step 3 in [Restoring the target system](#)
  3. Update gateways in the catalog to point to new Gateway systems. Complete Step 6 in [Restoring the target system](#)
- If additional Portals added after completing the initial migration, you must:
  1. Add the new Portal related endpoints in the mapping file.
  2. Register gateways and portals on the target system. Complete Step 3 in [Restoring the target system](#)
  3. Update portals in the catalog to point to new portal systems. Complete Step 4 in [Restoring the target system](#)
  4. Restore portal backups for each site on the namespace where the new portal is installed. Complete Step 5 in [Restoring the target system](#)
- The stale data for which migration is not complete will remain on the target system until you install the additional subsystems and complete migration, or until you use the Cloud Manager or API Manager UI to manually delete it.

- Reuse of Gateways from the source system:

1. Export the ingress-ca secret from source system using the `-export_cert` flag in [Preparing the source system](#). The secret is saved to `data/MANAGEMENT_SUBSYSTEM_NAME/ingress-ca_secret.yaml`
2. Install the ingress-ca secret manually on the target cluster. This step must be completed before you begin [Installing the target system](#).
  - The top CR name you are going to use while installing API Connect must be used while creating the secret name and its contents.
  - The name of the ingress-ca secret must be `TOP_CR_NAME-ingress-ca` in case of OpenShift or CP4I. For Kubernetes, it must be `ingress-ca`
  - An example of an `ingress-ca` secret is given in the following example. Replace `TOP_CR_NAME` with the top CR name you are going to use to install API Connect. For Kubernetes, all the values will be just `ingress-ca`.
  - After modifying the contents of `ingress-ca` and saving the yaml, create the secret using `oc create -f filename.yaml -n NAMESPACE`

```
apiVersion: v1
data:
  ca.crt: CA_CERT
  tls.crt: TLS_CERT
  tls.key: TLS_KEY
kind: Secret
metadata:
  annotations:
    cert-manager.io/alt-names: ''
    cert-manager.io/certificate-name: TOP_CR_NAME-ingress-ca
    cert-manager.io/common-name: ingress-ca
    cert-manager.io/ip-sans: ''
    cert-manager.io/issuer-group: ''
    cert-manager.io/issuer-kind: Issuer
    cert-manager.io/issuer-name: TOP_CR_NAME-self-signed
    cert-manager.io/uri-sans: ''
  name: <TOPCR>-ingress-ca
type: kubernetes.io/tls
```

3. Run the migration steps, starting with Step 1 in [Installing the target system](#). Install API Connect, using the same TOP\_CR\_NAME, by following the remainder of the steps in [Installing the target system](#).
4. When you complete [Restoring the target system](#), do not map the source system gateways that are to be reused. Just skip them.
5. Once the migration is complete, restart the gateways pods on the source system, wait for few minutes, and run the health check script to check the status of webhooks.
6. Validate the APIs running on the source system gateways.

- Delta changes

Once the migration procedure is started, any delta changes in the source system databases are not handled by the migration scripts. These changes must be handled manually.

- o To avoid delta changes, shutdown the Postgres database in the management subsystem. See [Shutting down the Postgres database](#).
- o If there are delta changes to the management database after saving the configuration for the source system, you can optionally take another backup of the Management subsystem, just prior to restoring the Management subsystem. See [Restoring the target system](#).

- Sizing

Before installing the target API Connect system, make sure proper capacity planning is done to handle the production work loads. Ensure you have sufficient memory, CPU, and disk size as needed, based on the deployment profile being installed.

- Expected migration time

The time required to complete migration can depend on the following:

- o The size of management database. Backup and restore are dependent on this size.
- o Migration of the Portal and Gateway data in all the provider orgs depends on:
  - Number of provider orgs
  - Number of catalogs in these provider orgs
  - Whether Portals are configured for these catalogs
  - Total number of APIs published
- o Creation of Portal sites and restore of Portal backup depends on:
  - Deployment profile (n1, n3 etc) being used
  - Disk performance

- Total number of Portal sites being create or restored
- The amount of customization in a Portal site. Customization plays a role in the time needed to restore.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## v10 migration requirements

Ensure your deployment meets the migrations prerequisites and requirements.

Topics:

- [Version prerequisites](#)
- [Subsystem requirements](#)
- [Scripting requirements](#)
- [Credentials requirements](#)
- [How to obtain hostnames](#)
- [How to obtain realm values](#)
- [Backing up subsystems](#)
- [Limitations](#)

## Version prerequisites

The API Connect versions on the source and target systems must be the same.

## Subsystem requirements

All subsystems must be in a healthy state.

You must manually create storage classes like block storage or file system storage. Applies to all subsystems and, when installing on CP4I, to Platform Navigator.

- Management subsystem:
  - You must configure Management subsystems with either S3 or SFTP backups.
  - If s3 storage is being used, postgres in the Management subsystem must be stopped on the source system.
 

Note: When postgres is stopped, there is no impact on the published APIs in the gateways. However, the Cloud Manager and API Manager UI will not be available because the underlying microservices are down. Users will be able to browse the APIs in the Portal. But new consumer orgs or applications or users cannot be created.
  - If the Postgres cluster name on the target is different than the source system, restore will fail. For more information on configuring the target system, see [Installing the target system](#).
- Developer Portal subsystem:
  - Developer Portal subsystems must be configured with either S3 or SFTP backups.
  - For Developer Portal subsystem, you must have all the mappings between old and new endpoints and hostnames.
- Gateway subsystem:
  - If a custom gateway image is being used on the source system, the same image must be used on the target system
  - For a Gateway subsystem, you must have all the mappings between old and new endpoints and hostnames.

## Scripting requirements

- Python 3 and PyYAML python module must be present on the system where the scripts are run. To install the PyYAML module:

```
pip3 install pyyaml
```

- Do not have any spaces in the complete directory path where the scripts are executed.
- Ensure that the API Connect version of the `apic` toolkit is the same version as for the scripts, and that the toolkit is located in the path where the scripts are executed. Validate toolkit commands to make sure the Cloud Manager and API Manager hostnames are resolved and able to run few commands. Make sure apic toolkit commands are working before trying out the scripts.
- If you are using hostnames, you may need to update the `/etc/hosts` file for the apic toolkit to work.
- When the scripts are run on the target system, the configuration (data directory) saved from the source system must be available in the location where scripts are present.
- Save the output logs for every script being executed.

## Credentials requirements

- In all the scripts where the credentials are passed on the command line, these credentials are the admin org (Cloud Manager) credentials.
- You must be able to use `kubectl` (for native Kubernetes) or `oc` (OpenShift) commands to access the source system cluster and the target system cluster.
- To administer the admin org, you must have credentials with administrative role to access Cloud Manager.
- For provider orgs, if you do not use the migration user, and plan to use provider org credentials, you must have the provider org credentials for the API Manager interface.
- You must manually create:
  - Secrets for entitlement keys to download images from Docker registry.
  - DataPower admin credentials and secret, if the target system is native Kubernetes.

- After migration, the users on the target system will be in the same user registry as in the source system. For example, in CP4I, users from a local user registry (LUR) are not moved to a Zen user registry.

## How to obtain hostnames

The hostnames used in the scripts (`--server` or `-s` or `-api_manager_hostname`) and also in the files `gateway_portal_mapping.yaml` or `provider_org_credentials.yaml` can be obtained using the following commands.

The command must be run on the source cluster or target cluster, based on the step for which the hostname is needed.

- Kubernetes:

```
kubectl get ingress -n <NAMESPACE>
```

- OpenShift and Cloud Pak for Integration:

```
oc get routes -n <NAMESPACE>
```

Example output on Kubernetes:

```
kubectl get ingress -n ask1
NAME                                CLASS                                HOSTS                                ADDRESS
PORTS                                AGE
analytics1-ac-endpoint              <none>                               ac1.testuser1-master.fyre.example.com
1.2.104.133,1.2.104.137,1.2.104.147,1.2.104.157,1.2.104.158,1.2.104.161,1.2.104.166  80, 443  5d7h
analytics1-ai-endpoint              <none>                               ail.testuser1-master.fyre.example.com
1.2.104.133,1.2.104.137,1.2.104.147,1.2.104.157,1.2.104.158,1.2.104.161,1.2.104.166  80, 443  5d7h

```

## How to obtain realm values

The value of realm (`--realm` or `-r`) used while running the scripts can be obtained as shown in the following examples. The realm values are for Cloud Manager (admin org) and provider org.

- Example for Cloud Manager (admin org):

The value is passed as a command line option while running the script.

```
apic identity-providers:list --scope admin --fields title,realm --server api.test1-master.fyre.example.com
total_results: 3
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: googleoidc
  realm: admin/googleoidc
- title: ldap1
  realm: admin/ldap1
```

- Example for provider org realm values:

The value is used in `provider_org_credentials.yaml` while updating Portal and Gateway information in the provider orgs, when the default migration user is not used. See Step 4 and Step 6 in [Restoring the target system](#).

```
apic identity-providers:list --scope provider --fields title,realm --server api.testuser1-master.fyre.example.com
total_results: 3
results:
- title: API Manager User Registry
  realm: provider/default-idp-2
- title: googleoidc
  realm: provider/googleoidc
- title: ldap1
  realm: provider/ldap1
```

## Backing up subsystems

It is necessary to backup the data in Management and Portal subsystems on the source system. If backup is not configured, you can use the following links to configure backup:

- Management subsystem. Use the directions for your platform:
  - Native Kubernetes: [Backing up and restoring the management subsystem](#)
  - OpenShift and Cloud Pak for Integration: [Backing up and restoring the management subsystem on OpenShift and Cloud Pak for Integration](#)
  - VMware: [Backing up and restoring the management subsystem](#)

- Developer Portal subsystem. Use the directions for your platform:
  - Native Kubernetes: [Backing up and restoring the Developer Portal in a Kubernetes environment](#)
  - OpenShift and Cloud Pak for Integration: [Backing up and restoring Developer Portal on OpenShift and Cloud Pak for Integration](#)
  - VMware: [Backing up and restoring the Developer Portal](#)

## Limitations

---

1. Analytics service and data is not migrated.
2. If migrating from v10 non-CP4I environment (source apic cluster) to v10 CP4i environment (target apic cluster), make sure the Cloud Manager password for `admin` user is not `7iron-hide` on the source cluster. If default password `7iron-hide` is used, migration will fail after step 3 in [Restoring the target system](#), as configurator job assumes that the install is a fresh installation, and changes the password automatically.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## v10 migration steps

Complete the steps that are required for your v10 migration path.

### Before you begin

---

Ensure you have reviewed [v10 migration overview](#) and [v10 migration requirements](#).

### Procedure

---

1. Identify the supported migration path you will use. If necessary, review [Supported v10 migration paths](#) in [v10 migration overview](#).
2. Follow the instructions for your migration path:
  - For all paths except migration from OpenShift to Cloud Pak for Integration on the same cluster, complete the following tasks in order:
    - [Preparing the source system](#)
    - [Installing the target system](#)
    - [Restoring the target system](#)
    - [Verifying the target system](#)
  - If migrating from OpenShift to Cloud Pak for Integration on the same cluster, complete [Migrating from OpenShift to Cloud Pak for Integration on the same cluster](#).
- [Preparing the source system](#)  
Run the `save_v10_source_configuration.py` script to gather the source system configuration.
- [Installing the target system](#)  
On the target system, configure a cluster, create the necessary secrets, and install API Connect.
- [Restoring the target system](#)  
Restore the saved configuration and backups from the source system onto the target system.
- [Verifying the target system](#)  
Verify that the target system is in a healthy state and fully configured.
- [Migrating from OpenShift to Cloud Pak for Integration on the same cluster](#)  
Migrate your API Connect v10 deployment from OpenShift to Cloud Pak for Integration, while remaining on the same cluster.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Preparing the source system

Run the `save_v10_source_configuration.py` script to gather the source system configuration.

### Before you begin

---

Review [v10 migration requirements](#).

### About this task

---

The `save_v10_source_configuration.py` script:

- Creates a data directory with all configuration saved in it.
  - Generates two yaml files in the same directory as the script:
    - `gateway_portal_mapping.yaml`
    - `provider_org_credentials.yaml`
- Important:** The yaml files must be filled in:

- gateway\_portal\_mapping.yaml must be filled in if, when restoring onto the target system, you choose to run `register_gateway_portals_in_target.py` in silent mode. See step 3.c in [Restoring the target system](#).
- provider\_org\_credentials.yaml must be filled in if, when restoring onto the target system, you choose not to use the migration user credentials while updating Portal and Gateway information. See step 4 and step 6 in [Restoring the target system](#).

To view script parameters:

```
python3 save_v10_source_configuration.py --help
```

## Procedure

1. Save configuration from the source system. Complete the instructions for the platform type of your source system:

- Kubernetes, or OpenShift, or Cloud Pak for Integration

To save the source system configuration, run `save_v10_source_configuration.py` with the appropriate parameters for your deployment:

- If all subsystems are in the same namespace, and you are using username/password authentication. This command saves configuration of all the installed subsystems in the namespace:

```
python3 save_v10_source_configuration.py -u USERNAME -p PASSWORD -s PLATFORM_API_HOSTNAME -r REALM_NAME -n NAMESPACE
```

- If a subsystem needs to be skipped so that its configuration is not saved:

- Skip Portal:

```
python3 save_v10_source_configuration.py -u USERNAME -p PASSWORD -s PLATFORM_API_HOSTNAME -r REALM_NAME -n NAMESPACE -skip_ptl
```

- Skip Analytics:

```
python3 save_v10_source_configuration.py -u USERNAME -p PASSWORD -s PLATFORM_API_HOSTNAME -r REALM_NAME -n NAMESPACE -skip_a7s
```

- If all subsystems are in the same namespace, and you are using SSO authentication:

```
python3 save_v10_source_configuration.py --sso -s PLATFORM_API_HOSTNAME -n NAMESPACE
```

- If all subsystems are in different namespace, and you are using username/password authentication:

```
python3 save_v10_source_configuration.py -u USERNAME -p PASSWORD -s PLATFORM_API_HOSTNAME -r REALM_NAME -mgmt_ns <mgmt_namespace> -ptl_ns <ptl_namespace> -gw_ns <gw_namespace> -a7s_ns <a7s_namespace>
```

- If the cluster has multiple Gateways, Portals, or Analytics subsystems distributed across namespaces in the cluster, you can save the configuration of the source system using one of the ways shown below. Multiple namespaces need to be separated by "|" symbol. The namespaces used in below example command are ns1, ns2, ns3. Both commands work the same way.

- ```
python3 save_v10_source_configuration.py -u USERNAME -p PASSWORD -s PLATFORM_API_HOSTNAME -r REALM_NAME -n "ns1|ns2|ns3"
```

- ```
python3 save_v10_source_configuration.py -u USERNAME -p PASSWORD -s PLATFORM_API_HOSTNAME -r REALM_NAME -mgmt_ns "ns1" -ptl_ns "ns1|ns2" -gw_ns "ns1|ns2|ns3" -a7s_ns "ns1|ns2"
```

- If ingress-ca certificates must be saved or exported in the configuration, run the previous commands with `-export_cert` flag. Applicable only when you are saving management subsystem configuration.

- VMware

On VMware appliance, save the source configuration by running the `save_v10_source_configuration.py` script on the Management and Portal nodes:

- Copy the `apic` toolkit and `apicup` installer to the management node.
- Copy the script `save_v10_source_configuration.py` to the management node:
  - If ingress-ca and root-ca certificates must be saved in the configuration, copy this script to the project directory for this appliance and upload the project directory to the appliance. The script must be run from inside the project directory.
  - If ingress-ca and root-ca certificates are not needed, just copy this script to the appliance.
- Change to root user (`sudo -i`) and set PATH to the directory where the apic toolkit is present. This directory must be at the beginning of the path.
- Change to the directory where script is located. Check the PATH to verify that the apic toolkit is present. To validate, use `apic login` and `apicup version`.
- Collect source system configuration. If certificates needed, add the flag `-export_cert` to the command.

```
python3 save_v10_source_configuration.py -u USERNAME -p PASSWORD -s PLATFORM_API_HOSTNAME -r REALM_NAME -mgmt_ns default
```

- On the Management node, from the location where the script is run, download the data directory, gateway\_portal\_mapping.yaml, and provider\_org\_credentials.yaml files. Copy them to the location where the form factor migration scripts are present.
- Copy the `save_v10_source_configuration.py` script and data directory to the Portal node and run the script as root user, using the following command. If multiple Portal nodes are present, repeat the same command for each Portal node in the appliance.

- ```
python3 save_v10_source_configuration.py -ptl_ns default -skip_mgmt
```

- On the Portal node, from the location where the script is run, download the data directory and merge it with the data directory downloaded from the Management node.

2. Next, begin configuration of the target cluster. Continue with [Installing the target system](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Installing the target system

On the target system, configure a cluster, create the necessary secrets, and install API Connect.

## Before you begin

---

Complete [Preparing the source system](#).

## About this task

---

Run the `create_secrets_in_target.py` script to create the necessary secrets. If necessary, shutdown the Postgres database, and then install API Connect, either manually or by running the `install_apic_on_ocp.py` script.

Note: For data migration, you have the option of performing a complete migration at once, or performing migration in more than one step. To review these options, see [v10 migration planning](#).

## Procedure

---

1. Configure a target cluster either Kubernetes or OpenShift or Cloud Pak for Integration, where you intend to migrate the source system data.

- Note that this configuration is for the cluster only. No API Connect software is installed yet.
- Make sure `KUBECONFIG` is set to this target cluster, so you can access the cluster using `oc` or `kubectl`.

2. Create the namespaces in the target cluster where you want the API Connect subsystems to run.

- The namespaces can be different than the source system values.
- If you have additional subsystems to be installed in different namespaces, create these namespaces also.

3. Run `create_secrets_in_target.py` to create the following secrets:

- Database backup secrets for Management and Portal subsystems
- Application credentials
- Encryption secrets from the source system

Usage examples:

- If both Management and Portal are in the same namespace, or if Portal is not installed.

```
python3 create_secrets_in_target.py -n NAMESPACE
```

- If both Management and Portal are in different namespaces:

```
python3 create_secrets_in_target.py -mgmt_ns <MGMT_NAMESPACE> -ptl_ns <PTL_NAMESPACE>
```

- If you are creating multiple Portal subsystems in the target API Connect system, to match the configuration of the source system, you must run the script more than once for each Portal subsystem from the source system.

The script detects that there are two Portal subsystems in the source system, and prompts you to select the subsystem name that matches the target Portal, as shown in the following commands:

- For Management and first Portal on the target system:

```
python3 create_secrets_in_target.py -mgmt_ns <MGMT_NAMESPACE> -ptl_ns <PTL_NAMESPACE1>
```

- For the second Portal on the target system:

```
python3 create_secrets_in_target.py -skip_mgmt -ptl_ns <PTL_NAMESPACE2>
```

4. If applicable to your deployment, shutdown the Postgres database on your source system.

You can shutdown the Postgres database now, to ensure that there are no delta changes to your source system while the remainder of the migration process takes place.

Important: If s3 backup is being used for the Management subsystem in the source system, the postgres database MUST be shutdown before launching the target API Connect cluster. If it is not shutdown, the launch of the target apic cluster will fail.

For steps to shutdown Postgres database on Kubernetes or OpenShift, see [Shutting down the Postgres database](#).

5. Launch the target API Connect system.

- a. Review prerequisites:

- Have a new OpenShift cluster ready with enough resources (CPU, memory, and disk) as required for the installation profile you will use.
- As needed, create an entitlement key to download the images related to API Connect.
- The target system must match the topology (number of Gateways, Portals and Analytics) of the source system to ensure that all the data in the Management database is migrated. If all the data in the Management database is not migrated, the not migrated (stale) data must be manually deleted. Alternatively, you can attempt the remaining migration later after installing the additional Portals and Gateways. See [v10 migration planning](#).

Important: If s3 backup is being used for the Management subsystem in the **target** system, once the Management subsystem is ready, you will see that the backup job pods and stanza-create job pods are in **Error** state. This is expected behavior. Once management backup is restored, the error resolves and backups will work. Since the backup will **not** happen until the Management database is restored, it is very important to restore Management subsystem backup on the target system (see step 2 in [Restoring the target system](#)) immediately after installing the target system. Any delay can cause the disk to fill up with write-ahead log (WAL) files.

To review how to monitor Postgres db disk usage, see:

- [Monitoring Postgres disk usage on OpenShift](#)
- [Monitoring Postgres disk usage on VMware](#)
- [Monitoring Postgres disk usage on Kubernetes](#).

- b. Launch the target API Connect system either manually or by using the `install_apic_on_ocp.py` script:

- To manually launch from the OpenShift cluster UI:

This method is the recommended way to launch the target API Connect system for production systems.

This method is also used for advanced customization or when using custom certificates while launching the target API Connect system.

- Install and launch the target API Connect cluster. See the instructions for your deployment type:
  - API Connect on OpenShift: [Deploying on OpenShift and Cloud Pak for Integration](#)
  - Cloud Pak for Integration: [Installing on IBM Cloud Pak for Integration](#)
- Before creating the top level CR, use the yaml view to add the properties which you saved from the source system configuration. For the Management subsystem, the saved configuration is in `data/config.yaml`. For the Portal subsystem, the saved configuration is in `data/config_portal.yaml`.

Important: If you do not use the configuration from the source system, the migration fails.

- Management subsystem properties:
  - encryption\_secret
  - Management subsystem name
  - site name
  - database backup credentials
  - custom application credentials
  - originalUID
- Portal subsystem properties:
  - encryption\_secret
  - site name
  - database backup credentials
  - originalUID

Note: If target system is Kubernetes, the properties must be in the Management and Portal subsystem CRs.

- The top level CR must look like the following example. The values for this top CR are from the generated artifacts (`data/config.yaml` and `data/config_portal.yaml`) after running [Preparing the source system](#). Note that the example shows a value for `spec.management.name`. You can obtain this value from `config.yaml`.

```
apiVersion: apiconnect.ibm.com/v1beta1

      siteName: be023200
  portal:
    encryptionSecret:
      secretName: portall-enc-key
      originalUID: 1adc672a-0e77-4890-b476-c41fcedb0b64
    portalBackup:
      credentials: ftp-mgmt-backup-secret
      host: 1.2.3.4
      path: /root/backup/portall
      port: 22
      protocol: sftp
      siteName: cb06099f
  profile: n1xc10.m48
  storageClassName: rook-ceph-block
  version: 10.0.4.0
```

- You can also use the script `install_apic_on_ocp.py` with `-no_install` flag to generate the top level CR yaml, and use the yaml in the OpenShift UI and customize further.

- To launch using the `install_apic_on_ocp.py` script:  
The script is used to launch API Connect on OpenShift or API Connect with Cloud Pak for Integration using a top level CR that specifies one of each subsystem type:
  - Management
  - Developer Portal
  - Analytics
  - API Gateway

Prerequisite:

- The OpenShift cluster must be ready, and accessible using `oc`.
- Important:** The script is used to launch **ONLY** the specific version of API Connect based on the downloaded version of the artifacts.

Usage:

- Run the script with `--help` option to show additional flags available like `-production` and `-profile`.
- License use is set to `nonproduction` by default unless the flag `-production` is used while running this script.
- The profile defaults to Development profile `n1xc10.m48` unless the `-profile` flag is set to a Production level profile such as `n3cx14.m48`. Development profile deploys 1 replica of each pod and is only for light, non-critical workloads such as basic development and testing.
- Optionally, you can use the `-no_install` flag if you want to generate the yaml files (top level CR and other files needed in installation) without installing. In the following example commands, add the `-no_install` flag to the existing command parameters. You can use this top level CR from the OpenShift UI, and create an API Connect cluster.
- Note : If CP4I environment, check if configurator job is completed and also check the output of:

```
oc get apiconnectcluster -n NAMESPACE
```

Example command invocations:

Note: Each of the example commands includes parameters for a Production profile deployment: `-production -profile n3xc14.m48`. If you have a Development profile, omit these parameters.

- API Connect on OpenShift:
  - If the apiconnect and DataPower operators must be installed in all namespaces:

```
python3 install_apic_on_ocp.py -license LICENSE_VALUE -n NAMESPACE -name topCRName -storageclass_apic STORAGE_CLASS_NAME -production -profile n3xc14.m48
```

- If the apiconnect and DataPower operators must be installed in a specific namespace:

```
python3 install_apic_on_ocp.py -license LICENSE_VALUE -n NAMESPACE -name topCRName -storageclass_apic STORAGE_CLASS_NAME -operator_in_specific_namespace -production -profile n3xc14.m48
```

- API Connect in Cloud Pak for Integration:
  - If operators are in all namespaces:

```
python3 install_apic_on_ocp.py -license LICENSE_VALUE1 -n NAMESPACE -name topCRName -storageclass_apic STORAGE_CLASS_NAME1 -cp4i -storageclass_pn STORAGE_CLASS_NAME2 -license_pn LICENSE_VALUE2 -production -profile n3xc14.m48
```

- If operators are in a specific namespace:

```
python3 install_apic_on_ocp.py -license LICENSE_VALUE1 -n NAMESPACE -name topCRName -storageclass_apic STORAGE_CLASS_NAME1 -cp4i -storageclass_pn STORAGE_CLASS_NAME2 -license_pn LICENSE_VALUE2 -operator_in_specific_namespace -production -profile n3xc14.m48
```

- If operators are in all namespaces, with additional flags `-production` (for license to be set to production) and `-profile` (using n3 profile in this example):

```
python3 install_apic_on_ocp.py -license LICENSE_VALUE1 -n NAMESPACE -name topCRName -storageclass_apic STORAGE_CLASS_NAME1 -cp4i -storageclass_pn STORAGE_CLASS_NAME2 -license_pn LICENSE_VALUE2 -production -profile n3xc14.m48
```

6. Optional: Install any additional Gateways, Developer Portals, or Analytics subsystems that are needed.

- Complete this step now if your target system will have additional Gateways, Developer Portals, or Analytics subsystems to match what is there in the source API Connect system, and you want to complete data migration for all subsystems in one pass through the procedures in [Restoring the target system](#).
- Skip this step now, and proceed to step 7 if either of the following cases are true:
  - If your target system will not need any additional Gateways, Developer Portals, or Analytics subsystems.
  - Your target system will have additional Gateways, Developer Portals, or Analytics subsystems but you want to first complete data migration based on the top CR installation (1 Management, 1 Portal, 1 Gateway, 1 Analytics), before you install any additional subsystems.

Note: To review the data migration choices, see [v10 migration planning](#).

If you choose complete this step now, see:

- [Deploying on OpenShift and Cloud Pak for Integration](#)
- [Installing on IBM Cloud Pak for Integration](#)

7. Next, restore the configuration from the source system. Continue with [Restoring the target system](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Restoring the target system

Restore the saved configuration and backups from the source system onto the target system.

## Before you begin

Complete [Installing the target system](#).

## About this task

Use scripts to:

- Restore the Management subsystem
- Register Gateways and Portals on the target system
- Update Portals in the Catalog to point to new Portal systems
- Restore Portal backups for each site
- Update Gateways in the Catalog to point to new Gateway systems

All scripts run on the target system must be run from a location where the data directory is present so that the source configuration can be used.

Note: You can optionally run scripts in `--silent` mode, particularly for the following scenarios:

- Register Gateways and Portals in the target system. (Step 3)
- Update Portals in the Catalog to point to new Portal systems. (Step 4)
- Update Gateways in the Catalog to point to new Gateway systems. (Step 6)

If there are multiple Portals and Management subsystems present in the data directory (as saved during [Preparing the source system](#)), the restore script prompts you to select the subsystem name to use for migration while running the script. If running in silent mode, that value must be supplied as an additional flag.

Deployments with multiple Portals and Gateways are a common scenario. The saved data can have multiple Management subsystems only if you ran `save_v10_source_configuration.py` against multiple clusters with different Management subsystem names, without cleaning the data directory.

## Procedure

1. Before restoring the Management subsystem backup, determine whether there have been any delta changes to your source system since you backed up the Management subsystem database and Portal database.
  - If you shutdown the Postgres database, as instructed in [Installing the target system](#), there are no delta changes. Continue to step 2.
  - If you did not shutdown the Postgres database, there could be some delta changes to the Management database, because the Management subsystem on the source system remains in READY state. In this case, to ensure you capture the latest configuration, repeat [Preparing the source system](#). By doing so, the Management and Portal databases are backed up again. The latest backup will then be used to restore to the target system.
2. Restore a Management subsystem backup onto the target system.
  - a. On the target API Connect system, ensure that the Management subsystem is up and running.
  - b. Run `restore_management_db.py`. Examples:
    - OpenShift or Kubernetes target system:

```
python3 restore_management_db.py -n <MGMT_NAMESPACE>
```

or:

```
python3 restore_management_db.py -mgmt_ns <MGMT_NAMESPACE>
```
    - Cloud Pak for Integration target system:

```
python3 restore_management_db.py -n <namespace> -s <PLATFORM_API_HOSTNAME>
```
    - If for some reason the management subsystem is not healthy, restore using the command:

```
python3 restore_management_db.py -n <MGMT_NAMESPACE> -ignore_health_check
```
3. Register Gateways and Portals on the target system.
  - a. Review prerequisites:
    - The `register_gateway_portals_in_target.py` script must be run on the target system after the Management database from the source system has been restored.
    - The Gateway and Developer Portal subsystems that need to be registered must be in a healthy state.
  - b. Review usage notes:
    - The credentials provided from this step will be same as the credentials used on the source system, because the Management database from the source system is restored.
    - Keep the endpoints ready for the new Gateway and Portal services so that they can be registered by running `register_gateway_portals_in_target.py`. To view endpoints, use `oc get routes`.
    - If you run `register_gateway_portals_in_target.py` for a Cloud Pak for Integration target system, and you see the error `The API Connect Gateway Service is already registered to another API Manager instance`, restart all the gateway pods, wait for them to become healthy, and run `register_gateway_portals_in_target.py` again.
    - Make sure the mapping of old URLs with the new ones are correct. For example, when the source system is a VMware appliance, if wrongly mapped (wrong values provided) communication errors occur during Gateway registration. Example errors messages:
      - `"Error: An error occurred communicating with the gateways subsystem "`
      - `"error: 'Client network socket disconnected before secure TLS connection was established'"`
  - c. Run `register_gateway_portals_in_target.py` in either interactive mode or silent mode:
    - Interactive mode  
The `register_gateway_portals_in_target.py` script displays the Portal and Gateway endpoints from the source system, and prompts the user to enter the corresponding values from the target system. Examples:
      - If Management, Portal and Gateway subsystems are in the same namespace:

```
python3 register_gateway_portals_in_target.py -s PLATFORM_API_HOSTNAME -u USERNAME -p PASSWORD -r REALM_NAME -n NAMESPACE
```

- If Management, Portal and Gateway subsystems are in different namespaces.  
If multiple Gateways or Portals are present across namespaces, you can give multiple namespaces separated by "|" symbol for `-ptl_ns` and `-gw_ns`.

```
python3 register_gateway_portals_in_target.py -s PLATFORM_API_HOSTNAME -u USERNAME -p PASSWORD -r REALM_NAME -mgmt_ns MGMT_NAMESPACE -ptl_ns PORTAL_NAMESPACE -gw_ns GATEWAY_NAMESPACE
```

- If using SSO authentication:

```
python3 register_gateway_portals_in_target.py -s PLATFORM_API_HOSTNAME --sso -n NAMESPACE
```

- Silent mode

The `gateway_portal_mapping.yaml` file, with mapping between old and new endpoints for Gateway, Portal, and Analytics endpoints, must be located in the same directory as `register_gateway_portals_in_target.py`.

This `gateway_portal_mapping.yaml` file is generated when saving the source API Connect system configuration with properties data filled in. For every Gateway, Portal, and Analytics subsystem registered with Management in the source system, the yaml has the endpoint mapping between source and target systems.

Remaining data must be filled to use the yaml in silent mode. All values must begin with `https://`.

- Example:

```
python3 register_gateway_portals_in_target.py -n namespace -u USERNAME -p PASSWORD -s PLATFORM_API_HOSTNAME -r REALM_NAME -silent
```

- Example: If the subsystems are in multiple namespaces.

For example, `ns1`, `ns2`, `ns3` namespaces contain the subsystems. Both of the following commands work the same way:

```
python3 register_gateway_portals_in_target.py -n "ns1|ns2|ns3" -u USERNAME -p PASSWORD -s PLATFORM_API_HOSTNAME -r REALM_NAME -silent
```

```
python3 register_gateway_portals_in_target.py -s PLATFORM_API_HOSTNAME -u USERNAME -p PASSWORD -r REALM_NAME -mgmt_ns ns1 -ptl_ns "ns1|ns2" -gw_ns "ns1|ns2|ns3" -silent
```

- Example `gateway_portal_mapping.yaml` file with:

- Two Gateways
- One Portal or Analytics subsystem
- All data mapped to the target API Connect system:

```
analytics_mapping:
  registered_analytics_name:
    https://ac.source-apic.example.com: https://a1-a7s-ac-endpoint-apic1.apps.vlxocp-3278.cp.fyre.example.com
gateway_mapping:
  registered_apigw_name:
    https://rgw.source-apic.fyre.example.com: https://a1-gw-gateway-apic1.apps.vlxocp-3278.cp.fyre.example.com
    https://rgwd.source-apic.fyre.example.com: https://a1-gw-gateway-manager-apic1.apps.vlxocp-3278.cp.fyre.example.com
  registered_v5gw_name:
    https://gw.source-apic.fyre.example.com: https://v5gw.gw.apps.vlxocp-3278.cp.fyre.example.com
    https://gwd.source-apic.fyre.example.com: https://v5gw.gwd.apps.vlxocp-3278.cp.fyre.example.com
portal_mapping:
  registered_portal_name:
    https://api.portal.source-apic.fyre.example.com: https://a1-ptl-portal-director-apic1.apps.vlxocp-3278.cp.fyre.example.com
    https://portal.source-apic.fyre.example.com: https://a1-ptl-portal-web-apic1.apps.vlxocp-3278.cp.fyre.example.com
```

- Example `gateway_portal_mapping.yaml` file with:

- Only two Gateways
- One Portal or Analytics
- One Gateway not mapped

Note that "not mapped" means that the data in the Management subsystem related to this Gateway is not mapped, and the Gateway will not be migrated during this migration phase.

The Gateway could be migrated later; for example, after the second Gateway is created on the target system. Until the data related to the not-migrated Gateway or Portal is migrated or deleted, there will be stale data in the database.

The same behavior can be achieved by leaving the values empty, or removing the entire section (name and mapping).

```
analytics_mapping:
  registered_analytics_name:
    https://ac.source-apic.example.com: https://a1-a7s-ac-endpoint-apic1.apps.vlxocp-3278.cp.fyre.example.com
gateway_mapping:
  registered_apigw_name:
    https://rgw.source-apic.fyre.example.com: https://a1-gw-gateway-apic1.apps.vlxocp-3278.cp.fyre.example.com
    https://rgwd.source-apic.fyre.example.com: https://a1-gw-gateway-manager-apic1.apps.vlxocp-3278.cp.fyre.example.com
  registered_v5gw_name:
    https://gw.source-apic.fyre.example.com: NEW_GATEWAY_API_ENDPOINT_BASE_IN_TARGET_SYSTEM
    https://gwd.source-apic.fyre.example.com: NEW_GATEWAY_ENDPOINT_IN_TARGET_SYSTEM
portal_mapping:
  registered_portal_name:
    https://api.portal.source-apic.fyre.example.com: https://a1-ptl-portal-director-apic1.apps.vlxocp-3278.cp.fyre.example.com
```

`https://portal.source-apic.fyre.example.com: https://al-ptl-portal-web-apic1.apps.vlxocp-3278.cp.fyre.example.com`

4. Use `update_to_new_portals.py` to update Portals in the catalog to point to new Portal systems.

Note: If there is no Portal subsystem on the source system, skip this step. Also, skip this step if no Portal sites are created in any of the provider orgs. Continue with [6](#).

a. Review prerequisites:

- The Management and Portal subsystems on the target API Connect system must be in a healthy state.
- The `update_to_new_portals.py` script must be run on the target system after the following actions have been completed:
  - The Management database from the source system has been restored.
  - The new Gateway or Portal instance is registered in the Cloud Manager, using script or from the UI.
- The credentials for accessing the admin org (Cloud Manager UI) and, if required, the provider org (API Manager UI) must be available for running the script.

b. Run the `update_to_new_portals.py` script in one of two modes, based on how the Provide Org credentials are available. The modes are:

- Using a common migration user created by the script
- Using credentials provided by the user in a yaml file

Important: The provider org credentials must have administrative access.

Examples:

- Using a common migration user created by the script :

The `update_to_new_portals.py` script runs in this mode by default. This script creates a migration user `muser1` in `migrationur` local user registry, and uses it to migrate Portal information in all the provider orgs. Once the migration is done, the user and user registry are deleted. There is no change in data once the migration is complete.

Examples:

- If the Management and Portal subsystems are in the same namespace

```
python3 update_to_new_portals.py -s PLATFORM_API_HOSTNAME -u USERNAME -p PASSWORD -r REALM_NAME -n NAMESPACE -api_manager_hostname PLATFORM_API_HOSTNAME -silent
```

- If using SSO authentication:

```
python3 update_to_new_portals.py -s PLATFORM_API_HOSTNAME --sso -n NAMESPACE -api_manager_hostname API_MANAGER_HOSTNAME -silent
```

- If the Management and Portal subsystems are in different namespaces:

```
python3 update_to_new_portals.py -s PLATFORM_API_HOSTNAME -u USERNAME -p PASSWORD -r REALM_NAME -mgmt_ns MGMT_NAMESPACE -ptl_ns PTL_NAMESPACE -api_manager_hostname PLATFORM_API_HOSTNAME -silent
```

- Using credentials provided by the user in a `provider_org_credentials.yaml` file:

The `provider_org_credentials.yaml` file, with some data filled in, is generated by the `save_v10_source_configuration.py` script you ran in [Preparing the source system](#). The yaml file is available in the same directory as the script. The script has to be edited and all details filled in before it can be used.

Examples:

- If Management and Portal subsystems are in the same namespace:

```
python3 update_to_new_portals.py -s PLATFORM_API_HOSTNAME -u USERNAME -p PASSWORD -r REALM_NAME -n NAMESPACE -no_migration_user -silent
```

- If using SSO authentication:

```
python3 update_to_new_portals.py -s PLATFORM_API_HOSTNAME --sso -n NAMESPACE -no_migration_user -silent
```

- If Management and Portal subsystems are in different namespaces:

```
python3 update_to_new_portals.py -s PLATFORM_API_HOSTNAME -u USERNAME -p PASSWORD -r REALM_NAME -mgmt_ns MGMT_NAMESPACE -ptl_ns PTL_NAMESPACE -no_migration_user -silent
```

Example `provider_org_credentials.yaml`:

- With credentials given for every provider org. In this example, only two orgs are present.

```
provider_org_credentials:
  apiManagerHostName: PLATFORM_API_HOSTNAME
  PORG_NAME_1:
    password: PASSWORD_FOR_THIS_REALM_TO_BE_CHANGED
    realm: provider/default-idp-2
    username: USERNAME_FOR_THIS_REALM_TO_BE_CHANGED
  PORG_NAME_2:
    password: PASSWORD_FOR_THIS_REALM_TO_BE_CHANGED
    realm: provider/default-idp-2
    username: USERNAME_FOR_THIS_REALM_TO_BE_CHANGED
  useSameCredentialsForAllProviderOrgs: false
```

- With credentials given for just one provider org. Also requires `useSameCredentialsForAllProviderOrgs` set to true. This method can be used only when the same credentials are used for all provider orgs.

Note: In some cases, there are multiple provider orgs in the Management database.

```
provider_org_credentials:
  apiManagerHostName: PLATFORM_API_HOSTNAME
  PORG_NAME_1:
    password: PASSWORD_FOR_THIS_REALM_TO_BE_CHANGED
    realm: provider/default-idp-2
    username: USERNAME_FOR_THIS_REALM_TO_BE_CHANGED
  useSameCredentialsForAllProviderOrgs: true
```

- With SSO credentials and just one provider org:

```

provider_org_credentials:
  apiManagerHostName: PLATFORM_API_HOSTNAME
  useSameCredentialsForAllProviderOrgs: false
  org_anme:
    #sso authentication
    #the key(that can expire in sometime) has to be generated separately using
    https://<apiManagerHostname>/auth/manager/sign-in/?from=TOOLKIT
  apiKey: some_key

```

5. Restore Portal backups for each site.

Note: If there is no Portal subsystem on the source system, skip this step. Continue with [6](#).

To restore the Portal sites on the target system, you can either use the using script `restore_portal_db.py` or complete a manual restore.

- Restoring through the script:

```
python3 restore_portal_db.py -n PORTAL_SUBSYSTEM_NAMESPACE
```

- Restoring through manual steps:

- Log in to the Portal admin container:

```
oc exec -it <www_pod> -c admin -- bash
```

- List the site backups:

```
remote_transfer_backup -l
```

The list of backups that need to be restored is available in the output logs as a report of [Step 4](#).

- Download each site backup, and run it for all sites:

```
remote_transfer_backup -d <SITE_BACKUP_FILENAME>
```

- Restore each of the site backups:

```
restore_site -f -u <SITE_URL> <SITE_BACKUP_FILENAME>
```

Note: If there are more than one Portal subsystems on the target system, as needed to correspond to the Portal subsystems on the source system, run the script for each of the matching source and target Portal subsystems.

For example, if there are two Portals on the target system, matching what is on the source system, and these Portals are installed in namespaces `target1` (for the top-level CR) and `pt12` (for second portal), then the script will be run twice, as follows:

```
python3 restore_portal_db.py -n target1
```

```
python3 restore_portal_db.py -n pt12
```

6. Run `update_to_new_gateways.py` to update Gateways in the Catalog to point to new Gateway systems.

a. Review prerequisites:

- The Gateway subsystem must be in a healthy state.
- The `update_to_new_gateways.py` script must be run on the target system after the following actions have been completed:
  - The Management database from the source system has been restored.
  - The new Gateway instance is registered in the Cloud Manager, using script or from the UI.
- The credentials for accessing the admin org (Cloud Manager UI) and, if required, the provider org (API Manager UI) must be available for running the script.

b. Run the `update_to_new_gateways.py` script in one of two modes, based on how the Provider Org credentials are available. The modes are:

- Using a common migration user created by the script
- Using credentials provided by the user in a yaml file

Important: The provider org credentials must have administrative access.

- Using a common migration user created by the script:
 

The `update_to_new_gateways.py` script runs in this mode by default. This script creates a migration user `muser1` in `migrationur` local user registry, and uses it to migrate Portal information in all the provider orgs. Once the migration is done, the user and user registry are deleted. There is no change in data once the migration is complete.

Examples:

- If the Management and Gateway subsystems are in the same namespace:

```
python3 update_to_new_gateways.py -s PLATFORM_API_HOSTNAME -u USERNAME -p PASSWORD -r REALM_NAME -n NAMESPACE -api_manager_hostname PLATFORM_API_HOSTNAME -silent
```

- If using SSO authentication:

```
python3 update_to_new_gateways.py -s PLATFORM_API_HOSTNAME --sso -n NAMESPACE -api_manager_hostname PLATFORM_API_HOSTNAME -silent
```

- If the Management and Gateway subsystems are in different namespaces:

```
python3 update_to_new_gateways.py -s PLATFORM_API_HOSTNAME -u USERNAME -p PASSWORD -r REALM_NAME -mgmt_ns MGMT_NAMESPACE -pt1_ns PTL_NAMESPACE -api_manager_hostname PLATFORM_API_HOSTNAME -silent
```

- Using credentials provided by the user in a `provider_org_credentials.yaml` file:

The `provider_org_credentials.yaml` file, with some data filled in, is generated by the `save_v10_source_configuration.py` script you ran in [Preparing the source system](#). The yaml file is available in the same directory as the script. The script has to be edited and all details filled in before it can be used.

- If the Management and Gateway subsystems are in the same namespace:

```
python3 update_to_new_gateways.py -s PLATFORM_API_HOSTNAME -u USERNAME -p PASSWORD -r REALM_NAME -n NAMESPACE -no_migration_user -silent
```

- If using SSO authentication:

```
python3 update_to_new_gateways.py -s PLATFORM_API_HOSTNAME --sso -n NAMESPACE --no_migration_user -silent
```

- If the Management and Gateway subsystems are in different namespaces:  
Note that if multiple gateway subsystems present across namespaces, you can give multiple namespaces separated by the "|" symbol for `-gw_ns`.

```
python3 update_to_new_gateways.py -s PLATFORM_API_HOSTNAME -u USERNAME -p PASSWORD -r REALM_NAME -mgmt_ns MGMT_NAMESPACE -gw_ns GW_NAMESPACE --no_migration_user -silent
```

- Example `provider_org_credentials.yaml`
  - With credentials given for every provider org, and only two orgs present:

```
provider_org_credentials:
  apiManagerHostName: PLATFORM_API_HOSTNAME
  PORG_NAME 1:
    password: PASSWORD_FOR_THIS_REALM_TO_BE_CHANGED
    realm: provider/default-idp-2
    username: USERNAME_FOR_THIS_REALM_TO_BE_CHANGED
  PORG_NAME 2:
    password: PASSWORD_FOR_THIS_REALM_TO_BE_CHANGED
    realm: provider/default-idp-2
    username: USERNAME_FOR_THIS_REALM_TO_BE_CHANGED
  useSameCredentialsForAllProviderOrgs: false
```

- With credentials given for just one provider org, and `useSameCredentialsForAllProviderOrgs` is set to `true`.  
This can be used only when same credentials are used for all provider orgs.

Note: There can be multiple provider orgs in the Management database.

```
provider_org_credentials:
  apiManagerHostName: PLATFORM_API_HOSTNAME
  PORG_NAME 1:
    password: PASSWORD_FOR_THIS_REALM_TO_BE_CHANGED
    realm: provider/default-idp-2
    username: USERNAME_FOR_THIS_REALM_TO_BE_CHANGED
  useSameCredentialsForAllProviderOrgs: true
```

- With SSO credentials and just one provider org:

```
provider_org_credentials:
  apiManagerHostName: PLATFORM_API_HOSTNAME
  useSameCredentialsForAllProviderOrgs: false
  porg_anme:
    #sso authentication
    #the key (that can expire in sometime) has to be generated separately using
    https://<apiManagerHostname>/auth/manager/sign-in/?from=TOOLKIT
  apiKey: some_key
```

7. Continue to [Verifying the target system](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Verifying the target system

Verify that the target system is in a healthy state and fully configured.

---

### Before you begin

Complete [Restoring the target system](#).

---

### About this task

Check the health of the target system, complete any optional configuration, and validate data, APIs, and URLs.

---

### Procedure

1. Use the `health_check_post_migration.py` script to health check the target system.

Examples:

- When all the subsystems are in the same namespace, and the deployments uses username/password authentication:

```
python3 health_check_post_migration.py -s PLATFORM_API_HOSTNAME -r REALM_NAME -u USERNAME -p PASSWORD -n NAMESPACE
```

- When all the subsystems are in the same namespace, and the deployments uses username/password authentication, with use of the optional flag `-check_portal_site_health` to check the health of Portal sites:

```
python3 health_check_post_migration.py -s PLATFORM_API_HOSTNAME -r REALM_NAME -u USERNAME -p PASSWORD -n NAMESPACE -check_portal_site_health
```

- When subsystems are present in different namespaces, and the deployment uses username/password authentication

```
python3 health_check_post_migration.py -s PLATFORM_API_HOSTNAME -r REALM_NAME -u USERNAME -p PASSWORD -mgmt_ns NAMESPACE -gw_ns NAMESPACE
```

- When all subsystems are in different namespaces, and the deployment uses username/password authentication:

```
python3 health_check_post_migration.py -s PLATFORM_API_HOSTNAME -r REALM_NAME -u USERNAME -p PASSWORD -mgmt_ns NAMESPACE -gw_ns NAMESPACE -ptl_s NAMESPACE -a7s_ns NAMESPACE
```

- When all subsystems are in the same namespace, and the deployment uses SSO authentication:

```
python3 health_check_post_migration.py -n NAMESPACE --sso -s PLATFORM_API_HOSTNAME
```

- When all subsystems are in the same namespace, and the deployment uses SSO authentication silent mode:

```
python3 health_check_post_migration.py -n NAMESPACE --sso -s PLATFORM_API_HOSTNAME -api_key API_KEY_VALUE
```

- When there are multiple subsystems across namespaces:

```
python3 health_check_post_migration.py -s PLATFORM_API_HOSTNAME -r REALM_NAME -u USERNAME -p PASSWORD -n "namespace1|namespace2|namespace3"
```

2. Complete any optional configuration steps needed for your deployment:

- a. If necessary, update redirect URLs in the authorization server.

If OIDC or SSO authentication is being used, the redirect URLs must be updated in the authorization server after migration. For example, for Google OIDC, you must to add the new redirect URLs in Google Developer Console. The new redirect URLs can be found in the user registry in Cloud Manager.

- b. If necessary, complete configuration for Analytics.

If the Analytics service is present on the target system, backups must be configured. Also, use the Cloud Manager UI to manually associate the Analytics with the Gateways, as needed.

- c. If the target system is Cloud Pak for Integration, you must use the password from the target API Connect system to log in to Platform Navigator.

- d. If necessary, update Portal and Gateway services names in scripts or utilities.

The migrated Portal and Gateway services will have new names (old\_name + "new"). Any scripts and utilities written using the apic toolkit must be updated if they are using names as input parameter and not the ids. This is applicable to only Portal and Gateway names.

3. Validate configuration data:

- a. Validate the data in the target API Connect system by logging into Cloud Manager and API Manager UIs.

- b. Validate the APIs published in the Gateways.

- c. Validate the Portal site URLs

- d. If necessary, update the DNS mapping info.

Once all of the APIs are verified, you may need to update the DNS mapping info, to redirect the calls to the new Gateways and Portals.

The v10 migration is now complete.

4. After migration is finished, and verification of the target system is complete, you can uninstall API Connect on the source system.

See [Uninstalling API Connect](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Migrating from OpenShift to Cloud Pak for Integration on the same cluster

Migrate your API Connect v10 deployment from OpenShift to Cloud Pak for Integration, while remaining on the same cluster.

---

### Before you begin

Complete [v10 migration requirements](#).

---

### About this task

In this scenario, host name does not change.

---

### Procedure

1. If necessary, update the Cloud Manager admin password.

On the source system, if the Cloud Manager admin password is changed in the source system to what was the default when installed, the Cloud Manager admin password must be updated in the secret with name `<TOP_CR_NAME>-mgmt-admin-pass`. Make sure the password is correct in the secret.

2. Install IBM Cloud Pak Platform UI and create an instance of it.

3. Restart `apiconnect` operator pod.

This will detect a Cloud Pak for Integration environment and reconcile the subsystems. Wait for the subsystems to be healthy.

4. Login to Cloud Manager and check the services under the topology section.

**Known issue:** If you see an additional Analytics service with a different name for the same Analytics endpoint, you must delete the newly created Analytics service.

5. Perform verification:

Check that configurator job is run and complete. Verify login, zen URLs and all other details.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## v10 migration troubleshooting

Troubleshoot problems with v10 migration.

Topics:

- [Script help](#)
- [Restarting migration](#)
- [Factory reset of portal subsystem](#)
- [Avoid error when a gateway is already registered to another API manager](#)

---

### Script help

```
python3 <SCRIPT_FILE_NAME> --help
```

---

### Restarting migration

On the target system, after running `register_gateway_portals_in_target.py` or `update_to_new_portals.py` or `update_to_new_gateways.py` script:

- If you want to restore the Management database and try the steps again:
  - Run the restore Management db (Step 2 on [Restoring the target system](#)) with the `-reset_gateway_portal` flag as shown

```
python3 restore_management_db.py -n namespace -s PLATFORM_API_HOSTNAME -reset_gateway_portal
```

If running on a Kubernetes environment, supply the Cloud Manager admin password by using the `-p` flag. After this, continue with next steps of migration.

- If you deleted the data directory after registering Gateways or Portals, but want to use the same target API Connect system which you already installed, then:
  1. Complete [Preparing the source system](#) to create the data directory.
  2. Run the restore management db (Step 2 on [Restoring the target system](#)) with the `-reset_gateway_portal` flag as shown

```
python3 restore_management_db.py -n namespace -s PLATFORM_API_HOSTNAME -reset_gateway_portal
```

If running on a Kubernetes environment, supply the Cloud Manager admin password by using the `-p` flag. After this, continue with next steps of migration.

---

### Factory reset of portal subsystem

You can do a factory reset of the Portal subsystem by either manually or by using a migration script.

- Using migration script  
The script will restore the Management database and will factory reset the Portal subsystem, and also delete Gateway pods. The gateway pods will get restarted.

The script will factory reset the Portal subsystem and also delete Gateway pods. When Gateway pods are deleted, they are also restarted.

```
python3 restore_management_db.py -n namespace -s PLATFORM_API_HOSTNAME -reset_gateway_portal
```

If using a Kubernetes environment, you must also supply the Cloud Manager admin password by using the `-p` flag. After this command, you must run the remaining steps of migration, starting with Step 3 in [Restoring the target system](#).

```
python3 register_gateway_portals_in_target.py -n NAMESPACE -u USERNAME -p PASSWORD -s HOSTNAME -r REALM_NAME -reset_gateway_portal
```

- **Manual steps**

1. Log in to the Portal www pod:

```
kubect1 exec -it PORTAL_WWW_POD_NAME -c admin -n NAMESPACE -- bash
```

2. Run the command :

```
curl -X DELETE -k --cert /etc/nginx/ssl/portal-director-client-both.pem https://localhost:3009/v2/portal/factory-reset
```

3. If any sites are there, use the `list_sites` command to check if all sites are deleted.
4. Check health of the Portal subsystem.

---

### Avoid error when a gateway is already registered to another API manager

Error messages

```
Error: An error occurred communicating with the gateways subsystem at 'some_url' (status: 400, response: '"Unable to perform initial registration for API Management. Error: The API Connect Gateway Service is already registered to another API Manager instance"')
```

You can fix the error condition manually, or use a script:

- Manual step, when Gateway is in a Kubernetes or OpenShift cluster:  
Restart all the gateway pods.

- Using the migration script when Gateway is in a Kubernetes or OpenShift cluster:  
The script will restore the Management database, factory reset the Portal subsystem, and delete the Gateway pods. Once deleted, Gateway pods get restarted.

1. Run the following script:

```
python3 restore_management_db.py -n namespace -s PLATFORM_API_HOSTNAME --reset_gateway_portal
```

If using a Kubernetes environment, you must also supply the Cloud Manager admin password by using the `-p` flag.

2. After this command, you must run the remaining steps of migration, starting with Step 3 in [Restoring the target system](#).

- Gateway is on an Appliance  
Reboot all the Gateway appliances.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Shutting down the Postgres database

Shut down the Postgres database to ensure no changes are made to the database during migration.

Instructions:

- [Shutting down Postgres database in Management subsystem on Kubernetes or VMware](#)
- [Shutting down Postgres database in Management subsystem on OpenShift](#)

## Shutting down Postgres database in Management subsystem on Kubernetes or VMware

When using s3 backup configuration for the Management subsystem, the following steps should be run on the source system, before the target API Connect system is installed.

- If on a VMware appliance deployment, connect to the Management node and log in as root user (`sudo -i`), so that you can run `kubectl`.
- Enable pgo client:

```
kubectl set env deploy/ibm-apiconnect ENABLE_PGO_CLIENT="true" -n OPERATOR_NAMESPACE
```

- Wait for `pgo-client` pod to come up.
- Bring down the apic operator:

```
kubectl scale deploy ibm-apiconnect --replicas=0 -n OPERATOR_NAMESPACE
```

- Scale down deployments.  
Before scaling down the deployments, make a note of the current replicas:

```
kubectl get deployment -n namespace
```

- Standard deployments :
  - juhu
  - portal-proxy
  - apim
  - lur
  - taskmanager
  - hub (when Test and Monitor is enabled)

a. Scale down:

```
kubectl scale deploy <deployment_name> --replicas=0 -n NAMESPACE
```

b. To get the name of the Postgres cluster:

```
kubectl get pgcluster -n NAMESPACE
```

c. Connect to pgo client pod and run:

```
pgo update cluster PG_CLUSTER_NAME --shutdown -n NAMESPACE
```

## Shutting down Postgres database in Management subsystem on OpenShift

When using s3 configuration, the following steps should be run on the source system, before the target API Connect system is installed.

- Change to operator namespace:

```
oc project "{OPERATOR NS}"
```

- `oc edit csv ibm-apiconnect.v2.4.0`

a. Search for `APPLIANCE` and add these two lines above it:

```
- name: ENABLE_PGO_CLIENT
  value: "true"
```

b. Save and wait for the pgo-client pod to come up.

- `oc scale deploy ibm-apiconnect --replicas=0`
- Bring down apiconnect operator pod:

```
oc scale deploy ibm-apiconnect --replicas=0
```

5. Change to the namespace where API Connect is installed:

```
oc project "{APIC NS}"
```

6. Scale down the following deployments: juhu, portal-proxy, apim, lur, taskmanager

```
oc scale deploy JUHU_DEPLOYMENT_NAME --replicas=0
oc scale deploy PORTAL_PROXY_DEPLOYMENT_NAME --replicas=0
oc scale deploy APIM_DEPLOYMENT_NAME --replicas=0
oc scale deploy LUR_DEPLOYMENT_NAME --replicas=0
oc scale deploy TASKMANAGER_DEPLOYMENT_NAME --replicas=0
```

7. To get the name of the pg cluster:

```
oc get pgcluster
```

8. Log in to pgo client pod:

```
oc exec -it $(oc get po|grep pgo|awk '{print $1}') -- bash
```

9. Shutdown Postgres database:

```
pgo update cluster PG_CLUSTER_NAME --shutdown -n NAMESPACE
```

## Starting the Postgres database in the Management subsystem on Kubernetes and OVA

Use these steps when you are moving back to the source system because the migration failed, and you want to bring up the Postgres database, if it was shutdown.

1. If on an appliance (VMware), connect to the Management node and log in as root user (`sudo -i`), so that you can run the `kubect1` commands.
2. Get the name of the Postgres cluster:

```
kubect1 get pgcluster -n NAMESPACE
```

3. Connect to the pgo client pod and run the command:

```
pgo update cluster PG_CLUSTER_NAME --startup -n NAMESPACE
```

4. Scale up the deployments that use Postgres.

Standard deployments : juhu, portal-proxy, apim, lur, taskmanager, hub (when test and monitor is enabled)

```
kubect1 scale deploy DEPLOYMENT_NAME --replicas=N -n NAMESPACE
```

The value of **N** is from the `kubect1 get deployment -n namespace` output that you got before shutting down the Postgres database. It is 1 if using n1 profile, and 3 when using n3 profile.

5. Bring up the apic operator:

```
kubect1 scale deploy ibm-apiconnect --replicas=1 -n OPERATOR_NAMESPACE
```

6. If s3 backups are used, perform a Management restore with the backup that was taken as part of [Preparing the source system](#).  
Note: Any backups that are taken on the target system are not valid for the source system. The backups must not be used during restoration.
7. Ensure that all subsystems are healthy.

## Starting postgres database on the Management subsystem on OpenShift

Use these steps when you are moving back to the source system because the migration failed, and you want to bring up the Postgres database, if it was shutdown.

1. Change to the project where the top-level CR (apic) is installed:

```
oc project APIC_NAMESPACE
```

2. Get the name of the Postgres cluster:

```
oc get pgcluster
```

3. Log in to pgo client pod:

```
oc exec -it $(oc get po|grep pgo|awk '{print $1}') -- bash
```

4. Start the postgres database:

```
pgo update cluster PG_CLUSTER_NAME --startup -n NAMESPACE
```

5. Scale up the deployments: juhu, portal-proxy, apim, lur, and taskmanager. Use the following commands, where **N** is the value of replicas. If an n1 profile being used the value is 1, and if an n3 profile is being used the value is 3.

- `oc scale deploy JUHU_DEPLOYMENT_NAME --replicas=N`
- `oc scale deploy PORTAL_PROXY_DEPLOYMENT_NAME --replicas=N`
- `oc scale deploy APIM_DEPLOYMENT_NAME --replicas=N`
- `oc scale deploy LUR_DEPLOYMENT_NAME --replicas=N`
- `oc scale deploy TASKMANAGER_DEPLOYMENT_NAME --replicas=N`

6. Bring down the apiconnect operator pod:

```
oc scale deploy ibm-apiconnect --replicas=1 -n OPERATOR_NAMESPACE
```

7. If s3 backups are used, perform a Management restore with the backup that was taken as part of [Preparing the source system](#).  
Note: Any backups that are taken on the target system are not valid for the source system. The backups must not be used during restoration.
8. Ensure that all subsystems are healthy.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Replacing passwords, keys, and certificates

Ensure the security of your API Connect deployment by replacing compromised passwords, keys, and certificates.

### About this task

---

Each subsystem uses one or more passwords, database keys, and registration secrets. In some cases, an update takes effect immediately or on the next log-in, but some components require a restart to apply the update. Follow the procedure for updating each subsystem to ensure that you complete all required steps.

All subsystems use TLS certificates to encrypt communications both within each subsystem, between subsystems, and with clients. The procedure for renewing a certificate depends on whether you use IBM Certificate Manager. After you replace a certificate in a subsystem, you must restart all pods that are affected by the certificate, so there will be a service interruption.

The instructions in this section are written for deployments on Kubernetes and details for other platforms appear at the end of the section. Before you begin updating passwords, keys, and certificates, review the entire section to ensure you understand the procedures and are aware of any platform-specific differences that affect your deployment.

Attention: Before you change any passwords, keys, or certificates, you should disable scheduled backups for the Management subsystem and disable data collection for the Analytics subsystem as explained in this section. After the updates are complete, enable backups and data collection.

- [Disabling backups before updating secrets and certificates](#)  
Disable scheduled backups to ensure that you don't update secrets and certificates while a backup is running in your API Connect deployment.
- [Stopping Analytics data collection](#)  
When you renew secrets and certificates for the Analytics subsystem in your API Connect deployment, you must restart Analytics pods. Data cannot be moved to storage while pods are unavailable and if you do not stop collection, that data is lost.
- [Management subsystem: updating the password, keys, and secrets](#)  
Update the cloud administrator password, the key for encrypted database fields, and the `client_ID` and `client_secret` values for the Management subsystem in an API Connect deployment.
- [Gateway subsystem: updating the password and secret](#)  
Update the administrator password and the `client_secret` values for the Gateway subsystem in an API Connect deployment.
- [Portal subsystem: updating keys and secrets](#)  
Update the database passwords, keys, and the `client_secret` values for the Portal subsystem in an API Connect deployment.
- [Analytics subsystem: replacing the TLS profile and keys](#)  
Update the Analytics subsystem's TLS profile and keys for backup and restore operations in your API Connect deployment.
- [Renewing TLS certificates](#)  
Renew TLS certificates in your API Connect deployment.
- [Management subsystem: restarting pods](#)  
Restart Management subsystem pods in your API Connect deployment.
- [Gateway subsystem: restarting pods](#)  
Restart Gateway subsystem pods and components in your API Connect deployment.
- [Portal subsystem: restarting pods](#)  
Restart Portal subsystem pods in your API Connect deployment.
- [Analytics subsystem: restarting endpoints and pods](#)  
Restart the pods that support the Analytics service and endpoints in your API Connect deployment.
- [Re-enabling scheduled backups](#)  
If you disabled scheduled backups before updating keys, secrets, or passwords, enable the backups again for your API Connect deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Disabling backups before updating secrets and certificates

Disable scheduled backups to ensure that you don't update secrets and certificates while a backup is running in your API Connect deployment.

### About this task

---

Manually disable any configured backup schedule prior to updating and passwords, keys, profiles, secrets, or certificates. If a backup is taken while an update is running, then that backup should be considered potentially corrupted.

### Procedure

---

1. Disable backups by completing the following steps:
  - a. Open the management cluster CR for editing by running the following command:

```
kubectl -n namespace edit CR-name
```

where:

- `namespace` is the namespace where the Management subsystem is installed.
- `CR-name` is the name of the CR that was used to install the Management subsystem.

- In the `databaseBackup` section of the CR, remove the `schedule` entry.
- Save and close.

- Verify that no backups are running by completing the following steps:

- List all your Management backups by running the following command:

```
kubectl -n namespace get managementbackup
```

where `namespace` is the namespace where the Management subsystem is installed.

- In the results, check the STATUS column to ensure that all backups are listed as `Ready`.

If any backups are still running, wait for them to complete before proceeding to the next topic. The `Ready` status indicates that the backup was finished successfully. If the status is `Failed` then the backup did not complete successfully.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Stopping Analytics data collection

When you renew secrets and certificates for the Analytics subsystem in your API Connect deployment, you must restart Analytics pods. Data cannot be moved to storage while pods are unavailable and if you do not stop collection, that data is lost.

### About this task

Complete the following steps to stop the collection of Analytics data and write to disk any data that is currently in the pipeline.

### Procedure

- Disable shard allocation for storage by running the following command:

Disabling shard allocation is optional, but is recommended because it prevents new shards from being created for replication when a node is unavailable, and helps avoid corruption issues in full system restarts.

```
kubectl -n namespace exec -it storage-master|shared_pod -- curl_es _cluster/settings -XPUT -d '{"persistent": {"cluster.routing.allocation.enable": "none"}}'
```

where:

- `namespace` is the namespace where the Analytics subsystem is installed.
- `storage-master|shared_pod` is the name of any storage-master or storage-shared pod. You can get the name of your storage pods by running the following command and substituting in the namespace where Analytics is installed:

```
kubectl -n namespace get po
```

When you disable shard allocation, the response looks like the following example:

```
{"acknowledged": true, "persistent": {"cluster": {"routing": {"allocation": {"enable": "none"}}}, "transient": {}}
```

- Unassociate Analytics service from the Gateway service.

Unassociating the services is optional but is recommended because it prevents new data from entering the pipeline while the Analytics pods are unavailable, and helps avoid corruption issues in full system restarts.

Unassociate the Analytics service from all Gateway services as explained in step 7 in the topic, [Associating an analytics service with a gateway service](#).

- Perform a synced flush of storage by running the following command:

Flushing the storage is optional, but is recommended because it helps to avoid losing the data that was not yet written to disk before you restart pods. This step flushes all current index operations synchronously and attempts to write everything that is in flux to disk.

```
kubectl -n namespace exec -it storage-master|shared_pod -- curl_es _flush/synced -XPOST
```

where:

- `namespace` is the namespace where the Analytics subsystem is installed.
- `storage-master|shared_pod` is the name of any storage-master or storage-shared pod. You can get the name of your storage pods by running the following command and substituting in the namespace where Analytics is installed:

```
kubectl -n namespace get po
```

When you flush storage, the response looks like the following example:

```
{"_shards": {"total": 33, "successful": 13, "failed": 0}, ".export-status": {"total": 1, "successful": 1, "failed": 0}, ".apic-config": {"total": 1, "successful": 1, "failed": 0}, ".kibana-6": {"total": 1, "successful": 1, "failed": 0}, "apic-api-2020.06.19-000002": {"total": 15, "successful": 5, "failed": 0}, "apic-api-2020.06.18-1": {"total": 15, "successful": 5, "failed": 0}}
```

The operation often fails, and it is safe to rerun it multiple times until it passes and there are all "failed" counts are zero. If it continues to fail after running multiple attempts over the span of a couple minutes, you can proceed to the next step.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Management subsystem: updating the password, keys, and secrets

Update the cloud administrator password, the key for encrypted database fields, and the `client_ID` and `client_secret` values for the Management subsystem in an API Connect deployment.

### About this task

---

- [Changing the cloud administrator password](#)  
Update the cloud administrator password for the Management subsystem using the Cloud Manager UI, the toolkit CLI, or an API call.
- [Changing the database encryption key](#)  
Replace the value of the secret that is used for encrypting database fields in the Management subsystem.
- [Changing the registration client id and client secret for applications](#)  
Change the registration credentials (the `client_id` and `client_secret`) for applications provided by the Management subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Changing the cloud administrator password

Update the cloud administrator password for the Management subsystem using the Cloud Manager UI, the toolkit CLI, or an API call.

### About this task

---

In the Management subsystem for an API Connect on-premises deployment, the administrator is called the *cloud administrator* and works with the management server to configure the deployment of the local server cloud. Updating the cloud administrator password for the Management subsystem requires no service interruption because the change takes place immediately.

You can change the cloud administrator's password using any of the following methods.

Note: Passwords must contain eight or more characters, with at least one character from three of the following categories: lowercase letters, uppercase letters, numerals, and punctuation (for example: ! \$ # %). The same character cannot be used more than twice consecutively.

Cloud Manager UI

1. [Log in to the Cloud Manager UI](#).
2. [Change your Cloud Manager password](#).

Toolkit CLI

1. Run the `apic login` command to [log in to a management server](#).
2. Run the `apic me:change-password` command to [change your password](#).

API call

1. Run the `apic login` command to [log in to a management server](#).  
You must log in to a management server with the toolkit CLI before you can call the API Connect APIs.
2. Execute the `/api/me/change-password` API call, as explained in the "Resource: Me" section of the IBM API Connect Platform - Cloud Management API.

The next time that you log in as the cloud administrator, you must use the new password.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Changing the database encryption key

Replace the value of the secret that is used for encrypting database fields in the Management subsystem.

### About this task

---

This update does not require an outage; however some operations might take longer than usual due to database locking.

### Procedure

---

1. Create a secret rotation CR that specifies the name of your management cluster.

You can optionally specify the name of a secret containing the new `encryption_secret.bin` as shown in the following example, or you can omit it so that a new key is generated automatically.

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementSecretRotation
metadata:
  name: rotate-secret
spec:
  managementCluster: management
  rotateEncryptionSecret:
    rotate: true
    # encryptionSecret: name_of_secret
```

Note: If you upgraded from V2018, the database encryption key was carried forward and is called `managementUpgradeName-encryption-secret`.

2. Run the following command to apply the CR and change the secret:

```
kubectl -n namespace create -f rotate_secret.yaml
```

where:

- `namespace` is the namespace where you installed the Management subsystem.
- `rotate_secret.yaml` is the name of the file containing the CR. Notice that the file name does not have to match the value of the `name` specified in the CR.

3. Verify that the secret was generated using one of the following methods:

- Run the `kubectl get job` command and verify that the results include a job for the new CR. The job is named based on the management cluster name and the CR name, using the following format: `managementCluster-crName`. For the example CR `rotate-secret` created for the `management` cluster, the job is named `management-rotate-secret`.
- Look in the pod logs of the `apiconnect` operator and locate the record with the name that you specified in the `kind` field in the CR, and check its progress. For the example CR, the `kind` value is "ManagementSecretRotation". You can also use the log to verify that database tables were updated.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Changing the registration `client_id` and `client_secret` for applications

Change the registration credentials (the `client_id` and `client_secret`) for applications provided by the Management subsystem.

### About this task

Update the application registration `client_id` and `client_secret` by changing the Kubernetes secret containing them. The `apim` file-watcher detects the change and automatically updates the following secrets in the database:

- toolkit: `management-cli-cred` (Customer facing)  
When you update the secret for the toolkit, users must download and install new toolkit credentials as explained in [Installing the toolkit](#).
- consumer-toolkit: `management-ccli-cred` (Customer facing)  
When you update the secret for the toolkit, users must download and install new toolkit credentials as explained in [Installing the toolkit](#).
- designer: `management-dsgr-cred` (Customer facing)  
When you update the secret for API Designer, users must download and install new credentials as explained in [Installing the toolkit](#).
- atm: `management-atm-cred` (Internal)
- consumer-ui: `management-cui-cred` (Internal)
- juhu: `management-juhu-cred` (Internal)
- ui: `management-ui-cred` (Internal)  
The API Manager and Cloud Manager read the credentials from the back-end on start-up.

When you update registration credentials, the registration name that is associated with the updated secret changes. Table 1 lists the registration secrets with the default registration name and the pattern used for generating updated registration names for each secret. The new registration names follow the patterns shown in the table. The second and subsequent updates append a number to the name; for example, `toolkit-application-registration`, `toolkit-application-registration0` and then `toolkit-application-registration1`.

Table 1. Secret names and the corresponding default, and new, registration names for each secret

Secret	Default registration name	New registration name pattern
<code>management-cli-cred</code>	<code>toolkit-default</code>	<code>toolkit-application-registration*</code>
<code>management-ccli-cred</code>	<code>consumer-toolkit-default</code>	<code>consumer-toolkit-application-registration*</code>
<code>management-dsgr-cred</code>	<code>designer-default</code>	<code>designer-registration*</code>
<code>management-atm-cred</code>	<code>atm-default</code>	<code>atm-default*</code>
<code>management-cui-cred</code>	<code>consumer-ui-default</code>	<code>consumer-ui-default*</code>
<code>management-juhu-cred</code>	<code>juhu-default</code>	<code>juhu-default*</code>
<code>management-ui-cred</code>	<code>ui-default</code>	<code>ui-default*</code>

### Procedure

1. To renew an internal certificate, complete the following steps:

- a. Create a ManagementSecretRotation CR (for example, operationcr.yaml) with contents similar to the following example, and list the secrets that you want to update:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementSecretRotation
metadata:
  name: rotate-credentials
spec:
  managementCluster: management
  rotateClientIDandSecret:
    secrets:
      - management-ui-cred
      - management-cui-cred
      - management-juhu-cred
      - management-atm-cred
```

- b. Apply the CR by running the following command:

```
kubect1 create -f operationcr.yaml -n namespace
```

where:

- `namespace` is the namespace where you installed the Management subsystem
- `operationcr.yaml` is the file that contains the CR

Applying the resource updates the credential for the specified secrets with new values.

2. To update customer-facing credentials, complete the following steps:

- a. For each of the credential secrets, run the following command to update the `client_id` and `client_secret`:

```
kubectledit secret credential_secret_name -n namespace
```

where:

- `namespace` is the namespace where the Management subsystem is installed.
- `credential_secret_name` is the name of the secret that you want to update.

The response opens the secret in a text editor as shown in the following example:

```
apiVersion: v1
data:
  credential.json: eyAiaWQiOiAiNTY3MTYyNjYtZDE0Zi00ODZmLWI0MmYtZTE3MzZkZTg3NjE0IiwgInNlY3JldCI6ICJmYjU5MDdhNy0zMjZjLTQ4ZWYtYjQ0ZC1hMTI5mZkMzNiMTEiIH0=
```

In the secret, the value of `credential.json` is a base64 encoded string of the following JSON format. Decode it first, modify the values of `id` and `secret`, and encode back as base64 and paste it in the secret. (Note that either `id` or `secret` or both can be updated, but if the credentials have been compromised then it's recommended to update both `id` and `secret`). For example:

- b. Decode the value of `credential.json`.

To decode the value, copy it from the secret in step 2a, and paste it between the quotation marks as the `encoded_value` in the following command:

```
echo "encoded_value" | base64 --decode
```

Using the value returned in step 1, the command looks like the following example:

```
echo "eyJhbnQiOiAiNTY3MTYyNjYtZDE0Zi00ODZmLWI0MmYtZTE3MzZkZTg3NjE0IiwgInNlY3JldCI6ICJmYjU5MDdhNy0zMjZjLTQ4ZWYtYjQ0ZC1hMTI5mZkMzNiMTEiIH0=" | base64 --decode
```

The response displays decoded values of the `id` and `secret`, as in the following example:

```
{ "id": "56716266-d14f-486f-b41f-e1736de87614", "secret": "fb5907a7-326c-48ef-b44d-a129ffd33b11" }
```

- c. Update the values of `id` and `secret`.

You can use any string that meets the following requirements:

- The `id` (it becomes `client_id`) must be unique across all credentials in your entire deployment.
- The values must be enclosed in straight quotation marks. To make sure you use the correct character, create the values in a plain text editor.

- d. Encode the updated `id` and `secret` as base64 by running the following command:

```
echo -n '{ "id": "new_id", "secret": "new_secret" }' | base64
```

Replace `new_id` and `new_secret` with your updated values. For example:

```
echo -n '{ "id": "21034840-b439-a393-4482-a948bcb39603", "secret": "43450ab9-4038-acf0-0498-793b29ade396" }' | base64
```

Returns the following base64-encoded value:

```
aWQ6IDIxMDMOODQwLWI0MzktYTM5My00NDgyLWE5NDhiY2IzOTYwMygc2VjcmV0OiA0MzQ1MGFiOS00MDM4LWFfZjZjAtMDQ5OC03OTNiMjhhZGUzOTY=
```

- e. Paste the newly coded value for `credential.json` into the secret.

- f. Save the secret.

When you save the secret, the logs in the `apim` pods indicate that a new registration was created. For example, if the `client_id` changed, the display looks similar to the following messages

```
2020-09-14T09:55:58.331Z bhendi:audit [ce64fd50-e4de-4cfb-baa7-7379a892b2c9] Created internal resource "Registration"

'user-interface-registration (User Interface Registration)' (id=bb02b3bf-5e80-4547-842e-e60f4aald0ce,
url=/api/cloud/registrations/bb02b3bf-5e80-4547-842e-e60f4aald0ce, namespace=cloud)
2020-09-14T11:00:52.377Z audit [866bb70b-3bb5-4ac3-9a59-0b60ade7feb2] Creating a new registration for type, ui, with
client_id: ui-client-id.

```

g. If the response shows any errors, you must correct the errors.

When the logs show no errors, the saved values are updated in the Management subsystem's database.

h. Confirm that the new registration exists in the registrations list by running the following toolkit CLI command:

```
apic --server server registrations:list
```

where **server** is the Management server endpoint URL.

i. Verify that the updated registration is now in effect by running the following toolkit CLI command:

```
apic --server server registrations:get new_registration_name --output -
```

where:

- **server** is the Management server endpoint URL
- **new\_registration\_name** is the new registration name (including any numeric suffix) following the patterns in Table 1.

j. Save the old registration (refer to Table 1 to determine the previous registration's file name) in case you need it when restoring an older backup.

Restoring a backup restores the registration credentials (client\_ID, client\_secret) that were in use at the time that the selected backup was created.

k. If you updated the registration credentials for API Designer or the toolkit, inform users so they can download new credentials.

Users can download and set up new credentials as explained in [Installing the toolkit](#). Other credentials are updated automatically and require no actions from the user.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Gateway subsystem: updating the password and secret

Update the administrator password and the `client_secret` values for the Gateway subsystem in an API Connect deployment.

### About this task

- [Changing the Gateway administrator password](#)  
Change the Gateway administrator password by updating the CR and reinstalling the subsystem.
- [Changing the Gateway client secret](#)  
The Gateway subsystem receives its `client_secret` from the Management subsystem.
- [Changing the secret for Gateway peering](#)  
Update the secret that protects gateway-peering communications within a Gateway cluster in your API Connect deployment.
- [Updating the TLS profile for Gateway](#)  
Update the TLS profile that secures communications with the Gateway subsystem in your API Connect deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Changing the Gateway administrator password

Change the Gateway administrator password by updating the CR and reinstalling the subsystem.

## About this task

---

Updating the administrator password for the Gateway subsystem requires no measurable reduction in API enforcement performance (gateways remain "up"); however, services such as SNMP will experience a disconnect until the password is updated on all pods.

## Procedure

---

1. Determine the name of the secret that is used in the Gateway CR by running the following command:

```
kubectl -n namespace get gatewaycluster gw-cluster-name -o yaml
```

where `namespace` is the namespace where you installed the Gateway subsystem.

In the resource, the Gateway's `secretName` is in the `adminUser` section.

2. Update the secret by running the following command to edit the resource:

```
kubectl -n namespace edit secret secretName
```

where `namespace` is the namespace where you installed the Gateway subsystem.

Change the value of `.data.password` to be the base64-encoded value of a new password. The new password can be any string you want but you must encode it to base64.

3. Save and close.

The Gateway pods automatically restart, one at a time, until all pods are using the new secret.

4. To verify that the Gateway subsystem(s) are fully installed, run the following command:  
Replace `namespace` with the appropriate namespace.

```
kubectl -n namespace get GatewayCluster
```

where `namespace` is the namespace where you installed the Gateway subsystem.

The update is complete when the `READY` status is `True`, and the `SUMMARY` reports that all services are online (2/2) for all the Gateway subsystems that were updated. Example:

NAME	READY	SUMMARY	VERSION	RECONCILED VERSION	AGE
gwv5	True	2/2	10.0.0.0	10.0.0.0-1219	7m31s
gwv6	True	2/2	10.0.0.0	10.0.0.0-1219	7m32s

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Changing the Gateway `client_secret`

The Gateway subsystem receives its `client_secret` from the Management subsystem.

## About this task

---

If you changed the `client_secret` on the Management subsystem, force a dynamic reconfiguration and reregistration (DRR) as explained in [How can I force re-population of the configuration data?](#) On completion, the Gateway subsystem uses the new `client_secret` in its communications with the Management subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Changing the secret for Gateway peering

Update the secret that protects gateway-peering communications within a Gateway cluster in your API Connect deployment.

## About this task

---

You can update the secret for an appliance-based gateway or a Kubernetes-based gateway. This task causes a disruption in API transactions because the secret must be changed on all gateways at the same time, and all gateways must be restarted.

## Procedure

---

1. Appliance only: Manually update the Gateway Peering Identification Credential and Validation Credential objects.

Attention: If your Gateway is not deployed on an appliance, skip to step 2.

As soon as you begin this process, nodes will be out of sync. The nodes will remain out of sync until the entire process is complete. If the nodes do not recover from the out-of-sync condition, you might need to perform a DRR. For information about dynamic reregistration and reconfiguration and (DRR), see [Dynamically re-registering and reconfiguring a Gateway service in a Kubernetes deployment](#).

2. Kubernetes only: If your Gateway is deployed on Kubernetes, update the secret by completing the following steps.
  - a. Determine the name of your Gateway cluster by running the following command:

```
kubectl -n namespace get gatewayCluster
```

where *namespace* is the namespace where the Gateway subsystem is deployed.

- b. Determine the name of the secret currently being used for gateway peering by running the following command:

```
kubectl -n namespace describe gatewayCluster gateway-cluster
```

where:

- *namespace* is the namespace where the Gateway subsystem is deployed.
- *gateway-cluster* is the name that you obtained in step 2a.

In the response, the name of the secret currently being used displays after the heading **Apic Gateway Peering TLS** as shown in the following example:

Spec:

```
Admin User:
Secret Name:      datapower-admin-credentials
API Debug Probe: true
API Debug Probe Expiration Minutes: 60
API Debug Probe Max Records: 1000
Apic Gateway Peering TLS:
Secret Name:      gateway-peering
```

- c. Show the age of the secret currently being used by running the following command:

```
kubectl -n namespace get secret gateway-peering-secret
```

where:

- *namespace* is the namespace where the Gateway subsystem is deployed.
- *gateway-peering-secret* is the secret name that you obtained in step 2b.

- d. Delete the secret and then immediately delete all of the Gateway pods in the Gateway cluster by running the following two commands:

```
kubectl -n namespace delete secret gateway-peering-secret
kubectl -n namespace delete pod gw-pod1 gw-pod2 gw-pod3
```

where:

- *namespace* is the namespace where the Gateway subsystem is deployed.
- *gateway-peering-secret* is the secret name that you obtained in step 2b.

When you delete the secret and the pods, the following events occur automatically:

- i. The cert-manager recreates the secret.
- ii. The DataPower operator recreates the gateway pods.
- iii. Dynamic reconfiguration re-installs the API metadata onto the gateways.

For information about dynamic reregistration and reconfiguration and (DRR), see [Dynamically re-registering and reconfiguring a Gateway service in a Kubernetes deployment](#).

- e. To verify the update, show the age of the new gateway peering secret by running the following command:

```
kubectl -n namespace get secret gateway-peering-secret
```

where:

- *namespace* is the namespace where the Gateway subsystem is deployed.
- *gateway-peering-secret* is the secret name that you obtained in step 2b.

Make sure that the secret is new and does not show the same age as previously.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Updating the TLS profile for Gateway

Update the TLS profile that secures communications with the Gateway subsystem in your API Connect deployment.

### Procedure

---

1. Appliance only: update the TLS profile by modifying the configuration of the REST management interface.

Attention: If your Gateway is not deployed on an appliance, skip to step 2.

For information on the REST management interface commands, see [REST Management Interface commands](#) in the DataPower Gateway documentation.
2. Kubernetes only: update the TLS profile using the Domain API, which is exposed in the GatewayCluster CRD.

The update requires a change the `rest-mgmt` service in the `default` domain. For information, see [Domain API](#) in the DataPower Operator documentation. For information on updating the domain definition, see [Domain configuration](#) in the same documentation.

Note: The Gateway's API call SNI endpoint already supports replacing customer-provided keys and certifications as explained in [Binding a TLS server profile to a gateway service](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Portal subsystem: updating keys and secrets

Update the database passwords, keys, and the `client_secret` values for the Portal subsystem in an API Connect deployment.

---

### About this task

- [Changing the secret for Portal data and system tools](#)  
Replace the encryption key that generates the secret used for securing the database and system tools that are used by the Portal subsystem.
- [Changing the Portal client secret](#)  
Change the `client_secret` for the Portal subsystem to keep it in sync with the Management subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Changing the secret for Portal data and system tools

Replace the encryption key that generates the secret used for securing the database and system tools that are used by the Portal subsystem.

---

### Before you begin

If you are using a stand-alone, single data center deployment, you can update the encryption key with the PortalSecretRotation CR, as explained in [Using a PortalSecretRotation CR to update the portal CA](#). The PortalSecretRotation CR is not supported for a two data center configuration or a Cloud Pak for Integration deployment, so you must update the key manually as explained in the following steps.

---

### About this task

The Portal subsystem uses a database plus several system tools to manage storage, hot backups, and cluster synchronization. The following services are all secured with the secret that is generated by the Portal CR during installation:

- MySQL root account for each Portal site
- Csync2 cluster synchronization service

Updating the portal-encryption-secret will make the following changes to your deployment:

- Change the root MySQL password
- Generate a new, site-specific MySQL password for each site
- Generate a new csync2 cluster key
- Re-encrypt all `client_ids` and `client_secrets` in the portal database

If you need to change the secret, the update is applied to all of the listed services. You can change the secret by generating a new value and restarting pods to pick up the new value. In a two data center deployment, you must manually copy the new secret to the other site.

---

### Procedure

Generate a new secret and apply it to the deployment using the appropriate steps for your environment:

- Single data center  
Run the following command to generate a new secret and apply it to the deployment:

```
kubectl -n namespace patch secret portal-enc-key -p '{"data": {"encryption_secret": "$(head -c72 /dev/urandom | base64 -w0 | base64 -w0)"}' --type=secret
```

where `namespace` is the namespace where you installed the Portal subsystem.

The `portal-enc-key` was generated during installation and added to the CR as the `encryptionSecret` setting. When you generate a new secret, the value is updated automatically. If you saved the secret in a file after the [Portal installation](#) as recommended, be sure to update that file now.

- Two data centers  
a. Generate the new secret on DC1 by running the following command:

```
head -c72 /dev/urandom | base64 -w0 | base64 -w0 > secret.txt
```

The `portal-enc-key` was generated during installation and added to the CR as the `encryptionSecret` setting. When you generate a new secret, the value is updated automatically. If you saved the secret in a file after the [Portal installation](#) as recommended, be sure to update that file now.

- b. Open a terminal to each DC in the same working directory where you saved `secret.txt` (or, copy the file to somewhere you can open a terminal to each DC).

c. In each terminal, verify that you can access `secret.txt` by typing the following command:

```
echo $(cat secret.txt)
```

d. In each terminal, type the following command -- but do not press Enter yet:

```
kubectl -n namespace patch secret portal-enc-key -p "{\"data\": {\"encryption_secret\": \"$(cat secret.txt)\"}}"
```

where `namespace` is the namespace where you installed the Portal subsystem.

e. Press Enter in both terminals at the same time (or as close in time as possible).

There is a 5-minute time-out that starts as soon as any of the pods has the new secret mounted by Kubernetes. All pods will get the secret at slightly different times, but within about a minute of each other. If the 5-minute time-out expires before all pods across both DCs have the new secret, then the pods will rotate the new secret in at different times, resulting in errors in the logs and some down time for various pods, until they manage to rotate the new secret into use and recover.

## Results

When pods restart, the new secret is used to secure the services. The `portal-www` admin logs display messages as the new secret is used to re-encrypt the database. The following example shows sample log messages when the updated secret is applied to the database:

```
[ upgrade stdout] 2872 888ec0:8cb2cc:73add2 2020-08-06 13:16:21: NEW k8s encryption key detected on this system!
Reencrypting portal data
[ upgrade stderr] 2954 888ec0:73add2:7fcelb 2020-08-06 13:16:21: refresh_encryption_key: Command Started:
/opt/ibm/bin/refresh_encryption_key
FEgX8F5MXtwvoJ8Wpxw5DB/6MKK/qPKfRt5FaId3jy5IjbpXL8wi3/33q3KOySh8/zh11rVNFZTlzRnVfkGheLr9Le/Pb9jq
[ upgrade stdout] 2872 888ec0:8cb2cc:73add2 2020-08-06 13:16:21: No portal service exists! Simply overriding the key
[ upgrade stdout] 2872 888ec0:8cb2cc:73add2 2020-08-06 13:16:21: New key installed
(FEgX8F5MXtwvoJ8Wpxw5DB/6MKK/qPKfRt5FaId3jy5IjbpXL8wi3/33q3KOySh8/zh11rVNFZTlzRnVfkGheLr9Le/Pb9jq)
[ upgrade stderr] 2954 888ec0:73add2:7fcelb 2020-08-06 13:16:21: refresh_encryption_key: Command Finished:
/opt/ibm/bin/refresh_encryption_key
FEgX8F5MXtwvoJ8Wpxw5DB/6MKK/qPKfRt5FaId3jy5IjbpXL8wi3/33q3KOySh8/zh11rVNFZTlzRnVfkGheLr9Le/Pb9jq with RC 0
[ upgrade stderr] 2872 888ec0:8cb2cc:73add2 2020-08-06 13:16:21: Command Finished: /opt/ibm/bin/sysupgrade with RC 0
```

If there is a Portal service registered and Developer Portal sites installed, then this task re-encrypts that data as well. When the site encryption is complete, the log displays a "Command Finished" message for the `refresh_encryption_key` command, as shown in the following example:

```
Command Finished: /opt/ibm/bin/refresh_encryption_key <KEY> with RC 0
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Changing the Portal `client_secret`

Change the `client_secret` for the Portal subsystem to keep it in sync with the Management subsystem.

### About this task

The Portal subsystem uses the same `client_secret` as the Management subsystem. If you change the `client_secret` on the Management subsystem, update the Portal subsystem by pulling the credential from the Management subsystem.

Note: If you did not deploy the Portal subsystem, skip this task.

### Procedure

1. On a Portal pod, run the following command to pull the Portal service's `client_secret` from the Management subsystem:

```
kubectl -n namespace exec -t portal-mydc-ww-0 -- bash -ic refresh_cloud_credentials
```

where `namespace` is the namespace where you installed the Portal subsystem.

2. Then, run the following command to update the credential for the Portal sites:

Note: If you did not deploy any Portal sites, skip this step.

```
kubectl -n namespace exec -t portal-mydc-ww-0 -- bash -ic "refresh_site_credentials -a"
```

where `namespace` is the namespace where you installed the Portal subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Analytics subsystem: replacing the TLS profile and keys

Update the Analytics subsystem's TLS profile and keys for backup and restore operations in your API Connect deployment.

- [Updating the TLS profile for Analytics](#)  
Update the TLS Profile for the Analytics service in your API Connect deployment.
- [Updating the Analytics backup/restore secret](#)  
Update the secret that secures backed-up data for the Analytics subsystem in an API Connect deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Updating the TLS profile for Analytics

Update the TLS Profile for the Analytics service in your API Connect deployment.

### Procedure

1. Unassociate Analytics service from the Gateway service.  
Unassociate the Analytics service from all gateway services as explained in step 7 in the topic, [Associating an analytics service with a gateway service](#).
2. Update the TLS Profile for the Analytics service.  
See step 3 in the topic, [Registering an analytics service](#).
3. Associate the Analytics service with the Gateway service.  
See [Associating an analytics service with a gateway service](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Updating the Analytics backup/restore secret

Update the secret that secures backed-up data for the Analytics subsystem in an API Connect deployment.

### About this task

When you configure S3 storage for backing up Analytics data, you encrypt the S3 provider's access key and save it as a Kubernetes secret for your Analytics deployment. If the S3 access key or your Kubernetes secret is compromised, obtain a new key from the S3 provider and use it to generate a new Kubernetes secret.

Important: When you invalidate a key, be sure to save a copy of it with a notation listing the dates when it was used. If you need to restore a backup that was created with the invalidated key, you will need to use that key to access the data. One method of saving the key is to create a new version of the CR every time you change the key, so that you can easily refer to the settings and key that were used for each backup.

This task assumes that you have already [configured the backup settings for your Analytics subsystem](#) and now want to replace the Kubernetes secret that is specified as the `analytics-backup-secret` in the Analytics CR.

### Procedure

1. Update the secret for your S3 storage:
  - a. Obtain a new access key and corresponding access key secret from your S3 provider.
  - b. Invalidate the previous credentials that were specified in the Analytics CR.
2. Verify that the secret is now invalid by running the following command:

```
kubectl -n namespace exec -it storage_master/shared_pod -- curl_es_snapshot/apic-analytics/_verify -XPOST
```

where:

- `namespace` is the namespace where Analytics is deployed.
- `storage-master/storage-shared_pod` the name of any one of the storage master or shared pods.  
You can retrieve the list of storage pod names by running the following command:

```
kubectl get po -n namespace
```

A successful invalidation operation returns a `repository_verification_exception` message as in the following example:

```
{"error":{"root_cause":[{"type":"repository_verification_exception","reason":"[apic-analytics] path is not accessible on master node"}],"type":"repository_verification_exception","reason":"[apic-analytics] path is not accessible on master node"},"caused_by":{"type":"i_o_exception","reason":"Unable to upload object [tests-5PQ7Hm0zRs6ryr6wm_ZA1A/master.dat-temp] using a single upload"},"caused_by":{"type":"amazon_s3_exception","reason":"The AWS Access Key ID you provided does not exist in our records. (Service: Amazon S3; Status Code: 403; Error Code: InvalidAccessKeyId; Request ID: 8ea5a567-e1dd-4959-bc1a-5933a8a559c6; S3 Extended Request ID: null)"}}, "status":500}
```

If the invalidation was not successful, then the secret is still valid and the response includes the names of the analytics-storage pods, as in the following example:

```
{ "nodes": { "NsrFYadiQhumJBb-6XuQUw": { "name": "analytics-storage-master-0" }, "uoXoBx4KQH00bhi-yqWekQ": { "name": "analytics-storage-data-0" } } }
```

Attention: Make sure that you successfully invalidate the current secret to prevent unauthorized access to your data.

3. Delete the invalidated Kubernetes secret by running the following command:

```
kubectl -n namespace delete secret name
```

where:

- `namespace` is the namespace where Analytics is deployed.
- `name` is the name of the current (invalidated) Kubernetes secret, which is specified in the `credentials` setting in the `databaseBackup` section of the Analytics CR. Every time you update the secret, you must assign it a new name.

4. Create a new Kubernetes secret by running the following command and filling in your access key, access key secret, and namespace:

```
kubectl -n namespace create secret generic new_secret_name --from-literal=username='S3_access_key' --from-literal=password='S3_access_key_secret'
```

where:

- `namespace` is the namespace where Analytics is deployed.
- `new_secret_name` is a new name for storing the new Kubernetes secret. Every time you update the secret, you must assign it a new name.
- `S3_access_key` and `S3_access_key_secret` are the values that you received from the S3 provider.

5. Edit the Analytics CR file and replace the invalidated secret with the new secret.
  - a. In the CR, locate the `credentials` setting in the `databaseBackup` section.
  - b. Replace the invalidated secret name with the name of the new secret that you just generated.
  - c. Save and close the CR file.
6. Run the following command to apply the updated CR so that the new secret takes effect:

```
kubectl -n namespace apply -f path/to/analytics-cr
```

where:

- `namespace` is the namespace where Analytics is deployed.
- `path/to/analytics-cr` is the path and file name of the Analytics CR.

7. After the pods restart, run the following command to verify that the new secret is valid and in use:  
This step uses the same command as step 2 to determine whether a key is valid, but this time you want to ensure that the new key is valid.

```
kubectl -n namespace exec -it storage_master/shared_pod -- curl -es _snapshot/apic-analytics/_verify -XPOST
```

where:

- `namespace` is the namespace where Analytics is deployed.
- `storage-master/storage-shared_pod` the name of any one of the storage master or shared pods.  
You can retrieve the list of storage pod names by running the following command:

```
kubectl get po -n namespace
```

If the new secret is valid and in use, the response includes the names of the analytics-storage pods, as in the following example:

```
{ "nodes": { "NsrFYadiQhumJBb-6XuQUw": { "name": "analytics-storage-master-0" }, "uoXoBx4KQH00bhi-yqWekQ": { "name": "analytics-storage-data-0" } } }
```

If the new secret is not valid, the response indicates a `repository_verification_exception` as in the following example:

```
{ "error": { "root_cause": [ { "type": "repository_verification_exception", "reason": "[apic-analytics] path is not accessible on master node" }, { "type": "repository_verification_exception", "reason": "[apic-analytics] path is not accessible on master node", "caused_by": { "type": "i_o_exception", "reason": "Unable to upload object [tests-5PQ7Hm0zRs6ryr6wm_ZA1A/master.dat-temp] using a single upload", "caused_by": { "type": "amazon_s3_exception", "reason": "The AWS Access Key ID you provided does not exist in our records. (Service: Amazon S3; Status Code: 403; Error Code: InvalidAccessKeyId; Request ID: 8ea5a567-e1dd-4959-bc1a-5933a8a559c6; S3 Extended Request ID: null)" } } } ], "status": 500 }
```

In this case, wait 1 minute and then run the command again. If the response still indicates an invalid secret, new S3 access key and secret are valid before repeating the procedure.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Renewing TLS certificates

Renew TLS certificates in your API Connect deployment.

### About this task

When you install API Connect, the deployment uses Kubernetes cert-manager to create *issuers*, *CA certificates*, *server certificates*, and *client certificates*. You can accept the certificates generated during deployment, or create custom certificates. For information on creating certificates for your deployment, see [Certificates in a Kubernetes environment](#).

If you use Kubernetes cert-manager to generate and manage certificates (both default certificates and custom certificates), you can easily renew them with as explained in this section. If you used a different application to create certificates, you are responsible for renewing them manually. This section provides instructions for renewing certificates, as well as lists of the certificates to renew. The next section explains how to restart subsystems to apply the new certificates.

Note: The topics in this section use variables to represent the subsystem name in each certificate name, to indicate that the name is based on the name you provide in the Kubernetes Custom Resource (CR) for each subsystem instance. For example, the CA for the Management subsystem is referred to as `management_CR-ca` to indicate that the name depends on the value you provided in the management CR.

- [Renewing certificates with cert-manager](#)  
Use Kubernetes cert-manager to renew the issuers, CA certificates, and derived certificates that it manages for your API Connect deployment.
- [Renewing custom certificates](#)  
If you did not use cert-manager to generate certificates for your API Connect deployment, you must renew them manually.

How to renew the Portal encryption secret in an API Connect two data center disaster recovery deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Renewing certificates with cert-manager

Use Kubernetes cert-manager to renew the issuers, CA certificates, and derived certificates that it manages for your API Connect deployment.

### Before you begin

Kubernetes cert-manager can only renew the certificates that it stores and manages. If you created custom certificates using a different application, you must renew them manually.

If you configured automatic renewal of certificates with cert-manager, you must still restart the pods affected by the updated certificates. For more information, see [Automatic renewal with cert-manager](#).

For lists of the different certificates used in an API Connect deployment, see the following topics:

- [List of Issuers, CA certificates, and secrets](#)
- [List of external certificates](#)
- [List of internal certificates](#)

### About this task

The following steps explain how to renew certificates using Kubernetes cert-manager. The instructions also apply to renewing internal certificates on VMware. For information on renewing other certificates on VMware, see [Renewing certificates on VMware](#).

If you are using a single data center configuration with a stand-alone API Connect deployment, you can update the CA certificate for the following subsystems using the appropriate secret-rotation CR:

- Management subsystem: Update the CA certificate with the ManagementSecretRotation CR, as explained in [Using a ManagementSecretRotation CR to update the management CA](#) (not supported for a two data center configuration or Cloud Pak for Integration).
- Portal subsystem: Update the CA certificate with the PortalSecretRotation CR, as explained in [Using a PortalSecretRotation CR to update the portal CA](#) (not supported for a two data center configuration or Cloud Pak for Integration).

The CA certificates for the Analytics and Gateway subsystems can only be updated using step 2 in the following procedure. Beginning with v 10.0.2, the end certificates (issued by the cert-manager), have a default duration of 530 days.

### Procedure

1. VMware only: Connect to the virtual machine as the API Connect administrator by completing the following steps:
  - a. Run the following command to connect as the API Connect administrator, replacing `ip_address` with the appropriate IP address:

```
ssh ip_address -l apicadm
```

- b. When prompted, select Yes to continue connecting.

c. When you are connected, run the following command to receive the necessary permissions for working directly on the appliance:

```
sudo -i
```

2. To renew a CA certificate or an issuer (for example, `ingress-ca`, `management_CR-ca`, `analytics_CR-ca`, or `portal_CR-ca`), complete the following steps:
  - a. Run the following command to list of all the certificate names, with the status and the date and time of the last update for each certificate:

```
kubectl get certificate -o wide
```

- b. Run the following command to renew the CA certificate:

```
kubectl get certificate certificate_name -o=jsonpath='{.spec.secretName}' | xargs kubectl delete secret
```

where *CA\_certificate\_name* is the name of the CA certificate that you want to renew, and will be one of the following CA certificates: `ingress-ca`, `management_CR-ca`, `analytics_CR-ca`, or `portal_CR-ca`.

Tip: For the `management_CR-ca`, you can optionally create a special CR (Custom Resource) to renew the CA certificate and its dependent certificates, then restart the dependent pods. For instructions, see [Using a ManagementSecretRotation CR to update the management CA](#), later in this topic.

- c. Proceed to step 3 and renew each of the end-entity certificates that were issued by the cert-manager issuer based on the CA certificate.
3. Renew an end-entity certificate by running the following command:

```
kubectl get certificate certificate_name -o=jsonpath='{.spec.secretName}' | xargs kubectl delete secret
```

where *certificate\_name* is the name of the certificate that you want to renew.

Refer to the following topics to see the list of certificates that need renewing based on the CA certificate that you renewed in step 1:

- [List of internal certificates](#)
- [List of external certificates](#)

4. For each updated certificate, restart all of the pods that are affected by that certificate.

To see which pods are affected by each certificate, see the following topics:

- [List of external certificates](#)
- [List of internal certificates](#)

Then, see the following topics for instructions for restarting pods:

- [Management subsystem: restarting pods](#)
- [Gateway subsystem: restarting pods](#)
- [Analytics subsystem: restarting endpoints and pods](#)
- [Portal subsystem: restarting pods](#) for a two data center configuration or Cloud Pak for Integration

If you are using a single data center configuration with a stand-alone API Connect deployment, the Portal subsystem pods pick up the new certs and restart any internal processes automatically. Changing the portal-server or portal-client certificates will be a zero downtime operation. However, changing the portal-ca certificate will cause downtime because all portal-db pods need to restart MySQL to allow for the certificate to update. The pods will not restart, but they will all go non-ready and then ready again, which will take a few minutes.

Note: Due to a known issue, when the `ingress-ca` is renewed, it is possible that [Analytics in the Developer Portal](#) might stop working. If this happens, complete the following steps to ensure that certificate changes take effect:

- a. Log in to the Cloud Manager user interface.
- b. In the navigation list, click  Topology.
- c. Edit the Analytics service.
- d. On the Analytics page, edit the Summary field to force a change; for example, by adding a space to the end of a sentence.
- e. Click Save.

- [Using a ManagementSecretRotation CR to update the management CA](#)
- [Using a PortalSecretRotation CR to update the portal CA](#)
- [Automatic renewal with cert-manager](#)

If TLS certificates are automatically renewed in your API Connect deployment, you must restart the pods that are affected by the updated certificates.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Using a ManagementSecretRotation CR to update the management CA

### About this task

Applying the `ManagementSecretRotation` CR (Custom Resource) is an alternative method for renewing the `management_CR-ca` and its dependencies, and then restarting the dependent pods. This option applies only to the `management_CR-ca`.

Restriction: The `ManagementSecretRotation` CR can only be used with a stand-alone deployment using a single data center. Do not attempt to use it with a two data center configuration or a Cloud Pak for Integration deployment.

### Procedure

1. Create a `ManagementSecretRotation` CR (for example, `operationcr.yaml`) with contents similar to the following example:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementSecretRotation
metadata:
  name: rotate-issuer
spec:
  managementCluster: management_CR_name
```

```
rotateCertificates:
  certificates:
    - management_CR-ca
```

where `management_CR_name` is the name of the management CR that the system was deployed with.

2. Apply the CR by running the following command:

```
kubectl create -f operationcr.yaml -n namespace
```

where:

- `namespace` is the namespace where you installed the Management subsystem
- `operationcr.yaml` is the file that contains the CR

Applying the CR updates the `management_CR-ca`, along with any certificates that are signed by it. To view a list of the updated certificates, run the following command and check the `status` block of the CR:

```
kubectl get managementsecretrotation rotate-issuer -n namespace
```

In the command, replace `namespace` with the namespace where you installed the Management subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Using a PortalSecretRotation CR to update the portal CA

### About this task

Applying the `PortalSecretRotation` CR (Custom Resource) is an alternative method for renewing the `portal_CR-ca` and its dependencies, and then restarting the dependent pods. This option applies only to the `portal_CR-ca`.

Restriction: The `PortalSecretRotation` CR can only be used with a stand-alone deployment using a single data center. Do not attempt to use it with a two data center configuration or a Cloud Pak for Integration deployment.

### Procedure

1. Create a `PortalSecretRotation` CR (for example, `portal-secret-cr.yaml`) with contents similar to the following example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalSecretRotation
metadata:
  name: portal-rotate-secret
spec:
  # Name of the portal cluster's secrets you want to rotate.
  portalCluster: portal
  # List of certificates you want to rotate (Listing an issuer will rotate any certs issued by the issuer e.g listing just
  # portal-ca will rotate portal-ca, portal-client and portal-server)
  rotateCertificates:
    certificates:
      - portal-ca
  rotateEncryptionSecret:
    # Set to true if you want to rotate the encryption secret.
    rotate: true
    # Optional value to set the encryption secret to, if supplied secret exists in the env. If not supplied the rotated
    # secret will be random.
    encryptionSecret: new-encryption-secret
```

If you set `rotate: true` in the `rotateEncryptionSecret` section, the `portal-encryption-secret` will be updated and the following changes will be made:

- Change the root MySQL password
- Generate a new, site-specific MySQL password for each site
- Re-encrypt all `client_ids` and `client_secrets` in the portal database

2. Apply the CR by running the following command:

```
kubectl create -f portal-secret-cr.yaml -n namespace
```

where:

- `namespace` is the namespace where you installed the Portal subsystem
- `portal-secret-cr.yaml` is the file that contains the CR

Applying the CR updates the `portal_CR-ca`, along with any certificates that are signed by it. To view a list of the updated certificates, run the following command and check the `status` block of the CR:

```
kubectl get portalsecretrotation portal-rotate-secret -n namespace
```

In the command, replace `namespace` with the namespace where you installed the Portal subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Automatic renewal with cert-manager

If TLS certificates are automatically renewed in your API Connect deployment, you must restart the pods that are affected by the updated certificates.

## About this task

When you renew TLS certificates in your API Connect deployment, you must restart the pods that use the renewed certificates so the pods can use the updated certificates. If you configured your deployment so that TLS certificates are renewed by cert-manager automatically based on expiry-time and renewBefore settings, it's important to monitor the certificates so that you can restart affected pods when the certificates are renewed and avoid problems caused by outdated certificates.

## Procedure

1. Monitor the deployment for automatically renewed certificates.

Tip: You can monitor the cert-manager logs manually as explained in the following steps, but you will be less likely to overlook a certificate renewal if you set up a logs-based alerting mechanism that informs you when cert-manager renews any certificate.

- To determine when a particular certificate is due for renewal, complete the following steps:
  - Retrieve the list of certificate names by running the following command:

```
kubectl get certs
```

- From the list of certificates, choose the one you want to know about and run the following command:

```
kubectl get cert certificate_name -o yaml
```

The output looks like the following example:

```
apiVersion: cert-manager.io/v1alpha1
kind: Certificate
metadata:
  ...
spec:
  commonName: management-server
  ...
  duration: 12720h0m0s
  ...
  renewBefore: 24h0m0s
  secretName: management-server
status:
  ...
  notAfter: "2022-06-21T16:28:47Z"
  ...
```

In the example, you can see that the certificate will expire by 2022-06-21T16:28:47Z (`status.notAfter`) and the renewal will take place 24 hours (`spec.renewBefore`) before that time. This can be used to keep track of which certificates will be renewing when to perhaps to have a better idea of when to lookout for renewals for each cert in the cert-manager logs.

- To determine when a certificate was renewed, complete the following steps:
  - Run the following command to display the cert-manager log:

```
kubectl logs Cert-manager_pod_name -n cert-manager
```

- In the log output, look for lines similar to the following example:

```
I0108 14:23:18.001074      1 controller.go:129] cert-manager/controller/certificates "level"=0 "msg"="syncing
item" "key"="default/test-cert"
I0108 14:23:18.009940      1 issue.go:109] cert-manager/controller/certificates/certificates/issue "level"=0
"msg"="certificate issued" "related_resource_kind"="Secret" "related_resource_name"="test-cert"
"related_resource_namespace"="default"
I0108 14:23:18.018664      1 sync.go:331] cert-manager/controller/certificates/certificates "level"=0
"msg"="certificate scheduled for renewal" "duration_until_renewal"="-5.018566857s"
"related_resource_kind"="Secret" "related_resource_name"="test-cert" "related_resource_namespace"="default"
I0108 14:23:18.019070      1 controller.go:135] cert-manager/controller/certificates "level"=0 "msg"="finished
processing work item" "key"="default/test-cert"
```

The 4 statements (shown in the example) indicate when a certificate is about to be renewed, and when the renewal is complete a few seconds later.

2. If a CA certificate was renewed, renew all of the certificates issued by that CA's issuer.  
For the list of CA certificates and issuer, see [List of Issuers, CA certificates, and secrets](#).

3. Restart pods affected by the renewed certificates.

When the logs show that a certificate was renewed, restart the pods that use the secret based on that certificate, so that the pods can load the renewed secret.

- a. Determine which pods are affected by the updated certificate by reviewing the following topics:
  - [List of external certificates](#)
  - [List of internal certificates](#)
- b. Restart the pods affected by the certificate as explained in the following topics:
  - [Management subsystem: restarting pods](#)
  - [Gateway subsystem: restarting pods](#)
  - [Analytics subsystem: restarting endpoints and pods](#)
  - [Portal subsystem: restarting pods](#) for a two data center configuration or Cloud Pak for Integration

If you are using a single data center configuration with a stand-alone API Connect deployment, the Portal subsystem pods pick up the new certificates and restart any internal processes automatically. Changing the portal-server or portal-client certificates will be a zero downtime operation. However, changing the portal-ca certificate will cause downtime because all portal-db pods need to restart MySQL to allow for the certificate to update. The pods will not restart, but they will all go non-ready and then ready again, which will take a few minutes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Renewing custom certificates

If you did not use cert-manager to generate certificates for your API Connect deployment, you must renew them manually.

### About this task

You can recreate custom certificates that you generated, or that were generated by the operator during installation. After you renew certificates, restart the affected pods to ensure that the updated certificates are used.

### Procedure

1. Renew the certificates that you generated:

Use one of the following methods to renew the certificates that you created:

- Update the secret
- Delete and then recreate the secret
- Update the CR to reference a different secret name

2. Renew the certificates that were generated by the operator:

To renew the certificates generated by the operator, delete each certificate so that it can be recreated by the operator.

3. Restart the affected pods so they can pick up the renewed certificates.

For information on which pods are associated by each certificate, see the following topics:

- [List of external certificates](#)
- [List of internal certificates](#)

For instructions on restarting pods, see the following topics:

- [Restarting Analytics pods and data collection](#)
- [Management subsystem: restarting pods](#)
- [Gateway subsystem: restarting pods](#)
- [Portal subsystem: restarting pods](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Renewing the postgres-pgbouncer-secret

### About this task

The `postgres-pgbouncer-secret` depends on several certificates and secrets, which are listed in Table 1. In the table, the names of items use the variable `management_CR`, which should be replaced with the name of CR that was used for installing the Management subsystem.

Whenever any of the listed certificates is updated, the `postgres-pgbouncer-secret` is updated automatically. After the secret is updated, you must restart the `postgres-pgbouncer` pod.

Table 1. `postgres-pgbouncer-secret` dependencies

Secret	Depends on	Pods
<code>management_CR-random-postgres-pgbouncer-secret</code>	<ul style="list-style-type: none"> <li>• <code>management_CR-ca</code></li> <li>• <code>management_CR-db-client-pgbouncer</code></li> <li>• <code>management_CR-&lt;random&gt;-postgres-pgbouncer</code></li> <li>• <code>management_CR-db-client-postgres</code></li> <li>• <code>management_CR-db-client-apicuser</code></li> </ul>	<code>postgres-pgbouncer</code>

### Procedure

1. Update all of the certificates that `postgres-pgbouncer-secret` depends on.
2. Restart all of the pods that are affected by the updated certificates.
3. Wait for the `postgres-pgbouncer-secret` to be updated.

There are two ways to know when the `postgres-pgbouncer-secret` has been updated:

- Wait until you see the "updating pgbouncer secret" message in the `ibm-apiconnect` operator log, as in the following example:

```
{ "level": "info", "ts": "2020-08-20T14:29:03.503Z", "logger": "controller_management_cluster", "msg": "Certificate has changed", "cert": "postgres-pgbouncer.crt" }
{ "level": "info", "ts": "2020-08-20T14:29:03.503Z", "logger": "controller_management_cluster", "msg": "Certificate has changed", "cert": "postgres-pgbouncer.key" }
{ "level": "info", "ts": "2020-08-20T14:29:03.503Z", "logger": "controller_management_cluster", "msg": "Certificate has changed", "cert": "pgbouncer.crt" }
{ "level": "info", "ts": "2020-08-20T14:29:03.503Z", "logger": "controller_management_cluster", "msg": "Certificate has changed", "cert": "pgbouncer.key" }
{ "level": "info", "ts": "2020-08-20T14:29:03.503Z", "logger": "controller_management_cluster", "msg": "updating pgbouncer secret", "secret": "management-a7239c78-postgres-pgbouncer-secret" }
```

Watch the `postgres-pgbouncer-secret` for update

- Watch the `postgres-pgbouncer-secret` for updates by running the following command:

```
kubectl get secret management-<random>-postgres-pgbouncer-secret -w
```

Note: If the `postgres-pgbouncer` pod is restarted too soon, the `apim`, `taskmanager`, and `lux` pods will not work correctly and will restart repeatedly. Correct the problem by ensuring that the `postgres-pgbouncer-secret` is updated before proceeding to step 4 to restart the `postgres-pgbouncer` pod.

4. Restart the `postgres-pgbouncer` pod by running the following command:

```
kubectl -n namespace rollout restart deployment/deployment_name
```

where:

- `namespace` is the namespace where you installed the Management subsystem.
- `deployment_name` is the name of the Management subsystem deployment.

You can determine the deployment name by running the following command:

```
kubectl -n namespace get deployment | grep CR_name
```

where:

- `namespace` is the namespace where you installed the Management subsystem.
- `CR-name` is the name of the CR used for installing the Management subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## List of Issuers, CA certificates, and secrets

A summary of certificate issuers, with the CA issued by each, and the corresponding secret used to sign certificates in an API Connect deployment..

Table 1 presents a list of the certificate issuers used in an API Connect deployment, with the CA issued by each, and the corresponding secret used to sign certificates. The `selfsigning-issuer` is used only for creating CAs, and does not have a corresponding certificate or secret of its own. The certificates generated by the issuers in Table 1 use the `custom-certs-external.yaml` template.

Table 1. Issuers, CAs, and secrets

Issuer	CA certificate	Secret
<code>selfsigning-issuer</code>	N/A	N/A
<code>ingress-issuer</code>	<code>ingress-ca</code> issued by <code>selfsigning-issuer</code>	<code>ingress-ca</code> Attention: If you change the <code>ingress-ca</code> secret in a 2 data center deployment, you must change it to the same value in both data centers.
<code>analytics_CR-ca</code>	<code>analytics_CR-ca</code> issued by <code>selfsigning-issuer</code>	<code>analytics_CR-ca</code>
<code>management_CR-ca</code>	<code>management_CR-ca</code> issued by <code>selfsigning-issuer</code>	<code>management_CR-ca</code>
<code>portal_CR-ca</code>	<code>portal_CR-ca</code> issued by <code>selfsigning-issuer</code>	<code>portal_CR-ca</code>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## List of external certificates

A summary of certificates used for communications between subsystems and clients in an API Connect deployment.

### Ingress (front-end) certificates

Table 1 presents a list of ingress certificates (issued by `ingress-issuer`) with the corresponding secret and affected pods. The certificates in Table 1 use the `custom-certs-external.yaml` template.

Table 1. Ingress certificates, secrets, and affected pods

Issuer / CA certificate	Certificate	Usage	Secret	Pods
ingress-issuer	analytics_CR-ac-endpoint	ingress-issuer	analytics_CR-ac-endpoint	analytics_CR-mtls-gw Restart the pod with the following command: kubect1 -n <namespace> rollout restart deploy analytics_CR-mtls-gw
ingress-issuer	analytics_CR-ai-endpoint	ingress-issuer	analytics_CR-ai-endpoint	analytics_CR-mtls-gw Restart the pod with the following command: kubect1 -n <namespace> rollout restart deploy analytics_CR-mtls-gw
ingress-issuer	*-api-endpoint-*	ingress-issuer	*-api-endpoint-*	N/A
ingress-issuer	*-apim-endpoint-*	ingress-issuer	*-apim-endpoint-*	N/A
ingress-issuer	*-cm-endpoint-*	ingress-issuer	*-cm-endpoint-*	N/A
ingress-issuer	*-consumer-endpoint-*	ingress-issuer	*-consumer-endpoint-*	N/A
ingress-issuer	portal_CR-admin	ingress-issuer	portal_CR-admin	portal_CR-nginx In a single data center deployment, pods restart automatically when secrets are updated. In a two data center configuration or a Cloud Pak for Integration deployment, you must restart the pods manually within a 5-minute period of time to avoid encountering (recoverable) errors. In a two data center configuration, restart pods in both data centers within that 5-minute period. Restart the pod with the following command: kubect1 -n <namespace> rollout restart deploy portal_CR-nginx
ingress-issuer	portal_CR-web	ingress-issuer	portal_CR-web	N/A
ingress-issuer	hub-endpoint	ingress-issuer	hub-endpoint	N/A
ingress-issuer	turnstile-endpoint	ingress-issuer	turnstile-endpoint	N/A

## Subsystem communication certificates

Table 2 lists all of the common subsystem communication certificates (issued by `ingress-issuer`), with the usage, corresponding secret, and affected pods. The certificates in Table 2 use the `custom-certs-external.yaml` template.

When any certificate is renewed, the corresponding pods must be restarted.

Table 2. Subsystem certificates, secrets, and affected pods

Issuer / CA certificate	Certificate	Usage	Secret	Pods
ingress-issuer	analytics_CR-client-client	client	analytics_CR-client-client	<ul style="list-style-type: none"> <li>management_CR-analytics_CR-proxy</li> <li>management_CR-apim</li> <li>management_CR-taskmanager</li> <li>portal_CR-www (via webhook, no restart needed)</li> </ul>
ingress-issuer	analytics_CR-ingestion-client	client	analytics_CR-ingestion-client	<ul style="list-style-type: none"> <li>management_CR-apim</li> <li>management_CR-taskmanager</li> <li>gateway_CR (via webhook, no restart needed)</li> </ul>

ingress-issuer	Site-dependent names. Example: dc1-mgmt-replication/dc2-mgmt-replication	server	Site-dependent names. Example: dc1-mgmt-replication/dc2-mgmt-replication	<ul style="list-style-type: none"> <li>management_CR-tunnel</li> </ul>
ingress-issuer	Site-dependent names. Example: dc1-mgmt-replication-client/dc2-mgmt-replication-client	client	Site-dependent names. Example: dc1-mgmt-replication-client/dc2-mgmt-replication-client	<ul style="list-style-type: none"> <li>management_CR-&lt;remote-sitename&gt;-postgres (on passive site in two data center configuration)</li> </ul>
ingress-issuer	Site-dependent names. Example: dc1-pt1-replication/dc2-pt1-replication	server	Site-dependent names. Example: dc1-pt1-replication/dc2-pt1-replication	<ul style="list-style-type: none"> <li>portal_CR-tunnel</li> </ul> Restart the pods on both the active site and the passive site.

Issuer / CA certificate	Certificate	Usage	Secret	Pods
<code>ingress-issuer</code>	Site-dependent names. Example: <code>dc1-pt1-replication-client/dc2-pt1-replication-client</code>	client	Site-dependent names. Example: <code>dc1-pt1-replication-client/dc2-pt1-replication-client</code>	<ul style="list-style-type: none"> <li><code>portal_CR-&lt;remote-sitename&gt;-db-X</code></li> <li><code>portal_CR-&lt;remote-sitename&gt;-www-X</code></li> </ul> Restart the pods on both the active site and the passive site.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## List of internal certificates

A summary of certificates used for communications within subsystems in an API Connect deployment.

Table 1 presents a list of certificates used for microservice-to-microservice communications with the corresponding secret and affected pods. The certificates in Table 1 must be specified using cert-manager. The issuer can be any cert-manager issuer (default is `selfsigning-issuer`) using the custom-certs-internal.yaml template.

Note: When any certificate is renewed, the corresponding pods must be restarted unless otherwise noted in Table 1. If the `postgres-pgbouncer` pod is listed for a certificate, restart that pod by running the following command:

```
kubectll rollout restart deployment/deployment_name
```

For more information, see [Renewing the postgres-pgbouncer-secret](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## V2018 upgrade: List of certificates to update manually

If you upgraded to API Connect V10 from V2018, some external certificates are carried over from the V2018 deployment and are not managed by cert-manager. When you update any of the retained certificates, you must restart the affected pods manually.

### Ingress (front-end) certificates

Table 1 presents a list of the ingress certificates that were carried forward when you upgraded from V2018, and the pods that you must restart when you update each certificate.

If multiple Portal web ingress endpoints have been configured, then the certificates for those additional endpoints must be updated manually as well.

Table 1. V2018 ingress certificates and affected pods

Certificate and Secret	Pods
<i>client-tls-xxxxxxxxxx</i>	<ul style="list-style-type: none"> <li>• <i>analytics-mtls-gw-hashed-suffix</i></li> </ul>
<i>ingestion-tls-xxxxxxx</i>	<ul style="list-style-type: none"> <li>• <i>analytics-mtls-gw-hashed-suffix</i></li> </ul>
<i>platform-api-tls-xxxxxxx</i>	N/A
<i>api-manager-tls-xxxxxxx</i>	N/A

<i>v5GwName-apic-gateway-peering-tls</i>	N/A
<i>v5GwName-apic-gateway-service-tls</i>	N/A
<i>v6GwName-datapower-admin-credentials</i>	N/A
<i>v6GwName-apic-gateway-peering-tls</i>	N/A

Certificate and Secret	Pods
<code>v6GwName-apic-gateway-service-tls</code>	N/A
<code>portal-uuid-admin</code>	<ul style="list-style-type: none"> <li><code>portal-nginx</code></li> </ul>
<code>www-tls-xxxxxxxxxxxxxxxx</code>	N/A

## Subsystem communication certificates

Table 2 presents a list of the subsystem communication certificates that were carried forward when you upgraded from V2018, and the pods that you must restart when you update each certificate.

Table 2. V2018 subsystem communication certificates and affected pods

Usage	Certificate and Secret	Pods
client	<code>managementUpgradeName-analytics-client-client</code>	<ul style="list-style-type: none"> <li><code>management-analytics-proxy</code></li> <li><code>management-apim</code></li> <li><code>management-taskmanager</code></li> <li><code>portal-www</code> (via webhook, no restart needed)</li> </ul>
client	<code>managementUpgradeName-analytics-ingestion-client</code>	<ul style="list-style-type: none"> <li><code>management-apim</code></li> <li><code>management-taskmanager</code></li> <li><code>gateway</code> (via webhook, no restart needed)</li> </ul>
client	<code>managementUpgradeName-portal-admin</code>	<ul style="list-style-type: none"> <li><code>management-apim</code></li> <li><code>management-taskmanager</code></li> <li><code>management-portal-proxy</code></li> </ul>
client	<code>gw-apic-gateway-service-tls</code>	<ul style="list-style-type: none"> <li><code>gww6</code></li> <li><code>gww5</code></li> </ul>
clientserver	<code>gw-apic-gateway-peering-tls</code>	<ul style="list-style-type: none"> <li><code>gww6</code> (redis)</li> <li><code>gww5</code> (redis)</li> </ul>

## Database encryption key

The database encryption key is carried forward from V2018, and uses the name: `managementUpgradeName-encryption-secret`. You can update the value of this secret as explained in [Changing the database encryption key](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Certificate lists for Cloud Pak for Integration

When you deploy API Connect as an IBM Cloud Pak for Integration capability, certificates receive different names. Refer to the tables in this section for the names used on issuer, internal, and external certificates.

- CP4I: List of Issuers, CA certificates, and secrets**  
 A summary of certificate issuers, with the CA issued by each, and the corresponding secret used to sign certificates in an API Connect deployment with IBM Cloud Pak for Integration (CP4I).
- CP4I: List of external certificates**  
 A summary of certificates used for communications between subsystems and clients in an API Connect deployment with IBM Cloud Pak for Integration (CP4I).
- CP4I: List of internal certificates**  
 A summary of certificates used for communications within subsystems in an API Connect deployment with IBM Cloud Pak for Integration (CP4I).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## CP4I: List of Issuers, CA certificates, and secrets

A summary of certificate issuers, with the CA issued by each, and the corresponding secret used to sign certificates in an API Connect deployment with IBM Cloud Pak for Integration (CP4I).

Table 1 presents a list of the certificate issuers used in an API Connect deployment, with the CA issued by each, and the corresponding secret used to sign certificates. In the table, the names of items use the variable `APIC_instance_name`, which should be replaced with the name of your deployed API Connect instance.

The `APIC_instance_name-self-signed` is used only for creating CAs, and does not have a corresponding certificate or secret of its own.

Table 1. Issuers, CAs, and secrets

Issuer	CA certificate	Secret
<code>APIC_instance_name-self-signed</code>	N/A	N/A
<code>APIC_instance_name-ingress-issuer</code>	<code>APIC_instance_name-ingress-ca</code> issued by <code>APIC_instance_name-self-signed</code>	<code>APIC_instance_name-ingress-ca</code>
<code>APIC_instance_name-a7s-ca</code>	<code>APIC_instance_name-a7s-ca</code> issued by <code>APIC_instance_name-self-signed</code>	<code>APIC_instance_name-a7s-ca</code>
<code>APIC_instance_name-mgt-ca</code>	<code>APIC_instance_name-mgt-ca</code> issued by <code>APIC_instance_name-self-signed</code>	<code>APIC_instance_name-mgt-ca</code>
<code>APIC_instance_name-ptl-ca</code>	<code>APIC_instance_name-ptl-ca</code> issued by <code>APIC_instance_name-self-signed</code>	<code>APIC_instance_name-ptl-ca</code>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## CP4I: List of external certificates

A summary of certificates used for communications between subsystems and clients in an API Connect deployment with IBM Cloud Pak for Integration (CP4I).

### Ingress (front-end) certificates

Table 1 presents a list of ingress certificates (issued by `APIC_instance_name-ingress-issuer`) with the corresponding secret and affected pods. In the table, the names of items use the variable `APIC_instance_name`, which should be replaced with the name of your deployed API Connect instance. Pods are listed for convenience; when you update certificates the pods are restarted automatically and do not require a manual restart.

Table 1. Ingress certificates, secrets, and affected pods

Issuer / CA certificate	Certificate	Secret	Pods
<code>APIC_instance_name-ingress-issuer</code>	<code>APIC_instance_name-a7s-ac-endpoint</code>	<code>APIC_instance_name-a7s-ac-endpoint</code>	<ul style="list-style-type: none"> <li><code>APIC_instance_name-a7s-mtls-gw</code></li> </ul>
<code>APIC_instance_name-ingress-issuer</code>	<code>APIC_instance_name-a7s-ai-endpoint</code>	<code>APIC_instance_name-a7s-ai-endpoint</code>	<ul style="list-style-type: none"> <li><code>APIC_instance_name-a7s-mtls-gw</code></li> </ul>
<code>APIC_instance_name-ingress-issuer</code>	<code>APIC_instance_name-mgt-admin</code>	<code>APIC_instance_name-mgt-admin</code>	<ul style="list-style-type: none"> <li>N/A</li> </ul>
<code>APIC_instance_name-ingress-issuer</code>	<code>APIC_instance_name-mgt-api-manager</code>	<code>APIC_instance_name-mgt-api-manager</code>	<ul style="list-style-type: none"> <li>N/A</li> </ul>
<code>APIC_instance_name-ingress-issuer</code>	<code>APIC_instance_name-mgt-consumer-api</code>	<code>APIC_instance_name-mgt-consumer-api</code>	<ul style="list-style-type: none"> <li>N/A</li> </ul>
<code>APIC_instance_name-ingress-issuer</code>	<code>APIC_instance_name-mgt-platform-api</code>	<code>APIC_instance_name-mgt-platform-api</code>	<ul style="list-style-type: none"> <li>N/A</li> </ul>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Renewing certificates on VMware

Replacing passwords, keys, and certificates and then restarting the subsystems requires some differences in the procedures and commands on VMware in your API Connect deployment..

Attention:

The instructions in this section apply only to the Management, Portal, and Analytics subsystems. For Gateway appliance-specific instructions, see [Configuring the API Connect Gateway Service](#) in the *DataPower Gateway* documentation.

## Using SSH to connect to the server so you can run Kubernetes commands

If the instructions in a referenced topic require you to run `kubect1` commands directly on servers, you must first log in to the virtual machine (appliance) as follows:

1. Run the following command to connect as the API Connect administrator, replacing `ip_address` with the appropriate IP address:

```
ssh ip_address -l apicadm
```

2. When prompted, select Yes to continue connecting.

3. When you are connected, run the following command to receive the necessary permissions for working directly on the appliance:

```
sudo -i
```

Then, you can follow the instructions in each topic and run `kubect1` commands as needed.

## Determining which certificates are due for renewal

To determine which certificates are due to expire and must be renewed, SSH into the server as explained in the previous section. Then, run the following command and check the EXPIRATION column in the results:

```
kubect1 get certificate
```

- [VMware: Renewing internal certificates with cert-manager](#)  
On VMware OVA/Appliance, the internal certificates are managed using Kubernetes cert-manager.
- [VMware: Renewing external certificates with apicup](#)  
On VMware OVA/Appliance, the external public-facing and the cross-subsystem certificates are managed with the `apicup` utility.
- [VMware: Renewing the postgres-pgbouncer-secret](#)  
Renew the `postgres-pgbouncer-secret` that is used by the Management subsystem in an API Connect deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## VMware: Renewing internal certificates with cert-manager

On VMware OVA/Appliance, the internal certificates are managed using Kubernetes cert-manager.

### About this task

The subsystem CR is configured with `microServiceSecurity` set to `CertManager`, and the `certManagerIssuer` is pointing to a `selfsigning-issuer` as in the following example:

```
microServiceSecurity: certManager
certManagerIssuer:
  name: selfsigning-issuer
  kind: Issuer
```

Note: Cert-manager is only used for renewing internal certificates. For the list of internal certificates that must be renewed with cert-manager, see [List of internal certificates](#). For information on renewing other certificates, see [Renewing certificates on VMware](#)

### Procedure

Follow the instructions in [Renewing certificates with cert-manager](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## VMware: Renewing external certificates with apicup

On VMware OVA/Appliance, the external public-facing and the cross-subsystem certificates are managed with the `apicup` utility.

### About this task

When API Connect is deployed on VMware, the public-facing external certificates, as well as some internal cross-subsystem certificates, are managed with `apicup` but are stored as Kubernetes secrets. Complete the following steps to renew certificates that are managed with `apicup` and restart the affected pods.

### Procedure

1. Renew the certificates as explained in [Replacing custom certificates](#).  
For information on setting up new certificates, see [Setting custom certificates](#).
2. Use Tables 1 and 2 to determine which certificates to renew and which pods to restart:  
Table 1 presents a list of secrets for external (ingress/front-end certificates) with the corresponding pod that must be restarted when the secret changes.

Table 1. External (ingress/front-end) secrets and affected pods

Secret	Pods
<code>analytics-client-ingress</code>	<code>analytics-mtls-gw</code>
<code>analytics-ingestion-ingress</code>	<code>analytics-mtls-gw</code>
<code>platform-api</code>	N/A
<code>api-manager-ui</code>	N/A
<code>cloud-admin-ui</code>	N/A
<code>consumer-api</code>	N/A
<code>hub</code>	N/A
<code>portal-admin-ingress</code>	<code>portal-nginx</code>
<code>portal-www-ingress</code>	N/A
<code>turnstile</code>	N/A

Table 2 presents a list of secrets for internal (cross-subsystem) certificates with the corresponding pod that must be restarted when the secret changes.

Table 2. Internal (subsystem) secrets and affected pods

Secret	Pods
analytics-client-client	<ul style="list-style-type: none"> <li>management-analytics-proxy</li> <li>management-apim</li> <li>management-taskmanager</li> <li>portal-www (via webhook, no restart needed)</li> </ul>
analytics-ingestion-client	<ul style="list-style-type: none"> <li>management-apim</li> <li>management-taskmanager</li> <li>gateway (via webhook, no restart needed)</li> </ul>
portal-client	<ul style="list-style-type: none"> <li>management-apim</li> <li>management-taskmanager</li> <li>management-portal-proxy</li> </ul>
Site-dependent names. Example: management-replication-ingress/dc2-mgmt-replication	<ul style="list-style-type: none"> <li>management-tunnel</li> </ul>
Site-dependent names. Example: management-replication-client/dc2-mgmt-replication-client	<ul style="list-style-type: none"> <li>management-remote-sitename-postgres (on passive site in 2DC-HA config)</li> </ul>
Site-dependent names. Example: portal-replication-ingress/dc2-ptl-replication	<ul style="list-style-type: none"> <li>portal-tunnel</li> </ul>
Site-dependent names. Example: portal-replication-client/dc2-ptl-replication-client	<ul style="list-style-type: none"> <li>portal-remote-sitename-db-X</li> <li>portal-remote-sitename-www-X</li> </ul>

3. Restart the pods listed in the corresponding row for each certificate that you renewed.

For instructions for restarting pods, see the following topics:

- [Management subsystem: restarting pods](#)
- [Gateway subsystem: restarting pods](#)
- [Portal subsystem: restarting pods](#)
- [Analytics subsystem: restarting endpoints and pods](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## VMware: Renewing the postgres-pgbouncer-secret

Renew the `postgres-pgbouncer-secret` that is used by the Management subsystem in an API Connect deployment.

### Before you begin

Renewing the `postgres-pgbouncer-secret` on VMware uses the same steps as on Kubernetes, but you must SSH into the server first.

### Procedure

1. SSH into the server:

a. Run the following command to connect as the API Connect administrator, replacing `ip_address` with the appropriate IP address:

```
ssh ip_address -l apicadm
```

b. When prompted, select Yes to continue connecting.

c. When you are connected, run the following command to receive the necessary permissions for working directly on the appliance:

```
sudo -i
```

2. Follow the instructions in [Renewing the postgres-pgbouncer-secret](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Renewing certificates in a two data center deployment on Kubernetes and OpenShift

Renewing TLS certificates in an API Connect two data center disaster recovery deployment requires you to copy some updated information between data centers while ensuring that the shared information is not overwritten during the remaining updates.

### About this task

Begin the process by updating certificates as needed on data center 1 (DC1). Then, copy the `ingress-ca` from DC1 to data center 2 (DC2) before updating certificates on DC2. Finally, you will copy encryption keys for the Management and Portal subsystem from DC1 to DC2.

## Procedure

Complete the following steps in the sequence shown to ensure that you do not overwrite information that was copied from DC1 while updating DC2.

1. DC1: Renew TLS certificates as explained in [Renewing TLS certificates](#).
2. DC2: Complete the following steps to copy the `ingress-ca` from DC1:
  - a. On DC1, export the `ingress-ca` secret to a YAML file by running the following command:

```
kubectl -n namespace get secret ingress-ca -o yaml > ingress-ca.yaml
```

- b. Still on DC1, edit the `ingress-ca.yaml` file to remove all labels, annotations, `creationTimestamp`, `resourceVersion`, `uid`, and `selfLink`.
- c. Copy the `ingress-ca.yaml` to DC2.
- d. On DC2, apply the `ingress-ca.yaml` file by running the following command:

```
kubectl -n namespace apply -f ingress-ca.yaml
```

- e. Validate that the `ingress-ca` on DC2 matches the `ingress-ca` on DC1:
  - i. On DC1, run the following command to save the original `ingress-ca` as a PEM file:

```
kubectl -n namespace get secrets ingress-ca -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc1
```

- ii. On DC2, run the following command to save the copied `ingress-ca` as a PEM file::

```
kubectl -n namespace get secrets ingress-ca -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc2
```

- iii. Copy `/tmp/ingress.pem.dc1` from DC1 and store it in the `/tmp` folder on DC2.
- iv. On DC2, run the following command to compare the two files and verify that there are no differences:

```
diff /tmp/ingress.pem.dc1 /tmp/ingress.pem.dc2
```

3. DC2: Update all external certificates that are based on the `ingress-ca` (see [List of external certificates](#)).
4. DC2: Update all of the internal certificates (see [List of internal certificates](#)).

At this point, DC1 and DC2 have the same `ingress-ca` secrets. Next, copy the encryption keys for the Management and Portal subsystems from DC1 to DC2.

5. Copy the encryption key for the Management subsystem to DC2 by completing the following steps:
  - a. On DC1, copy the management encryption key:
    - i. Get the name of the management encryption key by running the following command:

```
$ kubectl -n namespace get mgmt -o yaml | grep enc
```

The response looks like the following example:

```
encryptionSecret: dallas-enc-key
```

Make a note of the secret name for the next step. In the example, the key's name is `dallas-enc-key`.

- ii. Retrieve the secret from the encryption key by running the following command (substitute in the name of the key from the previous step):

```
kubectl get secret dallas-enc-key -o yaml
```

The output looks like the following example:

```
apiVersion: v1
data:
  encryption_secret.bin:
VKBNFj7sAOizxvE1H6i+9P31oJHvWwsO+x*****EGe/K+x6b3D7FEWGgoyG1WBUJKB4+T21My2iR5rBTov
pyLiY5g*****tSiRcQRegMPNBPgL829SVBCxuv3I=
kind: Secret
metadata:
  creationTimestamp: "2020-08-28T12:53:41Z"
  labels:
    app.kubernetes.io/instance: m1
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: dallas-enc-key
  name: dallas-enc-key
  namespace: default
  resourceVersion: "43039"
  selfLink: /api/v1/namespaces/default/secrets/m1-enc-key
  uid: 46c92395-9cc2-4421-b2c4-48e472c0cbb1
type: Opaque
```

- iii. Copy the output and save it in a YAML file; for example `dc1-enc-key.yaml`.
- iv. Edit the file and make the following changes:
  - Delete the contents of the `metadata` section (retain the section).
  - In the `metadata` section, add in a `name` attribute, with `dc1-enc-key` as the value.

The following example shows the updated file:

```
apiVersion: v1
data:
  encryption_secret.bin:
VKBNFj7sAOizxvE1H6i+9P31oJHvWwsO+x*****EGe/K+x6b3D7FEWGgoyG1WBUJKB4+T21My2iR5rBTov
pyLiY5g*****tSiRcQRegMPNBPgL829SVBCxuv3I=
kind: Secret
metadata:
  name: dc1-enc-key
type: Opaque
```

- v. Copy the updated file (`dc1-enc-key.yaml`) to the `/tmp` folder on DC2.
- b. On DC2, run the following command to create a secret from the encryption key file (`dc1-enc-key.yaml`) that you copied from DC1:

```
$ kubectl -n namespace create -f /tmp/dc1-enc-key.yaml
```

The response looks like the following example:

```
secret/dc1-enc-key created
```

6. Update the encryption key for the Portal subsystem on DC1 and then copy it to DC2 as explained in [Changing the secret for Portal data and system tools](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Renewing certificates in a two data center deployment on VMware

How to renew the Portal encryption secret in an API Connect two data center disaster recovery deployment.

### About this task

---

Complete the following steps to renew the Portal encryption secret in a two data center disaster recovery deployment on VMware.

### Procedure

---

Complete the following steps in the sequence shown to ensure that you do not overwrite information that was copied from the **active** data center, in this example DC1, while updating the **passive** data center, in this example DC2.

1. Run a health check on DC1 to ensure the deployment is in a good state. For example:

```
apicup subsys health-check dc1_portal
```

2. Run a health check on DC2 to ensure the deployment is in a good state. For example:

```
apicup subsys health-check dc2_portal
```

3. List the certificates on DC1:

```
apicup certs list dc1-portal
```

4. List the certificates on DC2:

```
apicup certs list dc2-portal
```

5. Clear the certificates on DC1:

```
apicup certs set dc1-portal encryption-secret --clear
```

6. Clear the certificates on DC2:

```
apicup certs set dc2-portal encryption-secret --clear
```

7. Generate new certificates on DC1:

```
apicup certs generate dc1-portal
```

8. Copy the new certificates on DC1:

```
apicup certs get dc1-portal encryption-secret -t key > new_port-encryption-secret
```

9. Set the new certificates from DC1 onto DC2:

```
apicup certs set dc2-portal encryption-secret new_port-encryption-secret
```

10. Install the certificates on both the **active** and **passive** data centers at the same time:

```
apicup subsys install dc1-portal
apicup subsys install dc2-portal
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Management subsystem: restarting pods

Restart Management subsystem pods in your API Connect deployment.

### About this task

---

This section describes how to restart Management subsystem pods.

## Procedure

1. Determine the deployment name by running the following command:

```
kubectl -n namespace get deployment | grep CR_name
```

where:

- *namespace* is the namespace where the Management subsystem is installed.
- *CR\_name* is the name of the CR used for installing the Management subsystem.

2. Restart pods by running the appropriate `kubectl` commands, shown in Table 1.  
Use the deployment name that you obtained in step 1.

Table 1. Management pods and the commands to restart them

Pod	Restart command
management-analytics-proxy	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code>
management-apim	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code> A manual restart is not needed when the certificate is updated.
management-client-downloads-server	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code> A manual restart is not needed when the certificate is updated.
management-hub	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code>
management-juhu	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code>
management-ldap	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code> A manual restart is not needed when the certificate is updated.
management-lur	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code> A manual restart is not needed when the certificate is updated.
management-natscluster	Execute for each <code>natscluster</code> pod, one at a time: <code>kubectl exec management-natscluster-n -- bash -c "kill -HUP 1"</code> A manual restart is not needed when the certificate is updated.
postgres-operator	<code>kubectl rollout restart deployment postgres-operator -n &lt;namespace&gt;</code>
management-random-postgres*	Rollout restart all the postgres deployments: <code>kubectl -n &lt;namespace&gt; get deploy -o name   grep postgres   egrep -v "backrest pgbouncer operator"   xargs kubectl -n &lt;namespace&gt; rollout restart</code>
management-random-postgres-pgbouncer	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code> A manual restart is not needed when the certificate is updated.
management-portal-proxy	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code> A manual restart is not needed when the certificate is updated.
management-stancluster	Execute for each <code>stancluster</code> pod, one at a time: <code>kubectl delete pod management-stancluster-n -n &lt;namespace&gt;</code> A manual restart is not needed when the certificate is updated.
management-taskmanager	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code> A manual restart is not needed when the certificate is updated.
management-tunnel	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code>
management-turnstile	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code>
management-ui	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code>
management-remote-sitename-postgres	<code>kubectl rollout restart deployment/<i>deployment_name</i> -n &lt;namespace&gt;</code>

3. Verify that all Management pods are ready by running the following command:

```
kubectl -n namespace get po
```

where *namespace* is the namespace where the Management subsystem is installed.

The restart is complete when all pods are **Running** and **Ready**.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Gateway subsystem: restarting pods

Restart Gateway subsystem pods and components in your API Connect deployment.

## About this task

When you update Gateway subsystem secrets and certificates, the pods restart automatically.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Portal subsystem: restarting pods

Restart Portal subsystem pods in your API Connect deployment.

### Procedure

1. If you are restarting pods after updating the `portal-ca`, complete the following steps:

- a. Delete all of the `portal` pods with the following command:

In the command, `namespace` is the namespace where the Portal subsystem is installed:

- For a development profile:

```
kubectl delete pods portal-sitename-db-0 portal-sitename-www-0 -n namespace
```

- For a production profile:

```
kubectl delete pods portal-sitename-db-0 portal-sitename-db-1 portal-sitename-db-2 portal-sitename-www-0 portal-sitename-www-1 portal-sitename-www-2 -n namespace
```

- b. Reload the NGINX configuration by running the following command:

```
kubectl -n namespace exec -it portal-tunnel -- openresty -s reload
```

2. If you updated any other certificate, you can perform a rolling restart on the pods by completing the following steps:

- a. Determine the statefulset names by running the following command:

```
kubectl -n namespace get statefulset | grep CR_name
```

Where:

- `namespace` is the namespace where the Portal subsystem is installed.
- `CR-name` is the name of the CR used for installing the Portal subsystem.

- b. Restart pods by running the appropriate `kubectl` commands, which are shown in Table 1. Use the statefulset name that you obtained in step 2a.

Table 1. Portal pods and the commands to restart them

Pod name	Restart command
<code>portal-local_sitename-db</code>	<code>kubectl rollout restart statefulset/statefulset_name</code>
<code>portal-local_sitename-www</code>	<code>kubectl rollout restart statefulset/statefulset_name</code>
<code>portal-tunnel</code>	<code>kubectl rollout restart statefulset/statefulset_name</code>
<code>portal-remote_sitename-db</code>	<code>kubectl rollout restart statefulset/statefulset_name</code>
<code>portal-remote_sitename-www</code>	<code>kubectl rollout restart statefulset/statefulset_name</code>
<code>portal-nginx</code> Attention: Restart this pod last.	<code>kubectl rollout restart statefulset/statefulset_name</code>

3. Verify that all Portal pods are ready by running the following command:

```
kubectl -n namespace get po
```

Where `namespace` is the namespace where the Portal subsystem is installed.

The restart is complete when all pods are **Running** and **Ready**.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Analytics subsystem: restarting endpoints and pods

Restart the pods that support the Analytics service and endpoints in your API Connect deployment.

- [Restarting the Analytics client endpoint](#)  
Restart the pods that support the Analytics client endpoint in your API Connect deployment.
- [Restarting the Analytics ingestion endpoint](#)  
Restart the pods that support the Analytics ingestion endpoint in your API Connect deployment.
- [Restarting Analytics pods and data collection](#)  
Restart the pods that support the internal communications within the Analytics subsystem in your API Connect deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Restarting the Analytics client endpoint

Restart the pods that support the Analytics client endpoint in your API Connect deployment.

### About this task

---

The client endpoint contains the external certificates that secure communications with the Analytics subsystem. The default names of the secrets for these certs are `ingress-ca`, `analytics-ac-endpoint` (server), and `analytics-client-client` (client).

When you refresh the certificates for the client endpoint, restart the NGINX configuration and the Analytics pods by completing the following steps.

### Procedure

---

1. Reload the NGINX configuration in the `analytics-mtls-gw` pod by running the following command:

```
kubectl -n namespace exec analytics-mtls-gw -- openresty -s reload
```

where:

- `namespace` is the namespace where Analytics is installed.
- `analytics-mtls-gw` is the name of the `analytics-mtls-gw` pod.

2. Restart the analytics-proxy pods by running the following command:

```
kubectl -n namespace delete po -l app.kubernetes.io/name=analytics-proxy,app.kubernetes.io/instance=CR_name
```

where:

- `namespace` is the namespace where Analytics is installed.
- `CR_name` is the name of the CR used for installing the Management subsystem (default is `management`).

3. Verify that the Analytics subsystem is working correctly by opening the Analytics user interface in both Portal and API Manager services.  
**Note:** Due to a known issue, when the `ingress-ca` is renewed, it is possible that [Analytics in the Developer Portal](#) might stop working. If this happens, complete the following steps to ensure that certificate changes take effect:
  - a. Log in to the Cloud Manager user interface.
  - b. In the navigation list, click  Topology.
  - c. Edit the Analytics service.
  - d. On the Analytics page, edit the Summary field to force a change; for example, by adding a space to the end of a sentence.
  - e. Click Save.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Restarting the Analytics ingestion endpoint

Restart the pods that support the Analytics ingestion endpoint in your API Connect deployment.

### About this task

---

The ingestion endpoint contains the external certificates that secure communications with the Analytics subsystem. The default names of these of the secrets for these certificates are `ingress-ca`, `analytics-ai-endpoint` (server), and `analytics-ingestion-client` (client).

When you refresh the certificates for the ingestion endpoint, restart the Analytics pods by completing the following steps.

### Procedure

---

1. Reload the NGINX configuration in the `analytics-mtls-gw` pod by running the following command:

```
kubectl -n namespace exec analytics-mtls-gw -- openresty -s reload
```

where:

- `namespace` is the namespace where Analytics is installed.
- `analytics-mtls-gw` is the name of the `analytics-mtls-gw` pod.

The Management and Gateway subsystems pick up the change automatically and do not require a restart.

2. Verify that the Analytics service is working by completing the following steps:
  - a. Invoke an API on your gateway that uses the associated Analytics subsystem.
  - b. Use the Analytics user interface to confirm that new data was posted to the Analytics service.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Restarting Analytics pods and data collection

Restart the pods that support the internal communications within the Analytics subsystem in your API Connect deployment.

### About this task

The internal certificates are used for all Analytics microservices to communicate with each other within the subsystem. The default names of the secrets for these are **analytics-client**, **analytics-server**, and **analytics-ca**.

When you refresh the internal certificates for the Analytics subsystem, restart the Analytics pods by completing the following steps.

### Procedure

1. If you did not already [stop Analytics data collection](#), complete that task now.  
Data cannot be moved to storage while pods are unavailable and if you do not stop collection before restarting Analytics pods, that data is lost.

2. Restart all of the Analytics pods by running the following command:

```
kubectl -n namespace delete po -l app.kubernetes.io/instance=CR_name
```

where:

- **namespace** is the namespace where the Analytics subsystem is installed.
- **CR\_name** is the name of the CR for installing the Analytics subsystem (default name: **analytics**).

3. Verify that all Analytics pods are ready by running the following command:

```
kubectl -n namespace get po
```

where **namespace** is the namespace where the Analytics subsystem is installed.

Make sure that every pod is **Running** and **Ready**.

4. If you [disabled shard allocation](#), check the storage cluster's health by running the following command:  
Note: If you did not disable shard allocation, skip this step. If you stopped shard allocation, check the cluster's health before re-enabling shard allocation.

```
kubectl -n namespace exec -it storage-master|shared_pod -- curl es _cluster/health?pretty
```

where:

- **namespace** is the namespace where the Analytics subsystem is installed.
- **storage-master|shared\_pod** is the name of any storage-master or storage-shared pod. You can get the name of your storage pods by running the following command:

```
kubectl get po -n namespace
```

When you check the cluster's health, the response looks like the following example:

```
{
  "cluster_name" : "apic-analytics-cluster",
  "status" : "yellow",
  "timed_out" : false,
  "number_of_nodes" : 9,
  "number_of_data_nodes" : 3,
  "active_primary_shards" : 13,
  "active_shards" : 13,
  "relocating_shards" : 0,
  "initializing_shards" : 0,
  "unassigned_shards" : 20,
  "delayed_unassigned_shards" : 0,
  "number_of_pending_tasks" : 0,
  "number_of_in_flight_fetch" : 0,
  "task_max_waiting_in_queue_millis" : 0,
  "active_shards_percent_as_number" : 39.39393939393939
}
```

Wait for the status to be **yellow** before proceeding to the next step.

5. Associate the Analytics service with the Gateway service.  
Note: If you did not unassociate the Analytics service from the Gateway, skip this step.  
See [Associating an analytics service with a gateway service](#).
6. Enable shard allocation by running the following command:  
Note: If you did not disable shard allocation, skip this step.

```
kubectl -n namespace exec -it storage-master|shared_pod -- curl -s -XPUT -d '{"persistent": {"cluster.routing.allocation.enable": "all"}}'
```

where:

- `namespace` is the namespace where the Analytics subsystem is installed.
- `storage-master|shared_pod` is the name of any storage-master or storage-shared pod. You can get the name of your storage pods by running the following command:

```
kubectl get po -n namespace
```

When you enable shard allocation, the response looks like the following example:

```
{"acknowledged": true, "persistent": {"cluster": {"routing": {"allocation": {"enable": "all"}}}, "transient": {}}
```

7. Check the storage cluster's health again and wait until the status is **green**.
8. Verify that the Analytics service is working by completing the following steps:
  - a. Invoke an API on your gateway that uses the associated Analytics subsystem.
  - b. Use the Analytics user interface to confirm that new data was posted to the Analytics service.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Re-enabling scheduled backups

If you disabled scheduled backups before updating keys, secrets, or passwords, enable the backups again for your API Connect deployment.

### About this task

---

#### Procedure

---

1. Open the management cluster CR for editing by running the following command:

```
kubectl -n namespace edit CR-name
```

where:

- `namespace` is the namespace where the Management subsystem is installed.
- `CR-name` is the name of the CR that was used to install the Management subsystem.

2. In the `databaseBackup` section of the CR, replace the `schedule` entry that you removed earlier when you disabled scheduled backups.
3. Save and close the file.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## The API Connect operations tool: apicops

Use the apicops operations tool to check the health, troubleshoot, and run maintenance operations on your API Connect installation.

The API Connect apicops tool is in active development and is available to download from [github.com](#). It is available for Linux® and macOS. All suggestions, feedback, and bug reports can be raised in this repository.

### Installing

---

Download the binary for your operating system from [latest release](#). Rename the file to `apicops`, and give it execute permission: `chmod +x apicops`.

### Running apicops

---

Apicops requires access to your Kubernetes or OpenShift environment. For more information about using apicops, see: [Requirements for running apicops](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring and managing your server environment

You configure and manage the servers that comprise your IBM® API Connect on-premises cloud by using the Cloud Manager user interface.

The Cloud Manager user interface is the part of IBM API Connect that enables a Cloud Administrator to define and manage the API Connect on-premises cloud.

You can use the Cloud Manager to define the API Connect cloud by performing the following tasks:

- Create Provider organizations and invite users to serve as the owner
- Create and manage user roles and role defaults
- Create availability zones for services
- Register the relevant servers that will provide the gateway, analytics, and portal services
- Associate an analytics service with a gateway to enable reports for API Events
- Configure resources for user authentication, TLS security, and OAuth providers and make the resources visible to all or selected provider organizations
- Connect to an existing SMTP mail server and edit templates for system-generated emails
- Set the default gateway service for catalogs
  
- **[Cloud Manager configuration checklist](#)**  
A summary, with links, of the key initial configuration tasks that you must complete in the Cloud Manager user interface after installing and deploying IBM API Connect, and further supplementary tasks.
- **[Activating your Cloud Manager user account](#)**

## Cloud Manager configuration checklist

A summary, with links, of the key initial configuration tasks that you must complete in the Cloud Manager user interface after installing and deploying IBM® API Connect, and further supplementary tasks.

### Key initial tasks

Task	Description
<a href="#">Log in to the Cloud Manager user interface</a>	A default admin user account is provided for you to begin your configuration tasks.
<a href="#">Configure an email server for notifications</a>	The email server sends registration invitations and other event-driven emails. You must configure the email server before you add any provider organizations or register a Portal service.
<a href="#">Specify your email server as the notification server</a>	Select the email server to be used as the notification server, and configure the sender name and email address to be included in the emails.
<a href="#">Register a Gateway service</a>	A Gateway service represents a cluster of gateway servers that host published APIs and provide the API endpoints used by client applications. Gateways execute API proxy invocations to backend systems and enforce API policies including client identification, security and rate limiting.
<a href="#">Register an Analytics service</a>	The Analytics service collects API event data from the Gateway service.
<a href="#">Associate the Analytics service with a Gateway service</a>	You must associate an Analytics service with each of the Gateway services from which you want to collect API event data.

Task	Description
<a href="#">Register a Portal service</a>	The Portal service provides a developer portal used by application developers to discover APIs and onboard consumers.
<a href="#">Create a provider organization</a>	For developers to be able to publish APIs, and for API managers to be able to manage the API lifecycle, they must be a member of a provider organization. You must create a least one provider organization specifying the owner, who can add further members.

## Further supplementary tasks

Task	Description
<a href="#">Configure authentication and security</a>	API Connect provides default local user registries, but you can configure your own user registries, of various types, for user interface and API access control. You can also configure TLS profiles for securing data transmission over HTTPS, and OAuth providers for securing third-party website or application access to APIs.
<a href="#">Create an Availability Zone</a>	An Availability Zone is a logical or physical set of data centers containing one or more API Connect services. Availability Zones provide redundancy and failover in the event of network issues. A default Availability Zone is provided when you install API Connect but you can add further Availability Zones to reflect your data center topology.
<a href="#">Administer members and roles</a>	You can add further users as members of the administration organization, and control their permissions by assigning predefined roles. You can also create your own custom roles.
<a href="#">Monitor your API Connect cloud</a>	API Connect generates events to allow you to monitor the status of your cloud.

## Related concepts

- [Cloud Manager Tutorials](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Activating your Cloud Manager user account

If you have been invited to be an administrator of your API Connect cloud, you must activate your account by using the activation link that was sent by another administrator. You can then access the Cloud Manager user interface.

## Before you begin

A cloud administrator invited you to join API Connect .

## Procedure

1. Complete the following steps to activate your Cloud Manager account:

If the Identity Provider uses LDAP

An invitation email with an activation link is sent. Click the activation link, or paste it in a browser, to log in directly with your LDAP user credentials. Upon authentication, the API Connect user record is updated from the backend identity provider.

If the Identity Provider uses a local registry

An invitation email with an activation link is sent. Click the activation link or paste it in a browser. The activation link takes you to a sign up page where you enter your first name, last name and password. Passwords must have a minimum of 8 characters and contain characters from at least three of the four following categories:

- Uppercase letters
- Lowercase letters
- Numbers
- Special characters (for example: ! # \$ %)

Note:

- The email address that you enter on the sign up page must match the email address to which the invitation email was sent, otherwise the account activation fails.
- If you previously had an account that was removed, and you are being invited again, you must re-activate your account by using the Sign In option on the page, **not** by completing the registration form and using the Sign Up option; attempting to re-register will fail.

If the Identity Provider uses an authentication URL

An invitation email with an activation link is sent. Click the activation link or paste it in a browser. The activation link takes you to a sign up page where you enter your credentials, which then become your user name and password. Upon authentication, the API Connect user record is updated from the backend identity provider.

If multiple user registries are available for selection on the sign up page, then make sure that the correct registry for your Cloud Manager account is selected. You might need to ask your administrator which user registry is appropriate for your account.

For information on configuring user registries and making them available for Cloud Manager login, see [User registries overview](#) and [Selecting user registries for Cloud Manager and API Manager](#).

2. Click Sign up to complete your registration, then click Sign in to open the Cloud Manager login page.

## Results

---

You have created your API Connect administrator account.

## What to do next

---

Log in to the Cloud Manager user interface and, depending on your role, start to manage the cloud topology, and work with provider organizations and cloud resources. To access the Cloud Manager login page in the future, use the following URL:

```
https://host/admin
```

where *host* is the fully qualified host name or IP address of the Management server.

## Related concepts

---

- [Administering members and roles](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Accessing the Cloud Manager user interface

How to navigate to and log in to the Cloud Manager user interface.

### Before you begin

---

To open the Cloud Manager user interface, enter the URL for the <cloud-admin-ui> endpoint that is entered during installation, followed by `/admin`. The <cloud-admin-ui> endpoint is configured in the Management subsystem by using the following command: `apicup subsys set mgmt cloud-admin-ui <endpoint>`.

The first time that you access the Cloud Manager user interface, you enter `admin` for the user name and `7iron-hide` for the password. You are prompted to change the Cloud Administrator password and email address.

### Procedure

---

1. Open a browser and enter the URL for the cloud-admin-ui endpoint followed by `/admin`. Note that this is secure connection that uses HTTPS, for example:  
`https://<cloud-admin-ui>/admin`.
2. Enter the Cloud Administrator user name and password.
  - Kubernetes and VMware  
If you are logging in for the first time, enter `admin` for the user name and `7iron-hide` for the password. Otherwise, enter `admin` for the user name and your own password.
  - OpenShift  
The default user name is `admin`. Run the following commands to retrieve the default password, which is generated automatically during deployment:

```
oc get secret -n <namespace> | grep mgmt-admin-pass
oc get secret -n <namespace> <secret_name_from_previous_command> -o jsonpath="{.data.password}" | base64 -d && echo
""
```
3. If your cloud contains multiple user registries, as configured on the Settings\_> User Registries screen, then choose the user registry that contains your login credentials. You might need to ask your administrator which user registry is appropriate for your account.
4. Click Sign In.  
Important: The first time that you access the cloud console, you must, for security reasons, enter a new password and your email address. If you forget your password and request a password reset, the notification email is sent to this email address. The email is sent by the email server that is configured in the **Notifications** section of the cloud **Settings**.

## Results

---

The Cloud Manager user interface opens to the home page, as shown in the following screen capture:

## What to do next

Configure the email server so you can reset your password if needed and send other notifications. See [Tutorial: Configuring the Cloud](#).

Configure your topology by registering services. See [Tutorial: Configuring the Cloud](#).

Create a Provider Organization. See [Tutorial: Creating a Provider Organization](#).

## Related tasks

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining your Cloud Manager topology

To define your API Connect on-premises cloud, you define availability zones and register services within those zones to securely create, promote, and track APIs. The installation procedure provides initial configuration of an Availability Zone containing the Management service.

## About this task

The Cloud Manager topology consists of Availability Zones that contain the API Connect services (management, gateway, analytics and portal services). Availability Zones can contain one or more gateway services, analytics service, and portal service, but there is one management service that spans all Availability Zones. When configuring your Availability Zones and Services, the recommended practice is that the gateway, analytics, and portal services do not communicate across Availability Zones. Only the management service can span across Availability Zones.

The following diagram illustrates the topology for services and Availability Zones in an API Connect network:

One of the following roles is required to register and manage services:

- Administrator
- Topology Administrator
- Owner
- A custom role with the **Topology:Manage** permission

Following are the tasks involved in defining the API Connect topology:

- Create one or more Availability Zones.
- Register one or more Gateway, Analytics, and Portal services in each Availability Zone
- Associate an Analytics service with each Gateway service
- Set the visibility for the services

There are two types of deployment scenarios:

1. Appliance-based deployment using .ova files on Virtual Machines
2. Container-based deployment using Docker and Kubernetes clusters

The configuration of the Management service will differ depending upon the deployment scenario. For both, a Management service is added to the Default Availability Zone by the installation utility.

Once the cloud is defined and an email server has been configured, you invite other users to access API Manager to create APIs. You expose these APIs to the development community through the Developer Portal user interface.

To define the API Connect cloud, complete the following tasks:

- **Configuring the Management service**  
A Management service is configured in the Default Availability Zone by the installation script. For an appliance-based deployment on VMs, additional Management services may be configured using the .ova file. For a container-based deployment, only one Management service is configured for the cloud.
- **Creating an Availability Zone**  
An Availability Zone is a logical or physical set of data centers containing one or more API Connect services. Availability Zones provide redundancy and failover in the event of network issues. The Default Availability Zone is created during installation; it includes a Management service.
- **Registering a gateway service**  
A gateway service is required to handle incoming traffic for APIs.
- **Registering an analytics service**  
Configure at least one analytics service in your API Connect on-premises cloud. The analytics service is always associated with a gateway service, from which it collects API event data.
- **Registering a Portal service**  
Define one or more Portal services in your API Connect on-premises cloud.
- **Associating an analytics service with a gateway service**  
To collect data about your API usage and other statistics, you must associate an analytics service with each gateway service. You can associate multiple gateway services with one analytics service, but each gateway can be associated with only one analytics service.
- **Setting visibility for a service**  
The visibility setting determines which provider organizations can access a service.

## Related concepts

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring the Management service

A Management service is configured in the Default Availability Zone by the installation script. For an appliance-based deployment on VMs, additional Management services may be configured using the .ova file. For a container-based deployment, only one Management service is configured for the cloud.

## Before you begin

---

You must complete the following tasks:

- Run the Install Assist installation program to configure the Default Availability Zone that contains the Management service. See [Installing API Connect into a Kubernetes environment](#) and [Deploying the Management OVA file](#).

## About this task

---

The Management service is added to your cloud by the installation script. It will be added to the Default Availability Zone. You cannot add or configure Management services using the Cloud Manager user interface.

The Management service is handled differently depending on the deployment option:

- Appliance-based deployment: API Connect Services are deployed on VMs using an .ova configuration file. Multiple Management services may be deployed, but each Availability Zone can have only one Management service.
- Container-based deployment: Services are deployed in Docker containers and managed in Kubernetes clusters. One Management service is deployed for the entire cloud using the installation script.

## Results

---

One or more Management services are configured.

## What to do next

---

Complete the following task:

- [Registering a gateway service](#)

## Related tasks

---

- [Creating an Availability Zone](#)
- [Registering a gateway service](#)
- [Registering an analytics service](#)
- [Registering a Portal service](#)
- [Associating an analytics service with a gateway service](#)
- [Setting visibility for a service](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating an Availability Zone

An Availability Zone is a logical or physical set of data centers containing one or more API Connect services. Availability Zones provide redundancy and failover in the event of network issues. The Default Availability Zone is created during installation; it includes a Management service.

## Before you begin

---

You must complete the following task:

- Run Install Assist to configure the Default Availability Zone that contains the Management service. See [Installing API Connect into a Kubernetes environment](#) or [Deploying the Management OVA file](#).

## About this task

Availability zones organize API Connect operations based upon your business needs. Availability zones are sets of logical or physical data centers containing one or more API Connect services. Multiple availability zones in your cloud provide redundancy and fail over in the event of network issues. Availability zones can be organized by region, for global separation, or for physical or logical separation of data centers.

The Default Availability Zone is created during the installation process. It contains the Management service that was configured by Install Assist. You register one or more gateway, analytics, and portal services in the availability zones to configure your API Connect cloud topology.

Note: For appliance-based deployments, additional management services may be added (one per availability zone) using the installation script. However, for container-based deployments using Docker and Kubernetes, only one management service is allowed. No additional management services can be added if you are using container-based deployment.

When you create an availability zone, you should provide a descriptive title; a name is generated automatically for internal identification. For example:

Table 1. Example availability zones

Title	Name
US Availability Zone	us-availability-zone
Hampshire Availability Zone	hampshire-availability-zone
Newport Availability Zone	newport-availability-zone
London South Availability Zone	london-south-availability-zone

One of the following roles is required to add and manage Availability Zones:

- Administrator
- Topology Administrator
- Owner
- A custom role with the **Topology:Manage** permission

## Procedure

Follow these steps to add one or more additional Availability Zones to your on-premises cloud:

1. In the Cloud Manager, click  Topology.
2. You will see the current Availability Zones configured in your cloud. The Default Availability Zone is created by the installation script, and includes the Management service. To add another Availability Zone, choose Create Availability Zone.
3. Enter the following values:

Field	Description
Title (required)	Enter a descriptive title for the availability zone. This title will display on the screen.
Name (required)	This field is auto-populated by the system and used as the internal field name.
Summary (optional)	Enter a brief description.

4. Click Create to complete the operation.

## Results

The availability zone will be added on the Services page. You can now add gateway, analytics, and portal services to the availability zone.

## Related tasks

- [Registering a gateway service](#)
- [Registering an analytics service](#)
- [Registering a Portal service](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Registering a gateway service

A gateway service is required to handle incoming traffic for APIs.

## Before you begin

Before registering a Gateway service in Cloud Manager, the DataPower® API Connect Gateway Service has to either be installed as a subsystem in your Kubernetes cluster or enabled on the DataPower appliance. For a Kubernetes environment, see [DataPower Gateway subsystem on Kubernetes](#). For appliances, see [Configuring API Connect Gateway Service](#) for more information.

Also complete the following task:

- [Configuring the Management service](#)

Note:

If you enabled Event Endpoint Management in Cloud Pak for Integration, an Event Gateway Service is provided for event endpoints. For more information about registering an Event Gateway Service, see the [Cloud Pak for Integration documentation](#).

## About this task

A Gateway service represents a cluster of gateway servers that host published APIs and provide the API endpoints used by client applications. Gateways execute API proxy invocations to backend systems and enforce API policies including client identification, security and rate limiting.

One of the following roles is required to register and manage a gateway services:

- Administrator
- Topology Administrator
- Owner
- A custom role with the **Topology:Manage** permission

Note: You can also register, and manage, gateway services by using the developer toolkit CLI; for details, see [apic gateway-services](#).

## Procedure

Complete the following steps to configure a Gateway service for your cloud:

1. In the Cloud Manager, click  Topology.
2. From the Availability Zone that will contain the Gateway service, select Register Service.
3. On the Configure Service page, select DataPower Gateway as the service type. Select the Gateway type that you want to create, either DataPower Gateway (v5 compatible) or DataPower API Gateway. For a description of the gateway types, see [API Connect gateway types](#)
4. Enter the values to configure the Gateway service. You will need to obtain the endpoints from your deployment configuration. For a Kubernetes environment, the endpoints are configured by the following values in the CR (custom resource) file. For an appliance, the endpoint is configured in DataPower.

Field	Description
Title (required)	Enter a descriptive title for the gateway service. This title will be displayed on the screen.
Name (required)	This field is auto-populated by the system and used as the internal field name.
Summary (optional)	Enter a brief description.
Management endpoint on the gateway service: Endpoint (required)	Enter the API Connect Gateway Service endpoint. <ul style="list-style-type: none"> <li>• For a Kubernetes environment, the Management Endpoint is the endpoint created in the CR (custom resource). See <a href="#">DataPower Gateway subsystem on Kubernetes</a> for more information.</li> <li>• For an appliance, the Management Endpoint is the <i>Management address</i> to the API Connect Gateway Service shown in the <a href="#">gateway service connection diagram</a>. For one gateway, this takes the form <i>http://&lt;ip-address-for-gateway&gt;:3000</i>. For multiple gateways, it would be the address:port of the load balancer</li> </ul>
Management endpoint on the gateway service: TLS client profile (required)	Specify the TLS Client profile to use when contacting the gateway through the management endpoint. Note: <ul style="list-style-type: none"> <li>• The default value is Gateway management client TLS client profile:1.0.0. If you are using a DataPower Gateway in a Kubernetes deployment, with mutual TLS enabled, use this setting. For any other gateway, if the gateway is not configured with the correct TLS credentials the gateway registration will fail with this setting. To prevent registration failure, select either Default TLS client profile:1.0.0 or your own custom TLS client profile. For information on configuring a custom TLS client profile, see <a href="#">Creating a TLS Client Profile</a>.</li> <li>• TLS protocol version 1.3 is not supported.</li> </ul>
API invocation endpoint: API endpoint base (required)	Enter the base portion of the URL that maps to the base portion of the URL for incoming API traffic. It is a public FQDN with additional paths that are specific to your API calls. For example: <b>https://api.mycompany.com</b> Note: If you are using the DataPower API Gateway, HTTP/2 is enabled automatically on the API invocation endpoint. If you are using the DataPower Gateway (v5 compatible), HTTP/2 is not supported on the API invocation endpoint.
API invocation endpoint: Server Name Indication (SNI) - Host name	For supporting Server Name Indication (SNI) at the API Endpoint Base. The default hostname of "*" is required to allow all hosts. Enter other host names as needed. Wild card format is supported. The SNI capability enables you to serve multiple TLS secure host names through the same Gateway service, using the same IP address and port, without requiring them to use the same TLS profile. Note: To allow requests from clients that don't support SNI, you <b>must</b> include a host name value of "*".
API invocation endpoint: Server Name Indication (SNI) - TLS server profile	The TLS server profile that supports the given hostname for SNI.  Restriction: If you are using the DataPower API Gateway, HTTP/2 is enabled automatically on the API invocation endpoint. Therefore, using a TLS server profile that supports only TLS protocol version 1.3 is not supported and will result in the gateway being unable to receive API traffic. You must use a TLS server profile that includes TLS protocol version 1.2 as one of its supported protocols. This restriction does not apply if you are using the DataPower Gateway (v5 compatible), which does not support HTTP/2.
OAuth shared secret (optional)	For sites using native OAuth providers, enter the shared secret that will be used by all API calls going through the gateway. Note: The specified shared secret must be 64 characters (64 bytes) in length, prefixed with <b>0x</b> , and must consist only of hexadecimal characters. For example: <b>0xa354282f227c10250511ae9c9e8c7ed9f4f1bd0d7c04cb6d5bd178f8c62296e3</b>

The following diagram illustrates the gateway service connection:

---

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Registering an analytics service

Configure at least one analytics service in your API Connect on-premises cloud. The analytics service is always associated with a gateway service, from which it collects API event data.

---

## Before you begin

You must complete the following tasks:

- [Creating an Availability Zone](#)
- [Registering a gateway service](#)

---

## About this task

The Analytics service collects API event data from the Gateway service. In Cloud Manager, you configure the Analytics service and then associate it with one or more Gateways. You can have multiple Gateways associated with a single Analytics service, but each Gateway can be associated with only one Analytics service. Using the Analytics service, you can filter, sort, and aggregate the API event data and view the results on a dashboard.

One of the following roles is required to register and manage Analytics services:

- Administrator
- Topology Administrator
- Owner

- A custom role with the **Topology:Manage** permission

## Procedure

Complete the following steps to configure the Analytics services for your cloud:

1. In the Cloud Manager, click  Topology.
2. In the Availability Zone that will contain the Analytics service, select Register Services > Analytics.
3. Enter the values to configure the Analytics service:

Field	Description
Title (required)	Enter a descriptive title for the Analytics service. This title will display on the screen.
Name (required)	This field is auto-populated by the system and used as the internal field name.
Summary (optional)	Enter a brief description.
Management endpoint on the analytics service: Endpoint (required)	Enter the fully-qualified domain name for the Analytics client endpoint that you defined during installation. Note: If you disabled internal storage for Analytics, provide the ingestion endpoint instead. <ul style="list-style-type: none"> <li>• In a Kubernetes deployment, the client endpoint (or ingestion endpoint) is defined in the CR with the <code>STACK_HOST</code> variable. For more information, see step 2 in <a href="#">Creating the Analytics CR</a>.</li> <li>• In a VMware deployment, the client endpoint (or ingestion endpoint) is defined with an <code>apicup</code> command during installation. For more information, see step 7 in <a href="#">Deploying the Analytics subsystem</a>.</li> </ul>
TLS client profile (required)	Select the TLS Client Profile that will be used to communicate with the Analytics service. The Client Profile applies to the Endpoint that you specified in the previous row.
Advanced analytics configuration (available when editing an analytics service)	Configure advanced parameters in Kibana.

4. Click Save to complete the operation.

## Results

The Analytics service is added to your cloud settings.

## What to do next

Associate the Analytics service one or more Gateway services. For more information, see [Associating an analytics service with a gateway service](#).

## Related tasks

- [Registering a gateway service](#)
- [Registering a Portal service](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Registering a Portal service

Define one or more Portal services in your API Connect on-premises cloud.

## Before you begin

You must complete the following tasks:

- [Creating an Availability Zone](#)
- [Registering a gateway service](#)
- [Configuring an email server for notifications](#)
- [Setting up notifications](#)

## About this task

Each Availability Zone contains one or more Portal services. The Portal service provides a Developer Portal used by application developers to discover APIs and onboard consumers. An email server must be configured and set as the email server for the cloud before registering a Portal service. One of the following roles is required to register and manage Portal services:

- Administrator
- Topology Administrator
- Owner
- A custom role with the **Topology:Manage** permission

Important: It's not recommended to have more than 100 sites per Developer Portal service. Note that it's not necessary to have a Portal site for every Catalog, for example Catalogs that are only for API Developers don't need a Portal site, as the APIs can be tested by using credentials from the API Manager. If more than 100 sites are

required, you should configure additional Developer Portal services.

## Procedure

Complete the following steps to configure the Portal services for your cloud:

1. In the Cloud Manager, click  Topology.
2. In the Availability Zone that will contain the Portal service, select Register Services > Portal.
3. Enter the values to configure the Portal service.

Field	Description
Title (required)	Enter a descriptive title for the portal service. This title will display on the screen.
Name (required)	This field is auto-populated by the system and used as the internal field name.
Summary (optional)	Enter a brief description.
Management endpoint on the portal service: Endpoint (required)	Enter the IP address, fully-qualified host name, service, or ingress name. Used for communication with API Manager. <ul style="list-style-type: none"><li>• In a Kubernetes deployment, the endpoint is defined in the CR by <code>api.portal.\$STACK_HOST</code>. See <a href="#">Developer Portal subsystem on Kubernetes</a>.</li><li>• If configured during installation in a VMware environment, it is the <code>apicup subsys set portal portal-admin</code> value.</li></ul>
Management endpoint on the portal service: TLS client profile (optional)	Select the TLS Client Profile that will be used to communicate with the portal service. The profile applies to the Management Endpoint. Note: TLS protocol version 1.3 is not supported.
Portal website URL (required)	The URL that will be used for public access to the portal. <ul style="list-style-type: none"><li>• In a Kubernetes deployment, the endpoint is defined in the CR by <code>portal.\$STACK_HOST</code>. See <a href="#">Developer Portal subsystem on Kubernetes</a>.</li><li>• If configured during installation in a VMware environment, it is the <code>apicup subsys set portal portal-www &lt;portal&gt;.&lt;hostname&gt;.&lt;domainname&gt;</code> value.</li></ul> <p>Multiple portal-www endpoints may be configured, as described here in these topics: <a href="#">Defining multiple portal endpoints for a Kubernetes environment</a> and <a href="#">Defining multiple portal endpoints for a VMware environment</a>.</p>

4. When you are finished, click Save.

## Results

The Portal service is configured in your cloud and can be used to publish APIs.

## Related tasks

- [Registering a gateway service](#)
- [Registering an analytics service](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Associating an analytics service with a gateway service

To collect data about your API usage and other statistics, you must associate an analytics service with each gateway service. You can associate multiple gateway services with one analytics service, but each gateway can be associated with only one analytics service.

## Before you begin

You must complete the following tasks:

- Run Install Assist to configure the Default Availability Zone that contains the Management service.
- Register a gateway service and an analytics service.

## About this task

Each gateway service is associated with an analytics service. Each gateway service can be associated with only one analytics service (a one-one relationship), however, each analytics service can be associated with one or more gateway services (a one-many relationship). The associated analytics service collects API event data from the gateway service.

In order to associate an analytics service with a gateway, you must first configure at least one analytics service and one gateway service.

One of the following roles is required to associate an analytics service with a gateway service:

- Administrator
- Topology Administrator

- Owner
- A custom role with the **Topology:Manage** permission

Follow these steps to associate an analytics service with a gateway service:

## Procedure

---

1. In the Cloud Manager, click  Topology.
2. In the section for the Availability Zone you want to work on, locate the Gateway service that requires an Analytics service in the SERVICE column.
3. Locate the ASSOCIATED ANALYTICS SERVICE column.
4. If an Analytics service has been configured, the Associate Analytics service link is enabled for each Gateway service. Click Associate Analytics Service in the same row as the Gateway service that requires an Analytics service.
5. In Associate Analytics Service, you will see the name of the Gateway service and a list of Analytics services that have been configured in your cloud.
6. Select the Analytics service to associate with the Gateway service by adding a checkmark, then click Associate.
7. To remove the associated Analytics service, select Unassociate analytics service from the actions menu. Note that when there is no Analytics service associated with a Gateway service, all analytics collection will be disabled and there will be no data in either the API Manager Dashboards or third-party offloads.

## Results

---

The Analytics service is associated with a Gateway service and will collect API event data for that Gateway.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Setting visibility for a service

---

The visibility setting determines which provider organizations can access a service.

## Before you begin

---

You must complete the following tasks:

- Run Install Assist to configure the Default Availability Zone that contains the Management service
- Create additional availability zones if needed, see [Creating an Availability Zone](#)
- Register at least one gateway service, see [Registering a gateway service](#)
- Register other services

## About this task

---

The visibility setting controls which provider organizations can use a service. The default visibility setting is Public.

One of the following roles is required to set the visibility for services:

- Administrator
- Topology Administrator
- Owner
- A custom role with the **Topology:Manage** permission

## Procedure

---

Follow these steps to set the visibility for the services in your on-premises cloud:

1. In the Cloud Manager, click  Topology.
2. From the list of Services, choose Set visibility from the actions menu next to the name of the service that requires the visibility setting.
3. Select the visibility setting for the service. The options are:
  - Private - the service is not visible and cannot be used by any provider organization
  - Public - the service is visible and can be used by all provider organizations
  - Custom - the service is visible only to the provider organizations designated by you
4. For Custom visibility, select the provider organizations that will be able to use the service.
5. Click Make visible to complete the operation.

## Results

---

For Private, the service cannot be used by any provider organizations. For Public, the service can be used by all provider organizations. For Custom, the service can be used by the provider organizations that you designate.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Managing authentication and security

Secure Cloud Manager and API Manager as well as your Catalogs with a user registry. Secure your APIs with OAuth. Create TLS profiles to ensure that information you share among web servers will not be stolen or tampered with.

As Cloud Administrator or Topology Administrator (or with a custom role that contains the `Settings:Manage` permission), you can configure the following authentication and security mechanisms:

- User registries to authenticate users of Cloud Manager and API Manager and of your Catalogs and APIs.
- OAuth providers to provide protection for APIs.
- TLS profiles to secure transmission of data through the Gateway to external web sites and among web servers.

The following topics describe how to configure user registries, OAuth providers, and TLS profiles:

- [User registries overview](#)  
API Connect supports several types of user registries for authenticating users. The credentials for all users of Cloud Manager, API Manager, and the Developer Portal must be stored in a user registry.
- [TLS profiles overview](#)  
API Connect supports TLS Profiles for securing data transmission over HTTPS.
- [OAuth Provider overview](#)  
API Connect supports OAuth Specification 2.0, for both Native and Third party implementations.

## Related concepts

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## User registries overview

API Connect supports several types of user registries for authenticating users. The credentials for all users of Cloud Manager, API Manager, and the Developer Portal must be stored in a user registry.

## Introduction to user registries

---

A user registry holds unique user account credentials, primarily usernames and passwords, which are accessed during authentication for logging into Cloud Manager, API Manager, the Developer Portal, and also for calling APIs (if the API is configured to use Basic Authentication in the Security Definition). The Cloud Administrator configures user registries to ensure that all users are successful at logging in.

User registries also provide security when calling APIs. For information on configuring Security Definitions for APIs, see [Creating a basic authentication security definition](#).

User registries are configured as Resources. Once the user registry has been configured as a resource in Resources > User registries, the next step is indicate the active user registries for your cloud in Settings > User registries. The user registry must be made active in your cloud in order to make it available for authentication. When a user logs into Cloud Manager or API Manager, the specified user registry is queried for credentials to confirm the user's identity. To make a user registry available to the Developer Portal, you must define the registry for consumer onboarding in the associated Catalog. In the API Manager UI, click Manage followed by the relevant Catalog, and then click Settings > Onboarding; for more information see [Creating and configuring Catalogs](#).

In Cloud Manager and API Manager, a registry cannot be changed after a user is invited to be the owner of a provider organization, even if the invitation is not yet accepted.

User registries in API Connect serve the following primary functions:

- To authenticate a user at login time based upon username and password.
- To store basic profile information such as first name, last name, and email address.
- To provide secure access to Catalogs.
- To provide Basic Authentication for APIs when called by an application.

In order to log in to Cloud Manager, API Manager, the Developer Portal, or access a catalog, a user must have valid credentials (username and password) stored in a user registry that is configured in API Connect.

The Security Definition for an API can be configured to require a username and password, called the Basic Authentication method. With Basic Authentication, the username and password are included in the HTTP authorization header, and the credentials are verified through user registry.

User registries that are configured in Cloud Manager have the following characteristics:

- They are available to Cloud Manager, API Manager, the Developer Portal, and for Basic Authentication for APIs.
- They are available to provider organizations, as determined by the visibility setting.
- They can be edited and deleted only in Cloud Manager.

User registries that are configured in API Manager have the following characteristics:

- They are available to the Developer Portal (for Catalogs) and for Basic Authentication for APIs.
- They are available only to the Provider Organization that created them.

## User registries supported by API Connect

---

API Connect integrates with several types of user registries to accommodate all security solutions. You can use your corporate LDAP registry, an Authentication URL, or an LUR to provide secure access to Cloud Manager, API Manager, the Developer Portal, and APIs. API Connect includes two internal databases that serve as local user registries, or LURs. The Providers LUR supports credentials for Provider organizations and the Admin LUR supports credentials for the Administrator organization. Multiple registries may be configured.

The following user registry types can serve as a resource in API Connect:

- Local user registry (LUR) - An internal database of usernames and passwords stored on the local server. Contains the Admin user account which may not be modified or deleted.
- LDAP - A user registry definition that points to an existing corporate LDAP directory. May be set up as case-sensitive.
- Authentication URL - Accesses a URL that points to a service for validating user credentials.
- OpenID Connect (OIDC).
- [Configuring an Authentication URL user registry](#)  
An Authentication URL user registry provides a simple mechanism for authenticating users by referencing a custom identity provider.
- [Configuring a shared custom user registry](#)  
You can configure a custom user registry to provide user authentication for the Cloud Manager, the API Manager, and the Developer Portal.
- [Configuring an LDAP user registry in the Cloud Manager](#)  
You can use the Cloud Manager UI to configure an LDAP user registry as a shared resource to provide user authentication for the Cloud Manager, the API Manager, and the Developer Portal. APIs can also be secured with an LDAP user registry.
- [Configuring a Local User Registry](#)  
A Local User Registry (LUR) can be configured to provide user authentication for both Cloud Manager and API Manager.
- [Configuring an OIDC user registry](#)  
Configure a shared OIDC user registry for user onboarding and authentication when multi-factor authentication (MFA) is required.
- [Setting visibility for a user registry](#)  
The visibility setting determines which provider organizations can access a resource, for example, user registries.
- [Deleting a user registry](#)  
As the Cloud Manager administrator, you can delete user registries.
- [Removing a user from a user registry](#)  
As an API Connect user, you can remove yourself from an API Connect user registry. As an administrative user, you can remove other users from an API Connect user registry.

## Related tasks

---

- [Configuring an Authentication URL user registry](#)
- [Configuring a Local User Registry](#)
- [Configuring an LDAP user registry in the Cloud Manager](#)
- [Setting visibility for a user registry](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring an Authentication URL user registry

An Authentication URL user registry provides a simple mechanism for authenticating users by referencing a custom identity provider.

### About this task

---

This topic describes how to configure a new Authentication URL user registry as a Resource in your cloud. After the user registry is configured, you must select it for use in your cloud in Settings > User Registries. See [Selecting user registries for Cloud Manager and API Manager](#).

One of the following roles is required to configure user registries.:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings:Manage` permissions

Note:

API Connect issues an HTTP **GET** call to the Authentication URL endpoint, sending the user's credential. The following example shows a call made to an Authentication URL identity provider with an endpoint defined as `https://myauthurl.example.com/user/authenticate`:

```
GET /user/authenticate HTTP/1.1
Host: myauthurl.example.com
Authorization: Basic c3Bvb246Zm9yaw=
```

If the Authentication URL endpoint returns an HTTP status code of **200**, the user authenticates successfully. An HTTP status code other than **200** indicates a failed login attempt. API Connect forwards any HTTP Header starting with **x-** (with the exception of **x-Client-Certificate**), and **Cookie** to the Authentication URL identity provider, to aid the authentication decision; for example:

```
GET /user/authenticate HTTP/1.1
Host: myauthurl.example.com
Authorization: Basic c3Bvb246Zm9yaw=
X-Forwarded-For: 8.8.9.9
X-Custom-Header-From-Customer: special
Cookie: MyCookie=VGhpc0lzV21ja2VkQW1hemluZw==
```

When a user is presented with the form for completing their API Connect user registration, which fields are pre-populated depends on which fields are returned in the response from the Authentication URL identity provider. If any of the following fields are returned, they will be pre-populated in the registration form:

- `username`
- `email`
- `first_name`
- `last_name`

If the `username` field is not returned, the registration form displays the user name that was provided by the user. The pre-population capability requires that the response from the Authentication URL identity provider satisfies the following conditions:

- The `Content-Type` must be `application/json`.
- The response body format must be JSON.

A sample response is as follows:

```
HTTP/1.1 200 OK
Content-Type: application/json; charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
```

```
{
  "username": "myuser",
  "email": "myuser@example.com",
  "first_name": "My",
  "last_name": "User"
}
```

## Procedure

1. In the Cloud Manager, click .
2. Select User Registries to see the list of current user registries in your cloud.
3. Click Create in the User Registries section.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

4. Select Authentication URL User Registry and enter the following parameters:

Field	Description
Title (required)	Enter a descriptive name to use on the screen.
Name (required)	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see <a href="#">apic user-registries</a> .
Summary (optional)	Enter a brief description.
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see <a href="#">Accessing the Cloud Manager user interface</a> , <a href="#">Accessing the API Manager user interface</a> , and <a href="#">Activating your API Manager user account</a> .  Note: The Developer Portal uses the <b>Title</b> of the User Registries when rendering them at the login page, rather than the <b>Display Name</b> .
URL (required)	Enter the URL for the authentication service. When establishing authentication, API Connect makes a GET call to the URL. The call includes the user name and password it has collected from the user in its authorization header. Either 200 OK or 401 Unauthorized will be returned.
TLS Client Profile (optional)	Select a TLS Client Profile to allow secure authentication with a specific web server.
Case sensitive	To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend Authentication URL server: <ul style="list-style-type: none"> <li>• <b>Only</b> select Case sensitive if your backend server supports case-sensitivity.</li> <li>• <b>Do not</b> select Case sensitive if your backend server does not support case-sensitivity.</li> </ul> Note: The Developer Portal does not support case sensitive usernames. Note: After at least one user has been onboarded into the registry, you cannot change this setting.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.

Field	Description
Unique email address	Select this checkbox if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

5. Click Save.

## Results

The Authentication URL user registry is saved and is available to be selected as a user registry for Cloud Manager or API Manager by selecting it in Settings. User Registries. It can also be used for Basic Authentication in the Security Definition for an API.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Configuring a shared custom user registry

You can configure a custom user registry to provide user authentication for the Cloud Manager, the API Manager, and the Developer Portal.

## Before you begin

To configure a custom user registry as a resource in the Cloud Manager, the external user directory must be created and available to use with your API Connect ecosystem.

Custom user registries can be used for authenticating users to the Cloud Manager, the API Manager, and the Developer Portal, but cannot be used to secure APIs.

One of the following roles is required to configure a custom user registry:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

## About this task

You can create a custom user registry that is specific to a provider organization, or one that can be shared and available to all of the provider organizations in your API Connect environment. An organization-specific custom user registry can be used for authenticating Developer Portal users, while a shared custom user registry can be used for authenticating Cloud Manager, API Manager, and Developer Portal users.

This topic describes how to configure a shared custom user registry. If you want to create an organization-specific registry, see [Creating an organization-specific custom user registry](#) for more information. Note also that the visibility of a user registry is set to **shared** by default. However, you can change the visibility setting to make the registry private, or visible only to specific provider organizations. For more information, see [Setting visibility for a user registry](#).

Note:

- You can also create custom user registries by using the API Connect REST APIs (see the [API Connect REST API documentation](#)).

You can use the following instructions to create a writable or a read-only custom user registry.

API Connect provides two methods for creating a shared custom user registry in the Cloud Manager, as described in the following sections:

- [Creating a shared custom user registry by using the Cloud Manager UI](#)
- [Creating a shared custom user registry by using the developer toolkit CLI](#)

## Creating a shared custom user registry by using the Cloud Manager UI

You configure a custom user registry by first creating a custom user registry type that defines your external user registry, and then creating a new custom user registry resource that references the custom user registry type that you just created. To make the registry available for user authentication, you need to add the registry to the Cloud Manager, or to the API Manager, or both, depending on your requirements. When the custom user registry is used for authentication, API Connect makes a REST call to the endpoint of your external registry, as defined in the custom user registry type.

## Creating a custom user registry type

Use the following instructions to create a custom user registry type that defines your external user registry.

1. In the Cloud Manager, click  Resources.
2. Click Create in the User registry type section.
3. Enter the following information:

Property	Description
Title	A descriptive name of the custom user registry type to display in the UI. For example, <i>My custom user registry type</i> .
Name	The name of the user registry type. This name is auto-generated, and is used in CLI commands.
Version	The version number of the custom user registry type.
Summary	A brief description of the custom user registry type.
Properties	Enter the properties of your external user registry. Must include the property:  <code>remote: true</code>  This property must be set to <code>true</code> to indicate that this is an external user registry.
Secured Endpoint	Denotes the external registry secured endpoint section of the custom user registry type.
URL	The secure endpoint of your external user registry interface, where your platform REST API is located. It is made up of the URL and port, for example:  <code>https://custom.ms.com:8888</code>  API Connect will make REST calls to this endpoint for the user registry actions.
TLS Client Profile	Optionally set the TLS Client Profile URL that the custom server requires.
Headers	Optionally complete the user-defined header section to your external registry specification.
Configuration schema	Optionally complete the user-defined configuration schema section to your external registry specification.

4. Click Create. A new user registry with a Type of Custom is displayed in the User registry type list.

## Creating a custom user registry resource

Use the following instructions to create a new custom user registry resource that references the custom user registry type that you just created.

1. Click Create in the User Registries section of Resources.
2. Click the Custom user registry tile.
3. Enter the following information:

Property	Description
Custom type	The name of the custom user registry type that you just created. For example, <i>my-custom-user-registry-type</i> . Use the drop-down arrow to select different custom user registry types.
Title	A descriptive name to display in the UI.
Name	The name of the custom user registry. This name is auto-generated, and is used in CLI commands.
Summary	A brief description of the custom user registry.
Endpoint	Optional endpoint information.
Case sensitive	To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend server: <ul style="list-style-type: none"> <li>• <b>Only</b> select Case sensitive if your backend server supports case-sensitivity.</li> <li>• Do <b>not</b> select Case sensitive if your backend server does not support case-sensitivity.</li> </ul> Note: <ul style="list-style-type: none"> <li>• The Developer Portal does not support case sensitive usernames.</li> <li>• After at least one user has been onboarded into the registry, you cannot change this setting.</li> </ul>
User registry managed	Determines whether API Connect manages your user registry. Valid values are: <ul style="list-style-type: none"> <li>• <code>true</code> - select the checkbox</li> <li>• <code>false</code> - clear the checkbox</li> </ul>
User managed	Determines whether your user registry is writable or not. Select the checkbox to set to <code>true</code> for writable. Clear the checkbox for the non-writable option.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

4. Click Create. The new user registry is displayed in the User registries list.

## Adding your custom user registry to the Cloud Manager or API Manager login

To make the custom user registry available for user authentication in the Cloud Manager or the API Manager, you must set it as active in the Settings > User Registries section of the Cloud Manager UI. See [Selecting user registries for Cloud Manager and API Manager](#) for more information.

If you want to make the custom user registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. In the API Manager UI, click Manage followed by the relevant Catalog, and then click Catalog settings > Onboarding. In the Catalog User Registries section, click Edit, select the user registry, and click Save. For more information, see [Creating and configuring Catalogs](#).

## Creating a shared custom user registry by using the developer toolkit CLI

You configure a custom user registry by first configuring an integration document that defines your external user registry, and then creating a new custom user registry resource that references the integration document that you just created. You use developer toolkit CLI commands to create the integration document, and then the custom user registry. Finally, to make the registry available for user authentication, you need to configure the registry in the management server, or in the appropriate

Catalog, or both, depending on your requirements. When the custom user registry is used for authentication, API Connect makes a REST call to the endpoint of your external registry, as defined in the integration document.

## Logging in to the management server CLI

Before you can define the custom user registry, you must log in to your management server from the developer toolkit CLI as a member of the cloud administration organization. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm admin/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.

For full details of the login command, see [Logging in to a management server](#).

For more information about how to use the CLI, see [Installing the toolkit](#), and [Overview of the command-line tool](#).

## Defining your integration document

You define the configuration of your external user registry in an `integration_file.yaml` document, as shown in the following example.

```
integration: '1.0.0'
integration_type: 'user_registry'
info:
  name: 'custom_user_registry'
  version: '1.0.0'
  title: 'Custom External User Registry'
  summary: 'Configure External User Registry'
properties:
  remote: true
secured_endpoint:
  endpoint: 'https://custom.ms.com:8888'
  tls_client_profile_url: ${tlsClientProfileUrl}
headers:
  key1: value1
  key2: value2
configuration_schema:
  option_config1:
    type: string
  option_config2:
    type: boolean
```

The integration document properties are described in the following table:

Property	Description
<code>integration_type</code>	The type of integration, which in this case is <code>user_registry</code> .
<code>info</code>	Denotes the information section for the integration document.
<code>name</code>	The name of the user registry type, for example <code>custom_user_registry</code> . This name is used in the user registry file to denote the registry type.
<code>version</code>	The version number of the integration document.
<code>title</code>	A descriptive name to display in a graphical user interface.
<code>summary</code>	A brief description of the integration document.
<code>properties</code>	Denotes the property section of the integration document.
<code>remote</code>	Indicates that this is an external user registry. Must be set to <code>true</code> .
<code>secured_endpoint</code>	Denotes the external registry endpoint section of the integration document.
<code>endpoint</code>	The secure endpoint of your external user registry interface, where your platform REST API is located. It is made up of the url and port, for example:  <code>https://custom.ms.com:8888</code>  API Connect will make REST calls to this endpoint for the user registry actions.
<code>tls_client_profile_url</code>	Optionally set the TLS Client Profile URL that the custom server requires.
<code>headers</code>	Complete the user-defined header section to your external registry specification.
<code>configuration_schema</code>	Complete the user-defined configuration schema section to your external registry specification.

Save your `integration_file.yaml` so it can be accessed by the `integrations:create` command in the following section.

## Creating your custom integration

To create your custom user registry integration, run the following CLI command:

```
apic integrations:create --server mgmt_endpoint_url --subcollection user-registry integration_file.yaml
```

where:

- `mgmt_endpoint_url` is the management platform API endpoint URL.
- `integration_file` is the name of the YAML file that defines the configuration of your external user registry.

At this point API Connect makes a REST request call to the `endpoint` that is configured in the integration document, and the external platform REST API will need to return the requested information.

On completion of the integration creation, the command displays the following summary details:

```
integration_name custom_integration_url
```

The `integration_name` is derived from the `name` property in the configuration YAML file. The `custom_integration_url` is the URL with which the integration can be accessed. Both properties are needed when defining your custom user registry in the next section.

After your custom integration has completed successfully, you can continue to create the custom user registry.

## Defining your custom user registry

You define the configuration of your custom user registry in a `custom_config_file.yaml` file, as shown in the following example.

```
name: 'custom_registry_name'
title: 'display_title'
registry_type: 'custom_user_registry'
integration_url: custom_integration_url
case_sensitive: true_or_false
user_managed: true_or_false
user_registry_managed: true_or_false
email_required: true_or_false
email_unique_if_exist: true_or_false
identity_providers:
- name: provider_name
  title: 'provider_title'
configuration:
  custom_config1: 'value1'
  customize: true
```

The registry properties are described in the following table:

Property	Description
<code>name</code>	The name of the custom user registry. This name is used in the CLI commands.
<code>title</code>	A descriptive name to display in a graphical user interface.
<code>registry_type</code>	The registry type that you configured in the <code>name</code> property in the integration document, for example <code>custom_user_registry</code> .
<code>integration_url</code>	The custom integration URL in your API Connect configuration. You can determine the custom integration URL by using the following CLI command:  <pre>apic integrations:list --server mgmt_endpoint_url --subcollection user-registry</pre> Or you can copy and paste from the summary of the integration creation.
<code>case_sensitive</code>	Determines whether your user registry is case-sensitive. Valid values are: <ul style="list-style-type: none"> <li>• <code>true</code></li> <li>• <code>false</code></li> </ul> To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend LDAP server: <ul style="list-style-type: none"> <li>• <b>Only set <code>case_sensitive</code> to <code>true</code></b> if your backend LDAP server supports case-sensitivity.</li> <li>• Set <code>case_sensitive</code> to <code>false</code> if your backend LDAP server does not support case-sensitivity.</li> </ul> Note: After at least one user has been onboarded into the registry, you cannot change this setting.
<code>user_managed</code>	Determines whether your user registry is writable or not. Must be set to <code>true</code> for writable. Set to <code>false</code> if you don't want the registry to be writable.
<code>user_registry_managed</code>	Determines whether API Connect manages your user registry. Valid values are: <ul style="list-style-type: none"> <li>• <code>true</code></li> <li>• <code>false</code></li> </ul>
<code>email_required</code>	Determines whether an email address is required as part of the user onboarding process. Valid values are: <ul style="list-style-type: none"> <li>• <code>true</code></li> <li>• <code>false</code></li> </ul> If set to <code>true</code> , the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
<code>email_unique_if_exist</code>	Determines whether email addresses must be unique within the user registry. Valid values are: <ul style="list-style-type: none"> <li>• <code>true</code></li> <li>• <code>false</code></li> </ul> Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

Property	Description
<code>identity_providers</code>	An array containing the details of your custom server, where: <ul style="list-style-type: none"> <li><code>name</code> - is the name of the custom server and is the name that is used in CLI commands</li> <li><code>title</code> - is the display name of the custom server</li> </ul>
<code>configuration</code>	The user-defined configuration based on the <code>configuration_schema</code> that is defined in the integration document.

Save your `custom_config_file.yaml` so it can be accessed by the `user-registries:create` command in the following section.

## Creating your custom user registry

To create your shared custom user registry, run the following CLI command:

```
apic user-registries:create --server mgmt_endpoint_url --org admin custom_config_file.yaml
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `--org admin` means that the registry will be created in the admin organization, which is required for a user registry to be shared.
- `custom_config_file` is the name of the YAML file that defines the configuration of your custom user registry.

On completion of the registry creation, the command displays the following summary details:

```
registry_name registry_url
```

The `registry_name` is derived from the `name` property in the custom user registry YAML file. The `registry_url` is the URL with which the custom registry resource can be accessed.

Your shared custom user registry is now created; see the following sections for instructions on how to make the registry available to users.

## Configuring your custom registry for Cloud Manager or API Manager login

If you want to make your custom registry available for authenticating Cloud Manager and API Manager users, you must configure it on the management server.

- Determine the URL of your custom user registry by using the following command (or you can copy and paste from the summary of the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org admin
```

- Determine what the current user registries are, because you will need to confirm these as well as add your new custom registry:

```
apic user-registry-settings:get --server mgmt_endpoint_url --output -
```

This command outputs a list of all the current user registries in your environment, similar to the following example:

```
type: user_registry_setting
api_version: 2.0.0
name: user-registry-setting
admin_user_registry_default_url: >-
  https://server.com/api/user-registries/xxxxx/xxxxx-1234
admin_user_registry_urls:
  - >-
    https://server.com/api/user-registries/xxxxx/xxxxx-1234
provider_user_registry_default_url: >-
  https://https://server.com/api/user-registries/xxxxx/xxxxx-5678
provider_user_registry_urls:
  - >-
    https://https://server.com/api/user-registries/xxxxx/xxxxx-5678
created_at: '2019-09-30T12:22:19.467Z'
updated_at: '2019-10-17T10:05:37.867Z'
url: 'https://server.com/api/cloud/settings/user-registries'
```

- Enter the following command to update your user registries (the terminating hyphen character means that the command takes input from the command line):

```
apic user-registry-settings:update --server mgmt_endpoint_url -
```

The following message is output:

```
Reading USER_REGISTRY_SETTING_FILE arg from stdin
```

- If you want to make your custom registry available for authenticating Cloud Manager users, enter the following data, followed by a new line:

```
admin_user_registry_urls:
  - >-
    current_admin_user_registry_urls
  - new_custom_user_registry_url
```

where:

- `current_admin_user_registry_urls` are the current admin user registry URLs, as listed in Step 2 in the `admin_user_registry_urls` section. Note that you must include all of the user registry URLs that you want to remain, listing each URL on a new line.
- `new_custom_user_registry_url` is the URL of your new custom user registry, as determined in Step 1.

- If you want to make your custom registry available for authenticating API Manager users, enter the following data, followed by a new line:

```
provider_user_registry_urls:
  - >-
    current_provider_user_registry_urls
  - new_custom_user_registry_url
```

where:

- `current_provider_user_registry_urls` are the current provider organization user registry URLs, as listed in Step 2 in the `provider_user_registry_urls` section. Note that you must include all of the user registry URLs that you want to remain, listing each URL on a new line.
  - `new_custom_user_registry_url` is the URL of your new custom user registry, as determined in Step 1.
6. Press **CTRL D** to terminate the input. A confirmation message is output, for example:

```
user-registry-setting https://server.com/api/cloud/settings/user-registries
```

where `server.com` is your management server endpoint.

## Configuring your custom registry in a Catalog

If you want to make your custom registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Complete the following steps:

1. Determine the URL of your custom user registry by using the following command (or you can copy and paste from the summary of the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org admin
```

2. Log in to the management server as a member of a provider organization by entering the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

For full details of the `apic login` command, see [Logging in to a management server](#).

3. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic configured-catalog-user-registries:create --server mgmt_endpoint_url --org organization_name --catalog catalog_name -
```

where `catalog_name` is the value of the `name` property of the required Catalog. The command returns:

```
Reading CONFIGURED_CATALOG_USER_REGISTRY_FILE arg from stdin
```

4. Enter the following data, followed by a new line:

```
user_registry_url: custom_registry_url
```

where `custom_registry_url` is the URL of your custom registry, obtained in step 1.

5. Press **CTRL D** to terminate the input.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring an LDAP user registry in the Cloud Manager

You can use the Cloud Manager UI to configure an LDAP user registry as a shared resource to provide user authentication for the Cloud Manager, the API Manager, and the Developer Portal. APIs can also be secured with an LDAP user registry.

### Before you begin

To configure an LDAP user registry as a shared resource in the Cloud Manager, the LDAP directory must be created for use with your API Connect ecosystem.

LDAP registries can be used to secure APIs, to authenticate users to the Cloud Manager and the API Manager, or for securing a Catalog to authenticate Developer Portal users.

Important: If you are using an LDAP registry to secure APIs, the STARTTLS protocol, which upgrades an insecure protocol to a secure one by applying TLS security, is not supported.

One of the following roles is required to configure an LDAP user registry:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

### About this task

You can create an LDAP user registry that is specific to a provider organization, or one that can be shared and available to all of the provider organizations in your API Connect environment. An organization-specific LDAP user registry can be used for authenticating Developer Portal users in a specific provider organization. While a shared LDAP user registry can be used across the Cloud Manager, the API Manager, and the Developer Portal components in your environment.

This topic describes how to configure a shared LDAP user registry that is available to all of the provider organizations in your API Connect environment. If you want to create an organization-specific registry, see [Creating an LDAP user registry in API Manager](#) for more information. Note also that the visibility of a user registry is set to `shared` by default. However, you can change the visibility setting to make the registry private, or visible only to specific provider organizations. For more information, see [Setting visibility for a user registry](#).

Note:

- If you configure your LDAP user registry to be writable (by selecting the User Managed check box on the registry), you can use the Developer Portal UI for onboarding and authenticating new Developer Portal users, as well as those users that already exist in the LDAP database. A writable LDAP user registry cannot be used to authenticate Cloud Manager and API Manager users.
- You can also create and manage LDAP user registries by using the developer toolkit CLI (see [Using the CLI to configure a shared LDAP user registry](#)), and by using the API Connect REST APIs (see the [API Connect REST API documentation](#)).
- If you are using the DataPower® API Gateway, LDAP group authentication is not supported.
- You can map external LDAP groups to API Connect user roles to enable greater control of user access, but this configuration can be done only by using the developer toolkit CLI; see [Using the CLI to configure a shared LDAP user registry](#) for details.

You create an LDAP user registry by configuring a set of properties in the Cloud Manager UI. If you want to enable writable LDAP, you must complete the Attribute Mapping section by selecting the User Managed checkbox, and providing the mapping of your source LDAP attribute names to the target API Connect values. You can also change a registry to be read-only again by clearing the User Managed checkbox. After configuring the user registry, you must set it as active in Settings > User Registries. To make the registry available to the Developer Portal, you must define the registry for consumer onboarding in the associated Catalog. To secure APIs with an LDAP registry, you must configure security definitions.

For general information about authenticating with LDAP, see [LDAP authentication](#).

## Procedure

Follow these steps to configure a new LDAP user registry as a shared resource in the Cloud Manager UI.

1. In the Cloud Manager, click  Resources.
2. Click Create in the User Registries section.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

3. Select LDAP User Registry for the user registry type, and enter the following information:

Field	Description
Title	Enter a descriptive name to display on the screen.
Name	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see <a href="#">apic user-registries</a> .
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see <a href="#">Accessing the Cloud Manager user interface</a> , <a href="#">Accessing the API Manager user interface</a> , and <a href="#">Activating your API Manager user account</a> .  Note: The Developer Portal uses the <b>Title</b> of the User Registries when rendering them at the login page, rather than the <b>Display Name</b> .
Summary (optional)	Enter a brief description.
Address	Enter the IP address or host name of the LDAP server.
Port	Enter the Port number that API Connect can use to communicate with the LDAP registry. For example, 389.
Select a TLS Client Profile (optional)	Select the TLS Client Profile the LDAP server requires.
Select an LDAP protocol version	Select the version number for the LDAP protocol that you are using.
Case-sensitivity	To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend LDAP server: <ul style="list-style-type: none"> <li>• <b>Only</b> select Case sensitive if your backend LDAP server supports case-sensitivity.</li> <li>• Do <b>not</b> select Case sensitive if your backend LDAP server does not support case-sensitivity.</li> </ul> Note: The Developer Portal does not support case sensitive usernames. Note: After at least one user has been onboarded into the registry, you cannot change this setting.
Enable External Group Mapping	Enable this property if you want user to use this user registry to map external LDAP groups to API Connect user roles to enable more control of user authorization.
Email required	Select this check box if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this check box if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

4. Click Next and enter the authentication information, which will vary depending on the selected Authentication Method. The choices are:
  - Compose DN - Select this format if you can compose the user LDAP Distinguished Name (DN) from the user name. For example, `uid=<username>,ou=People,dc=company,dc=com` is a DN format that can be composed from the user name. If you are unsure whether Compose (DN) is the correct option, contact your LDAP administrator. If you are using an LDAP registry to secure APIs, Compose DN is not supported with the DataPower API Gateway.
  - Compose UPN - Select this format if your LDAP directory supports binding with User Principal Names such as `johnd@acme.com`. The Microsoft Active Directory is an example of an LDAP directory that supports Compose UPN authentication. If you are unsure whether your LDAP directory supports binding with UPNs, contact your LDAP administrator.  
Note: The Admin Bind DN and Admin Bind Password are not used with this authentication method.
  - Search DN - Select this format if you cannot compose the user LDAP Distinguished Name from the user name; for example, if the base DNs of the users are different. This format might require an administrator DN and password to search for users in the LDAP directory. If your LDAP directory permits anonymous binds, you can omit the admin DN and password. If you are unsure if your LDAP directory permits anonymous binds, contact your LDAP administrator.

For all of the authentication methods:

If you are creating an LDAP registry to authenticate users of an API, you can specify an LDAP authorization group to restrict API access. To be able to call an API that is secured by the LDAP registry, a user must successfully authenticate with their LDAP user ID and password **and** they must be a member of the specified authorization group. The authorization group can be a Static Group or Dynamic Group. A static group is one in which the individual members of the group are explicitly listed. A dynamic group is one which is defined according to the set of attributes that the group members share in common.

5. For authentication method Compose DN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Prefix	Specify the prefix to the DN. For example <code>(uid=</code> .
Suffix	Specify the suffix to the DN. For example <code>)</code> .
Base DN (optional)	Enter a base DN in the Base DN field, or click Get Base DN to populate the field with a retrieved base DN.
Use group authentication (optional)	Static or Dynamic. For Static Group, enter the Group Based DN, Prefix, and Suffix. For Dynamic Group, enter the Filter condition for the group. Note: If you are using the DataPower API Gateway, LDAP group authentication is not supported.

6. For authentication method Compose UPN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Suffix	Enter the domain part of the user principal name. For example, <code>@acme.com</code> .
Use group authentication (optional)	Enter the Filter condition for the group. Note: If you are using the DataPower API Gateway, LDAP group authentication is not supported.

7. For authentication method Search DN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Prefix	Specify the prefix to the DN. For example <code>(uid=</code> .
Suffix	Specify the suffix to the DN. For example <code>)</code> .
Base DN (optional)	Enter a base DN in the Base DN field, or click Get Base DN to populate the field with a retrieved base DN.
Use group authentication (optional)	Static or Dynamic. For Static Group, enter the Group Based DN, Prefix, and Suffix. For Dynamic Group, enter the Filter condition for the group. Note: If you are using the DataPower API Gateway, LDAP group authentication is not supported.

8. Optional: Click Test configuration to test the settings for your LDAP user registry. Enter valid credentials to ensure that you can access the LDAP database.

9. Optional: If you want to make your LDAP user registry writable, select the User Managed checkbox in the Attribute Mapping section, and provide the mapping of your source LDAP attribute names to the target API Connect values. Click Add to add each name/value pair, specified as follows:

- LDAP ATTRIBUTE NAME - is the name of the source LDAP attribute.
- API CONNECT VALUE - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [ ] with the value that the user supplies when signing up.

The default user profile properties that API Connect requires during user registration are `username`, `first_name`, `last_name`, `email`, and `password`, as shown in the following example:

LDAP ATTRIBUTE NAME	API CONNECT VALUE
<code>dn</code>	<code>uid=[username],ou=users,dc=company,dc=com</code>
<code>cn</code>	<code>[first_name] [last_name]</code>
<code>sn</code>	<code>[last_name]</code>
<code>mail</code>	<code>[email]</code>
<code>userPassword</code>	<code>[password]</code>

You must ensure that you enter the correct attribute mapping values for your LDAP configuration, to enable API Connect to access the LDAP database. Note that a writable LDAP user registry cannot be used to authenticate Cloud Manager and API Manager users.

10. Click Create.

Your new LDAP registry is shown in the list of User Registries on the Resources page.

## What to do next

To make the LDAP registry available for user authentication in the Cloud Manager and the API Manager, you must set it as active in the Settings > User Registries section. See [Selecting user registries for Cloud Manager and API Manager](#) for more information.

If you want to make the LDAP registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. In the API Manager UI, click Manage followed by the relevant Catalog, and then click Settings > Onboarding. In the Catalog User Registries section, click Edit, select the user registry, and click Save. For more information, see [Creating and configuring Catalogs](#).

If you want to use the LDAP user registry to secure APIs, see the following information:

- To use for basic authentication in the security definition for an API, see [Creating a basic authentication security definition](#).
- To use for authentication in the User Security configuration for a native OAuth provider, see [Configuring user security for a native OAuth provider](#).
- [Using the CLI to configure a shared LDAP user registry](#)  
You can use the developer toolkit CLI to configure an LDAP user registry to provide user authentication for the Cloud Manager, the API Manager, and the Developer Portal. APIs can also be secured with an LDAP user registry.

## Using the CLI to configure a shared LDAP user registry

You can use the developer toolkit CLI to configure an LDAP user registry to provide user authentication for the Cloud Manager, the API Manager, and the Developer Portal. APIs can also be secured with an LDAP user registry.

### Before you begin

---

To configure an LDAP user registry as a resource in the Cloud Manager, the LDAP directory must be created and available to use with your API Connect ecosystem.

LDAP registries can be used to secure APIs, or for authenticating users to the Cloud Manager, the API Manager, and the Developer Portal.

Important: If you are using an LDAP registry to secure APIs, the STARTTLS protocol, which upgrades an insecure protocol to a secure one by applying TLS security, is not supported.

One of the following roles is required to configure an LDAP user registry:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

### About this task

---

You can create an LDAP user registry that is specific to a provider organization, or one that can be shared and available to all of the provider organizations in your API Connect environment. An organization-specific LDAP user registry can be used for onboarding and authenticating Developer Portal users, while a shared LDAP user registry can be used for authenticating Cloud Manager, API Manager, and Developer Portal users.

This topic describes how to configure a shared LDAP user registry. If you want to create an organization-specific registry, see [Using the CLI to create an organization-specific LDAP user registry](#) for more information. Note also that the visibility of a user registry is set to **shared** by default. However, you can change the visibility setting to make the registry private, or visible only to specific provider organizations. For more information, see [Setting visibility for a user registry](#).

Note:

- If the LDAP user registry is configured as writable (by enabling the `user-managed` property on the registry), you can use the Developer Portal UI for onboarding and authenticating new Developer Portal users, as well as those users that already exist in the LDAP database. A writable LDAP user registry cannot be used to authenticate Cloud Manager and API Manager users.
- You can also create LDAP user registries by using the Cloud Manager UI (see [Configuring an LDAP user registry in the Cloud Manager](#)), and by using the API Connect REST APIs (see the [API Connect REST API documentation](#)).
- If you are using the DataPower® API Gateway, LDAP group authentication is not supported.
- You can map external LDAP groups to API Connect user roles to enable more control of user authorization by using the developer toolkit CLI. The following instructions explain how to set the `external_group_mapping_enabled` configuration on your LDAP user registry resource. For information about how to set external role mapping on your API Connect user roles, see [Configuring LDAP group mappings on Cloud Manager user roles](#).

You configure an LDAP user registry by first defining the registry details in a configuration file. You then use a developer toolkit CLI command to create the registry, passing the configuration file as a parameter. Finally, to make the registry available for user authentication, you need to configure the registry in the management server, or in the appropriate Catalog, or both, depending on your requirements. To secure APIs with an LDAP registry, you must configure security definitions. You can use the following instructions to create a writable or a read-only LDAP user registry.

For general information about authenticating with LDAP, see [LDAP authentication](#).

### Logging in to the management server CLI

---

Before you can define the LDAP user registry configuration, you must log in to your management server from the developer toolkit CLI as a member of the cloud administration organization. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm admin/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.

For full details of the login command, see [Logging in to a management server](#).

For more information about how to use the CLI, see [Installing the toolkit](#), and [Overview of the command-line tool](#).

## Defining your LDAP configuration

You define the configuration of your LDAP user registry in an `ldap_config_file.yaml` file, as shown in the following example. Note that the actual contents of your YAML file will vary depending on the authentication method of your LDAP server, and this is explained in the following tables.

```
name: registry_name
title: "display_title"
integration_url: LDAP_integration_url
user_managed: true_or_false
user_registry_managed: false
external_group_mapping_enabled: true_or_false
case_sensitive: true_or_false
email_required: true_or_false
email_unique_if_exist: true_or_false
identity_providers:
- name: provider_name
  title: provider_title
endpoint:
  endpoint: "ldap_server_url_and_port"
configuration:
  authentication_method: authentication_method
  authenticated_bind: "true_or_false"
  admin_dn: "admin_dn"
  admin_password: admin_password
  search_dn_base: "search_dn_base"
  search_dn_scope: search_dn_scope
  search_dn_filter_prefix: prefix
  search_dn_filter_suffix: suffix
  attribute_mapping:
    dn: "distinguished_name"
    cn: "common_name"
    sn: "last_name"
    mail: "email_address"
    userPassword: "password"
```

The registry properties that are common to each authentication method are described in the following table:

Property	Description
<code>name</code>	The name of the registry. This name is used in CLI commands.
<code>title</code>	A descriptive name to display in a graphical user interface.
<code>integration_url</code>	The LDAP integration URL in your API Connect configuration. You can determine the LDAP integration URL by using the following CLI command: <code>apic integrations:list --server mgmt_endpoint_url --subcollection user-registry</code>
<code>user_managed</code>	Determines whether your user registry is writable or not. Must be set to <code>true</code> for writable LDAP. You can change this setting to <code>false</code> if you don't want the registry to be writable; see the Switching your LDAP registry between writable and read-only section at the end of this topic for details. Note that a writable LDAP user registry cannot be used to authenticate Cloud Manager and API Manager users.
<code>user_registry_managed</code>	Must be set to <code>false</code> for LDAP. Determines whether API Connect manages your user registry. Only LUR registries are managed by API Connect.
<code>external_group_mapping_enabled</code>	Determines whether your user registry supports LDAP group mapping. Valid values are: <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul> The default value is <code>false</code> .
<code>case_sensitive</code>	Determines whether your user registry is case-sensitive. Valid values are: <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul> To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend LDAP server: <ul style="list-style-type: none"> <li><b>Only</b> set <code>case_sensitive</code> to <code>true</code> if your backend LDAP server supports case-sensitivity.</li> <li>Set <code>case_sensitive</code> to <code>false</code> if your backend LDAP server does not support case-sensitivity.</li> </ul> Note: After at least one user has been onboarded into the registry, you cannot change this setting.

Property	Description
<b>email_required</b>	Determines whether an email address is required as part of the user onboarding process. Valid values are: <ul style="list-style-type: none"> <li>• <b>true</b></li> <li>• <b>false</b></li> </ul> <p>If set to <b>true</b>, the source identity provider must supply the email address as part of the authentication process during onboarding.  Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.</p>
<b>email_unique_if_exist</b>	Determines whether email addresses must be unique within the user registry. Valid values are: <ul style="list-style-type: none"> <li>• <b>true</b></li> <li>• <b>false</b></li> </ul> <p>Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.</p>
<b>identity_providers</b>	An array containing the details of your LDAP server, where: <ul style="list-style-type: none"> <li>• <b>name</b> - is the name of the LDAP server and is the name that is used in CLI commands</li> <li>• <b>title</b> - is the display name of the LDAP server</li> </ul>
<b>endpoint</b>	The endpoint of your LDAP server, made up of the url and port, for example: <b>"ldap://server.com:389"</b>
<b>tls_profile</b>	Optionally set the TLS Client Profile that the LDAP server requires.
<b>protocol_version</b>	Optionally set the version number for the LDAP protocol that you are using. Valid values are: <ul style="list-style-type: none"> <li>• 2</li> <li>• 3</li> </ul> <p>Defaults to 3 if not explicitly set.</p>

The properties in the configuration section will vary depending on the selected authentication method. The three authentication methods are:

- **compose\_dn** - Set this format if you can compose the user LDAP Distinguished Name (DN) from the user name. For example, **uid=<username>,ou=People,dc=company,dc=com** is a DN format that can be composed from the user name. If you are unsure whether Compose (DN) is the correct option, contact your LDAP administrator. If you are using an LDAP registry to secure APIs, **compose\_dn** is not supported with the DataPower API Gateway.
- **compose\_upn** - Set this format if your LDAP directory supports binding with User Principal Names such as **john@acme.com**. The Microsoft Active Directory is an example of an LDAP directory that supports Compose UPN authentication. If you are unsure whether your LDAP directory supports binding with UPNs, contact your LDAP administrator.  
Note: The Admin Bind DN and Admin Bind Password are not used with this authentication method.
- **search\_dn** - Select this format if you cannot compose the user LDAP Distinguished Name from the user name; for example, if the base DN of the users are different. This format might require an administrator DN and password to search for users in the LDAP directory. If your LDAP directory permits anonymous binds, you can omit the admin DN and password. If you are unsure if your LDAP directory permits anonymous binds, contact your LDAP administrator.

For authentication method **compose\_dn**, set the following configuration properties:

Properties	Description
<b>authentication_method</b>	<b>compose_dn</b>
<b>authenticated_bind</b>	The bind method. Valid values are: <ul style="list-style-type: none"> <li>• <b>"true"</b> - authenticated bind</li> <li>• <b>"false"</b> - anonymous bind</li> </ul> <p>If specific permissions are not needed to search the registry, select <b>"false"</b>. If specific permissions are necessary, select <b>"true"</b>.</p>
<b>admin_dn</b>	If <b>authenticated_bind</b> is set to <b>"true"</b> , enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example: <b>"cn=admin,dc=company,dc=com"</b>
<b>admin_password</b>	If <b>authenticated_bind</b> is set to <b>"true"</b> , enter the user password for the <b>admin_dn</b> .
<b>search_dn_base</b>	Optionally set a base DN, for example: <b>"dc=company,dc=com"</b>
<b>bind_prefix</b>	Set the prefix to the DN, for example: <b>(uid=</b>
<b>bind_suffix</b>	Set the suffix to the DN, for example: <b>)</b>

Properties	Description
<b>attribute_mapping</b>	<p>If <b>user_managed</b> is set to <b>true</b>, provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows:</p> <pre>ldap_registry_attribute_name: "apic_ldap_attribute_value"</pre> <p>Where:</p> <ul style="list-style-type: none"> <li><code>ldap_registry_attribute_name</code> - is the name of the source LDAP attribute</li> <li><code>apic_ldap_attribute_value</code> - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [ ] with the value that the user supplies when signing up.</li> </ul> <p>The user profile properties that API Connect requires during user registration are <b>username</b>, <b>first_name</b>, <b>last_name</b>, <b>email</b>, and <b>password</b>. The following extract shows an example of an attribute mapping:</p> <pre>attribute_mapping: dn: "uid=[username],ou=users,dc=company,dc=com" cn: "[first_name] [last_name]" sn: "[last_name]" mail: "[email]" userPassword: "[password]"</pre>

For authentication method **compose\_upn**, set the following configuration properties:

Properties	Description
<b>authentication_method</b>	<b>compose_upn</b>
<b>authenticated_bind</b>	<p>The bind method. Valid values are:</p> <ul style="list-style-type: none"> <li><b>"true"</b> - authenticated bind</li> <li><b>"false"</b> - anonymous bind</li> </ul> <p>If specific permissions are not needed to search the registry, select <b>"false"</b>. If specific permissions are necessary, select <b>"true"</b>.</p>
<b>admin_dn</b>	<p>If <b>authenticated_bind</b> is set to <b>"true"</b>, enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example:</p> <pre>"cn=admin,dc=company,dc=com"</pre>
<b>admin_password</b>	If <b>authenticated_bind</b> is set to <b>"true"</b> , enter the user password for the <b>admin_dn</b> .
<b>bind_suffix</b>	<p>Enter the domain part of the user principal name. For example:</p> <pre>@acme.com</pre>
<b>attribute_mapping</b>	<p>If <b>user_managed</b> is set to <b>true</b>, provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows:</p> <pre>ldap_registry_attribute_name: "apic_ldap_attribute_value"</pre> <p>Where:</p> <ul style="list-style-type: none"> <li><code>ldap_registry_attribute_name</code> - is the name of the source LDAP attribute</li> <li><code>apic_ldap_attribute_value</code> - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [ ] with the value that the user supplies when signing up.</li> </ul> <p>The user profile properties that API Connect requires during user registration are <b>username</b>, <b>first_name</b>, <b>last_name</b>, <b>email</b>, and <b>password</b>. The following extract shows an example of an attribute mapping:</p> <pre>attribute_mapping: dn: "uid=[username],ou=users,dc=company,dc=com" cn: "[first_name] [last_name]" sn: "[last_name]" mail: "[email]" userPassword: "[password]"</pre>

For authentication method **search\_dn**, set the following configuration properties:

Property	Description
<b>authentication_method</b>	<b>search_dn</b>
<b>authenticated_bind</b>	<p>The bind method. Valid values are:</p> <ul style="list-style-type: none"> <li><b>"true"</b> - authenticated bind</li> <li><b>"false"</b> - anonymous bind</li> </ul> <p>If specific permissions are not needed to search the registry, select <b>"false"</b>. If specific permissions are necessary, select <b>"true"</b>.</p>
<b>admin_dn</b>	<p>If <b>authenticated_bind</b> is set to <b>"true"</b>, enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example:</p> <pre>"cn=admin,dc=company,dc=com"</pre>
<b>admin_password</b>	If <b>authenticated_bind</b> is set to <b>"true"</b> , enter the user password for the <b>admin_dn</b> .
<b>search_dn_base</b>	<p>Optionally set a base DN, for example:</p> <pre>"dc=company,dc=com"</pre>
<b>search_dn_scope</b>	<p>Optionally set the search DN scope. The scope determines which part of the directory information tree is examined. Possible values are:</p> <ul style="list-style-type: none"> <li><b>base</b></li> <li><b>one</b></li> <li><b>sub</b></li> </ul>

Property	Description
<code>search_dn_filter_prefix</code>	Set the prefix to the DN, for example: <code>(uid=</code>
<code>search_dn_filter_suffix</code>	Set the suffix to the DN, for example: <code>)</code>
<code>attribute_mapping</code>	<p>If <code>user_managed</code> is set to <code>true</code>, provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows:</p> <pre>ldap_registry_attribute_name: "apic_ldap_attribute_value"</pre> <p>Where:</p> <ul style="list-style-type: none"> <li><code>ldap_registry_attribute_name</code> - is the name of the source LDAP attribute</li> <li><code>apic_ldap_attribute_value</code> - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in <code>[ ]</code> with the value that the user supplies when signing up.</li> </ul> <p>The user profile properties that API Connect requires during user registration are <code>username</code>, <code>first_name</code>, <code>last_name</code>, <code>email</code>, and <code>password</code>. The following extract shows an example of an attribute mapping:</p> <pre>attribute_mapping: dn: "uid=[username],ou=users,dc=company,dc=com" cn: "[first_name] [last_name]" sn: "[last_name]" mail: "[email]" userPassword: "[password]"</pre>

Save your `ldap_config_file.yaml` so it can be accessed by the `user-registries:create` command in the following section. See the [Example](#) section for an example configuration file.

## Creating your LDAP user registry

To create your shared LDAP user registry, run the following CLI command:

```
apic user-registries:create --server mgmt_endpoint_url --org admin ldap_config_file.yaml
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `--org admin` means that the registry will be created in the admin organization, which is required for a user registry to be shared.
- `ldap_config_file` is the name of the YAML file that defines the configuration of your LDAP user registry.

On completion of the registry creation, the command displays the following summary details:

```
registry_name registry_url
```

The `registry_name` is derived from the `name` property in the configuration YAML file. The `registry_url` is the URL with which the registry resource can be accessed. Your shared LDAP user registry is now created; see the following sections for instructions on how to make the registry available to users.

## Configuring your LDAP registry for Cloud Manager or API Manager login

If you want to make your LDAP registry available for authenticating Cloud Manager and API Manager users, you must configure it on the management server.

- Determine the URL of your LDAP user registry by using the following command (or you can copy and paste from the summary of the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org admin
```

- Determine what the current user registries are, because you will need to confirm these as well as add your new LDAP registry:

```
apic user-registry-settings:get --server mgmt_endpoint_url --output -
```

This command outputs a list of all the current user registries in your environment, similar to the following example:

```
type: user_registry_setting
api_version: 2.0.0
name: user-registry-setting
admin_user_registry_default_url: >-
  https://server.com/api/user-registries/xxxxx/xxxxx-1234
admin_user_registry_urls:
- >-
  https://server.com/api/user-registries/xxxxx/xxxxx-1234
provider_user_registry_default_url: >-
  https://https://server.com/api/user-registries/xxxxx/xxxxx-5678
provider_user_registry_urls:
- >-
  https://https://server.com/api/user-registries/xxxxx/xxxxx-5678
created_at: '2019-09-30T12:22:19.467Z'
updated_at: '2019-10-17T10:05:37.867Z'
url: 'https://server.com/api/cloud/settings/user-registries'
```

- Enter the following command to update your user registries (the terminating hyphen character means that the command takes input from the command line):

```
apic user-registry-settings:update --server mgmt_endpoint_url -
```

The following message is output:

```
Reading USER_REGISTRY_SETTING_FILE arg from stdin
```

- If you want to make your LDAP registry available for authenticating Cloud Manager users, enter the following data, followed by a new line:

```
admin_user_registry_urls:
- >-
  current_admin_user_registry_urls
- new_ldap_user_registry_url
```

where:

- `current_admin_user_registry_urls` are the current admin user registry URLs, as listed in Step 2 in the `admin_user_registry_urls` section. Note that you must include all of the user registry URLs that you want to remain, listing each URL on a new line.
  - `new_ldap_user_registry_url` is the URL of your new LDAP user registry, as determined in Step 1.
5. If you want to make your LDAP registry available for authenticating API Manager users, enter the following data, followed by a new line:

```
provider_user_registry_urls:
- >-
  current_provider_user_registry_urls
- new_ldap_user_registry_url
```

where:

- `current_provider_user_registry_urls` are the current provider organization user registry URLs, as listed in Step 2 in the `provider_user_registry_urls` section. Note that you must include all of the user registry URLs that you want to remain, listing each URL on a new line.
  - `new_ldap_user_registry_url` is the URL of your new LDAP user registry, as determined in Step 1.
6. Press **CTRL D** to terminate the input. A confirmation message is output, for example:

```
user-registry-setting https://server.com/api/cloud/settings/user-registries
```

where `server.com` is your management server endpoint.

## Configuring your LDAP registry in a Catalog

If you want to make your LDAP registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Complete the following steps:

1. Determine the URL of your LDAP user registry by using the following LDAP command (or you can copy and paste from the summary of the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org admin
```

2. Log in to the management server as a member of a provider organization by entering the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

For full details of the `apic login` command, see [Logging in to a management server](#).

3. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic configured-catalog-user-registries:create --server mgmt_endpoint_url --org organization_name --catalog catalog_name -
```

where `catalog_name` is the value of the `name` property of the required Catalog. The command returns:

```
Reading CONFIGURED_CATALOG_USER_REGISTRY_FILE arg from stdin
```

4. Enter the following data, followed by a new line:

```
user_registry_url: ldap_registry_url
```

where `ldap_registry_url` is the URL of your LDAP registry, obtained in step 1.

5. Press **CTRL D** to terminate the input.

## Switching your LDAP registry between writable and read-only

After an LDAP user registry has been created, it can be switched between writable and read-only by updating the `user_managed` property in the registry configuration. Complete the following steps.

1. Determine the name or ID of the LDAP user registry that you want to update, by running the following command (or you can use the summary from the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org admin
```

The command returns a list of all the user registries on that server, shown by name followed by their registry URL. The registry ID is located at the end of the URL, for example `https://company.com/api/user-registries/x-x-x-x-x/registry_id`.

2. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic user-registries:update --server mgmt_endpoint_url --org admin registry_name_or_id -
```

where `registry_name_or_id` is the name or ID of the LDAP user registry that you want to update (as determined in the previous step). The command returns:

```
Reading USER_REGISTRY_FILE arg from stdin
```

3. Enter the following data, followed by a new line:

```
user_managed: true_or_false
```

where `true` makes the registry writable, and `false` makes the registry read-only.

4. Press **CTRL D** to terminate the input.

Note that if you are changing your registry from read-only to writable, you must also set the `attribute_mapping` configuration, as described in the previous registry property tables.

## Using an LDAP user registry to secure APIs

If you want to use the LDAP user registry to secure APIs, see the following information:

- To use for basic authentication in the security definition for an API, see [Creating a basic authentication security definition](#).
- To use for authentication in the User Security configuration for a native OAuth provider, see [Configuring user security for a native OAuth provider](#).

For details of all the `apic user-registries` and `apic configured-catalog-user-registries` commands, see [apic user-registries](#) and [apic configured-catalog-user-registries](#).

## Example

The following example shows a configuration file that uses the Search DN authentication method for setting up writable LDAP:

```
name: sdn-ldap
title: "SDN LDAP User Registry"
integration_url: https://mycompany.com/api/cloud/integrations/user-registry/xxx-xxx-xxx
user_managed: true
user_registry_managed: false
case_sensitive: false
identity_providers:
- name: ldap
  title: "SDN LDAP Identity Provider"
endpoint:
  endpoint: "ldap://mycompany.com:389"
configuration:
  authentication_method: search_dn
  authenticated_bind: "true"
  admin_dn: "cn=admin,dc=company,dc=com"
  admin_password: xxxx
  search_dn_base: "dc=company,dc=com"
  search_dn_scope: sub
  search_dn_filter_prefix: (uid=
  search_dn_filter_suffix: )
  attribute_mapping:
    dn: "uid=[username],ou=users,dc=company,dc=com"
    cn: "[first_name] [last_name]"
    sn: "[last_name]"
    mail: "[email]"
    userPassword: "[password]"
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring a Local User Registry

A Local User Registry (LUR) can be configured to provide user authentication for both Cloud Manager and API Manager.

### About this task

Local User Registries (LURs) are the default user registries included in API Connect. LURs are local databases included with API Connect. Two default LURs are installed and configured during installation of API Connect. They cannot be deleted. The default Admin user account is stored in the Provider LUR.

You can create and configure a new LUR. After you create it, you must set it as active in Settings > User Registries. See [Selecting user registries for Cloud Manager and API Manager](#).

One of the following roles is required to configure user registries:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

## Procedure

Follow these steps to configure a new LUR:

1. In the Cloud Manager, click .
2. Click Create in the User Registries section.  
Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

3. Select Local User Registry as the type for the user registry and enter the following information:

Field	Description
Title (required)	Enter a descriptive name for use on the screen.
Name (required)	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see <a href="#">apic user-registries</a> .
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see <a href="#">Accessing the Cloud Manager user interface</a> , <a href="#">Accessing the API Manager user interface</a> , and <a href="#">Activating your API Manager user account</a> . Note: The Developer Portal uses the <b>Title</b> of the User Registries when rendering them at the login page, rather than the <b>Display Name</b> .
Summary (optional)	Enter a brief description.
Case sensitive	Select this setting if user names are case-sensitive. Note: The Developer Portal does not support case sensitive usernames. Note: After at least one user has been onboarded into the registry, you cannot change this setting.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. For new Local User Registries, this setting is always selected; so if email addresses are contained in the user record, they must be unique. However, for existing Local User Registries this setting can be edited. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

4. Click Save.

## Results

The user registry is saved and is available to be configured for user authentication in Cloud Manager or API Manager by selecting it in Settings > User Registries. See [Selecting user registries for Cloud Manager and API Manager](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring an OIDC user registry

Configure a shared OIDC user registry for user onboarding and authentication when multi-factor authentication (MFA) is required.

You can create an OIDC user registry that is specific to a provider organization, or that is shared and available to all the provider organizations in your API Connect environment. An organization-specific OIDC user registry is used for onboarding and authenticating Developer Portal users, while a shared OIDC user registry can be used for onboarding and authenticating Cloud Manager, API Manager, and Developer Portal users.

This topic describes how to create a shared registry. For information on how to create an organization-specific registry, see [Creating an OIDC user registry](#).

API Connect provides two methods for creating an OIDC user registry in Cloud Manager, as described in the following sections:

- [Using the UI to configure an OIDC user registry](#)
- [Using the CLI to configure an OIDC user registry](#)

## Using the UI to configure an OIDC user registry

Use the Cloud Manager application's user interface to configure a shared OIDC user registry when multi-factor authentication (MFA) is required.

1. In the Cloud Manager navigation pane, click  Resources.
2. Click User Registries.
3. Click Create and select OIDC User Registry.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the

Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

- On the Create OIDC User Registry page, use the fields in each of the following sections to configure the registry settings, and then click Create. Many of the registry settings are preconfigured to simplify the configuration steps.

#### Provider Type

Use the settings in Table 1 to define the provider type.

Table 1. Provider Type settings

Field	Description
Provider Type	OIDC provider. Select one of the following supported OIDC providers: <ul style="list-style-type: none"> <li>Facebook</li> <li>GitHub</li> <li>Google</li> <li>LinkedIn</li> <li>Slack</li> <li>Twitter</li> <li>Windows Live</li> <li>Standard OIDC (default value allows you to specify another provider)</li> </ul>
Title	Provide a descriptive name for display purposes.
Name	Automatically generated. This name is used in CLI commands to reference the registry. For details of the CLI commands for managing user registries, see the <a href="#">apic user-registries</a> topic in the Command Line tool reference section of this documentation.
Summary	Provide a brief description of the new registry.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

#### Provider Endpoint

Automatically generated for most supported providers. In the Authorization Endpoint field, type the URL of the provider's authorization endpoint.

#### Token Endpoint

Fill in the settings as described in Table 2.

Table 2. Token Endpoint settings

Field	Description
URL	Preconfigured for most of the supported OIDC providers. Type the URL of the provider's token endpoint.
TLS	Select the TLS Client Profile for the token endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

#### Userinfo Endpoint

Fill in the settings as described in Table 3.

Table 3. Userinfo Endpoint settings

Field	Description
URL	Preconfigured for most of the supported OIDC providers. Type the URL of the provider's userinfo endpoint.
TLS	Select the TLS Client Profile for the userinfo endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

#### JWKS Endpoint

Fill in the settings as described in Table 4.

Table 4. JWKS Endpoint settings

Field	Description
URL	Type the URL of the read-only endpoint that contains the public keys' information in JWKS format.
TLS	Select the TLS Client Profile for the userinfo endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

#### Logout

Fill in the settings as described in Table 5.

Table 5. Logout

Field	Description
Logout redirect	Optionally, give a logout redirect URL, allowing APIC to initiate an https 302 redirect to the configured endpoint. Note: When the Developer Portal uses this feature, it does not retain control afterwards. Instead, the content is presented from the redirected endpoint.

#### Client Information

Fill in the settings as described in Table 6.

Table 6. Client Information settings

Field	Description
Client ID	Provide the client ID of the application that is registered with the selected OIDC provider.
Client Secret	Provide the client secret of the application that is registered with the selected OIDC provider.
Response Type	Preconfigured for most of the supported OIDC providers. Specify the data type of the response that will be received from the OIDC provider.
Scopes	Preconfigured for most of the supported OIDC providers. Specify the access scope for the OIDC provider.
Client Authentication Method	Preconfigured for most of the supported OIDC providers. Select the authentication method to be used with the OIDC provider. Options are: <ul style="list-style-type: none"> <li>Http basic authentication schema</li> <li>Data encoded form body</li> </ul>

#### Additional Support

Optional. Select the additional security parameters described in Table 7.

Table 7. Additional security options

Security parameter	Description
--------------------	-------------

Security parameter	Description
NONCE	Enable the NONCE extension to prevent compromised requests from being used again (replayed).
Proof Key for Code Exchange (PKCE)	Enable the PKCE extension to allow public clients to mitigate the threat of having the authorization code intercepted.

#### Advanced Features

Optional. Select the advanced features described in Table 8.

Table 8. Advanced features

Feature	Description
Auto onboard	Allow users to execute calls to APIs without logging in first, provided they present a valid token issued by the OIDC provider.
Always use the userinfo endpoint	Configures the OIDC user registry to always fetch user data from the userinfo endpoint, if populated.
Use Portal as Endpoint for external OIDC provider traffic	When authenticating users, redirect the external OIDC provider to communicate with the Developer Portal instead of API Manager.
Return third-party access token	Include the third-party OIDC access token in the response. Note: Enable this setting for debugging purposes only. This setting is not recommended for use in a production environment. When this setting is enabled, the token size will increase when a request is made to API Connect using the token. The larger token size might exceed the HTTP protocol limit, resulting in an ERR_HTTP2_PROTOCOL_ERROR or ERR_CONNECTION_CLOSED error.
Return third-party id_token	Include the third-party OIDC id_token in the response. Note: Enable this setting for debugging purposes only. This setting is not recommended for use in a production environment. When this setting is enabled, the token size will increase when a request is made to API Connect using the token. The larger token size might exceed the HTTP protocol limit, resulting in an ERR_HTTP2_PROTOCOL_ERROR or ERR_CONNECTION_CLOSED error.
Token Relay	Allow <code>access_token/refresh_token</code> to send in 302 redirect for logout
Userinfo POST	If supported by your OIDC provider, by using HTTP POST method when contacting userinfo endpoint. Note: Not all OIDC providers support POST. Ensure that your OIDC provider supports this before you enable the feature.

#### User Mapping

Fill in the settings as described in Table 9.

Note:

The User Mapping fields are preconfigured for most of the supported OIDC providers to minimize potential errors; use care when changing the settings. For the Standard OIDC option, contact your OIDC provider to obtain the details of the fields.

Table 9. User mapping settings

Field	Description
Username	The name of the field in the response token that contains the user's user name. Note: The username field must be unique for this OIDC registry, because it identifies the user in the system and cannot be changed.
Email	The name of the field in the response token that contains the user's email address.
First name	The name of the field in the response token that contains the user's given name.
Last name	The name of the field in the response token that contains the user's surname.

#### Redirect URI

The Redirect URI section lists the endpoints to which the OIDC authorization server will redirect the authorization code. There is one endpoint for each API Connect organization type: Cloud administration, Provider organization, and Consumer organization. The redirect endpoint is required when a user registers their application with the OIDC provider. For example, if this OIDC user registry is used by a provider organization, the user must register the provider organization's redirect endpoint with the OIDC provider. These read-only fields are provided for you to copy the endpoint values as required.

### Enabling the OIDC user registry

Complete the following steps to enable the new user registry for Cloud Manager, API Manager, or both.

1. On the navigation pane, click  Settings.
2. Click User Registries, > Edit.
3. Click Edit in the section that corresponds to the application for which you are enabling the new user registry.
4. Select the new OIDC user registry.
5. When you have finished enabling the registry, click Save.

## Using the CLI to configure an OIDC user registry

Use the developer toolkit CLI to configure a shared OIDC user registry when multi-factor authentication (MFA) is required.

You configure an OIDC user registry by first defining the registry details in a configuration file. You then use a CLI command to create the registry, passing the configuration file as parameter. To make the registry available to the Developer Portal, you must enable the registry in the associated Catalog.

Note:

- An OIDC registry, in common with a Local User Registry, cannot be used to secure APIs on the gateway.
- Because the interaction with the third party OIDC provider is handled by the Management server, the Management server is the application from the point of view of the third party OIDC provider. Your OIDC redirection endpoint, which is used by authorization server to send the token to the Management server, must be accessible to the OIDC provider through your firewall. When you register your application with the third party OIDC provider, you are required to supply the associated OIDC redirect URI, `https://consumer.mycompany.com/consumer-api/oauth2/redirect` for example. However, this information is not available until you have created your OIDC user registry in API Connect. You must therefore first register your application without this information, then update it later, as detailed in the instructions on this page.

### Logging in to the Management server

Before you can create an OIDC user registry, you must log in to your management server from the CLI. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm admin/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`. For full details of the `apic login` command, see [Logging in to a management server](#).

## Defining your OIDC registry configuration

You define the configuration of your OIDC user registry in a YAML file. As a minimum, the YAML file must have the following content:

```
title: registry_title
integration_url: oidc_integration_url
case_sensitive: case_sensitivity_setting
email_required: true_or_false
email_unique_if_exist: true_or_false
configuration:
  client_id: 'app_client_id'
  client_secret: 'my-client-secret'
  provider_type: oidc_provider_type
```

where:

- `registry_title` is your chosen descriptive title for the user registry.
- `oidc_integration_url` is the OIDC integration URL in your API Connect configuration. You can determine the OIDC integration URL by using the following CLI command:

```
apic integrations:list --server mgmt_endpoint_url --subcollection user-registry
```

- `case_sensitivity_setting` determines whether your user registry is case-sensitive. Valid values are:
  - `true`
  - `false`

To ensure proper handling of user name capitalization, you **must** ensure that your case-sensitivity setting here matches the setting on the backend OIDC provider:

- **Only** set `case_sensitive` to `true` if the backend OIDC provider supports case-sensitivity.
- Set `case_sensitive` to `false` if the backend OIDC provider does not support case-sensitivity.

Note: After at least one user has been onboarded into the registry, you cannot change this setting.

- `email_required` determines whether an email address is required as part of the user onboarding process. Valid values are:
  - `true`
  - `false`

If set to `true`, the source identity provider must supply the email address as part of the authentication process during onboarding.

Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.

- `email_unique_if_exist` determines whether email addresses must be unique within the user registry. Valid values are:
  - `true`
  - `false`

Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

- `app_client_id` is the client ID of the application that is registered with the OIDC server, and must be in string format.
- `my-client-secret` is the client secret of the application that is registered with the OIDC server, and must be in string format.
- `oidc_provider_type` is the type of OIDC provider; specify one of the following values:

- `facebook`
- `github`
- `google`
- `linkedin`
- `slack`
- `twitter`
- `windows_live`
- `standard`

Use the `standard` provider type for any OIDC provider that is compliant with the OIDC standard.

Note: If the provider type is `standard`, you must include the following additional properties in the `configuration` section of your YAML file:

```
authorization_endpoint: 'oidc_auth_endpoint'
token_endpoint:
  endpoint: 'oidc_token_endpoint'
```

where:

- `oidc_auth_endpoint` is the authorization endpoint on the OIDC server, and must be in string format.
- `oidc_token_endpoint` is the token endpoint on the OIDC server, and must be in string format.

## Default OIDC configurations

For each OIDC provider type, API Connect assumes a default configuration, but you can override the default configuration properties in your YAML file. The default configurations are as follows:

- Facebook

```
authorization_endpoint: 'https://www.facebook.com/v3.1/dialog/oauth'
token_endpoint:
  endpoint: 'https://graph.facebook.com/v3.1/oauth/access_token'
userinfo_endpoint:
  endpoint: 'https://graph.facebook.com/me'
scope: email public_profile
field_mapping:
  username: email
  email: email
  last_name: last_name
  first_name: first_name
```

- Github

```
authorization_endpoint: 'https://github.com/login/oauth/authorize'
token_endpoint:
  endpoint: 'https://github.com/login/oauth/access_token'
userinfo_endpoint:
  endpoint: 'https://api.github.com/user'
scope: 'read:user user:email'
field_mapping:
  username: login
  email: email
  last_name: name
  first_name: name
```

- Google

```
authorization_endpoint: 'https://accounts.google.com/o/oauth2/v2/auth'
token_endpoint:
  endpoint: 'https://www.googleapis.com/oauth2/v4/token'
scope: openid profile email
field_mapping:
  username: email
  email: email
  last_name: family_name
  first_name: given_name
```

- LinkedIn

```
authorization_endpoint: 'https://www.linkedin.com/oauth/v2/authorization'
token_endpoint:
  endpoint: 'https://www.linkedin.com/oauth/v2/accessToken'
userinfo_endpoint:
  endpoint: 'https://api.linkedin.com/v1/people/~:(id,first-name,last-name,picture-url,public-profile-url,email-address)?format=json'
scope: r_basicprofile r_emailaddress
field_mapping:
  username: emailAddress
  email: emailAddress
  last_name: lastName
  first_name: firstName
credential_location: form_body
```

- Slack

```
authorization_endpoint: 'https://slack.com/oauth/authorize'
token_endpoint:
  endpoint: 'https://slack.com/api/oauth.access'
userinfo_endpoint:
  endpoint: 'https://slack.com/api/users.identity'
scope: identity.basic identity.email
field_mapping:
  username: user.email
  email: user.email
  last_name: user.name
  first_name: user.name
```

- Twitter

```
request_endpoint: https://api.twitter.com/oauth/request_token'
authorization_endpoint: https://api.twitter.com/oauth/authenticate'
token_endpoint:
  endpoint: 'https://api.twitter.com/oauth/access_token'
userinfo_endpoint:
  endpoint: 'https://api.twitter.com/1.1/account/verify_credentials.json'
oauth_signature_method: 'HMAC-SHA1'
field_mapping:
  email: email
  first_name: name
  last_name: name
  username: screen_name
```

- Windows Live

```
authorization_endpoint: 'https://login.microsoftonline.com/common/oauth2/v2.0/authorize'
token_endpoint:
  endpoint: 'https://login.microsoftonline.com/common/oauth2/v2.0/token'
scope: openid offline_access profile email
field_mapping:
  email: email
  username: preferred_username
  first_name: name
  last_name: name
```

- Standard

```
response_type: code
scope: openid
field mapping:
  username: sub
  email: email
  last_name: family_name
  first_name: given_name
credential_location: auth_header
```

Although this is the default configuration for the `standard` provider type, you should contact your OIDC provider to obtain the details of the fields that you need to define.

## Creating your OIDC user registry

To create your OIDC user registry, use the following CLI command:

```
apic user-registries:create --server mgmt_endpoint_url --org admin oidc_config_file
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `organization_name` is the value of the `name` property of your provider organization.
- `oidc_config_file` is the name of the YAML file that defines the configuration of your OIDC user registry.

On completion of the registry creation, the command displays the following summary details:

```
registry_name registry_url
```

By default, the `registry_name` is derived from the `title` property in the configuration YAML file but you can override this by including a `name` property in the file. The `registry_url` is an internal URL that API Connect assigns to the registry.

After you have created your OIDC user registry, you must update your application registration with the third party OIDC provider to include the OIDC redirect URI; you can obtain this information by using the following command, which displays the details of the registry in the command window:

```
apic user-registries:get --server mgmt_endpoint_url --org organization_name registry_name --output -
```

The required `oidc_redirect_uri` value is in the `consumer:` section; for example:

```
consumer:
  oidc_redirect_uri: https://consumer.mycompany.com/consumer-api/oauth2/redirect
```

## Enabling your OIDC registry in a Catalog

If you want to make your OIDC registry available for onboarding and authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Complete the following steps:

1. Determine the URL of your OIDC user registry by using the following command:

```
apic user-registries:list --server mgmt_endpoint_url --org admin
```

2. Log in to the Management server as a member of a provider organization; enter the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

For full details of the `apic login` command, see [Logging in to a management server](#).

3. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic configured-catalog-user-registries:create --server mgmt_endpoint_url --org organization_name --catalog catalog_name -
```

where `catalog_name` is the value of the `name` property of the required Catalog. The command returns

```
Reading CONFIGURED_CATALOG_USER_REGISTRY_FILE arg from stdin
```

4. Enter the following data, followed by a new line:

```
user_registry_url: oidc_registry_url
```

where `oidc_registry_url` is the URL of your OIDC registry, obtained in step [1](#).

5. Press **CTRL D** to terminate the input.

For details of all the `apic user-registries` and `apic configured-catalog-user-registries` commands, see [apic user-registries](#) and [apic configured-catalog-user-registries](#).

You can also complete the operations described in this topic by using the API Connect REST APIs; see the [API Connect REST API documentation](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Setting visibility for a user registry

The visibility setting determines which provider organizations can access a resource, for example, user registries.

## Before you begin

---

You must complete the following tasks:

- [Creating an Availability Zone](#)
- [Registering a gateway service](#)

## About this task

---

The user registry visibility setting controls which provider organizations are able to use that registry for authenticating Developer Portal users, or for securing APIs. For details on how to specify the user registries that can be used for authenticating users of the Cloud Manager and API Manager user interfaces, see [Selecting user registries for Cloud Manager and API Manager](#).

## Procedure

---

Follow these steps to set the visibility for the resources (user registries) in your on-premises cloud:

1. In the Cloud Manager, click  Resources.
2. Select User Registries as the resource to view.
3. From the list of user registries, choose Edit visibility from the actions menu next to the name of the user registry you are working with.
4. Select the visibility setting for the user registry. The options are:
  - Private - the user registry is not visible and cannot be used by any provider organization
  - Public - the user registry is visible and can be used by all provider organizations
  - Custom - the user registry is visible only to the provider organizations designated by you
5. For Custom visibility, select the provider organizations that you want to have access to the user registry.
6. Click Make visible to complete the operation.

## Results

---

For Private, the user registry cannot be used by any provider organizations. For Public, the user registry can be used by all provider organizations. For Custom, the user registry can be used by the provider organizations that you designate.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Deleting a user registry

As the Cloud Manager administrator, you can delete user registries.

## About this task

---

Complete the following steps to delete a user registry. All users within the user registry will be deleted. The pre-configured user registries (API Manager Local User Registry and Cloud Manager Local User Registry) may not be deleted. Any user registry marked as the Default in Settings > User Registries also may not be deleted.

One of the following roles is required to delete a user registry:

- Administrator
- Owner

## Procedure

---

1. In the Cloud Manager, click .
2. Select User Registries to see the list of current user registries in your cloud.
3. Choose Delete from the overflow menu that is adjacent to the user registry you want to delete.
4. Optionally, you can delete multiple user registries by marking the checkboxes and selecting Delete Selected User Registries from the overflow menu for the list.
5. Confirm the deletion.

## Results

---

The user registry is deleted and removed from the User Registries list in Cloud Manager. All user accounts contained in the user registry are deleted.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Removing a user from a user registry

As an API Connect user, you can remove yourself from an API Connect user registry. As an administrative user, you can remove other users from an API Connect user registry.

For details on how to remove a user from a user registry, see the following subtopics:

- [Removing yourself from a user registry](#)  
As an API Connect user, you can remove yourself from the API Connect user registry in which you were registered, by using the developer toolkit CLI.
- [Removing another user from a user registry](#)  
You can remove a user from an API Connect user registry by using the developer toolkit CLI.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Removing yourself from a user registry

As an API Connect user, you can remove yourself from the API Connect user registry in which you were registered, by using the developer toolkit CLI.

### Before you begin

You cannot remove yourself from a user registry if you are a member of a provider organization. Before removing yourself from a user registry, ensure that you have been deleted from any provider organizations. For more information, see [Removing a user from an organization](#).

### Procedure

1. Log in to the management server as the user that you want to remove.  
The format of the login command depends on whether you are a user in the Cloud Manager admin organization, or you are a user in a provider organization.

If you are a Cloud Manager admin user, enter the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm admin/identity_provider
```

If you are a provider organization user, enter the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

If you want to log in as a member of the cloud administration organization, or as a member of a provider organization, you can help determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope scope --server mgmt_endpoint_url --fields title,realm
```

where `scope` has the value `admin` or `provider` depending on whether you want to log in as a member of the cloud administration organization, or as a member of a provider organization. The output lists the names and titles of all identity providers, for example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`, and the default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

Note: If the same user registry is used for both the Cloud Manager and API Manager user interfaces, and you have access to both, when you remove yourself from the user registry you will lose access to both user interfaces regardless of which organization you log in to.

2. Remove yourself from the user registry. Enter the following command:

```
apic me:delete --server mgmt_endpoint_url
```

For example:

```
apic me:delete --server platform-api.myserver.com.com
```

The command confirms successful removal by returning the details of the deleted user; for example:

```
user1 [state: enabled] https://platform-api.myserver.com.com/api/user-registries/32830897-1d23-4fac-acf5-0193d0b2c1b5/4438937a-6ad0-4eaa-9163-820888ac6245/users/040adb11-e9a4-4d93-9c2e-62a974da0689
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Removing another user from a user registry

You can remove a user from an API Connect user registry by using the developer toolkit CLI.

## Before you begin

To complete this task, you must have Administrator access to your API Connect cloud, or be the owner of a provider organization, depending on the scope of the user registry.

You cannot remove a user from a user registry if that user is a member of the Cloud Manager admin organization, a provider organization, or a consumer organization, and that user registry is used for the associated login. Before removing a user from a user registry, ensure that they have been deleted from any organizations for which that user registry is used for login. For more information, see [Deleting a member](#) or [Removing a user from an organization](#).

## Procedure

1. Log in to the management server.
  - If the user registry is defined at the cloud administration level, and therefore available to all provider organizations, you must log in as a member of the Cloud Manager admin organization.
  - If the user registry is defined at a provider organization level, and therefore specific to that provider organization, you must log in as the organization owner.For full details of the `apic login` command, see [Logging in to a management server](#).

Note: If the same user registry is used for both the Cloud Manager and API Manager user interfaces, and the user has access to both, when you remove them from the user registry they will lose access to both even though you are logging in to the admin organization.

2. Identify the name of the user registry from which you want to remove the user. Enter the following command:

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

where `organization_name` has the value `admin` if you are logged in as a member of the Cloud Manager admin organization, or is the name of the provider organization if you are logged in as an organization owner.

For example:

```
apic user-registries:list --server platform-api.myserver.com.com --org admin
```

The command returns a list of all user registries, with the registry name displayed first; for example:

```
api-manager-lur https://platform-api.myserver.com.com/api/user-registries/3283e897-1d23-4fac-acf5-0193d0b2c1b5/4438937a-6ad0-4eaa-9163-820888ac6245
cloud-manager-lur https://platform-api.myserver.com.com/api/user-registries/3283e897-1d23-4fac-acf5-0193d0b2c1b5/3adbf524-cd74-4051-99c0-89ce5ffcc9c0
my-ldap https://platform-api.myserver.com.com/api/user-registries/3283e897-1d23-4fac-acf5-0193d0b2c1b5/29eae413-cd74-4051-99c0-89ce5ffcc9c0
```

3. Identify the name of the user, from the required user registry, that you want to remove. Enter the following command:

```
apic users:list --server mgmt_endpoint_url --org organization_name --user-registry user_registry_name
```

For example:

```
apic users:list --server platform-api.myserver.com.com --org admin --user-registry my-ldap
```

The command returns a list of all users in the user registry, with the user name displayed first; for example:

```
user1 [state: enabled] https://platform-api.myserver.com.com/api/user-registries/32830897-1d23-4fac-acf5-0193d0b2c1b5/4438937a-6ad0-4eaa-9163-820888ac6245/users/040adb11-e9a4-4d93-9c2e-62a974da0689
user2 [state: enabled] https://platform-api.myserver.com.com/api/user-registries/32830897-1d23-4fac-acf5-0193d0b2c1b5/4438937a-6ad0-4eaa-9163-820888ac6245/users/12f1aa82-d9f0-4670-99f1-7500d1fb6583
```

4. Remove the required user from the user registry. Enter the following command:

```
apic users:delete user_name --server mgmt_endpoint_url --org organization_name --user-registry user_registry_name
```

For example:

```
apic users:delete user1 --server platform-api.myserver.com.com --org admin --user-registry my-ldap
```

The command confirms successful removal by returning the details of the deleted user; for example:

```
user1 [state: enabled] https://platform-api.myserver.com.com/api/user-registries/32830897-1d23-4fac-acf5-0193d0b2c1b5/4438937a-6ad0-4eaa-9163-820888ac6245/users/040adb11-e9a4-4d93-9c2e-62a974da0689
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## TLS profiles overview

API Connect supports TLS Profiles for securing data transmission over HTTPS.

## Introduction to TLS profiles

Important: API Connect includes several default TLS profiles to help you get started working with the application. The default profiles should not be used in a production environment. It is important to create your own profiles to ensure a secure network.

API Connect may need to transmit data across an untrusted network, for example, when accessing the Gateway, email server, or LDAP server. TLS provides secure network layer transportation of data between two parties.

There are two types of TLS Profiles: a TLS Server Profile and a TLS Client Profile. A TLS Server Profile is used by the Gateway to configure its endpoint for use during API execution. A TLS Client profile is used whenever the system needs to communicate with another endpoint over TLS.

The components of a TLS Profile are:

- TLS Protocol version indicates the versions of the Transport Layer Security Protocol required for the profile. TLS Protocol versions 1.0, 1.1, 1.2, and 1.3 are supported.
- Optional support for mutual authentication and renegotiation for Server Profiles.
- Optional support for weak server connections and Server Name Indication for Client Profiles.
- Cipher suites to secure HTTPs communication within the API Connect ecosystem.
- Keystores containing public and private key pairs.
- Truststores containing public keys for trusted third party services, such as Google, Facebook, or Verisign.
- [Viewing TLS Profiles, Keystores, and Truststores](#)  
The current list of TLS profiles, Keystores, and Truststores can be viewed on the main TLS screen.
- [Creating a TLS Server Profile](#)  
In Cloud Manager, you can configure the profile that is used on the gateway when it acts as a TLS server.
- [Creating a TLS Client Profile](#)  
In Cloud Manager, TLS profiles are configured as a Resource to provide secure transmission of data over HTTPs.
- [Creating a Keystore](#)  
Each keystore contain a matched pair of a public certificates and its private keys. These artifacts provide identity information during a TLS handshake.
- [Creating a Truststore](#)  
A truststore contains a list of certificates. The certificates are used to verify the peer during a TLS handshake.
- [Viewing certificate details and adding certificates to a keystore or truststore](#)  
You can view details for the certificates in an existing keystore or truststore and add additional certificates.
- [Generating a self-signed certificate using OpenSSL](#)  
OpenSSL is an open source implementation of the SSL and TLS protocols. It provides the transport layer security over the normal communications layer, allowing it to be intertwined with many network applications and services.
- [Generating a PKCS#12 file for Certificate Authority](#)  
PKCS#12 (P12) files define an archive file format for storing cryptographic objects as a single file. API Connect supports the P12 file format for uploading a keystore and truststore. The keystore should contain both a private and public key along with intermediate CA certificates.
- [Binding a TLS server profile to a gateway service](#)  
You can bind the SSL certificate of a TLS profile to a gateway service to establish an HTTPS binding. This enables you to access the service by using the HTTPS communication protocol.
- [Updating the PKCS#12 certificate for a TLS server profile](#)  
A server certificate bound to a gateway service can be invalidated if the host name in the digital certificate of the server does not match the URL specified by the client, or because it has expired. When this happens, you must update the TLS profile with a new CA certificate or PKCS#12 (P12) file.

---

## Viewing TLS Profiles, Keystores, and Truststores

The current list of TLS profiles, Keystores, and Truststores can be viewed on the main TLS screen.

---

## Before you begin

Important: API Connect includes several default TLS profiles to help you get started working with the application. The default profiles should not be used in a production environment. It is important to create your own profiles to ensure a secure network.

One of the following roles is required to view TLS Server Profiles:

- Administrator
- Owner
- Topology Administrator
- Viewer
- Custom role with the `Settings: Manage or Settings: view` permissions

---

## About this task

The TLS list screen provides a list of TLS Profiles, Keystores and Truststores configured for your cloud. Users with view permissions can use this screen as a reference for the TLS Profiles.

Users with manage permissions can create new Profiles, Keystores, and Truststores; edit existing ones; and delete items that are no longer needed. Users can view the Keystores and Truststores assigned to the profiles.

Users can view and set the visibility for Client Profiles. For more information on visibility, see [Setting visibility for a TLS Client Profile](#)

## Procedure

Following are the tasks you can perform using the list screen as a base:

1. In the Cloud Manager, click  Resources.
2. Select TLS.
3. Complete your management task:
  - To create a new item, click Create next to the table for the type of item you want to create.
  - To edit an existing item, either click the Title of the item, or click the options menu  and then click Edit.
  - To set the visibility of a TLS Client Profile, click the options menu  for the profile, and then click Edit Visibility.
  - To delete an existing item, click the options menu  for the profile, and then click Delete.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a TLS Server Profile

In Cloud Manager, you can configure the profile that is used on the gateway when it acts as a TLS server.

### Before you begin

Important: API Connect includes several default TLS profiles to help you get started. The default profiles should not be used in a production environment. It is important to create your own profiles to secure your network.

One of the following roles is required to configure TLS Server Profiles:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: manage permissions`

### About this task

The Server profile is for the gateway when it is acting as the TLS server.

## Procedure

Perform the following steps to create a TLS Server profile:

1. In the Cloud Manager, click  Resources.
2. Select TLS.
3. Click Create in the TLS Server Profile table.
4. Enter the fields to configure the TLS Server Profile:

Field	Description
Title (required)	Enter a Title for the profile. The title is displayed on the screen.
Name (required)	The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage TLS Server Profiles, see <a href="#">apic tls-server-profiles</a> .
Version (required)	Assign a version number for the profile. Using version numbers allows you to create multiple server profiles with the same name and different configurations, for example, <i>MyProfile 1.0</i> and <i>MyProfile 1.1</i> .
Summary (optional)	Enter a description of the profile.
Protocols (required)	Select one or more supported TLS protocol versions. The default is 1.2.

Field	Description
Mutual Authentication (required)	Determines the level of two-way authentication for the server profile. In two-way authentication, the server responds to a client by sending a request for the client certificate. <ul style="list-style-type: none"> <li>None (default) No support for mutual authentication.</li> <li>Request Enable this option to request client authentication during the TLS handshake. When the application sends the request, the gateway requests that the application sends the certificate. If the client does not send the certificate, the certificate is not checked on the gateway.</li> <li>Require Enable this option to require client authentication during the TLS handshake. When the application sends the request, the gateway requests that the application sends the certificate. If the client does not send the certificate, the TLS handshake fails and the request is blocked.</li> </ul>
Limit Renegotiation (optional)	Client-initiated renegotiation allows the connection to be retried. The default is to prevent renegotiation. Remove the checkmark to allow renegotiation.
Keystore (required)	A keystore is a repository containing a public and private key pair. The Server Profile requires a keystore in order to securely identify the system. When an application sends an API request, the keystore is used to verify a matching certificate.
Truststore (optional)	A truststore is a repository containing certificates. The certificates are used to verify the peer during a TLS handshake. If, in addition to a keystore, a truststore is specified, the certificate is further checked for validity by ensuring that is signed by the root certificate, which must be in the truststore.
Ciphers (required)	Cipher suites are encryption/decryption algorithms used to secure HTTPs communication within the API Connect ecosystem. Select the ciphers that the profile supports. Note: The TLS 1.3 ciphers are clearly indicated. If you select TLS version 1.3 as one of the protocols for the profile but do not select any TLS 1.3 ciphers, <b>all</b> the TLS 1.3 ciphers are added to the list of ciphers supported by the profile. If you do not select TLS version 1.3 but select one or more TLS 1.3 ciphers, those ciphers are <b>not</b> added to the list of ciphers supported by the profile.

5. Click Save.

## Related concepts

- [TLS profiles overview](#)

## Related tasks

- [Creating a TLS Client Profile](#)
- [Creating a Keystore](#)
- [Creating a Truststore](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a TLS Client Profile

In Cloud Manager, TLS profiles are configured as a Resource to provide secure transmission of data over HTTPs.

### Before you begin

One of the following roles is required to configure TLS Profiles:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

### About this task

API Connect uses both TLS Server and TLS Client profiles. A TLS Server profile is presented when a communication request is received. The Server profile validates the request against the Keystore and protocol version to determine whether the connection is secure. The Client profile is presented to initiate communication with another system. Client Profiles may be made visible for use by provider organizations in policies in API Manager. See [Setting visibility for a TLS Client Profile](#).

### Procedure

Perform the following steps to create a TLS Client profile:

- In the Cloud Manager, click  Resources.
- Select TLS.
- Click Create in the TLS Client Profile table.
- Enter the fields to configure the TLS Client Profile:

Field	Description
Title (required)	Enter a Title for the profile. The title is displayed on the screen.
Name (required)	The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage a TLS Client Profile, see <a href="#">apic tls-client-profiles</a> .

Field	Description
Version (required)	Assign a version number for the profile. Using version numbers allows you to create multiple server profiles with the same name and different configurations, for example, <i>MyProfile 1.0</i> and <i>MyProfile 1.1</i> .
Summary (optional)	Enter a description of the profile.
Protocols (required)	Select one or more supported TLS protocol versions. The default is 1.2.
Server Connection (optional)	Specify whether to support weak or insecure credentials. <ul style="list-style-type: none"> <li>Allow insecure server connections - Insecure server connections may result from self-signed certificates, expired or corrupted certificates, or certificates from an unknown or untrusted source. Check this box to allow the connection to proceed with an insecure connection. The default is to not allow insecure server connections.</li> <li>Support Server Name Indication (SNI) - Check this box to enable SNI. SNI allows support for multiple certificates presented on the same IP address using different host names. The client profile sends the name of a virtual domain as part of the TLS negotiation. The default is to enable SNI.</li> </ul>
Keystore (optional)	A Keystore is a repository containing public and private key pairs. Select the keystore where you will store the certificates for the profile. Default keystores are provided, and you can also create your own.
Truststore (optional)	A Truststore is a repository containing verified public keys, which are usually obtained from a third-party certificate authority. Truststores provide secure identification for peer systems. A truststore is usually used when mutual authentication is enabled. Select a truststore for the profile. Default truststores are provided, and you can also create your own.
Ciphers (required)	Cipher suites are encryption/decryption algorithms used to secure HTTPs communication within the API Connect ecosystem. Select the ciphers that the profile supports. Note: The TLS 1.3 ciphers are clearly indicated. If you select TLS version 1.3 as one of the protocols for the profile but do not select any TLS 1.3 ciphers, <b>all</b> the TLS 1.3 ciphers are added to the list of ciphers supported by the profile. If you do not select TLS version 1.3 but select one or more TLS 1.3 ciphers, those ciphers are <b>not</b> added to the list of ciphers supported by the profile.

5. Click Save.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Setting visibility for a TLS Client Profile

The visibility setting determines which provider organizations can access a resource.

### Before you begin

You must complete the following task:

- [Creating a TLS Client Profile](#)

### About this task

The visibility setting gives you control over the resources that are available to provider organizations.

### Procedure

Follow these steps to set the visibility for the resources in your on-premises cloud:

1. In the Cloud Manager, click  Resources.
2. Select TLS as the resource to view.
3. From the table of TLS Client Profiles, choose Edit visibility from the  options menu next to the name of the profile you are managing.
4. Select the visibility setting for the profile. The options are:
  - Private - the profile is visible only in Cloud Manager and cannot be used by any provider organization
  - Public - the profile is visible and can be used by all provider organizations
  - Custom - the profile is visible only to the provider organizations designated by you

5. For Custom visibility, select the provider organizations that you want to have access to the profile.
6. Click Save to complete the operation.

## Results

For Private, the profile cannot be used by any provider organizations. For Public, the profile can be used by all provider organizations. For Custom, the profile can be used by the provider organizations that you designate. If visible, the profiles will be available in API Manager.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining elliptic curve cryptographic schemes for a TLS client profile

You define the elliptic curve cryptographic schemes for a TLS client profile by using the developer toolkit CLI.

### About this task

To define elliptic curve cryptographic schemes for a TLS client profile, you include `elliptic_curve_auto_negotiation` and `elliptic_curve` properties in a YAML file definition for the TLS client profile. The `elliptic_curve` property lists the required elliptic curve cryptographic schemes. For example:

```
elliptic_curve_auto_negotiation: false
elliptic_curve:
  - secp521r1
  - secp384r1
  - prime256v1
```

You then use the developer toolkit CLI to create the TLS client profile in API Connect.

When `elliptic_curve_auto_negotiation` is set to `true`, the system negotiates the Elliptic-curve Diffie-Hellman (ECDH) key agreement automatically with its peer, and any `elliptic_curve` property settings are ignored.

The following example shows a complete YAML file for a TLS client profile:

```
type: tls_client_profile
name: my-tls-client-profile
version: 1.0.0
title: My TLS client profile
protocols:
  - tls_v1.2
ciphers:
  - ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
elliptic_curve_auto_negotiation: false
elliptic_curve:
  - sect163k1
insecure_server_connections: false
server_name_indication: true
```

Note:

- The `elliptic_curve_auto_negotiation` option is not supported by any of the API Connect gateway types. If the TLS client profile is targeted for an API Connect gateway; this setting is ignored by the gateway.
- The elliptic curve cryptographic schemes shown in each row of the following table are equivalent. However, API Connect recognizes only one or the other depending on how the TLS profile is used, as indicated in the table.

Table 1.

API enforcement on the gateway	API Connect server access security
secp192r1	prime192v1
secp256r1	prime256v1

Therefore, if you want to use either of these schemes and are unsure whether you are targeting the TLS client profile to the API Connect gateway for API enforcement, whether you are using it to secure user access to the API Connect servers, or whether it will be used for both purposes, specify both equivalent schemes; API Connect will simply ignore the non-relevant scheme. For example:

```
elliptic_curve:
  .
  .
  .
  - secp256r1
  - prime256v1
  .
  .
```

## Procedure

To create a TLS client profile with elliptic curve cryptographic schemes defined, complete the following steps:

1. Create a YAML file definition for your TLS client profile, with the required `elliptic_curve` property.
2. Log in to the management server from the developer toolkit CLI. Log in either as a member of the cloud administration organization or as a member of a provider organization, depending on where you want to create the TLS client profile. For details, see [Logging in to a management server](#).
3. Create the TLS client profile by using the following command:

```
apic tls-client-profiles:create --server mgmt_endpoint_url --org organization_name tls_client_profile_yaml_file
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL, and is the same as that which was used when you logged in at step 2.
- `organization_name` is either `admin`, for the cloud administration organization, or the name of your provider organization, and is the same as that which was used when you logged in at step 2.
- `tls_client_profile_yaml_file` is the name of the YAML file that contains the definition for your TLS client profile.

Note: When you install IBM® API Connect, the API Connect gateway has a pre-supplied default TLS client profile that is used for API enforcement if you do not configure a TLS client profile; you cannot configure this default TLS client profile on the gateway.

For reference details of all the `apic tls-client-profiles` commands, see [apic tls-client-profiles](#).

You can also complete the operations described in this topic by using the API Connect REST APIs; see the [API Connect REST API documentation](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a Keystore

Each keystore contain a matched pair of a public certificates and its private keys. These artifacts provide identity information during a TLS handshake.

### Before you begin

Cloud Manager and API Manager both support and use TLS certificates, but they do not themselves produce strong encryption keys or manage your encryption keys. Encryption keys are generated and managed according to your own procedures. For more information, see [Generating a PKCS#12 file for Certificate Authority](#) and [Generating a self-signed certificate using OpenSSL](#).

One of the following roles is required to configure Keystores:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

### About this task

API Connect includes pre-configured Keystores which may be used for testing purposes. For production environments, we suggest creating a new, secure Keystore.

### Procedure

Perform the following steps to create a TLS Client profile:

1. In the Cloud Manager, click  Resources.
2. Select TLS.
3. Click Create in the Keystore table.

Field	Description
Title (required)	Enter a Title for the Keystore. The title is displayed on the screen.
Name (required)	The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage keystores, see <a href="#">apic keystores</a> .
Summary (optional)	Enter a brief description.
Private Key & Public Key: Step 1: Upload private key	Upload the file containing the private key certificate. If necessary, you can click Browse to locate the file. If the file contains both the private and public keys, upload it in Step 1. Private and public keys are always uploaded in pairs, either in a single file or separate files.
Private key password (optional)	Enter the password for the private key if it has a password.
Private Key & Public Key: Step 2: Upload public key	If the public key is contained in a separate file, upload it in Step 2. Private and Public keys are always uploaded in pairs, either in a single file or separate files.

4. Click Save.

Note: After they have been uploaded, private keys cannot be downloaded from API Connect.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a Truststore

A truststore contains a list of certificates. The certificates are used to verify the peer during a TLS handshake.

### Before you begin

---

One of the following roles is required to configure Truststores:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

### About this task

---

Cloud Manager and API Manager both support and use TLS certificates, but they do not themselves produce strong encryption keys or manage your encryption keys. Encryption keys are generated and managed according to your own procedures. For more information, see [Generating a PKCS#12 file for Certificate Authority](#) and [Generating a self-signed certificate using OpenSSL](#).

API Connect includes pre-configured Truststores which may be used for testing purposes. For production environments, we suggest creating a new, secure Truststore.

### Procedure

---

1. In the Cloud Manager, click  Resources.
2. Select TLS.
3. Click Create in the Truststore table.

Field	
Title (required)	Enter a Title for the Truststore. The title is displayed on the screen.
Name (required)	The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage truststores, see <a href="#">apic truststores</a> .
Summary (optional)	Enter a brief description.
Public Keys	Upload the file containing the public key certificate. If necessary you can click Browse to locate the file.

4. Click Save.

### Related concepts

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Viewing certificate details and adding certificates to a keystore or truststore

You can view details for the certificates in an existing keystore or truststore and add additional certificates.

### Before you begin

---

One of the following roles is required to edit Keystores and Truststores:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

### About this task

---

API Connect includes pre-configured Keystores and Truststores which you can use for testing purposes. For production environments, we suggest creating a new, secure Keystore or Truststore. From an existing Keystore or Truststore, you can edit the title, view the details of the certificates, and add new certificates.

## Procedure

---

To work with existing keystores and truststores:

1. In the Cloud Manager, click  Resources.
2. Select TLS.
3. Click the name of the keystore or truststore.
4. Edit the name and summary if needed.
5. The Subject, Finger Print, and Expiration date is shown for each certificate in the keystore or truststore. Click > to view the certificate details.
6. Add additional private and/or public keys if needed.
7. Click Save.

Note: After they have been uploaded, private keys cannot be downloaded from API Connect.

# Generating a self-signed certificate using OpenSSL

OpenSSL is an open source implementation of the SSL and TLS protocols. It provides the transport layer security over the normal communications layer, allowing it to be intertwined with many network applications and services.

## Before you begin

---

One of the following roles is required to complete this task:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

## About this task

---

This topic tells you how to generate a self-signed SSL certificate request using the OpenSSL toolkit to enable HTTPS connections.

## Procedure

---

To generate a self-signed SSL certificate using the OpenSSL, complete the following steps:

1. Write down the Common Name (CN) for your SSL Certificate. The CN is the fully qualified name for the system that uses the certificate. For static DNS, use the hostname or IP address set in your Gateway Cluster (for example, `192.16.183.131` or `dp1.acme.com`).
2. Run the following OpenSSL command to generate your private key and public certificate. Answer the questions and enter the Common Name when prompted.

```
openssl req -newkey rsa:2048 -nodes -keyout key.pem -x509 -days 365 -out certificate.pem
```

3. Review the created certificate:

```
openssl x509 -text -noout -in certificate.pem
```

4. Combine your key and certificate in a PKCS#12 (P12) bundle:

```
openssl pkcs12 -inkey key.pem -in certificate.pem -export -out certificate.p12
```

5. Validate your P2 file.

```
openssl pkcs12 -in certificate.p12 -noout -info
```

Once the certificate file is created, it can be uploaded to a keystore.

6. In the Cloud Manager, click  Resources.
7. Select TLS.
8. Click Create in the Keystore table.
9. Create a Keystore and upload the certificate file following the instructions at [Creating a Keystore](#).
  - Note:
    - API Connect supports only the P12 (PKCS12) format file for the present certificate.
    - Your P12 file must contain the private key, the public certificate from the Certificate Authority, and all intermediate certificates used for signing.
    - Your P12 file can contain a maximum of 10 intermediate certificates.
10. Click Save.

## Related concepts

- [TLS profiles overview](#)

## Related tasks

- [Creating a TLS Server Profile](#)
- [Creating a TLS Client Profile](#)

- [Creating a Truststore](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Generating a PKCS#12 file for Certificate Authority

PKCS#12 (P12) files define an archive file format for storing cryptographic objects as a single file. API Connect supports the P12 file format for uploading a keystore and truststore. The keystore should contain both a private and public key along with intermediate CA certificates.

## Before you begin

One of the following roles is required to add a key to a keystore or truststore:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

Before you can generate a P12 file, you must have a private key (for example: *key.pem*), a signed certificate by a Certificate Authority (for example *certificate.pem*) and one or more certificates from the CA authority.

Note: If your certificate file contains more than one certificate, you must manually split the file and create a single file for each entry. Each entry must be bound by the following markers:

```
-----BEGIN CERTIFICATE-----
-----END CERTIFICATE-----
```

## Procedure

1. If you have intermediate certificates from your CA, concatenate them into a single .pem file to build your `caChain`. Be sure to enter a new line following each certificate's data.

```
cat ca1.pem ca2.pem ca3.pem > caChain.pem
cat caChain.pem
-----BEGIN CERTIFICATE-----
MIIEPjCCA46gAwIBAgIQEod26KZabjd+BQMG1Dw16jANBgkqhkiG9w0BAQUFADCB
...
lQX7CkTJn61AJUusyEa8H/gjVQnHp4VOLFR/dKgeVcCRvZF7Tt5AuiyHY
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
MIIEPDCCAySgAwIBAgIQSEus8arH1xND0aJ0NUmXJTANBgkqhkiG9w0BAQUFADBv
...
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
MIIEjCCA6gAwIBAgIBATANBgkqhkiG9w0BAQUFADBEvMQswCQYDVOQGEWJTRTEU
...
-----END CERTIFICATE-----
```

2. Create the P12 file including the private key, the signed certificate and the CA file you created in step 1, if applicable. Omit the `-CAfile` option if you don't have CA certificates to include.

The following command uses OpenSSL, an open source implementation of the SSL and TLS protocols.

```
openssl pkcs12 -inkey key.pem -in certificate.pem -export -out certificate.p12 -CAfile caChain.pem -chain
```

Once the certificate file is created, it can be uploaded to a keystore.

3. In the Cloud Manager, click  Resources.

4. Select TLS.
5. Click Create in the Keystore table.
6. Create a Keystore and upload the certificate file following the instructions at [Creating a Keystore](#).  
Note:
  - API Connect supports only the P12 (PKCS12) format file for the present certificate.
  - Your P12 file must contain the private key, the public certificate from the Certificate Authority, and all intermediate certificates used for signing.
  - Your P12 file can contain a maximum of 10 intermediate certificates.
7. Click Save.

# Binding a TLS server profile to a gateway service

You can bind the SSL certificate of a TLS profile to a gateway service to establish an HTTPS binding. This enables you to access the service by using the HTTPS communication protocol.

---

## Before you begin

One of the following roles is required:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Topology: Manage permissions`

For more information on which user roles have access, see [Adding members to the admin organization](#).

---

## About this task

Perform the following steps to bind a TLS profile to a gateway service.

---

## Procedure

1. In the Cloud Manager user interface, click  Topology, then select the gateway service that you want to work with.
2. Scroll down to the API Invocation Endpoint section, and under Server Name Indication (SNI) select the required TLS server profile.  
You can also bind a TLS server profile during the initial registration of a gateway service; see [Registering a gateway service](#).
3. Click Save when done.

---

## Results

The TLS profile binds to the gateway service.

---

## Related tasks

- [Creating a TLS Server Profile](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Updating the PKCS#12 certificate for a TLS server profile

A server certificate bound to a gateway service can be invalidated if the host name in the digital certificate of the server does not match the URL specified by the client, or because it has expired. When this happens, you must update the TLS profile with a new CA certificate or PKCS#12 (P12) file.

## Before you begin

---

One of the following roles is required:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

## About this task

---

If the expiration date of a certificate or a P12 file is approaching, or if a certificate is invalidated, use the steps in this topic to update a TLS profile bound to a gateway service. CA certificate and P12 file expiration dates are displayed in the details of the containing keystore; see step 3.

You update the certificate for a TLS server profile by replacing the certificate in the keystore that is associated with the TLS server profile.

Complete the following steps to update a TLS profile that has an invalidated or expired certificate or P12 file.

## Procedure

---

1. In the Cloud Manager user interface, click  Resources, then click TLS.
2. To identify the keystore that is associated with the TLS server profile, complete the following steps:
  - a. In the TLS Server Profile section, select the required profile.
  - b. In the Keystore/Truststore section, note the selected keystore, then click Cancel to close the TLS server profile details page.
3. In the Keystore section, select the required keystore.

The Certificates section displays the expiration date of a certificate. You can expand a certificate to see further details.
4. Click Browse and select the required P12 file.

Note:

  - API Connect supports only the P12 (PKCS12) format file for the present certificate.
  - Your P12 file must contain the private key, the public certificate from the Certificate Authority, and all intermediate certificates used for signing.
  - Your P12 file can contain a maximum of 10 intermediate certificates.
5. Click Save when done.

## Related tasks

---

## OAuth Provider overview

---

API Connect supports OAuth Specification 2.0, for both Native and Third party implementations.

## Introduction to OAuth

---

OAuth is a token-based authorization protocol that allows third-party websites or applications to access user data without requiring the user to share personal information. In API Connect, you can secure an API with OAuth.

In Cloud Manager, you configure both Native and Third party OAuth providers that can be made visible to selected Provider organizations. The OAuth Provider configuration is based on the OAuth 2.0 Specification, which is available at <https://tools.ietf.org/html/rfc6749>. Knowledge of the OAuth 2.0 specification is required to implement an OAuth Provider in API Connect.

One of the following roles is required to configure OAuth Providers:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

Note: In a multi-node cluster, OAuth operations will fail if quorum is lost. Quorum requires that the number of active nodes is greater than 50% of the total number of nodes in the cluster.

- [Configuring a native OAuth provider](#)

Native OAuth providers are configured and managed by you within your cloud.
- [Configuring a third-party OAuth provider](#)

Enter the secure endpoints to provide OAuth authentication from a third party.
- [Setting the visibility for OAuth providers](#)

The visibility setting determines which provider organizations can use an OAuth provider to secure APIs.

- [OAuth concepts for API Connect](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring a native OAuth provider

Native OAuth providers are configured and managed by you within your cloud.

### About this task

A native OAuth provider object provides settings for OAuth processing operations such as generating and validating OAuth tokens. An OAuth provider object is referenced by an OAuth security definition to protect an API. When a native OAuth provider is used, the OAuth operations are performed natively by API Connect.

Every OAuth provider object has a backing API. Your configuration here automatically updates the OpenAPI document of the API. You can edit the OpenAPI document directly by navigating to the  Resources > OAuth Providers page, selecting your OAuth provider, then clicking API Editor.

Note: Take care when modifying the code directly on the Source tab of the API Editor because validation is limited. For example:

- If you change the name of auto generated assembly actions in the source code, the assembly will be prevented from updating dynamically when the OAuth provider settings are modified.
- You must ensure that the OAuth provider name matches the value specified in the `oauth-provider-settings-ref` field in each OAuth assembly action.

When a published API references an OAuth provider object, the backing API is automatically made available in the gateway.

One of the following roles is required to configure a native OAuth provider:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings:Manage` permissions

Note:

- The OAuth provider logs Analytics data for failure cases, but does not log successful cases. Activity log policies that call for logging of Analytics data upon success do not apply for the OAuth provider.
- You must ensure the OAuth Provider is configured in the Sandbox Catalog before using the OAuth Provider in a non-Sandbox Catalog.

### Procedure

OAuth provider configuration uses a series of screens. The first set of screens controls a basic OAuth provider configuration. Perform the following steps to configure a native OAuth Provider for your cloud:

1. In the Cloud Manager, click  Resources.
2. Click OAuth Providers > Add > Native OAuth provider.
  - a. Complete the following parameters for the first screen, then click Next.

Field	Description
Title	Enter a title for the native OAuth provider.
Name	This field is auto-populated by the system.
Description (optional)	Enter a brief description.
Base path (optional)	The base path is the URL segment of the API that is shared by all operations in the API. It does not include the host name or any additional segments for paths or operations. The base path must be unique for a given catalog. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
Gateway Type	Select the gateway type, either DataPower® Gateway (v5 compatible) or DataPower API Gateway. For information about types of gateways, see <a href="#">API Connect gateway types</a> .  OAuth Providers apply to one gateway type.

- b. In the next screen, enter the following additional configuration parameters, then click Next.

Field	Description
Authorize Path	<code>/oauth2/authorize/</code> is the standard OAuth endpoint to login to account
Token Path	<code>/oauth2/token/</code> is the standard OAuth endpoint to exchange code for access token.
Supported grant types	<ul style="list-style-type: none"> <li>• Implicit - An access token is returned immediately without an extra authorization code exchange step.</li> <li>• Application - Application to application. Corresponds to the OAuth grant type "Client Credentials." Does not require User Security.</li> <li>• Access code - An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type "Authorization Code."</li> <li>• Resource owner - Password - The user's username and password are exchanged directly for an access token, so can only be used by first-party clients.</li> <li>•  Resource owner - JWT - A verified signed JSON Web Token is exchanged directly for an access token.</li> </ul>
Supported client types	<ul style="list-style-type: none"> <li>• Confidential - Client can maintain secure credentials on a secure server</li> <li>• Public - Client credentials are not secure. (Public is not available for DataPower API Gateway at this time.)</li> </ul>

- c. Enter the scopes in the next screen. A scope becomes an option in the request and response for an access token. Click Add to add additional fields for scopes. Click Next when done.

Field	Description
sample_scope_1	Scope for token
additional scopes	Scope for token

- d. Enter the parameters for User Security in the next screen. Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization. User Security is not required for the Application grant type. Click Next when done.

Field	Description
Identity Extraction	<p>Determines how the user credential is extracted:</p> <ul style="list-style-type: none"> <li>Basic Authentication - HTTP basic authentication (requires no additional configuration)</li> <li>Default HTML Form - Use default login form for user name and password</li> <li><b>API Gateway only</b> Context variable - Specify which variable contains the user name and password. API Connect OAuth context variables as listed here <a href="#">API Connect context variables</a> Note: DataPower API Gateway only. Not available for DataPower Gateway (v5 compatible).</li> <li>Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see <a href="#">Creating a custom HTML login form for user security</a>.</li> <li>Redirect - Enter an endpoint to redirect to a third-party identity provider. For more information, see <a href="#">Authenticating and authorizing through a redirect URL</a>.</li> <li><b>API Gateway only</b> Disabled - do not collect the user credential</li> </ul> <p>Note: If you use either the Default HTML Form or Redirect identity extraction methods, the response from the redirect endpoint <b>must</b> maintain the order of the query parameters before the <b>state_nonce</b> query parameter, otherwise the authorization fails.</p>
Authentication	<p>Authenticate application users with a user registry. Select an LDAP or Authentication URL user registry or create the SampleAuthURL User Registry. For a DataPower API Gateway, you have the option to disable authentication with a user registry.</p>
Authorization	<p>The following methods for extracting the user credential are available:</p> <ul style="list-style-type: none"> <li>Authenticated - Authorize authenticated users automatically.</li> <li>Default HTML Form - Use default HTML form to authorize.</li> <li>Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see <a href="#">Creating a custom HTML authorization form for user security</a>.</li> <li><b>API Gateway only</b> Disabled - Disable authorization.</li> </ul>

- Review the Summary for the native OAuth provider configuration.
- Click Back to make changes.
- Click Finish to save the basic configurations and to proceed to the Advanced Parameters for a native OAuth Provider.

## Results

Depending upon the visibility setting, the OAuth Provider can be used to secure the APIs in catalog.

- [Configuring basic settings for a native OAuth provider](#)  
You can update the identification details and basic configuration settings for a native OAuth provider.
- [Configuring scopes for a native OAuth provider](#)  
Access tokens contain authorization for specific scopes.
- [Configuring user security for a native OAuth provider](#)  
Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization.
- [Configuring tokens for a native OAuth provider](#)  
Set time to live for access tokens and refresh tokens, and a time period for maximum consent for all tokens.
- [Configuring token management and revocation for a native OAuth provider](#)  
Select whether to use a native gateway (DataPower) or third party endpoint for token revocation.
- [Configuring introspection for a native OAuth provider](#)  
Define an introspection path to allow the metadata for an access token to be examined.
- [Configuring metadata for a native OAuth provider](#)  
Use Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.
- [Configuring the OIDC parameters for a native OAuth provider](#)  
Open ID Connect (OIDC) provides an additional authentication protocol based on OAuth 2.0. OIDC provides user information encoded in a JSON Web Token, or JWT.
- [Editing a native OAuth provider by using the API Editor](#)  
You can edit the source and assembly policies for the Native OAuth Provider using the API editor.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring basic settings for a native OAuth provider

You can update the identification details and basic configuration settings for a native OAuth provider.

### About this task

One of the following roles is required to configure the basic settings for a native OAuth Provider:

- Administrator

- Owner
- Topology Administrator
- Custom role with the `Settings:Manage` permissions

You can select the basis settings pages for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the basic settings for an existing native OAuth provider. If you want to update the basic settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, > OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

1. To modify the identification details, click Info in the sidebar menu, then update the following fields as required:

Field	Description
Title	Enter a title for the native OAuth provider.
Name	This field is auto-populated by the system.
Description (optional)	Enter a brief description.
Base path (optional)	The base path is the URL segment of the API that is shared by all operations in the API. It does not include the host name or any additional segments for paths or operations. The base path must be unique for a given catalog. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.

2. To modify the basic configuration settings, click Configuration in the sidebar menu, then update the following fields as required:

Field	Description
Authorize Path	<code>/oauth2/authorize/</code> is the standard OAuth endpoint to login to account
Token Path	<code>/oauth2/token/</code> is the standard OAuth endpoint to exchange code for access token.
Supported grant types	<ul style="list-style-type: none"> <li>• Implicit - An access token is returned immediately without an extra authorization code exchange step.</li> <li>• Application - Application to application. Corresponds to the OAuth grant type "Client Credentials." Does not require User Security.</li> <li>• Access code - An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type "Authorization Code."</li> <li>• Resource owner - Password - The user's username and password are exchanged directly for an access token, so can only be used by first-party clients.</li> <li>• <span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Resource owner - JWT - A verified signed JSON Web Token is exchanged directly for an access token. Tip: Selecting only the Resource owner - JWT grant type when defining a native OAuth provider in the user interface is not supported and results in an invalid configuration. To avoid this problem, additionally select either the Access code or the Resource owner - Password grant type.</li> </ul> <p>Note: If you plan to configure OpenID Connect (OIDC) for a native OAuth provider, you must include at least one of the following grant types: Implicit, Access code.</p>
Supported client types	<ul style="list-style-type: none"> <li>• Confidential - Client can maintain secure credentials on a secure server</li> <li>• Public - Client credentials are not secure.</li> </ul>

DataPower Gateway (v5 compatible) only Note: If the gateway type is DataPower® Gateway (v5 compatible) and, when the native OAuth provider was created, only the Application grant type was selected, you cannot add further grant types until you configure the user security settings. In particular, you must specify the user registry for authenticating application users. To configure the user security settings, complete the following steps:

- a. Click User Security in the sidebar menu, then click Edit.
  - b. Update the user security settings as required; for more details, see [Configuring user security for a native OAuth provider](#).
  - c. Click Save when done.
3. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring scopes for a native OAuth provider

Access tokens contain authorization for specific scopes.

### About this task

Client applications can request only the scopes or a subset of the scopes that you define here. The scopes are included in the access tokens that are generated from the provider. When an OAuth protected API is invoked, the gateway checks the scopes carried in the access tokens against the list of allowed scopes in the security definition for the API to determine whether to grant access.

In addition, you can enforce advanced scope checks. The advanced scope check URLs are invoked after application authentication or after user authentication based on which URLs are configured. The final scope permission that is granted by the access token is the result of all scope checks.

Per IETF RFC 6749, the value of the scope parameter is a list of space-delimited, case-sensitive strings. For more information, see [The OAuth 2.0 Authorization Framework](#).

One of the following roles is required to configure scopes for a native OAuth Provider:

- Administrator
- Owner

- Topology Administrator
- Custom role with the `Settings:Manage` permissions

You can select the scope settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the scope settings for an existing native OAuth provider. If you want to update the scope settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

Perform the following steps to configure the scopes for the access token:

1. Click **Scopes** in the sidebar menu. The currently configured scopes are listed. Review and update the scopes as required.

Field	Description
sample_scope_1	Scope for token
additional scopes	Scope for token

In the **Default scopes** section, select the default scopes to be used if the API request doesn't contain any scopes.

If the user authorization method is set to **Default HTML Form** in the **User Security** settings, all scopes specified here are added automatically to the authorization consent form.

2. **Advanced scope check before token generation.** This setting specifies the scope check endpoint where additional scope verification is performed in addition to the basic scopes. The advanced scope check URLs are invoked after application authentication or after owner authentication based on which URLs are configured. The scopes are included in the token and will overwrite any previous scopes.

Field	Description
Application scope check	Allow extra verification by running a scope check from an endpoint. Enter the endpoint and an optional TLS Profile to use for an application scope check.
Owner scope check	Further refine the scope with an additional check. Enter the endpoint and an optional TLS Profile to use for an owner scope check.

For more information about scope, see [Scope](#).

3. **Advanced scope check after token generation.** This setting specifies an additional scope check at the API consumer level to verify compliance with the scope requirements of the API.

Field	Description
Enabled	Select the check box to enable the advanced scope check after token validation. Enter an optional default validator endpoint.
Use endpoint from API	Select the check box to use the endpoint from the API, or clear the check box to override the endpoint from the API.

For more information about scope, see [Scope](#).

4. Click **Save** when done.

## Results

Depending upon the visibility setting, the OAuth Provider with the specified scopes can be used to secure the APIs in catalog.

## Related information

- [Scope](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Configuring user security for a native OAuth provider

Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization.

## About this task

User security authenticates the user. It is required for the **Implicit**, **Access code**, and **Resource owner - Password** grant types. It is not used for the **Application** or **Resource owner - JWT** grant types.

One of the following roles is required to configure user security for a native OAuth Provider:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings:Manage` permissions

You can select the user security settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the user security settings for an existing native OAuth provider. If you want to update the user security settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

Perform the following steps to configure the user security settings for the OAuth Provider:

1. Click User Security in the sidebar menu.
2. Specify the following parameters for User Security. Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization. User Security is not required for the Application or Resource owner - JWT grant types. Click Next when done.

Field	Description
Identity Extraction	<p>Determines how the user credential is extracted:</p> <ul style="list-style-type: none"><li>• Basic Authentication - HTTP basic authentication (requires no additional configuration)</li><li>• Default HTML Form - Use default login form for user name and password</li><li>• <span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Context variable - Specify which variable contains the user name and password. API Connect OAuth context variables as listed here <a href="#">API Connect context variables</a></li><li>• Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see <a href="#">Creating a custom HTML login form for user security</a>.</li><li>• Redirect - Enter an endpoint to redirect to a third-party identity provider. For more information, see <a href="#">Authenticating and authorizing through a redirect URL</a>.</li><li>• <span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Disabled - do not collect the user credential</li></ul> <p>Note: If you use either the Default HTML Form or Redirect identity extraction methods, the response from the redirect endpoint <b>must</b> maintain the order of the query parameters before the <code>state_nonce</code> query parameter, otherwise the authorization fails.</p>
Authentication	Authenticate application users with a user registry. Select an LDAP or Authentication URL user registry or create the SampleAuthURL User Registry.
Authorization	<p>Various methods may be used to authorize application users. For a DataPower® API Gateway, the following methods for extracting the user credential are available:</p> <ul style="list-style-type: none"><li>• Authenticated - Authorize authenticated users automatically.</li><li>• Default HTML Form - Use default HTML form to authorize. If you select the Default HTML Form method, all scopes that are specified in the Scopes settings are added automatically to the authorization consent form.</li><li>• Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form.</li><li>• <span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Disabled - Disable authorization.</li></ul>

3. Click Save when done.

## Results

Depending upon the visibility setting, the OAuth Provider can be used to secure the APIs in catalog.

## Related information

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring tokens for a native OAuth provider

Set time to live for access tokens and refresh tokens, and a time period for maximum consent for all tokens.

### About this task

Access tokens are granted to the client application to allow the application to access resources on behalf of the application user. Refresh tokens are issued to the client to obtain a new access token when the current access token becomes invalid or expires, or to obtain additional access tokens with identical or more narrow scope. You can also specify how long the consent given by the combination of any number of access and refresh token remains valid.

One of the following roles is required to configure tokens for a native OAuth Provider:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings:Manage` permissions

You can select the token settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the token settings for an existing native OAuth provider. If you want to update the token settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

Perform the following steps to configure tokens for the native OAuth provider:

1. Click Tokens in the sidebar menu.
2. Define the settings to configure tokens.

Field	Description
Access tokens time to live	Enter the expiration time period in seconds for access tokens.
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> One time use access token	Click the check box to enable one time use for the access token. Access tokens are multiple use by default which allows them to be used for multiple requests. When one time use is enabled, the access token will be consumed after one use. The OAuth flow will need to be repeated to obtain another access token. Note: If you select this option, you must also enable token management; see one of the following topics, depending on the user interface you are using: <ul style="list-style-type: none"> <li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (Cloud Manager)</li> <li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (API Manager)</li> </ul>
Refresh tokens	Click the check box to enable Refresh tokens. Set the Count to limit the number of times a refresh token can be issued. Set the Refresh Token Time to Live value to determine the time to live, or expiration time period, for each refresh token in seconds.
One time use refresh token	Clear the check box to disable one time use for the refresh tokens. Refresh tokens are one time use by default which allows them to be used one time only to generate an access token and a new refresh token. When refresh token one time use is disabled then the refresh token count is limited to one and the refresh token can be used multiple times to generate new access tokens, however, another refresh token will not be generated unless the initial OAuth flow (Authorization Code or Password) is repeated. Note: If you select this option, you must also enable token management; see one of the following topics, depending on the user interface you are using: <ul style="list-style-type: none"> <li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (Cloud Manager)</li> <li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (API Manager)</li> </ul>
Maximum consent	Click the check box to enable Maximum consent and enter the Maximum Consent Time to Live value in seconds. This is the time to live, or expiration time period, for all tokens, both access and refresh.
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Token secret	Click the check box to select the Shared Secret which was configured for the gateway. If no Shared Secret was entered in the Gateway Configuration, then enter an key name and key value to use as the token secret.
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Proof Key for Code Exchange	Proof Key for Code Exchange (PKCE) is a method to protect OAuth 2.0 public clients from an authorization code interception attack when they use Authorization Code grant requests. You can enable this extension when deploying with the DataPower® API Gateway.  For more information, see <a href="#">RFC 7636</a> .  Select the options for your OAuth Providers: <ul style="list-style-type: none"> <li>• Enable proof key for code exchange If selected, enforces PKCE when submitted in Authorization Code grant requests.</li> <li>• Always required If selected, requires PKCE in all Authorization Code grant requests.</li> <li>• Allow plain Select this check box to allow the plain challenge method in Authorization Code grant requests.</li> </ul>

3. Click Save when done.

## Results

Depending upon the visibility setting, the OAuth Provider can be used to secure the APIs in catalog.

## Related information

- [Refresh tokens](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Configuring token management and revocation for a native OAuth provider

Select whether to use a native gateway (DataPower) or third party endpoint for token revocation.

## About this task

Token management enables you to prevent replay attacks by configuring token revocation. API Connect supports token revocation using a native gateway (DataPower) or a third party endpoint. For a native gateway, quota enforcement is used to manage tokens. For a third party endpoint, a URL to an external service is used to manage tokens.

For more information, see the IETF RFC 7009 [OAuth 2.0 Token Revocation](#).

One of the following roles is required to configure token management and revocation for a native OAuth Provider:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings:Manage` permissions

You can select the token management settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the token management settings for an existing native OAuth provider. If you want to update the token management settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

---

Perform the following steps to configure revocation settings for tokens:

1. Select Token Management in the sidebar menu.
2. Enable token management by selecting the check box.
3. From the Type list, select either Native or External. Native points to DataPower as the token storage location; External points to a revocation URL for token storage.  
Note: If you are using the API Manager user interface then, for the External option to be available, you must be using DataPower® API Gateway Version 10.0.1.0 or later, and the gateway service must be enabled in the Sandbox Catalog; for details on how to enable a gateway service in a Catalog, see [Creating and configuring Catalogs](#).
4. For Native, select one or both of the Resource owner revocation path and Client revocation path.
  - Resource owner revocation path - Uses the standard OAuth revocation path to allow the resource owner (end user) to revoke the application permission.
  - Client revocation path - Uses the standard OAuth revocation path to allow the client (application) to revoke a single token when the application closes.For more information about managing tokens with the Native DataPower Gateway, see [Token management with the native DataPower Gateway](#).
5. For External, the settings depend on the gateway type, as follows:  
DataPower API Gateway:
  - Endpoint - the URL of the external management endpoint.
  - TLS Client Profile (optional) - the TLS client profile to secure connections.
  - Security - how to secure connections. The only supported method is basic authentication.
  - Basic authentication username (optional) - the user name for authentication.
  - Basic authentication password (optional) - the password for authentication.
  - Basic authentication request header name (optional) - the request header that contains the authentication string; if you supply both a request header name and user name/password, the request header authentication method is used.
  - Custom header pattern (optional) - the name pattern of the headers to use for sending additional information to the external management service.
  - Cache type - the cache type to control whether and how to cache positive responses. If you select Time to live, specify how long to keep responses in the cache; the default value is 900 seconds.
  - Fail on error - if selected, processing is stopped if the connection to the external management service fails.Note: For details of the JSON format that is required when exchanging messages with the external management service, see [JSON format to exchange messages with the external management service](#).  
DataPower Gateway (v5 compatible):
  - Endpoint - Enter the URL to an external web server that contains information about access or refresh tokens. API Connect calls the URL to determine if the associated token can be trusted. The token server then checks a token *blocklist* (a data store of inactive tokens) to ensure that the token is still valid. If the token is still valid, API Connect continues the processing. For more information see [Token revocation](#).
  - TLS Client Profile - Select a TLS profile to verify the external endpoint.
6. Click Save when done.

## Results

---

Depending on the visibility setting, the OAuth Provider can be used to secure the APIs in catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring introspection for a native OAuth provider

Define an introspection path to allow the metadata for an access token to be examined.

### About this task

---

Token introspection allows an authorized holder of an access token to examine the contents of tokens using an introspection path. The access token to introspect must be obtained through the native OAuth provider. Introspection provides context for the token by allowing an authorized protected resource to query the authorization server to determine the set of metadata for a given token. The metadata includes whether or not the token is currently active, the scopes assigned to the token, and the authorization context in which the token was granted (including who authorized the token and which client it was issued to). API Connect token introspection conforms to IETF RFC 7662. See [OAuth 2.0 Token Introspection](#).

One of the following roles is required to enable introspection for a native OAuth Provider:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings:Manage permissions`

You can select the introspection settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the introspection settings for an existing native OAuth provider. If you want to update the introspection settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, OAuth Providers.

2. Select the required native OAuth provider.

## Procedure

---

Perform the following steps to enable introspection:

1. Click Introspection in the sidebar menu.
2. Select the check box to enable Introspection. The OAuth standard path for introspection, /oauth2/introspect is automatically entered. This path will be used when another entity inspects the token contents.
3. Click Save when done.

## Results

---

Tokens will be queried using the /oauth2/introspect path. Depending upon the visibility setting, the OAuth Provider can be used to secure the APIs in catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring metadata for a native OAuth provider

---

Use Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.

### About this task

---

Configure an Authentication URL or an External URL from which custom metadata is collected for inclusion in the token. The metadata is either stored inside the access token or it is sent along with the access token to the client application. For more information about how the metadata is collected, see [OAuth external URL and authentication URL](#).

Following are examples of metadata that can be included with the access token:

- Metadata about the authenticated resource owner
- Grant type that was used to obtain the token
- A confirmation code to be provided to the client application

One of the following roles is required to configure metadata collection for a native OAuth Provider:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings:Manage` permissions

You can select the metadata settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the metadata settings for an existing native OAuth provider. If you want to update the metadata settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

---

Perform the following steps to configure metadata collection:

1. Click Metadata in the sidebar menu.
2. Select Collect metadata to enable metadata collection.
3. The Authentication URL user registry is selected by default and is required. For more information about the Authentication URL, see [Authentication URL user registry](#).
4. Select the External URL to collect metadata from an external URL. Enter the endpoint and an option TLS Client Profile.
5.  If required, override the default Header name token value. The value of this header, if returned in the response from the OAuth endpoint, is placed in the response payload and indicated as `metadata`.
6.  If required, override the default Header name payload value. The value of this header, if returned in the response from the OAuth endpoint, is placed within the access token and indicated as `miscinfo`.
7. Save the OAuth Provider.
8. Click Save when done.

## Results

---

Depending upon the visibility setting, the OAuth Provider can be used to secure the APIs in catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring the OIDC parameters for a native OAuth provider

Open ID Connect (OIDC) provides an additional authentication protocol based on OAuth 2.0. OIDC provides user information encoded in a JSON Web Token, or JWT.

### About this task

---

When you enable OpenID connect, a template is provided for generating ID tokens along with access tokens and the required assembly policies are automatically created. You can customize the policies to suit your needs in the API Editor. The sample key provided is for test purposes only and is used to sign the JWT token.

One of the following roles is required to configure an OIDC template for a native OAuth Provider:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings:Manage` permissions

Note: You can configure OIDC parameters only if the selected grant types for the native OAuth provider include at least one of the Implicit or Access code grant types; see [Configuring basic settings for a native OAuth provider](#).

You can select the OIDC settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the OIDC settings for an existing native OAuth provider. If you want to update the OIDC settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, OAuth Providers.
2. Select the required native OAuth provider.

### Procedure

---

Perform the following steps to configure an OIDC template:

1. Click OpenID Connect in the sidebar menu.
2. Select the initial check box to configure an OIDC Template. Enter the following parameters:

Field	Description
<input type="checkbox"/> API Gateway only Support hybrid response types (optional)	Select the response types for the OpenID Connect hybrid flow to be supported by this OAuth provider.
<input type="checkbox"/> API Gateway only Auto Generate OIDC API Assembly	Select this option to generate the full OIDC assembly. Leave this option unselected to simply enable OIDC support in the OAuth provider and allow the developer to implement their own assembly.
<input type="text"/> DataPower Gateway (v5 compatible) only ID token issuer	Descriptive text to indicate the source of the key.
<input type="text"/> DataPower Gateway (v5 compatible) only ID token signing key	Specify the JSON Web Key (JWK) to be used to sign the ID token.
<input type="text"/> DataPower Gateway (v5 compatible) only ID token signing algorithm	Select the algorithm used to sign the token.

3. Click Save when done. You can edit the policies by using the API Editor.

### Results

---

Depending upon the visibility setting, the OAuth Provider can be used to secure the APIs in catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Editing a native OAuth provider by using the API Editor

You can edit the source and assembly policies for the Native OAuth Provider using the API editor.

### About this task

---

If you have configured an OIDC template, you can customize it in API Editor. In the API Editor, the Source tab allows you to edit the code for the configuration using a text editor. The API Assemble tab provides a graphical drag-and-drop editor (identical to the one in API Manager) that allows you to add additional elements to the assembly for the OAuth Provider.

Note: Take care when modifying the code directly on the Source tab of the API Editor because validation is limited. For example:

- If you change the name of auto generated assembly actions in the source code, the assembly will be prevented from updating dynamically when the OAuth provider settings are modified.
- You must ensure that the OAuth provider name matches the value specified in the `oauth-provider-settings-ref` field in each OAuth assembly action.

One of the following roles is required to configure tokens for a native OAuth Provider:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings:Manage` permissions

You can modify the native OAuth provider configuration by selecting the API Editor page immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the configuration for an existing native OAuth provider. If you want to update the configuration for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, > OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

Perform the following steps to edit the OAuth configuration:

1. Click API Editor in the sidebar menu.
2. In the Source tab, view and edit the policies to customize the behavior for the OAuth provider.
3. In the API Assemble tab, use the drag and drop editor to add additional policies to the OIDC behavior.
 

Note: If you add a policy that references a TLS profile, an `invoke` policy for example, then when you publish an API that uses this OAuth provider, you must ensure that the TLS profile is enabled for the Catalog to which you publish the API. For details on how to enable a TLS profile in a Catalog, see [Creating and configuring Catalogs](#).
4. Click Save when done.

## Results

Depending upon the visibility setting, the OAuth Provider can be used to secure the APIs in catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring a third-party OAuth provider

Enter the secure endpoints to provide OAuth authentication from a third party.

### About this task

One of the following roles is required to configure OAuth Providers:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings:Manage` permissions

## Procedure

Complete the following steps to configure a third party OAuth provider:

1. In the Cloud Manager, click  Resources.
2. Select OAuth Providers, > Add, > Third party OAuth Provider.
  - a. Complete the following parameters for the first screen and click Next.

Field	Description
Title	Enter a descriptive title for the gateway service. This title will be displayed on the screen.
Name	This field is auto-populated by the system and used as the internal field name.
Supported grant types	Select from the following options: <ul style="list-style-type: none"> <li>• Implicit: An access token is returned immediately without an extra authorization code exchange step.</li> <li>• Application: Application to application. Corresponds to the OAuth grant type Client Credentials. Does not require User Security.</li> <li>• Access code: An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type Authorization Code.</li> <li>• Resource owner - Password: The user's username and password are exchanged directly for an access token, so can only be used by first-party clients.</li> <li>• <span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Resource owner - JWT: a JSON Web Token (JWT) Bearer Token is used as a means for requesting an OAuth 2.0 access token, and for client authentication, as defined by the <a href="#">JSON Web Token (JWT) Profile for OAuth 2.0 Client Authentication and Authorization Grants</a>.</li> </ul>

Field	Description
Gateway type	Select the gateway type, either DataPower® Gateway (v5 compatible) or DataPower API Gateway. For information about types of gateways, see <a href="#">API Connect gateway types</a> .  OAuth Providers apply to one gateway type.

b. Specify configuration settings for the endpoints.

Field	Description
Authorization URL	An authorization URL where the resource owner grants authorization to the client application to access a protected resource. Example:  <code>https://example.com/oauth2/authorize</code>
Token URL	A token request URL where the client application exchanges an authorization grant for an access token. Example:  <code>https://example.com/oauth2/token</code>
Introspect URL	The introspection URL is where the API gateway validates the access tokens that are issued by the third party provider. Example:  <code>https://example.com/oauth2/introspect</code>  For more information on integrating third party OAuth providers for introspection, see <a href="#">OAuth introspection for third-party OAuth providers</a> .
<input type="checkbox"/> API Gateway only Introspect cache type	The cache type determines how long responses from the third party provider are cached, if at all. Select one of the following options: <ul style="list-style-type: none"> <li>No cache (default): Responses are not cached.</li> <li>Protocol: Defined by the <code>cache-control</code> header in the provider response.</li> <li>Time to live: Defined by the provider.</li> </ul>
<input type="checkbox"/> API Gateway only Cache Time to Live	The length of time, in seconds, for which provider responses are cached, if the Introspect cache type is set to Time to live. The default value is 900.
TLS Profile (optional)	Select an optional TLS profile for communicating with the third party provider.
Security	Default is Basic Authentication.
Basic authentication request header name	The <code>x-introspect-basic-authorization-header</code> is available to provide a user-configured HTTP Basic authentication header.
<input type="checkbox"/> API Gateway only Basic authentication username (optional)	The default user name for HTTP Basic authentication.
<input type="checkbox"/> API Gateway only Basic authentication password (optional)	The default password for HTTP Basic authentication.
<input type="checkbox"/> API Gateway only Token validation	Specifies the method used to determine the success of the introspection request that is sent to the third party service to validate the provided token. Select one of the following options: <ul style="list-style-type: none"> <li>Connected: The query is successful if the status return code is <b>200</b>.</li> <li>Active (default): The query is successful if the status return code is <b>200</b> and the response JSON body includes the property <code>active</code>: <b>true</b>.</li> </ul>
<input type="checkbox"/> API Gateway only Custom header pattern (optional)	A regular expression for request headers that are to be passed to the third-party provider; for example, <code>x-Introspect-*</code> .
<input type="checkbox"/> API Gateway only Authorization header pass through	Select this check box if you want to retain the <code>Authorization</code> header for a bearer token. The default behavior is to remove this header.

c. Enter the scopes in the third screen. A scope becomes an option in the request and response for an access token. Click Add to add additional fields for scopes. Click Next when done.

Field	Description
sample_scope_1	Scope for token
sample_scope_2	Scope for token
additional scopes	Scope for token

d. Review the settings on the Summary panel.

3. Click Save and Edit to complete the configuration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Setting the visibility for OAuth providers

The visibility setting determines which provider organizations can use an OAuth provider to secure APIs.

### About this task

One of the following roles is required to configure OAuth Providers:

- Administrator
- Owner

- Topology Administrator
- Custom role with the `Settings:Manage` permissions

## Procedure

---

Follow these steps to set the visibility for the OAuth providers in your on-premises cloud:

1. In the Cloud Manager, click  Resources.
2. Select OAuth Providers.
3. Choose Edit visibility from the actions menu next to the name of the OAuth provider that requires a visibility setting.
4. Select the visibility setting for the OAuth provider. The options are:
  - Private - the OAuth provider is not visible and cannot be used by any provider organization. It is accessible only to the admin organization in Cloud Manager.
  - Public - the OAuth provider is visible and can be used by all provider organizations
  - Custom - the OAuth provider is visible only to the provider organizations that you designate
5. For Custom visibility, select the provider organizations that you want to have access to the OAuth provider.
6. Click Save to complete the operation.

## Results

---

For Private, the OAuth provider is not visible and cannot be used by any provider organizations. For Public, the OAuth provider is visible and can be used by all provider organizations. For Custom, the OAuth provider is visible only to the provider organizations designated by you.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## OAuth concepts for API Connect

OAuth is a token-based authorization protocol that allows third-party websites or applications to access user data without requiring the user to share personal information.

Note: In a multi-node cluster, OAuth operations will fail if quorum is lost. Quorum requires that the number of active nodes is greater than 50% of the total number of nodes in the cluster.

- [OAuth user scenario](#)  
Potential users of OAuth with IBM® API Connect have a number of methods to secure their API. The following scenario provides an overview of the available options.
- [OAuth introspection for third-party OAuth providers](#)  
OAuth token validation can be offloaded to the third-party Open Authorization (OAuth)/Open ID Connect (OIDC) provider by using the Introspection URL. Clients can use a third-party OAuth or OIDC provider to obtain a token that is protected by IBM API Connect. IBM API Connect can use this feature along with the mentioned provider to protect access to the API.
- [OAuth external URL and authentication URL](#)  
You can use the Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.
- [Scope](#)  
Per IETF RFC 6749, the value of the scope parameter is expressed as a list of space-delimited, case-sensitive strings.
- [Tokens](#)  
Tokens can be managed using refresh tokens and revocation URLs. You can extend the life of tokens using refresh tokens. You can end the life of a token by specifying a revocation URL.
- [Authentication URL user registry](#)  
You can use an Authentication URL user registry to specify a REST authentication service that manages user authentication, and optionally provides additional metadata to be embedded in the token.
- [Custom forms for user security](#)  
You can create custom forms for the authorization and identity extraction phase of OAuth.
- [Securing an API with a JSON Web Token](#)  
There are two methods to secure your API with a JSON Web Token. You can use the `jwt-generate` command, or you can use a token that has been generated external to IBM API Connect.
- [Troubleshooting OAuth](#)  
You can find the answers to some common questions in the Developer Portal, or in support communities and forums in DeveloperWorks, on GitHub, or on Youtube.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## OAuth user scenario

Potential users of OAuth with IBM® API Connect have a number of methods to secure their API. The following scenario provides an overview of the available options.

## Scenario overview

---

In this scenario, Alice is a user of an application. Alice can grant permission for an application to access specific information about Alice in a third-party system that is using OAuth. Depending on the type of OAuth that is supported by the target service, Alice does not enter her user name and password into the application. Instead, the application receives an access token that represents her credentials (user name and password). The application can now access the information about Alice in the target system.

For example, Alice maintains a list of books that she reads on a service that is provided by mybooks.com. Following the purchase of a smartphone, Alice installs an application on her new phone to display the book details. The phone application wants to call an API provided by mybooks.com, which can access the information. The mybooks.com API is secured by using the OAuth protocol.

To access the book details, the application must complete a two-step process:

1. The application must first obtain permission from Alice.
2. The application then uses that permission to call the target service and obtain the list of books.

In the first step, the application typically directs Alice to the provider of the target service, mybooks.com. Alice provides her user name and password, and gives permission for the application to access her information. It is important that Alice trusts that she is providing her credentials to the provider of the target service and not to an untrusted proxy application. For example, by checking that the security certificate of the website where Alice enters her credentials matches what Alice expects from the provider of the target service.

The result of this step is the access token that the application can use to call the API. The application then generates the appropriately formatted OAuth request. For example, the Authorization header, or HTTP query parameters, which includes the access token, consumer key, and signature method that are required by OAuth. This OAuth request is used to invoke the API proxy operation.

## Scenario within API Connect

---

No changes to the definition of your API operation are required to support this scenario.

1. Alice grants permission for the application to access her information *before* the invocation of the API.
2. When the application provides the Authorization header, or query parameters, containing the OAuth details about the call to the operation endpoint, the header is automatically passed through to the target service without any additional configuration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## OAuth introspection for third-party OAuth providers

OAuth token validation can be offloaded to the third-party Open Authorization (OAuth)/Open ID Connect (OIDC) provider by using the Introspection URL. Clients can use a third-party OAuth or OIDC provider to obtain a token that is protected by IBM API Connect. IBM® API Connect can use this feature along with the mentioned provider to protect access to the API.

You can use API Connect to protect an API that is secured by using the third-party OAuth access token in accordance with Introspection specification as defined in [RFC 7662](#). In addition to the specification, the `x-Introspect-` header is provided to pass other content to the third party as you require.

Authentication information can be carried in the request by configuring a basic authentication request header.

The following sequence diagram depicts the overall flow of request and response. The purpose of this diagram is only to provide a general visualization of the nature of the flow; for the precise details, refer to the explanatory information after the diagram.

The Introspect URL is configured in the Third Party OAuth provider configuration. See [Configuring a third-party OAuth provider](#).

When an API is protected by a third-party OAuth provider, API Connect will extract the bearer token and issue an HTTP POST request to the endpoint specified in the Introspect URL field.

The GET request is protected by API Connect with this feature.

You can use a header prefix to pass information to the third-party provider. The header prefix can include a regular expression and specifies the name pattern of the headers to use for sending additional information, such as `x-introspect-*`.

```
GET /petstore/pet/123 HTTP/1.1
Host: apiconnect.com
x-Introspect-type: dog
x-Introspect-name: simon
x-custom-apic: petstore123
Authorization: Bearer tGzv3JOkF0XG5Qx2TlKWIA
x-IBM-Client-Id: xxx-xxx
```

However, if you want to use a different header prefix, specify the required value in the Custom header pattern field in the third party OAuth provider configuration. For third-party OAuth provider configuration details, see [Configuring a third-party OAuth provider](#). The Custom header pattern feature is available only with the DataPower® API Gateway, if you are using the DataPower Gateway (v5 compatible) the header prefix must be `x-Introspect-`.

API Connect will issue this POST request to the introspection endpoint specified in `x-tokenIntrospect`, as illustrated in the code sample:

```
POST /oauth/introspectURL HTTP/1.1
Host: apiconnect.ibm.com
Content-Type: application/x-www-form-urlencoded
x-Introspect-type: dog
x-Introspect-name: simon
x-custom-apic: petstore123
token_type_hint=access_token&token=tGzv3JOkF0XG5Qx2TlKWIA
```

The third party OAuth/OIDC provider will respond with HTTP 200 indicating the request was successful and that payload contains the token information. API Connect honors the active claim as defined in the RFC specification.

If the value of the active claim is `true`, the token is treated as valid.

```
HTTP/1.1 200 OK
Content-Type: application/json; charset=UTF-8
Cache-Control: no-store
Pragma: no-cache

{
  "active": true,
  "token_type": "bearer",
  "client_id": "xxx-xxx",
  "username": "John Smith",
  ...
}
```

If the value of the active claim is `false`, the token is treated as invalid.

```
HTTP/1.1 200 OK
Content-Type: application/json; charset=UTF-8
Cache-Control: no-store
Pragma: no-cache

{
  "active": false
}
```

A response code other than **HTTP 200** indicates failure to process the request.

When the OAuth token is valid and active, context variables are populated with information from the introspect JSON response. For more information, see [API Connect context variables](#).

When contacting the introspection endpoint, API Connect uses `client_id/appId` and `client_secret/appSecret` to construct the HTTP Basic authorization header.

By default, if `x-introspect-basic-authorization-header` exists in the request, the value is used for the HTTP Basic authentication header when the introspection endpoint is contacted. API Connect verifies that the HTTP Basic authentication header value is Base64 encoded before it is sent, and encodes it if necessary as shown in the following example. If the header is already encoded, it is sent without modification.

```
GET /petstore/pet/123 HTTP/1.1
Host: apiconnect.com
x-introspect-basic-authorization-header: user:password
```

API Connect issues the following:

```
POST ..
Authorization: Basic M3JkLXBhcncR5LWNsaWVudF9pZDozcmQtcGFydH1fY2xpZW50X3N1Y3JldA==token_type_hint=access_token&token= ..
```

If you are using the DataPower API Gateway, you can specify your own value for the HTTP Basic authentication header by providing the required value in the Basic authentication request header name field in the third party OAuth provider configuration. The following rules determine what authentication data is passed to the introspection endpoint:

- If there is a basic authentication header in the request, the specified credentials are used. The value must be either a string in the format `user:password`, or the Base64 encoded equivalent; API Connect will Base64 encode the value if necessary before sending the request to the introspection endpoint.
- If there is no basic authentication header in the request but there are values specified in the Basic authentication username and Basic authentication password fields in the third party OAuth provider configuration, those values are used.
- If there is no basic authentication header in the request, and user name and password details are not supplied in the third party OAuth provider configuration, but `client_id` and `client_secret` values are supplied in the body of the request, these are used.
- Otherwise, an error is returned.

For third-party OAuth provider configuration details, see [Configuring a third-party OAuth provider](#).

If either, or both, of `scope` and `scope validate url` are configured, and if the response is an active token with a scope claim from the third-party OAuth Provider introspection endpoint, API Connect will further enforce the scope validation in the following order:

1. If `scope` is configured for the OAuth API protection, verify the third-party scope against the scope that is configured.
2. If `scope validation url` is configured, verify the third-party scope against the scope validation URL.
3. If the third-party OAuth provider introspection endpoint does not return a scope, the Gateway will not check the scope defined in the security definition of the API where the third-party OAuth provider resource is used. For details on configuring an OAuth security definition in an API, see [Creating an OAuth security definition](#).

For more information, see [Scope](#).

DataPower Gateway (v5 compatible) only By default the API Connect client ID and scope are sent to the third party OAuth provider. You can suppress this behavior in either of the following ways:

- Supply a `suppress-parameters` header as follows:

```
suppress-parameters: client_id
suppress-parameters: scope
```

or

```
suppress-parameters: client_id scope
```

depending on which parameters you want to suppress.

- Define an API property called `suppress-parameters` in the API definition itself, with one of the following string values:

```
client_id
```

```
scope
```

or

```
client_id scope
```

depending on which parameters you want to suppress. For information on how to define API properties, see [Setting API properties](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## OAuth external URL and authentication URL

You can use the Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.

---

## Including custom metadata in a token

In many scenarios, custom metadata needs to be included during the access token generation process. The metadata is either stored inside the access token or it is sent along with the access token to the client application. The client application can then send that access token, or the metadata in the payload, in a subsequent request to IBM® API Connect where the metadata is retrieved, validated, or sent to the downstream systems as required.

Examples include, but are not limited to:

- When resource owners are authenticated, metadata about the authenticated resource owner needs to be stored within the access token.
- The grant type that was used to obtain the token is another example of metadata stored within the access token.
- A confirmation code that needs to be sent to the client application along with access token is stored as metadata within the access token.

## Configuring External URL or Authentication URL in API Connect to obtain metadata

Metadata can be set by using either or both of the following URLs:

- External URL - When you call the External URL, an HTTP GET request is sent and API Connect expects an HTTP 200 OK along with an optional set of the specified response headers.
- Authentication URL - When you call the Authentication URL, the API Connect gateway sends a GET request with HTTP headers and then processes any HTTP response from the URL. For authentication, a REST authentication service is expected at the Authentication URL.  
See: [Authentication URL](#).

The External URL endpoint is entered in the Metadata section when you configure an OAuth Provider in the Cloud Manager or API Manager UI.

Use the following HTTP headers in the response, depending on the type of gateway you are using:

- DataPower® API Gateway:

**X-API-OAUTH-METADATA-FOR-PAYLOAD**

**X-API-OAUTH-METADATA-FOR-ACCESSTOKEN**

Note: These are the default header names for the DataPower API Gateway but you can override them; see [Configuring metadata for a native OAuth provider](#).

- DataPower Gateway (v5 compatible):

**API-OAUTH-METADATA-FOR-PAYLOAD**

**API-OAUTH-METADATA-FOR-ACCESSTOKEN**

The response header value from **X-API-OAUTH-METADATA-FOR-PAYLOAD** or **API-OAUTH-METADATA-FOR-PAYLOAD** is placed in the response payload and indicated as **metadata**.

The response header value from **X-API-OAUTH-METADATA-FOR-ACCESSTOKEN** or **API-OAUTH-METADATA-FOR-ACCESSTOKEN** is placed within the access token and indicated as **miscinfo**.

The two metadata response headers are case insensitive and you must escape any special characters in the string value content.

An example response payload that contains metadata along with the access token:

```
{
  "token_type": "bearer",
  "access_token": "AAEkNzhjDHYyyYy...cL0Mv6ct137w7ZU",
  "metadata": "m:metadata-for-payload_content"
  "expires_in": 3600,
  "scope": "read",
  "refresh_token": "AAEnj5SynCMYbF...oEZ6JjxYax_HdNg",
}
```

This example output from the token introspection endpoint shows the contents of the access token with **miscinfo** containing the metadata information.

```
{
  "active": true,
  "token_type": "bearer",
  "client_id": "78c2f10f-799a-4e1f-8e0a-098634997a35",
  "username": "Fred Smith",
  "sub": "fred",
  "exp": 1479850049,
  "expstr": "2016-11-22T21:27:29Z",
  "iat": 1479846449,
  "nbf": 1479846449,
  "nbfstr": "2016-11-22T20:27:29Z",
  "scope": "read",
  "miscinfo": "m:metadata-for-accesstoken_content",
  "client_name": "MobileApp"
}
```

## Input to the External URL

The following request headers are sent to the External URL.

Note: Any existing metadata values that were previously sent from the Authentication URL are also sent in the two request headers **x-existing-metadata-for-payload** and **x-existing-metadata-for-access-token**. The Metadata URL can make use of this information to create a new set of metadata values.

The two request headers that are sent to the Metadata URL are displayed in bold text.

```
X-existing-metadata-for-payload payload-from-auth-url
X-existing-metadata-for-access-token token-from-auth-url
X-URI-in /org/env/miscinfo/oauth2/token (the URL that was sent to APIConnect for this particular token request)
X-METHOD-in POST
X-POST-Body-in client_id=client_id&grant_type=password&scope=read&username=name&password=password
X-X-Client-IP IP_address
X-X-Global-Transaction-ID ID_number
...
```

Note: If you are using the DataPower API Gateway rather than the DataPower Gateway (v5 compatible), the **X-POST-Body-in** header is not supported.

## Retrieving Metadata in API Connect

As described in the previous example scenarios, the metadata can be retrieved from the access token in the Application API and sent to the downstream systems. Retrieval can be done in the API assembly, which is secured to accept tokens in the security definitions.

In the resource API that accepts an access token, the `miscinfo` field can be accessed in the Assembly with the `oauth.miscinfo` context variable, as in the example.

```
apim.setvariable('message.body', apim.getvariable('oauth.miscinfo'));
```

You can also use token introspection to look at the contents of the access token.

## Refresh tokens and metadata

The Authentication URL (if configured for authentication) is invoked first, during authentication of the resource owner. The External URL is invoked as the last step, just before the generation of the access token. The only exception is when access tokens are generated from a refresh token. In cases where refresh tokens are used to generate new access tokens, the External URL is not invoked. The metadata from the refresh token is retained and then copied into the newly generated access token.

## Identifying the source of the metadata

The metadata is prefixed with keywords to indicate whether it originated from the External URL or the Authentication URL.

- Metadata from the External URL is prefixed with `m`:
- Metadata from the Authentication URL is prefixed with `a`:

Note: When revocation is enabled, some internal details are also stored in the `miscinfo` field, in brackets within the access token as shown in the following example:

```
"miscinfo": "[tlsprofile@https://api-revoke-url:443/server/revocation-url]m:metadata-for-accesstoken_content"
```

## Maximum size of the metadata

Metadata for the access token cannot exceed 512 bytes.

Metadata for the payload does not have a specific size restriction, except for when you use the Authorization code grant type. These restrictions are described in following sections.

## Characters are not allowed in metadata in certain scenarios

When you use the Authorization code grant type, or when a consent form is used for implicit grant type, there is a temporary state or code where the metadata from the authentication URL is stored. API Connect internally uses two prefixes - `!ma` and `!mp` to differentiate between payload and token metadata received from the Authentication URL and store them internally in the temporary state/code. Hence these specific character sequences - `!ma` and `!mp` should not be used as the metadata itself.

## Grant types and metadata

The OAuth grant types described in the following sections include `authorization code` (access code), `implicit`, and `client credentials` (application).

Authorization code grant type

- When metadata is included from an Authentication URL for an Authorization code grant type, as it is a three legged flow, both the content and the payload are stored within the `dp-state` and carried on to the authorization code and to the access token. Note that around 10 characters are used internally to differentiate between the metadata for payload and metadata for the access token when stored in the `dp-state`. In addition, if revocation is enabled, that will also be part of the token metadata. Hence the combined size of the token metadata, the payload metadata (including the 10 characters of internal data), and internal revocation details, cannot exceed 512 bytes in total.

If the overall size of the metadata exceeds 512 bytes, then the access token generation succeeds, but the metadata fields contain an error message of "metadata too large" as shown in the example.

```
"metadata": "m:error: metadata too large for AZ code grant type[Authorization Code-metadata-url-payload]"
"miscinfo": "[r:gateway]m:error: metadata too large for AZ code grant type[Authorization Code-metadata-url-token]"
```

This size restriction can be overcome when the metadata is sent from the Metadata URL and not from the Authentication URL, because the metadata is not stored in `dp-state` or in the authorization code.

Example of the `authorization code` (access code) grant type:

```
$ curl -k -d
"grant_type=authorization_code&code=$mycode&client_id=$myid&scope=scope_introspect&redirect_uri="
https://9.70.153.90/fei/sb/introspectpl/oauth2/token
{ "token_type": "bearer",
"access_token": "AAEkOTh1ZDhhNjYtYTQ1ZS00YTmzLWE0N2QtZmE2OGZkMzQ0NzQ2Zn5Tl_TqYFeIfB7Bff6HFGibEoOjWXXEA84oFsWue4NY-
RRZVdnGSaXAIYJz7s5vczfk5EV-BIb_6P_lYKm3ahrfrhR5kI3sPO0uADEoseIP5-09anUpEM5yhsayXvZbJ_6VDYz-hyXSJHTNqVj-

```

#### Implicit grant type

- When implicit grant type is used, the access token and the metadata are returned in the `Location` header as a fragment, as you see in the example.

```
< Location:
https://localhost#access_token=AAEkOThlZDhhNjYtYTQ1ZS00YTMzLWE0N2QtZmE2OGZkMzQ0NzQ2buS2KfWdq-
nYBJSi4nmPxQBtLae17tKBPRMzwp5BC386nlxpoOTE1G748ZVH6Mq_TJL3GeV3PtXTVIkWOlBji_7t1jjiQfnpVfrNkovvZkhUexYmFkcDsmLSdaWxZ6Pc
IMPAC4ojT8qV1sYV-
ChTk36yqOx_NiKimZaDikDk7WTg&expires_in=3600&scope=scope_introspect&token_type=bearer&metadata=a%3A[Implicit-Test-
auth-url-payload]

$ curl -k -H "X-IBM-Client-Id: $myid" -H "X-IBM-Client-Secret: $mysecret" -d
"token_type_hint=access_token&token=$mytoken" https://9.70.153.90/fe1/sb/introspectp1/oauth2/introspect
{ "active": true, "token_type": "bearer", "client_id": "98ed8a66-a45e-4a33-a47d-fa68fd344746",
"username": "anyuser", "sub": "anyuser", "exp": 1484768365, "expstr": "2017-01-18T19:39:25Z", "iat": 1484764765,
"nbf": 1484764765, "nbfstr": "2017-01-18T18:39:25Z", "scope": "scope_introspect", "miscinfo": "[r:gateway]a:[Implicit-
Test-auth-url-token]", "client_name": "oauth_app" }
```

#### Client credentials grant type

Authentication URL will not be invoked when using client credentials grant type, as there is no resource owner. The metadata from Authentication URL is not available for this grant type. However, content returned from Metadata URL will be included as metadata.

## Behavior when retrieving metadata with both an External URL and an Authentication URL

If an External URL is configured and a connection to the external server is successful, the response headers overwrite any existing metadata obtained from the Authentication URL to become the final value. Therefore, you must carefully examine the incoming request headers and create appropriate response headers from the External URL.

If an External URL is configured, but the connection to the External URL fails, then a failure message of "error on metadata url" is written for metadata in both the payload and the access token.

If an External URL is configured and the connection is successful, but the remote server does not send any of the specified HTTP response headers, a blank value is written for metadata in both the payload and the access token.

Attention: An External URL overwrites existing values from Authentication URL. This includes blank values.

If no External URL is configured, the metadata that is obtained from the Authorization URL is retained as the final value.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Scope

Per IETF RFC 6749, the value of the scope parameter is expressed as a list of space-delimited, case-sensitive strings.

In IBM® API Connect, scopes have no inherent meaning. Instead, scopes are defined in the OAuth Provider so that an application can request an access token that is valid for one or more of the scopes. In the secured API, scopes are listed as requirements for an access token to be considered valid. All scopes that are listed by the security definition for the API must be granted by the access token.

## OAuth provider

To provide more refined support for the OAuth scope handling, API Connect allows the [Authentication URL user registry](#) extension to modify the scope value.

When you define an [OAuth provider](#), the Advanced scope check extensions provide the flexibility to check and override allowed scopes. The optional extensions are Application scope check and Owner scope check.

The scope that is eventually received by the application is determined by the interactions that are described in the three following paragraphs. Scope processing follows the sequence of items 1, 2, and 3 in the following list, offering three opportunities to override the scope value. Figure 1 provides an overview of the process.

- After the application successfully authenticates, and if OAuth Native provider `>Advanced scope check` `>Application scope check` is configured, API Connect makes a call to allow extra verification and uses the contents of `x-selected-scope` to override the scope value that was initially requested by the application. When Application scope check is enabled, the HTTP response header `x-selected-scope` must be present, or the call fails.
- If OAuth Native provider `>User Security` `>Authentication` is configured to authenticate application users using an Authentication URL, then API Connect makes a call, as documented in [Authentication URL user registry](#). When the response code is `HTTP 200`, and the response header `x-selected-scope` is present, the value that is configured in `x-selected-scope` is used as the new scope value, overriding both what the application already requested and what was provided in the Application scope check described in paragraph 1. In the response header, `x-selected-scope` is an optional element.
- After the user successfully authenticates, and if OAuth Native provider `>Advanced scope check` `>Owner scope check` is enabled and configured with a valid URL, API Connect makes a call to allow the content of `x-selected-scope` to refine the scope value. When Owner scope check is enabled, the HTTP response header `x-selected-scope` must be present, or the call fails.

Figure 1. OAuth advanced scope overview

The final scope permission that is granted by the access token is the result of the flow described in items 1, 2, and 3. [Figure 2](#) shows a more detailed view of the transaction flow with examples that show when `x-selected-scope` provides a new scope value.

Figure 2. OAuth advanced scope detail

```
HTTP/1.1 200 OK
Cache-Control: no-store
Pragma: no-cache
X-Custom-For-Assemble-Process: audit
```

Any HTTP response header that begins with "x-" is kept as the context variable `oauth.advanced-consent`. Based on the example successful response, `X-Custom-For-Assemble-Process: audit` becomes `oauth.advanced-consent.x-custom-for-assemble-process`, and can be accessed in the assemble step.

Additional validation options

You can optionally use additional fields for validation:

Request Header

Defines the regular expression to match against **request** headers. Matching headers are included in the request to the advanced scope validation endpoint.

Response Context Variable

Defines the regular expression to match against **response** headers. Matching headers are saved as context variables in the format `oauth.advanced-consent.*`.

## Related information

- [IETF RFC 6749](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Tokens

Tokens can be managed using refresh tokens and revocation URLs. You can extend the life of tokens using refresh tokens. You can end the life of a token by specifying a revocation URL.

This section contains information regarding token management, including refreshing and revoking tokens, redirecting, and managing tokens with the DataPower Gateway.

- [Refresh tokens](#)  
If you are using OAuth authentication, you can enable refresh tokens. Refresh tokens are issued to the client to obtain a new access token when the current access token becomes invalid or expires, or to obtain additional access tokens with identical or narrower scope.
- [Token revocation](#)

API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Refresh tokens

If you are using OAuth authentication, you can enable refresh tokens. Refresh tokens are issued to the client to obtain a new access token when the current access token becomes invalid or expires, or to obtain additional access tokens with identical or narrower scope.

When you are using OAuth authentication, API requests must include a valid access token, by using the Authorization HTTP header. Access tokens that are issued by the IBM® API Connect Token Endpoint are valid for 3600 seconds (1 hour) by default, as indicated by the `expires_in` property that is returned on the token request. The following code block shows an example API request with an Authorization header:

```
GET /bankingApi/accountSummary?client_id=32427ce5-bb7c-48a7-9de3-4bb629091103
HTTP/1.1
Accept: application/json
Host: api.ibm.com
Authorization: Bearer AAEFYy1hbGx1hdS5nVX4x6iTL2sb3ymBivQb...
```

After an access token expires, if the option is enabled in the OAuth provider configuration Tokens > Refresh tokens screen, the application uses refresh tokens. Each refresh token is valid for approximately 31 days after it is issued (or for the Time to Live time period specified) and can be used only once to request a new access token. Along with the new access token, a new refresh token is also returned. For details on how to enable refresh tokens, see [Configuring a native OAuth provider](#).

If the access token is expired and the application does not have a refresh token, it must restart the OAuth exchange by using the choice of Grant Type(s) allowed by the OAuth provider.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Token revocation

In IBM® API Connect, you can revoke or refresh tokens. If necessary, you can also revoke all tokens that are issued to a specific client ID or a resource owner.

### Token revocation using an external third party service

---

This topic describes token revocation using a third party, external service. This option is configured in the Native OAuth provider, using the Token Management `type` = Third party screen. The revocation URL is an endpoint that links to an external service which contains information about access or refresh tokens. API Connect is involved in the initial creation and validation of tokens. When an OAuth revocation URL is present, API Connect calls the URL to determine if the associated token can be trusted. The token server then checks a token *blocklist* (a data store of inactive tokens) to ensure that the token is still valid. If the token is still valid, API Connect continues the processing.

### Examples

---

A number of revocation examples follow. The first shows a sample fetch request and the response from a remote revocation URL.

#### GET request and response

---

In this example, an API Gateway server issues a GET request to the Revocation URL and receives a result. It shows that different resource owners (Laura and Emily) can revoke all tokens when using the same application (client ID).

Request:

```
<?xml version="1.0" encoding="UTF-8"?>
GET <revocationURL> HTTP/1.1
User-Agent: IBM-APIManagement/4.0
Accept: application/xml; text/xml
```

Response:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>

<!--
Access Tokens and/or Refresh Tokens that are revoked can be individually listed.
To keep this list small, please only include access tokens and refresh tokens that are valid.
For access tokens, any token older than 20 minutes is no longer valid.
For refresh tokens, any token older than 44700 minutes is no longer valid.
-->

<token type="access">AAETb2F1dGgtcmV2b2t1LWN1c3RvbnZaR1VbnPSc1..</token>
<token type="refresh">fZaR1VbnPSc1UGTjCRdq4mPbOosD2+aZIKbJ6bTeW...</token>

<!--
If a resource owner has revoked all tokens issued to a given application, please
list them as shown here.
-->

<resource-owner client-id="760d75a2-44b1-4485-8c6f-0d264fcf7398">laura</resource-owner>
<resource-owner client-id="760d75a2-44b1-4485-8c6f-0d264fcf7398">emily</resource-owner>

</oauth-revocation>
```

#### POST request and response

---

The next example shows a post request and response.

Request:

```
POST <revocationURL> HTTP/1.1
User-Agent: IBM-APIManagement/4.0
Content-Type: application/xml

<?xml version="1.0" encoding="UTF-8"?>
<token>
  <token_type>bearer</token_type>
  <access_token>AAENYy1hbGwtcmVmcVzaOfNeQKX8ZeojsBY9v0FI7/OerQvzKHq...</access_token>
  <expires_in>3600</expires_in>
  <scope>3600</scope>
  <resource-owner>alice</resource-owner>
  <client_id>83d9cdcd-ba72-4d00-abae-005da8da5fb1</client_id>
</token>
```

Response:

```
HTTP/1.1 200 OK
```

### Provide token information on revocation request

---

In this example, the application calls an API and passes a bearer token. In response, the Gateway fetches the revocation URL and provides information on the token being verified.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Alternatively, the same process occurs when using a refresh token to issue a new access token. The application sends a refresh request to the token service. The Gateway then fetches the revocation URL, providing information on the refresh token being verified.

Gateway:

```
GET <revocationURL>GET HTTP/1.1
refresh-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Note: If you are using a third party OAuth provider then, for API Calls with bearer tokens, when Introspect URL is enabled on the API, the revocation URL is not applicable. Instead, the third party endpoint must validate the token and also check for revocation before returning a 200 OK response to the Gateway.

## Revoking tokens issued to Alice up to and including a specific date

On May 1st, Alice loses her phone and needs to reset her password. As a result, the token provider wants to revoke every token issued before Alice lost her phone. In this example, the Gateway sends a GET request to the revocation service. The revocation service replies confirming revocation of the specified tokens.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <resource-owner before="2015-05-01T09:30:10Z">alice</resource-owner>
</oauth-revocation>
```

## Revoking all tokens issued up to and including a specific date

Under certain catastrophic conditions, you may need to revoke all tokens issued up to and including a specific date, for example, May 1st. In this example, the Gateway sends a GET request to the revocation service. The revocation service replies confirming revocation of the specified tokens.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <everytoken before="2015-05-01T09:30:10Z" />
</oauth-revocation>
```

## Putting it all together

The following shows the examples contained in this topic executed in a single action:

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
HTTP/1.1 200 OK
Content-Type: application/xml
Cache-Control: public, max-age=120
Date: Fri, 08 May 2015 21:49:03 GMT
```

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <resource-owner before="2015-04-08T09:30:10Z">mary</resource-owner>
  <resource-owner before="2015-04-12T09:30:10Z">john</resource-owner>
  <resource-owner before="2015-04-13T09:30:10Z">kevin</resource-owner>
  <resource-owner before="2015-04-01T09:30:10Z">alice</resource-owner>
</oauth-revocation>
```

Notes:

- In the previous example, there are no entries older than one month in the response (the maximum life of a refresh token).
- Each response is cached for up to two minutes according to response's directive.
- The **before** attribute uses the **xs:dateTime** syntax.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Authenticating and authorizing through a redirect URL

You can use a service that is hosted externally from IBM® API Connect to collect authentication and authorization details from your user when an application requests access on that user's behalf.

### Before you begin

To complete this task, you will need to either create or have created an OAuth security definition that uses Implicit grant type or Access Code (Authorization Code) grant type. For more information, see [Creating an OAuth security definition](#).

### About this task

If you use methods for authentication that are not supported by API Connect, you can redirect users to a suitable URL at which they can authenticate. The user is then returned to the OAuth process after authentication and authorization have been confirmed.

The following illustration indicates the transaction flow for third party authentication.

Figure 1. Third party authentication (AU) and authorization (AZ) transaction flow

1. The application initiates a request to access an API protected with a third-party entity. API Connect redirects the application with an **HTTP 302** redirect based on **identity extraction** -> **redirect** -> **redirect-url**, for user authentication (and optional authorization).
2. The application communicates directly with the third-party entity to gather user identity. API Connect is not involved in this communication. After the third-party entity finishes processing authentication (and optional authorization), it returns an **HTTP 302** redirect that uses the **original-uri** from the request, with the username and confirmation code appended.
3. API Connect receives the request that includes the username and confirmation code, and communicates with the authentication URL, based on **authentication** -> **x-ibm-authentication-url**, to confirm user identity before the request is completed.
4. An **HTTP 200** response from the third-party entity allows API Connect to continue the OAuth 2.0 request process as if the owner is authenticated. The request is then processed according to the **grants** type.
  - - **accessCode** returns a temporary code to the application.
  - - **implicit** returns the access token to the application.

For any response other than HTTP 200, the request fails with a statement added to the error log.

## Procedure

To create an external form, and to indicate the URL to which API Connect will redirect users, complete the following instructions:

1. Create your service for authentication and authorization. You will use the URL of the landing page of this service as your redirect URL.
  - a. To include elements in your form that are provided by API Connect, use the following query parameters from the URL that your user is redirected to. Note: With the exception of **original-url**, none of these parameters are included in the URL automatically; you must add them as required.

app-name	The name of the application requesting access, as provided through the Developer Portal.
appid	The id of the application requesting access.
catalog	The name of the catalog where the product is being used by the application.
catalogid	The id of the catalog where the product is being used by the application.
catalogtitle	User-friendly display name for the catalog.
org	The name of the consumer organization that hosts the application.
orgid	The id of the consumer organization that hosts the application.
orgtitle	User-friendly display name for the organization.
original-url	The original URL that the user was directed to by the application, including query parameters from the original URL that are necessary for standard OAuth 2.0 requests. You can include these parameters in your service to provide information to the user. Additionally the state_nonce is appended. The state_nonce is a hash code generated by API Connect for verification purposes. The URL is URL-encoded and should be decoded before further use, the <b>state_nonce</b> should remain unchanged.
provider	The name of the API provider organization.
providerid	The id of the API provider organization.
providertitle	User-friendly display name for the provider organization.
requested-scope	[optional] If <a href="#">Application Scope check</a> is enabled and replaces the <b>scope</b> from the initial application request, this field holds the <b>scope</b> value from the initial application request, and the new replacement scope value is put into <b>original-url</b> .
transid	transaction id used in the GW for the transaction which trigger this call

The URL to which the user is sent to when they are redirected to your page has the following form:

***Redirect\_URL?original-url=Original\_URL&state\_nonce=R\_State&app-name=Application\_Name***

where all variables are as described previously. The Redirect URL does not have a size limit enforced by API Connect.

- b. Create the stages of authentication, authorization, and any intermediate stages that you require to take place before you allow access to the application. Upon completion of these stages, redirect the user to the *Original\_URL* and append a user name, their confirmation code, and the application name to be evaluated for access grant or denial by API Connect. The confirmation code does not have a size limit enforced by API Connect. Original URL requires the following form:

***Original\_URL&username=User\_Name&confirmation=Confirmation\_Code***

where all variables are as described previously.

For example:

```
https://your_gateway.com/your_org/your_catalog/your_api/oauth/authorize?
response_type=code&redirect_uri=https://example.com/redirect&scope=/your_api&client_id=5af57a4a-6db9-4141-ad08-
5709432af66e&state_nonce=HoIbRG+6bZtq1B7LDkq4gj1D3SHKq1CbnYdHs/bMz2Y=&username=spoon&confirmation=12345678
```

- c. To send your own error responses after the authentication and authorization service, redirect the user to the *Original\_URL* and append an error code. You can also append a user name. Use the following form:

***Original\_URL&username=User\_Name&error=Error\_Response***

where *Error\_Response* is the message you wish to send and all other variables are described as previously.

For example:

```
https://your_gateway.com/your_org/your_catalog/your_api/oauth/authorize?
response_type=code&redirect_uri=https://example.com/redirect&scope=/your_api&client_id=5af57a4a-6db9-4141-ad08-
5709432af66e&state_nonce=HoIbRG+6bZtq1B7LDkq4gj1D3SHKq1CbnYdHs/bMz2Y=&username=User&error=access_denied
```

2. Create a service to validate the confirmation code and user name. API Connect makes a GET call to your authentication URL after the user is redirected back to the authorization URL. When the call is made, it includes in its authorization header the user name and confirmation code you supplied previously. Confirm that these are correct and respond with an HTTP success code such as 200 OK if you want to allow access, or non-200 HTTP response code, such as 401 Unauthorized to deny access.
3. In your OAuth provider configuration, supply the redirect URL that is used in Step 1 and the authentication URL that is used in Step 2. For more information on configuring an OAuth Provider, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Token management with the DataPower Gateway (v5 compatible)

API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.

In order to manage tokens with the DataPower® Gateway (v5 compatible), you must set the Token Management Type to Native in your Native OAuth provider configuration. See [Configuring token management and revocation for a native OAuth provider](#) when using Cloud Manager or [Configuring token management and revocation for a native OAuth provider](#) when using API Manager.

Also, the DataPower quota enforcement server must be enabled on the DataPower Gateway to use the distributed cache to manage tokens. See [Quota enforcement](#).

When distributed cache support is enabled, replay protection is provided across the gateway cluster through the quota enforcement server. This support ensures that the same token cannot be reused across the members of the quota enforcement peer group.

Important:

If you have a cluster of DataPower Gateway servers, the OAuth data synchronization behavior across the servers depends on whether or not you enable revocation:

- If you enable revocation, API Connect uses the DataPower quota enforcement server, and OAuth data is synchronized across the servers. If an access token is obtained from one server, the OAuth data synchronization ensures that the same authorization code cannot be used to obtain an access code from another server. You must ensure that the DataPower quota enforcement server is configured.
- If you disable revocation, API Connect does **not** use the DataPower quota enforcement server and OAuth data does not synchronize across the cluster of DataPower Gateway servers. Therefore, to prevent the same authorization code being used to obtain an access code from more than one server you must configure DataPower to synchronize OAuth data across the servers, by using the DataPower Gateway console.

To configure DataPower to synchronize OAuth data, ensure that the DataPower quota enforcement server is configured. For more information, see [Configuring the quota enforcement server](#).

## Resource owner revocation

When Resource owner revocation path is selected in the Token Management screen, the configuration inserts two REST API calls to /oauth2/issued.

- An HTTP GET operation that retrieves a list of all granted permissions for a specific user.
- An HTTP DELETE operation that revokes an application for a specific user.

The setting inserts header-based security definitions of client ID and client secret as shown in the **View permissions example**. The API call to revoke a given application for a given user is shown in the **Revoke permissions example**.

View permissions example

To list all the applications granted by user `cn=spoon,o=ibm` with username `spoon` and password `spoon` using a registered administration application of `5287fe53-8747-438a-8262-681ec75b79c5`.

- Request:

```
GET /oauth2/issued
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
[
  {
    "clientId": "7369ad66-5674-b7d3-4567-de35283421aca",
    "owner": "cn=spoon,o=ibm",
    "clientName": "PetStore Application",
    "scope": "listpet",
    "issuedAt": 1503327054,
    "consentedOn": 1503327054,
    "expiredAt": 1503330654,
    "refreshTokenIssued": false,
    "appId": "d2031f0f27339315333734ab9",
    "org": "PetStoreOrg",
    "orgTitle": "Katie Pet Grooming Inc",
    "orgId": "5887803de4b06e6998c4b2c7",
    "provider": "SuperStore",
    "providerTitle": "Simon SuperStore",
    "providerId": "5887803de4b06e6998c4b2c7",
    "catalog": "publicapi",
    "catalogTitle": "For public",
    "catalogId": "5887803de4b06e6998c4b2d3"
  },
  {
    "clientId": "a8746323-9825-a842-8736-abd8202356ac8",
    "owner": "cn=spoon,o=ibm",
    ...
  }
]
```

Revoke permissions example

To revoke application `a8746323-9825-a842-8736-abd8202356ac8` by owner `cn=spoon,o=ibm`.

- Request

```
DELETE /oauth2/issued?client-id=a8746323-9825-a842-8736-abd8202356ac8
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

## Client revocation

When Client revocation path is selected in the Token Management screen, the result is the following:

This option inserts one REST API call to /oauth2/revoke, which supports OAuth 2.0 [IETF RFC 7009](#). An HTTP POST operation that an application can send to this API to revoke either an `access_token`, or `refresh_token` with `token_type_hint` as shown in the following examples:

Revoke `access_token`

- Request:

```
POST /oauth2/revoke
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded
token_type_hint=access_token&token=AAIHZGVmYXVsdD1-KqwD0Yc3EDn941SWX14xuR....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

Revoke `refresh_token`

- Request:

```
POST /oauth2/revoke
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded
token_type_hint=refresh_token&token=.....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Token management with the DataPower API Gateway

API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.

Note: The steps described in this topic are required if you are using the DataPower® OVA or appliance version of the gateway. For the API Connect supplied Kubernetes deployment, the API Security Token Manager is preconfigured provided that, in the gateway service custom resource file, v5 compatibility mode is disabled and the token management service is enabled:

```
spec:
```

```
apicGatewayServiceV5CompatibilityMode: false
tokenManagementService:
  enabled: true
```

For more information, see [Installing the DataPower Gateway subsystem](#).

In order to manage tokens with the DataPower API Gateway, you must set the Token Management Type to Native in your Native OAuth provider configuration. See [Configuring token management and revocation for a native OAuth provider](#) when using Cloud Manager or [Configuring token management and revocation for a native OAuth provider](#) when using API Manager.

Note: This setting is also required when you use a third-party OAuth provider and **Introspect** **cache type** is set to **protocol** or **Time to live**.

For token management with the DataPower API Gateway, you must configure the API Security Token Manager on the gateway. Complete the following steps:

1. Log in to the DataPower administration console, selecting apiconnect for the domain, and WebGUI for the Graphical Interface.
2. In the search box, enter API Security Token Manager, then click on the API Security Token Manager link that displays in the search results.
3. For the Administrative state, select enabled.
4. Click the + icon alongside the Gateway Peering field to create a new gateway peering object.
5. Provide a Name and a Local address.
6. In the Local port and Monitor port fields, provide values that aren't already in use by services for the Local address.
7. Ensure that Peer group mode is selected.
8. Alongside the Peers field, use the add button and accompanying field to add at least two peers, to ensure that quorum is achieved.
9. If the Enable SSL option is selected, select a value for the Identification credentials.
10. For Persistence location, select a setting other than memory.
11. When done, click Apply.
12. Repeat steps 1 to 11 for each DataPower API Gateway in the peer group.
13. When done, click Apply, then click Save Configuration to save your changes.

For more information, see [Defining the API security token manager](#) and [Creating a gateway peering instance](#).

## Resource owner revocation

When Resource owner revocation path is selected in the Token Management screen, the configuration inserts two REST API calls to /oauth2/issued.

- An HTTP GET operation that retrieves a list of all granted permissions for a specific user.
- An HTTP DELETE operation that revokes an application for a specific user.

The setting inserts header-based security definitions of client ID and client secret as shown in the **View permissions example**. The API call to revoke a given application for a given user is shown in the **Revoke permissions example**.

View permissions example

To list all the applications granted by user `cn=spoon,o=ibm` with username `spoon` and password `spoon` using a registered administration application of `5287fe53-8747-438a-8262-681ec75b79c5`.

- Request:

```
GET /oauth2/issued
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
[
  {
    "clientId": "7369ad66-5674-b7d3-4567-de35283421aca",
    "owner": "cn=spoon,o=ibm",
    "clientName": "PetStore Application",
    "scope": "listpet",
    "issuedAt": 1503327054,
    "consentedOn": 1503327054,
    "expiredAt": 1503330654,
    "refreshTokenIssued": false,
    "appId": "d2031f0f27339315333734ab9",
    "org": "PetStoreOrg",
    "orgTitle": "Katie Pet Grooming Inc",
    "orgId": "5887803de4b06e6998c4b2c7",
    "provider": "SuperStore",
    "providerTitle": "Simon SuperStore",
    "providerId": "5887803de4b06e6998c4b2c7",
    "catalog": "publicapi",
    "catalogTitle": "For public",
    "catalogId": "5887803de4b06e6998c4b2d3"
  },
  {
    "clientId": "a8746323-9825-a842-8736-abd8202356ac8",
    "owner": "cn=spoon,o=ibm",
    ...
  }
]
```

```
}  
]
```

Revoke permissions example

To revoke application `a8746323-9825-a842-8736-abd8202356ac8` by owner `cn=spoon,o=ibm`.

- Request

```
DELETE /oauth2/issued?client-id=a8746323-9825-a842-8736-abd8202356ac8  
HTTP/1.1  
Host: apic.ibm.com  
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5  
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7  
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response

```
HTTP/1.1 200 OK  
Content-Type: application/json;charset=UTF-8  
Cache-Control: private, no-store, no-cache, must-revalidate  
Pragma: no-cache
```

```
{ "status": "success" }
```

## Client revocation

---

When Client revocation path is selected in the Token Management screen, the result is the following:

This option inserts one REST API call to `/oauth2/revoke`, which supports OAuth 2.0 [IETF RFC 7009](#). An HTTP POST operation that an application can send to this API to revoke either an `access_token`, or `refresh_token` with `token_type_hint` as shown in the following examples:

Revoke `access_token`

- Request:

```
POST /oauth2/revoke  
HTTP/1.1  
  
Host: apic.ibm.com  
  
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5  
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7  
Content-Type: application/x-www-form-urlencoded  
  
token_type_hint=access_token&token=AAIHZGVmYXVsdD1-KqwD0Yc3EDn94lSWX14xuR....
```

- Response:

```
HTTP/1.1 200 OK  
Content-Type: application/json;charset=UTF-8  
Cache-Control: private, no-store, no-cache, must-revalidate  
Pragma: no-cache
```

```
{ "status": "success" }
```

Revoke `refresh_token`

- Request:

```
POST /oauth2/revoke  
HTTP/1.1  
  
Host: apic.ibm.com  
  
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5  
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7  
Content-Type: application/x-www-form-urlencoded  
  
token_type_hint=refresh_token&token=.....
```

- Response:

```
HTTP/1.1 200 OK  
Content-Type: application/json;charset=UTF-8  
Cache-Control: private, no-store, no-cache, must-revalidate  
Pragma: no-cache
```

```
{ "status": "success" }
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Authentication URL user registry

You can use an Authentication URL user registry to specify a REST authentication service that manages user authentication, and optionally provides additional metadata to be embedded in the token.

This support can optionally enable any of the following:

- Providing the authenticated credential to IBM® API Connect. For example, the user logs-in with user name: `spoon`, and password: `fork`. When the user is authenticated, the credential becomes `cn=spoon,o=eatery`. The credential is kept in the OAuth `access_token` to represent the user.
- Providing metadata support. Allow extra metadata to be stored in the `access_token`.
- Overriding the `scope` that the application receives after a successful OAuth protocol processing. By responding with a specific header, the Authentication URL endpoint can replace the `scope` value that the application receives. For example, you can provide a specific resource owner an account number within the `scope` header response for use in future processing steps.

When you call the Authentication URL user registry, the API Connect gateway sends a GET request with HTTP headers and then processes any HTTP response from the URL. For authentication, a REST authentication service is expected at the Authentication URL.

The following response from the REST authentication service indicates that user authentication is successful and that API Connect will use `cn=spoon,o=eatery` as the user identity.

```
HTTP/1.1 200 OK
Server: example.org
X-API-Authenticated-Credential: cn=spoon,o=eatery
```

For information on how to configure a User Security policy in an API assembly for use with an Authentication URL user registry, see [User Security policy](#).

For an example of an OAuth provider configuration that uses an Authentication URL user registry, see [Example - using multiple OAuth policies in an OAuth provider assembly](#).

API Connect considers any non-200 HTTP response code a failed user authentication attempt.

When an Authentication URL user registry is invoked, two HTTP response headers are available that include metadata in the access token or in the response payload that contains the access token. For more information, see [OAuth external URL and authentication URL](#). The two metadata response headers are:

```
API-OAUTH-METADATA-FOR-ACCESSTOKEN
API-OAUTH-METADATA-FOR-PAYLOAD
```

When an Authentication URL is invoked, an HTTP response header is available to override the requested `scope` from the application. For more information, see [Scope](#). The response header is:

```
x-selected-scope
```

If you are using the DataPower® API Gateway rather than the DataPower Gateway (v5 compatible), this diagram is provided for guidance only and is not fully accurate for this release.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Custom forms for user security

You can create custom forms for the authorization and identity extraction phase of OAuth.

### About this task

The Native OAuth provider configuration provides the capability for requiring additional authentication and authorization steps for user security. Custom HTML forms may be created to extract the identity of the user and to authorize the user. This capability applies to Implicit, Resource owner password, and Access code grant types.

- [Creating a custom HTML login form for user security](#)  
Custom HTML forms can be created for user security during the identity extraction stage in OAuth.
- [Creating a custom HTML authorization form for user security](#)  
Custom HTML forms can be created for user security during the authorization stage in OAuth.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a custom HTML login form for user security

Custom HTML forms can be created for user security during the identity extraction stage in OAuth.

### Before you begin

The Native OAuth provider configuration includes Identity Extraction when using the Implicit, Access code, or Resource owner password grant types. You have the option to select how to extract the user credential and one of the choices is Custom HTML Form. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager. For more information, see [Configuring a native OAuth provider](#). This topic describes how to create the Custom HTML form for identity extraction.

### About this task

During three-legged OAuth definitions (Implicit flow, Resource owner password flow, and Access (Authorization) code flow, the user is presented with a form for signing in to the service provided by the API. You can present a custom form or a default form. Your custom form must fulfill certain requirements.

Important: The fields used by IBM® API Connect to inject information into your form have case-sensitive field names.

### Procedure

To create a custom sign-in form for your Native OAuth provider, complete the following steps:

1. Create a well formed XHTML document that will be parsed and transformed by API Connect to inject hidden fields.
2. For your XHTML form, set the method as POST, the encoding type as application/x-www-form-urlencoded, and the action as authorize. Add any other parameters that you require.  
For example:

```
<form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">
```

3. Create a text input field that is named `username` and create a password input field named `password`.
4. Add the line `<EI-INJECT-HIDDEN-INPUT-FIELDS>`. This third element is a placeholder that API Connect replaces with input fields to complement the user-submitted data.
5. Create a button to initiate the sign-in process.  
For example:

```
<button  
id=" _home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.apionprem.doc_oauth_custom_login_form_login_b  
utton" type="submit" name="login" value="true">Log in</button>
```

6. Optional: Add text that is displayed the first time that the user visits the sign-in page. Use the tag `<EI-LOGINFIRSTTIME>` for the text that you want to display.
7. Optional: Add text that appears when the user is returned to the sign-in page if they fail to authenticate. Use the tag `<EI-LOGINFAILED>` for the text that you want to display.
8. Optional: Have an error message displayed when an error in the custom form prevents it from being displayed to the user correctly. Use the tag `<EI-INTERNAL-CUSTOM-FORM-ERROR/>`; the message text is generated automatically. You should detect such errors during testing to prevent this error message being displayed to the end user.
9. Optional: You can add elements that are loaded from external sources, such as images or JavaScript.
10. Insert spacing and other features as you require. Completing Steps [1](#) through to [8](#) results in a form similar to the following example:

```
<html lang="en" xml:lang="en">  
<head><meta http-equiv="Content-Type" content="text/html; charset=UTF-8"/></head>  
<body>  
  <form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">  
    <h1>Please sign in</h1>  
    <p>Username </p>  
    <p ><input type="text" name="username" required="required" /> </p>  
    <p>Password </p>  
    <p ><input type="password" name="password" required="required" /> </p>  
    <EI-INJECT-HIDDEN-INPUT-FIELDS/>  
    <p > <button  
id=" _home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.apionprem.doc_oauth_custom_login_form_login_b  
utton" type="submit" name="login" value="true">Log in</button> </p>  
  
    <EI-LOGINFIRSTTIME>  
    <p>If you have forgotten your user name or password, contact your system administrator.</p>  
  </EI-LOGINFIRSTTIME>  
  
  <EI-LOGINFAILED>
```

```

    <p >At least one of your entries does not match our records.
      If you have forgotten your user name or password, contact your system administrator.</p>
  </EI-LOGINFAILED>

  <EI-INTERNAL-CUSTOM-FORM-ERROR/>

</form>
</body>
</html>

```

11. Make your form available at a URL of your choice.
12. If you have not already done so, configure your Native OAuth provider to use a Custom HTML form for identity extraction and provide the URL at which your form is available. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Creating a custom HTML authorization form for user security

Custom HTML forms can be created for user security during the authorization stage in OAuth.

## Before you begin

The Native OAuth provider configuration includes user authorization when using the Implicit, Access code, or Resource owner password grant types. You have the option to select how to authorize application users and one of the choices is Custom HTML Form. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager. This topic describes how to create the Custom HTML form for authorization.

## About this task

During three-legged OAuth definitions (Implicit flow, Resource owner password flow, and Access (Authorization) code flow, the user is presented with a form through which they grant permission to an application to access their data through the API on their behalf. You can present a custom form or a default form. Your custom form must fulfill certain requirements.

Important: The fields used by IBM® API Connect to inject information into your form have case-sensitive field names.

## Procedure

To create a custom authorization form for your Native OAuth provider, complete the following steps:

1. Create a well-formed XHTML document. This will be parsed and transformed by API Connect to inject hidden fields.
2. For your XHTML form, set the method as POST, the encoding type as application/x-www-form-urlencoded, and the action as authorize. Add any other parameters that you require.

For example:

```
<form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">
```

3. Add the line <AZ-INJECT-HIDDEN-INPUT-FIELDS/>. This line is a placeholder that API Connect will replace with input fields necessary for the completion of the OAuth process.
4. Create two buttons with the following code so that the user can grant or deny permission. Edit the text to suit your preferences.

```
<button class="cancel" type="submit" name="approve" value="false">No Thanks</button>
<button class="submit" type="submit" name="approve" value="true">Allow Access</button>
```

5. Optional: Display an error message when an error in the custom form prevents it from being displayed to the user correctly. Use the tag <AZ-INTERNAL-CUSTOM-FORM-ERROR/>; the message text is generated automatically. You should detect such errors during testing to prevent this error message being displayed to the end user.
6. Optional: You can add to the form HTML elements that will load features from external sources, such as images or JavaScript. For example, <script src="http://www.example.com/example.js" />
7. Insert spacing and additional elements as you require. Completing Steps 1 through to 6 results in a form similar to the following example:

```
<html lang="en" xml:lang="en">
  <head><title>Request for permission</title></head>
  <body class="customconsent">
    <div>
      <div>
        <form method="post" enctype="application/x-www-form-urlencoded" action="authorize">
          <AZ-INJECT-HIDDEN-INPUT-FIELDS/>
          <p>Greeting...</p><DISPLAY-RESOURCE-OWNER/>
        </form>
      </div>
    </div>
  </body>
</html>
```

```
<p>This app </p><OAUTH-APPLICATION-NAME/><p> would like to access your data.</p>
<div>
  <button class="cancel" type="submit" name="approve" value="false">No Thanks</button>
  <button class="submit" type="submit" name="approve" value="true">Allow Access</button>
</div>
</form>
</div>
<AZ-INTERNAL-CUSTOM-FORM-ERROR/>
</div>
</body>
</html>
```

8. Make your form available at a URL of your choice.
9. If you have not already done so, configure your Native OAuth provider to use a Custom HTML Form for authorization for User Security. Provide the URL as the endpoint at which your form is available. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

## Securing an API with a JSON Web Token

There are two methods to secure your API with a JSON Web Token. You can use the **jwt-generate** command, or you can use a token that has been generated external to IBM® API Connect.

### About this task

---

JSON Web Token (JWT) is an OAuth 2.0 compliant method of authentication that can be useful to secure your API in API Connect.

You can secure your API with a JSON Web Token by using either of the following methods:

- Generate a token through the **jwt-generate** command, and then augment the response payload with your generated token replacing the **id** token.
- Use a token that was generated outside of API Connect and include it into the response payload, by using the metadata URL.

### Procedure

---

Create a **jwt-generate** policy in the assembly.

- a. In API Manager, open the Assembly tab.
- b. Add a **jwt-generate** policy to the assembly for the API.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Troubleshooting OAuth

You can find the answers to some common questions in the Developer Portal, or in support communities and forums in DeveloperWorks, on GitHub, or on Youtube.

You can use the following links to go to the topics:

- [Enable an extended error description](#)
- [OAuth 2.0 support in the developer portal test tool](#)
- [OAuth requires quorum in a multi-node cluster](#)

### Enable an extended error description

---

The [OAuth 2.0 Authorization Framework](#) governs how IBM® API Connect is defined. According to the specification, OAuth 2.0 error conditions trigger a payload with error, and an optional field `error_description`. To prevent information leakage, the IBM DataPower® Gateway default setting returns the error only. However, during the development and testing phase of an application, it is useful to find out why an OAuth 2.0 request is being rejected. To enable this behavior, the caller can pass an HTTP request header in the OAuth request:

```
APIm-Debug: true
```

The presence of the header enables the 'just-in-time' debugging for that OAuth transaction, and `error_description` is returned as part of the error condition. The output helps the caller to determine why an OAuth request is rejected by API Connect as shown in the examples. Example error output without 'just-in-time' debugging:

```
{ "error": "invalid_request" }
```

Example error output with 'just-in-time' debugging:

```
{ "error": "invalid_request", "error_description": "Multiple OAuth client credentials are provided" }
```

## OAuth 2.0 support in the developer portal test tool

OAuth 2.0 support is exposed as an API through the provider OpenAPI definition. You can use the test tool that is included with API Connect to test the OAuth 2.0 configuration. For more information, see [Testing an API using the Developer Portal test tool](#).

## OAuth requires quorum in a multi-node cluster

In a multi-node cluster, OAuth operations will fail if quorum is lost. Quorum requires that the number of active nodes is greater than 50% of the total number of nodes in the cluster.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring the cloud settings

Before you can add a provider organization to your cloud, you must specify your cloud settings to configure an email server for notifications as well as user registry options and catalog defaults.

The cloud settings let you define basic configuration for your deployment. To view the current settings, log in to Cloud Manager and click  in the navigation pane.

Tip: When you are familiar with the cloud settings, you can modify them using the [Toolkit command-line interface](#) instead of the user interface. Visit the following pages to configure settings:

### Overview

Provide a title and description for your cloud administrator organization. For more information, see [Change the name of your cloud](#).

### Onboarding

Specify time-out settings for onboarding invitations, password resets, access tokens, and refresh tokens. To specify a timeout value, select or type an integer value in the Number field and then choose a unit of time (Seconds, Minutes, or Hours) in the Unit field.

For more information on setting timeouts, see the following topics:

- [Configuring invitation timeouts](#)
- [Configuring the password-reset notification and timeout](#)
- [Configuring timeouts for access tokens and refresh tokens](#)

### User Registries

Configure one or more user registries to authenticate users of Cloud Manager or API Manager. The user credentials for all users who login to each applications must be stored in the specified registries. For more information on configuring user registries, see [Selecting user registries for Cloud Manager and API Manager](#).

### Roles

Create roles and assign them to members of the Admin organization to specify which tasks members are authorized to perform. For more information on assigning roles, see [Administering members and roles](#).

### Role Defaults

The Role Defaults for the Admin organization are not configurable, but you can customize the base roles for provider organizations and consumer organizations. For more information on customizing base roles, see [Role Defaults overview](#).

### Endpoints

View the list of endpoints configured for API Manager, provider APIs, and consumer APIs during the installation process.

### Notifications

Select the email server for your on-premises cloud notifications, configure notification settings, and specify the sender name and email address to be included in the emails. You can also preview and customize email templates used for notifications. For more information on setting up notifications, see [Setting up notifications](#). Note: Be sure to [configure the email server](#), because it is needed for sending invitations and other notifications to users.

### Catalog Defaults

Specify one or more gateway services to be provided to every Catalog by default, so that Products (which contain APIs) can be made available to users. When a new Catalog is created in a provider organization, it is assigned to the default gateway service. Any changes you make to these settings do not affect existing Catalogs. For more information on selecting gateway services, see [Configuring the default gateway services for Catalogs](#).

### Audit Setting

Configure auditing settings to monitor API calls and log information about the calling users, the time of each call, and the activity involved in each event. The audit focuses on "who" did "what" and "when", including the request payload and the result of the operation. All create, update, and delete operations are audited. Generally, read operations are only audited if the calling user logged in with an OIDC Provider user registry. For more information about configuring the use of auditing, see [Configuring audit logging to monitor user operations](#).

Use the following list to locate instructions for using specific cloud settings:

- [Using the CLI to modify cloud settings](#)  
Use the toolkit CLI to edit the cloud settings.
- [Change the name of your cloud](#)  
You can change the name of your cloud.

- [Configuring an email server for notifications](#)  
Connect to an email server in your API Connect on-premises cloud. The email server sends registration invitations and other event-driven emails. You must configure the email server before you add any provider organizations or register a Portal service. Otherwise, the owner of the organization will not receive the email with the details that they require to access the API Manager.
- [Setting up notifications](#)  
Select an email server and set up the "sent from" information for notifications.
- [Configuring invitation timeouts](#)  
You can set the time period for when registration invitations for Cloud Settings access and the Admin organization expire.
- [Configuring API Key timeouts](#)  
You can set the time period for when an API Key expires.
- [Allowing the API key to be used for multiple logins](#)  
Use the toolkit CLI to enable API keys to be used for multiple toolkit logins.
- [Configuring the password-reset notification and timeout](#)  
Configure the time allowed for a user to reset a password, and customize the notification that the user receives.
- [Selecting user registries for Cloud Manager and API Manager](#)  
Select the user registries to authenticate users for Cloud Manager and API Manager.
- [Configuring timeouts for access tokens and refresh tokens](#)  
Configure timeout values for the access tokens and refresh tokens for user registries.
- [Viewing platform and UI endpoints](#)  
A view-only list of platform and UI endpoints is provided.
- [Configuring the default gateway services for Catalogs](#)  
Configure the list of default gateway services that are available to new Catalogs.
- [Managing the public/private key pairs for signing tokens](#)  
Manage the public/private key pairs that are used for signing tokens in API Connects.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using the CLI to modify cloud settings

Use the toolkit CLI to edit the cloud settings.

### About this task

Some cloud settings can be modified in the Cloud Manager UI, but all settings can be modified with the toolkit CLI. You can modify the cloud settings configuration file and upload the changes, or issue commands to modify individual settings directly. If multiple people modify the cloud settings, any newer settings overwrite older settings regardless of the method used to update the settings.

For more information about working with the toolkit CLI, see the following topics:

- For details on using `apic` to modify cloud settings, see [apic cloud-settings:update](#).
- For details on all the cloud settings commands, see [apic cloud-settings](#)

### Procedure

1. Run the following command to log in to a management server as a member of the cloud administration organization:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm admin/identity_provider
```

Cloud settings are stored on a management server and you must log in to the server before you can access the settings with the CLI.

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.

For more information on logging in, see [Logging in to a management server](#).

2. Optionally retrieve the current list of cloud settings with the following command:

```
apic cloud-settings:get --server mgmt_endpoint_url --output -
```

where `mgmt_endpoint_url` is the URL of the server where the cloud settings are stored.

3. Add or modify settings using one of the following methods:

- Issue each setting from the command line.  
For simple changes, you can issue commands to modify settings without editing the configuration file.

- Issue the following command to start the update process:

```
apic cloud-settings:update --server mgmt_endpoint_url -
```

where *mgmt\_endpoint\_url* is the URL of the server where the cloud settings are stored. Include the hyphen at the end of the command to indicate that input follows on the next command line.

- Type the information for a single setting on one line, and press ENTER to submit it.  
Specify each setting on a single line and use the following format to specify the setting's name and value:

```
setting_name: setting_value
```

For example, the following command updates a single setting:

```
apic cloud-settings:update --server mgmt_endpoint_url -  
refresh_expires_in: expiration_time  
Ctrl+D
```

- Type Ctrl+D to indicate that the data entry is complete, as shown in the example.
- Upload a file containing the settings.  
If you have multiple settings or lengthy values to add or modify, you might prefer to make all of the changes at once by creating or modifying the configuration file and then uploading it.

- Create a .yaml file with your settings.  
You can choose the file name but must use YAML format. The file can contain as few or as many settings as needed.

Settings use the following format; notice that the setting's name must be enclosed in quotation marks as shown in the example. The last setting in the file does not end with a comma.

```
"setting_name": setting_value,
```

- Upload the file with the following command:

```
apic cloud-settings:update --server mgmt_endpoint_url my_cloud_settings.yaml
```

For information on using input files with the toolkit CLI, see [./com.ibm.apic.toolkit.doc/rpic\\_cli\\_command\\_line\\_input.html](#).

4. When you are ready to log out of the management server, use the following command:

```
apic logout --server mgmt_endpoint_url
```

## Results

---

The settings are cached for a maximum of five minutes, so you might experience a delay before your changes take effect.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Change the name of your cloud

You can change the name of your cloud.

### About this task

---

You can change the name of your cloud using the Overview page.

One of the following roles is required to change the name of your cloud:

- Administrator
- Owner
- A custom role with the `cloud settings:manage`

### Procedure

---

Follow these steps to change the name of your cloud:

1. In the Cloud Manager, click  Settings.
2. Select Overview..
3. Click Edit to change the name of your cloud.
4. Enter a Title and the name is auto-generated. Enter a brief Summary and click Save.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Configuring an email server for notifications

Connect to an email server in your API Connect on-premises cloud. The email server sends registration invitations and other event-driven emails. You must configure the email server before you add any provider organizations or register a Portal service. Otherwise, the owner of the organization will not receive the email with the details that they require to access the API Manager.

## Before you begin

You must complete the tasks in the following section:

1. [Defining your Cloud Manager topology](#).

## About this task

This task can be completed by users who are assigned one of the following roles:

- Cloud Owner
- Cloud Administrator
- Topology Administrator
- Custom role with **Settings:Manage** permission

The email server sends invitation emails with activation links and other system messages. More than one email server may be configured in Cloud Manager, but only one email server may be selected as the active server to send notifications at any one time. For instructions on how to select the active email server and to view a list of the email messages that are sent, see [Setting up notifications](#).

Note: If you do not select an email server for sending notification emails, it is not possible for a user to reset their password from either the Cloud Manager or API Manager login pages.

## Procedure

To configure one or more email servers to use for email notifications in Cloud Manager, complete the following steps:

1. In the Cloud Manager, click  Resources.
2. Choose Notifications.
3. Enter the values to configure the email server.

Field	Description
Title (required)	Enter a descriptive title for the availability zone. This title will display on the screen.
Name (required)	This field is auto-populated by the system and used as the internal field name.
Address (required)	IP address for the email server
Port (required)	Port that the email server runs on
Authenticate User	Enter a user name to use for authorization with the SMTP server. The user name is required if the SMTP server requires authentication.
Authenticate Password	Enter the password for the Authenticate User. This password is used for authorization with the SMTP server. The password is required if the SMTP server requires authentication.
TLS Client Profile (optional)	Select an optional TLS Client Profile that will be used to communicate with the email server if the Secure Connection option is selected.
Secure Connection	Select this option to specify that TLS security is used. The following conditions apply: <ul style="list-style-type: none"><li>• If this option is not selected then TLS security is not used even if the email server is configured to use the STARTTLS protocol.</li><li>• If this option is selected and a TLS Client Profile is selected, that profile is used and the STARTTLS protocol configuration on the email server is honored.</li><li>• If this option is selected and no TLS Client Profile is selected, the Default TLS client profile is used and the STARTTLS protocol configuration on the email server is honored.</li></ul>

4. You can send a test email to confirm that the email server is properly configured. Click Test email in the Test Connection panel to open a dialog window. Enter one or more valid email addresses in the Recipients field. Separate multiple recipients with commas. Click Send test email. Check that the test email was received by the recipients.
5. If the test email is successful, click Save to save the email server configuration. If the test is unsuccessful, check the configuration values and update as needed.  
Note: In order to send emails, you must select an email server as your active server in Settings > Notifications.

## Results

The email server is configured.

## What to do next

You must now select the email server to use as your active email server in Cloud Settings > Notifications. You can enter the sender information, and customize the email templates. For more information, see [Setting up notifications](#).

Note: If you do not select an email server for sending notification emails, it is not possible for a user to reset their password from either the Cloud Manager or API Manager login pages.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Setting up notifications

Select an email server and set up the "sent from" information for notifications.

### Before you begin

---

You must configure an email server to use for your notifications in Resources > Notifications, before you can set up the notification configuration in Settings > Notifications. See [Configuring an email server for notifications](#) for more information.

### About this task

---

In Settings > Notifications, you select the email server that you want to use as the active server to send notification emails. An active email server is required to send email notifications. More than one email server may be configured in Cloud Manager, but only one email server may be selected to send notifications at any one time. The email server must be configured and selected for notifications before adding a Portal Service to your cloud.

You also configure the sender information to be included on all the emails and optionally, edit the standard text for the email templates.

One of the following roles is required to add roles to select the email server, enter the sender information, and edit the email templates:

- Administrator
- Owner
- A custom role with the `Cloud settings:Manage` permission

Note: If you do not select an email server for sending notification emails, it is not possible for a user to reset their password from either the Cloud Manager or API Manager login pages.

### Procedure

---

1. In the Cloud Manager, click  Settings.
2. In the Settings navigation list, click Notifications.
3. To configure the active email server:
  - a. Click Edit in the Sender & Email Server section.
  - b. Select an email server in the list; a check mark is displayed next to the currently selected server.
  - c. Click Save.
4. To delete an email server from the list, click the options menu next to the server name and select Delete.
5. To change the sender name and email address for notifications:
  - a. Click Edit in the Sender & Email Server section.
  - b. Fill in the Name and Email address that notifications will be sent from.
  - c. Click Save.
6. To preview and edit the notification email templates, see [Customizing email notification templates](#)

### What to do next

---

You can now [create a provider organization](#).

- [Customizing email notification templates](#)

API Connect includes a set of email templates for invitations and other notification emails. You can preview the templates and customize the text if required. You can also style the notifications to match your business theme.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Customizing email notification templates

API Connect includes a set of email templates for invitations and other notification emails. You can preview the templates and customize the text if required. You can also style the notifications to match your business theme.

### About this task

---

The API Connect emails are sent automatically when certain system events occur. The email templates are organized by scope, as explained in Table 1.

Table 1. Notification scopes

Scope	Events that trigger the notification
admin	Admin organization activities such as invitations, portal sign up, and password reset.
catalog	Activities related to Catalogs; for example: such as application life cycle events, invitations to catalogs, product approvals, and subscription approvals.

Scope	Events that trigger the notification
consumer	Activities to consumer applications and subscription requests in the Developer Portal, invitations to Consumer organizations, and password reset requests for Developer Portal accounts.
provider	Invitations
space	Invitations

One of the following roles is required to configure email notifications:

- Administrator
- Owner
- A custom role with the `Cloud settings:Manage` permission

Note: You can also customize notifications by using the developer toolkit CLI, or by using the API Connect REST APIs. See [Using the CLI to modify cloud settings](#), or [API Connect REST APIs](#), for more information.

## Procedure

1. In the Cloud Manager, click  Settings.
2. In the Settings navigation list, click Notifications.  
On the Notifications page, templates display in a list, sorted by scope. When selecting a template to modify, be sure to select the version that applies to the appropriate scope.
3. To preview the text for a template, select Preview from the actions menu next to the template name.
4. To edit the text for the template, either click the template name, or select Edit in the action menu.  
When a template is opened, an attempt is made to get the language from the browser setting, but if this isn't possible the template defaults to English.

The text includes variables; for example, `{{catalog}}`. The notification text is based on Handlebars syntax. Most variables are enclosed in double curly braces `{{ }}`, but can be enclosed in triple curly braces `{{{ }}` to disable HTML escaping, when the variable is a URL link for example. For more information on Handlebars, see <https://handlebarsjs.com/>.

To obtain the complete list of variables that are available for a particular notification template, complete the following steps:

- a. Log in to the management server from the command line as a member of the cloud administration organization; for details, see [Logging in to a management server](#). You can use the same management server URL, user name, and password in the login command that you use to log in to the Cloud Manager user interface.
- b. Enter the following command:

```
apic notification-templates:get template_name --server mgmt_endpoint_url --scope cloud --subcollection template_scope --fields variables --output -
```

where:

- `template_name` is the name of the required notification template, as displayed in the Template column in the user interface.
- `template_scope` is the scope name displayed in the Scope column alongside that template.

For example:

```
apic notification-templates:get member-invitation --server https://myserver.com --scope cloud --subcollection catalog --fields variables --output -
```

The variables that are available for the template are displayed; for example:

```
variables:
- org
- catalog
- activationLink
- expiresAt
```

The `--output -` parameter causes the command output to be written to the command line. You can specify `--output filepath` to have the output written to a .yaml file at the specified location, or omit it altogether to have a file written to the current folder.

5. To view and edit the notification template in a different language, select one of the following supported languages from the View template in drop-down list:
  - Chinese (Simplified)
  - Chinese (Traditional)
  - Czech
  - Dutch
  - English (US English)
  - French
  - German
  - Italian
  - Japanese
  - Korean
  - Polish
  - Portuguese
  - Russian
  - Spanish
  - Turkish
6. Edit the Subject as required.
7. Select the Content type that you want to use for the template, from HTML, PlainText, or Both. The default content type is PlainText.  
An edit window for the selected content type is displayed, or both edit windows are displayed if Both is selected.
8. Edit the body of the template as required.  
For HTML content, only the tags and their attributes that are shown in the following table are allowed.

Table 2. List of allowed HTML tags and their attributes

HTML tag	Attribute
<code>&lt;a&gt;</code>	"class", "href", "hreflang", "style"
<code>&lt;em&gt;</code>	"class", "style"

HTML tag	Attribute
<strong>	"class", "style"
<cite>	"class", "style"
<blockquote>	"class", "cite", "style"
<code>	"class", "style"
<ul>	"class", "type", "style"
<ol>	"class", "start", "type", "style"
<li>	"class", "style"
<dl>	"class", "style"
<dt>	"class", "style"
<dd>	"class", "style"
<h1>	"class", "id", "style"
<h2>	"class", "id", "style"
<h3>	"class", "id", "style"
<h4>	"class", "id", "style"
<h5>	"class", "id", "style"
<h6>	"class", "id", "style"
<p>	"class", "style"
<div>	"class", "style"
 	"class", "style"
<span>	"class", "style"
<img>	"class", "src", "alt", "data-entity-type", "data-entity-uuid", "data-align", "data-caption", "width", "height", "style"
<table>	"class", "id", "style"
<tr>	"class", "id", "style"
<td>	"class", "id", "style"

If an HTML tag that is not allowed is used in a notification, the tag and its contents are displayed in the email as plain text.

Images can be used by adding a `<img`

`src="https://path/to/image.png"/>` tag in the template. The `src` attribute for the image must be a fully qualified web URL, and must be externally accessible so that the email recipients can access the image. It's not possible to reference local images, they must be fully qualified URLs. It's also not possible to embed or attach images or other files in the emails.

9. Click Save when done.

Note: Edits made to a template are saved only for the specific language version that is edited.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring invitation timeouts

You can set the time period for when registration invitations for Cloud Settings access and the Admin organization expire.

### About this task

One of the following roles is required to change the name of your cloud:

- Administrator
- Owner
- A custom role with the `cloud settings:manage` permission

### Procedure

Follow these steps to set the invitation timeout:

1. In the Cloud Manager, click  Settings.
2. In the Settings navigation list, click Onboarding.
3. Click Edit next to the invitation timeout setting that you want to change:
  - Cloud Settings Invitation Timeout
  - Admin Organization Invitation Timeout
4. To specify a timeout value, select or type an integer value in the Number field and then choose a unit of time (Seconds, Minutes, or Hours) in the Unit field.
5. Click Save.

### Results

Invitations contain a link, which expires after the specified the timeout. If the user does not register before the expiration, you can send a new invitation.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring API Key timeouts

You can set the time period for when an API Key expires.

### About this task

---

One of the following roles is required to change the name of your cloud:

- Administrator
- Owner
- A custom role with the `cloud settings:manage` permission

### Procedure

---

Follow these steps to set the API Key timeout:

1. In the Cloud Manager, click  Settings.
2. In the Settings navigation list, click Onboarding.
3. Click Edit next to the API Key timeout setting.
4. To specify a timeout value, select or type an integer value in the Number field and then choose a unit of time (Seconds, Minutes, or Hours) in the Unit field.
5. Click Save.

### Results

---

API Key times out based on the set timeout value.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Allowing the API key to be used for multiple logins

Use the toolkit CLI to enable API keys to be used for multiple toolkit logins.

### About this task

---

Users can log in to the API Connect management server with the toolkit using an API key. By default, the API key can be used only once. You can change the behavior by enabling the API key to be used multiple times.

Use the CLI to set the `api_key_multiple_uses` setting to `true` and enable the API key to be used multiple times for logins. By default, the setting is set to `false` and is disabled. For information on configuring Cloud Manager settings with the CLI, see [Using the CLI to modify cloud settings](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring the password-reset notification and timeout

Configure the time allowed for a user to reset a password, and customize the notification that the user receives.

### Before you begin

---

Configure an email server that can be used for mailing notifications to users. If you do not configure an email server, a link cannot be sent to a user who wants to reset a password. For information on configuring the email server, see [Setting up notifications](#).

### About this task

---

When a user clicks Forgot Password? and provides an email address on the sign-in page, an email is generated with a link where the user can reset the password. When you deploy API Connect, the password-reset settings are configured with default values. You can optionally modify the time-out setting to set a new expiration for resets as well as the notification that is emailed to users.

### Procedure

---

1. In the Cloud Manager, click  Settings.

2. In the Settings navigation list, click Onboarding.
3. Configure the password reset timeout:
  - a. In the Settings navigation list, click Onboarding.
  - b. Click Edit next to Reset Password Time to Live.
  - c. To specify a timeout value, select or type an integer value in the Number field and then choose a unit of time (Seconds, Minutes, or Hours) in the Unit field.
  - d. Click Save.
4. Customize the notification template for password resets:
  - a. In the Settings navigation list, click Notifications.
  - b. In the Notifications Templates list, select the appropriate version of the "password-reset" template by clicking the name.  
You can create different versions of the template for different user roles.
  - c. Customize the template as explained in [Customizing email notification templates](#).
  - d. Click Save.

---

## Results

Password reset notifications contain a link, which expires after the specified the timeout. If the user does not reset the password before the link expires, they can request a new link.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Selecting user registries for Cloud Manager and API Manager

Select the user registries to authenticate users for Cloud Manager and API Manager.

---

### About this task

In Settings > User registries, you select one or more user registries to authenticate users of Cloud Manager and API Manager. The user credentials for all users who login to the applications must be stored in the selected registries.

One of the following roles is required to select the user registries for Cloud Manager and API Manager:

- Administrator
- Owner
- A custom role with the `cloud settings:manage` permission

For details on how to control which user registries can be used by provider organizations for authenticating Developer Portal users, or for securing APIs, see [Setting visibility for a user registry](#).

---

### Procedure

To select the user registries for Cloud Manager and API Manager, follow these steps:

1. In the Cloud Manager, click  Settings.
2. In the Settings navigation list, click User Registries.
3. The current list of user registries is displayed for Cloud Manager and for API Manager. To add user registries, click Edit in either the Cloud Manager or API Manager panel.  
Note: The list of user registries is derived from the user registries that were previously configured as a Resource in Resources > User Registries. For more information, see [User registries overview](#).
4. Select the user registry by placing a check mark next to the name in the list. Remove a user registry by removing the check mark.
5. Click Save.

---

### Results

The user registry list is updated to reflect the selected user registries available for authenticating users.

---

### What to do next

To set a user registry as the default, click the options menu next to the registry name in the list, and select Set as default.

- [Setting a default user registry for Cloud Manager and API Manager](#)  
You can select a default user registry for Cloud Manager and and for API Manager.

---

### Related tasks

- [Configuring an Authentication URL user registry](#)
- [Configuring a Local User Registry](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Setting a default user registry for Cloud Manager and API Manager

You can select a default user registry for Cloud Manager and for API Manager.

### About this task

---

In Settings > User registries, you can set a user registry as the default user registry.

One of the following roles is required to select the user registries for Cloud Manager and API Manager:

- Administrator
- Owner
- A custom role with the `cloud.settings.manage` permission

### Procedure

---

1. In the Cloud Manager, click  Settings.
2. In the Settings navigation list, click User Registries.
3. To set a user registry as the default, click the options menu next to the registry name in the list, and select Set as default.

Note: The list of user registries is derived from the user registries that were previously configured as resources in Resources > User Registries. For more information, see [User registries overview](#)

### Results

---

The user registry list is updated to reflect the default user registry.

### Related tasks

---

- [Configuring an LDAP user registry in the Cloud Manager](#)

---

## Configuring timeouts for access tokens and refresh tokens

Configure timeout values for the access tokens and refresh tokens for user registries.

### About this task

---

IBM® API Connect supports the use of access tokens and refresh tokens for user registries that authenticate users of the Cloud Manager, the API Manager, and the Developer Portal.

Access tokens allow users to sign in and remain logged in for a specified amount of time (the timeout period). Refresh tokens allow the access token to be renewed automatically without requiring the user to sign in again. Access tokens are configured by default, and you can modify the timeout setting. Refresh tokens are disabled by default but are configured with a default timeout when you enable them.

Refresh tokens, when enabled, are generated every time an access token is created. Refresh tokens can be used to obtain a new access token without having to prompt a user to re-login. If you enable the use of refresh tokens, then when the token expires it is refreshed automatically in the background so that the user can continue working without interruption. When the user logs out, the refresh token is revoked and the application can no longer use it.

Note: If users log in with non-OIDC user registries, the use of refresh tokens is supported in API Manager, API Designer, the Developer Portal, and the CLI Toolkit. When the refresh token expires, the user is always redirected to the login page.

If users log in with OIDC user registries:

- The use of refresh tokens is supported only in the Developer Portal and the CLI Toolkit
- If the OIDC providers do not support refresh tokens, API Connect will not issue a `refresh_token`, regardless of the setting of `refresh_token_enabled` in the cloud settings.
- For more information about OIDC configuration, see [Configuring an OIDC user registry](#).

You can configure access tokens and refresh tokens using the [Cloud Manager UI](#), or the [Toolkit CLI](#).

### Using the UI to configure tokens

---

Configure timeout settings for access tokens and refresh tokens in the Cloud Manager Settings pages.

## Procedure

1. Click  in the navigation pane.
2. Configure the timeout for access tokens:
  - a. On the Onboarding page, click Edit next to Access Token Time to Live.
  - b. To specify a timeout value, select or type an integer value in the Number field and then choose a unit of time (Seconds, Minutes, or Hours) in the Unit field.
  - c. Click Save.
3. Configure the timeout for refresh tokens:
  - a. On the Onboarding page, click Edit next to Refresh Token Time to Live.
  - b. To specify a timeout value, select or type an integer value in the Number field and then choose a unit of time (Seconds, Minutes, or Hours) in the Unit field.
  - c. Click Save.

## Using the CLI to configure tokens

---

Use the Toolkit CLI to configure timeout settings for access tokens and refresh tokens.

### About this task

Use the following properties to specify refresh tokens for cloud settings:

- **access\_token\_expires\_in**  
Integer. Represents the expiration time, in seconds, for access tokens issued by API Connect.
- **refresh\_expires\_in**  
Integer. Represents the expiration time, in seconds, for refresh tokens issued by API Connect. Must be greater than **access\_token\_expires\_in**.
- **refresh\_token\_enabled**  
Boolean. Disabled by default. To enable, set to **true**. When enabled, generates a **refresh\_token** field in the response to the **/token** API call.

The following extract from a cloud settings file shows example settings for these properties:

```
"type": "cloud_setting",
"api_version": "2.0.0",
"name": "cloud-setting",
"access_token_expires_in": 28800,
.
.
"refresh_expires_in": 57600,
"refresh_token_enabled": false,
.
.
```

Use the toolkit CLI (**apic**) to update the cloud settings with new values for the properties. You can either specify values as command line arguments, or enter them manually in a configuration file as explained in [Using the CLI to modify cloud settings](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Viewing platform and UI endpoints

A view-only list of platform and UI endpoints is provided.

### About this task

---

You can view the list of endpoints configured during the installation process. Included in this view-only list are the following endpoints:

- API Manager URL - the URL for opening the API Manager UI
- Platform REST API endpoint for the Admin and Provider REST APIs - this endpoint handles the REST APIs for Admin and Provider functions.
- Platform REST API endpoint for consumer REST APIs - this endpoint handles the REST APIs for consumer (Portal) functions.

One of the following roles is required to view endpoints:

- Administrator
- Owner
- A custom role with the `cloud settings:manage` or `cloud-settings: view permissions`

## Procedure

---

To view the endpoints, follow these steps:

1. In the Cloud Manager, click  Settings.
2. Select Endpoints.
3. View the list of endpoints.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring the default gateway services for Catalogs

Configure the list of default gateway services that are available to new Catalogs.

### About this task

---

One of the following roles is required to configure Catalog Defaults:

- Administrator
- Owner
- A custom role with the `cloud settings:manage` permission

You publish APIs by adding them to a Product and then publishing the Product to a Catalog. To be able to publish Products to a Catalog, the Catalog must be assigned at least one gateway service so that the APIs in the Product are available to be called at a gateway service endpoint. You can assign more than one gateway service to a Catalog, and they can be of mixed types: DataPower® API Gateway, DataPower Gateway (v5 compatible), and Event Gateway Service.

A Product is gateway type specific: DataPower API Gateway, DataPower Gateway (v5 compatible), or Event Gateway Service. By default, when you publish a Product to a Catalog, it is published to all the assigned gateway services of the same gateway type as the Product, but you can choose to publish the Product only to selected gateway services, of that type, at publish time; see [Publishing a draft Product](#) for more information. The APIs in the Product will be available to be called at all the specified gateway service endpoints.

The procedure described in this topic specifies the gateway services that are assigned by default to newly created Catalogs, but you can change the assigned gateway services for a specific Catalog; see [Creating and configuring Catalogs](#).

### Procedure

---

To configure the gateway services that are assigned to new Catalogs by default, complete the following steps:

1. In the Cloud Manager, click  Settings.
2. In the Settings navigation list, click Catalog Defaults.
3. Click Edit to change the list of default gateway services.
4. Select the required gateway services, then click Save.

### Results

---

When a new Catalog is created in a provider organization, the default gateway services are automatically assigned to it. Any changes you make to the list of default services affects only the Catalogs that are created after you save your changes. Existing Catalogs are not affected.

### Related information

---

## Managing the public/private key pairs for signing tokens

Manage the public/private key pairs that are used for signing tokens in API Connects.

API Connect uses public-key cryptography to secure tokens. By default, an API Connect deployment receives one public/private key pair, which is used for signing and verifying tokens. When a token is created, API Connect signs it with the deployment's private key. Any third-party can verify that digital signature with the deployment's public key.

The public/private key pair is generated for you by API Connect on the first start-up after installation, upgrade, or migration. The keys are stored in a keystore object.

### Why do you need public/private key pairs?

---

API Connect uses a public/private key pair to sign and verify the following tokens:

- `access_token`: Verifies that the user has permission to access resources.
- `id_token`: Stored within the access token to specifies the user's ID. **Confirm?**
- `temporary_token`: Provides for short-lived access so that the user can log in and receive an access token. For example, when the user receives a link for resetting a password or to register for an account.

## How does APIC use the public/private key pair?

---

Each API Connect deployment is assigned a public key, which is made openly available, plus a corresponding private key, which can only be accessed by that deployment. To verify a user's access to resources for a transaction, API Connect signs every token with the private key. Any other party can use the openly available public key to verify the signature. Because the private key is not shared, it can be used repeatedly instead of generating a new value for each signature.

When your app accesses an API endpoint, the `access_token` is in JWT format and includes a "kid" value that is the new key.

Note: The signature for public/private key schema is larger than for shared secrets, so the `access_token` that is returned will also be larger. If you encounter issues with headers becoming too large, refer to the following topic: [Resolving login problems by increasing HTTP header size](#).

## How can you manage public/private key pairs?

---

By default, your deployment is assigned one key pair, which is stored in a keystore and never expires. The same key pair is used for signing and verify all tokens. The key pair consists of a public key and a private key:

- `key_signing`: The private key that API Connect uses for signing tokens
- `key_verify`: The public key that anyone can access and use for verifying token signatures

API Connect uses the following cloud settings to determine which public/private keystores are used for each type of token:

- `access_token_keystore_urls`: [`keystore_url_0`, `keystore_url_n`]
- `id_token_keystore_urls`: [`keystore_url_0`, `keystore_url_n`]
- `temporary_token_keystore_urls`: [`keystore_url_0`, `keystore_url_n`]

Each setting specifies an array of URLs where the keystores are hosted, with the keystore at position 0 representing the current key pair. You can optionally generate additional key pairs, store them in new keystores, and use them with the tokens to enhance security. Each key pair is stored in its own keystore and can be set to expire at a different time. Providing a different key pair for each type of token is a good practice because it limits the damage if a token is compromised.

If you specify one keystore for a token, that key pair is used for every new token of the same type, and it never expires. If you specify multiple keystores, you can assign a lifetime to each and when the keys in the first keystore expire, the keys are obtained from the next keystore in the list, and so on.

You can use the public/private key pairs and keystores to perform the following operations with tokens:

### Sign a token

The first keystore in the array is the current keystore; use its `key_signing` key to sign tokens.

### Verify a token's signature

To verify a token's signature, start with the current keystore (the first in the array). If the token doesn't match the `key_verify` key, move to the older keystores and compare the token with the `key_verify` value in each.

### Add key pairs

When you create a new key pair, add the keys to a separate keystore, and then add that keystore's URL to the end of the token's keystore array. The first keystore in the array is the "current" keystore, and subsequent keystores in the array are used in turn.

### Revoke key pairs

If you suspect that a token is compromised, you can revoke the keys for signing and verifying it. To revoke a key pair, delete the corresponding keystore from the token's keystore array. Removing a keystore removes the keys that were used for signing and verifying tokens, and invalidates all of the tokens that were issued with that key pair.

Attention: You must always retain at least one key pair for signing and verifying tokens.

### Rotate through keystores to periodically change the key pairs in use

To rotate through key pairs for a token, configure at least two keystores for the token. Specify the "current" keystore first in the array, followed by the "next" keystores. Make sure that the each keystore's lifetime overlaps that of the next keystore so that keys from the current keystore don't expire before the new key pair takes effect.

Before you configure the lifetime for a keystore, you can refer to the Onboarding section of the Cloud Settings page to quickly see the lifetime that is configured for each type of token. Then make sure you specify enough keystores, with long enough lifetimes, to span each token's lifetime. For example, if the `temporary_token` lives for 72 hours and the key used for signing it lives for 24 hours, you need to provide at least 3 sets of keys to span the token's lifetime:

```
temporary_token: [keystore1, keystore2, keystore3]
```

- [Configuring public/private key pairs for tokens](#)  
Configure public/private key pairs for signing and verifying tokens in your API Connect deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring public/private key pairs for tokens

---

Configure public/private key pairs for signing and verifying tokens in your API Connect deployment.

### About this task

---

By default, an API Connect deployment receives one public/private key pair, which is used repeatedly. The public/private key pair is generated for you the first time you start API Connect after installing or upgrading it. The keys are stored in a keystore object. You can add and revoke keys, and configure a rotation through keys for enhanced security.

You can configure key pairs for tokens in the [Cloud Manager user interface](#), or by [using the Toolkit CLI](#).

## Using the Cloud Manager UI to configure public/private key pairs

Use the Cloud Manager user interface to configure key pairs for signing and verifying tokens.

### About this task

Manage Keystore assignment and Keystore history for tokens

### Procedure

1. In the Cloud Manager, click .
2. In the Settings navigation list, click Signed Token.  
The Signed Token page displays the list of supported tokens for signing.
3. Review the current token settings:
  - Click Payload to display the payload code for the set of tokens.
  - Click History log next to a token to view its previous keystore assignments (this history never includes the current keystore assignment). The most recent assignment displays at the top of the list. You can remove any keystore assignment from the history by clicking .
4. To add or change a keystore assignment for a token, complete the following steps:
  - a. On the Signed Token page, click Edit.
  - b. On the Edit signed token page, select a keystore for the token you want to modify.
  - c. Click Save to save your changes and update the keystore history.  
Changes take effect immediately.

The previously selected keystore is added to the history for the token that you just updated. The history never includes the current keystore assignment.

## Using the Toolkit CLI to configure public/private key pairs

Use the Toolkit CLI to configure key pairs for signing and verifying tokens.

### About this task

Use the following properties to the keystore URLs that contain the public/private key pair for each type of token. For each setting, the list of keystores is an array of strings, with each string representing the complete URL of a keystore. The first keystore in the array (*keystore\_url\_0*) is the one that is currently in use.

- access\_token:  
`access_token_keystore_urls: [keystore_url_0, keystore_url_n]`
- id\_token:  
`id_token_keystore_urls: [keystore_url_0, keystore_url_n]`
- temporary\_token:  
`temporary_token_keystore_urls: [keystore_url_0, keystore_url_n]`

The keystore URLs can be lengthy. You can avoid errors by writing the settings in a file and uploading that file. Format the settings as a .yaml file (you can choose the file name) and upload the file using the toolkit CLI. The following example configures a different keystore for each type of token:

```
access_token_keystore_urls:
- >-
  https://mgmt_endpoint_url/api/orgs/1cdb71a1-b53c-4b66-b162-1b0f45ca8a54/keystores/de5298dd-a00b-45a0-9d08-96c5d93e1273
id_token_keystore_urls:
- >-
  https://mgmt_endpoint_url/api/orgs/1cdb71a1-b53c-4b66-b162-1b0f45ca8a54/keystores/85a21745-8ac3-499d-929a-2d017bade815
temporary_token_keystore_urls:
- >-
  https://mgmt_endpoint_url/api/orgs/1cdb71a1-b53c-4b66-b162-1b0f45ca8a54/keystores/63d6462f-c93d-439b-b422-0e604381e97a
```

### Procedure

1. Create a YAML file with the keystore settings for each type of token as shown in the example.  
For information on using input files with the toolkit CLI, see [Reading input from the command line](#).
2. Run the following command to log in to a management server as a member of the cloud administration organization:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm admin/identity_provider
```

Cloud settings are stored on a management server and you must log in to the server before you can access the settings with the CLI.

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`. For more information on logging in, see [Logging in to a management server](#).

3. Upload the YAML file with the new settings by running the following command:

```
apic cloud-settings:update --server mgmt_endpoint_url my_token_keystore_settings.yaml
```

4. Run the following command to log out of the management server:

```
apic logout --server mgmt_endpoint_url
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Administering provider organizations

Manage the provider organizations who have accounts to publish APIs in your API Connect cloud.

### About this task

---

Perform these tasks to manage your provider organizations:

- [Creating a provider organization](#)  
For developers to publish APIs, they must be a member of a provider organization. The first step is to create a provider organization and specify an organization owner. Then members can be added to the provider organization and can start publishing APIs.
- [Editing a provider organization](#)  
You can edit the title of a provider organization, and also transfer ownership to a new organization owner.
- [Deleting a provider organization](#)  
You can delete a provider organization. All Catalogs and Spaces are also removed.
- [Viewing current provider organizations](#)  
View the list of current provider organizations for your cloud, including organization title, owner's name and email address, and status. From the list screen, you can add new provider organizations and owners, edit and delete provider organizations, send messages, and change owners.
- [Sending messages to provider organization owners](#)  
You can send an email message to the owner of a provider organization. You can also style the email to match your business theme.

### Related tasks

---

- [Creating a provider organization](#)
- [Editing a provider organization](#)
- [Deleting a provider organization](#)
- [Viewing current provider organizations](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a provider organization

For developers to publish APIs, they must be a member of a provider organization. The first step is to create a provider organization and specify an organization owner. Then members can be added to the provider organization and can start publishing APIs.

### Before you begin

---

This task can be completed by users who are assigned one of the following roles:

- Cloud Owner
- Cloud Administrator
- Organization Manager
- Custom role with the `Provider-org:Manage` permission

You must also complete the following tasks before beginning:

- [Configuring an email server for notifications](#)
- [Setting up notifications](#)

### About this task

---

Note that an email server must be configured and an active email server must be selected before a provider organization account can be created.

There are two options for creating a provider organization account, as follows:

- Option 1: Create a provider organization and send an email invitation to a new user to register and become the organization owner. Choose the Add > Invite organization owner option.
- Option 2: Create a provider organization and specify the user who will be the organization owner. Choose the Add > Create organization option.

## Procedure

---

- **Option 1:** To create a provider organization and invite a new user to register as the owner, complete the following steps:

1. In the Cloud Manager, click  Provider Organizations.
2. Click Add > Invite organization owner
3. Enter a valid email address and click Invite. An email containing an activation link is sent to the email address inviting the person to register. The link opens the registration form. Alternately, you can copy and paste the activation link into an email; click Get Activation Link and click Copy in the pop up window. Note that the email server requires the Authenticate User and Authenticate Password values in order to send invitations. See [Configuring an email server for notifications](#).

The new provider organization is placed in Pending status, and is changed to Enabled status after the owner completes the registration form to activate their account. The owner can then log in to the API Manager user interface with the API Connect user name that they specified during account activation.

Note: If you use this option with a Local User Registry, and the user already exists in the registry, the user must re-activate their account by using the Sign In option, **not** by completing the registration form and using the Sign Up option; attempting to re-register will fail. This stipulation includes users that were previously provider organization owners but whose organization was deleted.

- **Option 2:** To create a provider organization and specify the user who will be the organization owner, complete the followings steps:

1. In the Cloud Manager, click  Provider Organizations.
2. Click Add > Create organization.
3. In the Title field, enter a title for the provider organization. If desired, the title can be edited after the provider organization is created.
4. The internal Name is automatically generated for you by the system. The Name field contains the string that is included in the organization segment of the URL for API calls. For more information, see [Calling an API](#).  
Tip: The Name field is auto-generated to ensure its validity in the URL.

The value in the Name field is also used to identify the provider organization in developer toolkit CLI commands. To view the CLI commands to manage provider organizations, see [apic orgs](#).

5. Select the user registry for the provider organization owner.

The remaining procedure varies according to the type of the selected user registry, as follows:

- Local User Registry
  - Select whether the user is an Existing user or a New User.
    - For an existing user, complete the following steps:
      - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account.
      - Click Create. The provider organization is created and immediately enabled. The specified owner can log in to the API Manager user interface. If the new provider organization is the user's only provider organization, the API Manager user interface opens in that provider organization; if the user is a member of more than one provider organization, they can then select the new provider organization from the Organization list.
    - For a new user, complete the following steps:
      - Enter a unique user name for the new user.
      - Supply an email address, name details, and a password.
      - Click Create. The user account is created, and the provider organization is created and immediately enabled. The specified owner can log in to the API Manager user interface with the specified user name and password; the user interface open in the new provider organization.
- LDAP
  - Enter the name of a user that exists in the selected user registry.
  - Click Create. The provider organization is created and immediately enabled. The specified owner can log in to the API Manager user interface with their LDAP user name. If the new provider organization is the user's only provider organization, the API Manager user interface opens in that provider organization; if the user is a member of more than one provider organization, they can then select the new provider organization from the Organization list.
- Authentication URL and OIDC
  - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account. If the required organization owner has not previously been invited and activated their account, you must use the invitation mechanism described in [Option 1](#).
  - Click Create. The provider organization is created and immediately enabled. The specified owner can log in to the API Manager user interface. If the new provider organization is the user's only provider organization, the API Manager user interface opens in that provider organization; if the user is a member of more than one provider organization, they can then select the new provider organization from the Organization list.

## What to do next

---

For details of how an invited organization owner activates their account see [Activating your API Manager user account](#). For details of how to log in to the API Manager user interface, see [Accessing the API Manager user interface](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Editing a provider organization

You can edit the title of a provider organization, and also transfer ownership to a new organization owner.

## Before you begin

---

This task can be completed by users who are assigned the following roles:

- Cloud Owner
- Cloud Administrator
- Organization Manager
- Custom role with the `Provider-org:Manage` permission

## About this task

---

If you transfer ownership, the new organization owner can be an existing user, or you can create a new user. When the ownership changes, the new owner is assigned administration privileges for the organization, and the previous owner has their administration privileges removed. Optionally, you can also have the ownership of all Catalogs and Spaces in the organization transferred to the new organization owner. If required, you can restore the privileges to the previous owner as described in [Administering members and roles](#).

## Procedure

---

To update a provider organization, complete the following tasks:

1. In the Cloud Manager, click  Provider Organizations.
2. Click the name of the provider organization that you want to update.
3. To change the title, enter a new title in the Title field, then click Save.
4. To transfer ownership, select the user registry for the provider organization owner you want to transfer ownership to. The remaining procedure varies according to the type of the selected user registry, as follows:
  - Local User Registry
    - Select whether the user is an Existing user or a New User.
      - For an existing user, complete the following steps:
        - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account.
        - To also have the ownership of all Catalogs and Spaces in the organization transferred to the new organization owner, select Also transfer ownership of owned Catalogs and Spaces.
        - Click Save.
      - For a new user, complete the following steps:
        - Enter a unique user name for the new user.
        - Supply an email address, name details, and a password.
        - To also have the ownership of all Catalogs and Spaces in the organization transferred to the new organization owner, select Also transfer ownership of owned Catalogs and Spaces.
        - Click Save.
  - LDAP
    - Enter the name of a user that exists in the selected user registry.
    - To also have the ownership of all Catalogs and Spaces in the organization transferred to the new organization owner, select Also transfer ownership of owned Catalogs and Spaces.
    - Click Save.
  - Authentication URL and OIDC
    - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account. If the required organization owner has not previously been invited and activated their account, you must ensure they have been invited to the organization first.
    - To also have the ownership of all Catalogs and Spaces in the organization transferred to the new organization owner, select Also transfer ownership of owned Catalogs and Spaces.
    - Click Save.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Deleting a provider organization

You can delete a provider organization. All Catalogs and Spaces are also removed.

## Before you begin

---

This task can be completed by users who are assigned the following roles:

- Cloud Owner
- Cloud Administrator
- Organization Manager
- Custom role with the `Provider-org:Manage` permission

## About this task

---

The user account for the owner of the deleted provider organization remains in the associated API Connect user registry. The user can still log in to the API Manager user interface; if they are a member of one or more other provider organizations then those organizations are accessible, otherwise only information links are available, with no access to view or manage any resources.

The user can be added again as a provider organization owner at a later time; see [Creating a provider organization](#).

## Procedure

---

To delete a provider organization, complete the following tasks:

1. In the Cloud Manager, click  Provider Organizations.
2. Navigate to the provider organization that you want to delete in the list and select Delete from the Actions menu.
3. Confirm that you want to delete the provider organization.  
The provider organization is deleted and removed from the Provider Organizations list.

## Results

---

The provider organization, and its Catalogs and Spaces, are deleted.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Viewing current provider organizations

View the list of current provider organizations for your cloud, including organization title, owner's name and email address, and status. From the list screen, you can add new provider organizations and owners, edit and delete provider organizations, send messages, and change owners.

## Before you begin

---

You must also complete the following tasks before beginning:

- [Configuring an email server for notifications](#)
- [Setting up notifications](#)
- [Creating a provider organization](#)

This task can be completed by users who are assigned one of the following roles:

- All roles
- Custom role with the `Provider-org:Manage` or the `Provider-org:View` permissions

## About this task

---

All roles can view the list of provider organizations. Use the provider organization list screen to manage your provider organizations.

## Procedure

---

1. In the Cloud Manager, click  Provider Organizations.
2. View the list of provider organizations and their status. The statuses are as follows:
  - **Pending:** A provider organization is in `Pending` status until the invited owner successfully completes the registration form.
  - **Active:** A provider organization is in `Active` status if the owner is an existing user with an account in a user registry.
3. The Actions menu performs different functions depending on the organization's status. Use the Actions menu to edit or delete an Active organization. For Pending organizations, use the Actions menu to delete the organization and to resend the invitation to the owner.
  - For an Enabled organization, you can Edit or Delete the organization.
  - For a Pending organization, you can Resend the Invitation, or Delete the request.
4. Add new provider organizations using the Add menu. See [Creating a provider organization](#)

## Related tasks

---

- [Creating a provider organization](#)
- [Editing a provider organization](#)
- [Deleting a provider organization](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Sending messages to provider organization owners

You can send an email message to the owner of a provider organization. You can also style the email to match your business theme.

## Before you begin

---

This task can be completed by users who are assigned the following roles:

- Cloud Owner
- Cloud Administrator
- Organization Manager
- Custom role with the `Provider-org:Manage` permission

Note: You can also send email messages by using the developer toolkit CLI, or by using the API Connect REST APIs. See [Cloud administration commands](#), or [API Connect REST APIs](#), for more information.

## Procedure

To send a message, complete the following steps:

1. In the Cloud Manager, click  Provider Organizations.
2. Click the options icon  alongside the provider organization that you want to work with, then click Message owner. The Send message window opens, and the email address of the provider organization owner is displayed as the recipient.
3. Enter the subject of the message in the Subject field.
4. Select the Content type that you want to use for the entering the content of the message, from HTML, PlainText, or Both. The default content type is PlainText. An edit window for the selected content type is displayed, or both edit windows are displayed if Both is selected. For HTML content, only the tags and their attributes that are shown in the following table are allowed.

Table 1. List of allowed HTML tags and their attributes

HTML tag	Attribute
<a>	"class", "href", "hreflang", "style"
<em>	"class", "style"
<strong>	"class", "style"
<cite>	"class", "style"
<blockquote>	"class", "cite", "style"
<code>	"class", "style"
<ul>	"class", "type", "style"

If an HTML tag that is not allowed is used in a notification, the tag and its contents are displayed in the email as plain text.

Images can be used by adding a `<img`

`src="https://path/to/image.png"/>` tag in the template. The `src` attribute for the image must be a fully qualified web URL, and must be externally accessible so that the email recipients can access the image. It's not possible to reference local images, they must be fully qualified URLs. It's also not possible to embed or attach images or other files in the emails.

5. Enter the content of the message.
6. Click Send.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Administering members and roles

Cloud Administrators can add members and assign them roles to enable them to work in Cloud Manager. The Cloud and Topology Administrators can also create roles and role defaults. You can also delete users to prevent them from accessing Cloud Manager.

### About this task

To manage roles, add members, and assign roles to member, perform the following tasks:

- [Creating roles in the admin organization](#)  
Cloud Manager ships with a set of pre-configured roles. As the Cloud Manager administrator, you can create custom roles, add permissions, and assign the roles to

members of the Admin organization.

- [Editing roles in the admin organization](#)

As the Cloud Manager administrator, you can edit the roles in the Admin Organization. Both pre-configured roles and custom roles may be edited, except for the Owner, Viewer, and Member roles. The Owner, Viewer, and Member roles may not be edited or deleted.

- [Configuring LDAP group mappings on Cloud Manager user roles](#)

As a Cloud Manager administrator, you can configure LDAP group mapping on API Connect roles in the Admin organization by using the developer toolkit CLI.

- [Deleting roles in the admin organization](#)

Roles can be deleted (except for the Owner, Viewer, and Member roles) from the Admin organization. If there are members assigned to a role that has been deleted, they will be assigned the Viewer role.

- [Viewing members and roles](#)

Use the Members page to view the current members of the Admin organization and manage the role assignments.

- [Adding members to the admin organization](#)

As the Cloud Manager administrator, you can add and remove members of the Admin organization and assign roles to them. Once removed, a user can no longer access the Cloud Manager.

- [Assigning roles to members](#)

As the Cloud Manager administrator, you manage the roles that are assigned to members. A member's role determines the tasks they are authorized to perform in Cloud Manager.

- [Deleting a member](#)

As the Cloud Manager administrator, you can delete members of the API Connect cloud administration organization. Once deleted, the user and associated roles are removed, however the user's account still remains in API Connect.

- [Role Defaults overview](#)

Role Defaults are role templates that determine the default roles created in new Provider and Consumer organizations. Cloud Manager ships with a set of pre-configured Role Defaults. As the Cloud Manager administrator, you can edit the pre-configured Role Defaults.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Creating roles in the admin organization

Cloud Manager ships with a set of pre-configured roles. As the Cloud Manager administrator, you can create custom roles, add permissions, and assign the roles to members of the Admin organization.

---

### About this task

If you are assigned a role that has the `Settings: manage` permission, you can create custom roles for the Admin organization. The Admin organization roles apply only to Cloud Manager users.

One of the following roles is required to add custom roles:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: manage` permissions

---

### Procedure

Perform the following steps to add custom roles to the Admin Organization:

1. In the Cloud Manager, click  Settings.
2. Select Roles.
3. Click Add to add a new role.
4. Enter the Title for the role. The Name will be auto-generated.
5. Use the check boxes to select the permissions for the role. For a description of the permissions and the actions they enable, see [User roles and permissions in the Cloud Manager UI](#).
6. Save the custom role.

---

### Results

The custom role appears in the list of roles and can be assigned to members.

---

### What to do next

Assign the role to a member in the Members list. See [Assigning roles to members](#)

---

### Related tasks

- [Editing roles in the admin organization](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Editing roles in the admin organization

As the Cloud Manager administrator, you can edit the roles in the Admin Organization. Both pre-configured roles and custom roles may be edited, except for the Owner, Viewer, and Member roles. The Owner, Viewer, and Member roles may not be edited or deleted.

---

### About this task

You can customize the per-configured roles (except for the Owner, Viewer, and Member roles) to reflect your business needs.

If you are assigned a role that has the `Settings: manage` permission, you can edit the roles for the Admin organization. The Admin organization roles apply only to Cloud Manager users.

One of the following roles is required to edit roles:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: manage` permissions

Following are the edits you can perform for a role:

- Change the title
- Add or delete permissions

---

### Procedure

Perform the following steps to edit roles in the Admin organization:

1. In the Cloud Manager, click  Settings.
2. Select Roles.
3. Locate the Role you want to edit, and select Edit from the overflow menu.
4. Enter the desired Title for the role. The Name will be auto-generated.
5. Use the check boxes to select the permissions for the role. For a description of the permissions and the actions they enable, see [User roles and permissions in the Cloud Manager UI](#).
6. Save the updated role.

---

### Results

The Role will be updated with a new name and/or permissions. An updated role will affect the members who are assigned the role. If you change the name of a role, you will have to assign it to the members. If you change the permissions for a role, the way that members use the product may change.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring LDAP group mappings on Cloud Manager user roles

As a Cloud Manager administrator, you can configure LDAP group mapping on API Connect roles in the Admin organization by using the developer toolkit CLI.

---

### Before you begin

You must have an LDAP user registry resource in the Cloud Manager that has the `external_group_mapping_enabled` configuration set to `true`. See [Using the CLI to configure a shared LDAP user registry](#) for information.

One of the following roles is required to edit roles:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: manage` permissions

Note: The Admin organization roles apply only to Cloud Manager users. If you want to apply LDAP group mapping to API Manager users, see [Configuring LDAP group mapping on API Manager user roles](#). LDAP group mapping cannot be applied to Developer Portal users.

---

### About this task

You can map external LDAP groups to the API Connect preconfigured user roles (except for the Owner and Member roles), as well as to any custom user roles, to reflect your business needs.

Notes:

- After LDAP group mapping is enabled on a role, user onboarding always honors the group mappings.

- Once on-boarded, user membership in API Connect is valid throughout the login period (`access_token_ttl`), irrespective of any changes in the external LDAP registry. Membership is updated only on the next login, when the LDAP information is fetched and refreshed.
- One or more API Connect roles can be mapped to one or more LDAP groups, and one or more LDAP groups can be mapped to a role.
- When multiple LDAP groups are mapped to a single role, it means that a user from any one of the LDAP groups can log in to API Connect.
- If a user is removed from the external LDAP user registry, then to ensure quick removal from API Connect you must also delete the user membership in API Connect.

You can configure LDAP group mappings using one of the following methods:

- [Using the UI to configure LDAP group mappings](#)
- [Using the CLI to configure LDAP group mappings](#)

## Using the UI to configure LDAP group mappings

Use the Cloud Manager UI to configure LDAP group mappings.

### Procedure

1. Login to the Cloud Manager UI as a user with the appropriate permissions.
2. Click Settings > Roles > Add a new Role or edit existing role .
3. Select the following settings:
  - Enable external group mapping - select to enable external group mapping for this role.
  - LDAP user Registry - LDAP user registry list which has external group mapping enabled. User must select one of the LDAP user registry from this list.
  - LDAP group names - add one or more LDAP group names that you want to map to the user role.
  - User group prefix - add the prefix for the LDAP user group.
  - User group suffix - add the suffix for the LDAP user group.
4. Save your changes.

### Results

The role is updated with the LDAP group mapping information. Users can now log on to the Cloud Manager, and automatically be assigned the correct access permissions for their role.

## Using the CLI to configure LDAP group mappings

Use the toolkit CLI to configure LDAP group mappings.

### About this task

For detailed information about how to use the CLI, see [Installing the toolkit](#), and [Overview of the command-line tool](#).

### Procedure

Perform the following steps to map external LDAP groups to Cloud Manager user roles.

1. Log in to the management server CLI.  
Before you can update the role configuration, you must log in to your management server from the developer toolkit CLI as a member of the cloud administration organization. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm admin/identity_provider
```

where `mgmt_endpoint_url` is the platform API endpoint URL.

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.

For full details of the login command, see [Logging in to a management server](#).

2. Run the following command to get the URL of the LDAP user registry resource in the Cloud Manager that you want to map the user roles to:

```
apic user-registries:get ldap_user_registry --org admin --server mgmt_endpoint_url --output -
```

where:

- `ldap_user_registry` is the name or ID of your LDAP user registry resource.
- `--org admin` means that the registry details are retrieved from the admin organization.
- `mgmt_endpoint_url` is the platform API endpoint URL.

This command outputs the configuration details of your LDAP user registry, and the `url` is shown at the end of the list, for example:

```
type: user_registry
api_version: 2.0.0
id: 35e75bad-1d89-4a65-a70f-xxxxxx
name: ldap
```

```

title: LDAP
integration_url: >-
  https://server.com/api/cloud/integrations/user-registry/147b5fb1-e88e-41e3-90e9-xxxxxx
registry_type: ldap
user_managed: false
user_registry_managed: false
external_group_mapping_enabled: true
...
url: >-
  https://server.com/api/user-registries/3d58ce7e-16a8-493b-9684-xxxxxx/35e75bad-1d89-4a65-a70f-xxxxxx

```

3. Create a role yaml file that contains the following LDAP group mapping configuration properties:

```

external_group_mapping:
  user_registry_url: https://server.com/api/user-registries/3d58ce7e-16a8-493b-9684-xxxxxx/35e75bad-1d89-4a65-a70f-xxxxxx
  ldap_groups:
    - 'cn=apic-administrators,ou=ibmgroups,o=ibm.com'
    - 'cn=apic-developers,ou=ibmgroups,o=ibm.com'
  user_group_filter_prefix: (&(uniquemember=
  user_group_filter_suffix: )(objectClass=groupOfUniqueNames))

```

Where:

- `user_registry_url` is the URL of your LDAP user registry resource from Step [#task\\_cmc\\_role\\_mapping\\_ldap\\_url](#).
- `ldap_groups` is a list of the LDAP group names that you want to map to the user role.
- `user_group_filter_prefix` is the prefix for the LDAP user group.
- `user_group_filter_suffix` is the suffix for the LDAP user group.

4. Run the following command to update the user role with the `external_group_mapping` configuration properties:

```
apic roles:update role_name --scope org --org admin? --server mgmt_endpoint_url mapping_properties_file
```

Where:

- `role_name` is the name of the user role that you want to add the LDAP group mapping to.
- `--scope` is the organization scope that you want the update to apply to. Valid values are: `catalog|consumer-org|org|space`.
- `--org admin?`
- `mgmt_endpoint_url` is the platform API endpoint URL.
- `mapping_properties_file` is the name of your mapping properties file from Step [#task\\_cmc\\_role\\_mapping\\_role\\_file](#), for example `role_mapping_file.yaml`.

If you prefer to enter the configuration properties interactively on the command line, you can substitute the `mapping_properties_file` for a terminating hyphen character `-`, and enter the information manually, followed by pressing **CTRL** **D** to terminate the input.

If you want to create a custom role that includes LDAP group mapping, you can include the `external_group_mapping` configuration section in the `role_file`, and then create the new role by using the `apic roles:create` command.

For more information about the `apic roles` commands, see [apic roles](#) in the CLI reference section.

## Results

The role is updated with the LDAP group mapping information. Users can now log on to the Cloud Manager, and automatically be assigned the correct access permissions for their role.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Deleting roles in the admin organization

Roles can be deleted (except for the Owner, Viewer, and Member roles) from the Admin organization. If there are members assigned to a role that has been deleted, they will be assigned the Viewer role.

### About this task

All custom roles may be deleted. Pre-configured roles can also be deleted, except for the Owner, Viewer, and Member roles. Owner, viewer, and Member role cannot be deleted or edited. Members who are assigned a deleted role are given the most limited role, Viewer, with View-only privileges. These members will need to be assigned a new role if they require any other privileges.

If you are assigned a role that has the `Settings: manage` permission, you can delete roles for the Admin organization. The Admin organization roles apply only to Cloud Manager users.

One of the following roles is required to delete custom roles:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: manage` permissions

### Procedure

Perform the following steps to delete roles in the Admin organization:

1. In the Cloud Manager, click  Settings.
2. Select Roles.
3. Locate the Role you want to delete, and select Delete from the overflow menu.
4. Confirm that you want to proceed with deleting the role.

## Results

---

The Role will be deleted. Members who had been assigned the role are given the Viewer role.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Viewing members and roles

Use the Members page to view the current members of the Admin organization and manage the role assignments.

## Procedure

---

To view the members of the Admin organization and their roles in Cloud Manager, follow these steps:

1. In the Cloud Manager, click  Members.
2. From the Members list, you can scroll through the list of users to see their current roles and their status.
  - **Pending** - The invitation with the activation link has been sent to the user, but they have not yet completed the registration form.
  - **Enabled** - The user has completed the registration form and is now able to login and access the features associated with their role.

Note: If your role has the proper permissions, you can assign roles, add, and delete members from this list.

## What to do next

---

- To add members, see [Adding members to the admin organization](#)
- To change the roles assigned to members see [Assigning roles to members](#)
- To delete a member, see [Deleting a member](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding members to the admin organization

As the Cloud Manager administrator, you can add and remove members of the Admin organization and assign roles to them. Once removed, a user can no longer access the Cloud Manager.

## About this task

---

Membership in the Admin organization is required to use Cloud Manager to view and manage the topology of the API Connect cloud, to set up and manage provider organizations, and to manage other features of the cloud. There are two ways to add a member:

- Invite member - send an email invitation to a new user to register as a member of the Admin organization.
- Add member - specify the user and add them as a member of the Admin organization immediately.

One of the following roles is required to add members:

- Administrator
- Owner

## Procedure

---

- To send an email invitation to a new user to register as a member of the Admin organization, complete the following steps:
  1. In the Cloud Manager, click  Members.  
The list of current members for the Admin organization is displayed. You can view the owner of the Admin Organization by expanding View Owners.
  2. Click Add > Invite member.
  3. Enter a valid email address.
  4. Select the roles that you want to assign to the user.
  5. Click Invite. An email containing an activation link is sent to the email address inviting the person to register. The link opens the registration form. Alternately, you can copy and paste the activation link into an email; click Get Activation Link and click Copy in the pop up window.  
Note that the email server requires the Authenticate User and Authenticate Password values in order to send invitations. See [Configuring an email server for notifications](#).

The user is placed in Pending status, and is changed to Enabled status after they complete the registration form to activate their account. They can then log in to the Cloud Manager user interface with the API Connect user name that they specified during account activation.

Note: If you use this option with a Local User Registry, and the user already exists in the registry, the user must re-activate their account by using the Sign In option, **not** by completing the registration form and using the Sign Up option; attempting to re-register will fail. This stipulation includes users that were previously members but were deleted from the admin organization.

- To specify the user and add them as a member of the Admin organization immediately, complete the following steps:
  1. In the Cloud Manager, click  Members.  
The list of current members for the Admin organization is displayed. You can view the owner of the Admin Organization by expanding View Owners.
  2. Click Add > Add member.
  3. Select the required user registry  
The remaining procedure varies according to the type of the selected user registry, as follows:
    - Local User Registry
      - Select whether the user is an Existing user or a New User.
        - For an existing user, complete the following steps:
          - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account.
          - Select the roles that you want to assign to the user, then click Add. The user is added and their membership is immediately enabled. The specified user can log in to the Cloud Manager user interface.
        - For a new user, complete the following steps:
          - Enter a unique user name for the new user.
          - Supply an email address, name details, and a password.
          - Select the roles that you want to assign to the user, then click Add. The user account is created, and the user membership is immediately enabled. The specified user can log in to the Cloud Manager user interface.
    - LDAP
      - Enter the name of a user that exists in the selected user registry.
      - Select the roles that you want to assign to the user, then click Add. The user is added, and the user membership is immediately enabled. The specified user can log in to the Cloud Manager user interface with their LDAP user name.
    - Authentication URL and OIDC
      - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account.
      - Select the roles that you want to assign to the user, then click Add. The user is added, and the user membership is immediately enabled. The specified user can log in to the Cloud Manager user interface.

## What to do next

---

The new member can log in and work in Cloud Manager. The member's authorization is defined by the roles assigned to them.

For instructions on assigning roles, see [Assigning roles to members](#). The list of roles and permissions can be viewed at [User roles and permissions in the Cloud Manager UI](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Assigning roles to members

As the Cloud Manager administrator, you manage the roles that are assigned to members. A member's role determines the tasks they are authorized to perform in Cloud Manager.

### About this task

---

Members in the Admin organization use Cloud Manager to view and manage the topology of the Cloud, to set up and manage provider organizations, and to work with other features of the API Connect Cloud. The member's role determines what tasks they are authorized to perform.

When assigning roles, you need to be aware that all members always have a basic set of permissions, which are contained in the **Member** role. The Member role is automatically granted to all members and cannot be removed. For this reason, you do not explicitly assign the Member role. You can grant additional permissions by selecting one or more roles. If additional roles are not assigned, then the user will have only the basic Member role.

One of the following roles is required to assign roles to members:

- Administrator
- Owner

### Procedure

---

Perform the following steps to assign one or more roles to a member:

1. In the Cloud Manager, click  Members.
2. The list of current members for the Admin organization is displayed.
3. To change the roles assigned to a member, select the roles by marking the check boxes next to their name. The roles will be updated instantly. The list of roles and permissions can be viewed at [User roles and permissions in the Cloud Manager UI](#)

### Results

---

The member will be assigned the permissions for the role(s).

## What to do next

---

The new member can work in Cloud Manager. The member's authorization is defined by the roles assigned to them.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Deleting a member

As the Cloud Manager administrator, you can delete members of the API Connect cloud administration organization. Once deleted, the user and associated roles are removed, however the user's account still remains in API Connect.

## About this task

---

One of the following roles is required to delete a member:

- Administrator
- Owner

Note: The user account of the deleted user remains in the associated API Connect user registry. The user can still log in to the Cloud Manager user interface but only information links are available; there is no access to view or manage any resources.

The user can be added again as a member at a later time; see [Adding members to the admin organization](#).

## Procedure

---

To delete a member of the cloud administration organization, complete the following steps:

1. In the Cloud Manager, click  Members.
2. Choose Delete from the overflow menu that is adjacent to the member you want to delete.
3. Confirm the deletion.

## Results

---

The member is deleted and removed from the Members list in Cloud Manager.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Role Defaults overview

Role Defaults are role templates that determine the default roles created in new Provider and Consumer organizations. Cloud Manager ships with a set of pre-configured Role Defaults. As the Cloud Manager administrator, you can edit the pre-configured Role Defaults.

## Role Defaults concepts

---

Role Defaults determine the base roles applied to either Provider or Consumer Organizations. The Role Defaults for the Admin organization are not configurable. Role Defaults help to standardize base roles for all organizations. Roles and permissions may be added or modified in the Role Defaults to customize the base roles as needed. Role Defaults are a "point-in-time" configuration, which effects only new organizations. You can add, delete, or modify roles (except for the Owner, Member, and Viewer roles) in the organization to customize the permissions for each organization.

Rules for editing Role Defaults:

- Edits to Role Defaults are not applied retroactively to existing organizations. Edits apply only to new organizations created after the changes are made.
- Role Defaults apply to all new organizations; roles can then be edited at the organization, catalog, and space level.
- Edits made to roles in an organization do not affect the Role Defaults. Role Defaults are the "parent" and organization roles are the "child". The child inherits from the parent, but changes do not filter up from the organization to the Role Default.
- [Managing role defaults for provider organizations](#)  
Role Defaults are role templates that determine the default roles created in new Provider and Consumer organizations. Cloud Manager ships with a set of pre-configured Role Defaults. As the Cloud Manager administrator, you can edit the pre-configured Role Defaults.
- [Managing role defaults for consumer organizations](#)  
Role Defaults are role templates that determine the default roles created in new Provider and Consumer organizations. Cloud Manager ships with a set of pre-configured Role Defaults. As the Cloud Manager administrator, you can edit the pre-configured Role Defaults.

---

## Managing role defaults for provider organizations

Role Defaults are role templates that determine the default roles created in new Provider and Consumer organizations. Cloud Manager ships with a set of pre-configured Role Defaults. As the Cloud Manager administrator, you can edit the pre-configured Role Defaults.

### About this task

---

If you are assigned a role that has permissions to manage Cloud Settings, you can create manage the Role Defaults for the provider organizations. One of the following roles is required to add roles to the role defaults:

- Administrator
- Topology Administrator
- Owner

Perform the following steps to add or edit roles to the Roles Defaults for provider organizations:

### Procedure

---

1. In the Cloud Manager, click  Settings.
2. Select Role Defaults.
3. Click Add to add a new role.
  - a. To edit a role, select Edit from the overflow menu for the role.
  - b. To delete a role from the Role Default, select Delete from overflow menu and confirm the deletion. Owner, Member, and Viewer roles cannot be deleted.  
**Note:** Role deletions apply to new members added after the deletion. If a current member is assigned the role, they will continue to have the permissions connected with the role. You need to manage the deletions for each member in the Members screen.
4. Enter the Title for the role. The Name will be auto-generated.
5. Use the check boxes to select the permissions for the role. For a description of the permissions and the actions they enable, see [User roles and permissions in the Cloud Manager UI](#).
6. Save the role.

### Results

---

The role appears in the list of roles for the provider organization Role Defaults. It will be included in the roles that can be assigned to members for all new provider organizations. The roles can be edited for individual organizations.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Managing role defaults for consumer organizations

Role Defaults are role templates that determine the default roles created in new Provider and Consumer organizations. Cloud Manager ships with a set of pre-configured Role Defaults. As the Cloud Manager administrator, you can edit the pre-configured Role Defaults.

### About this task

---

If you are assigned a role that has permissions to manage Cloud Settings, you can create and manage the Role Defaults for consumer organizations. One of the following roles is required to add roles to the role defaults:

- Administrator

- Topology Administrator
- Owner

Perform the following steps to add or edit roles to the roles defaults for consumer organization:

## Procedure

---

1. In the Cloud Manager, click  Settings.
2. Select Role Defaults.
3. Click Add to add a new role.
  - a. To edit a role, select Edit from the overflow menu for the role.
  - b. To delete a role from the Role Default, select Delete from overflow menu and confirm the deletion. Owner, Member, and Viewer roles cannot be deleted.  
Note: Role deletions apply to new members added after the deletion. If a current member is assigned the role, they will continue to have the permissions connected with the role. You need to manage the deletions for each member in the Members screen.
4. Enter the Title for the role. The Name will be auto-generated.
5. Use the check boxes to select the permissions for the role. For a description of the permissions and the actions they enable, see [User roles and permissions in the Cloud Manager UI](#).
6. Save the role.

## Results

---

The role appears in the list of roles for the consumer organization Role Defaults. It will be included in the roles that can be assigned to members for new consumer organizations. The roles can be edited for catalogs, but permissions inherited from the Role Default cannot be deleted. Permissions can be added at the catalog level, but not deleted.

## Monitoring the cloud

API Connect generates events to monitor the status of your cloud.

## About this task

---

You can monitor your API Connect cloud and configure destination targets for your analytics data by using the following tasks:

- [Configuring Analytics to collect API event data](#)  
Configure the collection of API event data so it can be filtered, sorted, and aggregated to help you review usage and performance.
- [Configuring audit logging to monitor user operations](#)  
Configure auditing in IBM API Connect to monitor user operations such as who published which product and when.
- [Reviewing a gateway's processing status](#)  
Review the processing status for the Gateway services that are enabled in your API Connect Catalogs and Spaces.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring Analytics to collect API event data

Configure the collection of API event data so it can be filtered, sorted, and aggregated to help you review usage and performance.

Use the API Connect Analytics service to monitor API usage and performance. API analytics provide data to help you manage service levels, set quotas, establish controls, set up security policies, manage communities, and analyze trends. The data for Analytics is collated from API events that are logged when API operations are invoked. The captured event data can be forwarded to the Analytics user interface in the API Connect API Manager or offloaded to third-party systems.

## API event records

---

An API event is logged each time an API operation is invoked, and an event record is generated for each API event on the Gateway server. The API event record contains information about the API call. When an analytics service is associated with a gateway, it will capture API events. The content of the record depends on the logging policy that is set for the operation. For more information about the fields that are displayed in an API event record, see [API event record fields](#).

## Analytics configuration options

API Connect offers several configuration options to customize data collection, storage, and retention. For example, you can define filters that refine data to add or remove fields before it is stored. You can choose to offload some, or all, of the data to a third-party storage system. You can choose whether to store any Analytics data in API Connect. If you offload all of your Analytics data, you can disable the Analytics UI in API Connect. Some options are configured during installation, while other options are easily changed even after your Analytics subsystem is in service.

- [Counting total API calls for your Analytics service](#)  
Count the API calls for the IBM® API Connect Analytics subsystem and return the total categorized by response status.
- [Viewing API event data in API Connect](#)  
API Connect generates API event data. The captured event data can be viewed in the API Manager or offloaded to third-party systems.
- [Including geoIP fields in Analytics data](#)  
Configure Analytics settings to include geoIP fields in the data.
- [Configuring data retention and index rollover time periods](#)  
You can set a time period for data retention and index rollover using the Advanced Analytics Configuration option for an analytics service.
- [Configuring the analytics message queue](#)  
The analytics message queue is embedded in the data ingestion pipeline. It is most useful when offloading data from the analytics subsystem to a third-party system. It ensures that data collection continues in the event of a failure.
- [Offloading analytics to third-party systems](#)  
The event data that is generated and collected in your API Connect on-premises deployment can optionally be forwarded to external third-party systems for storage and analysis.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Counting total API calls for your Analytics service

Count the API calls for the IBM® API Connect Analytics subsystem and return the total categorized by response status.

### Before you begin

This procedure requires you to deploy the Analytics subsystem and store data in IBM API Connect. If your organization did not deploy the Analytics subsystem, then you cannot use this process to track usage. If you deployed Analytics but offload all of your data and do not store it in IBM API Connect, then you must capture usage information from the third-party application where you offload data.

### About this task

If your IBM API Connect bases costs on usage, you can use the following procedure to track this information so that you can accurately report it.

## Procedure

1. Find an analytics-storage pod (for example, coordinating, data, master, or basic) by running the following command.

```
kubect1 get pods
```

2. Build a query for your request to the analytics datastore.
  - a. Set the **size** to 0 to disable the return of raw data.  
The following example shows how to specify the **size**.

```
{  
  "size": 0  
}
```

Tip: If you want to return some raw data to verify that the range query in the next step works, set the **size** to 1 instead.

- b. Add a **range** query for date filtering.  
The following example shows how to specify the time range in your query:

```
{  
  "size": 0,  
  "query": {  
    "range": {  
      "datetime": {  
        "gte": "YYYY-MM-DD",  
        "lt": "YYYY-MM-DD"  
      }  
    }  
  }  
}
```

This setting filters the query by specifying a time range that begins on or after (is greater than or equal to) the **gte** date, and ends before (is less than) the **lt**.

Note:

When specifying the time range, note the following considerations about the value that you specify for the date:

- Format: The value must use the ISO-8601 format (`YYYY-MM-DDThh:mm:ss.yyyZ`) or a shortened version of that format (for example, `YYYY-MM-DD`).
- Timezone: The value must follow UTC time (Coordinated Universal Time) because the query will be executed by the analytics-storage pod (which runs on UTC time), so it's important to allow for any time difference when you run a query.

c. Build the aggregation.

The aggregation code uses regular expressions to match the patterns for response codes (for example all of the responses with a code that begins with "1"). The query counts the documents within the specified time range that match each set of response codes, and then calculates the total number of documents.

The following example shows the complete query. The `aggs` section contains the code to count the total number of API calls.

```
{
  "size": 0,
  "query": {
    "range": {
      "datetime": {
        "gte": "YYYY-MM-DD",
        "lt": "YYYY-MM-DD"
      }
    }
  },
  "aggs": {
    "status_codes": {
      "filters": {
        "filters": {
          "1xx": {
            "regexp": {
              "status_code": "1.*"
            }
          },
          "2xx": {
            "regexp": {
              "status_code": "2.*"
            }
          },
          "3xx": {
            "regexp": {
              "status_code": "3.*"
            }
          },
          "4xx": {
            "regexp": {
              "status_code": "4.*"
            }
          },
          "5xx": {
            "regexp": {
              "status_code": "5.*"
            }
          }
        }
      }
    }
  }
}
```

3. Submit a request with your query to the analytics-storage pod that you located in step 1.

Run the following command, where:

- `analytics-storage-pod` represents the name of the analytics-storage pod that you identified in step 1.
- `analytics_query` is the content of the query, as shown in step 2c.

```
kubectl exec -it analytics-storage-pod -- \
curl_es /apic-api-r/_search?pretty \
-d 'analytics_query' \
-H 'Content-Type: application/json'
```

4. Review the response.

Most of the information in the response can be ignored because it doesn't apply to your use case. Locate the `aggregations.status_codes.buckets` field, which contains the individual fields that represent the status codes.

The status code fields are labeled as `1xx`, `2xx`, `3xx`, `4xx`, and `5xx`. Each of the status code fields has an object as its value with a field called `doc_count`.

In each status code field, locate the `doc_count` field and note its value, which represents the total number of API calls for the current status code within the specified time range.

The following example shows a sample response with an aggregated total of 100,000 API calls.

```
{
  "took" : 19,
  "timed_out" : false,
  "_shards" : {
    "total" : 2500,
    "successful" : 2500,
    "skipped" : 0,
    "failed" : 0
  },
  "hits" : {
    "total" : 100000,
    "max_score" : 0.0,
    "hits" : [ ]
  },
  "aggregations" : {
```

```

    "status_codes" : {
      "buckets" : {
        "1xx" : {
          "doc_count" : 10000
        },
        "2xx" : {
          "doc_count" : 60000
        },
        "3xx" : {
          "doc_count" : 5000
        },
        "4xx" : {
          "doc_count" : 15000
        },
        "5xx" : {
          "doc_count" : 10000
        }
      }
    }
  }
}

```

## What to do next

To ensure you correctly track the API calls, you should run the query on a daily basis and store the accumulated daily totals where you can make sure they are backed up. You can create a script based on the query and schedule it to run daily. For more information about creating the script, see [Creating a script to count API calls](#).

- [Creating a script to count API calls](#)

Optionally create a script containing a query that counts the API calls for the IBM API Connect Analytics subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a script to count API calls

Optionally create a script containing a query that counts the API calls for the IBM® API Connect Analytics subsystem.

## Before you begin

Create a query to count the total number of API calls in the Analytics subsystem as explained in [Counting total API calls for your Analytics service](#).

## About this task

If you need to count your API calls to track the totals for your contract, then you must run the query to count API calls on a periodic basis. You can automate the process by creating a script that contains the query. To ensure you correctly track the API calls, schedule the script to run on a daily basis and store the accumulated daily totals where you can make sure they are backed up.

The example script includes the following changes to the original query. The changes make it easier to run the script repeatedly without editing it each time.

- Accept the namespace and release name of the analytics service as input.  
If you only deployed one release in the namespace, then you can leave the release name blank. For appliance deployments, use `default` as the value of the namespace, and leave the release name blank.
- Identify the analytics-storage pod automatically and saves it in the `POD` variable to be used by your query.
- Change the query's time range variables from ISO format to date math syntax so that you can run the script again without editing the time range.  
You should run the script at the same time every day to ensure consistent counts. Using date math, you can use variables to calculate yesterday's date and today's date. Then, your script can use those dates to retrieve the total number of calls for the 24 hours that elapsed between the beginning of yesterday and the beginning of today.
  - Set the start date (`gte`) to the value `now-1d/d`, which represents the beginning of yesterday.
  - Set the end date (`lte`) to `now/d`, which represents the beginning of today.

Note: Remember, the values for the time range variables are calculated from the current system time of the analytics-storage pod, which follows UTC time (Coordinated Universal Time). It's important to allow for any time difference when you run a query because your timing might cause an inadvertent date change for the results.

For example, if today is January 2 in EST and your current time is 5:00 AM (2019-01-02T05:00:00), then the system time on the analytics-storage pod (in UTC) is 10:00 AM on January 2 (2019-01-02T10:00:00). The date math calculation for yesterday (`now-1d/d`) is equal to 2019-01-01T00:00:00, and the date math calculation for today (`now/d`) is equal to 2019-01-02T00:00:00. The query captures the API call counts for "yesterday", which is the 24 hours of the date 2019-01-01T00:00:00. But if your current time in EST is 8:00 PM on January 2, the time on the system time on the analytics-storage pod is 1:00 AM on January 3. "Yesterday" is now January 2 and "today" is now January 3, so the query returns the call count for January 2 instead of January 1.

## Procedure

1. Create the script.

The following example shows the completed script. In the script, the `kubect1` `exec` statement must be on a single line.

```
#!/bin/bash
NAMESPACE=$1
RELEASE_NAME=$2

POD=`kubectl get po -n $NAMESPACE -o custom-columns=NAME:.metadata.name | grep -e "storage-master-0" | head -n 1`

kubectl exec -it $POD -n $NAMESPACE -- curl -s /apic-api-r/search?pretty -H 'Content-Type: application/json' -d '{
"size": 0, "query": { "range": { "datetime": { "gte": "now-1d/d", "lt": "now/d" } } }, "aggs": { "status_codes": {
"filters": { "filters": { "1xx": { "regexp": { "status_code": "1." } }, "2xx": { "regexp": { "status_code": "2." } },
"3xx": { "regexp": { "status_code": "3." } }, "4xx": { "regexp": { "status_code": "4." } }, "5xx": { "regexp": {
"status_code": "5.*" } } } } } } } }
```

2. Save the file and make it executable, as shown in the following example.

```
chmod +x path/to/my-script-filename.sh
```

3. Run the script.

Invoke it with your namespace and release name as shown in the following example:

```
./my-script-filename.sh namespace release_name
```

Remember, you can omit the release name if it's not needed, as shown in the following example:

```
./count.sh apic
```

For appliance deployments, you can use `default` as the namespace and omit the release name as shown in the following example:

```
./my-script-filename.sh default
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Viewing API event data in API Connect

API Connect generates API event data. The captured event data can be viewed in the API Manager or offloaded to third-party systems.

An API event is logged each time an API operation is invoked, and an event record is generated for each API event on the Gateway server. The API event record contains information about the API call. When an analytics service is associated with a gateway, it will capture API events.

The content of the API event record depends on the logging policy that is set for the operation. For more information about the fields that are displayed in an API event record, see [API event record fields](#). For information about how to configure your logging preferences for API events, see [activity-log policy](#) and [Including elements in your assembly](#).

By default, API providers can view API event data within API Connect in the following ways:

- By opening the Analytics user interface in API Manager, which is accessed by clicking `Manage > Catalog_name > Analytics`. Analytics data for each Catalog or Space is collected into *dashboards*. Each dashboard contains a set of related *visualizations* that depict analytics data as a graphical or metric representation. Default dashboards are provided for viewing and customizing analytics data for APIs, Plans, Products, Catalogs and Spaces. Custom dashboards can also be created. For more information about accessing and working with the API event data shown in API, Plan, and Product dashboards, see [Managing your Products](#).
- By using the debug function for the integrated test tool that is provided in the API Manager user interface. The debug function is typically used to view information about the API configuration in order to identify possible causes for an API invocation failure.

API consumers who are members of a consumer organization can also view analytics data within dashboard views in the Developer Portal user interface. The dashboard views depict API invocation metrics about the APIs used either by a single application or within the entire consumer organization. For more information about accessing the analytics data for APIs that are invoked by developer applications, see [Analytics in the Developer Portal](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Including geoIP fields in Analytics data

Configure Analytics settings to include geoIP fields in the data.

### About this task

By default, the `client_geoip` and `gateway_geoip` fields are not included in Analytics data.

You typically configure the fields to include in data while deploying the Analytics subsystem. For information on including the geoIP fields in Analytics data, see the appropriate topic for your environment:

- Kubernetes: [Configuring Analytics to include geoIP fields](#)
- VMware: [Configuring Analytics to include geoIP fields](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring data retention and index rollover time periods

You can set a time period for data retention and index rollover using the Advanced Analytics Configuration option for an analytics service.

### Before you begin

---

This task assumes you have registered an analytics service and associated it with a gateway service. See [Registering an analytics service](#) and [Associating an analytics service with a gateway service](#).

One of the following roles is required to set the Data Retention and Index Rollover values:

- Administrator
- Topology Administrator
- Owner
- A custom role with the `topology:manage` permission

### About this task

---

Each API call is recorded as a document in a shared index. Periodically, a new index is created and the previous index is stored. You can specify Index Rollover and Data Retention settings that control how often new indexes are created, and how long indexes are stored.

The Index Rollover settings determine how long an index accumulates data before it "rolls over" into storage and a new index is created. You can control the duration of an index two ways: by setting a maximum age for the index (default is 1 day), and by setting a maximum number of documents that can be recorded in the index (default is 25 million documents). When the rollover occurs, a new index is created and documents are recorded there, while the previous index is stored until its age exceeds the Data Retention setting. If you change the rollover settings, consider both the amount of data being stored within each index as well as the number of indexes being stored. Allowing indexes to grow too large, or storing too many indexes at once, might cause issues.

The Data Retention setting determines how long the stored indexes (and the data they contain) are retained. Once every day, all indexes that are older than the specified retention period are purged. Retention is based on the index's age, not the age of the data within that index. When the index's own creation date exceeds the retention period, the index and all its data is deleted even if some of the data stored in that index is younger than the retention period. Data is purged by deleting entire records so you cannot choose to delete only certain fields.

The default retention period is 90 days. Reasons for changing this setting include storage constraints, and data retention requirements for your organization. You might want to set this value to be less than the default if a large number of API events are stored, especially if payload logging is enabled on the APIs. Although there is no hard retention limit, we do not recommend exceeding 10 years (approximately 3650 days). If you modify the retention value, you should modify the index rollover setting as well to ensure that they remain in sync.

The most recently created index (the index that is currently being written to) is not deleted, even if you set the retention period as small as 1 hour. If you regularly need to delete data quickly, adjust the Index Rollover setting so that a new index is rolled over to sooner, and the old index can be deleted.

To change the data retention and index rollover settings, you must configure your settings in the Cloud Manager, and then edit the schedule in the related cronjob as explained in the following procedure.

### Procedure

---

1. Modify the Cloud Manager properties that specify the data retention and index rollover settings:

- a. In the Cloud Manager, click  Topology.
- b. Locate the Analytics service that requires data retention and index rollover settings, then click the title to open the Edit Analytics Service page.
- c. Click the Advanced Analytics Configuration link to load Kibana.
- d. In Kibana, click Storage in the API Connect section.
- e. For Data Retention, select a number and a unit of time, and then click Save.
- f. Enter the desired value for Index Rollover and click Save.

2. Modify the schedule for the cronjob that manages data retention and index rollovers.

If you want to set the data retention or index rollover frequency to more than once per day, then you must also edit the schedule that determines when the related cronjob runs.

On all platforms, the retention and rollover actions are triggered using a [Kubernetes cronjob](#), which runs once per day by default. If you want the cronjob to run more frequently, modify its schedule by completing the following steps:

- a. View the current cronjob schedule by running the following command:

- Kubernetes:

```
kubectl -n <apic-analytics-namespace> get cronjob
```

- OpenShift and Cloud Pak for Integration:

```
oc -n <apic-analytics-namespace> get cronjob
```

- VMware:

- Run the following command to connect as the API Connect administrator, replacing `<ip_address>` with the appropriate IP address:

```
ssh <ip_address> -l apicadm
```

- When prompted, select Yes to continue connecting.
- When you are connected, run the following command to receive the necessary permissions for working directly on the appliance:

```
sudo -i
```

- View the current cronjob schedule by running the following command:

```
kubectl -n <apic-analytics-namespace> get cronjob
```

The response displays the current **SCHEDULE**, as in the following example:

NAME	SCHEDULE	SUSPEND	ACTIVE	LAST SCHEDULE	AGE
analytics-cj-retention	30 1 * * *	False	0	8h	266d
analytics-cj-rollover	15,45 * * * *	False	0	19m	266d

- b. Run the following command to edit the cronjob so you can modify the schedules:

- Kubernetes:

```
kubectl -n <apic-analytics-namespace> edit cronjob <cronjob_name>
```

- OpenShift:

```
oc -n <apic-analytics-namespace> edit cronjob <cronjob_name>
```

- VMware:

```
kubectl -n <apic-analytics-namespace> edit cronjob <cronjob_name>
```

- c. Adjust the cronjob's rollover and retention schedules, and then save your changes.

Important: Do not make any other changes to the cronjob. Other changes might result in the retention and rollover actions failing to complete successfully. To configure the job to run more than once a day, modify the schedule and update the minutes and hour values as needed (the values in positions 1 and 2).

The format for the schedule consists of 5 fields, separated with spaces. Each field is represented with a \* and based on its position, controls the value shown in the following list:

- \* \* \* \* \* schedule includes 5 fields
- \* \* \* \* + ----- position 5: day of week (0 - 6 where 0=Sunday)
- \* \* \* + ----- position 4: month (1 - 12)
- \* \* + ----- position 3: day of month (1 - 31)
- \* + ----- position 2: hour (0 - 23)
- + ----- position 1: minutes (0 - 59)

For example, the following schedule runs a job at 30 minutes (position 1) past the first hour (position 2) every day: 30 1 \* \* \*

If you want a job to run more than once an hour, you can specify multiple minutes values by separating them with a comma. The following schedule runs a job at 15 minutes and 45 minutes past the every hour of every day: 15,45 \* \* \* \*

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring the analytics message queue

The analytics message queue is embedded in the data ingestion pipeline. It is most useful when offloading data from the analytics subsystem to a third-party system. It ensures that data collection continues in the event of a failure.

### About this task

The analytics message queue is an optional service that you typically configure while deploying the Analytics subsystem. For information on enabling the message queue, see the appropriate topic for your environment:

- Kubernetes: [Enabling the message queue for analytics data](#)
- VMware: [Enabling the message queue for analytics data](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Offloading analytics to third-party systems

The event data that is generated and collected in your API Connect on-premises deployment can optionally be forwarded to external third-party systems for storage and analysis.

### About this task

API Connect supports the offload of API analytics data to the following third-party systems: HTTP, Elasticsearch, Apache Kafka, and Syslog. You can configure a custom certificate for connecting to the third-party target, enable a message queue to ensure no data is lost during outages, and define filters to refine data that will be stored.

You typically configure data offloading while deploying the Analytics subsystem. For information about offloading options, see the appropriate topic for your environment:

- Kubernetes: [Choosing configuration options for Analytics](#)
- VMware: [Choosing configuration options for Analytics](#)
- **Choosing a third-party system for analytics offload**  
You can offload analytics data for API events to a third-party system for storage and analysis.
- **Configuring output plugins to specify the endpoints for analytics offload**  
Configure output plugins on Kubernetes, OpenShift, or Cloud Pak for Integration that direct analytics data to your third-party systems.
- **Customizing analytics data with filters**  
Configure filters that refine analytics data before it is redirected to storage.
- **Troubleshooting your analytics offload**  
Review information on common issues with offloading Analytics data.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Choosing a third-party system for analytics offload

You can offload analytics data for API events to a third-party system for storage and analysis.

API Connect supports the offload of API analytics data to the following third-party systems: HTTP, Elasticsearch, Apache Kafka, and Syslog. For information about the different systems, see the appropriate topic for your environment:

- Kubernetes: [Choosing configuration options for Analytics](#)
- VMware: [Choosing configuration options for Analytics](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring output plugins to specify the endpoints for analytics offload

Configure output plugins on Kubernetes, OpenShift, or Cloud Pak for Integration that direct analytics data to your third-party systems.

### About this task

---

API Connect supports the offload of API analytics data to the following third-party systems: HTTP, Elasticsearch, Apache Kafka, and Syslog.

You typically configure the output plugins for data offloading while deploying the Analytics subsystem. For information about the different systems, see the section on "Selecting a third-party system for offloading data" in the appropriate topic for your environment:

- Kubernetes, OpenShift, or Cloud Pak for Integration: [Configuring offloading for analytics data](#)
- VMware: [Configuring offloading for analytics data](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Customizing analytics data with filters

Configure filters that refine analytics data before it is redirected to storage.

You can customize the Analytics data before storing it, by adding fields, removing fields, and modifying fields. The filter can be applied both to data stored in API Connect and to data that you offload to a third-party system. You can filter the API event data based on the event record fields that are described in [API event record fields](#). For information about configuring filters to refine data, see the appropriate topic for your environment:

- Kubernetes: [Choosing configuration options for Analytics](#)
- VMware: [Choosing configuration options for Analytics](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Troubleshooting your analytics offload

Review information on common issues with offloading Analytics data.

If you determine that your third-party system is not receiving analytics data, you can complete some checks to help determine the cause and resolve the problem. For information on troubleshooting data offload, see the appropriate topic for your environment:

- Kubernetes: [Troubleshooting your Analytics offload](#)
- VMware: [Troubleshooting your Analytics offload](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring audit logging to monitor user operations

Configure auditing in IBM® API Connect to monitor user operations such as who published which product and when.

Audit logging is useful when you want to monitor the create, update, and delete activity in your deployment; for example, who made changes, when, and what they changed.

Note: Actions performed by [Portal administrators](#) are not captured by the audit feature.

---

### What events are audited?

All create, update, and delete operations that are done by users in the Admin UI, Manager UI, Toolkit, and REST API are captured by this feature. For Portal users, all create, update, and delete operations involving applications are captured. Generally, read operations are only audited if the calling user logged in with an OIDC Provider user registry.

Internal calls and calls between system components are not audited because they are part of the product functionality and are not executed by users.

---

### How are audit events logged?

Audit events are logged by sending the information about operations to one or more endpoints of the following types: HTTP, Syslog UDP, Syslog TCP, or Syslog TLS.

- HTTP endpoints:  
Audit logging messages are sent as HTTP/HTTPS requests and use the payload format defined by the Cloud Auditing Data Federation (CADF). If the endpoint requires authentication, you can configure a header that will be included in the audit logging request. Audit logging requests are issued once only, on the assumption that every endpoint is available to receive the requests. There is no error checking to ensure that requests are received and stored by the endpoints, and failed requests are not re-sent. If you suspect that audit logging requests are not successfully reaching an endpoint, you can check the server logs on the console, where any error messages are recorded.

There are two modes that control how the auditing is sent to an endpoint: blocking and non-blocking. In non-blocking mode (the default), an audit event is sent to the endpoint and the system does not wait for a response from the endpoint. Non-blocking mode provides the best performance. Blocking mode should be used with caution: when an audit event is sent, the system pauses and waits for a response from the endpoint. Blocking mode has a negative impact on performance.

- Syslog endpoints:  
Audit logging messages are sent as syslog messages. If the endpoint requires mutual TLS, you can configure a TLS profile to send the required client certificates. Audit logging requests are issued once only, on the assumption that every endpoint is available to receive the requests. There is no error checking to ensure that requests are received and stored by the endpoints, and failed requests are not re-sent. If you suspect that audit logging requests are not successfully reaching an endpoint, you can check the server logs on the console, where any error messages are recorded.

All syslog messages are sent as non-blocking regardless of the auditing mode, since syslog messages are designed to be fire and forget (syslog was originally a UDP protocol, which by its nature does not have any acknowledgment). Blocking is only used for HTTP endpoints.

Note: With the microservices nature of API Connect, any changes to the audit settings can take up to five minutes to be fully honored by all of the microservices supporting it.

---

### What's included in the audit logging request?

- HTTP endpoints:  
The payload containing the audit logging record includes information about the user who executed the operation, the date and time of the call, the resource affected by the call, the operation performed, and the payload. To see the most recent set of fields that are included in the payload, refer to the OpenAPI schema for the audit logging request in the Provider API, which you can download at [https://us-south.functions.cloud.ibm.com/api/v1/web/API%20Connect%20Native\\_apic-on-prem/default/v10-index.http](https://us-south.functions.cloud.ibm.com/api/v1/web/API%20Connect%20Native_apic-on-prem/default/v10-index.http).

The following code example shows a sample payload for an audit logging message directed to an HTTP endpoint (IDs and users are not real):

```
{
  "id": "f6fcacb5-e8eb-4e2c-0f67-53b6a792d7f0",

  },
  "attachments": [
    {
      "timestamp": {
        "start": "2020-02-01T15:18:15.802Z",
        "end": "2020-02-01T15:18:16.011Z"
      },
      "cloud_name": "management.example.com",
      "request_id": "f6fcacb5-e8eb-4e2c-0f67-53b6a792d7f0",
      "method": "patch",
      "operation": "tls_client_profile_updateByNameVersion",
      "summary": "Update the TLS Client Profile object by name and version",
      "resource": "tls_client_profile",
      "user": {
        "url": "/api/user-registries/38385c9f-7837-583c-01f7-9d8c37a9a80d/10de0db0-27b5-35d7-b4b5-635eabb48b4a/users/24c6cddc-7a7e-5fc6-882d-5317d822048e",
        "context": "admin",
        "idp_name": "default-idp-1",
        "name": "tjwatson"
      },
      "registration": {
        "url": "/api/cloud/registrations/9d13c715-e3dc-55ef-92f1-1c2651c0a660",
        "type": "toolkit"
      }
    }
  ]
}

```

- Syslog endpoints:

The nature of syslog messaging means that the information logged is less structured and shorter than information logged using structured HTTP endpoints. With syslog, the information is more of a summary.

The following code example shows some sample payloads for an audit logging message directed to a syslog endpoint (IDs and users are not real):

```

The user admin:default-idp-1/admin has deleted the resource Org 'alpha (Alpha title)', id 19cf81c7-7cb3-43de-b5e5-d92cdfb26214 and url https://localhost:3003/api/orgs/19cf81c7-7cb3-43de-b5e5-d92cdfb26214
The user admin:default-idp-1/admin has deleted the resource Gateway Service 'webhook-gw-v5 (Webhook Gateway Service (v5) title)', id 08b87e25-616d-451e-8766-bad1c7b82a42 and url https://localhost:3003/api/orgs/69c878db-4f11-4c3e-9499-10daa25f04de/availability-zones/cb2caa3d-d619-4c2e-85f8-709956495a7b/gateway-services/08b87e25-616d-451e-8766-bad1c7b82a42
The user provider:default-idp-2/steve@example.com has created the resource Catalog 'climbon:1.0.1 (The climbon product description)', id 665036df-28ad-447e-b8de-fe9d6967b66d and url https://localhost:3003/api/catalogs/19cf81c7-7cb3-43de-b5e5-d92cdfb26214/8641fda7-43f8-4e59-b405-58a4844016c9/products/665036df-28ad-447e-b8de-fe9d6967b66d

```

## Verifying that the endpoint is receiving audit logging messages

By default, auditing operates in `non_block` mode to ensure best performance. In `non_block` mode, each audit logging message is sent immediately without waiting to ensure that the previous message was received. If you suspect that audit logging messages are not being received by the endpoint, download the server logs from the Kubernetes console and examine the `apim` microservices file for messages related to the connection state. Review the messages to validate that the connection was successful or to further diagnose issues.

For HTTP endpoints (not available for Syslog endpoints), you can test the connection by issuing a `test-connection` call using either the toolkit or a REST API. A response status of `204` indicates that the call was successful and the endpoint is available. The following example contains the payload from a connection test (IDs and users are not real):

```

{
  "id": "8d8eaaa2-1b46-4dcb-cadf-639d7d1f7f20",
  "typeURI": "http://schemas.dmtf.org/cloud/audit/1.0/event",
  "action": "create",
  "outcome": "success",

```

```

"eventType": "activity",
"reason": {
  "reasonCode": "200",
  "reasonType": "HTTP"
},
"eventTime": "2020-01-30T15:51:18.254Z",
"initiator": {
  "name": "admin:default-idp-1/tjwatson",
  "typeURI": "service/security/account/user"
},
"target": {
  "id": "test-connection",
  "typeURI": "cloud_setting"

    "method": "post",
    "operation": "cloud_setting_auditEndpointTestConnection",
    "summary": "Test connection using one of the auditing endpoints",
    "resource": "cloud_setting",
    "user": {
      "id": "/api/user-registries/dd49cebf-d3ba-5fee-92eb-f895328bc9ef/d51fa599-a5f3-50e2-a786-fafcc76daca5/users/7ff5fff8-3d4b-3524-8687-524740580d0b",
      "context": "admin",
      "idp_name": "default-idp-1",
      "name": "tjwatson"
    },
    "registration": {
      "url": "/api/cloud/registrations/734c04f7-0fe2-3ffa-b745-81027a3b8c76",
      "type": "toolkit"
    }
  }
]
}

```

Tip: To ensure that audit logging messages are not lost due to an unavailable endpoint, verify each endpoint periodically.

- [Configuring the audit settings](#)  
Use the Cloud Manager UI or the toolkit CLI to enable auditing and configure settings.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring the audit settings

Use the Cloud Manager UI or the toolkit CLI to enable auditing and configure settings.

### About this task

The audit feature tracks platform-level changes in API Connect through the use of platform APIs, CLI, and Web UI. For information on tracking run-time API execution, see [API Analytics](#).

You can configure audit settings using either the Cloud Manager UI, or the [Toolkit CLI](#).

---

## Using the Cloud Manager UI to configure audit settings

Use the Cloud Manager user interface to enable auditing of customer API calls.

### Before you begin

Configure one or more audit endpoints where logging data can be directed, and validate that every endpoint is available by testing the connection as explained in [Configuring audit logging to monitor user operations](#).

### About this task

By default, auditing is disabled. If you enable auditing, the API Connect management node emits audit events as messages and sends them to the endpoint for storage.

## Procedure

1. In the Cloud Manager, click  Settings, > Audit Setting, > Edit.
2. Click Enable to enable the audit feature, or Disable to disable it.
3. Select an audit mode:
  - Non-blocking - Default value, offers the best performance. Each request is passed immediately without waiting for a response to the previous request. This is susceptible to errors if a request is dependent on the results of an earlier request whose response is not received before the new request is sent.
  - Blocking - If you select this mode, expect a degradation in performance. Each request is allowed to finish execution before the next request is sent. This mode results in fewer errors when requests are dependent on the responses of earlier operations, but the delayed requests slow the network.  
Note: Blocking mode is only applied to HTTP endpoints and is ignored for Syslog endpoints.
4. Click Add and select the type of endpoint that you want to add (you must add at least one endpoint). Endpoints can be of the following types: HTTP, Syslog UDP, Syslog TCP, or Syslog TLS.
5. In the Endpoints section, fill in the fields to describe the new endpoint:

### HTTP

- URL - Required, must not be empty. The URL of the server where audit logging messages will be sent. If you previously saved the audit settings with an empty URL and experienced problems, you can edit the URL to correct it.
- TLS client profile - Optional. The URL of the server where the endpoint's TLS client profile is stored.
- Header name and Header value - Optional. Multiple headers are allowed (click Add to add another header). For each header, specify the header name and the header value.

### Syslog UDP

- Host name - Required, must not be empty. The host name of the server where audit logging messages will be sent; for example: www.example.com. Do not include the `syslog://` protocol with the host name. When audit logging messages are directed to the host server, the protocol is added to the host name programmatically.

- Port - Optional. The port number where audit logging messages should be directed.

### Syslog TCP

- Host name - Required, must not be empty. The host name of the server where audit logging messages will be sent; for example: www.example.com. Do not include the `syslog://` protocol with the host name. When audit logging messages are directed to the host server, the protocol is added to the host name programmatically.

- Port - Optional. The port number where audit logging messages should be directed.

### Syslog TLS

- Host name - Required, must not be empty. The host name of the server where audit logging messages will be sent; for example: www.example.com. Do not include the `syslog://` protocol with the host name. When audit logging messages are directed to the host server, the protocol is added to the host name programmatically.

- Port - Optional. The port number where audit logging messages should be directed.
- TLS client profile - Optional. The URL of the server where the endpoint's TLS client profile is stored.

6. Verify that you can reach the endpoint by clicking Test.
7. To specify another endpoint, click Add at the beginning of the "Endpoints" section.
8. When you finish adding endpoints, click Save to save your settings.

## Results

With the microservices nature of API Connect, any changes to the audit settings can take up to five minutes to be fully honored by all of the microservices supporting it.

## What to do next

If you suspect that audit logging messages are not being received by the endpoint, see [Verifying that the endpoint is receiving audit logging messages](#) for information on validating the connection.

## Using the CLI to configure audit settings

---

Use the IBM API Connect toolkit CLI to enable auditing of API calls.

### Before you begin

Configure one or more audit endpoints where logging data can be directed, and validate that every endpoint is available by testing the connection as explained in [Configuring audit logging to monitor user operations](#).

### About this task

By default, auditing is disabled. If you enable auditing, the API Connect management node emits audit events as messages and sends them to the endpoint for storage.

Use the following settings to enable auditing with the CLI toolkit:

- **enable** - Boolean, defaults to **false** (no audit). Set to **true** if you want to enable auditing.
- **mode** - Enumerated, defaults to **non\_block**. The audit mode determines how audit requests are timed when they are sent to the endpoint:
  - **non\_block** - Default value, offers the best performance. Each request is passed immediately without waiting for a response to the previous request. This is susceptible to errors if a request is dependent on the results of an earlier request whose response is not received before the new request is sent.
  - **block** - If you select this mode, expect a degradation in performance. Each request is allowed to finish execution before the next request is sent. This mode results in fewer errors when requests are dependent on the responses of earlier operations, but the delayed requests slow the network.  
Note: Block mode is only applied to HTTP endpoints and is ignored for Syslog endpoints.
- **endpoints** - Array of strings. You must specify at least one endpoint where the audit logging messages are sent. Endpoints can be of the following types: HTTP, Syslog UDP, Syslog TCP, or Syslog TLS. For HTTP and Syslog TLS endpoints, you can optionally include a TLS client profile URL. For HTTP endpoints, you can additionally include one or more optional headers. For example, if the endpoint requires an authorization header, you can include it in the endpoint setting.

- **endpoint\_type** - String. Required. Allowed values are: **http**, **syslog\_udp**, **syslog\_tcp** or **syslog\_tls**.
- **endpoint** - String. Required, must not be empty or blank. The URL of the server where audit logging messages will be sent. Include the protocol (**http://** or **syslog://**) and the port, if applicable. For example, **syslog://<hostname>:<port>**.
- **tls\_client\_profile\_url** - String. Optional; supported only for HTTP and Syslog TLS endpoints. The URL of the server where the endpoint's TLS client profile is stored.
- **headers** - String. Optional; supported only for HTTP endpoints. Multiple headers are allowed. For each header, specify the header name and the header value using the format shown in the example.

The endpoint setting can be lengthy, so uploading the settings in a file helps to avoid errors. Format the settings as a .yaml file (you can choose the file name) and upload the file using the toolkit CLI. The following example enables auditing in non-blocking mode with multiple endpoints to demonstrate how the settings should be formatted.

```
audit_setting:
  enabled: true
  mode: non_block
  endpoints:
    - endpoint_type: syslog_udp
      endpoint:
        endpoint: syslog://syslog-audit-endpoint.example_1.com:514
    - endpoint_type: syslog_tls
      endpoint:
        endpoint: syslog://syslog-tls-audit-endpoint.example_1.com:1601
        tls_client_profile_url: https://security.tls_example.com/api/orgs/d8eac736-b4e2-3aa6-c7ff-978a4cd19d0b/tls-client-
profiles/19d0f087-b4e2-3aa6-926b-9f6d51d028c3
    - endpoint_type: http
      endpoint:
        endpoint: https://mutt-audit-endpoint.example_1.com/auditing
    - endpoint_type: http
      endpoint:
        endpoint: https://auditing-endpoint.example_1.com/inputs/64e38c02-acd9-6530-76f8-dd0f336d7b11
        tls_client_profile_url: https://security.tls_example.com/api/orgs/d8eac736-b4e2-3aa6-c7ff-978a4cd19d0b/tls-client-
profiles/19d0f087-b4e2-3aa6-926b-9f6d51d028c3
        headers:
          authorization: Basic c3Bvb246c2l1tb25rYXRpZXVtYQ==
    - endpoint_type: http
      endpoint:
        endpoint: https://auditing-endpoint.example_2.com/inputs/64e38c02-acd9-6530-76f8-dd0f336d7b11
        headers:
          authorization: Basic c3Bvb246c2l1tb24=
          x-header: ForYourEyeOnly
```

## Procedure

1. Create a YAML file with the audit settings as shown in the example.  
For information on using input files with the toolkit CLI, see [Reading input from the command line](#).
2. Run the following command to log in to a management server as a member of the cloud administration organization:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm admin/identity_provider
```

Cloud settings are stored on a management server and you must log in to the server before you can access the settings with the CLI.

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total results: 2
results:
  - title: Cloud Manager User Registry
    realm: admin/default-idp-1
  - title: Corporate LDAP user registry
    realm: admin/corporate-ldap
```

The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is **default-idp-1**.

For more information on logging in, see [Logging in to a management server](#).

3. Upload the YAML file with the auditing settings by running the following command:

```
apic cloud-settings:update --server mgmt_endpoint_url my_audit_settings.yaml
```

4. Run the following command to log out of the management server:

```
apic logout --server mgmt_endpoint_url
```

## Results

With the microservices nature of API Connect, any changes to the audit settings can take up to five minutes to be fully honored by all of the microservices supporting it.

## What to do next

If you suspect that audit logging messages are not being received by the endpoint, see [Verifying that the endpoint is receiving audit logging messages](#) for information on validating the connection.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Reviewing a gateway's processing status

Review the processing status for the Gateway services that are enabled in your API Connect Catalogs and Spaces.

### About this task

Sometimes you might want to check the status of an API event that is being processed by the gateway. For example, you might want to ensure that a Product was published before and is available on the gateway before you invoke one of its APIs. Or perhaps it appears that API events are being processed too slowly and you want to see if all of the events for a particular gateway service are affected.

You can review a gateway's processing status in the API Manager user interface, or by [using the toolkit CLI](#) to retrieve the information.

Notes:

- You can only obtain processing status information for the DataPower® API Gateway. This feature is not supported for the DataPower Gateway (v5 compatible) service.
- Processing information is collected for each Catalog. If you view information for a particular Space, the display shows the results for the entire Catalog instead.

You can view the gateway processing status using the [UI](#) or the [CLI](#).

## Using the UI to view the gateway processing status

### About this task

Use the API Manager user interface to view the processing status for all of the gateway services associated with a particular Catalog or Space.

### Procedure

1. Open the Gateway services page:
  - a. Log in to API Manager.
  - b. In the navigation pane, click  Manage.
  - c. Select a Catalog.
  - d. Click the Catalog settings tab.
  - e. On the Settings page, click Gateway services.

A list of all of the gateway services for the selected Catalog, including all of its Spaces, displays the gateway type and its endpoint URL. In addition, a status icon displays for each service name to provide a quick indication of that service's current status:

-  Normal: Between 0 and 10 events are waiting to be processed
-  Increased: Between 10 and 20 events are waiting to be processed
-  High: More than 20 events are waiting to be processed

You can view details about a service's status to gain insight into possible issues.

2. On the Gateway services page, click  next to a service and select View gateway processing status. The Gateway processing status page displays a list of the events that were sent to the gateway. For each event, you can see the following information:

- Event type: The action performed by the event; for example, subscribing to a product, deleting an application, or creating a new consumer organization.
- Category: The feature area affected by the event; for example, subscriptions, applications, or consumer organizations.
- Time: The time when the event was processed by the gateway service.
- Status: The current event's processing status; for example, Queued (not yet sent for processing), Sent (but not processed yet), or Processed (complete). The number of events in the Queued and Sent states determine the status level for the service.

The display includes events that were not processed yet, as well as the last event processed. If a particular event is not listed as Sent or Queued, then that event was already processed.

## Using the CLI to obtain a gateway's processing status

### About this task

You can use the developer toolkit CLI to obtain information about the processing status for the Gateway services that are enabled in your Catalogs and Spaces.

The processing status information is returned in the following fields:

Field	Description
<code>service_up_to_date</code>	If <code>true</code> then all outstanding events have been processed by the Gateway service.

Field	Description
service_state	An overall status summary of the various states of events and processing by the Gateway service: <ul style="list-style-type: none"> <li>• <b>green</b> indicates normal status with between 0 and 10 events waiting to be processed</li> <li>• <b>orange</b> indicates that between 10 and 20 events are waiting to be processed</li> <li>• <b>red</b> indicates that more than 20 events are waiting to be processed</li> </ul>
last_processed_event	Details of the last event that was processed by the Gateway service, helping to provide a timeline of when the last event was processed, and some statistics about how long ago it was and how long the processing took.
last_sent_event	Details of the last event that was sent to the gateway service
number_of_outstanding_sent_events	The number of events that have been sent but not yet processed by the Gateway service.
number_of_outstanding_queued_events	The number of events that have been queued but not yet sent to the Gateway service.

The following example shows a "green" response that includes the status information and the list of sent events:

```
gateway_processing_status:
  service_up_to_date: false
  service_state: green
  last_processed_event:
    event_id: 40e1a564-2aea-429b-9d35-f588218688a1

    processed_at: '2020-06-02 22:32:10.838+00'
    generated_at: '2020-06-02 22:31:43.38615+00'
    filter: product_del
    event_processing_time: 22597
    elapsed_time_since_last_processed_event: 18427
  last_sent_event:
```

```
event_id: 93d0bf8f-ebfb-4a8b-aa22-7f805719d5c8
title: >-
  Update Product (name-version:lts-cat0-product-11:1.0.0, id:
  d0bf799f-7f3a-4546-b267-a85c6a7f4b10) by user shavon0
sent_at: '2020-06-02 22:32:28.426+00'
generated_at: '2020-06-02 22:32:25.505109+00'
number_of_outstanding_sent_events: 37
number_of_outstanding_queued_events: 1
```

The result includes events that were not processed yet, as well as the last event processed. If a particular event is not listed as Sent or Queued, then that event was already processed.

## Procedure

To obtain processing status information for a Gateway service, complete the following steps:

1. Log in to your API Connect Management server as a provider organization member, by using the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `user_id` is the user ID of your provider organization account, and is the same as the user ID that you use to log in to the API Manager user interface.
- `password` is the password for your administrator account.
- `identity_provider` is the identity provider that is used to authenticate API Manager users.

For example:

```
apic login --server platform-api.myserver.com --username myuser --password password --realm provider/myldap
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details on how to log in to your management server from the CLI, see [Logging in to the management server](#).

2. Obtain the Gateway processing status for a Gateway service that is enabled in a Catalog by running the following command:

```
apic configured-gateway-services:get --server mgmt_endpoint_url --scope catalog --org organization_name --catalog
catalog_name gateway_service_name --fields "add(gateway_processing_status)" --output -
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- The `--scope scope` parameter specifies `catalog` as the scope of the request.
- `organization_name` is the name of the provider organization that contains the Catalog.
- `catalog_name` is the name of the Catalog in which the Gateway service is enabled.
- `gateway_service_name` is the name of the Gateway service whose processing status you want to obtain.
- The `--fields "add(arguments)"` parameter can include either, or both, of the following arguments (separated with a comma):
  - `gateway_processing_status`: returns the total number of sent events, queued events, and processed events
  - `events`: returns lists of sent events with details about each event

For example:

```
apic configured-gateway-services:get --server platform-api.myserver.com --scope catalog --org myorg --catalog sandbox my-
gateway-service --fields "add(gateway_processing_status)" --output -
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Changing your Cloud Manager password and profile information

You can change your Cloud Manager password and update your profile information.

### Procedure

To change your password or profile information, follow these steps:

1. Log in to the Cloud Manager user interface.

2. Click the User icon  and then select My Account.
3. In the Profile section, enter a new email address and First Name and Last Name for the account owner.
4. Click Save.
5. In the Change password section, enter your current password and your new password, and confirm the new password.  
The password must contain six characters at a minimum. It must contain at least three of the following types of characters:
  - Lowercase letters
  - Uppercase letters
  - Numbers
  - Characters from the following list of allowed punctuation and special characters:

```
!
\"
#
$
%
&
\
(
)
*
+
,(comma)
- (dash/hyphen)
.(period)
/
:(colon)
;(semi-colon)
<
=
>
?
@
[
\
]
^
_(underscore)
` (back quote/grave accent)
{
| (pipe)
}
~ (tilde)
```

The password cannot contain more than two consecutive repeating characters.

6. Click Save.

## Results

---

Your profile information and password are changed.

## Related concepts

---

- [Configuring and managing your server environment](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Resolving login problems by increasing HTTP header size

You can resolve login problems for the Cloud Manager UI by increasing the maximum HTTP client header size.

### About this task

---

Login attempts to the user interface might fail with error **502 (Bad Gateway)**. This error can occur when logging in from a browser that has a large number of cookies. The error occurs because size of the login request exceeds the maximum HTTP client header size.

The maximum HTTP client header size is limited for security reasons. To workaroud this issue, you can clear the browser cache and cookies, or open an incognito window from the browser, and then retry the login.

Alternatively, you can increase the maximum HTTP client header size. Use caution when increasing the maximum size because larger headers can raise a security risk to your system.

### Procedure

---

1. **SSH** to your management system or appliance.
2. Enter the following commands:

```
kubectl get deployment -n namespace | grep apim-v2
kubectl edit deployment -n namespace apiconnect-apim-v2-deployment
```

3. In the `env` section of the deployment configuration, change `--max-http-header-size=12000` to a larger value that works for your environment. For example:

```
- name: NODE_OPTIONS
  value: --max-old-space-size=8094 --max-http-header-size=16000
```

4. Save the updated configuration.
5. Run `kubectl get pod -n namespace` a few times until the new `apiconnect-apim-v2` pod is up and running.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Onboarding a new admin for Cloud Pak for Integration

Use the API Connect toolkit CLI to create a new admin account for use with Cloud Pak for Integration.

### About this task

If you changed the local admin account for Cloud Pak for Integration, you must create a new admin user in API Connect to ensure that the new Cloud Pak for Integration admin can log in to API Connect with the Common Services User Registry.

### Procedure

1. Download and install the API Connect toolkit CLI and credentials file as explained in [Installing the toolkit](#).
2. Log in to the toolkit CLI.  
Logging in to the toolkit CLI requires the endpoint URL for your API Connect management server. In Cloud Pak for Integration, the URL indicates the location of the management server within the Cloud Pak for Integration deployment.

- a. Determine the URL to the API Connect management server by running the following command:

```
oc -n APIC_namespace get mgmt APIC_instance -o jsonpath="{.status.zenRoute}" && echo ""
```

The response looks like the following example URL:

```
apic-mgmt-admin-apic.deve-cip-hlag-8e86d3798137c73f524cf9-0000.eu-de.containers.appdomain.cloud
```

- b. Log in to the API Connect toolkit CLI by running the following command:

```
apic -s API_Connect_URL login -u admin -p <password> -r admin/default-idp-1
```

where `API_Connect_URL` is the URL of the management server in your API Connect instance.

3. Create a new admin account by completing the following steps.  
Use the toolkit CLI to create an admin account in the Common Services User Registry and then add the new admin to the API Connect `administrator` role.

- a. Create a YAML file called `newCp4iAdmin.yaml` with the following information for the new admin account.

```
username: <new_cp4i_admin_username>
first_name: CP4I
last_name: Administrator
```

- b. Create the CP4i admin account by running the following command:

```
apic -s API_Connect_URL users:create -o admin --user-registry common-services newCp4iAdmin.yaml
```

- c. Verify that the account was created by running the following command:

```
apic -s API_Connect_URL users:get -o admin --user-registry common-services <new_cp4i_admin_username> --output -
```

- d. Get the new admin account's URL by running the following command:

```
apic -s API_Connect_URL users:list -o admin --user-registry common-services | grep <new_cp4i_admin_username> | awk '{print $4}'
```

- e. Get the URL of the API Connect `administrator` role by running the following command:

```
apic -s API_Connect_URL roles:list --scope org -o admin | grep -w administrator | grep -v topology | awk '{print $2}'
```

- f. Create a YAML file called `newcp4iadminmember.yaml` with the following content:

```
name: <new_cp4i_admin_username>
user:
  url: <user_URL>
role_urls:
- <role_URL>
```

- g. Use the `newcp4iadminmember.yaml` file to add the new admin as a member of the API Connect instance's admin organization.  
Create the new member by running the following command:

```
apic -s API_Connect_URL members:create --scope org -o admin newcp4iadminmember.yaml
```

- h. Verify that the new admin account works by using it to log in to the Cloud Manager interface in your API Connect instance.
4. Remove the old Cloud Pak for Integration admin user from API Connect.
- After you verify that the new Cloud Pak for Integration admin can log into the API Connect Cloud Manager interface, delete the previous Cloud Pak for Integration admin account.
- a. Remove the previous admin from the membership of the API Connect admin organization by running the following command:

```
apic -s API_Connect_URL members:delete --scope org -o admin cs-admin
```

When you initially deployed API Connect as a component of Cloud Pak for Integration, the admin username was `admin` and the member in the API Connect admin organization was `cs-admin`. If the `cs-admin` member does not exist in the admin organization, then the Cloud Pak for Integration admin user was changed after deployment. In this case, the member uses the same name as admin account's user name. Delete the member with that name:

```
apic -s API_Connect_URL members:delete --scope org -o admin <old_cp4i_admin_username>
```

- b. Delete the previous Cloud Pak for Integration admin user account from the Common Services User Registry by running the following command:

```
apic -s API_Connect_URL users:delete -o admin --user-registry common-services <old_cp4i_admin_username>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Extending the Gateway server behavior

To support your enterprise requirements, you can extend the Gateway servers within IBM® API Connect to provide extra enforcement behavior.

### Before you begin

---

Before you develop your extensions, consider the guidelines in the following topics depending on which type of gateway you are using:

- [Gateway extension guidelines - DataPower Gateway \(v5 compatible\)](#)
- [Gateway extension guidelines - DataPower API Gateway](#)

For information on the different types of gateway, see [API Connect gateway types](#).

### About this task

---

API Connect Gateway servers uses a subset of DataPower® enforcement capabilities. You can supply DataPower Extensions to customize these enforcement capabilities further.

The DataPower extensibility function can be used to perform actions that include schema validation, antivirus scanning, message filtering, authentication, and authorization, token translation, message enrichment, encryption & decryption, digital signing, and validation and message transformation. For more information, see [IBM DataPower Version 7.5 documentation](#).

### Procedure

---

To extend the default enforcement capabilities that are provided in API Connect for the Gateway server, complete the following steps.

1. In your IBM DataPower environment, develop the configuration that you want to add to your Gateway server.
2. Test your enforcement configuration before you add the configuration to the Gateway server.
3. When you complete the IBM DataPower configuration, save the enforcement objects and files as a DataPower exported .zip file. The package file is ready to be uploaded to the Gateway server.
4. Copy your exported configuration .zip file to a centralized file system ready for upload to the Gateway server.

### What to do next

---

Upload your extension to the Gateway server; see [Configuring your Gateway server extensions](#).

- [Gateway extension guidelines - DataPower Gateway \(v5 compatible\)](#)  
Before you develop your extensions to the DataPower Gateway (v5 compatible), consider these guidelines.
- [Gateway extension guidelines - DataPower API Gateway](#)  
Before you develop your extensions to the DataPower API Gateway, consider these guidelines.
- [Configuring your Gateway server extensions](#)  
You can add extra IBM DataPower enforcement capabilities to a Gateway service by uploading a .zip file that defines the required extension behavior, and then enabling the extension in IBM DataPower.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

DataPower Gateway (v5 compatible)

# Gateway extension guidelines - DataPower Gateway (v5 compatible)

Before you develop your extensions to the DataPower® Gateway (v5 compatible), consider these guidelines.

Note: These guidelines apply to the DataPower Gateway (v5 compatible). If you are using the DataPower API Gateway, see [Gateway extension guidelines - DataPower API Gateway](#).

For information on the different types of gateway, see [API Connect gateway types](#).

You can download sample gateway extensions from <https://github.com/ibm-apiconnect/dp-extensions>.

You can create DataPower Processing Rules that can extend the enforcement behavior of the IBM® API Connect Gateway server at the following locations:

- **pre-request** extension:
  - Before the Gateway server begins to use the policies in the assembly to process the request.
- **post-request** extension:
  - After the Gateway server processes all of the policies in the assembly up to the proxy policy, if a proxy policy is used.
  - After the Gateway server processes all policies in the assembly, but before any catch logic is processed, if a proxy policy is not used.
- **post-response** extension:
  - After the Gateway server processes all of the remaining policies in the assembly after the proxy policy (including catch logic), but before the response is returned to the client application, if a proxy policy is used.
  - After the Gateway server processes the catch logic, but before the response is returned to the client application, if a proxy policy is not used.
- **post-error** extension:
  - If an error occurs, then before the Gateway server returns the error response to the client application.

To configure the Gateway server to call your extension Processing Rule, you must create an XML file that indicates the extension location and Processing Rule name. For example,

```
<extensions>
<extension location="pre-request">CustomRule1</extension>
<extension location="post-request">CustomRule2</extension>
<extension location="post-response">CustomRule3</extension>
<extension location="post-error">CustomRule4</extension>
</extensions>
```

The `<extension>` element entries are optional for any of the locations. Refer to the Gateway server Extension schema for the XML file syntax.

An extension Processing Rule can be applied to a specific organization or to all of the organizations and Catalogs. If the `<extension>` element does not have a tenant attribute, then the `<extension>` element is applied to all of the organizations. The following example shows an `<extension>` element without a tenant attribute.

```
<extension location="post-error">gen_error_handling</extension>
```

To apply an extension Processing Rule to a specific organization, enter the organization name as the value for the tenant attribute in the `<extension>` element. The following example shows an `<extension>` element with a tenant attribute value of `organization1`.

```
<extension location="post-error" tenant="organization1">organization1_error_handling</extension>
```

If you want to exclude a specific organization in an extension Processing Rule, enter the organization name as the value for the tenant attribute in an empty `<extension>` element. Add the empty `<extension>` element immediately after the custom rule `<extension>` element that you want to exclude the organization from. The following example shows an empty `<extension>` element with a tenant attribute value of `organization1`.

```
<extension location="pre-request">a_specified_CustomRule</extension>
<extension location="pre-request" tenant="organization1"></extension>
```

Important: An extension Processing Rule with a specified tenant attribute takes precedence over an `<extension>` element that applies to all of the organizations. Also, only one extension Processing Rule is applied to each extension location.

This XML file must be saved to the following location and included in your DataPower exported configuration .zip file:

```
local:///ext/extensions.xml
```

There can be only one DataPower exported configuration .zip file added to a Gateway server in API Connect.

CAUTION:

- Do not modify these files directly in the DataPower API Gateway file system, use the gateway extension mechanism described on this page.
- Do not apply gateway extension modifications to configuration in the local:/config-sequence.cfg file.

## DataPower configuration restrictions

All Processing Rules have read access to the INPUT context.

Processing Rules must not rely on context variables that are created by the IBM Gateway server enforcement configuration, because those configuration variables might change in the future.

All Processing Rules except Before Request can transform or alter the message flowing through the Gateway server. Ensure that the Processing Rule returns the desired message output context back to the Gateway server at the end of processing.

To avoid name conflicts, all DataPower configuration object names prefixed with `webapi` are reserved for IBM use.

The following folders cannot be modified:

- `local:///isp/*`
- `local:///gwapi/*`

As a best practice, avoid adding asynchronous actions in your custom Processing Rules because they increase the use of memory per transaction.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Gateway extension guidelines - DataPower API Gateway

Before you develop your extensions to the DataPower® API Gateway, consider these guidelines.

Note: These guidelines apply to the DataPower API Gateway. If you are using the DataPower Gateway (v5 compatible), see [Gateway extension guidelines - DataPower Gateway \(v5 compatible\)](#).

For information on the different types of gateway, see [API Connect gateway types](#).

### Introduction

You apply an extension to a DataPower API Gateway by uploading one or more .cfg files that define the required extension behavior. These .cfg files contain DataPower API Gateway CLI commands. For details of the full set of CLI commands that are available, see the [DataPower API Gateway CLI command documentation](#).

You package the .cfg files in a .zip file, together with any additional required files that are referenced from CLI commands; for example, a .json file that contains the OpenAPI definition for an API. The .cfg files are processed in alphanumeric order by file name.

Note: All the .cfg files must be at the root of the .zip file. If you are attempting to use an API Connect Version 2018 gateway extension that has files in sub-directories, see [Gateway extensions manifest](#) for information on how to deploy multiple extensions in a single package.

You upload the extension .zip file to an API Connect Gateway service, and enable the extension, as described in [Configuring your Gateway server extensions](#). Gateway server extensions can be deployed without having to restart the DataPower API Gateway.

To control how gateway extensions are applied to the DataPower API Gateway, you can include a Gateway extensions manifest as a manifest.json file. The manifest allows you to deploy multiple extensions of different types in a single package. For more information, see [Gateway extensions manifest](#).

### Using CLI commands in a Gateway extension

Although you can use any DataPower API Gateway CLI commands in your extension .cfg files, typically you use commands that modify API Connect objects that have previously been deployed to the DataPower API Gateway.

When API Connect objects are deployed to a DataPower API Gateway, .cfg are created on the Gateway that define the configuration of those objects. By examining those .cfg on the Gateway, you can determine the precise names of API Connect objects that you want to modify, and the current values of the properties of those objects. You can access these .cfg files by completing the following steps:

1. Log in to the DataPower administrative user interface; for the Graphical Interface, select WebGUI rather than Blueprint Console.
2. Switch to the DataPower application domain for API Connect if necessary.
3. Under Files and Administration, click File Management.
4. Expand the temporary: folder to locate the .cfg files. The files for API Connect objects are named according to their containing provider organization and Catalog, as follows:

```
20.provider-org-name_catalog-name_collection.cfg
```

The prefix 20 controls the position of the file in the overall processing sequence, which is in alphanumeric order by file name.

Restriction:

- Do not modify these files directly in the DataPower API Gateway file system. Instead, use the gateway extension mechanism described on this page.
- Do not apply gateway extension modifications to configuration in the local:/config-sequence.cfg file.

Note: Modifying a .cfg file triggers the execution of all other .cfg files that run commands on the same object.

Config-Sequence tracks all of the objects that it manages through the .cfg files. Any change to a .cfg file that causes config-sequence to run commands on an object automatically executes all other .cfg files that run commands on the same object.

Example: If a new product is published to catalog A, then the .cfg file for that collection in temporary://config will be modified by the apic-gw-service to reflect the new product. Because that .cfg file was changed, config-sequence will execute every other .cfg file that also runs operations on catalog A, in the sequence of locations defined in the config-sequence object. If there are 2 .cfg files in the same location that run commands on catalog A, they run in alphabetical order.

### Example 1 - change the scope of the rate limit for a Plan

Suppose the DataPower API Gateway configuration for a Plan has the following CLI command:

```
api-plan myorg_sandbox_financial-services_1.0.0_basic
```

The **api-plan** command has the following syntax:

```
api-plan plan_name
```

and creates a Plan of the specified name, or modifies a Plan of the same name if it already exists. By using the specified name, you can add **api-plan** commands in your Gateway extension .cfg files to modify the Plan.

Note: The names of API Connect objects in the DataPower API Gateway configuration are derived from their configuration in API Connect. For example, a Plan name has the following structure:

```
provider-org-name_catalog-name_product-name_product-version_plan-name
```

where:

- *provider-org-name* is the name of the provider organization.
- *catalog-name* is the name of the Catalog in that provider organization.
- *product-name* is the name of the Product that contains the Plan.
- *product-version* is the version of the Product.
- *plan-name* is the name of the Plan.

The default scope to which a Plan rate limit applies is per application. To change this setting on the Plan in this example, so that the rate limit scope is per client ID, add the following command to a .cfg in your Gateway extension:

```
api-plan myorg_sandbox_financial-services_1.0.0_basic
rate-limit-scope per-client-id
exit
```

For more information on configuring Plans by using DataPower API Gateway CLI commands, see [API Plan commands](#).

## Example 2 - add a path to an API definition

The .cfg file in this example performs the following actions:

1. Uses the **top** and **configure terminal** commands to reset CLI processing.
2. Uses the **api-operation** command as follows:
  - a. Creates a new operation called **bank\_branches\_get\_operation**.
  - b. Uses the **reset** command to set all properties to their default values.
  - c. Sets the operation method to **GET**.
3. Uses the **api-path** command as follows:
  - a. Creates a new path called **bank\_branches\_path**.
  - b. Uses the **reset** command to set all properties to their default values.
  - c. Sets the path URL segment to **/details**.
  - d. Adds the previously created operation **bank\_branches\_get\_operation** to the path.
4. Uses the **api-definition** command as follows:
  - a. Modifies the existing API definition called **myorg\_sandbox\_myapi\_1.0.0**.  
Note: The name of the API definition was derived from its configuration in API Connect when it was published to the DataPower API Gateway, and has the following structure:

```
provider-org-name_catalog-name_api-name_api-version
```

where:

- *provider-org-name* is the name of the provider organization.
  - *catalog-name* is the name of the Catalog in that provider organization.
  - *api-name* is the name of the API definition in API Connect.
  - *api-version* is the version of the API.
- b. Adds the previously created path **bank\_branches\_path** to the API definition.  
Note: The **reset** command is not used here because that would reset all the current settings on the **myorg\_sandbox\_myapi\_1.0.0** API definition, whereas the requirement is to add a new path to the existing configuration of the API definition.

The .cfg file is as follows:

```
top; configure terminal

api-operation bank_branches_get_operation
reset
method GET
exit

api-path bank_branches_path
reset
path "/details"
operation bank_branches_get_operation
exit

api-definition myorg_sandbox_myapi_1.0.0
path bank_branches_path
exit
```

For more information on the DataPower API Gateway CLI commands used in this example, see the following pages:

- [Initial login and common commands](#)
- [API Operation commands](#)
- [API Path commands](#)
- [API Definition commands](#)

## Gateway extension limitations

This section details the limitations of the extensions to the DataPower API Gateway.

- If you use an extension to create a user-defined policy and then delete the extension, the extension is removed from the filesystem, but the configuration sequence is not triggered to clean up related files. For the policy to be cleaned up, you must send a modified extension that explicitly removes the user-defined policy from **apic-gw-service**, as in the following example.

```
apic-gw-service
no user-defined-policies udp-basic_1.0.0
exit
```

- **user-defined-policy-yaml** policies that use or reference another policy can be deployed only after the referenced policy has been advertised to API Manager. The deploy type must be set to **deferred** and the API Connect Gateway Service must be restarted.

- Deleting an extension that is used to create a user-defined policy using a `.cfg` file does not remove the policy reference in the `apic-gw-service` object. The policy is not removed from the assembly palette until a reboot or restart of the Gateway pod. To properly remove the policy, send an `apic extensions:update` command that explicitly removes the policy from the `apic-gw-service` prior to sending the `apic extensions:delete` command.
- v5 policies that contain files outside of the `/policy` directory are not supported. If multiple v5 policies reference the same file outside the `/policy` directory, the last applied policy will overwrite the file and will be used by all policies that reference it. Removing any policy that contains the file will cause the file to be deleted and may cause errors for the remaining policies that use it.
- If an extension contains or references objects and files that are also referenced by other objects outside of the extension, deleting the extension can cause errors that are difficult to troubleshoot.
- It is possible to delete an extension that is referenced by published APIs. This may cause those API requests to return errors.
- For an extension type of `user-defined-policy`, extra assembly functions may be present in the DataPower import `.zip` file, even if there is no `.yaml` file to indicate their presence. Using these functions without declaring them using a `.yaml` file is not supported. A policy `.yaml` file is required for each policy you want to advertise to API Manager.
- Extension type `user-defined-policy-yaml` may leak generated Gatewayscript `.js` files in temporary `/js/` or `.xslt` files when deleted.
- Extension types that use SOMA imports must use new objects with no overrides. If you override a singleton or shared object using an extension of this type, then the object will not be restored to its previous state when the extension is deleted, and those objects may be missing after the extension is deleted. You must then restore any needed objects.
- [Gateway extensions manifest](#)  
A Gateway extensions manifest allows you to control how gateway extensions are applied to the DataPower API Gateway.
- [v5 policy emulation limitations](#)  
This page details the limitations of v5 policy emulation for the current release.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Gateway extensions manifest

A Gateway extensions manifest allows you to control how gateway extensions are applied to the DataPower® API Gateway.

The manifest allows you to deploy multiple extensions of different types in a single package. It is a JSON file that lists all of the extensions `.zip` files that are to be applied and instructions on when to deploy them. You can also use the manifest to enable v5 policy emulation for the API Connect Gateway Service. v5 policy emulation allows you to deploy supported v5 built-in policies and custom policies, and manage them from API Manager without having to rewrite them for DataPower API Gateway. v5 policy emulation is supported only for policies that are applied to the Gateway service scope.

The `manifest.json` file must be at the root level of the extensions `.zip` file with all of the Gateway extension files specified in the manifest.

The `manifest.json` file contains the following sections.

### properties section

The properties section determines whether to enable v5 framework to deploy supported v5 built-in policies and custom policies and manage them from API Manager without having to rewrite them for DataPower API Gateway.

Table 1. `properties` section properties

Property	Description
<code>deploy-policy-emulator</code>	Determines whether to enable v5 framework emulation. Valid values are <code>true</code> and <code>false</code> .  v5 framework emulation is enabled for the API Connect Gateway service if <code>deploy-policy-emulator</code> set to <code>true</code> , if a v5 policy is detected in the files list, or if a <code>deploy-policies</code> entry is specified.
<code>deploy-policies</code>	Contains a list of built-in policies to advertise for v5 emulation. The following policies are supported. <ul style="list-style-type: none"> <li>• <code>gatewayscript_1.0.0</code></li> <li>• <code>if_1.5.0</code></li> <li>• <code>invoke_1.5.0</code></li> <li>• <code>proxy_1.5.0</code></li> <li>• <code>redact_1.5.0</code></li> <li>• <code>switch_1.5.0</code></li> <li>• <code>validate-usernetoken_1.0.0</code></li> <li>• <code>xslt_1.0.0</code></li> </ul>

### files section

The `files` section is an array of file entries. Each file entry must reference a file that is in the `extension.zip` file.

Table 2. `files` section properties

Property	Description
<code>filename</code>	The location of the file in the <code>.zip</code> file. This property is required only if files are specified.

Property	Description
<b>type</b>	<p>The file type. This property is required. The following types are supported.</p> <p><b>dp-import</b> A gateway import used to add other services to a gateway. Note: A <b>dp-import</b> file cannot be used to change the <b>apic-gw-service</b> object. If it is used for this purpose, the extension is rejected.</p> <p><b>extension</b> A complete, valid gateway extension for an API Gateway. The extension must be a <b>.zip</b> file that contains <b>.cfg</b> files. For more information, see <a href="#">Gateway extension guidelines - DataPower API Gateway</a>.</p> <p><b>policy-v5</b> A complete, valid v5 policy implementation. For more information, see <a href="#">Authoring policies for the DataPower Gateway (v5 compatible)</a>.</p> <p><b>user-defined-policy</b> A valid API Gateway policy import <b>.zip</b> file that contains one or more policies. The <b>.zip</b> file contains one or more YAML policy definition files. The YAML files are used to indicate which policies to advertise to the API Manager server as service-level user policies. If a YAML file references an assembly function that does not exist in the implementation, the extension is rejected. The <b>.zip</b> file also contains an implementation directory that includes a policy import <b>.zip</b> file. The policy import file contains all the configurations and files necessary to run the user policies, including the assembly functions to advertise to the API Manager.</p> <p><b>user-defined-policy-yaml</b> A YAML file that includes an assembly. This assembly is converted to an assembly function and advertised to the API Manager at the gateway service user policy level. If the assembly references another user policy, that policy must already be advertised to the API Manager before it can be deployed.</p>
<b>deploy</b>	<p>When to deploy the file.</p> <p><b>immediate</b> Deploy the file as soon as it is received by the API Connect Gateway Service.</p> <p><b>deferred</b> Deploy the file after the API Connect Gateway Service is restarted. This value is the default setting.</p>
<b>catalog</b>	<p>Indicates that a v5 policy is to be used only by certain catalogs and should not be advertised as a gateway service-level user policy. This property is valid only if the file type is <b>policy-v5</b>. The <b>catalog</b> value must be in the format <b>orgname_catalogname</b>.</p>

## Example manifest.json

The following example **manifest.json** file enables v5 policy emulation and specifies two built-in v5 policies to deploy. The files section lists two v5 policy implementation files and two extension files.

```
{
  "extension": {
    "properties": {
      "deploy-policy-emulator": true,
      "deploy-policies": [ "invoke_1.5.0", "proxy_1.5.0" ]
    },
    "files": [
      {
        "filename": "jws-sign-policy.zip",
        "deploy": "deferred",
        "type": "policy-v5",
        "catalog": "testorg_testcatalog"
      }, {
        "filename": "jws-verify-policy.zip",
        "deploy": "immediate",
        "type": "policy-v5"
      }, {
        "filename": "APIGWLegacyExt_1.zip",
        "deploy": "deferred",
        "type": "extension"
      }, {
        "filename": "APIGWLegacyExt_2.zip",
        "deploy": "immediate",
        "type": "extension"
      }
    ]
  }
}
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## v5 policy emulation limitations

This page details the limitations of v5 policy emulation for the current release.

- The reverse solidus character (\) may be removed from policy property values.
- The source parameter for XSLT and GatewayScript policies is base-64 encoded to preserve escaping. It cannot be easily viewed from the DataPower command line or the DataPower WebGUI.

- Some DataPower service variables (for example, `var://service/mpgw/skip-backside`) may not be applicable in API Gateway, depending on how the variables are used.
- User-defined policies that make any alterations to a DataPower context are not supported.
- Execution of a 1.0.0 policy may fail if a previous 2.0.0 policy updates the `message.body` content type (for example, from XML to JSON, or JSON to XML).
- A proxy 1.5.0 policy can return an incorrect response if it is the last action within a switch `case` or `otherwise` property. The response is parsed. The correct behavior is to not parse the response. To work around this issue, set the `final-action: true` parameter on the proxy.
- Proxy 1.5.0 and invoke 1.5.0 policies do not preserve the `gtid` header.
- The `cache-putpost-response` property is not included in the schema for invoke 1.5.0 and proxy 1.5.0 policies.
- Setting HTTP response headers in a v5 user-defined policy, GatewayScript policy, or XSLT policy is not supported.
- Non-UTF-8 characters are not supported.
- JSON data returned in the response of an API running in v10 with v5 emulation is formatted without spaces.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring your Gateway server extensions

You can add extra IBM® DataPower® enforcement capabilities to a Gateway service by uploading a .zip file that defines the required extension behavior, and then enabling the extension in IBM DataPower.

### About this task

You can upload a Gateway server extension to a Gateway service in either of the following ways:

- [Use the Cloud Manager user interface](#)
- [Use the developer toolkit CLI](#)

### Procedure

- To upload a Gateway server extension to a Gateway service by using the Cloud Manager user interface, complete the following steps:
  1. In the Cloud Manager user interface, click  Topology.
  2. Alongside the required Gateway service, click the options icon , then click Configure gateway extension.
  3. Click Add.
 

Note: You cannot upload more than one Gateway extension .zip file to the same Gateway service. If a Gateway server extension has previously been uploaded, the Add button is not available; you can replace the previous extension by clicking the options icon  alongside gateway-extension, then clicking Edit.
  4. Upload the extension as indicated, either by dragging and dropping the .zip file, or by browsing and selecting it.
  5. Click Save when done.
- To upload a Gateway server extension by using the developer toolkit CLI, complete the following steps:
  1. Log in to your API Connect Cloud Manager server as an administrator, using the following command:

```
apic login --server <cloud-manager_endpoint_url> --username <admin_user_ID> --password <admin_password> --realm admin/<identity_provider>
```

where:

- `<cloud-manager_endpoint_url>` is the Cloud Manager endpoint URL; for example: `mgmt-admin.<myserver>.com`.
- `<admin_user_ID>` is the user ID of your administrator account, and is the same as the user ID that you use to log in to the Cloud Manager user interface.
- `<admin_password>` is the password for your administrator account.
- `<identity_provider>` is the identity provider that is used to authenticate administrative users.

For example:

```
apic login --server mgmt-admin.myserver.com --username admin --password my-admin-password --realm admin/myldap
```

2. Upload the Gateway extension .zip file by using the following command:

```
apic gateway-extensions:create <extension_zip_file> --scope org --org admin --gateway-service <gateway_service> --availability-zone <availability-zone> --server <cloud-manager_endpoint_url>
```

where:

- `<extension_zip_file>` is the Gateway extension .zip file that you want to upload.
- `<gateway_service>` is the name of the Gateway service that you want add the extension to.
- `<availability-zone>` is the name of the availability zone that contains the Gateway service.
- `<cloud-manager_endpoint_url>` is the platform API endpoint URL.

For example:

```
apic gateway-extensions:create myextension.zip --scope org --org admin --gateway-service mygateway-service --availability-zone availability-zone-default --server mgmt-admin.myserver.com
```

This example uses the default supplied availability zone name of `availability-zone-default`, which will be the required value if you have not configured your own availability zones. To check the names of the currently configured availability zones, use the following command:

```
apic availability-zones:list --org admin --server <cloud-manager_endpoint_url>
```

For details on configuring availability zones, see [Creating an Availability Zone](#).

To check the names of the currently configured gateway services, use the following command:

```
apic gateway-services:list --org admin --availability-zone <availability-zone> --server <cloud-manager_endpoint_url>
```

You can confirm that the extension has been added to the Gateway service by using the `gateway-extensions:get` command; for example:

```
apic gateway-extensions:get --scope org --org admin --gateway-service mygateway-service --availability-zone availability-zone-default --server mgt-admin.myserver.com --output -
```

(the parameter setting `--output -` writes the details of the Gateway extension object to the command window. You can specify the name of an existing folder to have the details written to a `.yaml` file in that folder.)

For reference details of the `apic`

`gateway-extensions` commands, see [apic gateway-extensions](#).

Note: You cannot upload more than one Gateway extension `.zip` file to the same Gateway service. If you want add further extensions later, update the original `.zip` file, then use the `apic`

`gateway-extensions:update` command to replace the previous gateway extensions file with the revised one; for example:

```
apic gateway-extensions:update mynewextension.zip --scope org --org admin --gateway-service mygateway-service --availability-zone myavailabilityzone --server mgt-admin.myserver.com
```

3. Apply the extension to each server by restarting the API Connect gateway service object; complete the following steps on **each** Gateway server in the Gateway service:

Note: In Kubernetes environments, the following steps can be accomplished by issuing `kubectl`

`delete pod` on **each** gateway pod. Be sure to wait until each pod gets back to the ready state before deleting the next gateway pod.

- a. Remove the Gateway server from the load balancing group.
- b. Disable, then enable the API Connect gateway service object. You can do this by using either the DataPower administrative user interface in a web browser, or by using the DataPower CLI.

- By using the administrative user interface:

- Log in to the DataPower administrative user interface; for the Graphical Interface, select WebGUI rather than Blueprint Console.
- Switch to the DataPower application domain for API Connect if necessary.
- Search for API Connect Gateway Service.
- Set the Administrative State to disabled.
- Apply the changes.
- Set the Administrative State to enabled.
- Apply the changes.

- By using the CLI:

- Enter configuration mode by entering the command `configure`.
- Navigate to the DataPower application domain for API Connect by entering the command `switch api_connect_domain_name`, where `api_connect_domain_name` is the name of your API Connect application domain.
- Disable the API Connect gateway service object by entering the following command:

```
apic-gw-service; admin-state disabled; exit
```

- Enable the API Connect gateway service object by entering the following command:

```
apic-gw-service; admin-state enabled; exit
```

- c. Ensure that the gateway service object initialization has completed.

- d. Re-add the Gateway server to the load balancing group.

4. Apply the extension to each server by restarting the API Connect gateway service object; complete the following steps on **each** Gateway server in the Gateway service:

Note: In Kubernetes environments, the following steps can be accomplished by issuing `kubectl`

`delete pod` on **each** gateway pod. Be sure to wait until each pod gets back to the ready state before deleting the next gateway pod.

## Results

The extension is uploaded and applied to each of the servers in the Gateway service, and the associated enforcement capabilities are applied to all incoming API resource requests.

Warning: **DataPower Gateway (v5 compatible) only** If you upload an extension to the DataPower Gateway (v5 compatible), a status file called `extension_import_response.xml` is written to the `local:/ext` folder in the gateway file system. Do not remove this file, otherwise if your gateway extension is subsequently removed then the referenced objects cannot be reverted to their original state automatically, and you will therefore have to either complete these clean up tasks manually, or re-add the gateway extension to regenerate the `extension_import_response.xml` file and then remove the gateway extension again. If the `extension_import_response.xml` exists and there is a cleanup failure for any object, a failure file is written to the `local:/ext` folder, with the failure details.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Cloud Manager Tutorials

Tutorials for using the Cloud Manager user interface in IBM® API Connect.

## Prerequisites

To complete the following tutorials you must be the Cloud Administrator or Cloud Owner of an API Connect instance.

## Overview

These tutorials guide you through common tasks performed to set up and maintain the configuration of a cloud.

- [Tutorial: Configuring the Cloud](#)  
This tutorial shows you how to create a basic cloud configuration, with available gateway, analytics and developer portal services.
- [Tutorial: Creating a Provider Organization](#)  
This tutorial shows you how to create a Provider Organization.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Tutorial: Configuring the Cloud

This tutorial shows you how to create a basic cloud configuration, with available gateway, analytics and developer portal services.

### Before You Begin

---

This task can be completed by users who are assigned one of the following roles:

- Cloud Owner
- Cloud Administrator

You must configure the Default Availability Zone that contains the Management service. See [Installing the API Connect subsystem CRs](#) and [Deploying the Management OVA file](#).

You will need the following information to complete this tutorial.

- The IP address or FQDN of the gateway, and the port assigned to accept API requests from clients.
- The IP address or FQDN of the gateway, and the port assigned to communicate with the API Management server. This cannot be the same as the port for API requests.
- The FQDN of the Developer Portal service to accept requests from clients. This value was set using the InstallAssist command:

```
apicup subsys set ptl portal-www <portal>.<hostname>.<domainname>
```

- The FQDN of the Developer Portal to communicate with the API Management server. This value was set using the InstallAssist command:

```
apicup subsys set ptl portal-admin <padmin>.<hostname>.<domainname>
```

- The FQDN of the Analytics service to accept requests from clients. This value was set using the InstallAssist command:

```
apicup subsys set analyt analytics-client <ac>.<hostname>.<domainname>
```

- The address, port and optional login credentials for an SMTP email server.

Note: The port for the `portal-www`, `portal-admin`, and `analytics-client` services is **443**, and isn't configurable.

### About this tutorial

---

In this tutorial you are going to complete the following lessons:

- [Initial Cloud Manager Console login](#)
- [Configure an Email Server](#)
- [Register a Gateway Service](#)
- [Register a Portal Service](#)
- [Register an Analytics Service](#)
- [Configure a Default Gateway Service](#)

### Initial Cloud Manager Console login

---

Take the following steps to log in to the Cloud Manager user interface for the first time.

1. In a web browser, enter the management service URL. For example, `https://ManagementService.domain/admin` where `ManagementService.domain` is the fully qualified host name or IP address of the Management service.

# Cloud Manager

Sign in using the Cloud Manager User Registry

Username

Password

Sign In

[Forgot Password?](#)

2. Enter the Cloud Administrator user name and password. The default values are `admin` for the user name and `7iron-hide` for the password.
3. You are immediately required to change the admin password, as well as provide an email address for the cloud administrator. Enter the necessary information.  
Note: If you forget your password and request a password reset, the notification email is sent to this email address. This action will use the email server set in the Notifications section of the cloud Settings. This tutorial shows you how to set this configuration.

## Change Password

Current password

New Password

Confirm password

Save

4. Click Save.
5. Log in using the new password.

## Configure an Email Server

Take the following steps to configure an email server. This configuration allows you to recover the admin password or receive other important notifications.

1. Click  Resources icon or the Manage Resources tile.

Welcome to Cloud Manager

Let's get you up and running

 <b>Configure Cloud</b>  Edit settings for user registries, roles, endpoints, and more	 <b>Configure Topology</b>  Manage availability zones and services	 <b>Manage Resources</b>  Configure user registries, TLS, OAuth providers and email servers	 <b>Manage Organizations</b>  Create and manage API provider organizations and owners
 <b>Learn More</b>  Documentation and tutorials with step-by-step instructions	 <b>Connect</b>  Find expert answers in the API Connect community forum	 <b>Download Toolkit</b>  Download toolkit and credentials for various platforms	

2. Click Notifications.

<input type="checkbox"/>	Cloud Manager Local User Registry	Local User Registry	Private	:

3. Click Create.  
Resources

<input type="checkbox"/>	Title	Mail Server
--------------------------	-------	-------------

 You currently don't have any Email Servers.  
Click Create to add a new Email Server.

- 4. Enter the appropriate values in the fields These values vary depending on your site.
- 5. Click Save.

## Create Email Server

### Email Server Configuration

Title  
My Email Server

Name  
my-email-server

Address  
myemailserver.net

Port  
587

Authenticate User (optional)

Authenticate Password (optional)

TLS Client Profile (optional)  
Default TLS client profile

Secure Connection

## Test Connection

Send a test email to confirm that the email server is properly configured.

Test email

6. Click the  Settings icon, then click Notifications  Edit.
7. Ensure your email server is selected, then click Save.
8. Click the  Home icon.

## Register a Gateway Service

---

Take the following steps to register a gateway service.

1. Click the Configure Topology tile.

Welcome to Cloud Manager

Let's get you up and running

 Configure Cloud  Edit settings for user registries, roles, endpoints, and more	 Configure Topology  Manage availability zones and services	 Manage Resources  Configure user registries, TLS, OAuth providers and email servers	 Manage Organizations  Create and manage API provider organizations and owners
 Learn More  Documentation and tutorials with step-by-step instructions	 Connect  Find expert answers in the API Connect community forum	 Download Toolkit  Download toolkit and credentials for various platforms	

2. Click Register Service.

## Configure a Default Gateway Service

Take the following steps to configure a default gateway service for every catalog in the cloud.

1. Click  Settings icon .
2. Click Catalog Defaults.

## Settings

The screenshot shows the 'Settings' page with a sidebar menu on the left containing: Overview, Onboarding, User Registries, Roles, Role Defaults, Endpoints, Notifications, Catalog Defaults, and Audit Setting. The 'Catalog Defaults' section is active. The main content area is titled 'Organization' and includes an 'Edit' button in the top right corner. Below the title, there are three sections: 'Title' with the value 'Cloud Admin', 'Name' with the value 'admin', and 'Summary' with the value 'Cloud Admin organization'.

3. Click Edit.

## Settings

The screenshot shows the 'Settings' page with the sidebar menu on the left. The 'Catalog Defaults' section is active. The main content area is titled 'Gateway Services' and includes an 'Edit' button in the top right corner. Below the title, there is a subtitle: 'Configure the default set of gateway services configured for each catalog'. A table with columns 'Title' and 'Type' is shown, but it is empty. Below the table, there is a message: 'You currently don't have any Gateway Services. Click Edit to add Gateway Services.' accompanied by a server rack icon.

4. Select an available gateway service.
5. Click Save.

## Edit Gateways

The screenshot shows the 'Edit Gateways' dialog box. It has a subtitle: 'Configure the gateway services used by default in each catalog'. Below this is a table with columns 'Title' and 'Type'. The table contains one row with a checked checkbox in the first column, the title 'gateway\_service', and the type 'DataPower API Gateway'. Below the table, there is a link: 'Can't find the one you want? Register Gateways'. At the bottom of the dialog, there are 'Cancel' and 'Save' buttons.

## What you did in this tutorial

- Set new Cloud Manager Console login password
- Configured a Gateway Service
- Configured a Developer Portal Service
- Configured an Analytics Service
- Configured a Notifications Email Server
- Configured a Catalog Default Gateway Service

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Tutorial: Creating a Provider Organization

This tutorial shows you how to create a Provider Organization.

## Before You Begin

This task can be completed by users who are assigned one of the following roles:

- Cloud Owner
- Cloud Administrator

You must also complete the following tasks before beginning:

- [Configuring an email server for notifications](#)
- [Setting up notifications](#)

Note that an email server must be configured and an active email server must be selected before a provider organization account can be created.

## About this tutorial

In this tutorial you are going to complete the following lessons:

- [Create a Provider Organization](#)

## Create a Provider Organization

Take the following steps to create a new Provider Organization.

1. Log in to the Cloud Manager.
2. Click  Provider Organizations.

3. Click Add > Invite organization owner.

4. Enter the email address of the organization owner in the Owner's Email field.

5. Click Invite.
6. A notice appears when the activation email has been sent. Click Activation link..

7. A dialog box displays the activation link. Click the Copy to clipboard icon .

8. Open a new window in your browser. Paste the copied activation link into the Location bar. Optionally, you can click the activation link in the invitation email to open the registration form.
9. Complete fields shown in the form to sign up with the API Manager User Registry. Click Sign up.

## What you did in this tutorial

In this tutorial, you completed the following activities:

- Created a new Provider Organization.

## Related information

- [Importing an API](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Developing your APIs and applications

You develop APIs and LoopBack® applications by using the IBM® API Connect developer toolkit.

The API Connect developer toolkit provides both the API Manager user interface and a command line interface that you can use to develop APIs and LoopBack applications and publish them to API Connect.

You publish APIs by including them in a Product and then publishing the Product. You define your APIs and Products by creating and validating YAML definition files in your local file system. You can then interact with API Connect by using either the API Manager or the toolkit commands.

The developer toolkit is described in detail in the following subsections:

- [API development checklist](#)  
A summary, with links, of the key tasks for developing APIs in IBM API Connect.
- [Working with the toolkit](#)  
Install the developer toolkit by downloading an executable file. You can then use the toolkit commands to interact with IBM API Connect and publish APIs that you have defined in your file system.
- [Searching for items in API Manager](#)  
Use the search feature in IBM API Connect API Manager to easily locate items such as APIs, Catalogs, Spaces, applications, and subscriptions.
- [Working with API definitions](#)  
An API definition specifies the complete configuration for an API. You can create and configure your APIs either by using either the API Designer UI application, or by using the browser based API Manager UI.
- [Working with Products](#)  
In IBM API Connect, Plans and APIs are grouped together in Products, with which you can manage the availability and visibility of APIs and Plans.
- [Creating and validating API and Product definitions by using the CLI](#)  
The developer toolkit of IBM API Connect provides a command line interface that you can use to create and publish API and Product definitions, and also to validate YAML or JSON definitions.
- [Working with global policies](#)  
Use global policies to configure policy assemblies that are called just before, or just after, each of your API assemblies is called, or when an error is thrown. You can upload global policies into each of the gateway services in your Catalogs, and then designate, for each gateway service, which global policy should be called before an API assembly is called, after an API assembly is called, or if an error occurs when an API assembly is called. The designated global policies are applied to all the APIs that are deployed to the associated gateway service.
- [Reference](#)  
Reference information for developing your APIs in API Connect, including context variables, and template variables.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API development checklist

A summary, with links, of the key tasks for developing APIs in IBM® API Connect.

Task	Description
<a href="#">Activate your API Manager user account</a>	For you to be able to connect to a Management server by using either the API Designer or API Manager user interfaces, one or other of the following prerequisites must be satisfied: <ul style="list-style-type: none"><li>• Your administrator has created a provider organization, specifying you as the owner; see <a href="#">Creating a provider organization</a>.</li><li>• You have been added as a member of a provider organization; see <a href="#">Adding provider organization users and assigning roles</a>.</li></ul>
<a href="#">Install the API Connect developer toolkit</a>	The developer toolkit provides a command-line environment and an API Designer user interface, both of which enable you to develop and work with your APIs on your local machine; you publish your APIs to the Management server when ready. You can also develop your APIs directly on the Management server by using the API Manager user interface.
Log in to the user interface; see <a href="#">Logging in from API Designer</a> , or <a href="#">Accessing the API Manager user interface</a> , depending on which user interface you want to use.	After you have activated your account, you can log in to your Management server from either user interface. You can also use the API Designer in offline mode, but to be able to test and publish APIs you must be connected to a Management server.
Try out the <a href="#">tutorials</a>	A range of API development tutorials are provided, from a simple proxy REST API to more advanced secured APIs. The tutorials are written for the API Manager user interface but can be easily applied to the API Designer user interface.
<a href="#">Create your API definitions</a>	You can create API definitions in the following ways: <ul style="list-style-type: none"><li>• Create a REST API definition either by composing the API definition, and its operations, from scratch, creating a proxy API that calls an existing endpoint, or importing an OpenAPI definition.</li><li>• Expose an existing SOAP service as an API.</li><li>• Create a GraphQL API proxy definition that proxies a backend GraphQL server.</li></ul>

Task	Description
<ul style="list-style-type: none"> <li><a href="#">Secure your APIs (OpenAPI 2.0)</a></li> <li><a href="#">Secure your APIs (OpenAPI 3.0)</a></li> </ul>	You configure security for an API by creating one or more security definitions that you then apply to your API, and to the operations in your API. Security mechanisms include basic authentication through a user registry, and token based authentication with OAuth.
<a href="#">Test your APIs</a>	The user interfaces provide a test tool with which you can test your APIs through the gateway.
<a href="#">Productize and publish your APIs</a>	To make your APIs available to application developers, you include them in a Product that you then publish to the gateway.
<a href="#">Apply visibility controls and rate limiting to your APIs</a>	Visibility settings control which APIs the application developers can subscribe to. Rate limiting controls the usage of your APIs; for example, you can apply a rate limit of 100 calls per minute.
<a href="#">Develop your APIs by using the developer toolkit CLI</a>	You can use the developer toolkit CLI to develop APIs based on <a href="#">OpenAPI definition files</a> in YAML or JSON format.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Working with the toolkit

Install the developer toolkit by downloading an executable file. You can then use the toolkit commands to interact with IBM® API Connect and publish APIs that you have defined in your file system.

The following subsections describe how to install and use the toolkit:

- [Installing the toolkit](#)  
You can install the toolkit that provides CLI commands, and the API Designer user interface, for IBM API Connect.
- [Logging in from API Designer](#)  
To log in from the API Designer user interface for IBM API Connect, you will need the host name of the management server and the user name and password associated with your API Manager account.
- [Using the developer toolkit command-line tool](#)  
The IBM API Connect developer toolkit provides a command-line tool, `apic`, that you can use to perform all API Connect tasks. You can also use the command-line tool to script tasks such as continuous integration and delivery.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing the toolkit

You can install the toolkit that provides CLI commands, and the API Designer user interface, for IBM® API Connect.

### About this task

The toolkit is provided as executable files, so no actual installation is necessary, you just need to download the required compressed file and extract the contents.

There are two toolkit options available:

- CLI: provides a command line environment for working with IBM API Connect.
- CLI + LoopBack + Designer: provides a command line environment for working with IBM API Connect, including LoopBack® support, and the API Designer application.

To install the toolkit, download the compressed file that is appropriate for your chosen toolkit option and platform, then extract the contents to a chosen location on your local machine. The compressed file contains an executable file for running CLI commands and, if you choose the CLI + LoopBack + Designer option, an executable file for launching the API Designer application.

You can download the toolkit from one of the following locations:

- From IBM Fix Central.
- From the Cloud Manager or API Manager user interface.

## Procedure

To install and run the toolkit, complete the following steps:

1. Download the toolkit compressed file.
  - To download the toolkit from IBM Fix Central, complete the following steps:
    - Open the [IBM Fix Central site](#) in your browser.
    - In the Product selector field, enter `API Connect`, then select IBM API Connect from the drop down list.
    - Select your Installed Version and click Continue. If you do not know your installed IBM API Connect version, contact your administrator.
    - In the Text field, enter `toolkit`, then click Continue.
    - Select the toolkit file that you want to download.
    - Click Continue, then follow the instructions to complete the download operation.

- To download the toolkit from Cloud Manager or API Manager user interface, complete the following steps:
    - Open the Cloud Manager or API Manager user interface.
    - On the welcome page, click the Download Toolkit tile. The two toolkit options are listed.
    - Click your platform alongside either the CLI option or the CLI + LoopBack + Designer option as required, then save the associated compressed file to your local file system.
    - To download the API Designer credentials (Client ID and Client Secret), click Download alongside API Designer Credentials, then save the `designer_credentials.json` file to your local file system. A command is provided for installing the credentials, as described in detail in step 6.
    - To download the toolkit credentials (Client ID and Client Secret), click Download alongside Credential, then save the `credentials.json` file to your local file system. A command is provided for installing the credentials, as described in detail in step 5.
    - Close the Install API Connect Toolkit window.
2. Extract the contents of the toolkit compressed file to a folder of your choice.  
The contents of the file depend on the your chosen toolkit option and platform, as follows:

- The `apic-slim` or `apic-slim.exe` file is the CLI for IBM API Connect.
- The `apic` or `apic.exe` file is the CLI for IBM API Connect including LoopBack support.  
Tip: If you are using the CLI option, then if you rename the `apic-slim` file to `apic`, or the `apic-slim.exe` file to `apic.exe`, you can run the CLI commands exactly as documented, copy and paste sample commands from the documentation, and use any command scripts as-is if you later move to the CLI + LoopBack + Designer option.
- The `api_designer-platform` file is the API Designer user interface application for the specified platform.

3. Optional: Delete the `$HOME/.apiconnect/node_cli` directory.

You need to do this only if you replaced a version of `apic` or `apic.exe` and are using the `apic lb4` command. You need to delete the directory `get apic` to unpack the new loopback.

On Windows, `$HOME` is defined by environment `USERPROFILE`.

4. Run the CLI.

- For the Mac OSX or Linux® platforms, complete the following steps:
  - Open a terminal instance and navigate to the folder where you extracted the contents of the toolkit compressed file.
  - Make the CLI file an executable file by entering the following command:

```
chmod +x download_name
```

Where `download_name` is the name of the toolkit file that you downloaded, either `apic` or `apic-slim`.

- Run CLI commands as follows:

```
./apic_command_name_and_parameters
```

or

```
./apic-slim_command_name_and_parameters
```

For details of the CLI commands, see [apic](#).

- For the Windows platform, complete the following steps:
  - Open a command prompt and navigate to the folder where you extracted the contents of the toolkit compressed file.
  - Run CLI commands as follows:

```
apic_command_name_and_parameters
```

or

```
apic-slim_command_name_and_parameters
```

For details of the CLI commands, see [apic](#).

Tip: Add the folder location of your CLI file to your `PATH` variable so that you can run CLI commands from anywhere in your file system.

5. Install the toolkit credentials.

If you do not install the toolkit credentials that are provided for download, as detailed previously in the [toolkit credentials download instructions](#), API Connect uses a default set of credentials that are identical for all deployments. However, the downloaded credentials were generated during the deployment of your API Connect system and are unique to your installation. To install the credentials into your local toolkit, run the following command:

```
apic client-creds:set toolkit_credentials_file_path/credentials.json
```

where `credentials_file_path` is the location to which you downloaded the toolkit credentials JSON file. After you have run this command, your toolkit uses these new credentials to authenticate with the management server.

Note: At any one time, you can use only one set of toolkit credentials for login to a management server from the toolkit CLI. If you want to log in to a different management server you must install the toolkit credentials from that management server.

To revert to the default toolkit credentials for all login operations from the toolkit CLI, use the following command:

```
apic client-creds:clear
```

For increased security, an administrator can remove the default credentials from the management server by completing the following steps:

- Log in to the management server as an administrator; see [Logging in to a management server](#).
- Delete the default credentials by running the following commands:

```
apic registrations:delete toolkit --server mgmt_endpoint_url  
apic registrations:delete consumer-toolkit --server mgmt_endpoint_url
```

6. Install the API Designer credentials.

If you do not install the API Designer credentials that are provided for download, as detailed previously in the [API Designer credentials download instructions](#), API Connect uses a default set of credentials that are identical for all deployments. However, the downloaded credentials were generated during the deployment of your API Connect system and are unique to your installation. To install the custom credentials into your local API Designer, set the `APIC_DESIGNER_CREDENTIALS` environment variable to the credentials download location, using the mechanism appropriate for your operating system.

After you have set the `APIC_DESIGNER_CREDENTIALS` environment variable, your API Designer uses the new credentials to authenticate with the management server.

- Windows:

If you are using Windows, create an environment variable using one of the following methods:

- Create a permanent environment variable so that you can start API Designer from any location on your computer:
  - Open the Environment Variables page: Click Start > Settings > System and in the "Related Settings" section of the page, click Advanced System Settings.
  - On the Advanced tab of the System Properties dialog box, click Environment Variables.
  - In the "User variables" section, click New and create an environment variables with the following settings:
    - Variable: **APIC\_DESIGNER\_CREDENTIALS**
    - Value: `<designer_credentials_file_path>\designer_credentials.json` where `<designer_credentials_file_path>` is the location where you stored the `designer_credentials.json` file.
  - Click OK to save the new environment variable, and then exit the dialog box.
- If you don't have the required permissions to create a permanent environment variable, you can create a temporary one that will only be used while you are running the API Designer application. The following steps must be performed every time you start API Designer:
  - Open the Windows command prompt.
  - Run the following command to set the temporary environment variable:

```
set APIC_DESIGNER_CREDENTIALS=<designer_credentials_file_path>\designer_credentials.json
```

where `<designer_credentials_file_path>` is the location where you stored the `designer_credentials.json` file.

Note: Leave the command prompt open for the next step. You must set the temporary variable and start the API Designer within the same Windows command session.

- Now run the following command to start API Designer:

```
C:\>"Program Files\API Designer\API Designer.exe"
```

By default, API Designer is installed in the C:\Program Files\API Designer folder as shown in the example. If you installed it into a different location, use your own location in the command. Note that the path and file name are enclosed in quotation marks because they contain spaces.

- Mac:

If you are using Mac OS X, create an environment variable using one of the following methods:

- Run the following command to set the global environment variable:

```
launchctl setenv APIC_DESIGNER_CREDENTIALS <designer_credentials_file_path>/designer_credentials.json
```

where `<designer_credentials_file_path>` is the location where you stored the API Designer credentials JSON file.

- Pass in the environment variable while starting API Designer from the command line. With this method, you must run the following command every time you start API Designer:

```
APIC_DESIGNER_CREDENTIALS=<designer_credentials_file_path>/designer_credentials.json open  
<designer_application_file_path>/API Designer.app'
```

where:

- `<designer_credentials_file_path>` is the location to which you downloaded the API Designer credentials JSON file.
- `<designer_application_file_path>` is the location to which you downloaded and uncompressed the API Designer application.

7. Start the API Designer application from the location to where you stored the extracted file.

Note:

- To uninstall the API Designer application on a Windows platform with a non Administrator account, complete the following steps:
  - In Windows File Explorer, navigate to the `USER_HOME\AppData\Local\Programs\api-designer` folder.
  - Run the **Uninstall API Designer application**. Do not use the **Add or remove programs** window.
- To uninstall the API Designer application on a Windows platform with an Administrator account, you can either run the **Uninstall API Designer application** application, or you can use the **Add or remove programs** window.

## Results

---

The IBM API Connect toolkit CLI and, if selected, the API Designer user interface application are installed on your local system.

For information on using the API Designer user interface, see [Developing your APIs and applications](#).

For information on using the toolkit CLI, see [Using the developer toolkit command-line tool](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Logging in from API Designer

To log in from the API Designer user interface for IBM® API Connect, you will need the host name of the management server and the user name and password associated with your API Manager account.

## About this task

---

API Designer provides a secure login to a management server for staging and publishing APIs and Products. You log in to the same host that was configured for API Manager and use your API Manager user name and password. You will need an account on API Manager and membership in a provider organization to access the API Designer.

You can also use the Explorer tab to see how your APIs look to a consumer in the Developer Portal. You can check the descriptions of the different artifacts, and refine any schemas or examples, and you can also use the Try it tool to test the behavior of the API.

Note:

- Configuration changes that are made in API Manager are not available in API Designer concurrently. You will need to log out of API Designer and log back in to access any updates.
- Set `SKIP_IBMID_LOGIN=true` as an environment variable to bypass the IBM ID login screen for API Designer. This applies to users who are working on an internal network, without access to external networks.

## Procedure

---

To log in to API Designer, complete the following steps:

1. Download and extract API Designer, as described in [Installing the toolkit](#).
2. Start the API Designer user interface by running the application from the location where you extracted the contents of the toolkit compressed file.  
Note: If you see a message stating that credentials cannot be found, download new credentials as explained in [Downloading the toolkit](#).
3. Optional: If you see the Accept License page, click the URL read the license agreement, then click the button to accept the license. This prompt appears only one time. It does not appear once you have accepted the license on the current system.
4. Optional: If you see the IBM ID login page, enter your IBM customer ID.  
Note: You won't receive the IBM ID page if you are already authorized, or if you have set the `SKIP_IBMID_LOGIN` environment variable to `true`.
5. Open a directory on your local file system to store the API and Product specifications that you create in API Designer. The system defaults to a previously-accessed directory.  
Note: If you want to use an OpenAPI definition file from elsewhere, downloaded from an external website for example, rather than created by using API Connect, don't copy the file into your API Designer directory.  
Such an API will **not** be visible in the API Designer user interface if it doesn't contain the API Connect specific sections that are required by API Designer.

Instead, copy the OpenAPI definition file to another folder, then import it into API Designer; the import operation adds the necessary API Connect specific sections; see [Adding a REST API by importing an OpenAPI definition file](#).

For more information on the API Connect specific sections in an OpenAPI definition file, see [IBM extensions to the OpenAPI specification](#).

6. If this is the first time you have logged in, establish a connection to API Connect by completing the following steps:
  - Contact your administrator and request the "management endpoint URL" for connecting to API Connect.  
The management endpoint URL looks similar to the following example: `https://<host.domain>` and indicates the location where the API Manager is running.  
  
Note: If you are using API Connect as a component of Cloud Pak for Integration, the management endpoint URL follows this format:  
`https://cpd-your-company.domain/integration/apis/APIC_namespace/APIC_instance`  
  
Example: `https://cpd-company.com/integration/apis/apic/production`  
  
Do not add `/manager` to the URL. If you include `/manager` at the end of this URL, the connection with Cloud Pak for Integration will fail with a message stating that the host URL is invalid.
  - In the dialog window, enter the management endpoint URL as the Host URL and click Next.
  - Type the user name and password for your API Manager account.
  - Select a User Registry from the list.
  - Click Sign In.
7. For subsequent log ins, select the appropriate cloud where you will be working. You can select from any previous cloud connections.
8. When more than one cloud connection is configured, you can switch clouds when developing APIs and Products. See [Switching clouds from API Designer](#).  
Note: If you are using an OIDC user registry that supports single sign-on (SSO), you cannot switch clouds to log in to the same user registry with a different user ID. You must first restart the API Designer application so that you are logged out of the registry, then select the required cloud connection.
9. Click Add Another Cloud to add another cloud connection. Enter the URL, user name and password, and user registry to add the cloud connection.  
Note: If you are using an OIDC user registry that supports single sign-on (SSO), and you are already logged in, you cannot add a new cloud connection to log in to the same user registry with a different user ID. You must first restart the API Designer application so that you are logged out of the registry, then add the new cloud connection.
10. Delete a cloud connection by selecting the trash can icon.
11. API Designer will launch with the organization set to your provider organization in the selected cloud. If you have accounts for multiple provider organizations, it will default to the first organization in alphabetical order.
12. To choose another provider organization, select it from the drop-down list.
  - [Switching clouds from API Designer](#)  
You can switch clouds to work in another cloud in API Designer.
  - [Working offline with API Designer](#)  
You can work offline (without a connection to the cloud) with API Designer to create APIs. Some functionality is missing due to the lack of a cloud connection.
  - [Gathering support information in API Designer](#)  
When you report an issue with the API Designer application, enable debug mode and provide as much information as possible.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Switching clouds from API Designer

You can switch clouds to work in another cloud in API Designer.

## About this task

---

API Designer allows the flexibility to connect to multiple clouds. For example, your organization may have separate clouds for testing, development, and demos. You select the cloud connection when you log in, but you can also switch clouds when you are developing APIs and Products. Multiple clouds must be configured in order to switch clouds. You must have a valid API Manager account to connect to a cloud.

Note: If you are using an OIDC user registry that supports single sign-on (SSO), you cannot switch clouds to log in to the same user registry with a different user ID. You must first restart the API Designer application so that you are logged out of the registry, then select the required cloud connection.

## Procedure

---

To switch clouds for working in API Designer, complete the following steps:

1. Log in to API Designer and select a cloud, or configure a new cloud connection.
2. From the Develop: APIs and Products screen, you can switch to another cloud by selecting it from the Switch Cloud Connection menu.
3. Delete a cloud connection by selecting the trash can icon.

## Working offline with API Designer

You can work offline (without a connection to the cloud) with API Designer to create APIs. Some functionality is missing due to the lack of a cloud connection.

## About this task

---

API Designer provides the capability to work in offline mode without a connection to a management server. You can work on APIs with no management server, but some functions will be changed or missing.

The preferred method for working in API Designer is with a Cloud Connection to the management server when logging into API Designer. Working while connected to a management server provides full functionality, with automatic field completion. When working offline, you will need to remember the values to complete the fields that are backfilled from the management server.

Following are the differences when working in offline mode:

- There is no connection to a management server.
- There is no Provider Organization selection.
- Only the Develop APIs and Products tile may be selected. The Learn more and Connect menu tiles are not available.
- When creating an API, the Gateway Type defaults to V5 Gateway and the default policies are loaded.
- Stage and Publish for APIs and Products functions are not available.
- The Sandbox catalog is not available.
- When configuring a Security Definition, there are no selection lists available for the User Registry for a Basic Auth security definition or for the OAuth Provider for an OAuth 2 security definition. You will need to enter the User Registry and OAuth Provider values correctly as text.
- When adding custom Visibility and custom Subscribability values for a product, there is no selection list for the Organization field. You will need to enter the organization name correctly as text.

## Procedure

---

To work in offline mode in API Designer, complete the following steps:

1. Log in to API Designer and open a directory location.
2. To start offline mode, choose Work Offline from the selector in the upper right corner of the Connect to Cloud screen.
3. The Home page appears with the Develop APIs and Products tile. Select Develop APIs and Products to start working in offline mode.
4. To return to online mode, choose Connect to Cloud in the upper right hand corner and select the management server to log in to.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Gathering support information in API Designer

When you report an issue with the API Designer application, enable debug mode and provide as much information as possible.

To report an issue with API Designer, enable debug mode, collect the recommended information, and submit it with your report. Including the information will help IBM resolve the problem more quickly.

- [Enabling debug mode on Mac](#)
- [Enabling debug mode on Windows](#)
- [Enabling debug mode on Linux](#)
- [Information to gather for support](#)

## Enabling debug mode on Mac

Start API Designer with debug mode enabled:

1. Start a terminal or command prompt.
2. Navigate to the directory where API Designer is installed.
3. Run the following command to start API Designer in debug mode:

```
DESIGNER_DEBUG=true open API/Designer.app/
```

If you add `DESIGNER_DEBUG=true` to your `.bash_profile`, then every time you start API Designer it will open in debug mode.

## Enabling debug mode on Windows

Add a Windows environment variable that enables debug mode for API Designer:

1. Type "Environment" in the Windows search bar (on the task bar) and select Edit environment variables for your account.
2. In the Environment Variables dialog box, click New in the "User variables" section.
3. In the New User Variable dialog box, add the following variable settings and then click OK:
  - Variable name: `DESIGNER_DEBUG`
  - Variable value: `True`
4. Click OK to save your change.

## Enabling debug mode on Linux

To start API Designer with debug mode enabled, add the following command to your `.bash_profile`:

```
EXPORT DESIGNER_DEBUG=true
```

## Information to gather for support

Gather the following information about your problem and include it with your report.

- Operating system where you are running API Designer (Mac, Windows, or Linux)
- Product versions for API Designer and the API Manager that is connects to:
  1. Open API Designer.
  2. Click .

3. On the Help page, click the Product information tile.
4. On the Product information page, note down the following values for the following labels on the page:
  - Connected to API Manager Product version
  - Package

API Manager version	<b>Product information</b> <hr/> <b>Connected to API Manager Product version</b> 10.0.3.0
API Designer package version	<b>Git information</b> <hr/> <b>Git</b> 9affdfeeb3855c194edabdb933e1ee3c6f2afdbb <b>Package</b> 1.0.0 <b>api-client</b> 0.2.3 <b>apim-sdk</b> 5.0.31 <b>assembly-debugger</b> 0.1.38 <b>async-api-editor</b> 1.0.5 <b>doc-types</b> 0.1.20

- HAR file  
The HAR file contains the information about your browser's interaction with the web, and can be helpful in determining why your problem is happening. Complete the following steps to export the HAR file from the browser where you use API Designer:

1. Open API Designer.

2. Open the browser's developer console; for example in Google Chrome, click  More tools > Developer tools.

3. In the developer console, click the Network tab.

4. Click  to download the HAR file.

- Are you using API Designer in Online mode or Offline mode?  
If you're using Online mode, are you connecting to a local test environment, or to an API Manager server?
- When does the problem happen?  
Provide reproducible steps with optional screen captures or video so the support team can recreate the problem.
- Supporting data.  
Provide any related data that would be useful while examining the problem; for example, a copy of the API or Product that you were using.
- How often does the problem happen?  
Is the problem intermittent? Does it happen constantly? Does it only happen with certain artifacts (for example, only with a particular API)? If the problem is associated with an artifact, try to include it with your report.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Using the developer toolkit command-line tool

The IBM® API Connect developer toolkit provides a command-line tool, **apic**, that you can use to perform all API Connect tasks. You can also use the command-line tool to script tasks such as continuous integration and delivery.

The command line tool is described in detail in the following subtopics. For summary reference material for each of the available commands for the developer toolkit, see [Command-line tool reference for the developer toolkit](#).

- [Overview of the command-line tool](#)  
The IBM API Connect developer toolkit provides commands for cloud administration and API development and management.
- [Logging in to a management server](#)  
You log in to a management server from the command line by using the **apic login** command. The parameters that you supply determine the identity provider that is used to authenticate the supplied user ID, and the scope of the tasks that can be performed after successful log in.
- [Logging in to a management server with an OIDC registry](#)  
Logging in with an OIDC registry involves several steps, in which you obtain a temporary token and pass it to the toolkit to ensure it can communicate securely with the management server.
- [Cloud administration commands](#)  
A summary of the cloud administration commands in the IBM API Connect developer toolkit.
- [API development and management commands](#)  
A summary of the core commands in the IBM API Connect developer toolkit.
- [Creating APIs and applications](#)  
You can develop API proxies and API implementations by using the developer toolkit. In the documentation, *API* refers to the API proxy and *application* refers to the API implementation.

- [Publishing APIs and applications](#)  
To publish APIs and applications by using the developer toolkit of IBM API Connect, you set configuration variables to define where you want to publish, log in to the target cloud platform, and then use the appropriate publishing commands.
- [Managing API Products](#)  
Use the `apic products` and `apic apis` commands to manage Products and APIs that have been published to IBM API Connect Catalogs. Use the `--scope space` option to manage Products and APIs that have been published to Spaces within Catalogs.
- [Working with Drafts](#)  
Co-locate your APIs and applications in your local source code control systems to support typical development activities such as commits, branching, merges, continuous integration, and so on. The developer toolkit provides the bridge from the developer's environment to the IBM API Connect runtime services.
- [Reading input from the command line](#)  
If a developer toolkit command takes a file as an input parameter, you can direct the command to read the input directly from the command line rather than supplying a separate file; this can be useful when writing scripts to automate command line operations, for example.
- [Scripting with the toolkit commands](#)  
The IBM API Connect developer toolkit provides commands for cloud administration and API development and management.
- [Working with OpenAPI extensions](#)  
Use the developer toolkit CLI `extensions` commands to manage OpenAPI extensions in your Catalogs or Spaces.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Overview of the command-line tool

The IBM® API Connect developer toolkit provides commands for cloud administration and API development and management.

### Command syntax

In general, commands have the following syntax:

```
apic command:sub-command [argument] [options]
```

where

- `command` is the command, usually the thing on which you are acting (for example, product, app, API, Catalogs, and so on).
- `sub-command` is the action to perform.
- `argument` is the argument, where applicable (for example, `catalog`).
- `options` are any number of command-line options, which have the form `--option [value]`. Options also have a short form with a single dash instead of a double dash.

For example, `apic apps:publish --server mgmthost.com`.

For some commands, either the command or sub-command portion is optional. For example:

- `apic products:publish` is equivalent to `apic publish`.
- `apic products:list` is equivalent to `apic products`.

The `create` command has a slightly different syntax:

```
apic create:type [options]
```

Use the `-h` or `--help` option to view command help.

Note: The language in which the CLI help text, and other command response text, is displayed is determined by the locale setting on your local machine.

### Viewing command line tool help

Display general command-line help information by entering the following command: `apic --help` or `apic -h`. Display help information for a specific `apic` command by entering the following command: `apic command_name --help` or `apic command_name -h`.

### Viewing version information

Display the version of the command-line tool by entering the command: `apic --version`.

### Setting the mode

The API Connect toolkit CLI runs commands on either the provider organization or on the consumer organization. When you run the command, you use the different mode options to identify the instance on which you want to run the command. The following list provides a summary of the modes that are available:

apim

This mode applies to the administrative instances of the CLI. When you run commands in this mode, it uses the overall API Manager as its scope. This mode is the default mode.

An example of running a command in the apim mode:

```
apic extensions:list-all --mode apim --scope catalog --server server1 --catalog catalog1 --org myOrg --configured-gateway-service service1
```

portaladmin

This mode applies to the developer portal instances of the CLI. This mode supports commands that you can use to replicate all or part of your Developer Portal environment.

An example of running a command in the portaladmin mode:

```
apic --mode portaladmin custom-theme:create-export --catalog catalog1 --org myOrg --server server1 --format json
```

consumer

This mode applies to the consumer instances of the CLI. This command uses the consumer organizations that you have permission to access as its scope. You must specify this mode or set it as the default value for the command to use it.

An example of running a command in the consumer mode:

```
apic catalogs:list --mode consumer --scope catalog --server server1 --catalog catalog1 --org myOrg
```

To avoid having to supply the parameter on every consumer CLI command, you can set the `mode` configuration variable, as described in the next section.

## Using configuration variables

You can set the values of commonly-used properties in configuration variables. In general, it's easier and more consistent to set configuration variables instead of specifying them using command-line options.

Note:

You can set a configuration variable locally (the default) to affect only the current LoopBack project, or globally (with command-line option `-g`), to affect all projects. The local value supersedes the global value. You can set local configuration variables only for LoopBack projects. When you set configuration variables for OpenAPI projects, they are always global.

The values of local configuration variables are stored in the `project-root/.apiconnect/config` file, where `project-root` is the project root directory. The values of global configuration variables are stored in the `user-home-dir/.apiconnect/config` file, where `user-home-dir` is the user's home directory.

Use the following commands to work with configuration variables:

- `apic config:get varname` - Get a configuration variable. Use `apic config` to display the values of all local configuration variables or `apic config -g` to display the values of all global configuration variables.
- `apic config:set varname` - Set or update the specified configuration variable.
- `apic config:delete varname` - Delete the specified configuration variable.
- `apic config:clear` - Delete all configuration variables.

You set configuration property values by using the `apic config:set` command. By setting configuration properties (for example `catalog` and `app`), you do not need to supply values for these options when you enter a command.

Additionally, you can use `apic properties` commands to work with configuration properties:

- `apic properties:clear` - Clear the configuration properties.
- `apic properties:create` - Augment the configuration properties with additional name/value pairs.
- `apic properties:delete` - Delete the configuration property.
- `apic properties:get` - Get the configuration property.
- `apic properties:list` - List the configuration properties.
- `apic properties:update` - Update the configuration property.

Note:

If you have an environment variable of the same name as a CLI configuration property then, by default, its value will override the value of the corresponding CLI configuration property for any CLI command at that scope.

For example, if you have defined an environment variable called `SPACE` then, by default, that value will be assumed for the value of the `--space` parameter in the following command, regardless of any `space` configuration property setting:

```
apic products:publish my_product.yaml --scope space
```

To prevent environment variables overriding CLI configuration properties, define an environment variable called `APIC_LOAD_FROM_ENV`, set to the value `false`.

The following table describes the configuration variables:

Table 1. Configuration variables

Variable name	Description	Use instead of (or override with) these flags...
catalog	Default Catalog URI for all commands that manage aspects of a Catalog. Form: <code>mgmt-server/api/catalogs/org-name/catalog-name</code> , where <code>mgmt-server</code> is the management server, <code>org-name</code> is the organization name, and <code>catalog-name</code> is the Catalog name.  Note: The Catalog name <code>apic-dev</code> is reserved for local testing.	<code>--catalog</code> , <code>--organization</code> , <code>--server</code>
cloud	Default management server host name for cloud administration commands. Form: <code>mgmt-server/api/</code> .	<code>--server</code>
consumer	Default URI of an API consumer. Form: <code>mgmt-server/api/consumer-orgs/org-name/catalog-name/consumer-org-name</code> , where <code>mgmt-server</code> is the management server, <code>org-name</code> is the organization name, <code>catalog-name</code> is the Catalog name, and <code>consumer-org-name</code> is the consumer organization name.	<code>--server</code> , <code>--organization</code> , <code>--catalog</code> , <code>--consumer</code>
mode	The default value of the <code>--mode</code> parameter for CLI commands. Set the value to <code>apim</code> or <code>consumer</code> depending on whether you want to run commands on a provider organization or a consumer organization. If you do not set this variable, and do not supply a <code>--mode</code> parameter on a command, the value <code>apim</code> is assumed.	<code>--mode</code>
org	Default org URI for all commands that manage organizations. Form: <code>mgmt-server/api/orgs/org-name</code> , where <code>mgmt-server</code> is the management server, <code>org-name</code> is the organization name.  The <code>mgmt-server</code> portion sets the default value of the <code>--server</code> option.  You can append the port number to the server name if it is not the default value of 443.	<code>--organization</code> , <code>--server</code>

Variable name	Description	Use instead of (or override with) these flags...
space	Default Space URI for all commands that manage aspects of a Space. Form: <code>mgmt-server/api/spaces/org-name/catalog-name/space-name</code> , where <code>mgmt-server</code> is the management server, <code>org-name</code> is the organization name, <code>catalog-name</code> is the Catalog name, and <code>space-name</code> is the Space name.  You can append the port number to the server name if it is not the default value of 443.	--server, --organization, --catalog, --space

To set configuration properties, enter the following command:

```
apic config:set name=value
```

where `name` is the name of the configuration property and `value` the value to assign to it.

For example:

```
apic config:set catalog=https://platform-api.myserver.com/api/catalogs/climbon/sandbox
```

## Scripting commands

It's often helpful to automate a series of `apic` commands in a shell script. Since the `apic` tool first requires you to interactively accept the license, you must first use the following command:

```
apic --accept-license
```

Once you do that, your scripts can run non-interactively.

To disable collection of usage analytics, enter this command:

```
apic --live-help
```

## Related information

- [Command-line tool reference for the developer toolkit](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Logging in to a management server

You log in to a management server from the command line by using the `apic login` command. The parameters that you supply determine the identity provider that is used to authenticated the supplied user ID, and the scope of the tasks that can be performed after successful log in.

Attention: If you want to log in with an OIDC user registry or if you are an IBM Cloud Pak for Integration (CP4I) user, see [Logging in to a management server with an OIDC registry](#).

1. Clear the credentials from any previous login by running the following command:

```
apic client-creds:clear
```

Clearing the credentials ensures that you do not inadvertently log in with the wrong set of credentials (for example, from a different product release or environment).

2. Set the credentials that you want to use now by running the following command:

```
apic client-creds:set path_to_credentials/credential.json
```

where `path_to_credentials` is the location of the `credential.json` file that you want to use. For example:

```
apic client-creds:set /Users/local_user/credential.json
```

3. Log in by running the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm realm
```

The parameters for the `apic login` command are as follows:

`mgmt_endpoint_url`

The URL depends on the type of organization that you are logging in with:

- Cloud admin organization or Provider organization: Use one of the following URLs:
  - platform API endpoint URL
  - management API manager URL
- Consumer organization: Use the consumer API endpoint URL

These endpoint URLs are configured during the installation of API Connect, as described in [Installing the Management subsystem into a Kubernetes environment](#) and [Deploying the Management subsystem in a VMware environment](#). If you have access to the Cloud Manager user interface, you can view the configured endpoint URLs as described in [Viewing platform and UI endpoints](#), ignoring any segments at the end of the displayed URLs. If you are not sure of the endpoint URL, ask your administrator.

`user_id`

The user ID you want to log in with. Depending on the tasks that you want to perform, this user ID might be any of the following:

- A user ID that is a member of the cloud administration organization. This is an ID that you could also use to log in to the Cloud Manager user interface.
- A user ID that is a member of a provider organization. This is an ID that you could also use to log in to the API Manager user interface.
- A user ID that is a member of a consumer organization. This is an ID that you could also use to log in to the Developer Portal.

*password*

The password associated with the supplied user ID.

*realm*

The *realm* parameter specifies the identity provider that is used to authenticated the supplied user ID, and the scope of the tasks that can be performed after successful log in.

The format of the *realm* depends on the type of user, as follows:

- Member of the cloud administration organization:

`admin/identity_provider`

To determine the identity provider, see [How to determine the identity provider](#).

- Member of a provider organization:

`provider/identity_provider`

To determine the identity provider, see [How to determine the identity provider](#).

- Member of a consumer organization:

`consumer:provider_org:catalog/identity_provider`

where *provider\_org* is the name of your provider organization, and *catalog* is the name of the Catalog in that provider organization.

To determine the identity provider, see [How to determine the identity provider](#).

Important:

- If you have installed toolkit credentials, as detailed in [Installing the toolkit](#), then at any one time, you can use only one set of toolkit credentials for login to a management server from the toolkit CLI. If you want to log in to a different management server you must install the toolkit credentials from that management server.

To revert to the default pre-supplied toolkit credentials for all login operations from the toolkit CLI, use the following command:

```
apic client-creds:clear
```

- If you log in to the CLI as a member of a consumer organization, you must supply the `--mode=consumer` parameter to the `apic login` command, and to all consumer commands. To avoid having to type the parameter every time, you can set the `mode` configuration variable, by entering the following command:

```
apic config:set mode=consumer
```

You can also use the command interactively; enter `apic login` and you will be prompted for the values. For example:

```
apic login
Enter your API Connect credentials
Server? platform-api.myserver.com
Realm? provider/default-idp-2
Username? myuser
Password?
Logged into myserver.com successfully
```

Note: If you see a message stating that credentials cannot be found, download new credentials as explained in [Downloading the toolkit](#).

## How to determine the identity provider

If you want to log in as a member of the cloud administration organization, or as a member of a provider organization, you can help determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope scope --server mgmt_endpoint_url --fields title,realm
```

where *scope* has the value `admin` or `provider` depending on whether you want to log in as a member of the cloud administration organization, or as a member of a provider organization. The output lists the names and titles of all identity providers, for example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`, and the default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

By default, API Connect creates a local user registry for user login for every context. The identity providers associated with these default registries are as follows:

Registry	Identity provider name
Cloud Manager Local User Registry (for login as a member of the cloud administration organization)	default-idp-1
API Manager Local User Registry (for login as a member of a provider organization)	default-idp-2
Sandbox Catalog User Registry (for login as a member of a consumer organization)	sandbox-idp

If you want to log in as a member of a consumer organization, and you are not using the default Sandbox Catalog User Registry, ask your administrator for the name of your identity provider.

## Logging out

---

To log out of a management server, use the following command:

```
apic logout --server mgmt_endpoint_url
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Logging in to a management server with an OIDC registry

Logging in with an OIDC registry involves several steps, in which you obtain a temporary token and pass it to the toolkit to ensure it can communicate securely with the management server.

Attention: Logging in with an OIDC registry is supported for the developer toolkit (used with API Manager) and the Developer Portal admin toolkit, but is not supported for members of consumer organizations. If you are using IBM Cloud Pak for Integration (CP4I), review this topic for login instructions. If you want to log in using a non-OIDC registry, see [Logging in to a management server](#).

To log in, complete the following steps:

1. Clear the credentials from any previous login by running the following command:

```
apic client-creds:clear
```

Clearing the credentials ensures that you do not inadvertently log in with the wrong set of credentials (for example, from a different product release or environment).

2. Set the credentials that you want to use now by running the following command:

```
apic client-creds:set path_to_credentials/credential.json
```

where `path_to_credentials` is the location of the `credential.json` file that you want to use. For example:

```
apic client-creds:set /Users/local_user/credential.json
```

3. Log in by running the following command:

```
apic login --server mgmt_endpoint_url --sso
```

where `mgmt_endpoint_url` is the endpoint URL. When you log in with a Cloud admin or Provider organization, specify one of the following URLs:

- platform API endpoint URL
- management API manager URL

These endpoint URLs are configured during the installation of API Connect, as described in [Installing the Management subsystem into a Kubernetes environment](#) and [Deploying the Management subsystem in a VMware environment](#). If you have access to the Cloud Manager user interface, you can view the configured endpoint URLs as described in [Viewing platform and UI endpoints](#), ignoring any segments at the end of the displayed URLs. If you are not sure of the endpoint URL, ask your administrator.

CP4I: If you are using API Connect as a component of IBM Cloud Pak for Integration (CP4I), your administrator can provide the correct URL.

4. When the toolkit prompts for the context, type **admin** API Connect (administrators) or **provider** (everyone else):

```
Context? provider
```

5. The server responds with the following message:

```
Please copy and paste the url https://mgmt_endpoint_url/auth/manager/sign-in/?from=TOOLKIT to a browser to start the authentication process.
Do you want to open the url in default browser? [y/n]: y
```

Take one of the following actions:

- If you want to use your default browser to log in to API Manager, type **y** and press Enter. The API Manager sign-in page opens in a new browser tab.
- If you don't use to use your default browser, type **n** and press Enter.
  - Copy the URL from the command window.
  - Open a browser, paste the URL, and press Enter. The API Manager sign-in page displays.

6. On the API Manager sign-in page, select the OIDC registry and then log in to API Connect.

CP4I: Select the Common Services User Registry.

After you log in, API Connect displays the "You are authenticated!" message and provides a temporary token. Copy the token.

7. Return to the command window. Paste the token at the **API Key?** prompt and press Enter.

When the token is validated and you are successfully logged in to the toolkit, the following message displays:

```
Warning: Using default toolkit credentials.
Logged into mgmt_endpoint_url successfully
```

Note: If you see a message stating that credentials cannot be found, download new credentials as explained in [Downloading the toolkit](#).

---

## Logging out

To log out of a management server, use the following command:

```
apic logout --server mgmt_endpoint_url
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Cloud administration commands

A summary of the cloud administration commands in the IBM® API Connect developer toolkit.

### Authenticating

Use the `apic login` command to authenticate to an API Manager service, and the `apic logout` command to remove your local authentication credentials.

Note: When you authenticate successfully, your credentials are stored, in plain text, in the file `Linux .netrc` or `Windows _netrc`. You should therefore set the file permissions in such a way that your credentials are not accessible by others.

For full details on how to log in to your management server from the CLI, see [Logging in to the management server](#).

### Configuring the command-line tool to use TLS certificates

API Manager uses TLS profiles to secure data transmission. For information on how to create a TLS profile in API Manager, see [TLS profiles](#).

To configure the toolkit command-line tool to use certificates to communicate with an API Manager that has TLS profiles enabled, follow these steps:

For more information about the `NODE_EXTRA_CA_CERTS` environment variable, see [Node.js documentation](#).

Note: When using any CLI command that applies directly to the configuration of your IBM API Connect cloud, you must supply the parameter setting `--org admin` for a command that requires an organization name as a parameter.

### Command summary

The following tables summarize `apic` commands for cloud administration.

Table 1. Summary commands for cloud administrators

Command	Description	Sub-commands
<code>apic analytics-services</code>	Analytics Service commands	<ul style="list-style-type: none"><li><code>apic analytics-services</code> - Analytics Service collection operations.</li><li><code>apic analytics-services:clear</code> - Clear the Analytics Services.</li><li><code>apic analytics-services:create</code> - Create a Analytics Service.</li><li><code>apic analytics-services:delete</code> - Delete the Analytics Service by name or ID.</li><li><code>apic analytics-services:get</code> - Get the Analytics Service by name or ID.</li><li><code>apic analytics-services:list</code> - List the Analytics Services.</li><li><code>apic analytics-services:update</code> - Update the Analytics Service by name or ID.</li></ul>
<code>apic associates</code>	Associates commands	<ul style="list-style-type: none"><li><code>apic associates</code> - Associate collection operations.</li><li><code>apic associates:get</code> - Get the Associate by name or ID.</li><li><code>apic associates:list</code> - List the Associates.</li></ul>
<code>apic availability-zones</code>	Availability Zone commands	<ul style="list-style-type: none"><li><code>apic availability-zones</code> - Availability Zone collection operations.</li><li><code>apic availability-zones:clear</code> - Clear the Availability Zones.</li><li><code>apic availability-zones:create</code> - Create a Availability Zone.</li><li><code>apic availability-zones:delete</code> - Delete the Availability Zone by name or ID.</li><li><code>apic availability-zones:get</code> - Get the Availability Zone by name or ID.</li><li><code>apic availability-zones:list</code> - List the Availability Zones.</li><li><code>apic availability-zones:update</code> - Update the Availability Zone by name or ID.</li></ul>
<code>apic cloud-settings</code>	Cloud settings commands	<ul style="list-style-type: none"><li><code>apic cloud-settings:get</code> - Get the Cloud Setting.</li><li><code>apic cloud-settings:mail-server-configured</code> - indicates whether a mail server has been configured.</li><li><code>apic cloud-settings:topology</code> - Returns summary details of the configuration of your cloud topology.</li><li><code>apic cloud-settings:update</code> - Update the Cloud Setting.</li></ul>

Command	Description	Sub-commands
<b>apic configured-gateway-services</b>	Commands for Configured Gateway Services in a Catalog or Space.	<ul style="list-style-type: none"> <li>• <b>apic configured-gateway-services</b> - Configured Gateway Services operations.</li> <li>• <b>apic configured-gateway-services:clear</b> - Delete all Configured Gateway Services from a Catalog or Space.</li> <li>• <b>apic configured-gateway-services:create</b> - Configure a Gateway Service in a Catalog or Space.</li> <li>• <b>apic configured-gateway-services:delete</b> - Delete a Configured Gateway Service from a Catalog or Space.</li> <li>• <b>apic configured-gateway-services:get</b> - Obtain the details of a Configured Gateway Service in a Catalog or Space.</li> <li>• <b>apic configured-gateway-services:list</b> - List the Configured Gateway Services in a Catalog or Space.</li> </ul>
<b>apic credentials</b>	Credential commands	<ul style="list-style-type: none"> <li>• <b>apic credentials</b> - Application Credential collection operations.</li> <li>• <b>apic credentials:clear</b> - Clear the Application Credentials.</li> <li>• <b>apic credentials:create</b> - Create a Application Credential.</li> <li>• <b>apic credentials:delete</b> - Delete the Application Credential by name or ID.</li> <li>• <b>apic credentials:get</b> - Get the Application Credential by name or ID.</li> <li>• <b>apic credentials:list</b> - List the Application Credentials.</li> <li>• <b>apic credentials:reset</b> - Reset the client id and client secret.</li> <li>• <b>apic credentials:reset-client-secret</b> - Reset the client secret.</li> <li>• <b>apic credentials:update</b> - Update the Application Credential by name or ID.</li> <li>• <b>apic credentials:verify-client-secret</b> - Verify the client secret.</li> </ul>
<b>apic extensions</b>	Extension commands	<ul style="list-style-type: none"> <li>• <b>apic extensions</b> - Extension collection operations.</li> <li>• <b>apic extensions:document</b> - Get the document for an extension by id, or by name and version.</li> <li>• <b>apic extensions:get</b> - Get an extension by id, or by name and version.</li> <li>• <b>apic extensions:list</b> - List all versions of an extension given the name.</li> <li>• <b>apic extensions:list-all</b> - List all versions of all extensions.</li> </ul>
<b>apic gateway-services</b>	Gateway service commands	<ul style="list-style-type: none"> <li>• <b>apic gateway-services</b> - Gateway Service collection operations.</li> <li>• <b>apic gateway-services:clear</b> - Clear the Gateway Services.</li> <li>• <b>apic gateway-services:create</b> - Create a Gateway Service.</li> <li>• <b>apic gateway-services:delete</b> - Delete the Gateway Service by name or ID.</li> <li>• <b>apic gateway-services:get</b> - Get the Gateway Service by name or ID.</li> <li>• <b>apic gateway-services:list</b> - List the Gateway Services.</li> <li>• <b>apic gateway-services:reset-oauth-secret</b> - Reset the OAuth cryptographic</li> <li>• <b>apic gateway-services:update</b> - Update the Gateway Service by name or ID.</li> </ul>
<b>apic integrations</b>	Integrations commands	<ul style="list-style-type: none"> <li>• <b>apic integrations</b> - Integration collection operations.</li> <li>• <b>apic integrations:clear</b> - Clear the Integrations.</li> <li>• <b>apic integrations:clear-all</b> - Clear all of the Integrations in all of the collections.</li> <li>• <b>apic integrations:create</b> - Create a Integration.</li> <li>• <b>apic integrations:delete</b> - Delete the Integration by name or ID.</li> <li>• <b>apic integrations:get</b> - Get the Integration by name or ID.</li> <li>• <b>apic integrations:list</b> - List the Integrations.</li> <li>• <b>apic integrations:list-all</b> - List all Integrations in all collections.</li> <li>• <b>apic integrations:update</b> - Update the Integration by name or ID.</li> </ul>
<b>apic keystores</b>	Keystores commands	<ul style="list-style-type: none"> <li>• <b>apic keystores</b> - Keystore collection operations.</li> <li>• <b>apic keystores:clear</b> - Clear the Keystores.</li> <li>• <b>apic keystores:create</b> - Create a Keystore.</li> <li>• <b>apic keystores:delete</b> - Delete the Keystore by name or ID.</li> <li>• <b>apic keystores:get</b> - Get the Keystore by name or ID.</li> <li>• <b>apic keystores:list</b> - List the Keystores.</li> <li>• <b>apic keystores:update</b> - Update the Keystore by name or ID.</li> </ul>
<b>apic mail-servers</b>	Mail server commands	<ul style="list-style-type: none"> <li>• <b>apic mail-servers</b> - Mail Server collection operations.</li> <li>• <b>apic mail-servers:clear</b> - Clear the Mail Servers.</li> <li>• <b>apic mail-servers:create</b> - Create a Mail Server.</li> <li>• <b>apic mail-servers:delete</b> - Delete the Mail Server by name or ID.</li> <li>• <b>apic mail-servers:get</b> - Get the Mail Server by name or ID.</li> <li>• <b>apic mail-servers:list</b> - List the Mail Servers.</li> <li>• <b>apic mail-servers:test-connection</b> - Test a mail server connection.</li> <li>• <b>apic mail-servers:update</b> - Update the Mail Server by name or ID.</li> </ul>
<b>apic notification-templates</b>	Notification template commands	<ul style="list-style-type: none"> <li>• <b>apic notification-templates</b> - Notification Template collection operations.</li> <li>• <b>apic notification-templates:get</b> - Get the Notification Template by name or ID.</li> <li>• <b>apic notification-templates:list</b> - List the Notification Templates.</li> <li>• <b>apic notification-templates:list-all</b> - List all Notification Templates in all collections.</li> <li>• <b>apic notification-templates:update</b> - Update the Notification Template by name or ID.</li> </ul>

Command	Description	Sub-commands
<b>apic permissions</b>	Permissions commands	<ul style="list-style-type: none"> <li>• <b>apic permissions</b> - Permission collection operations.</li> <li>• <b>apic permissions:get</b> - Get the Permission by name or ID.</li> <li>• <b>apic permissions:list</b> - List the Permissions.</li> <li>• <b>apic permissions:list-all</b> - List all Permissions in all collections.</li> </ul>
<b>apic portal-services</b>	Portal services commands	<ul style="list-style-type: none"> <li>• <b>apic portal-services</b> - Portal Service collection operations.</li> <li>• <b>apic portal-services:clear</b> - Clear the Portal Services.</li> <li>• <b>apic portal-services:create</b> - Create a Portal Service.</li> <li>• <b>apic portal-services:delete</b> - Delete the Portal Service by name or ID.</li> <li>• <b>apic portal-services:get</b> - Get the Portal Service by name or ID.</li> <li>• <b>apic portal-services:list</b> - List the Portal Services.</li> <li>• <b>apic portal-services:update</b> - Update the Portal Service by name or ID.</li> </ul>
<b>apic services</b>	Services commands	<ul style="list-style-type: none"> <li>• <b>apic services</b> - Service collection operations.</li> <li>• <b>apic services:clear</b> - Clear the Services.</li> <li>• <b>apic services:clear-all</b> - Clear all Services in all collections.</li> <li>• <b>apic services:create</b> - Create a Service.</li> <li>• <b>apic services:delete</b> - Delete a Service.</li> <li>• <b>apic services:get</b> - Get the Service by name and version.</li> <li>• <b>apic services:list</b> - List the Services.</li> <li>• <b>apic services:list-all</b> - List all Services in all collections.</li> <li>• <b>apic services:update</b> - Update the Service by name and version.</li> </ul>
<b>apic space-settings</b>	Space settings commands	<ul style="list-style-type: none"> <li>• <b>apic space-settings:get</b> - Get the Space Setting.</li> <li>• <b>apic space-settings:update</b> - Update the Space Setting.</li> </ul>
<b>apic spaces</b>	Space commands	<ul style="list-style-type: none"> <li>• <b>apic spaces</b> - Space collection operations.</li> <li>• <b>apic spaces:clear</b> - Clear the Spaces.</li> <li>• <b>apic spaces:create</b> - Create a Space.</li> <li>• <b>apic spaces:delete</b> - Delete the Space by name or ID.</li> <li>• <b>apic spaces:get</b> - Get the Space by name or ID.</li> <li>• <b>apic spaces:list</b> - List the Spaces.</li> <li>• <b>apic spaces:transfer-owner</b> - Transfer owner to a new member.</li> <li>• <b>apic spaces:update</b> - Update the Space by name or ID.</li> </ul>
<b>apic tls-client-profiles</b>	TLS client profile commands	<ul style="list-style-type: none"> <li>• <b>apic tls-client-profiles</b> - TLS Client Profile collection operations.</li> <li>• <b>apic tls-client-profiles:clear</b> - Clear the TLS Client Profiles.</li> <li>• <b>apic tls-client-profiles:clear-all</b> - Clear all of the TLS Client Profiles in the collection.</li> <li>• <b>apic tls-client-profiles:create</b> - Create a TLS Client Profile.</li> <li>• <b>apic tls-client-profiles:delete</b> - Delete the TLS Client Profile by name or ID.</li> <li>• <b>apic tls-client-profiles:get</b> - Get the TLS Client Profile by name or ID.</li> <li>• <b>apic tls-client-profiles:list</b> - List the TLS Client Profiles.</li> <li>• <b>apic tls-client-profiles:list-all</b> - Lists all of the TLS Client Profiles in a collection.</li> <li>• <b>apic tls-client-profiles:update</b> - Update the TLS Client Profile by name or ID.</li> </ul>
<b>apic tls-server-profiles</b>	TLS server profile commands	<ul style="list-style-type: none"> <li>• <b>apic tls-server-profiles</b> - TLS Server Profile collection operations.</li> <li>• <b>apic tls-server-profiles:clear</b> - Clear the TLS Server Profiles.</li> <li>• <b>apic tls-server-profiles:clear-all</b> - Clear all of the TLS Server Profiles in the collection.</li> <li>• <b>apic tls-server-profiles:create</b> - Create a TLS Server Profile.</li> <li>• <b>apic tls-server-profiles:delete</b> - Delete the TLS Server Profile by name or ID.</li> <li>• <b>apic tls-server-profiles:get</b> - Get the TLS Server Profile by name or ID.</li> <li>• <b>apic tls-server-profiles:list</b> - List the TLS Server Profiles.</li> <li>• <b>apic tls-server-profiles:list-all</b> - List all of the TLS Server Profiles in the collection.</li> <li>• <b>apic tls-server-profiles:update</b> - Update the TLS Server Profile by name or ID.</li> </ul>
<b>apic truststores</b>	Truststore commands	<ul style="list-style-type: none"> <li>• <b>apic truststores</b> - Truststore collection operations.</li> <li>• <b>apic truststores:clear</b> - Clear the Truststores.</li> <li>• <b>apic truststores:create</b> - Create a Truststore.</li> <li>• <b>apic truststores:delete</b> - Delete the Truststore by name or ID.</li> <li>• <b>apic truststores:get</b> - Get the Truststore by name or ID.</li> <li>• <b>apic truststores:list</b> - List the Truststores.</li> <li>• <b>apic truststores:update</b> - Update the Truststore by name or ID.</li> </ul>

Command	Description	Sub-commands
<code>apic user-registries</code>	User registry commands	<ul style="list-style-type: none"> <li><code>apic user-registries</code> - User Registry collection operations.</li> <li><code>apic user-registries:clear</code> - Clear the User Registries.</li> <li><code>apic user-registries:create</code> - Create a User Registry.</li> <li><code>apic user-registries:delete</code> - Delete the User Registry by name or ID.</li> <li><code>apic user-registries:execute</code> - Execute a User Registry operation.</li> <li><code>apic user-registries:get</code> - Get the User Registry by name or ID.</li> <li><code>apic user-registries:list</code> - List the User Registries.</li> <li><code>apic user-registries:search</code> - search for users in a user registry.</li> <li><code>apic user-registries:test-connection</code> - Test a User Registry connection.</li> <li><code>apic user-registries:update</code> - Update the User Registry by name or ID.</li> </ul>
<code>apic user-registry-settings</code>	User registry settings commands	<ul style="list-style-type: none"> <li><code>apic user-registry-settings:get</code> - Get the User Registry Setting.</li> <li><code>apic user-registry-settings:update</code> - Update the User Registry Setting.</li> </ul>
<code>apic users</code>	Users commands	<ul style="list-style-type: none"> <li><code>apic users</code> - User collection operations.</li> <li><code>apic users:clear</code> - Clear the Users.</li> <li><code>apic users:create</code> - Create a User.</li> <li><code>apic users:delete</code> - Delete the User by name or ID.</li> <li><code>apic users:get</code> - Get the User by name or ID.</li> <li><code>apic users:list</code> - List the Users.</li> <li><code>apic users:request-password-reset</code> - send a password reset link.</li> <li><code>apic users:search-provider</code> - Search for provider users from an organization.</li> <li><code>apic users:update</code> - Update the User by name or ID.</li> </ul>
<code>apic webhooks</code>	Webhooks commands	<ul style="list-style-type: none"> <li><code>apic webhooks</code> - Webhooks collection operations.</li> <li><code>apic webhooks:get</code> - Get the Webhooks by name or ID.</li> <li><code>apic webhooks:list</code> - List the Webhooks.</li> <li><code>apic webhooks:update</code> - Update the Webhooks by name or ID.</li> </ul>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API development and management commands

A summary of the core commands in the IBM® API Connect developer toolkit.

### Authenticating

Use the `apic login` command to authenticate to an API Manager service, and the `apic logout` command to remove your local authentication credentials.

Note: When you authenticate successfully, your credentials are stored, in plain text, in the file `Linux .netrc` or `Windows _netrc`. Therefore, you should set the file permissions in such a way that your credentials are not accessible by others.

For full details on how to log in to your management server from the CLI, see [Logging in to the management server](#).

### Configuring the command-line tool to use TLS certificates

API Manager uses TLS profiles to secure data transmission. For information on how to create a TLS profile in API Manager, see [TLS profiles](#).

To configure the toolkit command-line tool to use certificates to communicate with an API Manager that has TLS profiles that are enabled, follow these steps:

For more information about the `NODE_EXTRA_CA_CERTS` environment variable, see [Node.js documentation](#).

### Creating and managing local files

You create and work with API and Product definition YAML files locally before you stage them to API Manager.

To create a local API definition file, use the `apic create:api` command. To create a local Product definition file, use the `apic create:product` command.

Use the `apic apis` and `apic products` commands to list API Manager artifacts of the specified type.

To validate the syntactical correctness of a local API or Product definition file, use the `apic validate` command.

To create a draft API in API Manager from a local API or Product definition file, use the `apic draft-apis:create` and `apic draft-products:create` commands, respectively.

Note: If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before an API is validated, created in draft, staged, or published. For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

### Working with Catalogs and Spaces

To create a Catalog, use the `apic catalog:create` command. To view information on a Catalog, use the `apic catalog:get` command; to list all Catalogs that are contained in organizations that the currently authenticated user is a member of, use the `apic catalogs` command.

You can use a *Space* to partition a Catalog so multiple teams can manage Products and APIs independently in a single Catalog. A Space is conceptually like a subcatalog, except that Products and APIs in all Spaces in a given Catalog are published to the same developer portal. For more information about Spaces, see [Using syndication in IBM API Connect](#).

To enable Spaces for a Catalog, use the following command:

```
apic catalogs:set catalog_name --spaces enabled
```

Use the toolkit `apic spaces` commands to create and manage Spaces:

- `apic spaces` - List Spaces contained in a Catalog.
- `apic:spaces create` - Create a Space in a Catalog.
- `apic:spaces get` - Get information on a Space in a Catalog.
- `apic:spaces set` - Set information on a Space in a Catalog.
- `apic:spaces delete` - Delete a Space in a Catalog.

## Command summary

The following tables summarize `apic` commands for API development and management.

Table 1. Summary of general-purpose commands

Command	Description	Subcommands
<code>apic config</code>	List and manage configuration variables. For more information, see <a href="#">Using configuration variables</a> . With no subcommand, lists values of defined configuration variables.	<ul style="list-style-type: none"> <li>• <code>apic config</code> - Manage configuration variables</li> <li>• <code>apic config:clear</code> - Delete all configuration variables</li> <li>• <code>apic config:delete</code> - Delete a configuration variable</li> <li>• <code>apic config:get</code> - Get a configuration variable</li> <li>• <code>apic config:list</code> - List the application and global configuration variables</li> <li>• <code>apic config:set</code> - Set or update configuration variables</li> </ul>
<code>apic create</code>	Create a draft API or Product definition YAML file.	<ul style="list-style-type: none"> <li>• <code>create:api</code> - Create a draft API OpenAPI definition YAML file</li> <li>• <code>create:product</code> - Create a Product definition YAML file</li> </ul>
<code>apic extensions</code>	Manage OpenAPI extensions in a Catalog. With no subcommand, lists the extensions in the production Catalog.	<ul style="list-style-type: none"> <li>• <code>apic extensions</code> - Extension collection operations.</li> <li>• <code>apic extensions:clear</code> - Delete all versions of an extension given the name.</li> <li>• <code>apic extensions:clear-all</code> - Delete all versions of all extensions.</li> <li>• <code>apic extensions:clone</code> - Download all versions of all extensions to your local drive.</li> <li>• <code>apic extensions:create</code> - Create an extension.</li> <li>• <code>apic extensions:delete</code> - Delete an extension by ID, or by name and version.</li> <li>• <code>apic extensions:document</code> - Get the document for an extension by ID, or by name and version.</li> <li>• <code>apic extensions:get</code> - Get an extension by ID, or by name and version.</li> <li>• <code>apic extensions:list</code> - List all versions of an extension given the name.</li> <li>• <code>apic extensions:list-all</code> - List all versions of all extensions.</li> <li>• <code>apic extensions:update</code> - Update an extension by ID, or by name and version.</li> </ul>

Command	Description	Subcommands
<code>apic lb4</code>	<p>Create LoopBack® project and project artifacts. With no subcommand, creates a new LoopBack project.</p> <p>Note: To use the <code>apic lb4</code> command, you need to add a double dash, <code>--</code>, after the <code>lb4</code> subcommand to tell <code>apic</code> that the options behind the <code>--</code> are for the subcommand belonging to <code>lb4</code>. The second <code>--</code> is to signify the end of the options. For example,</p> <pre>\$ apic lb4 controller -- --help</pre> <p>Note: You can use</p> <pre>\$ apic lb4 --help</pre> <p>to show a list of commands that are available, and you can use</p> <pre>\$ apic lb4 subcommand -- --help</pre> <p>to show the usage of a subcommand.</p>	<ul style="list-style-type: none"> <li>• <code>app</code> - Create a new LoopBack project (default)</li> <li>• <code>controller</code> - Add a controller to a LoopBack 4 application</li> <li>• <code>datasource</code> - Add a datasource to a LoopBack 4 application</li> <li>• <code>discover</code> - Discover models from relational databases</li> <li>• <code>example</code> - Download one of LoopBack 4 example projects</li> <li>• <code>extension</code> - Create a LoopBack 4 extension</li> <li>• <code>import-lb3-models</code> - Import one or more LoopBack 3 models to a LoopBack 4 application</li> <li>• <code>interceptor</code> - Generate interceptors</li> <li>• <code>model</code> - Add a new model to a LoopBack 4 application</li> <li>• <code>observer</code> - Generate life cycle observers for application start and stop</li> <li>• <code>openapi</code> - Generate controllers and models from OpenAPI specs</li> <li>• <code>relation</code> - Add a relation between two models in a LoopBack 4 application</li> <li>• <code>repository</code> - Add a new repository for a selected model to a LoopBack 4 application</li> <li>• <code>rest-crud</code> - Generate rest configs for model endpoints</li> <li>• <code>service</code> - Add a new remote or local service to a LoopBack 4 application</li> <li>• <code>update</code> - Check or update project dependencies of LoopBack modules</li> </ul>
<code>apic login</code>	Log in to API Manager.	<p>None. Specify server and credentials with the required flags:</p> <ul style="list-style-type: none"> <li>• <code>-p, --password password</code></li> <li>• <code>-r, --realm realm</code>. Determines the identity provider that is used to authenticated the supplied user ID, and the scope of the tasks that can be performed after successful log in.</li> <li>• <code>-s, --server mgmt_endpoint_url</code>. Use the value of the platform API endpoint URL for this entry.</li> <li>• <code>-u, --username user_name</code></li> </ul> <p>For full details on how to log in to your management server from the CLI, see <a href="#">Logging in to the management server</a>.</p>
<code>apic logout</code>	Log out from API Manager.	<p>None. Specify server with the required flag:</p> <ul style="list-style-type: none"> <li>• <code>-s, --server mgmt_service</code>.</li> </ul> <p>You can append the port number to the server name if it is not the default value of 443.</p>
<code>apic validate</code>	Validate API or Product definition YAML file.	None

Table 2. Summary of commands to manage APIs, Products, and Catalogs

Command	Description	Subcommands
<code>apic apis</code>	List and manage APIs that are staged or published to Catalog or Space. Default subcommand is <code>list-all</code> .	<ul style="list-style-type: none"> <li>• <code>apic apis</code> - API collection operations</li> <li>• <code>apic apis:get</code> - Get the OpenAPI definition YAML file for an API by name and version, or by ID</li> <li>• <code>apic apis:list</code> - List an API by name</li> <li>• <code>apic apis:list-all</code> - List all APIs in a Catalog or Space</li> <li>• <code>apic apis:update</code> - Update an API by name</li> </ul>
<code>apic apps</code>	List and manage developer applications that are registered in a consumer organization. Default subcommand is <code>list</code> .	<ul style="list-style-type: none"> <li>• <code>apic apps</code> - Application collection operations</li> <li>• <code>apic apps:clear</code> - Clear all applications</li> <li>• <code>apic apps:create</code> - Create an application</li> <li>• <code>apic apps:delete</code> - Delete an application by name or ID</li> <li>• <code>apic apps:get</code> - Get an application object by name</li> <li>• <code>apic apps:list</code> - List all the applications in a consumer organization</li> <li>• <code>apic apps:update</code> - Update an application by name or ID</li> </ul>
<code>apic catalogs</code>	List and manage Catalogs in a provider organization. Default subcommand is <code>list</code> .	<ul style="list-style-type: none"> <li>• <code>apic catalogs:clear</code> - Clear all Catalogs from provider organization</li> <li>• <code>apic catalogs:create</code> - Create a Catalog</li> <li>• <code>apic catalogs:delete</code> - Delete a Catalog by name or ID</li> <li>• <code>apic catalogs:get</code> - Get a Catalog object by name or ID</li> <li>• <code>apic catalogs:list</code> - List all the Catalogs in a provider organization</li> <li>• <code>apic catalogs:transfer-owner</code> - Transfer the ownership of a Catalog to another user</li> <li>• <code>apic catalogs:update</code> - Update a Catalog by name or ID</li> </ul>
<code>apic catalog-settings</code>	Manage the configuration settings for a Catalog	<ul style="list-style-type: none"> <li>• <code>apic catalog-settings:get</code> - Get the Catalog settings.</li> <li>• <code>apic catalog-settings:update</code> - Update the Catalog settings.</li> </ul>

Command	Description	Subcommands
<b>apic drafts</b>	List and manage the draft API and Product definitions in a provider organization. Default subcommand is <b>list</b> .	<ul style="list-style-type: none"> <li>• <b>apic drafts</b> - Draft collection operations</li> <li>• <b>apic drafts:clear</b> - Delete all draft APIs and Products in a provider organization</li> <li>• <b>apic drafts:list</b> - List the draft APIs and Products in a provider organization</li> </ul>
<b>apic draft-apis</b>	List and manage the draft API definitions in a provider organization. Default subcommand is <b>list-all</b> .	<ul style="list-style-type: none"> <li>• <b>apic draft-apis</b> - Draft API collection operations</li> <li>• <b>apic draft-apis:clear</b> - Delete all versions of a draft API by name</li> <li>• <b>apic draft-apis:clear-all</b> - Delete all draft APIs in a provider organization</li> <li>• <b>apic draft-apis:clone</b> - Clone all draft APIs in a provider organization</li> <li>• <b>apic draft-apis:create</b> - Create a draft API</li> <li>• <b>apic draft-apis:delete</b> - Delete a Draft API by name and version</li> <li>• <b>apic draft-apis:document</b> - Get the Draft API document by name and version</li> <li>• <b>apic draft-apis:get</b> - Get the OpenAPI definition YAML file for an API by name and version</li> <li>• <b>apic draft-apis:list</b> - List all versions of a draft API by name</li> <li>• <b>apic draft-apis:list-all</b> - List all draft APIs in a provider organization</li> <li>• <b>apic draft-apis:update</b> - Update a draft API by name and version, supplying the revised OpenAPI definition file</li> <li>• <b>apic draft-apis:update-wsdl</b> - Update a draft SOAP API by name and version, supplying the revised WSDL definition file in a .wsdl or .zip format Note: There must be a match of the service names in the existing WSDL with the revised WSDL. If a match is found, the WSDL service is converted into a YAML file that is used to update the API. If no match is found, an error message is displayed.</li> <li>• <b>apic draft-apis:validate</b> - Validates a draft API</li> <li>• <b>apic draft-apis:wsdl</b> - Get the Draft API WSDL document by name and version</li> </ul>
<b>apic draft-products</b>	List and manage the draft Product definitions in a provider organization. Default subcommand is <b>list-all</b> .	<ul style="list-style-type: none"> <li>• <b>apic draft-products</b> - Draft Product collection operations</li> <li>• <b>apic draft-products:clear</b> - Delete all versions of a draft Product by name</li> <li>• <b>apic draft-products:clear-all</b> - Delete all draft Products in a provider organization</li> <li>• <b>apic draft-products:create</b> - Create a draft Product</li> <li>• <b>apic draft-products:delete</b> - Delete a draft Product by name and version</li> <li>• <b>apic draft-products:get</b> - Get the Draft Product by name and version</li> <li>• <b>apic draft-products:list</b> - List the Draft Products</li> <li>• <b>apic draft-products:list-all</b> - List all draft Products in a provider organization</li> <li>• <b>apic draft-products:publish-all</b> - Publishes the Draft Product</li> <li>• <b>apic draft-products:update</b> - Update a draft Product by name and version, supplying the revised definition file</li> <li>• <b>apic draft-products:validate</b> - Validates a draft Product</li> </ul>
<b>apic members</b>	List and manage the members of a provider organization, consumer organization, Catalog, or Space. Default subcommand is <b>list</b> .	<ul style="list-style-type: none"> <li>• <b>apic members</b> - Member operations</li> <li>• <b>apic members:clear</b> - Delete all members</li> <li>• <b>apic members:create</b> - Create a member</li> <li>• <b>apic members:delete</b> - Delete a member by name or ID</li> <li>• <b>apic members:get</b> - Get a member object by name or ID</li> <li>• <b>apic members:list</b> - List all members</li> <li>• <b>apic members:update</b> - Update the member by name or ID</li> </ul>
<b>apic member-invitations</b>	List and manage member invitations. A member invitation is created when a user is invited to be a member of a provider organization, consumer organization, Catalog, or Space. Default subcommand is <b>list</b> .	<ul style="list-style-type: none"> <li>• <b>apic member-invitations</b> - Member invitation collection operations.</li> <li>• <b>apic member-invitations:clear</b> - Delete all member invitations.</li> <li>• <b>apic member-invitations:create</b> - Create a member invitation.</li> <li>• <b>apic member-invitations:delete</b> - Delete a member invitation by name or ID.</li> <li>• <b>apic member-invitations:get</b> - Get a member invitation object by name or ID.</li> <li>• <b>apic member-invitations:list</b> - List all member invitations.</li> <li>• <b>apic member-invitations:update</b> - Update a member invitation by name or ID.</li> </ul>
<b>apic orgs</b>	List and manage provider organizations, and the admin organization. Default subcommand is <b>list</b> .	<ul style="list-style-type: none"> <li>• <b>apic orgs</b> - Organization collection operations</li> <li>• <b>apic orgs:clear</b> - Delete all organizations</li> <li>• <b>apic orgs:create</b> - Create an organization</li> <li>• <b>apic orgs:delete</b> - Delete an organization by name or ID</li> <li>• <b>apic orgs:get</b> - Get an organization object by name or ID</li> <li>• <b>apic orgs:list</b> - List all organizations</li> <li>• <b>apic orgs:transfer-owner</b> - Transfer ownership of an organization</li> <li>• <b>apic orgs:update</b> - Update an organization by name or ID</li> </ul>
<b>apic org-settings</b>	Manage settings for provider organizations, and the admin organization.	<ul style="list-style-type: none"> <li>• <b>apic org-settings:get</b> - Get the settings object for an organization</li> <li>• <b>apic org-settings:update</b> - Update the settings for an organization</li> </ul>
<b>apic policies</b>	List and manage policies in a Catalog. Default subcommand is <b>list</b> .	<ul style="list-style-type: none"> <li>• <b>apic policies</b> - Policy collection operations</li> <li>• <b>apic policies:clear</b> - Clear the Policies</li> <li>• <b>apic policies:clear-all</b> - Clear all Policies in all collections</li> <li>• <b>apic policies:create</b> - Create a Policy</li> <li>• <b>apic policies:delete</b> - Delete a Policy</li> <li>• <b>apic policies:get</b> - Get the Policy by name and version</li> <li>• <b>apic policies:list</b> - List the Policies</li> <li>• <b>apic policies:list-all</b> - List all Policies in all collections</li> <li>• <b>apic policies:update</b> - Update the Policy by name and version</li> </ul>

Command	Description	Subcommands
<b>apic products</b>	List and manage Products that are staged or published to Catalog or Space. Default subcommand is <b>list-all</b> .	<ul style="list-style-type: none"> <li>• <b>apic products</b> - Product collection operations</li> <li>• <b>apic products:clear</b> - Delete all versions of a Product by name</li> <li>• <b>apic products:clear-all</b> - Delete all Products</li> <li>• <b>apic products:delete</b> - Delete a Product by name and version</li> <li>• <b>apic products:execute-migration-target</b> - Products execute migration target operations</li> <li>• <b>apic products:get</b> - Get a Product object by name and version</li> <li>• <b>apic products:list</b> - List all versions of a Product by name</li> <li>• <b>apic products:list-all</b> - List all Products</li> <li>• <b>apic products:publish</b> - Publish a Product to a Catalog or Space, supplying the Product definition YAML file</li> <li>• <b>apic products:replace</b> - Replace a Product with another Product</li> <li>• <b>apic products:set-migration-target</b> - Set the target Product for migrating subscriptions from a Product</li> <li>• <b>apic products:supersede</b> - Supersede a Product with another Product</li> <li>• <b>apic products:update</b> - Update a Product by name and version, supplying the revised Product definition YAML file</li> </ul>
<b>apic identity-providers</b>	View information about identity providers.	<ul style="list-style-type: none"> <li>• <b>apic identity-providers</b> - Identity provider operations</li> <li>• <b>apic identity-providers:list</b> - List the identity providers.</li> </ul>
<b>apic spaces</b>	List and manage Spaces contained in a Catalog. Default subcommand is <b>list</b> .	<ul style="list-style-type: none"> <li>• <b>apic spaces</b> - Space collection operations</li> <li>• <b>apic spaces:clear</b> - Delete all Spaces from a Catalog</li> <li>• <b>apic spaces:create</b> - Create a Space in a Catalog</li> <li>• <b>apic spaces:delete</b> - Delete a Space from a Catalog, by name or ID</li> <li>• <b>apic spaces:get</b> - Get a Space object by name or ID</li> <li>• <b>apic spaces:list</b> - List all the Spaces in a Catalog</li> <li>• <b>apic spaces:transfer-owner</b> - Transfer the ownership of a Space to another user</li> <li>• <b>apic spaces:update</b> - Update a Space by name or ID</li> </ul>
<b>apic subscriptions</b>	List and manage subscriptions in a Product or a Catalog. Default subcommand is <b>list</b> .	<ul style="list-style-type: none"> <li>• <b>apic subscriptions</b> - Subscription collection operations</li> <li>• <b>apic subscriptions:clear</b> - Clear the Subscriptions</li> <li>• <b>apic subscriptions:create</b> - Create a Subscription</li> <li>• <b>apic subscriptions:delete</b> - Delete the Subscription by name or ID</li> <li>• <b>apic subscriptions:get</b> - Get the Subscription by name or ID</li> <li>• <b>apic subscriptions:list</b> - List the Subscriptions</li> <li>• <b>apic subscriptions:update</b> - Update the Subscription by name or ID</li> </ul>

Table 3. Summary of other commands for API developers and managers

Command	Description	Subcommands
<b>apic consumer-orgs</b>	Manage consumer organizations	<ul style="list-style-type: none"> <li>• <b>apic consumer-orgs</b> - Consumer Organization collection operations.</li> <li>• <b>apic consumer-orgs:clear</b> - Clear the Consumer Organizations.</li> <li>• <b>apic consumer-orgs:create</b> - Create a Consumer Organization.</li> <li>• <b>apic consumer-orgs:delete</b> - Delete the Consumer Organization by name or ID.</li> <li>• <b>apic consumer-orgs:get</b> - Get the Consumer Organization by name or ID.</li> <li>• <b>apic consumer-orgs:list</b> - List the Consumer Organizations.</li> <li>• <b>apic consumer-orgs:transfer-owner</b> - Transfer owner to a new member.</li> <li>• <b>apic consumer-orgs:update</b> - Update the Consumer Organization by name or ID.</li> </ul>
<b>apic consumer-org-settings</b>	Manage consumer organization settings	<ul style="list-style-type: none"> <li>• <b>apic consumer-org-settings:delete</b> - Delete the Consumer Organization Setting.</li> <li>• <b>apic consumer-org-settings:get</b> - Get the Consumer Organization Setting.</li> <li>• <b>apic consumer-org-settings:update</b> - Update the Consumer Organization Setting.</li> </ul>
<b>apic groups</b>	Manage groups	<ul style="list-style-type: none"> <li>• <b>apic groups</b> - Group collection operations.</li> <li>• <b>apic groups:clear</b> - Clear the Groups.</li> <li>• <b>apic groups:create</b> - Create a Group.</li> <li>• <b>apic groups:delete</b> - Delete the Group by name or ID.</li> <li>• <b>apic groups:get</b> - Get the Group by name or ID.</li> <li>• <b>apic groups:list</b> - List the Groups.</li> <li>• <b>apic groups:update</b> - Update the Group by name or ID.</li> </ul>

Command	Description	Subcommands
<b>apic invitations</b>	Manage invitations. An invitation is created when a user is invited to be the owner of a provider organization, consumer organization, Catalog, or Space.	<ul style="list-style-type: none"> <li>• <b>apic invitations</b> - Invitation collection operations.</li> <li>• <b>apic invitations:clear</b> - Delete all invitations.</li> <li>• <b>apic invitations:create</b> - Create an invitation.</li> <li>• <b>apic invitations:delete</b> - Delete an invitation by name or ID.</li> <li>• <b>apic invitations:get</b> - Get the details of an invitation by name or ID.</li> <li>• <b>apic invitations:list</b> - List all invitations.</li> <li>• <b>apic invitations:update</b> - Update an invitation by name or ID.</li> </ul>
<b>apic member-invitations</b>	Manage member invitations. A member invitation is created when a user is invited to be a member of a provider organization, consumer organization, Catalog, or Space.	<ul style="list-style-type: none"> <li>• <b>apic member-invitations</b> - Member invitation collection operations.</li> <li>• <b>apic member-invitations:clear</b> - Delete all member invitations.</li> <li>• <b>apic member-invitations:create</b> - Create a member invitation.</li> <li>• <b>apic member-invitations:delete</b> - Delete a member invitation by name or ID.</li> <li>• <b>apic member-invitations:get</b> - Get the details of a member invitation by name or ID.</li> <li>• <b>apic member-invitations:list</b> - List all member invitations.</li> <li>• <b>apic member-invitations:update</b> - Update a member invitation by name or ID.</li> </ul>
<b>apic members</b>		<ul style="list-style-type: none"> <li>• <b>apic members</b> - Member collection operations.</li> <li>• <b>apic members:clear</b> - Clear the Members.</li> <li>• <b>apic members:create</b> - Create a Member.</li> <li>• <b>apic members:delete</b> - Delete the Member by name or ID.</li> <li>• <b>apic members:get</b> - Get the Member by name or ID.</li> <li>• <b>apic members:list</b> - List the Members.</li> <li>• <b>apic members:update</b> - Update the Member by name or ID.</li> </ul>
<b>apic registrations</b>		<ul style="list-style-type: none"> <li>• <b>apic registrations</b> - Registration collection operations.</li> <li>• <b>apic registrations:clear</b> - Clear the Registrations.</li> <li>• <b>apic registrations:create</b> - Create a Registration.</li> <li>• <b>apic registrations:delete</b> - Delete the Registration by name or ID.</li> <li>• <b>apic registrations:get</b> - Get the Registration by name or ID.</li> <li>• <b>apic registrations:list</b> - List the Registrations.</li> <li>• <b>apic registrations:update</b> - Update the Registration by name or ID.</li> </ul>
<b>apic role-defaults</b>		<ul style="list-style-type: none"> <li>• <b>apic role-defaults</b> - Role Default collection operations.</li> <li>• <b>apic role-defaults:clear</b> - Clear the Role Defaults.</li> <li>• <b>apic role-defaults:create</b> - Create a Role Default.</li> <li>• <b>apic role-defaults:delete</b> - Delete the Role Default by name or ID.</li> <li>• <b>apic role-defaults:get</b> - Get the Role Default by name or ID.</li> <li>• <b>apic role-defaults:list</b> - List the Role Defaults.</li> <li>• <b>apic role-defaults:list-all</b> - List all Role Defaults in all collections.</li> <li>• <b>apic role-defaults:update</b> - Update the Role Default by name or ID.</li> </ul>

Command	Description	Subcommands
<code>apic roles</code>		<ul style="list-style-type: none"> <li>• <code>apic roles</code> - Role collection operations.</li> <li>• <code>apic roles:clear</code> - Clear the Roles.</li> <li>• <code>apic roles:create</code> - Create a Role.</li> <li>• <code>apic roles:delete</code> - Delete the Role by name or ID.</li> <li>• <code>apic roles:get</code> - Get the Role by name or ID.</li> <li>• <code>apic roles:list</code> - List the Roles.</li> <li>• <code>apic roles:update</code> - Update the Role by name or ID.</li> </ul>
<code>apic tasks</code>		<ul style="list-style-type: none"> <li>• <code>apic tasks</code> - Task collection operations.</li> <li>• <code>apic tasks:clear</code> - Clear the Tasks.</li> <li>• <code>apic tasks:create</code> - Create a Task.</li> <li>• <code>apic tasks:delete</code> - Delete the Task by name or ID.</li> <li>• <code>apic tasks:get</code> - Get the Task by name or ID.</li> <li>• <code>apic tasks:list</code> - List the Tasks.</li> <li>• <code>apic tasks:update</code> - Update the Task by name or ID.</li> </ul>
<code>apic user-registries</code>		<ul style="list-style-type: none"> <li>• <code>apic user-registries</code> - User Registry collection operations.</li> <li>• <code>apic user-registries:clear</code> - Clear the User Registries.</li> <li>• <code>apic user-registries:create</code> - Create a User Registry.</li> <li>• <code>apic user-registries:delete</code> - Delete the User Registry by name or ID.</li> <li>• <code>apic user-registries:execute</code> - Execute a User Registry operation.</li> <li>• <code>apic user-registries:get</code> - Get the User Registry by name or ID.</li> <li>• <code>apic user-registries:list</code> - List the User Registries.</li> <li>• <code>apic user-registries:search</code> - search for users in a user registry.</li> <li>• <code>apic user-registries:test-connection</code> - Test a User Registry connection.</li> <li>• <code>apic user-registries:update</code> - Update the User Registry by name or ID.</li> </ul>
<code>apic user-registry-settings</code>		<ul style="list-style-type: none"> <li>• <code>apic user-registry-settings:delete</code> - Delete the User Registry Setting.</li> <li>• <code>apic user-registry-settings:get</code> - Get the User Registry Setting.</li> <li>• <code>apic user-registry-settings:update</code> - Update the User Registry Setting.</li> </ul>
<code>apic users</code>		<ul style="list-style-type: none"> <li>• <code>apic users</code> - User collection operations.</li> <li>• <code>apic users:clear</code> - Clear the Users.</li> <li>• <code>apic users:create</code> - Create a User.</li> <li>• <code>apic users:delete</code> - Delete the User by name or ID.</li> <li>• <code>apic users:get</code> - Get the User by name or ID.</li> <li>• <code>apic users:list</code> - List the Users.</li> <li>• <code>apic users:request-password-reset</code> - send a password reset link.</li> <li>• <code>apic users:search-provider</code> - Search for provider users from an organization.</li> <li>• <code>apic users:update</code> - Update the User by name or ID.</li> </ul>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating APIs and applications

You can develop API proxies and API implementations by using the developer toolkit. In the documentation, *API* refers to the API proxy and *application* refers to the API implementation.

LoopBack® is a high-performance Node.js interaction-tier framework for APIs and micro-services. The [LoopBack framework](#) can be downloaded and installed using the **CLI + LoopBack + Designer** option for downloading the toolkit. See [Installing the toolkit](#). To create a new LoopBack project, use the command `apic lb4`.

Note: IBM® API Connect is packaged with, and supports, LoopBack version 4. For more information on how to migrate your LoopBack 3 applications to LoopBack 4, see [LoopBack 4 Migration Guide](#).

You can use the developer toolkit or LoopBack to create language-independent APIs by using [OpenAPI](#) to proxy to an existing backend implementation or to augment applications that are developed in other languages or frameworks such as [Express®](#), Java™, [Swift](#), Go, and others.

## Creating development artifact definitions

Use the `apic create` command to create development artifacts, by using the following commands:

Command	Description
<code>apic create:api</code>	Create an OpenAPI definition.
<code>apic create:api --wsdl filename</code>	Create a SOAP API definition from a WSDL definition file, or a .zip file that contains the WSDL definition files for a service. The name and version of the generated API are obtained from the WSDL file. If you upload a .zip file, you can include in the .zip file an options file to specify additional directives. For details, see <a href="#">Using an options file when importing a WSDL service</a> .
<code>apic create:product</code>	Create an API Product definition.

Note: You can create an API or Product from an OpenAPI template file by using the `--template template-name` option.

You can also create Product and API definitions non-interactively by providing the `--title` option. This option sets several values that you can also customize with additional options; for example:

```
apic create:api --title Routes
apic create:product --title "Climb On"
```

You can also create the API and Product definitions at the same time:

```
apic create:api --title Routes --product "Climb On"
apic create:api --wsdl globalweather.wsdl --product "Weather Forecasting"
```

Alternatively, you can create APIs and then reference them when you create a new Product; for example:

```
apic create:api --title Routes
apic create:api --title Ascents
apic create:product --title "Climb On" --apis "routes.yaml ascents.yaml"
```

## Validating development artifact definitions

After you edit development artifacts or before you publish artifacts, best practice is to validate them; for example:

```
apic validate routes.yaml # Validate an API
apic validate climb-on.yaml # Validate the Product and its APIs
apic validate climb-on.yaml --product-only # Validate the Product only (do not validate the referenced APIs)
```

Note: If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before the draft API is created with the `apic drafts:validate` command. For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

## Developing LoopBack applications

After you've created a LoopBack application with the `apic lb4 app` command, you can add additional functionality to the application with the commands listed in the following table. Run these commands from the project root directory of the application. APIs created with LoopBack can be imported into API Manager.

Command	Description	Subcommands
---------	-------------	-------------

Command	Description	Subcommands
<code>apic lb4</code>	<p>Create LoopBack project and project artifacts. With no subcommand, creates a new LoopBack project.</p> <p>Note: To use the <code>apic lb4</code> command, you need to add a double dash, <code>--</code>, after the <code>lb4</code> subcommand to tell <code>apic</code> that the options behind the <code>--</code> are for the subcommand belonging to <code>lb4</code>. The second <code>--</code> is to signify the end of the options. For example,</p> <pre>\$ apic lb4 controller -- --help</pre>	<ul style="list-style-type: none"> <li>• <code>app</code> - Create a new LoopBack project (default)</li> <li>• <code>controller</code> - Add a controller to a LoopBack 4 application</li> <li>• <code>datasource</code> - Add a datasource to a LoopBack 4 application</li> <li>• <code>discover</code> - Discover models from relational databases</li> <li>• <code>example</code> - Download one of LoopBack 4 example projects</li> <li>• <code>extension</code> - Create a LoopBack 4 extension</li> <li>• <code>import-lb3-models</code> - Import one or more LoopBack 3 models to a LoopBack 4 application</li> <li>• <code>interceptor</code> - Generate interceptors</li> <li>• <code>model</code> - Add a new model to a LoopBack 4 application</li> <li>• <code>observer</code> - Generate life cycle observers for application start and stop</li> <li>• <code>openapi</code> - Generate controllers and models from OpenAPI specs</li> <li>• <code>relation</code> - Add a relation between two models in a LoopBack 4 application</li> <li>• <code>repository</code> - Add a new repository for a selected model to a LoopBack 4 application</li> <li>• <code>rest-crud</code> - Generate rest configs for model endpoints</li> <li>• <code>service</code> - Add a new remote or local service to a LoopBack 4 application</li> <li>• <code>update</code> - Check or update project dependencies of LoopBack modules</li> </ul>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Publishing APIs and applications

To publish APIs and applications by using the developer toolkit of IBM® API Connect, you set configuration variables to define where you want to publish, log in to the target cloud platform, and then use the appropriate publishing commands.

See the following sections for more information:

- [Setting configuration variables](#)
- [Logging in to API Connect](#)
- [Publishing APIs](#)

## Setting configuration variables

The `apic config` command provides global and project-based configuration variables that specify the target Catalog for publishing APIs and applications. The values of these variables are stored in `~/.apiconnect/config` (for global variables) and `project-dir/.apiconnect` (for project variables). For a full list of configuration variables, see [Overview of the command-line tool](#).

Set the `catalog` configuration variable to the URI of an API Connect Catalog to define a default Catalog target for all commands managing Catalogs. The `catalog` URI has the form:

```
https://mgmt_endpoint_url/api/catalogs/org_name/catalog_name
```

where `mgmt_endpoint_url` is the platform API endpoint URL, `org_name` is the provider organization name, and `catalog_name` is the Catalog name. The `mgmt_endpoint_url` portion sets the default value of the `--server` option, the `org_name` portion sets the default value of the `--org` option, and the `catalog_name` portion sets the default value of the `--catalog` option; you can override any of these values by including the corresponding option in a command.

Set the `space` configuration variable to the URI of an API Connect Space, to define a default Space target for all commands that manage Spaces. The `space` URI has the form:

```
https://mgmt_endpoint_url/api/spaces/org_name/catalog_name/space_name
```

where `mgmt_endpoint_url` is the platform API endpoint URL, `org_name` is the provider organization name, `catalog_name` is the Catalog name, and `space_name` is the name of the Space. The `mgmt_endpoint_url` portion sets the default value of the `--server` option, the `org_name` portion sets the default value of the `--org` option, the

`catalog_name` portion sets the default value of the `--catalog` option, and the `space_name` sets the default value of the `--space` option; you can override any of these values by including the corresponding option in a command.

Although setting these configuration variables is not required, doing so simplifies commands that interact with API Connect clouds by providing default values for frequently used command-line options.

Here is an example of publishing with and without the `catalog` configuration variable set.

Without the configuration variable set:

```
apic products publish climb-on.yaml --server mgmthost.com --org climbon --catalog sandbox
```

With the configuration variable set:

```
apic config:set catalog=https://platform-api.myserver.com/api/catalogs/climbon/sandbox
catalog: https://platform-api.myserver.com/api/catalogs/climbon/sandbox
apic products publish climb-on.yaml
```

You can override default values provided by the `catalog` configuration variable by providing one of the standard options with a different value. For example, use the `--catalog` option with the `apic products publish` command to specify the `qa` Catalog:

```
apic products publish climb-on.yaml --catalog qa
```

Don't forget about global configuration variables. If you use the same Catalog as the default target for multiple projects, set the value globally:

```
apic config:set --global catalog=https://platform-api.myserver.com/api/catalogs/climbon/sandbox
```

Note:

If you have an environment variable of the same name as a CLI configuration property then, by default, its value will override the value of the corresponding CLI configuration property for any CLI command at that scope.

For example, if you have defined an environment variable called `SPACE` then, by default, that value will be assumed for the value of the `--space` parameter in the following command, regardless of any `space` configuration property setting:

```
apic products:publish my_product.yaml --scope space
```

To prevent environment variables overriding CLI configuration properties, define an environment variable called `APIC_LOAD_FROM_ENV`, set to the value `false`.

## Logging in to API Connect

---

Use the `apic login` and `apic logout` commands to manage your authentication. For details, see [Logging in to a management server](#).

## Publishing APIs

---

Publishing APIs to API Catalogs in API Connect clouds enables you to socialize the APIs by using the developer portal and secure them by using the Gateway.

An *API Product* (or simply *Product*) is used to compose APIs for publishing. API Product managers can use it to bundle one or more APIs together, control the visibility of the Product in the developer portal (for example, only allow partners `x`, `y`, and `z` to view and subscribe to the Product), and define Plans to provide consumption options. The Products that reference the APIs and define the consumption Plans are also the primary unit of lifecycle management for APIs.

Use the `apic products publish` command (equivalent to `apic products:publish`) to publish API Products to an API Connect cloud. The following example demonstrates how to create APIs composed by a Product, and publishing the Product and its APIs to a Catalog:

```
apic create:api --title Routes
apic create:api --title Ascents
apic create:product --title "Climb On" --apis "routes.yaml ascents.yaml"
apic config:set catalog=https://platform-api.myserver.com/api/catalogs/climbon/sandbox
apic login --username some-user --password some-password --server platform-api.myserver.com --realm provider/default-idp-2
apic products publish climb-on.yaml
```

For full details on how to log in to your management server from the CLI, see [Logging in to a management server](#).

Add the `--stage` option to `apic publish` to stage the Product into a Catalog instead of publishing it. Products in a Catalog can be in the following states: staged, published, deprecated, or retired. For example:

```
apic products publish --stage climb-on.yaml
```

You can use a *Space* to partition a Catalog so multiple teams can manage Products and APIs independently in a single Catalog. A Space is conceptually like a subcatalog, except that Products and APIs in all Spaces in a given Catalog are published to the same developer portal. For more information about Spaces, see [Using syndication in IBM API Connect](#).

If default configuration values have been set for the Space, Catalog, organization and management server, the following publish command could be used:

```
apic products publish --scope space product.yaml
```

where `product` is the name of the product that you want to publish.

Note: If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before the Product that contains the API is staged or published with the `apic publish` command. For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Managing API Products

Use the `apic products` and `apic apis` commands to manage Products and APIs that have been published to IBM® API Connect Catalogs. Use the `--scope space` option to manage Products and APIs that have been published to Spaces within Catalogs.

## Product management command summary

The following table summarizes the commands available for managing API Products. Usage examples follow.

Example command	Description
<code>apic config:set catalog=https://platform-api.myserver.com/api/catalogs/myorg/sandbox</code>	Set the default Catalog.
<code>apic login --username some-user --password some-password --server platform-api.myserver.com --realm provider/my-identity-provider</code>	Login into the management server. For full details on how to log in to your management server from the CLI, see <a href="#">Logging in to the management server</a> .
<code>apic create:api --title Routes --product "ClimbOn"</code>	Create the Product and API.
<code>apic products:publish climbon.yaml</code>	Publish the Product to the default catalog. Add <code>--stage</code> argument to stage the Product.
<code>apic products:list-all --scope catalog</code>	List the Products in the default catalog.
<code>apic products:get climbon:1.0.0 --output -</code>	Display the Product's properties. Omit the output argument to download to a file.
<code>apic apis:list-all --scope catalog</code>	List the APIs in the Catalog.
<code>apic apis:get routes:1.0.0 --output -</code>	Get the API properties. Omit the output argument to download to a file.
<code>apic products:replace climbon:1.0.0 mapfile.txt</code>	Replace the Product indicated on the command line with the staged or published Product designated in the mapfile. This retires the replaced Product.
<code>apic products:supersede climbon:1.0.0 mapfile.txt</code>	Supersede the Product indicated on the command line with the staged or published Product designated in the mapfile. This deprecates the superseded Product.
<code>apic products:delete climbon:1.0.0</code>	Delete the Product from the Catalog. The Product must be either retired or deprecated.

## Using the `products` and `apis` commands through a full lifecycle

This example shows a complex lifecycle where a new version of a Product and API replaces the original version at run time.

Note: If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before the Product that contains the API is staged or published with the `apic publish` command. For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

Set the default Catalog and login to the mgmthost.com API Connect cloud

```
apic config:set catalog=https://platform-api.myserver.com/api/catalogs/climbon/sandbox
apic login --username some-user --password some-password --server platform-api.myserver.com --realm my-identity-provider
```

For full details on how to log in to your management server from the CLI, see [Logging in to the management server](#).

Create and publish an initial version

```
apic create:api --title Routes --version 1.0.0 --filename routes100.yaml
apic create:product --title "Climb On" --version 1.0.0 --apis routes100.yaml --filename climbon100.yaml
apic products:publish climbon100.yaml
```

Create a new version to fix a bug in the API, stage it to the Catalog

```
apic create:api --title Routes --version 1.0.1 --filename routes101.yaml
apic create:product --title "Climb On" --version 1.0.1 --apis routes101.yaml --filename climbon101.yaml
apic products:publish --stage climbon101.yaml
```

Inspect the Catalog

```
apic products:list-all --scope catalog
```

This produces a list of all Products in the catalog. Copy the ID of the `climbon:1.0.1` Product. The ID resembles the following example.

```
https://server/api/catalogs/3eca6046-3c27-4ad/ab8772bf-0f65-45/products/8f854623-bda1-4f9
```

Create a mapping file

For example, if you are replacing a Product, the mapping file specifies the Product that you want to replace, and the mapping of the Plans from the source Product to the target Product. For example, if you are replacing `climbon:1.0.0` with `climbon:1.0.1` then `product_url` property specifies the URL of `climbon:1.0.0`. This file takes the following form:

```
product_url: https://server/api/catalogs/{id}/products/{id}
plans:
- source: {source_plan_name_1}
  target: {target_plan_name_1}
- source: {source_plan_name_2}
  target: {target_plan_name_2}
  .
  .
```

Note:

- The source and target Plan names can be the same or different.
- Every Plan in the Product you are replacing must be mapped to a Plan in the replacement Product.

"Hot-replace" version 1.0.0 with 1.0.1

```
apic products:replace climbon:1.0.1 PRODUCT_PLAN_MAPPING_FILE
```

After it is replaced in this way, a Product is retired. It is no longer active.

Note: The Product specified on the command line is the replacement Product. For example, if you are replacing `climbon:1.0.0` with `climbon:1.0.1` then the Product specified on the command line is `climbon:1.0.1`.

Supersede version 1.0.0 with 1.0.1

Rather than hot-replacing an existing Product with a new one (usually an updated version), you can supersede the existing Product with a new one. When you replace a Product, all external application subscriptions to that Product are automatically moved to the new Product. When you supersede a Product, the subscriptions are not automatically moved to the new Product, some action must be taken to subscribe external applications to the superseding Product. The command to supersede a Product uses the same mapping file as the command to replace a Product. The name of the superseding Product is given on the command line.

```
apic products:supersede climbon:1.0.1 PRODUCT_PLAN_MAPPING_FILE
```

Once superseded, a Product is marked deprecated, meaning that no further subscriptions to the Product are allowed, although it is still active and existing subscriptions still work.

Note: The Product specified on the command line is the superseding Product. For example, if you are replacing `climbon:1.0.0` with `climbon:1.0.1` then the Product specified on the command line is `climbon:1.0.1`. The mapping file specifies the URL of the Product you are superseding.

Set a migration target

It is possible to set a migration target for the existing Product. This helps migration.

Use a command like the following to set the migration target.

```
apic products:set-migration-target climbon:1.0.0 PRODUCT_PLAN_MAPPING_FILE
```

Note: The Product specified on the command line is the Product from which you want to migrate subscriptions. The mapping file specifies the target Product for the subscriptions.

Once a migration target is set, external application developers will be able to migrate their application subscriptions through the Developer Portal with ease. It is also possible to execute a subscription migration using the following command.

```
apic products:execute-migration-target climbon:1.0.0
```

Delete a Product

When the replaced or superseded Product is no longer needed, it can be deleted.

```
apic products:delete climbon:1.0.0
```

## Additional Product and API operations

In addition to the lifecycle management capabilities, you can download Products and APIs in a catalog or space using the `clone` sub-command:

Command	Description
<code>apic products:clone</code>	Download all Products and their APIs from the catalog or space.
<code>apic apis:clone</code>	Download all APIs from the catalog or space.

It can also be useful to clear all Products and their APIs from a Catalog, particularly for a development Catalog (you must provide the name of the Catalog as the value of the `--confirm` parameter):

```
apic products:clear --confirm catalog_name
```

where `catalog_name` is the name of the Catalog.

You can use a *Space* to partition a Catalog so multiple teams can manage Products and APIs independently in a single Catalog. A Space is conceptually like a subcatalog, except that Products and APIs in all Spaces in a given Catalog are published to the same developer portal. For more information about Spaces, see [Using syndication in IBM API Connect](#).

To manage the Products and APIs that have been published to a Space, include the `--scope space` option with the `apic products` and `apic apis` commands. For example, to list the Products that are contained in a Space called `flights`, use the following command:

```
apic products --scope space --space flights --catalog production --org climbonorg --server platform-api.myserver.com
```

## Changing the lifecycle state of a Product in a Catalog or Space

To directly change the lifecycle state of a Product that has previously been staged or published to a Catalog or Space, complete the following steps:

- Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic products:update product_name:version --server mgmt_endpoint_url --org organization --scope scope --catalog catalog [-space space] -
```

where:

- `product_name` is the name of the Product whose lifecycle state you want to change.
- `version` is the version of that Product.
- `mgmt_endpoint_url` is the platform API endpoint URL.
- `organization` is the name of the provider organization in which the Product was previously staged or published.
- `scope` has one of the following values:
  - `catalog` if the Catalog does not have Spaces enabled.
  - `space` if the Catalog has Spaces enabled. If you specify `space` for the `--scope` parameter you must also supply the `--space` parameter.
- `catalog` is the name of the Catalog in which the Product was previously staged or published.
- (optional) `space` is the name of the Space. The `--space` parameter is required if the Catalog has Spaces enabled, in which case you must also include `--scope space` in the command.

The command returns:

Reading PRODUCT\_FILE arg from stdin

- Enter the following data, followed by a new line:

```
state: new_state
```

where *new\_state* is the state that you want to change the Product to, and must have one of the following values.

- staged
  - published
  - deprecated
  - retired
  - archived
- Press **CTRL D** to terminate the input. If the command is successful, the lifecycle state change is confirmed.  
For example:

```
apic products:update finance:1.0.0 --server https://myserver.com --org development --scope catalog --catalog sandbox -
Reading PRODUCT_FILE arg from stdin
state: published
finance:1.0.0 [state: published] https://myserver.com/api/catalogs/dce12994-a6a1-487b-83b6-c73bd8498799/006827d5-
9e82-427a-abe6-be5b126210f7/products/0f0af980-f505-4f36-b09c-d7b1c9c1a2f2
```

Note:

The command will not succeed if the lifecycle state change you are attempting is not permitted.

For example, the following lifecycle state changes are permitted:

- staged to published
- deprecated to retired

The following lifecycle state changes are not permitted:

- published to staged
- retired to published

For full details, see [The Product lifecycle](#).

To list all Products in a Catalog or Space, together with their lifecycle states, use the following command:

```
apic products:list-all --server mgmt_endpoint_url --org organization --scope scope --catalog catalog [--space space]
```

For example:

```
apic products:list-all --server https://myserver.com --org development --scope catalog --catalog sandbox
graphql-services:1.0.0 [state: staged] https://myserver.com/api/catalogs/dce12994-a6a1-487b-83b6-c73bd8498799/006827d5-
9e82-427a-abe6-be5b126210f7/products/7652d568-b396-4bfa-bf71-2f18cea63737
finance:1.0.0 [state: published] https://myserver.com/api/catalogs/dce12994-a6a1-487b-83b6-c73bd8498799/006827d5-
9e82-427a-abe6-be5b126210f7/products/0f0af980-f505-4f36-b09c-d7b1c9c1a2f2
```

To find out the lifecycle state of a specific Product, use the following command:

```
apic products:get product_name:version --server mgmt_endpoint_url --org organization --scope scope --catalog catalog [--space
space] --fields state --output -
```

For example:

```
apic products:get finance:1.0.0 --server https://myserver.com --org development --scope catalog --catalog sandbox --fields
state --output -
state: published
```

## Example scripts

A set of example toolkit scripts that demonstrate how to create and manage organizations, users, apps, Products and APIs are available at <https://github.com/ibm-apiconnect/example-toolkit-scripts>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Working with Drafts

Co-locate your APIs and applications in your local source code control systems to support typical development activities such as commits, branching, merges, continuous integration, and so on. The developer toolkit provides the bridge from the developer's environment to the IBM® API Connect runtime services.

API Connect provides an online development capability called *Drafts* where you can define API and Product definitions. The `apic drafts` commands enable synchronization of Product and API artifacts between local source code control systems and drafts.

You can use `drafts` to clear and list your drafts. For example:

```
apic config:set catalog=https://platform-api.myserver.com/api/catalogs/climbon/sandbox # set the default Catalog
apic login --username some-user --password some-password --server platform-api.myserver.com --realm provider/myldap # login
into the management server

apic create:api --title routes --product ClimbOn
apic drafts # list what is in drafts
```

```
apic drafts:clear --confirm drafts          # clear drafts collection
apic drafts:list                          # list the available drafts
```

For full details on how to log in to your management server from the CLI, see [Logging in to the management server](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Reading input from the command line

If a developer toolkit command takes a file as an input parameter, you can direct the command to read the input directly from the command line rather than supplying a separate file; this can be useful when writing scripts to automate command line operations, for example.

---

## Reading input from a file

Many developer toolkit commands that create or update new objects in API Connect take a file as an input parameter. For example:

- Register a new gateway service:

```
apic gateway-services:create [flags] GATEWAY_SERVICE_FILE
```
- Update a provider organization:

```
apic orgs:update [flags] ORG_FILE
```
- Create a new Catalog:

```
apic catalogs:create [flags] CATALOG_FILE
```
- Create a new consumer organization:

```
apic consumer-orgs:create [flags] CONSUMER_ORG_FILE
```
- Register a new developer application:

```
apic apps:create [flags] APP_FILE
```
- Create a new email server:

```
apic mail-servers:create [flags] MAIL_SERVER_FILE
```
- Update the list of applications that subscribe to a Product:

```
apic subscriptions:update [flags] SUBSCRIPTION_FILE
```

You can format the input file as a YAML file (the default) or as a JSON file. To use a JSON file as input, include the `--format json` parameter.

---

## Reading input from the command line

As an alternative to supplying an explicit file name to the command, you can supply a hyphen (-) in place of the file name parameter; the command will then read the file content directly from the command line as shown in the following examples.

- Register a new DataPower® Gateway (v5 compatible) gateway service:

```
apic gateway-services:create --server platform-api.myserver.com --org admin --availability-zone availability-zone-default -
Reading GATEWAY_SERVICE_FILE arg from stdin
name: dpgw-service
title: DataPower gateway service, compatible with v5
gateway_service_type: datapower-gateway
endpoint: 'https://mygwhost.com:3000'
api_endpoint_base: 'https://mygwhost.com:9443'
sni:
  - host: '*'
    tls_server_profile_url: https://platform-api.myserver.com/api/orgs/75203636-f038-4287-a732-24af4bf7059d/tls-server-
profiles/3c0a0e93-6aa4-4288-b09c-eccf4901b104
visibility:
  type: public
```

Note: You can obtain the `tls_server_profile_url` property value for a TLS server profile by using the following command, which lists the URLs for all TLS server profiles:

```
apic tls-server-profiles --org organization_name --server mgmt_endpoint_url
```

- Create a new provider organization:

```
apic orgs:create --server platform-api.myserver.com -
Reading ORG_FILE arg from stdin
name: development
title: Development organization
owner_url: https://platform-api.myserver.com/api/user-registries/1bbbd414-22f1-47cf-8eac-2050530d29a7/c082d755-866e-4394-
959f-fbb264c6c3a1/users/2db491c7-2d0f-4f60-a8ae-f38d07481f21
```

Note: You can obtain the `owner_url` property value by using the following command, which returns the `url` property for a specific user:

```
apic users:get username --user-registry user_registry_name --server mgmt_endpoint_url --org organization_name --fields url
--output -
```

- Create a new Catalog:

```
apic catalogs:create --server platform-api.myserver.com --org myorg -
Reading CATALOG_FILE arg from stdin
name: production
title: Production Catalog
summary: Catalog containing APIs in production use
```

- Create a new consumer organization:

```
apic consumer-orgs:create --server platform-api.myserver.com --catalog sandbox --org myorg -
Reading CONSUMER_ORG_FILE arg from stdin
name: finance-apps
title: Developers of finance applications
owner_url: https://platform-api.myserver.com/api/user-registries/a1fb8159-fda1-410f-93ab-a0ea5fd04535/70ce7ec3-e83f-4c87-
9f3c-4662ad108bbc/users/fddd5df5-c178-4a34-ab92-0a48344d5c9b
```

Note: You can obtain the `owner_url` property value by using the following command, which returns the `url` property for a specific user:

```
apic users:get username --user-registry user_registry_name --server mgmt_endpoint_url --org organization_name --fields url
--output -
```

- Register a new developer application:

```
apic apps:create --server consumer-api.myserver.com --org my-consumer-org --mode consumer -
Reading APP_FILE arg from stdin
name: finance
title: Finance application
summary: Mobile app for personal finance management
```

- Create a new email server:

```
apic mail-servers:create --org admin --server platform-api.myserver.com -
Reading MAIL_SERVER_FILE arg from stdin
title: My email server
name: my-email-server
host: smtp.myemail.com
port: 20
credentials:
  username: me@myemail.com
  password: password
```

- Create a new subscription to subscribe an application to a Product:

```
apic subscriptions:create --app myapp --catalog sandbox --org myorg --server platform-api.myserver.com --consumer-org my-
consumer-org -
Reading SUBSCRIPTION_FILE arg from stdin
product_url: https://platform-api.myserver.com/api/catalogs/960733c1-d7f7-4b90-9bc7-69dbf4ce31/ca34537d-adf4-4320-8495-
a7feaa62d679/products/638015c6-a8b0-452e-841f-2ac441ab6962
plan: default-plan
```

Note: You can obtain the `product_url` property value for a Product by using the following command, which lists the URLs for all versions of a Product given the Product name:

```
apic products:list product_name --scope catalog --catalog catalog_name --org provider_org_name --server mgmt_endpoint_url
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Scripting with the toolkit commands

The IBM® API Connect developer toolkit provides commands for cloud administration and API development and management.

## Scripting commands

---

It's often helpful to automate a series of `apic` commands in a shell script. Since the `apic` tool first requires you to interactively accept the license, you must first use the following command:

```
apic --accept-license
```

Once you do that, your scripts can run non-interactively.

Toolkit command scripts allow you to automate many of the tasks required to set up and maintain your API products. A set of example scripts are available at <https://github.com/ibm-apiconnect/example-toolkit-scripts>.

These scripts demonstrate how to perform the following tasks.

- Create a Provider Organization
- Configure a catalog to use one or more gateways
- Create draft APIs and Products
- Publish Products
- Replace an existing published product with a new version
- Delete a product
- Create a Consumer Organization
- Create a new consumer app
- Subscribe the new app to an existing published product
- Stage a new product version
- Supersede the existing published product with the new one
- Migrate existing subscriptions from the old product to the new product

## Related information

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Working with OpenAPI extensions

Use the developer toolkit CLI **extensions** commands to manage OpenAPI extensions in your Catalogs or Spaces.

You can extend the OpenAPI specification by adding either a JSON or YAML extension schema to an API, depending on the version of IBM® API Connect you are using. An extension is imported into a Catalog, or as Space ion a Catalog, then added to the API schema.

The commands described here are for importing OpenAPI extensions into a Catalog or Space, and viewing and managing them. After you have imported an OpenAPI extension, you can reference it in your API definitions; for details, see [Referring to an extension in an API definition](#).

Note: If Spaces are enabled in a Catalog, an OpenAPI extension that you import into one Space is imported into **all** Spaces; you cannot import an OpenAPI extension into an individual Space in the Catalog. Any subsequent updates are also applied to all Spaces.

Command name	Action	Syntax
--------------	--------	--------

Command name	Action	Syntax
<b>extensions clear</b>	<p>The <b>extensions:clear</b> command deletes all versions of an extension given the extension name.</p> <p>The parameters are as follows:</p> <p>--scope Specifies whether you want to clear the extensions in a Catalog or Space. The following options are available:</p> <p><b>catalog</b> The command is to be applied to Catalog</p> <p><b>space</b> The command is to be applied to a Space in a Catalog. When Spaces are enabled in a Catalog, you must set the scope to <b>space</b> and supply the <b>--space</b> parameter.</p> <p>--catalog or -c &lt;catalog_name&gt; Specifies a single Catalog with the Catalog name.</p> <p>--space Specifies the name of a Space in a Catalog. The <b>--space</b> parameter is required if the Catalog has Spaces enabled, in which case you must also include <b>--scope space</b> in the command.</p> <p>--configured-gateway-service &lt;service_name&gt; Specifies the name of the gateway service.</p> <p>--confirm &lt;catalog_name&gt; Confirms the clear of the extension.</p> <p>&lt;extension_name&gt; Specifies the name of the existing extension. Note: This is the extension name, not the file name.</p> <p>--org or -o &lt;organization_name&gt; Specifies a single organization with the organization name.</p> <p>--server or -s &lt;management_server_endpoint&gt; Specifies the server endpoint.</p>	<pre>apic extensions:clear --scope catalog space --catalog   -c catalog_name extension_name --server   -s management_server_endpoint --configured-gateway-service gw_service_name --confirm catalog_name --org   -o org_name [--space space]</pre> <p>Example:</p> <pre>apic extensions:clear --scope catalog --catalog catalog1 extension1 --server endpoint1 --configured-gateway-service gw_service1 --confirm catalog1 --org my_org</pre> <p>This example deletes all versions of the <b>extension1</b> extension that are in <b>catalog1</b> of the <b>my_org</b> organization, and are paired with <b>endpoint1</b>.</p>
<b>extensions clear-all</b>	<p>The <b>extensions:clear-all</b> command deletes all of the extensions in the specified Catalog or Space.</p> <p>The parameters are as follows:</p> <p>--scope Specifies whether you want to clear the extensions in a Catalog or Space. The following options are available:</p> <p><b>catalog</b> The command is to be applied to Catalog</p> <p><b>space</b> The command is to be applied to a Space in a Catalog. When Spaces are enabled in a Catalog, you must set the scope to <b>space</b> and supply the <b>--space</b> parameter.</p> <p>--catalog or -c &lt;catalog_name&gt; Specifies a single Catalog with the Catalog name.</p> <p>--space Specifies the name of a Space in a Catalog. The <b>--space</b> parameter is required if the Catalog has Spaces enabled, in which case you must also include <b>--scope space</b> in the command.</p> <p>--configured-gateway-service &lt;service_name&gt; Specifies the name of the gateway service.</p> <p>--confirm &lt;catalog_name&gt; Confirms the clear of the extension.</p> <p>--org or -o &lt;organization_name&gt; Specifies a single organization with the organization name.</p> <p>--server or -s &lt;management_server_endpoint&gt; Specifies the server endpoint.</p>	<pre>apic extensions:clear-all --scope catalog space --catalog   -c catalog_name --server   -s mgt_server_endpoint --configured-gateway-service gw_service_name --confirm catalog_name --org   -o org_name [--space space]</pre> <p>Example:</p> <pre>apic extensions:clear-all --scope catalog --catalog catalog1 --server endpoint1 --configured-gateway-service gw_service1 --confirm catalog1 --org my_org</pre> <p>This example deletes all the extensions that are in <b>catalog1</b> of the <b>my_org</b> organization, and are paired with <b>endpoint1</b>.</p>

Command name	Action	Syntax
<b>extensions clone</b>	<p>The <b>extensions:clone</b> command creates a local definition file for each extension.</p> <p>The parameters are as follows:</p> <p>--scope Specifies whether you want to clone the extensions in a Catalog or Space. The following options are available:</p> <p><b>catalog</b> The command is to be applied to Catalog</p> <p><b>org</b> Sets the scope to the organization.</p> <p><b>space</b> The command is to be applied to a Space in a Catalog. When Spaces are enabled in a Catalog, you must set the scope to <b>space</b> and supply the <b>--space</b> parameter.</p> <p>--catalog or -c &lt;catalog_name&gt; Specifies a single Catalog with the Catalog name.</p> <p>--space Specifies the name of a Space in a Catalog. The <b>--space</b> parameter is required if the Catalog has Spaces enabled, in which case you must also include <b>--scope space</b> in the command.</p> <p>--org or -o &lt;organization_name&gt; Specifies a single organization with the organization name.</p> <p>--server or -s &lt;management_server_endpoint&gt; Specifies the server endpoint.</p> <p>--configured-gateway-service &lt;service_name&gt; Specifies the name of the gateway service.</p>	<pre>apic extensions:clone --scope catalog space --catalog   -c catalog_name --org   -o org_name [--space space] --server   -s mgt_server_endpoint --configured-gateway-service gw_service_name</pre> <p>Example:</p> <pre>apic extensions:clone --scope catalog --catalog catalog1 --org my_org --server endpoint1 --configured-gateway-service gw_service_1</pre> <p>This example clones the extensions that are in <b>catalog1</b> of the <b>my_org</b> organization, and are paired with <b>endpoint1</b>.</p>
<b>extensions create</b>	<p>The <b>extensions:create</b> command creates an extension in a Catalog or Space, given an extension definition file.</p> <p>The parameters are as follows:</p> <p>--scope Specifies whether you want to clear the extensions in a Catalog or Space. The following options are available:</p> <p><b>catalog</b> The command is to be applied to Catalog</p> <p><b>space</b> The command is to be applied to a Space in a Catalog. When Spaces are enabled in a Catalog, you must set the scope to <b>space</b> and supply the <b>--space</b> parameter.</p> <p>&lt;extension_file&gt; Specifies the name of the extension file that contains the new information for your extension. Note: This is the OpenAPI file name, not the name of the extension.</p> <p>--server or -s &lt;management_server_endpoint&gt; Specifies the server endpoint.</p> <p>--catalog or -c &lt;catalog_name&gt; Specifies a single Catalog with the Catalog name.</p> <p>--space Specifies the name of a Space in a Catalog. The <b>--space</b> parameter is required if the Catalog has Spaces enabled, in which case you must also include <b>--scope space</b> in the command.</p> <p>--org or -o &lt;organization_name&gt; Specifies a single organization with the organization name.</p> <p>--configured-gateway-service &lt;service_name&gt; Specifies the name of the gateway service.</p>	<pre>apic extensions:create --scope catalog space extension_file --server   -s mgt_server_endpoint --catalog   -c catalog_name [--space space] --org   -o org_name --configured-gateway-service gw_service_name</pre> <p>Example:</p> <pre>apic extensions:create --scope catalog filename.yaml --server endpoint1 --catalog catalog1 --org my_org --configured-gateway-service gw_service_1</pre> <p>This example creates an extension in <b>catalog1</b> of the <b>my_org</b> organization, paired with <b>endpoint1</b>, using the <b>filename.yaml</b> OpenAPI extension definition file.</p>

Command name	Action	Syntax
<b>extensions delete</b>	<p>The <b>extensions:delete</b> command deletes a specific version of an extension.</p> <p>The parameters are as follows:</p> <p><b>--scope</b> Specifies whether you want to clear the extensions in a Catalog or Space. The following options are available:</p> <p><b>catalog</b> The command is to be applied to Catalog</p> <p><b>space</b> The command is to be applied to a Space in a Catalog. When Spaces are enabled in a Catalog, you must set the scope to <b>space</b> and supply the <b>--space</b> parameter.</p> <p><b>--server</b> or <b>-s</b> &lt;management_server_endpoint&gt; Specifies the server endpoint.</p> <p><b>--catalog</b> or <b>-c</b> &lt;catalog_name&gt; Specifies a single Catalog with the Catalog name.</p> <p><b>--space</b> Specifies the name of a Space in a Catalog. The <b>--space</b> parameter is required if the Catalog has Spaces enabled, in which case you must also include <b>--scope space</b> in the command.</p> <p>&lt;extension_name&gt;:&lt;version_number&gt; Specifies the name and version number of the extension. Note: <i>extension_name</i> is the extension name, not the file name.</p> <p><b>--org</b> or <b>-o</b> &lt;organization_name&gt; Specifies a single organization with the organization name.</p> <p><b>--configured-gateway-service</b> &lt;service_name&gt; Specifies the name of the gateway service.</p>	<pre> <b>apic extensions:delete --scope</b> catalog space <b>extension_name:version_number</b> <b>--catalog</b>   <b>-c</b> catalog_name <b>--org</b>   <b>-o</b> org_name [<b>--space</b> space] <b>--server</b>   <b>-s</b> mgt_server_endpoint <b>--configured-gateway-service</b> gw_service_name </pre> <p>Example:</p> <pre> <b>apic extensions:delete --scope</b> catalog <b>myextension:1.0.0</b> <b>--catalog</b> catalog1 <b>--org</b> orgmain <b>--server</b> endpoint1 <b>--configured-gateway-service</b> gw_service_1 </pre> <p>This example deletes <b>myextension</b> version 1.0.0 that is in <b>catalog1</b> of the <b>orgmain</b> organization, and is paired with <b>endpoint1</b>.</p>
<b>extensions get</b>	<p>The <b>extensions:get</b> command retrieves the definition file for a specific version of an extension.</p> <p>The parameters are as follows:</p> <p><b>--scope</b> Specifies whether you want to clone the extensions in a Catalog or Space. The following options are available:</p> <p><b>catalog</b> The command is to be applied to Catalog</p> <p><b>org</b> Sets the scope to the organization.</p> <p><b>space</b> The command is to be applied to a Space in a Catalog. When Spaces are enabled in a Catalog, you must set the scope to <b>space</b> and supply the <b>--space</b> parameter.</p> <p><b>--server</b> or <b>-s</b> &lt;management_server_endpoint&gt; Specifies the server endpoint.</p> <p><b>--catalog</b> or <b>-c</b> &lt;catalog_name&gt; Specifies a single Catalog with the Catalog name.</p> <p><b>--space</b> Specifies the name of a Space in a Catalog. The <b>--space</b> parameter is required if the Catalog has Spaces enabled, in which case you must also include <b>--scope space</b> in the command.</p> <p>&lt;extension_name&gt;:&lt;version_number&gt; Specifies the name and version number of the extension. Note: <i>extension_name</i> is the extension name, not the file name.</p> <p><b>--org</b> or <b>-o</b> &lt;organization_name&gt; Specifies a single organization with the organization name.</p> <p><b>--configured-gateway-service</b> &lt;service_name&gt; Specifies the name of the gateway service.</p>	<pre> <b>apic extensions:get --scope</b> catalog space <b>extension_name:version_number</b> <b>--catalog</b>   <b>-c</b> catalog_name <b>--org</b>   <b>-o</b> org_name [<b>--space</b> space] <b>--server</b>   <b>-s</b> mgt_server_endpoint <b>--configured-gateway-service</b> gw_service_name </pre> <p>Example:</p> <pre> <b>apic extensions:get --scope</b> catalog <b>myextension:1.0.0</b> <b>--catalog</b> catalog1 <b>--org</b> orgmain <b>--server</b> endpoint1 <b>--configured-gateway-service</b> gw_service_1 </pre> <p>This example gets <b>myextension</b> version 1.0.0 that is in <b>catalog1</b> of the <b>orgmain</b> organization, and is paired with <b>endpoint1</b>.</p>

Command name	Action	Syntax
<b>extensions list</b>	<p>The <b>extensions:list</b> command lists all versions of an extension given the extension name.</p> <p>The parameters are as follows:</p> <p>--scope Specifies whether you want to clone the extensions in a Catalog or Space. The following options are available:</p> <p><b>catalog</b> The command is to be applied to Catalog</p> <p><b>org</b> Sets the scope to the organization.</p> <p><b>space</b> The command is to be applied to a Space in a Catalog. When Spaces are enabled in a Catalog, you must set the scope to <b>space</b> and supply the <b>--space</b> parameter.</p> <p>--server or -s &lt;management_server_endpoint&gt; Specifies the server endpoint.</p> <p>--catalog or -c &lt;catalog_name&gt; Specifies a single Catalog with the Catalog name.</p> <p>--space Specifies the name of a Space in a Catalog. The <b>--space</b> parameter is required if the Catalog has Spaces enabled, in which case you must also include <b>--scope space</b> in the command.</p> <p>&lt;extension_name&gt; Specifies the name of the existing extension. Note: This is the extension name, not the file name.</p> <p>--org or -o &lt;organization_name&gt; Specifies a single organization with the organization name.</p> <p>--configured-gateway-service &lt;service_name&gt; Specifies the name of the gateway service.</p>	<pre>apic extensions:list --scope catalog space extension_name --catalog   -c catalog_name --org   -o org_name [--space space] --server   -s mgt_server_endpoint --configured-gateway-service gw_service_name</pre> <p>Example:</p> <pre>apic extensions:list --scope catalog my_extension --catalog catalog1 --org my_org --server endpoint1 --configured-gateway-service gw_service_1</pre> <p>This example lists all versions of the extension <b>my_extension</b> that are paired with <b>endpoint1</b>, are in <b>catalog1</b>, and in the <b>my_org</b> organization.</p>
<b>extensions list-all</b>	<p>The <b>extensions:list-all</b> command lists all of the extensions that are available in a Catalog or Space. This is the default command if you enter only <b>apic extensions</b>.</p> <p>The parameters are as follows:</p> <p>--scope Specifies whether you want to clone the extensions in a Catalog or Space. The following options are available:</p> <p><b>catalog</b> The command is to be applied to Catalog</p> <p><b>org</b> Sets the scope to the organization.</p> <p><b>space</b> The command is to be applied to a Space in a Catalog. When Spaces are enabled in a Catalog, you must set the scope to <b>space</b> and supply the <b>--space</b> parameter.</p> <p>--server or -s &lt;management_server_endpoint&gt; Specifies the server endpoint.</p> <p>--catalog or -c &lt;catalog_name&gt; Specifies a single Catalog with the Catalog name.</p> <p>--space Specifies the name of a Space in a Catalog. The <b>--space</b> parameter is required if the Catalog has Spaces enabled, in which case you must also include <b>--scope space</b> in the command.</p> <p>--org or -o &lt;organization_name&gt; Specifies a single organization with the organization name.</p> <p>--configured-gateway-service &lt;service_name&gt; Specifies the name of the gateway service.</p>	<pre>apic extensions:list-all --scope catalog space --catalog   -c catalog_name --org   -o org_name [--space space] --server   -s mgt_server_endpoint --configured-gateway-service gw_service_name</pre> <p>Example:</p> <pre>apic extensions:list-all --scope catalog --catalog catalog1 --org my_org --server endpoint1 --configured-gateway-service gw_service1</pre> <p>This example lists the extensions that are paired with <b>endpoint1</b>, are in <b>catalog1</b>, and in the <b>my_org</b> organization.</p>

Command name	Action	Syntax
<b>extensions update</b>	<p>The <b>extensions:update</b> command replaces the information of an existing version of an extension with the information in an external file.</p> <p>The parameters are as follows:</p> <p>--scope Specifies whether you want to clear the extensions in a Catalog or Space. The following options are available:</p> <p><b>catalog</b> The command is to be applied to Catalog</p> <p><b>space</b> The command is to be applied to a Space in a Catalog. When Spaces are enabled in a Catalog, you must set the scope to <b>space</b> and supply the <b>--space</b> parameter.</p> <p>--server or -s &lt;management_server_endpoint&gt; Specifies the server endpoint.</p> <p>--catalog or -c &lt;catalog_name&gt; Specifies a single Catalog with the Catalog name.</p> <p>--space Specifies the name of a Space in a Catalog. The <b>--space</b> parameter is required if the Catalog has Spaces enabled, in which case you must also include <b>--scope space</b> in the command.</p> <p>--org or -o &lt;organization_name&gt; Specifies a single organization with the organization name.</p> <p>--configured-gateway-service &lt;service_name&gt; Specifies the name of the gateway service.</p> <p>&lt;extension_name&gt;:&lt;version_number&gt; Specifies the name and version number of the extension. Note: <i>extension_name</i> is the extension name, not the file name.</p> <p>&lt;extension_file&gt; Specifies the name of the extension file that contains the new information for your extension. Note: This is the OpenAPI file name, not the name of the extension.</p>	<pre>apic extensions:update --scope catalog space extension_name:version_number extension_file --catalog   -c catalog_name --org   -o org_name [--space space] --server   -s mgt_server_endpoint --configured-gateway-service gw_service_name</pre> <p>Example:</p> <pre>apic extensions:update --scope catalog extension1:1.0.0 extension2.yaml --catalog catalog1 --org my_org --server endpoint1 --configured-gateway-service gw_service1</pre> <p>This example updates <b>extension1</b> version 1.0.0 that is paired with <b>endpoint1</b>, in <b>catalog1</b>, and in the <b>my_org</b> organization, from the file <b>extension2.yaml</b>.</p>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Searching for items in API Manager

Use the search feature in IBM® API Connect API Manager to easily locate items such as APIs, Catalogs, Spaces, applications, and subscriptions.

Search is available from any page in API Manager and can be accessed by typing in the search field in the page banner, or by clicking  Search in the navigation list.

## Using Search

The Search feature is available on all pages of the API Manager. To start searching, just type a string into the Search field and press Enter. Whenever you press Enter in the Search field, the Search page displays with results and additional options. If you press Enter in an empty Search field, or click  Search in the navigation list, then the Search page displays a list all items. If you type a string before pressing Enter, the page displays the results from the corresponding search.

Search results include all items that contain the search string in a text field. For example, suppose you searched for "Crafted". The results might look like the following image, with items that don't match the search string exactly, but do include the string in a text field such as a title or a name.

By default, the search returns all types of items that contain the string. Sort results on a particular column by clicking the column header.

When you find an item you want to work with, click the . . . actions menu next to the item's "Modified" date to see what you can do. The list of possible actions depends on the item's type.

You can limit the search results by selecting an item type from the list that displays before the results. Click More to view additional types. If you select a type from the More menu, it replaces a type in the list.

If you want to refine the search further, click Options. On the Options panel, click Catalogs to Search and select which catalogs to search (the default is all catalogs). You can select up to 5 catalogs for a limited search.

You can also choose whether only exact matches (the complete string) are included in results, or items containing similar strings are also included.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Working with API definitions

An API definition specifies the complete configuration for an API. You can create and configure your APIs either by using either the API Designer UI application, or by using the browser based API Manager UI.

If you are working with APIs that conform to the OpenAPI Specification, note that API Connect uses the following terms:

- **OpenAPI Specification:**  
The OpenAPI Specification defines a standard, language-agnostic interface to RESTful APIs. API Connect supports version 2 and version 3 of the OpenAPI Specification.
- **OpenAPI document:**  
One or more files that describe an API conforming to the OpenAPI Specification.
- **OpenAPI definition:**  
The description of an API that conforms to the OpenAPI Specification. In API Connect, you can create the API definition by filling in settings and properties, or by importing an OpenAPI document that contains an API definition that you want to work with.

The following topics provide full details for creating and configuring your APIs.

- **[Creating an API definition](#)**  
You can create API definitions by using the API Manager or the command line interface in IBM® API Connect.
- **[Editing an OpenAPI 2.0 API definition](#)**  
IBM API Connect provides a form based editor that enables you to configure APIs that conform to the OpenAPI 2.0 specification.
- **[Editing an OpenAPI 3.0 API definition](#)**  
IBM API Connect provides a form based editor that enables you to configure APIs that conform to the OpenAPI 3.0 specification.
- **[LDAP authentication](#)**  
The Lightweight Directory Access Protocol (LDAP) is an internet protocol for accessing and maintaining distributed directory information services over a network. If you rely on LDAP to authenticate users for web applications, take a minute to review the contents of this topic before beginning.
- **[Authentication URL user registry](#)**  
You can use an Authentication URL user registry to specify a REST authentication service to manage user authentication, and to optionally provide additional metadata to be embedded in the token.
- **[Activating an API](#)**  
After you have created an API definition you can activate it to make it available for testing.
- **[Testing an API](#)**  
Select a test tool and verify that your API works as you intended.
- **[Staging an API](#)**  
The graphical wizard provides an option that adds the API to a Product and stages the Product in a Catalog. When a Product is in the staged state, it is not yet visible to, or subscribable by, any developers. The syndication feature in IBM API Connect means that if Spaces are enabled for a Catalog, Products can be staged only to a Space within that Catalog.
- **[Publishing an API](#)**  
The user interface provides an option that adds an API to a Product and publishes the Product in a Catalog. Publishing a draft Product makes the APIs in that Product visible on the Developer Portal for use by application developers. The syndication feature in IBM API Connect means that if Spaces are enabled for a Catalog, Products can be published only to a Space within that Catalog.
- **[Creating a new version of an API definition](#)**  
You can create multiple versions of an API definition and edit the versions independently by using IBM API Connect.
- **[Updating an API definition from a file](#)**  
You can update an API by uploading a .yaml or .json file that contains the OpenAPI definition for the revised API.
- **[Updating a SOAP API](#)**  
You can update the configuration of an existing SOAP API either by uploading a WSDL file, or by uploading a .zip archive that contains a primary WSDL file together with other WSDL or XSD files that it references.
- **[Renaming an API definition](#)**  
By renaming an API definition, you change the **name** property that, together with the version, is used to uniquely identify the API definition in API Connect. The **name** property is initially generated automatically when you first create the API definition, based on the title, but you can later change it if desired.
- **[Changing an API rate limit](#)**  
When you activate an API to make it available for testing, as described in [Activating an API](#), no rate limit is applied to restrict calls to the API. However, if desired, you can apply a rate limit to the API, or modify a previously applied rate limit. The rate limit defines the maximum number of calls allowed in a specified time period.
- **[Adding an OpenAPI extension to an API](#)**  
You can extend the OpenAPI specification by adding either a JSON or YAML extension schema to an API. An OpenAPI extension is imported into a Catalog, or to a Space within a Catalog, and then added to the API schema.
- **[Downloading an API definition](#)**  
You can download the details of your API definitions so that you can store them for later recovery.
- **[Deleting an API definition](#)**  
You can delete an API definition that is no longer required.
- **[Using an options file when importing a WSDL service](#)**  
When you create an API definition, or add a target WSDL service to an API definition, by importing a .zip file, you can specify additional directives by including an options file in the .zip file.
- **[Variable references in API Connect](#)**  
In API Connect you can reference different variables in your API definition.
- **[API properties](#)**  
Properties are used by the gateway to control behavior of certain policies. Typically, you provide properties, but the policy can also provide properties settings.
- **[API policies and logic constructs](#)**  
Policies and logic constructs are pieces of configuration that control a specific aspect of processing in the Gateway server during the handling of an API invocation at run time.
- **[Tags in API Connect](#)**  
There are a number of forms of tagging in IBM API Connect.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating an API definition

You can create API definitions by using the API Manager or the command line interface in IBM® API Connect.

### Before you begin

---

An API is a set of functions that provide some business or technical capability and can be called by applications by using a defined protocol. Applications are typically mobile or web applications, and they use the HTTP protocol. An API definition is composed of paths, and can be one of the following types:

#### REST API definition

A REST API is a defined set of interactions that uses the HTTP protocol, typically by using JSON or XML as the data format that is exchanged. For example, a data request might use an HTTP GET method, and a data record might use an HTTP POST method. The choice of data format depends on the type of application that is calling the API. JSON is commonly used for web pages or mobile applications that present a user interface (by using JavaScript or HTML), whereas XML is often used for machine-to-machine scenarios.

You can create REST APIs by using LoopBack® functions to create models and data sources. These are then used by your REST API definition and exposed to your users.

Alternatively, you can expose and secure your existing APIs by using a [Proxy](#) or [Invoke](#) policy.

In either case, you can configure your API definition either by using the API Manager, or by writing an OpenAPI definition file and publishing it using either API Manager or the command line interface.

#### SOAP API

You can create SOAP API definitions that are based on an existing Web Services Description Language (WSDL) file. You can use this facility to benefit from the capabilities that are provided by API Connect, which include analytics and mapping between variables. You can also expose the API by using the Developer Portal for any existing SOAP services in your organization, including any SOAP services that are part of a service-oriented architecture (SOA) or Enterprise Service Bus (ESB) infrastructure.

You can create SOAP API definitions through either the command line interface, or through API Manager.

---

## About this task

You can create definitions for REST APIs or SOAP APIs.

- In the API Manager, you can add a REST API definition either by composing the API definition, and its operations, from scratch, or by importing an OpenAPI definition file. You can also use the tooling to quickly create a proxy API that calls an existing endpoint.
- If you have an existing SOAP service that you want to expose more widely, you can add a SOAP API to IBM® API Connect. You can use the Developer Portal to publicize the SOAP service to the developers. If a developer wants to use the SOAP API, you can use API Connect to manage their sign-up and access to the service, and track the usage of that API.

---

## Procedure

1. Quickly create an API definition by using one of the following wizards:

- [Creating a REST proxy API from a target service](#)
- [Creating a REST proxy API from an existing OpenAPI service](#)
- [Creating a new REST OpenAPI definition](#)
- [Creating a REST proxy API from an existing WSDL service](#)
- [Adding a REST API by importing an OpenAPI definition file](#)
- [Creating a SOAP proxy API from an existing WSDL service](#)

2. After you create your API definition, you can define it in more detail by following the instructions in [Editing an OpenAPI 2.0 API definition](#).

- [Creating a REST proxy API from a target service](#)

If you have an existing REST service that you want to expose through an IBM API Connect API definition, you can create a proxy API and specify the target endpoint by using the API Manager.

- [Creating a REST proxy API from an existing OpenAPI service](#)

If you have an existing OpenAPI described target service that you want to expose through an IBM API Connect API definition, you can create a proxy API and specify the target endpoint.

- [Creating a REST proxy API from an existing WSDL service](#)

If you have a SOAP service defined in a WSDL file, you can use the WSDL file to create an API Connect REST proxy API that calls that SOAP service.

- [Creating a SOAP proxy API from an existing WSDL service](#)

If you have a SOAP service defined in a WSDL file, you can use the WSDL file to create an API Connect SOAP proxy API that calls that SOAP service.

- [Creating a new REST OpenAPI definition](#)

You can create and edit draft REST API definitions by using the API Manager or the API Designer user interface in IBM API Connect.

- [Adding a REST API by importing an OpenAPI definition file](#)

You can use an OpenAPI definition file to import a REST API into IBM API Connect.

- [Adding a SOAP API by importing a zip file](#)

You can use an OpenAPI definition file to import a SOAP API into IBM API Connect.

- [Creating a GraphQL proxy API](#)

GraphQL is a query language for APIs that gives an application client greater control over what data it retrieves in an API request when compared with a REST API

request. IBM API Connect enables you to create a GraphQL API proxy definition that proxies a backend GraphQL server, and to define rate limiting controls that reflect the amount of data that is returned from the server by a request to the GraphQL API.

- [Importing an API from the CP4I asset repository](#)

If you are using IBM API Connect with IBM Cloud Pak for Integration (CP4I), you can import an API definition from the CP4I asset repository.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a REST proxy API from a target service

If you have an existing REST service that you want to expose through an IBM® API Connect API definition, you can create a proxy API and specify the target endpoint by using the API Manager.

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

Create proxy REST APIs in minutes by using the API Manager tool to create an API from target service. This procedure creates a REST proxy that routes all traffic to a target REST API or service endpoint.

### Procedure

To compose a proxy API from a target service, complete the following steps.

1. In the navigation pane, click  Develop, select the APIs tab, then click Add API (from REST, GraphQL or SOAP).  
The Select API type screen is displayed.
2. Select OpenAPI 2.0 or OpenAPI 3.0 according to which version of the OpenAPI specification your API is to be based on.
3. Select From target service.
4. Click Next. Specify the API summary in the Info section. You can fine-tune the API after it is created.
  - The Title can include special characters but should be kept short so that it can be easily displayed in the user interface.
  - The Name is entered automatically. The value in the Name field is a single string that is used to identify the API in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - The Version corresponds to the value of the `info.version` property of the API's OpenAPI definition. The `version.release.modification` version numbering scheme is recommended; for example `1.0.0`.
  - The Base path is the URL segment of the API and does not include the host name or any additional segments for paths or operations. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
  - The optional Description helps to identify the API.
5. Specify the existing REST API endpoint that you want to call in the Target Service URL field.
6. Click Next. In the Secure section, configure the API security that you require.
  - Secure using Client ID - Select this option to require an Application to provide a Client ID (API Key). This causes the `X-IBM-Client-Id` parameter to be included in the request header for the API. If selected, you can then select whether to limit the API calls on a per key (per Client ID) basis:
    - Limit API calls on a per key basis - If selected, you must configure the rate limit that you require. Rate limits control the maximum number of calls allowed within a time period (hour, minute, month or day). For example, 100 calls per hour.For information about security options in IBM API Connect, see [Configuring API security](#).
  - CORS - Select this option to enable cross-origin resource sharing (CORS) support for your API. This allows your API to be accessed from another domain.  
Note:
    - When CORS is enabled, the API Gateway runs the `cors` preflow policy to handle all CORS requests that are made to the API.
    - When CORS is enabled and a preflight request is received, only the following API actions are performed:
      - The `cors` preflow policy configures the appropriate response headers.
      - The response headers are set.
    - When a preflight request is received, the `request.attributes.isCORSPreflight` flag is set to `true`.
    - For all preflight requests, the `security` and `client-identification` preflow policies are always skipped, whether CORS is enabled or not enabled.
7. Click Next to create your API definition.  
The Summary panel displays messages as the definition is created, and the selected security options and rate limits are enforced.
8. Select one of the following options:
  - To further configure your API, click Edit API. For details, see [Editing an API definition](#).
  - If you do not want to configure your API further at this time, click the Develop link in the breadcrumb trail to return to the welcome page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

## Results

You created a proxy API from an existing target service.

## What to do next

## Creating a REST proxy API from an existing OpenAPI service

If you have an existing OpenAPI described target service that you want to expose through an IBM® API Connect API definition, you can create a proxy API and specify the target endpoint.

## About this task

---

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

Create proxy REST APIs in minutes by using the API Manager tool to create an API from existing OpenAPI service. This procedure creates a REST proxy that routes all traffic to a target REST API or service endpoint.

## Procedure

---

To compose a proxy API from an existing OpenAPI service, complete the following steps.

1. In the navigation pane, click  Develop, select the APIs tab, then click Add API (from REST, GraphQL or SOAP). The Select API type screen is displayed.
2. Select OpenAPI 2.0 or OpenAPI 3.0 according to which version of the OpenAPI specification your API is to be based on.
3. Select From existing OpenAPI service, and click Next.
4. To upload the service information from an OpenAPI file, you can either drag and drop your file, or browse and select the file that you want to use. Valid file types are YAML, YML, etc.
  - Click Browse and browse for the OpenAPI file.
  - Drag and drop the file into the active area.After you upload the file, the OpenAPI specification is evaluated and a message displays whether it is valid.
5. Click Next. Specify the API summary in the Info section. You can fine-tune the API after it is created.
  - The Title can include special characters but should be kept short so that it can be easily displayed in the user interface.
  - The Name is entered automatically. The value in the Name field is a single string that is used to identify the API in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - The Version corresponds to the value of the `info.version` property of the API's OpenAPI definition. The `version.release.modification` version numbering scheme is recommended; for example `1.0.0`.
  - The Base path is the URL segment of the API and does not include the host name or any additional segments for paths or operations. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
  - The optional Description helps to identify the API.
6. Click Next. In the Secure section, configure the API security that you require.
  - Secure using Client ID - Select this option to require an Application to provide a Client ID (API Key). This causes the `X-IBM-Client-Id` parameter to be included in the request header for the API. If selected, you can then select whether to limit the API calls on a per key (per Client ID) basis:
    - Limit API calls on a per key basis - If selected, you must configure the rate limit that you require. Rate limits control the maximum number of calls allowed within a time period (hour, minute, month or day). For example, 100 calls per hour.For information about security options in IBM API Connect, see [Configuring API security](#).
  - CORS - Select this option to enable cross-origin resource sharing (CORS) support for your API. This allows your API to be accessed from another domain.  
Note:
    - When CORS is enabled, the API Gateway runs the `cors` preflow policy to handle all CORS requests that are made to the API.
    - When CORS is enabled and a preflight request is received, only the following API actions are performed:
      - The `cors` preflow policy configures the appropriate response headers.
      - The response headers are set.
    - When a preflight request is received, the `request.attributes.isCORSPreflight` flag is set to `true`.
    - For all preflight requests, the `security` and `client-identification` preflow policies are always skipped, whether CORS is enabled or not enabled.
7. Optional: Select Activate API if you want to immediately use the API for further development and testing.  
Note:
  - When you select the Activate API option, API Connect automatically completes the following actions:

- Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title *api\_title* auto product. This Product is not visible in the Develop view and you cannot delete it directly. However, if you delete the API the draft Product is deleted together with the API; see [Deleting an API definition](#). The Product is visible in any Catalogs to which it is published. If you want to remove the Product from a Catalog, you must do this separately; see [Removing a Product from a Catalog](#)
  - Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API](#).
  - You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
  - To use the Activate API option, you must be assigned a role that has the **Product:Manage** and **Subscription:Manage** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).
8. Click Next to create your API definition.  
The Summary panel displays messages as the definition is created, and the selected security options and rate limits are enforced.
- If you selected Activate API, the wizard populates an API Endpoint URL that you can use in testing. If you have also selected Secure using Client ID, the wizard displays a Client ID and Client Secret you can use.
9. Select one of the following options:
- To further configure your API, click Edit API. For details, see [Editing an API definition](#).
  - If you do not want to configure your API further at this time, click the Develop link in the breadcrumb trail to return to the welcome page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

---

## Results

You created a proxy API from an existing OpenAPI service.

---

## What to do next

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

# Creating a REST proxy API from an existing WSDL service

If you have a SOAP service defined in a WSDL file, you can use the WSDL file to create an API Connect REST proxy API that calls that SOAP service.

---

## About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

If the WSDL file is a stand-alone file with no external dependencies, you can load the .wsdl file from a directory to create the REST API definition.

If the WSDL file references other WSDL files or references XSD files containing XML schema definitions, you must create a .zip archive of the WSDL file and its dependent documents, and then load the .zip file from a directory to add the REST API definition.

---

## Procedure

To add a REST API definition by loading a WSDL file, complete the following steps:

1. In the navigation pane, click  Develop, select the APIs tab, then click Add API (from REST, GraphQL or SOAP).  
The Select API type screen is displayed.
2. Select OpenAPI 2.0; this API type does not support OpenAPI 3.0.
3. On the Add API pane, select From existing WSDL service (REST Proxy). Click Next.  
The Create API from Existing WSDL Service (REST Proxy) window opens.
4. To upload the service information from a stand-alone .wsdl file, or a .zip file that contains a WSDL file and its dependent documents, you can either drag and drop your file, or browse and select the file that you want to use.  
After you upload the file, the WSDL is evaluated and a message displays whether the WSDL is valid.

If you upload a .zip file, you can include in the .zip file an options file to specify additional directives. For details, see [Using an options file when importing a WSDL service](#).

5. Click Next. At the Select Service panel, select a WSDL service from the imported file.
6. Click Next. Specify the API summary in the Info section. You can fine-tune the API after it is created.
  - The Title can include special characters but should be kept short so that it can be easily displayed in the user interface.
  - The Name is entered automatically. The value in the Name field is a single string that is used to identify the API in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - The Version corresponds to the value of the `info.version` property of the API's OpenAPI definition. The `version.release.modification` version numbering scheme is recommended; for example `1.0.0`.
  - The Base path is the URL segment of the API and does not include the host name or any additional segments for paths or operations. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
  - The optional Description helps to identify the API.
7. Click Next. In the Secure section, configure the API security that you require.
  - Secure using Client ID - Select this option to require an Application to provide a Client ID (API Key). This causes the `x-IBM-Client-Id` parameter to be included in the request header for the API. If selected, you can then select whether to limit the API calls on a per key (per Client ID) basis:
    - Limit API calls on a per key basis - If selected, you must configure the rate limit that you require. Rate limits control the maximum number of calls allowed within a time period (hour, minute, month or day). For example, 100 calls per hour.

For information about security options in IBM® API Connect, see [Configuring API security](#).

- CORS - Select this option to enable cross-origin resource sharing (CORS) support for your API. This allows your API to be accessed from another domain.  
Note:
  - When CORS is enabled, the API Gateway runs the `cors` preflow policy to handle all CORS requests that are made to the API.
  - When CORS is enabled and a preflight request is received, only the following API actions are performed:
    - The `cors` preflow policy configures the appropriate response headers.
    - The response headers are set.
  - When a preflight request is received, the `request.attributes.isCORSPreflight` flag is set to `true`.
  - For all preflight requests, the `security` and `client-identification` preflow policies are always skipped, whether CORS is enabled or not enabled.
8. Optional: Select Activate API if you want to immediately use the API for further development and testing.  
Note:
  - When you select the Activate API option, API Connect automatically completes the following actions:
    - Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title `api_title` auto product. This Product is not visible in the Develop view and you cannot delete it directly. However, if you delete the API the draft Product is deleted together with the API; see [Deleting an API definition](#). The Product is visible in any Catalogs to which it is published. If you want to remove the Product from a Catalog, you must do this separately; see [Removing a Product from a Catalog](#)
    - Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API](#).
  - You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
  - To use the Activate API option, you must be assigned a role that has the `Product:Manage` and `Subscription:Manage` permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).
9. Click Next to create your API definition.  
The Summary panel displays messages as the definition is created, and the selected security options and rate limits are enforced.  
  
If you selected Activate API, the wizard populates an API Endpoint URL that you can use in testing. If you have also selected Secure using Client ID, the wizard displays a Client ID and Client Secret you can use.
10. Select one of the following options:
  - To further configure your API, click Edit API. For details, see [Editing an API definition](#).
  - If you do not want to configure your API further at this time, click the Develop link in the breadcrumb trail to return to the welcome page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

---

## Results

You created a REST API definition by using an existing WSDL file.

---

## What to do next

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

You can also manage the Product lifecycle, and control who can see and subscribe to your Product, by opening the Sandbox Catalog associated with your API in the  Manage page of the API Manager UI.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a SOAP proxy API from an existing WSDL service

If you have a SOAP service defined in a WSDL file, you can use the WSDL file to create an API Connect SOAP proxy API that calls that SOAP service.

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

You can add a SOAP API to expose an existing SOAP service by supplying the WSDL file that defines that existing service in one of the following ways:

- If the WSDL file is a stand-alone file with no external dependencies, you can load the .wsdl file from a directory to create the SOAP API definition.
- You can provide one or more WSDL files in a single .zip file that contains the WSDL files and any necessary schemas. If the WSDL file references other WSDL files or references XSD files containing XML schema definitions, you must create a .zip archive of the WSDL file and its dependent documents, and then load the .zip file from a directory to add the SOAP API definition.
- If you are using API Designer with existing APIs that were created from a WSDL or WSDL.zip file in Version 5 API Designer, make sure that the following requirements are met:
  - The WSDL or WSDL.zip file must be stored in the same directory as the API's YAML file.
  - In the API's YAML file, the **x-ibm-configuration --> wsdl-definition --> wsdl** property must point directly to the WSDL or WSDL.zip file with no path specified (the files are located in the same directory).

The service must support Web Services Basic Profile Version 1.1 - Second Edition.

### Procedure

To add a SOAP API definition by loading a WSDL file, complete the following steps:

1. In the navigation pane, click  Develop, select the APIs tab, then click Add API (from REST, GraphQL or SOAP). The Select API type screen is displayed.
2. Select OpenAPI 2.0; this API type does not support OpenAPI 3.0.
3. Select From existing WSDL service (SOAP Proxy). Click Next. The Create API from Existing WSDL Service (SOAP Proxy) window opens.
4. To upload the service information from a stand-alone .wsdl file, or a .zip file that contains a WSDL file and its dependent documents, you can either drag and drop your file, or browse and select the file that you want to use. After you upload the file, the WSDL is evaluated and a message displays whether the WSDL is valid. If you upload a .zip file, you can include in the .zip file an options file to specify additional directives. For details, see [Using an options file when importing a WSDL service](#).
5. Click Next. At the Select Service panel, select a WSDL service from the imported file.
6. Click Next. Specify the API summary in the Info section. You can fine-tune the API after it is created.
  - The Title can include special characters but should be kept short so that it can be easily displayed in the user interface.
  - The Name is entered automatically. The value in the Name field is a single string that is used to identify the API in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - The Version corresponds to the value of the **info.version** property of the API's OpenAPI definition. The **version.release.modification** version numbering scheme is recommended; for example 1.0.0.
  - The Base path is the URL segment of the API and does not include the host name or any additional segments for paths or operations. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
  - The optional Description helps to identify the API.
7. Click Next. In the Secure section, configure the API security that you require.
  - Secure using Client ID - Select this option to require an Application to provide a Client ID (API Key). This causes the **x-IBM-Client-Id** parameter to be included in the request header for the API. If selected, you can then select whether to limit the API calls on a per key (per Client ID) basis:
    - Limit API calls on a per key basis - If selected, you must configure the rate limit that you require. Rate limits control the maximum number of calls allowed within a time period (hour, minute, month or day). For example, 100 calls per hour.For information about security options in IBM® API Connect, see [Configuring API security](#).
  - CORS - Select this option to enable cross-origin resource sharing (CORS) support for your API. This allows your API to be accessed from another domain. Note:
    - When CORS is enabled, the API Gateway runs the **cors** preflow policy to handle all CORS requests that are made to the API.
    - When CORS is enabled and a preflight request is received, only the following API actions are performed:
      - The **cors** preflow policy configures the appropriate response headers.
      - The response headers are set.
    - When a preflight request is received, the **request.attributes.isCORSPreflight** flag is set to **true**.
    - For all preflight requests, the **security** and **client-identification** preflow policies are always skipped, whether CORS is enabled or not enabled.
8. Optional: Select Activate API if you want to immediately use the API for further development and testing. Note:
  - When you select the Activate API option, API Connect automatically completes the following actions:

- Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title *api\_title* auto product. This Product is not visible in the Develop view and you cannot delete it directly. However, if you delete the API the draft Product is deleted together with the API; see [Deleting an API definition](#). The Product is visible in any Catalogs to which it is published. If you want to remove the Product from a Catalog, you must do this separately; see [Removing a Product from a Catalog](#)
  - Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API](#).
  - You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
  - To use the Activate API option, you must be assigned a role that has the **Product:Manage** and **Subscription:Manage** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).
9. Click Next to create your API definition.  
The Summary panel displays messages as the definition is created, and the selected security options and rate limits are enforced.
- If you selected Activate API, the wizard populates an API Endpoint URL that you can use in testing. If you have also selected Secure using Client ID, the wizard displays a Client ID and Client Secret you can use.
10. Select one of the following options:
- To further configure your API, click Edit API. For details, see [Editing an API definition](#).
  - If you do not want to configure your API further at this time, click the Develop link in the breadcrumb trail to return to the welcome page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

---

## Results

You created a SOAP API definition by using an existing WSDL file.

---

## What to do next

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

You can also manage the Product lifecycle, and control who can see and subscribe to your Product, by opening the Sandbox Catalog associated with your API in the  Manage page of the API Manager UI.

# Creating a new REST OpenAPI definition

You can create and edit draft REST API definitions by using the API Manager or the API Designer user interface in IBM® API Connect.

---

## About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task you must be assigned a role that has the **Api-Drafts:Edit** permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

---

## Procedure

To create a new REST OpenAPI definition, complete the following steps.

1. In the navigation pane, click  Develop, select the APIs tab, then click Add API (from REST, GraphQL or SOAP). The Select API type screen is displayed.
2. Select OpenAPI 2.0 or OpenAPI 3.0 according to which version of the OpenAPI specification your API is to be based on.
3. Select New OpenAPI .
4. Click Next. Specify the API summary in the Info section. You can fine-tune the API after it is created.

- The Title can include special characters but should be kept short so that it can be easily displayed in the user interface.
  - The Name is entered automatically. The value in the Name field is a single string that is used to identify the API in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - The Version corresponds to the value of the `info.version` property of the API's OpenAPI definition. The `version.release.modification` version numbering scheme is recommended; for example `1.0.0`.
  - The Base path is the URL segment of the API and does not include the host name or any additional segments for paths or operations. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
  - The optional Description helps to identify the API.
5. Click Next. In the Secure section, configure the API security that you require.
- Secure using Client ID - Select this option to require an Application to provide a Client ID (API Key). This causes the `X-IBM-Client-Id` parameter to be included in the request header for the API. If selected, you can then select whether to limit the API calls on a per key (per Client ID) basis:
    - Limit API calls on a per key basis - If selected, you must configure the rate limit that you require. Rate limits control the maximum number of calls allowed within a time period (hour, minute, month or day). For example, 100 calls per hour.
 For information about security options in IBM API Connect, see [Configuring API security](#).
  - CORS - Select this option to enable cross-origin resource sharing (CORS) support for your API. This allows your API to be accessed from another domain.
 

Note:

    - When CORS is enabled, the API Gateway runs the `cors` preflow policy to handle all CORS requests that are made to the API.
    - When CORS is enabled and a preflight request is received, only the following API actions are performed:
      - The `cors` preflow policy configures the appropriate response headers.
      - The response headers are set.
    - When a preflight request is received, the `request.attributes.isCORSPreflight` flag is set to `true`.
    - For all preflight requests, the `security` and `client-identification` preflow policies are always skipped, whether CORS is enabled or not enabled.
6. Click Next to create your API definition.  
The Summary panel displays messages as the definition is created, and the selected security options and rate limits are enforced.
7. Select one of the following options:
- To further configure your API, click Edit API. For details, see [Editing an API definition](#).
  - If you do not want to configure your API further at this time, click the Develop link in the breadcrumb trail to return to the welcome page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

## Results

You successfully created a REST API definition. For API Designer, the specifications for the APIs and Products are stored in the directory that you specified when you logged in. For API Manager, the specifications for the APIs and Products are stored on the management server.

## What to do next

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Adding a REST API by importing an OpenAPI definition file

You can use an OpenAPI definition file to import a REST API into IBM® API Connect.

## Before you begin

Your file must conform to version 2.0 of the OpenAPI specification. The format of the file can be JSON or YAML.

Note: Products that contain an API with a Swagger property using `regex` that include lookahead assertions, such as "(?" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!
The multipart 'openapi' field contains an OpenAPI definition with validation errors.
definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0, col:
0)
400
```

## About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

If you are using the API Designer UI and you want to use an OpenAPI definition file from elsewhere, downloaded from an external website for example, rather than created by using API Connect, use the import mechanism described here rather than copying the file into your local API Designer directory; the import operation adds API Connect specific sections that are required by API Designer.

## Procedure

---

To add a REST API by importing an OpenAPI file, complete the following steps:

1. In the navigation pane, click  Develop, select the APIs tab, then click Add API (from REST, GraphQL or SOAP). The Select API type screen is displayed.
2. Select OpenAPI 2.0 or OpenAPI 3.0 according to which version of the OpenAPI specification your API is to be based on.
3. In the Import section, select Existing OpenAPI, then click Next.
4. Choose one of the following methods for importing the file:
  - Drag and drop a file  
Open another window, select a file. Drag the file to the Select a file box, and release the file.
  - Browse for a file  
Click the Select a file box. Locate the file and select it.
  - Specify the URL of a file  
In the Or specify a file URL field, type or paste a URL for the file. Optionally add a User name and Password if they are required for accessing the file.

The following file types are supported if they contain a valid OpenAPI definition: .json, .yaml, and .yml.

5. Click Next to import the selected file.  
The wizard checks the validity of the YAML, and displays a message indicating successful validation.

Notes:

- If you are using the API Manager UI, the import operation fails if the file defines an API that has the same name and version as an existing API definition. However, if you are using the API Designer UI, API definitions are uniquely identified by the file name in your local file system; therefore, if you import two different files that define the same API name and version, two API definitions with the same name and version are created in API Connect, with no error.
  - Any validation error messages are displayed in English only, and are not translated.
6. Optional: Select Activate API if you want to immediately use the API for further development and testing.  
Note:
    - When you select the Activate API option, API Connect automatically completes the following actions:
      - Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title *api\_title* auto product. This Product is not visible in the Develop view and you cannot delete it directly. However, if you delete the API the draft Product is deleted together with the API; see [Deleting an API definition](#). The Product is visible in any Catalogs to which it is published. If you want to remove the Product from a Catalog, you must do this separately; see [Removing a Product from a Catalog](#)
      - Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API](#).
    - You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
    - To use the Activate API option, you must be assigned a role that has the **Product:Manage** and **Subscription:Manage** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).
  7. Click Next. The Import API Summary panel indicates that the YAML file is loaded and valid.  
If you selected Activate API, the wizard populates an API Endpoint URL, and displays a Client ID and Client Secret that you can use.
  8. Select one of the following options:
    - To further configure your API, click Edit API. For details, see [Editing an API definition](#).
    - If you do not want to configure your API further at this time, click the Develop link in the breadcrumb trail to return to the welcome page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

## Results

---

When the API definition has been imported, it is shown in the list of API definitions in the Develop page. For API Designer, the specifications for the APIs and Products are stored in the directory that you specified when you logged in. For API Manager, the specifications for the APIs and Products are stored on the management server.

## What to do next

---

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Adding a SOAP API by importing a zip file

You can use an OpenAPI definition file to import a SOAP API into IBM® API Connect.

### Before you begin

The format of the file must be .zip, and the file must contain the WSDL definition and the YAML file that defines the API. The YAML file must conform to version 2.0 of the OpenAPI specification.

Note: Products that contain an API with a Swagger property using **regex** that include lookahead assertions, such as "(?" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!  
The multipart 'openapi' field contains an OpenAPI definition with validation errors.  
definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0, col:  
0)  
400
```

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

If you are using the API Designer UI and you want to use an OpenAPI definition file from elsewhere, downloaded from an external website for example, rather than created by using API Connect, use the import mechanism that is described here rather than copying the file into your local API Designer directory; the import operation adds API Connect specific sections that are required by API Designer.

For more information on how to create a .zip file, see [Downloading an API definition](#).

### Procedure

To add a SOAP API by importing a .zip file, complete the following steps:

1. In the navigation pane, click  Develop, select the APIs tab, then click Add API (from REST, GraphQL or SOAP).  
The Select API type screen is displayed.
2. Select OpenAPI 2.0; this API type does not support OpenAPI 3.0.
3. In the Import section, select Existing OpenAPI, then click Next.
4. To import a file from your local file system, you can either drag and drop the file or click the link to select the file from your local file system.  
The wizard checks the validity of the WSDL and YAML, and displays a message that indicates a successful validation.  
Note:
  - If you are using the API Manager UI, the import operation fails if the file defines an API that has the same name and version as an existing API definition. However, if you are using the API Designer UI, API definitions are uniquely identified by the file name in your local file system; therefore, if you import two different files that define the same API name and version, two API definitions with the same name and version are created in API Connect, with no error.
  - Any validation error messages are displayed in English only, and are not translated.
5. Click Next.
6. Optional: Select Activate API if you want to immediately use the API for further development and testing.  
Note:
  - When you select the Activate API option, API Connect automatically completes the following actions:
    - Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title *api\_title* auto product. This Product is not visible in the Develop view and you cannot delete it directly. However, if you delete the API the draft Product is deleted together with the API; see [Deleting an API definition](#). The Product is visible in any Catalogs to which it is published. If you want to remove the Product from a Catalog, you must do this separately; see [Removing a Product from a Catalog](#)
    - Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API](#).
  - You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
  - To use the Activate API option, you must be assigned a role that has the **Product:Manage** and **Subscription:Manage** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).
7. Click Next. The Import API Summary panel indicates that the file is loaded and valid.  
If you selected Activate API, the wizard populates an API Endpoint URL, and displays a Client ID and Client Secret that you can use.
8. Select one of the following options:
  - To further configure your API, click Edit API. For details, see [Editing an API definition](#).
  - If you do not want to configure your API further at this time, click the Develop link in the breadcrumb trail to return to the welcome page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

## Results

When the API definition has been imported, it is shown in the list of API definitions in the Develop page. For API Designer, the specifications for the APIs and Products are stored in the directory that you specified when you logged in. For API Manager, the specifications for the APIs and Products are stored on the management server.

## What to do next

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a GraphQL proxy API

GraphQL is a query language for APIs that gives an application client greater control over what data it retrieves in an API request when compared with a REST API request. IBM® API Connect enables you to create a GraphQL API proxy definition that proxies a backend GraphQL server, and to define rate limiting controls that reflect the amount of data that is returned from the server by a request to the GraphQL API.

## About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

GraphQL provides the following particular advantages over REST APIs:

- The application client can request only the data that it needs. For example, when retrieving bank account records, request only the account number and current balance for each account, but not the customer name and address details. With a REST API request, either the backend REST service must provide separate endpoints for different data subsets, or the application client must retrieve the complete records and then discard the unwanted data.
- The application client can retrieve multiple related resources in a single request. For example, a customer's bank account record might include an array that references other finance products that the customer holds. If an application client wants to retrieve the bank account details for a specific customer, and details of the other finance products for that customer, then with a REST API the client would first retrieve the bank account details, then make separate requests for each of the other products. A GraphQL API can be designed to allow the client to retrieve all this information in a single request.

However, this flexibility presents rate limiting challenges, because two seemingly very similar requests might return vastly different amounts of data, and what might have required multiple REST API requests, each counting towards the rate limit, might require only a single GraphQL API request. It is important therefore that rate limiting controls are imposed that reflect the amount of data that is retrieved. API Connect extends the GraphQL standard by providing, in a GraphQL API definition, the ability to configure a range of settings that are used to calculate the complexity of a GraphQL request and an associated cost that counts towards the rate limit.

## Procedure

To create a GraphQL API proxy definition, complete the following steps:

1. In the navigation pane, click  Develop, select the APIs tab, then click Add API (from REST, GraphQL or SOAP). The Select API type screen is displayed.
2. Select OpenAPI 2.0; this API type does not support OpenAPI 3.0.
3. Select From existing GraphQL service (GraphQL proxy).
4. Click Next. Specify the API summary in the Info section. You can fine-tune the API after it is created.
  - The Title can include special characters but should be kept short so that it can be easily displayed in the user interface.
  - The Name is entered automatically. The value in the Name field is a single string that is used to identify the API in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - The Version corresponds to the value of the `info.version` property of the API's OpenAPI definition. The `version.release.modification` version numbering scheme is recommended; for example `1.0.0`.
  - The Base path is the URL segment of the API and does not include the host name or any additional segments for paths or operations. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
  - The optional Description helps to identify the API.
5. In the GraphQL Server section, specify the following values:
  - GraphQL server URL: this is the URL that is used for requests to the backend GraphQL API. The GraphQL schema is imported automatically from the specified URL.

- Schema name: the name that you enter here is used to identify the schema definition that is created from the imported GraphQL schema. The field is pre-populated with host name segment of the value entered in the GraphQL server URL field, but you can change it.
6. Click Next. If there are any warnings indicated relating to the imported schema, you can review them now by clicking View. You can deal with these warnings as appropriate after you have created your GraphQL proxy API.
  7. In the Operations and Paths section, select the operations and paths that you want to include. The operation path of `/graphql` is already selected and you cannot change this setting; this is the path for application client requests to API Connect that invoke the GraphQL API.

For details of the mechanisms supported for sending a request to the `/graphql/cost` endpoint, see [Request mechanisms supported by GraphQL endpoints](#).

You can also select the operation path of `graphql/cost`; this path enables application clients to obtain details of the cost of a request to the GraphQL API before making the actual request. In a production environment, in particular, you should consider carefully the resource implications of making this path available. For full details regarding the enablement of the cost endpoint, see [Enabling the cost endpoint for a GraphQL API](#).

To form the full API paths, these path segments are appended to the `basepath` that you specified in step 4.

To allow application clients to send introspection requests for this GraphQL proxy API, select Support default introspection. For full details, see [Supporting default introspection for a GraphQL API](#).

To allow users to test the GraphQL proxy API from a GraphQL editor, select Enable GraphQL editor. For full details, see [Enabling the GraphQL editor for a GraphQL API](#).

Note: The `graphql/cost`, Support default introspection, and Enable GraphQL editor options each automatically generate policy configuration in your API assembly that would have to be created manually if you disable this option and later decide that it is required.

8. Optionally, you can replace the GraphQL schema that was imported from the GraphQL server URL by uploading a schema from your local file system. Click Replace; you can then either drag and drop your file, or click where indicated to select the file from your local file system. Click Upload when done.

Note:

- The schema must be written in the GraphQL Schema Definition Language (SDL). For more information, see [Type language](#) in the GraphQL documentation at <https://graphql.org/>.
- If you upload a schema from a local file having previously uploaded a schema from a URL, the schema URL setting that is stored in the OpenAPI source for the API, and subsequently displayed in the user interface, retains the previously specified URL value rather than indicating a file location.

9. Click Next. In the Secure section, configure the API security that you require.

- Secure using Client ID - Select this option to require an Application to provide a Client ID (API Key). This causes the `X-IBM-Client-Id` parameter to be included in the request header for the API. For information about security options in IBM API Connect, see [Configuring API security](#).
- CORS - Select this option to enable cross-origin resource sharing (CORS) support for your API. This allows your API to be accessed from another domain.

Note:

- When CORS is enabled, the API Gateway runs the `cors` preflow policy to handle all CORS requests that are made to the API.
- When CORS is enabled and a preflight request is received, only the following API actions are performed:
  - The `cors` preflow policy configures the appropriate response headers.
  - The response headers are set.
- When a preflight request is received, the `request.attributes.isCORSPreflight` flag is set to `true`.
- For all preflight requests, the `security` and `client-identification` preflow policies are always skipped, whether CORS is enabled or not enabled.

10. Optional: Select Activate API if you want to immediately use the API for further development and testing.

Note:

- When you select the Activate API option, API Connect automatically completes the following actions:
  - Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title `api_title` auto product. This Product is not visible in the Develop view and you cannot delete it directly. However, if you delete the API the draft Product is deleted together with the API; see [Deleting an API definition](#). The Product is visible in any Catalogs to which it is published. If you want to remove the Product from a Catalog, you must do this separately; see [Removing a Product from a Catalog](#)
  - Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API](#).
- You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
- To use the Activate API option, you must be assigned a role that has the `Product:Manage` and `Subscription:Manage` permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

11. Click Next to create your API definition.

The Summary panel displays messages as the definition is created, and the selected security options are enforced.

If you selected Activate API, the wizard populates an API Endpoint URL that you can use in testing. If you have also selected Secure using Client ID, the wizard displays a Client ID and Client Secret you can use.

12. Click Next to create your API definition.

The Summary panel displays messages as the definition is created, and the selected security options and rate limits are enforced.

13. Select one of the following options:

- To further configure your API, click Edit API. For details, see [Editing an API definition](#).
- If you do not want to configure your API further at this time, click the Develop link in the breadcrumb trail to return to the welcome page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

## What to do next

Use the GraphQL schema editor to review, and deal with, any warnings associated with the schema, and to configure a range of settings that are used to calculate the complexity of a GraphQL request, and an associated cost that counts towards the rate limit; for details, see [Using the GraphQL schema editor](#).

- [Using the GraphQL schema editor](#)

The GraphQL schema editor allows you to configure a range of settings that are used to calculate the complexity of a GraphQL request, and an associated cost that counts towards the rate limit.

- [Supporting default introspection for a GraphQL API](#)  
If you select the Support default introspection option when creating a GraphQL proxy API, client applications can send standard GraphQL introspection requests to the API.
- [Enabling the GraphiQL editor for a GraphQL API](#)  
If you select the Enable GraphiQL editor option when creating a GraphQL proxy API, users can test the API by using a GraphiQL editor in a web browser; API Connect responds to the initial GraphiQL editor request with an HTML page that enables testing from the GraphiQL editor.
- [Enabling the cost endpoint for a GraphQL API](#)  
If you enable the `/graphql/cost` endpoint when creating a GraphQL proxy API, a calling application can obtain details of the cost of executing a request on the backend GraphQL server before making the actual backend request.
- [Securing a GraphQL API by using a client ID](#)  
If you select the Secure using Client ID option when creating a GraphQL proxy API, API Connect automatically adds Rate limit policies to the API assembly.
- [Request mechanisms supported by GraphQL endpoints](#)  
API Connect supports various mechanisms for sending requests to GraphQL proxy API endpoints.
- [Extensions to GraphQL](#)  
The API Connect DataPower® API Gateway extends the GraphQL specification by providing additional schema directives.
- [@remove directive](#)  
The `@remove` GraphQL schema directive specifies conditions for removing types and fields from validation or introspection for each transaction based on values in the API context.
- [GraphQL limitations](#)  
This page details the limitations in the API Connect GraphQL implementation for the current release.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using the GraphQL schema editor

The GraphQL schema editor allows you to configure a range of settings that are used to calculate the complexity of a GraphQL request, and an associated cost that counts towards the rate limit.

### Introduction

When the GraphQL schema editor opens, all the types defined in the GraphQL schema are listed. You can expand a type to display all the fields that are defined for that type.

For each type, you can specify the following setting:

#### Type weight

The weighting factor that you want to apply to the type for use when calculating the type cost for a request to the GraphQL API. In general, the weighting factor for a type will reflect the resource implications for a request that retrieves values of that type; for example:

- A complex object might be weighted more heavily than a String.
- Values of one type might be retrieved from a different backend database to values of another type, and accessing one database requires more CPU resource, so types associated with this database are weighted more heavily.

For each field, you can specify the following settings:

#### Field weight

The weighting factor that you want to apply to the field for use when calculating the field cost of a request to the GraphQL API.

#### Assumed size

The size limit that the backend server imposes on the number of values of this field that are returned, in a list, for each separate retrieval of the field in an API request. If an assumed size has been defined for this field in the imported GraphQL schema, its value is displayed. You can enter a value, or change the current value, and the schema definition stored in API Connect is updated accordingly. You must ensure that the specified value corresponds with the implementation or configuration on the backend server so that API Connect can apply rate limiting correctly. The assumed size is intended to be configured for fields that return lists of values, to tell the cost analysis how many values to expect.

#### Slicing arguments

A comma separated list of the arguments that are used by the backend server to limit the number of values of this field that are returned, in a list, for each separate retrieval of the field in an API request. These must correspond with the implementation or configuration on the backend server. For example, there might be slicing arguments of `first` and `last` that are used to specify a range of objects to be returned by an API request.

#### Sized fields

In some cases, a field with a configured Assumed size or Slicing arguments setting returns an object, a field of which returns the values whose number is to be sized. This is common in the [connections pattern for pagination](#), where fields with slicing arguments `first` or `last` return a `connections` object, that contains the sized list in an `edges` field. The Sized fields option allows the cost analysis to consider these indirect relationships between assumed sizes or slicing arguments and the sized list of values. Supply a comma separated list of field names.

You access the GraphQL schema editor in either of the following ways:

- Immediately after creating a new GraphQL proxy API, by clicking Edit API, then clicking the GraphQL Schema tab. For GraphQL proxy API creation details, see [Creating a GraphQL proxy API](#).
- By modifying the configuration of an existing API; complete the following steps:
  1. In the navigation pane, click Develop, then select the APIs tab.
  2. Alongside the GraphQL API definition that you want to work with, click the options icon and then click Edit API.
  3. Click the GraphQL Schema tab.

## Modifying a setting for a single type or field

For a numerical setting, click the setting alongside the required type or field, then enter the required value, or use the stepper control. For a setting that has a textual value, enter the value directly. You might first want to filter the display to show only a relevant subset of types and fields; see [Filtering the display](#).

## Modifying settings for multiple types and fields

To modify settings for multiple types and fields in a single operation, complete the following steps:

1. Select the check boxes alongside the types and fields whose settings you want to modify.
2. Click Apply analysis configuration.
3. On the Type tab, specify the settings that you want to apply to the selected types.
4. On the Field tab, specify the settings that you want to apply to the selected fields.
5. Click Apply to apply the settings to the selected types and fields.
6. When you have made all the required modifications to the selected types and fields, click Done; this actions clears all check box settings.

To restore any type or field settings to the initial default settings after having applied an analysis configuration, select the check boxes alongside the required types and fields, then click Remove analysis configuration.

You might first want to filter the display to show only a relevant subset of types and fields; see [Filtering the display](#).

## Filtering the display

To display only those type and fields that contain a specified string, enter the required filter string in the Search schema field, then press Enter.

If a type matches the filter, the type and all its fields are displayed. If a field matches the filter but not its parent type, the parent type is displayed together with all matching fields. You can enter multiple filter strings; the items displayed are those that contain all strings.

You can now use the operations described in [Modifying a setting for a single type or field](#) and [Modifying settings for multiple types and fields](#) to update the settings for the displayed types and fields.

To remove a specific filter string from the search, click the Close icon  for that filter string. To restore the full type and field display by removing all filter strings, click the Clear icon  at the end of the search field.

## GraphQL schema warnings

Where applicable, API Connect will recommend updates to the analysis configuration to protect the backend server from excessive resource utilization, and to ensure correct cost estimation for requests. These recommendations are displayed as warnings in the GraphQL schema editor.

If a type contains one or more fields with warnings, this is indicated by a warning count icon  2 alongside the type. You can click the warning count icon to see the warnings for that type; the Warnings window opens at the relevant warnings, for example:

To see the fields that have warnings, expand the type; a warning icon  is displayed alongside fields with warnings. To see the details of a warning for a field, click the warning icon  alongside the field

If you click Accept under any warning in the Warnings window, the recommended update is applied to the schema automatically.

To apply the suggested updates for all warnings in a single operation, click Apply all in the Warnings window, then click Apply to confirm.

You can filter the display to include only items with warnings; click the Menu icon , then select Show warnings only.

## Applying @remove directives to types and fields in the GraphQL schema

The `@remove` GraphQL schema directive specifies conditions for removing items from validation or introspection for each transaction based on values in the API context. For example, you can prevent specific Plans from using certain types or fields.

For more details on the `@remove` directive, including examples, see [rapic\\_graphql\\_extensions.html#reference\\_wrt\\_bk1\\_5mb\\_at\\_remove](#).

To apply an `@remove` directive to an item in your GraphQL schema, complete the following steps:

1. Click the settings icon  in the Show/hide column alongside the required item. The Show/hide settings window opens.
2. To remove the item depending on a boolean condition, enter the boolean expression in the Custom expression field; the following directive will be added to the item in the schema:

```
@remove(if: [expression])
```

To remove the item unconditionally, change the Show in schema slider control to Hide in schema; the following directive will be added to the item in the schema:

```
@remove(if: ["true"])
```

3. Click Next. A summary window opens. If the removal is permitted, any related items that will also have the `@remove` directive applied are listed; for example, if you apply an `@remove` directive to a type, and that type is referenced as the data type of a field on another type, the `@remove` directive is also applied to that field. If the removal is not permitted, an explanation is displayed.
4. If the removal is permitted, click Done to apply the `@remove` directive. If the removal is not permitted, either click Cancel to close the window or click Back and amend your settings.
5. To see the updates to the GraphQL JSON schema, click View source.

You can use the settings icon  to modify or delete previously applied `@remove` directives. To remove a conditional `@remove` directive, delete the expression from the Custom expression field. To remove an unconditional `@remove` directive, change the Hide in schema slider control to Show in schema.

## Viewing the GraphQL schema

To view the GraphQL JSON schema that was previously uploaded, click View source. Note that the schema includes `directive` statements and attribute values, added by API Connect, that reflect the configuration settings.

## Replacing the GraphQL schema

To replace the GraphQL schema, complete the following steps:

1. Click Replace.
2. Specify the replacement schema:
  - To replace the schema by introspecting a URL, complete the following steps:
    - Select Introspect from URL.
    - Enter the URL in the GraphQL server URL field, then click Introspect.

Note: If you replace the schema from a URL that is different to the one specified as the backend GraphQL server, in the GraphQL server URL field, when the GraphQL proxy API was created, the schema itself is replaced but the backend URL remains unchanged. You must correspondingly modify the URL setting on the `invoke` policy in the API assembly of your GraphQL proxy API.
  - To replace the schema by uploading a file, complete the following steps:
    - Select Upload schema definition language (SDL) file.
    - Either drag and drop the file or click the link to select the file from your local file system.

Note:

    - The schema must be written in the GraphQL Schema Definition Language (SDL). For more information, see [Type language](#) in the GraphQL documentation at <https://graphql.org/>.
    - If you upload a schema from a local file having previously uploaded a schema from a URL, the schema URL setting that is stored in the OpenAPI source for the API, and subsequently displayed in the user interface, retains the previously specified URL value rather than indicating a file location.

All the changes between the replacement schema and the current schema are listed.
3. Update the schema as required:
  - To have all new types and fields shown by default, select New schema for the Update schema defaults giving preference to setting. You can then choose to hide specific items by selecting Hide in the Action column alongside an item. Hiding an item causes an `@remove` directive to be added to the item in the schema source, as detailed in [Applying @remove directives to types and fields in the GraphQL schema](#).
  - To have all new types and fields hidden by default, select Old schema for the Update schema defaults giving preference to setting. You can then choose to show specific items by selecting Show in the Action column alongside an item.

Note: If the current schema contains items that are not in the replacement schema, these items are deleted. Such deletions are shown in the change listing with the Accept setting displayed in the Action column; you cannot change this setting.
4. Click Next. A change summary page is displayed. If any removals are not permitted, an explanation is displayed, and you cannot complete the schema replacement; either click Cancel to close the window or click Back and amend your settings..
5. Click Submit to complete the schema replacement.

## Downloading the GraphQL schema

To download the GraphQL schema to a local file, click the Download. Note that the downloaded schema includes all additional settings that reflect your configuration updates.

## Related reference

- [Extensions to GraphQL](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Supporting default introspection for a GraphQL API

If you select the Support default introspection option when creating a GraphQL proxy API, client applications can send standard GraphQL introspection requests to the API.

Introspection allows client applications to request details of all the types and fields that are defined in a GraphQL schema. API Connect itself sends an introspection request to the backend GraphQL server when you create a GraphQL proxy API so that it can load the schema into the API definition. However, if you select the Support default introspection option then GraphQL introspection requests from client applications are handled by API Connect and are not sent to the backend GraphQL server; this means that the response reflects any modifications you have made to the schema by using the [GraphQL schema editor](#).

A GraphiQL editor always attempts to introspect a GraphQL endpoint, so disabling this option significantly reduces the test capability for GraphiQL editor users. On the other hand, providing default introspection support can have resource implications, and you might choose to communicate the schema information in another way. Note, however, that this option automatically generates policy configuration in your API assembly that would have to be created manually if you disable this option and later decide that it is required; see the [API assembly policies for the default introspection support](#) section for details. Disabling this option also limits the capability of the Developer Portal to test the GraphQL proxy API.

For more information on introspection, see [Introspection](#) in the GraphQL documentation at <https://graphql.org/>.

## API assembly policies for the default introspection support

This section details the API assembly policy configuration that is generated automatically if the Support default introspection option is selected when a GraphQL proxy API is created. If the option is not selected at creation time, and you later decide that you want to enable it, you must add it manually to the API assembly.

A **case** is added to a **switch** policy with the following condition:

```
($operationPath() = '/graphql' and message.attributes.parse.GraphQLIntrospection = 'standard-introspection')
```

If the condition is true, the following policies are executed in sequence, with property settings as indicated:

Rate limit

Property	Value
Source	Plan by Name
Rate Limit Name	graphql-design-request
Operation	Consume

GraphQL introspect

Property	Value
Input	message
Output	No value, defaults to input

The automatically generated configuration, as it appears in the assembly UI, is as follows:

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Enabling the GraphiQL editor for a GraphQL API

If you select the Enable GraphiQL editor option when creating a GraphQL proxy API, users can test the API by using a GraphiQL editor in a web browser; API Connect responds to the initial GraphiQL editor request with an HTML page that enables testing from the GraphiQL editor.

Disabling the Enable GraphiQL editor option reduces gateway traffic and latency and, furthermore, the Developer Portal provides equivalent test capability regardless of whether or not you enable the option.

This option automatically adds the following property setting to the OpenAPI source for the GraphQL proxy API:

```
html-page: 'store:///graphiql.html'
```

If you disable the Enable GraphiQL editor during API creation and later decide that it is required, you can either manually add this property setting, or you can select Enable GraphiQL editor on the API Setup page of the Design tab of the API..

Note:

- The **html-page** property should be used **only** with a GraphQL proxy API.
- **store:///graphiql.html** is the only value allowed for the **html-page** property.
- If you add the **html-page** property but the Support standard introspection property was not enabled during API creation, the GraphiQL HTML page will not show any documentation regarding the GraphQL backend server, perform query validation, or perform smart lookup. For details on how to manually create the required assembly policy configuration, see [Supporting default introspection for a GraphQL API](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Enabling the cost endpoint for a GraphQL API

If you enable the `/graphql/cost` endpoint when creating a GraphQL proxy API, a calling application can obtain details of the cost of executing a request on the backend GraphQL server before making the actual backend request.

The "cost" does not relate purely to monetary cost but can take into account factors such as computational time, memory consumption, and other such factors, in addition to the actual financial costs associated with, say, using third-party systems to retrieve data.

In a production environment, in particular, you should consider carefully the resource implications of making this path available. Note, however, that enabling the `/graphql/cost` endpoint automatically generates policy configuration in your API assembly that would have to be created manually if you disable this option and later decide that it is required; see the [API assembly policies for the cost endpoint](#) section for details.

## API assembly policies for the cost endpoint

This section details the API assembly policy configuration that is generated automatically if the `/graphql/cost` operation path is selected when a GraphQL proxy API is created. If the path is not selected at creation time, and you later decide that you want to enable it, you must add it manually to the API assembly.

A **case** is added to a **switch** policy with the following condition:

```
($operationPath() = '/graphql/cost' and message.attributes.parse.GraphQLIntrospection = 'not-introspection')
```

If the condition is true, the following policies are executed in sequence, with property settings as indicated:

Rate limit

Property	Value
Source	Plan by Name
Rate Limit Name	graphql-design-request
Operation	Consume

Validate

Property	Value
Input	message
Output	No value, defaults to input
Validate against	GraphQL

Set Variable

Property	Value
Action	Set
Set	message.body
Type	any
Value	\$(message.attributes.graphql)

The automatically generated configuration, as it appears in the assembly UI, is as follows:

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Securing a GraphQL API by using a client ID

If you select the Secure using Client ID option when creating a GraphQL proxy API, API Connect automatically adds Rate limit policies to the API assembly.

This section details the Rate limit policy configuration that is generated automatically. If the Secure using Client ID option is not selected at creation time, and you later decide that you want to enable it, you must add the appropriate Rate limit policies manually to the API assembly.

The automatically generated Rate limit policies are added to the **switch** cases in the assembly as follows:

- **switch** case:

```
($operationPath() = '/graphql' and message.attributes.parse.GraphQLIntrospection = 'not-introspection' and message.attributes.graphql.operationType = 'subscription')
```

A single Rate limit policy with the following property settings:

Property	Value
Source	Plan by Name
Count Limit Name	graphql-subscription-type-cost

Property	Value
Operation	Increment
Count Limit Name	graphql-subscription-field-cost
Operation	Increment

The policy as it appears in the assembly UI is as follows:

This Rate limit policy limits the number of HTML web browser requests for a GraphQL editor sent to the `/graphql` endpoint.

- **switch case:**

```
($operationPath() = '/graphql' and message.attributes.parse.GraphQLIntrospection = 'not-introspection' and message.attributes.graphql.operationType != 'subscription')
```

Two Rate limit policies with the following property settings:

- Policy 1:

Property	Value
Source	Plan by Name
Rate Limit Name	graphql-type-cost
Operation	Consume
Rate Limit Name	graphql-field-cost
Operation	Consume
Rate Limit Name	graphql-input-type-cost
Operation	Consume

This Rate limit policy limits calls to the GraphQL proxy API by calculating the expected cost of the query, and then correspondingly reducing the available cost balance that remains of the total configured cost limit. The expected cost is calculated by applying the weighting factors that have been attached to the types and fields in the GraphQL schema; for more information, see [Using the GraphQL schema editor](#).

The expected cost is calculated by the Validate policy that precedes the Rate limit policy and placed in the API context to be made available to the Rate limit policy. For details on the Validate policy, see [Validate](#).

The details of the cost calculations to which the referenced rate limits are applied are as follows:

- **graphql-field-cost:** The weighted sum of fields being selected in a query. Fields that return values of scalar or enum types have a weight of 0.0 and therefore don't affect field cost. For example, consider the following query, where it is assumed that the value `max` in the `filter` argument of field `Query.offices` constrains the number of `Office` objects being returned:

```
query {
  offices (filter: {location: "NY", max: 3}) {
    address {
      street
    }
  }
}
```

The `Address.street` field is of type `String` and therefore has a weight of 0.0. Non scalar and non enum field weights that are not changed in the GraphQL schema editor assume a default value of 1.0. If the `Office.address` field weight has been set to 3.0, the total field cost is 10.0, calculated as follows:

Field	Weight	Field cost
<code>Query.offices</code>	1.0	1 x 1.0 = 1.0
<code>Office.address</code>	2.0	3 x 3.0 = 9.0
<code>Address.street</code>	0.0	0.0
	Total cost:	1.0 + 9.0 + 0.0 = 10.0

- **graphql-type-cost:** The weighted sum of types being returned by a query. Scalar or enum types have a weight of 0.0 and therefore don't affect type cost.

Considering the previous example, and assuming that all types have a default weight of 1.0, the total type cost is 7 (1 x `Query` type + 3 x `Office` types + 3 x `Address` types).

- **graphql-input-type-cost:**

The weighted sum of input types being sent in a query. Scalar or enum input types have a weight of 0.0 and therefore don't affect input type cost.

Considering the previous example, the input type cost is 1.0, because one `FilterInput` type is sent in the `filter` argument.

`FilterInput.location` is a `String` type and `FilterInput.max` is an `Int` type, so they are not included as they are scalars.

- Policy 2:

Property	Value
Source	Plan by Name
Rate Limit Name	graphql-type-cost
Operation	Replenish
Rate Limit Name	graphql-field-cost
Operation	Replenish

This Rate limit policy limits calls to the GraphQL proxy API by calculating the actual cost of the query, and then correspondingly reducing the available cost balance that remains of the total configured cost limit. The actual cost is calculated by applying the weighting factors that have been attached to the types and fields in the GraphQL schema; for more information, see [Using the GraphQL schema editor](#).

Note that if the actual cost is less than the expected cost, this Rate limit policy will appropriately restore some of the available cost balance that had been removed by Policy 1, thereby overriding the original actual cost limitation. The actual cost might be less than the expected cost if, for example, the query requested more data than was available in a backend database. You can delete one or other of these Rate limit policies from the assembly if desired. Note: Such unused cost is **not** restored if there are GraphQL response errors. The purpose of this restriction is to prevent malicious requests that cause large amounts of erroneous backend processing while only using a small amount of cost. The actual cost is calculated by the Validate policy that precedes the Rate limit policy and placed in the API context to be made available to the Rate limit policy. For details on the Validate policy, see [Validate](#).

The policies as they appear in the assembly UI are as follows:

- **switch case:**

```
($operationPath() = '/graphql/cost' and message.attributes.parse.GraphQLIntrospection = 'not-introspection')
```

A single Rate limit policy with the following property settings:

Property	Value
Source	Plan by Name
Rate Limit Name	graphql-design-request
Operation	Consume

The policy as it appears in the assembly UI is as follows:

This Rate limit policy limits the requests sent to the `/graphql/cost` endpoint for retrieving the cost of a GraphQL query.

- **switch case:**

```
($operationPath() = '/graphql' and message.attributes.parse.GraphQLIntrospection = 'standard-introspection')
```

A single Rate limit policy with the following property settings:

Property	Value
Source	Plan by Name
Rate Limit Name	graphql-design-request
Operation	Consume

The policy as it appears in the assembly UI is as follows:

This Rate limit policy limits standard introspection requests sent to the `/graphql` endpoint.

The rate limits that are referred to by the Rate Limit Name settings in these policies are predefined in Plans that are created in Products that contain one or more GraphQL proxy APIs. You can configure the actual rate limiting values there; for more information, see [Editing a draft Product](#).

For more information on the Rate Limit policy, see [Rate Limit](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Request mechanisms supported by GraphQL endpoints

API Connect supports various mechanisms for sending requests to GraphQL proxy API endpoints.

You can use any of the following mechanisms for sending requests to the `/graphql` and `/graphql/cost` endpoints on a GraphQL proxy API:

- **GET:** the GraphQL query must be specified in a URL query parameter called `query`. For example:

```
https://hostname/basepath/graphql?query={accounts(limit:100){name{first,last}}}
```

The following example includes the `variables` and `operationName` properties, with URL encoding:

```
https://hostname/basepath/graphql?query=query%20fetchAccounts%20($limit:%20Int)%20{accounts(limit:%20$limit)%20{name{first,last}}&variables={"limit":100}&operationName=fetchAccounts
```

- **POST** with a JSON-encoded body: the **Content-Type** header must be set to **application/json**, and the GraphQL query must be sent in the **query** key of the JSON object.  
For example:

```
{
  "query": "query fetchAccounts ($limit: Int) {accounts(limit: $limit) {name{first,last}}}",
  "variables": {"limit": 100},
  "operationName": "fetchAccounts"
}
```

The **variables** and **operationName** are optional. For more information, see [POST request](https://graphql.org/) in the GraphQL documentation at <https://graphql.org/>.

- **POST** with graphql content: the **Content-Type** header must be set to **application/graphql**; the entire body of the **POST** is treated as the GraphQL query

Note: For a request sent to the **/graphql** endpoint, the GraphQL proxy API always sends the request to the backend GraphQL server as a **POST** with a JSON-encoded body, so the backend GraphQL server must support this mechanism otherwise the call fails.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Extensions to GraphQL

The API Connect DataPower® API Gateway extends the GraphQL specification by providing additional schema directives.

### Custom schema directives

#### @cost

The **@cost** directive associates weight values with types or fields. Types are used to calculate type cost of a request to the GraphQL API. Fields are used to calculate field cost of a request to the GraphQL API. For more information, see [The Cost Directive](#).

#### @listSize

The **@listSize** directive applies slicing arguments to fields. For more information, see [The List Size directive](#).

#### @remove

The **@remove** GraphQL schema directive specifies conditions for removing types and fields from validation or introspection for each transaction based on values in the API context. For example, you can prevent specific API plans from using certain types or fields. For more information, see [@remove directive](#).

#### @scalarParam

The **@scalarParam** directive allows further customization of custom scalar types. For more information, see [@scalarParam directive](#).

### Related reference

- [Using the GraphQL schema editor](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## @remove directive

The **@remove** GraphQL schema directive specifies conditions for removing types and fields from validation or introspection for each transaction based on values in the API context.

For example, you can prevent specific Plans from using certain types or fields. For more information on the API context, see [API Connect context variables](#).

Note: The **@remove** directive dynamically modifies the schema so that queries that do not conform to the schema, after any **@remove** directives have been evaluated, would be rejected by a **validate** policy.

Syntax

```
@remove(if: [String]) on SCALAR | OBJECT | FIELD_DEFINITION | ARGUMENT_DEFINITION | INTERFACE | UNION | ENUM | ENUM_VALUE | IN
```

Arguments

Argument name	Type	Description
<b>if</b>	List of strings	JSONata condition that specifies the criteria for removal of a type or field from validation or introspection.

Limitations and propagation rules

For limitations and propagation rules, see [Limitations and propagation rules for the GraphQL @remove directive](#).

Example 1

Remove the **creditCard** type if the current API plan is **bronze**.

```
type creditCard @remove(if: ["plan.name in [\"bronze\"]"])
```

Example 2

Remove the **creditCard** type if the current API plan is not **gold**, and remove the field **card1** if the API plan is **bronze**.

```
type creditCard @remove(if: ["$not(plan.name = \"gold\")"]){
  field1: String
}
```

```

}
type User {
  card1: creditCard @remove(if: ["plan.name = 'bronze'", "$not(plan.name = \gold\)"])
}

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

API Gateway only

## GraphQL limitations

This page details the limitations in the API Connect GraphQL implementation for the current release.

- Specialized handling of custom scalars is not supported, except for validation of the `Long` custom scalar type. Input values provided for all other custom scalar types are passed through.
- The following actions and functions cannot read or write to parsed GraphQL queries. Some of these policies might read and write a serialized form of the GraphQL query.
  - Assembly GatewayScript policy
  - Assembly Map policy
  - Assembly Redaction policy
  - Assembly Set Variable policy
  - Assembly XSLT policy
  - `setVar()` function
- When reading parsed GraphQL queries, the Assembly Switch policy cannot use wildcards or read arguments.
- GraphQL schemas cannot be serialized.
- GraphQL messages received with `Content-Type: application/graphql` or `Content-Type: application/json` will send that same content type to the backend. This behavior cannot be overridden.
- All GraphQL schemas are checked for unbounded lists, including those that are not referenced in the assembly. This behavior can cause validation errors that prevent the GraphQL API from being published.
- The GraphQL schema editor generates warnings for fields that contain unbound lists of values if either of the following conditions is true.
  - The values in the list are of composite type. However, the warning is not valid if the composite type in the list has a defined type weight of 0.0 and all its sub-fields also have weights of 0.0 (both the fields and the types of the values they return).
  - The values in the list are of scalar type, for which a weight other than 0.0 was defined.
- Extending schemas is not supported.
- GraphQL APIs can be tested from the Developer Portal user interface. However, not all authentication methods are supported. You must use one of the following authentication methods:
  - Unsecured
  - Client ID, passed in the header
  - Client ID and secret, passed in the header

Also, `cost` metrics are not supported, and rate limits specific to GraphQL are not listed in Product plans.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Importing an API from the CP4I asset repository

If you are using IBM® API Connect with IBM Cloud Pak for Integration (CP4I), you can import an API definition from the CP4I asset repository.

### About this task

To complete this task you must be assigned a role that has the `Api-Drafts:Edit` permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

### Procedure

1. In the navigation pane, click  Develop, select the APIs tab, then click Add API (from REST, GraphQL or SOAP). The Select API type screen is displayed.
2. Select OpenAPI 2.0 or OpenAPI 3.0 according to which version of the OpenAPI specification your API is to be based on.
3. In the Import section, select From asset repository, then click Next.
4. Click Launch the asset repository.
5. From the asset repository listing, click the name of the API that you want to import. An API explorer window opens, enabling you to examine the details of the API.
6. Click Create from asset. The validity of the API definition is checked, and a message is displayed indicating successful validation.
7. Click Next.
8. Optional: Select Activate API if you want to immediately use the API for further development and testing.
 

Note:

  - When you select the Activate API option, API Connect automatically completes the following actions:

- Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title `api_title` auto product. This Product is not visible in the Develop view and you cannot delete it directly. However, if you delete the API the draft Product is deleted together with the API; see [Deleting an API definition](#). The Product is visible in any Catalogs to which it is published. If you want to remove the Product from a Catalog, you must do this separately; see [Removing a Product from a Catalog](#)
  - Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API](#).
  - You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
  - To use the Activate API option, you must be assigned a role that has the `Product:Manage` and `Subscription:Manage` permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).
9. Click Next.
- The Summary panel displays messages as the API definition is created.
10. Select one of the following options:
- To further configure your API, click Edit API. For details, see [Editing an API definition](#).
  - If you do not want to configure your API further at this time, click the Develop link in the breadcrumb trail to return to the welcome page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Editing an OpenAPI 2.0 API definition

IBM® API Connect provides a form based editor that enables you to configure APIs that conform to the OpenAPI 2.0 specification.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

### Procedure

You can open an API for editing in either of the following ways:

- During the initial creation of an API, the API wizard guides you to enter the minimum configuration settings; on completion of the initial configuration, click Edit API.
- To open an existing API for editing, complete the following steps:
  1. In the navigation pane, click  Develop, then select the APIs tab.
  2. Click the title of the API version that you want to work with.
- [Specifying API metadata](#)  
API metadata provides summary information about the API. You enter API metadata in the Info section of the API definition.
- [Specifying the host for an API](#)  
You specify a host for an API if you want external developers on the portal to access your APIs by using a host address that is not the same as the API endpoints that are defined for the gateway services where your API will run.
- [Specifying the basepath for an API](#)  
The base path is the initial URL segment of the API, and does not include the host name or any additional segments for paths or operations. It is shared by all operations in the API.
- [Specifying the schemes for an API](#)  
Schemes define which transfer protocols you want your API to use. If your API is enforced by an API Connect gateway, only the HTTPS protocol is supported.
- [Specifying the MIME types that an API consumes](#)  
You can specify which types of media your API will accept when calls are made to it. The API Connect gateway supports XML and JSON.
- [Specifying the MIME types that an API produces](#)  
You can specify which types of media your API will return when calls are made to it. The API Connect gateway supports XML and JSON.
- [Enforcing security requirements on an API](#)  
To enforce security requirements on an API, you apply previously created security schemes that specify various aspects of API security configuration.
- [Specifying external documentation for an API](#)  
You can reference an external resource for extended documentation for an API.
- [Adding tags to an API](#)  
You can include tags in API definition. Such tags are added to the OpenAPI definition of the API but are not used by API Connect for any indexing.
- [Defining Paths for an API](#)  
A Path is a unit of a REST API that you can call. A Path comprises an HTTP verb and a URL path. By configuring the Path, you define how the API is exposed to your developers.
- [Defining schemas for an API](#)  
Schema components define reusable schemas that provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation.
- [Defining parameters for an API](#)  
Parameters can specify variable elements of a URL path, query parameters, headers, or a request body.
- [Defining responses for an API](#)  
Responses define the HTTP status code and data returned in a response body and headers. Responses defined for an API can be used across operations.
- [Specifying gateway and portal settings](#)  
Define general configuration settings for your API.

- [Defining target services for an API](#)  
A target service defines a web service that you want to use in your API definition.
- [Setting API properties](#)  
In addition to the pre-supplied API properties that you can use to control the behavior of API Connect policies, you can define your own API properties. The properties that you define can be referenced in your API definitions.
- [Configuring application authentication for an API](#)  
Application authentication settings allow you to protect your API with a certificate, for example, by using TLS mutual authentication. You can select whether a client certificate is sent as a TLS client certificate or in an HTTP header.
- [Configuring activity logging](#)  
You can configure your logging preferences for the API activity that is stored in Analytics, overriding the default activity logging behavior.
- [Configuring v5 compatibility options](#)  
You can configure settings to ensure compatibility with API Connect Version 5.0 compatible APIs that are converted for use with the DataPower® API Gateway.
- [Including elements in your API assembly](#)  
An assembly is formed of elements that are applied to calls to and responses from operations in your API. Elements can be either policies or logic constructs.
- [Specifying the gateway type for an API definition](#)  
An API definition is specific to one or other of the gateway types, DataPower API Gateway or DataPower Gateway (v5 compatible). A default gateway type is set when you create an API definition, but you can edit the API configuration to specify a different gateway type.
- [Converting an API definition for deployment to the DataPower API Gateway](#)  
IBM API Connect provides two gateway types, DataPower Gateway (v5 compatible) and DataPower API Gateway. If you have an API definition that was developed for the DataPower Gateway (v5 compatible) and you want to port it to the DataPower API Gateway, you must make changes to convert it before deployment.
- [Modifying a GraphQL schema](#)  
For a GraphQL API, an editor is provided for modifying the associated GraphQL schema.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Specifying API metadata

API metadata provides summary information about the API. You enter API metadata in the Info section of the API definition.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand the General section, then click Info.
3. Provide the following information:
  - Title (required): The title of the API.
  - Name: The name was generated automatically when the API was created and cannot be changed. The value in the Name field is a single string that is used to identify the API in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - Version: The API version is specified when the API is initially created and cannot be changed thereafter. You can, however, create a new version of an existing API; see [Creating a new version of an API definition](#).
  - Description: An optional description of the API. You can use [CommonMark syntax](#) for rich text representation.
  - Terms of Service: A URL to the Terms of Service for the API.
  - Contact Name: The identifying name of the contact person/organization.
  - Contact Url: A URL pointing to the contact information.
  - Contact Email: The email address of the contact person/organization.
  - License Name: The license name used for the API.
  - License Url: A URL to the license used for the API.
4. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Specifying the host for an API

You specify a host for an API if you want external developers on the portal to access your APIs by using a host address that is not the same as the API endpoints that are defined for the gateway services where your API will run.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand the General section, then click Host.
3. Enter the required host name.

Note: To enable this capability, you must additionally configure API vanity endpoints in the Catalog Settings for the Catalog to which the API is published. For information on configuring vanity endpoints, see [Creating and configuring Catalogs](#)

4. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying the basepath for an API

The base path is the initial URL segment of the API, and does not include the host name or any additional segments for paths or operations. It is shared by all operations in the API.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand the General section, then click Base Path.
3. Enter the required base path, preceded by a forward slash character (/).
4. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying the schemes for an API

Schemes define which transfer protocols you want your API to use. If your API is enforced by an API Connect gateway, only the HTTPS protocol is supported.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand the General section then, if there are already one or more schemes defined, expand Schemes List.
3. To specify a new scheme, click the add icon  alongside Schemes List. To modify an existing scheme, click the scheme entry in the navigation pane.
4. Select the required scheme from the list provided, then click Create.
5. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying the MIME types that an API consumes

You can specify which types of media your API will accept when calls are made to it. The API Connect gateway supports XML and JSON.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand the General section then, if there are already one or more consumes MIME types defined, expand Consumes.
3. To specify a new MIME type, click the add icon  alongside Consumes. To modify an existing MIME type, click the MIME type entry in the navigation pane.
4. Enter the required value in the Mime Type field; for example, `application/json` or `application/xml`. Then click Create.
5. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).
