

*IBM API Connect 10.0.2.0 to 10.0.4.x*

**IBM**

---

## Tables of Contents

<b>API Connect overview</b>	<b>1</b>
What's new in the latest release (Version 10.0.4.0-ifix3)	2
What's new in Version 10.0.3.0	4
What's new in Version 10.0.2.0	8
Language versions offered by API Connect	9
Version 10.0.x known limitations	9
API Connect concepts	17
Who does what in API Connect?	17
Packaging strategy and terminology in API Connect	18
Understanding rate limits for APIs and Plans	21
API Connect components	22
API Connect: End-to-end solution example	24
API Connect gateway types	26
API Connect user roles	27
API Connect support	31
API Connect glossary	31
Accessibility features for IBM API Connect	34
Legal information	34
Tracking API volume for auditing and compliance	35
Notices	35
Terms and conditions for information centers	37
IBM API Connect Considerations for GDPR Readiness	37
Essential reading	40
<b>Tutorials</b>	<b>40</b>
<b>Installing and maintaining IBM API Connect</b>	<b>41</b>
Kubernetes, OpenShift, and Cloud Pak for Integration	42
OpenShift: Updating ImageContentSourcePolicy to mirror API Connect images from icr.io	42
Planning your deployment	43
Key Concepts: Custom Resources, Operators, and Operands	43
Deployment overview for endpoints and certificates	43
Kubernetes ingress controller prerequisites	44
Load balancer configuration in a Kubernetes deployment	45
Firewall requirements on Kubernetes	47
Planning your Analytics deployment	50
Planning the Analytics profile and storage	50
Planning your topology	51
Reference: Analytics microservices	51
Planning to add a message queue	52
Planning to offload data to a third-party system	52
Planning to reduce storage complexity	52
Planning to disable internal storage	53
Planning to modify your analytics data	53
Estimating internal storage space	54
A two data center deployment strategy on Kubernetes and OpenShift	56
Key Concepts: Cert-manager, Issuers, and Secrets	58
Certificates in a Kubernetes environment	59
Custom certificates on Kubernetes	63
Custom certificates reference	63
Generating custom certificates	65
Generating custom certificates using cert-manager in a two data center deployment	68
Configuring custom certificates before installation	70
Converting to custom front-end/ingress certificates after deployment	71
Using custom certificates with IBM Kubernetes Service	72
Custom certificates reference for IKS	72
Installing Cert-Manager v0.12 for IKS	74
Generating custom certificates using default values for IKS	74
Generating custom certificates manually for IKS	75
Installing API Connect on IKS with custom certificates	78
Webhooks deployed and managed by the API Connect Operator	80
Installing API Connect	81
Deployment requirements	82
IBM API Connect Version 10 software product compatibility requirements	85
API Connect licenses	85
Deployment procedures	87
Deploying on Kubernetes	87
Obtaining product files	87
Signature verification by using PGP	89
Deploying operators	90
Deploying operators in a single-namespace API Connect cluster	90
Installing cert-manager and certificates in a two data center deployment	93

Deploying operators in a multi-namespace API Connect cluster	94
Installing the API Connect subsystems	97
Installing the Management subsystem cluster	98
Installing the Developer Portal subsystem	100
Defining multiple portal endpoints for a Kubernetes environment	103
Installing the DataPower Gateway subsystem	104
Installing the Analytics subsystem	107
Creating the Analytics CR	107
Reference: Fields in the Analytics CR	109
Configuring your topology	112
Adding a message queue	112
Offloading data to a third-party system	113
Sample output plugins for offloading data	114
Providing a custom certificate for Analytics offload	115
Reducing storage complexity	116
Disabling internal storage	117
Modifying your analytics data	118
Sample filters for modifying analytics data	118
Defining your internal storage space	119
Installing analytics	121
Deploying on OpenShift and Cloud Pak for Integration	121
Preparing for installation	122
Operator, operand, and CASE versions	122
API Connect configuration settings	123
Basic configuration settings	123
Management subsystem settings	125
Gateway subsystem settings	127
Developer Portal subsystem settings	129
Analytics subsystem settings	130
Additional Kubernetes settings	131
Configuring timeouts for management endpoints	131
Installing with the top-level CR	132
Connected installation	133
Installing operators	133
Installing API Connect	135
Air-gapped installation	136
Installing with a bastion host	136
Installing with a portable computer	140
Installing with a portable storage device	145
Installing on IBM Cloud Pak for Integration	150
Troubleshooting installation and upgrade on OpenShift	150
Upgrading API Connect	154
Upgrading on Kubernetes	154
Upgrade considerations on native Kubernetes	155
Upgrading subsystems on native Kubernetes	157
Upgrading Management subsystem on native Kubernetes	160
Upgrading Portal subsystem on native Kubernetes	161
Upgrading Analytics subsystem on native Kubernetes	162
Upgrading Gateway subsystem on native Kubernetes	163
Enabling gateway peering and verifying cluster status	164
Enabling Analytics after upgrading	165
Troubleshooting upgrades on Kubernetes	165
Migrating API test data	167
Backing up API test data	168
Restoring API test data	169
Uninstalling Percona Server for MongoDB	170
Upgrading on OpenShift and Cloud Pak for Integration	171
Upgrade considerations on OpenShift and Cloud Pak for Integration	171
Preparing to upgrade on OpenShift and Cloud Pak for Integration	173
Upgrading on OpenShift and Cloud Pak for Integration in an online environment	176
Upgrading on OpenShift in an air-gapped environment	180
Upgrading API Connect on OpenShift using a bastion host	180
Upgrading on OpenShift using a portable computer	187
Upgrading on OpenShift using portable storage	193
Enabling Analytics after upgrading	199
Troubleshooting installation and upgrade on OpenShift	150
Maintaining API Connect	203
Advanced configuration	204
Installing License Service	204
Installing the Automated API behavior testing application	205
Installing the toolkit	206
Changing deployment profiles on Kubernetes	209

Changing deployment profiles on OpenShift	211
Replica override for microservices	212
Changing the deployment profile on Cloud Pak for Integration	213
Enabling UI feature flags on Kubernetes	214
Enabling UI feature flags on OpenShift and Cloud Pak for Integration	215
Installing a two data center deployment	216
Converting a single data center to a two data center deployment	223
Advanced configuration for the management subsystem	227
Configuring maximum size of client requests to the Management subsystem	227
Setting rate limits for public APIs on the management service for a Kubernetes environment	228
Configuring monetization on Kubernetes	229
Overriding resources for Postgres components on Kubernetes	230
Overriding resources for Postgres components on OpenShift	232
Advanced configuration for the gateway subsystem	233
Customizing a DataPower deployment	233
Enabling autoscaling of gateway pods	234
Dynamically re-registering and reconfiguring a Gateway service in a Kubernetes deployment	235
Backing up and restoring	236
Backups on Kubernetes	236
Backing up and restoring the management subsystem	236
Configuring backup settings for fresh install of the Management subsystem	237
Configuring S3 backup settings for fresh install of the Management subsystem	237
Configuring SFTP backup settings for fresh install of the Management subsystem	239
Configuring local backup settings for fresh install of the Management subsystem	240
Reconfiguring or adding backup settings after installation of the management subsystem	241
Generating a manual backup of the management subsystem	242
Restoring the management subsystem (v10.0.1.1 or later)	243
Troubleshooting management subsystem backups	245
Troubleshooting resiliency issues	245
Troubleshooting stanza-create job for S3 backup configuration	245
Restore failure with bootstrap pod error	246
Backing up and restoring the Developer Portal in a Kubernetes environment	247
Backing up and restoring the analytics database	254
Configuring backup settings for Analytics	254
Running a backup of the Analytics database	255
Restoring the Analytics database	256
Troubleshooting Analytics backup and restore	258
Backups on OpenShift	259
Backing up and restoring the management subsystem on OpenShift and Cloud Pak for Integration	259
Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration	260
Configuring S3 backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration	260
Configuring SFTP backup settings for fresh install of the Management subsystem on OpenShift and Cloud Pak for Integration	263
Configuring local backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration	264
Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration	265
Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration	267
Restoring the management subsystem on OpenShift and Cloud Pak for Integration	268
Troubleshooting management subsystem backups on OpenShift and Cloud Pak for Integration	270
Troubleshooting resiliency issues on OpenShift and Cloud Pak for Integration	270
Troubleshooting the stanza-create job for S3 backup configuration on OpenShift and Cloud Pak for Integration	270
Backing up and restoring Developer Portal on OpenShift and Cloud Pak for Integration	272
Configuring backups for Developer Portal on OpenShift and Cloud Pak for Integration	272
Backing up Developer Portal on OpenShift and Cloud Pak for Integration	274
Restoring Developer Portal on OpenShift and Cloud Pak for Integration	276
Troubleshooting Developer Portal backup and restore on OpenShift and Cloud Pak for Integration	279
Backing up and restoring the Analytics database on OpenShift and Cloud Pak for Integration	280
Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration	281
Running a backup of the Analytics database on OpenShift and Cloud Pak for Integration	282
Restoring the Analytics database on OpenShift and Cloud Pak for Integration	284
Disaster recovery	286
Disaster recovery on Kubernetes	286
Preparing for a disaster	286
Preparing the management subsystem for disaster recovery	286
Preparing the Developer Portal for disaster recovery	288
Preparing the Analytics subsystem for disaster recovery	290
Recovering from a disaster	290
Recovering the management subsystem on Kubernetes	290
Recovering the management subsystem from S3 backups	291
Recovering the management subsystem from SFTP backups	293
Recovering the Developer Portal after a disaster	295
Recovering the Analytics subsystem after a disaster	297
Disaster recovery on OpenShift and Cloud Pak for Integration	297
Preparing for disaster recovery on OpenShift	297

Preparing the Management subsystem for disaster recovery on OpenShift	298
Preparing the Portal subsystem for disaster recovery on OpenShift	299
Preparing the Analytics subsystem for disaster recovery on OpenShift	301
Recovering from a disaster on OpenShift	301
Configuring the OIDC credentials on OpenShift	304
Preparing for disaster recovery on Cloud Pak for Integration	305
Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration	306
Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration	307
Preparing the Analytics subsystem for disaster recovery on Cloud Pak for Integration	309
Recovering from a disaster on Cloud Pak for Integration	309
Configuring the OIDC credentials on Cloud Pak for Integration	313
Disabling the Analytics subsystem on Kubernetes	314
Disabling the Analytics subsystem on OpenShift and Cloud Pak for Integration	315
Maintaining a two data center deployment	316
Failure handling of a two data center deployment	318
Recovering from a failover of a two data center deployment	321
Backup and restore considerations for a two data center deployment	323
Upgrading a two data center deployment	324
Removing a two data center deployment	329
Monitoring and health checks	330
Monitoring on Kubernetes	330
Monitoring subsystems on Kubernetes	330
Monitoring Postgres disk usage	331
Monitoring on OpenShift	333
Monitoring the API Connect cluster on OpenShift	333
Monitoring Postgres disk usage on OpenShift	334
Monitoring on Cloud Pak for Integration	337
Monitoring the API Connect cluster on Cloud Pak for Integration	337
Monitoring Postgres disk usage on Cloud Pak for Integration	338
Obtaining simple health check data of Developer Portal sites by using a REST API call	341
Logging	341
Gathering logs for a Kubernetes environment	342
Changing logging levels	342
Configuring logging for a Kubernetes deployment	343
Troubleshooting	344
Troubleshooting on Kubernetes	344
Troubleshooting the management subsystem	344
Troubleshooting the management database	345
Increasing the PostgreSQL archive_timeout on Kubernetes	345
Recovering when disks are filled by the management database	346
Resizing a PersistentVolumeClaim for Postgres by volume expansion	347
Resizing a PersistentVolumeClaim for Postgres by moving content to a new PVC	348
Resolving a NATS streaming cluster failed restart	349
Troubleshooting Analytics on Kubernetes	350
Analytics start-up issues on Kubernetes	350
Analytics offload issues on Kubernetes	352
Empty Analytics display on Kubernetes	352
Analytics running out of disk space on Kubernetes	353
Troubleshooting on OpenShift and Cloud Pak for Integration	353
Power-cycling check on OpenShift and Cloud Pak for Integration	354
Troubleshooting the Management subsystem on OpenShift and Cloud Pak for Integration	354
Troubleshooting the management database on OpenShift and Cloud Pak for Integration	354
Increasing the PostgreSQL archive_timeout on OpenShift and Cloud Pak for Integration	355
Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database	356
Resizing a PVC for Postgres on OpenShift by using volume expansion	356
Resizing a PVC for Postgres on OpenShift by moving content	358
Troubleshooting Analytics on OpenShift and Cloud Pak for Integration	359
>Analytics start-up issues on OpenShift and Cloud Pak for Integration	360
Analytics offload issues on OpenShift and Cloud Pak for Integration	361
Empty Analytics display on OpenShift and Cloud Pak for Integration	361
Analytics running out of disk space on OpenShift and Cloud Pak for Integration	362
Uninstalling API Connect	363
Uninstalling API Connect subsystems	363
Removing Management subsystem postgres resources on Kubernetes	365
Removing API Connect	366
Removing postgres resources on Kubernetes after removing API Connect	368
Removing API Connect on OpenShift or Cloud Pak for Integration	370
Removing postgres resources on OpenShift and Cloud Pak for Integration	371
VMware	372
Planning your deployment	373
Deployment overview for endpoints and certificates	373
Firewall requirements on VMware	374

Firewall enabled ports for clustered OVA deployments	377

Maintaining API Connect	471
Advanced installation on VMware	472
Installing a two data center deployment	472
Installing the IBM License Metric Tool on VMware	478
Installing the toolkit	206
Installing the Automated API behavior testing application	481
Advanced configuration on VMware	482
Configuring API Connect subsystems in a cluster	482
Testing a new configuration against a current cluster	486
Adding disk space to a VMware appliance	486
Add a node to a VMware cluster	487
Adding a node to a VMware cluster for management subsystem	487
Adding a node to a VMware cluster for Developer Portal subsystem	488
Adding a node to a VMware cluster for Analytics subsystem	489
Changing deployment profiles on VMware	490
Appliance boot mode configuration	492
Running commands at boot with iso-ignored boot mode	494
Managing an appliance data disk	495
Adding a static route on a virtual machine	495
Replica override for microservices on VMware	496
Advanced configuration for management subsystem	497
Setting rate limits for public APIs on the management service	497
Configuring maximum size of client requests to the Management subsystem on VMware	498
Configuring monetization on VMware	499
Configuring use of an external NTP server	501
Overriding resources for Postgres components on VMware	502
Enabling UI feature flags on VMware	503
Backing up and restoring on VMware	504
Backing up and restoring the management subsystem	504
Configuring backup settings during initial installation of the management subsystem	505
Verify configuration for s3 backup	507
Reconfiguring backup settings for the management subsystem	509
Backing up the management subsystem	511
Restoring the management subsystem	512
Troubleshooting management subsystem backups on VMware	513
Troubleshooting resiliency issues	514
Troubleshooting stanza-create job for S3 backup configuration	514
Workaround for scheduling and retaining local backups on management subsystem on VMware	515
Backing up and restoring the Developer Portal	516
Configuring backup settings for the Developer Portal subsystem	516
Backing up the Developer Portal subsystem	519
Restoring the Developer Portal subsystem	520
Backing up and restoring the Analytics database on VMware	521
Configuring backup settings for Analytics	522
Running a backup of the Analytics database	523
Restoring the Analytics database	524
Disaster recovery	525
Preparing for a disaster	525
Preparing the management subsystem for disaster recovery on VMware	526
Preparing the Developer Portal subsystem for disaster recovery on VMware	526
Preparing the Analytics subsystem for disaster recovery on VMware	527
Recovering from a disaster	527
Recovering the management subsystem on VMware	528
Recovering the Developer Portal subsystem on VMware	529
Recovering the Analytics subsystem on VMware	531
Using VM snapshots for infrastructure backup and disaster recovery	531
Disabling the Analytics subsystem on VMware	533
Maintaining a two data center deployment	534
Backup and restore considerations for a two data center deployment	536
Failure handling of a two data center deployment	536
Recovering from a failover of a two data center deployment	540
Removing a two data center deployment	542
Upgrading a two data center deployment	543
Monitoring and health checks	547
Checking cluster health on VMware	547
Monitoring Postgres disk usage on VMware	548

Obtaining simple health check data of Developer Portal sites by using a REST API call	549
Monitoring the network with SNMP	550
Logging	551
Configuring remote logging for a VMware deployment	551
Workaround to enable log rotation	552
Gathering logs for a VMware environment	553
Changing logging levels	554
Troubleshooting	555
Running a filesystem check on a VMware root partition	555
Troubleshooting the management database	556
Increasing the PostgreSQL archive_timeout on VMware	557
Dynamically re-registering and reconfiguring a Gateway service in a VMware deployment	557
Troubleshooting Analytics on VMware	558
Analytics start-up issues on VMware	558
Analytics offload issues on VMware	560
Empty Analytics display on VMware	560
Analytics running out of disk space on VMware	561
Migrating a Version 5 deployment	562

VMware: Renewing the postgres-pgbouncer-secret	686
Renewing certificates in a two data center deployment on Kubernetes and OpenShift	686
Renewing certificates in a two data center deployment on VMware	688
Management subsystem: restarting pods	688
Gateway subsystem: restarting pods	689
Portal subsystem: restarting pods	690
Analytics subsystem: restarting endpoints and pods	690
Restarting the Analytics client endpoint	691
Restarting the Analytics ingestion endpoint	691
Restarting Analytics pods and data collection	692
Re-enabling scheduled backups	693
The API Connect operations tool: apicops	693
<b>Configuring and managing your server environment</b>	<b>693</b>
Cloud Manager configuration checklist	694
Activating your Cloud Manager user account	695
Accessing the Cloud Manager user interface	696
Defining your Cloud Manager topology	697
Configuring the Management service	699
Creating an Availability Zone	699
Registering a gateway service	700
Registering an analytics service	702
Registering a Portal service	703
Associating an analytics service with a gateway service	704
Setting visibility for a service	705
Managing authentication and security	706
User registries overview	706
Configuring an Authentication URL user registry	707
Configuring a shared custom user registry	709
Configuring an LDAP user registry in the Cloud Manager	714
Using the CLI to configure a shared LDAP user registry	717
Configuring a Local User Registry	723
Configuring an OIDC user Registry	724
Setting visibility for a user registry	729
Deleting a user registry	730
Removing a user from a user registry	730
Removing yourself from a user registry	731
Removing another user from a user registry	731
TLS profiles overview	732
Viewing TLS Profiles, Keystores, and Truststores	733
Creating a TLS Server Profile	734
Creating a TLS Client Profile	735
Setting visibility for a TLS Client Profile	736
Defining elliptic curve cryptographic schemes for a TLS client profile	737
Creating a Keystore	738
Creating a Truststore	739
Viewing certificate details and adding certificates to a keystore or truststore	739
Generating a self-signed certificate using OpenSSL	740
Generating a PKCS#12 file for Certificate Authority	741
Binding a TLS server profile to a gateway service	742
Updating the PKCS#12 certificate for a TLS server profile	742
OAuth Provider overview	743
Configuring a native OAuth provider	744
Configuring basic settings for a native OAuth provider	745
Configuring scopes for a native OAuth provider	746
Configuring user security for a native OAuth provider	747
Configuring tokens for a native OAuth provider	748
Configuring token management and revocation for a native OAuth provider	749
Configuring introspection for a native OAuth provider	750
Configuring metadata for a native OAuth provider	751
Configuring the OIDC parameters for a native OAuth provider	751
Editing a native OAuth provider by using the API Editor	752
Configuring a third-party OAuth provider	753
Setting the visibility for OAuth providers	754
OAuth concepts for API Connect	755

OAuth user scenario	755
OAuth introspection for third-party OAuth providers	756
OAuth metadata URL and authentication URL	758
Scope	761
Tokens	765
Refresh tokens	765
OAuth revocation URL	765
Authenticating and authorizing through a redirect URL	768
Token management with the DataPower Gateway (v5 compatible)	769
Token management with the DataPower API Gateway	771
Authentication URL	773
Custom forms for user security	774
Creating a custom HTML login form for user security	775
Creating a custom HTML authorization form for user security	776
Securing an API with a JSON Web Token	777
Troubleshooting OAuth	777
Configuring the cloud settings	778
Using the CLI to modify cloud settings	779
Change the name of your cloud	780
Configuring an email server for notifications	780
Setting up notifications	781
Customizing email notification templates	782
Configuring invitation timeouts	784
Configuring API Key timeouts	784
Allowing the API key to be used for multiple logins	785
Configuring the password-reset notification and timeout	785
Selecting user registries for Cloud Manager and API Manager	786
Setting a default user registry for Cloud Manager and API Manager	786
Configuring timeouts for access tokens and refresh tokens	787
Viewing platform and UI endpoints	788
Configuring the default gateway services for Catalogs	789
Managing the public/private key pairs for signing tokens	789
Configuring public/private key pairs for tokens	790
Administering provider organizations	792
Creating a provider organization	792
Editing a provider organization	793
Deleting a provider organization	794
Viewing current provider organizations	795
Sending messages to provider organization owners	795
Administering members and roles	796
Creating roles in the admin organization	797
Editing roles in the admin organization	797
Configuring LDAP group mappings on Cloud Manager user roles	798
Deleting roles in the admin organization	800
Viewing members and roles	801
Adding members to the admin organization	801
Assigning roles to members	802

Example WSDL file: globalweather.wsdl	2030

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API Connect overview

IBM® API Connect is an integrated API management offering, with capabilities and tooling for all phases of the API lifecycle. Key steps of the API lifecycle include create, secure, manage, socialize, and analyze. IBM API Connect Version 10 delivers enhanced capabilities for the market-leading IBM API management solution. In addition to the ability to deploy in complex, multi-cloud topologies, this version provides enhanced experiences for developers and cloud administrators in your organization.

IBM API Connect has two main focuses: the first is providing best in class API Management tooling, and the second is having a cloud native solution. This allows users to create, manage, and secure applications that are deployed across a variety of on-premises and cloud environments.

The following table explains the key phases in the API lifecycle in more detail.

Table 1. Key phases of the API lifecycle

Lifecycle Phase	Description
Create	Develop and write API definitions from an API development environment, eventually bundling these APIs into consumable products, and deploying them to production environments. For tutorials, walk-throughs, and in-depth guides for building, testing, and deploying APIs and Products in API Connect, see <a href="#">Tutorials</a> , and <a href="#">Developing your APIs and applications</a> .
Secure	Leverage the best-in-class API Gateway, gateway policies, and more, to manage access to your APIs and back-end systems. To learn more about adding security to your API, see <a href="#">Configuring API security</a> .  To learn more about how to add API Gateway policies to your API, see <a href="#">API policies and logic constructs</a> .
Manage	Governance structures are built in to the entire API lifecycle, from managing the view/edit permissions of APIs and Products being deployed, to managing what application developers can view and subscribe to when APIs are deployed. To understand and leverage API Connect management and governance controls along the API lifecycle, see <a href="#">Managing your APIs</a> .
Socialize	API Connect comes with an advanced Developer Portal that streamlines the onboarding process of application developers, and can be completely customized to an organization's marketing standards. To understand more about using the Developer Portal, see <a href="#">Developer Portal: Socialize your APIs</a> .
Analyze	Developers and Product Managers alike are given the tooling in API Connect to understand their API traffic patterns, latency, consumption, and more to make data driven insights into their API initiatives. To learn more about how to leverage API Connect analytics tooling, see <a href="#">API Analytics</a> .

API Connect has four major components: API Manager, Analytics, Developer Portal, and Gateway. These four components can be deployed in a variety of hybrid and multi-cloud topologies. The API Connect infrastructure can either be deployed and managed by an IBM team in an IBM Cloud environment, or it can be deployed and managed by the customers in their own dedicated environment or third-party cloud. There is also the option for having hybrid scenarios, for example, with the API Connect Reserved Instance Offering, users are able to have their API Manager and Developer Portal running in the IBM Cloud, but then place remote gateways next to their back-end services.

Configuration of customer deployed API Connect clouds is done through the Cloud Manager. For in-depth guides and instructions see [Configuring and managing your server environment](#).

For information about the API Connect components that provide these capabilities, and details about the strategy for packaging and publishing APIs for use by API consumers, see:

- [Packaging strategy and terminology in API Connect](#)
- [API Connect components](#)

Note: For a comprehensive technical guide to best practices, considerations, and deployment options for API Connect, see the [API Connect 2018.4.1.x Whitepaper](#).

- [What's new in the latest release \(Version 10.0.4.0-ifix3\)](#)  
This page details the enhancements in IBM API Connect Version 10.0.4.0-ifix3.
- [Language versions offered by API Connect](#)  
API Connect is offered in several languages, as enabled by the operating platform on which the product is installed.
- [Version 10.0.x known limitations](#)  
This page describes the known limitations for API Connect 10.0.x.
- [API Connect concepts](#)  
To help you get started, read about the API Connect concepts and obtain a high level understanding of the API management solution.
- [API Connect gateway types](#)  
IBM API Connect provides two gateway types, DataPower® API Gateway and DataPower Gateway (v5 compatible). In addition, Event Endpoint Management in Cloud Pak for Integration provides the Event Gateway Service for handling incoming requests to consume from a stream of events.
- [API Connect user roles](#)  
The IBM API Connect solution provides an infrastructure, tools, and facilities that allows users to create, manage, and stage APIs. The ability to perform tasks in the API Connect user interfaces is controlled through user roles, and the permissions that are assigned to those roles.
- [API Connect support](#)  
If you experience a problem with IBM API Connect that you cannot resolve, you can check the IBM Support website for the most recent technical bulletins and fixes. Otherwise, you can contact IBM Support.

The IBM API Connect and Cloud Manager glossary of terms and definitions.
- [Accessibility features for IBM API Connect](#)  
Accessibility features help users who have a physical disability, such as restricted mobility or limited vision, to use information technology products successfully.
- [Legal information](#)  
Notices, and terms and conditions for information centers.
- [IBM API Connect Considerations for GDPR Readiness](#)  
Information about features of IBM API Connect that you can configure, and aspects of the product's use, that you should consider to help your organization with

GDPR readiness.

- [Essential reading](#)

These articles by IBM API Connect product specialists provide a wealth of supporting information on APIs and the API economy.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## What's new in the latest release (Version 10.0.4.0-ifix3)

This page details the enhancements in IBM® API Connect Version 10.0.4.0-ifix3.

If you are moving to Version 10 from Version 5, also see the [What's new in Version 2018](#) page for the additional new features since Version 5.

As enterprises continue their digital transformation agendas, IT leaders are looking to APIs as a means to interconnect digital solutions across their hybrid and multicloud landscape. This API-led innovation helps organizations accelerate the delivery of new business models and superior client experiences as they create, secure, manage, and socialize APIs across multi-cloud landscapes. IBM API Connect Version 10 can help increase productivity and improve outcomes for teams involved in API-led innovation efforts, including the following roles:

- [Developers](#): Increase productivity by consistently building high-quality APIs.
- [API product managers](#): Enhance trust with API consumers through service-level agreement compliance.
- [API consumers](#): Accelerate use of data and processes to build new applications.
- [Developer Portal administrators](#): Socialize APIs across multi-cloud landscapes.
- [DevOps](#): Streamline operations across a multi-cloud and hybrid cloud landscape.
- [Security practitioners](#): Help ensure high levels of API security with modern standards and policy control.

Note: You can access the latest files from [IBM Fix Central](#) by searching for the API Connect product and your installed version.

### Use of inclusive terminology

While IBM values the use of inclusive language, terms that are outside of IBM's direct influence are sometimes required for the sake of maintaining user understanding. As other industry leaders join IBM in embracing the use of inclusive language, IBM will continue to update the product interface to reflect those changes.

---

## Version 10.0.4.0 ifixes

10.0.4.0-ifix3

Version 10.0.4.0-ifix3 contains only fixes.

10.0.4.0-ifix2

Version 10.0.4.0-ifix2 contains fixes, and it also supports OpenShift Container Platform 4.9 and future fix packs, and 4.10 and future fix packs.

10.0.4.0-ifix1

Version 10.0.4.0-ifix1 contains only fixes.

---

## Version 10.0.4.0 product release

The following sections detail the changes and additions in version 10.0.4.0.

---

## What's new for Developers

An API's payload URL must match the scope of the request URL

When you perform a Catalog or Space action on a Product (for example, replace or supersede), the URLs in the API's payload must specify the same scope (Catalog or Space) as the request URL. For example, if the request URL specifies /catalogs/ as the scope, then the URLs in the payload must also specify /catalogs/ as the scope. If the request URL specifies /spaces/ as the scope, then the URLs in the payload must also specify /spaces/ as the scope.

HTTP Bearer supported as the security scheme for OpenAPI 3 APIs

The HTTP Bearer security scheme (as specified in the OpenAPI 3 Specification) is now supported for OpenAPI 3 API definitions. For more information, see [Defining an HTTP bearer security scheme](#).

Import a REST API from a URL

When you create a REST API by importing the YAML file definition, you can specify the URL where the file is hosted. This saves you the intermediate step of downloading the file to your local storage before importing it. For more information, see [Adding a REST API by importing an OpenAPI definition file](#).

Test tab no longer includes websocket subscription in payload while invoking a GraphQL API when "by URL parameter" option is selected

When working with GraphQL APIs in the Test tab, invoking a websocket subscription with "by URL parameters" option will no longer include the subscription in the payload. The subscription will only be included in the URL parameters, matching the approach used by queries and mutations.

This change applies only to the Test tab (API Manager, API Designer) and does not affect third-party clients.

Test and debug support for non-Sandbox catalogs

You can now choose which catalog an API can be published to, directly from the API editor header. When selecting any catalog, the Test tab is enabled so you can click it to test your API. The test feature is no longer limited to the Sandbox catalog.

Added JSONata extension functions to support GraphQL APIs

When you use JSONata notation in assembly actions, you can use extension functions to retrieve elements from GraphQL messages. For more information, see [Constructing JSONata expressions to redact fields](#).

Enhanced support for GraphQL APIs

The custom scalar type `Long` allows use of integers that are lesser or greater than those handled by the default scalar type `Int`. For more information, see [Long custom scalar](#).

You can use the `@scalarParam` directive to customize custom scalar types. [Extensions to GraphQL](#).

CORS support for customizing an `Access-Control-Expose-Headers` response header

You can now customize the `Access-Control-Expose-Headers` response header in your CORS support for an API. For more information, see [Enabling CORS support for an API](#).

DataPower® Gateway (v5 compatible) mode now returns `null` for `apim.getvariable('request,body')`

DataPower Gateway (v5 compatible) mode now returns `null` for `apim.getvariable('request,body')` for a get request. For more information about how to reference different variables in your API definition, see [Variable references in API Connect](#).

## What's new for API product managers

---

Apply Catalog actions to Spaces

Certain Catalog actions can now be applied across Spaces. For example, you can replace or supersede Products hosted in the same Space, and as well as Products hosted in different Spaces. Review the following list for a summary of the Catalog actions that can be used when Spaces are enabled:

- Product gateway update: Space scope only
- Product lifecycle actions:
  - Stage/publish from draft or direct stage/publish from multipart Product: Space scope only
  - Other lifecycle actions can be at Space or Catalog scope
- Product composite lifecycle actions:
  - At the Space scope, both Products must be hosted in the same Space
  - At the Catalog scope, Products can be in different Spaces
- API update to online/offline status: Both Space and Catalog scopes are supported

Ability to select which gateway to publish to is now available in the Product create wizard

When you create a new draft Product in the API Manager UI, you can now select which gateway to publish your Product to. For more information, see [Creating a draft Product](#).

Create custom Plan metadata to display in the Developer Portal

Along with the Product and API custom metadata, you can now create custom metadata for your Plans. By adding the custom attribute `x-name: value` to the Plan OpenAPI source, you can specify custom metadata to display with your Plans in the Developer Portal. For more information, see [Editing a draft Product](#).

Custom email styling is now available for the emails that are sent from the Cloud Manager and the API Manager

You can now apply custom styling to the content of the emails that are sent from the Cloud Manager and the API Manager, such as invitations, product lifecycle events, and emails to provider and consumer organization owners. For more information, see the following topics:

- [Customizing email notification templates in the Cloud Manager](#)
- [Sending messages to provider organization owners](#)
- [Configuring notifications in the API Manager](#)
- [Sending messages to consumer organization owners](#)

## What's new for API consumers

---

Migrate subscriptions between Plans within a Product

You can now migrate subscriptions between Plans within a single Product, in addition to migrating them to a Plan within a different Product. When you migrate the subscriptions between Products, the Products can reside in the same Space or in different Spaces. For more information, see [Migrating application subscriptions](#).

Custom email styling is now available for the emails that are sent by the Developer Portal

API consumers can now receive emails from the Developer Portal that are custom styled to match your business theme. For more information, see [How to style the Developer Portal emails](#).

## What's new for Developer Portal administrators

---

New commands are available in the Developer Portal command-line tool

The following commands are now available in the Developer Portal command-line tool:

- `api:get-document` and `product:get-document` - Get a specific entire document for a given API or product on a specific Developer Portal site; see [Using the api commands](#) and [Using the product commands](#).
- `custom-translation` - Create an import or export task that will import or export a .tgz of custom translations for a Developer Portal site; see [Using the custom-translation commands](#).
- `custom-webserver-page` - Use the set, get, and delete commands, to customize the index, 404, 40x, and 50x web server error pages on your Developer Portal service. For more information, see [Using the custom-webserver-page commands](#).
- `drupal-config` - Manage the Drupal configuration objects on your Developer Portal service, for example to disable CSS and JS aggregation; see [Using the drupal-config commands](#).
- `factory-reset` - Perform a factory reset of your Developer Portal, deleting the portal service and all of its associated Developer Portal sites; see [Using the factory-reset command](#).
- `ip-security-enabled:update` - Enable or disable the IP security at the Portal service level; see [Using the ip-security-enabled command](#). For an overview of the IP address security measures that are available in the Developer Portal, see [How to manage IP security in the Developer Portal](#).
- `site:cache-rebuild` - Rebuild the Drupal cache on your Developer Portal site; see [Using the site commands](#).
- `site:state` - Obtain the current state of a Developer Portal site, for example to understand the general health of the site; see [Using the site commands](#).
- `twig` - Enable, disable and list the state of the twig debugging on a specific Developer Portal site; see [Using the twig commands](#).

The `Legal` module is now included in the list of core modules

The `Legal` module is now included in the list of core Developer Portal modules. This module provides more options for configuring your site terms and conditions. For more information, see [Forcing new users to accept terms and conditions](#).

Custom email styling is now available for the emails that are sent by the Developer Portal

You can now apply custom styling to the HTML content of the emails that are sent by the Developer Portal, such as those sent by using the Email subscribers wizard. For more information, see [How to style the Developer Portal emails](#).

#### Upgrade from php 7.4 to php 8.0

Php has been upgraded to version 8.0. If you are using additional contributed modules, or custom modules, check that they are compatible with php 8; also check the php release notes for any breaking changes.

## What's new for DevOps

---

#### Image host changing from docker.io to icr.io

API Connect is changing product image hosting services from docker.io to icr.io. API Connect images on docker.io are available but are subject to Docker rate-limiting terms after Dec 31, 2022. To prevent rate-limiting issues, complete the steps in [OpenShift: Updating ImageContentSourcePolicy to mirror API Connect images from icr.io](#).

#### APICOPS command to detect stale certificates

The new APICOPS command `apicops upgrade:stale-certs` returns a list of stale certificates; for example, so that you can delete them after a certificate manager upgrade. The API Connect upgrade instructions now include a step explaining when and how to check for stale certificates.

#### Migrate a v10 deployment to a different form factor

Use migration scripts to migrate API Connect to another form factor, or to a different deployment on the same form factor. For example, you can migrate a deployment on VMware to a deployment on OpenShift. The migration target system must be on the same version of API Connect as the source system. See [Migrating v10 to another form factor](#).

#### Migrate a v5 deployment to Cloud Pak for Integration

Migrate a v5 API Connect deployment to a Cloud Pak for Integration v2021.4. See [Migrating a Version 5 deployment](#).

#### Error message reference added for migrating a Version 5 deployment

An error message reference has been added to the documentation for migration a version 5 deployment. See [Migration troubleshooting](#).

#### Change your deployment profile after installation

After API Connect is installed, you can change your deployment profile from `development` to `production`, or from `production` to `development`. For more information, see the [installation instructions](#) for your environment.

#### Configure a second network interface card for the Developer Portal on VMware

You can configure a second network interface card (NIC) for the Developer Portal. Use of a second NIC allows you to separate internal traffic between Developer Portal and APIM from the public network traffic where end users can access the portal web sites. See [Configuring two NICs on the Developer Portal](#).

#### Drupal 9 upgrade compatibility check now added to the Developer Portal upgrade process

A compatibility check has been added to the Developer Portal upgrade process to verify that any additional contributed modules, or custom modules, or sub-themes, declare that they are compatible with Drupal 9. Any Developer Portal sites that contain modules or sub-themes that don't have this version declaration will fail to upgrade. For information about how to make the Drupal 9 version declaration in custom modules or sub-themes, see [Installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal](#). For more information about Drupal 9, see [About Drupal 9](#) on the drupal.org website.

#### Pre-upgrade health-check script improved

The `apicops` pre-upgrade script has been expanded to include additional checks of your deployment's health. Before upgrading to this release of API Connect, you should run the script and check the results as explained in the upgrade instructions for each platform.

## What's new for security practitioners

---

#### Additional email address settings for all user registries

The following two new settings are now available on all user registries to manage the use of email addresses when onboarding new users:

- Email required - Select this checkbox if an email address is required as part of the user onboarding process.
- Unique email address - Select this checkbox if email addresses must be unique within the user registry.

#### Note:

- An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
- Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.
- If Email required is selected, the source identity provider must supply the email address as part of the authentication process, or the user will fail to onboard.
- For new Local User Registries, the Unique email address setting is always selected; so if email addresses are contained in the user record, they must be unique. However, for existing Local User Registries this setting can be edited.

For more information, see [User registries overview for the Cloud Manager](#) or [Working with user registries in the API Manager](#), and select the required user registry type.

#### Increased OpenAPI 3.0 support

The following updates have been made to the Open API 3.0 support for APIs that are enforced by the DataPower API Gateway:

- All assembly policies are now supported, except for the `validate` and `map` policies.
- The HTTP JWT Bearer security scheme is now supported.

For more information, see [OpenAPI 3.0 support in IBM API Connect](#).

- [What's new in Version 10.0.3.0](#)

This page details the enhancements in IBM API Connect Version 10.0.3.0 over the previous Version 10.0.2.0 release.

- [What's new in Version 10.0.2.0](#)

This page details the enhancements in IBM API Connect Version 10.0.2.0 over the previous Version 10.0.1.2 release.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## What's new in Version 10.0.3.0

This page details the enhancements in IBM® API Connect Version 10.0.3.0 over the previous Version 10.0.2.0 release.

If you are moving to Version 10 from Version 5, also see the [What's new in Version 2018](#) page for the additional new features since Version 5.

Note: You can access the latest files from [Fix Packs Available for IBM API Connect v10](#).

---

## What's new for Developers

### New OpenAPI 2.0 editor

A new API editor is provided for OpenAPI 2.0 APIs. This editor is based on the design of the OpenAPI 3.0 editor that was introduced in IBM API Connect Version 10.0.1.1. For more information, see [Editing an OpenAPI 2.0 API definition](#).

### Search expanded to all list pages

The Search feature in lets you search the items displayed in list pages in API Manager and API Designer. Previously this feature was limited to a subset of list pages, but is now available in API Manager and API Designer all pages that display lists. For information on the Search feature, see [Searching list pages](#).

### Specify the HTTP status code and reason phrase when throwing an error

When configuring a Throw policy in the catch block of an API assembly, you can now specify the HTTP status code and reason phrase. For more information, see [throw](#).

### Enable persistent connections to a target endpoint

A new Persistent Connection option has been added to the Invoke policy that, when selected, enables persistent connections to the target endpoint, allowing connection re-use. For more information, see [Invoke](#).

### Specify the type of content to log for the Log policy

When configuring a Log policy in an API assembly, a new Log Level property allows you to specify the type of content to log. For more information, see [Log](#).

### Designate an error global policy

You can now deploy an error global policy to a gateway service, to be called whenever an error is thrown. For more information, see [Working with global policies](#).

### Expanded support for the GraphQL send type property on the Invoke policy

The Invoke policy now additionally supports the GraphQL send type property when the Backend type is Detect, or the HTTP Method is Keep. For more information, see [Invoke](#).

### Enhancements to GraphQL support

- GraphQL subscriptions are now supported in the payload, in addition to being supported in query requests.
- GraphQL requests can now be sent by using the GET method, in addition to the POST method.
- Two-phase introspection is now supported.
- Negative weights are now supported in analysis configurations.
- The default `@deprecated` directive now supports the `reason` argument for stating the reason why a field or type is marked as being deprecated.
- Query validation now checks to determine whether all `@directives` are known by the schema and legally positioned.
- The assembly validate action now correctly processes GraphQL responses that contain an error and no data or partial data.

For details of current limitations in GraphQL support, see [GraphQL limitations](#).

### Specify the testing preferences for an API

By default, when you test an API with the Test tab, a range of test parameters are configured by default. For example, a default Product is automatically generated, to which the API is added, and that Product is published to the Sandbox Catalog. However, you can now configure testing preferences for each of your APIs, including the required Product and target Catalog. For more information, see [Specifying the testing preferences for an API](#).

### Preserve headers for logging to analytics

When configuring activity logging for an API, you can now specify custom request and response headers that are preserved for logging to analytics. For more information, see [Configuring activity logging](#).

### Update a SOAP API from a WSDL file or a .zip archive

You can now use the Update WSDL option in the API Manager UI, or run the `apic draft-apis:update-wsdl` command in the developer toolkit, to update the configuration of an existing SOAP API. For more information, see [Updating a SOAP API](#) for the API Manager instructions, or [API development and management commands](#) for the developer toolkit CLI instructions.

### Testing an API by using the Explorer tab in the API editor

You can now use the Explorer tab in the API editor of the API Manager and API Designer UIs, to see how your APIs look to a consumer in the Developer Portal. You can check the descriptions of the different artifacts, and review any schemas or examples, and you can also use the Try it tool to test the behavior of the API. For more information, see [Testing an API with the Explorer tab](#).

### Modify the headers and parameters of an API request

You can now use the following API context variables to modify the headers and parameters of an API request by customizing the preflow policies:

- `request.headers.name`
- `request.original.headers.name`
- `request.parameters.name.values`
- `request.original.parameters.name.values`

For more information, see [API Connect context variables](#).

### Extend the OpenAPI specification by using the user interface

In addition to the CLI support that was available in previous releases, you can now use the user interface to extend the OpenAPI specification, by adding either a JSON or YAML extension schema to an API. An extension is imported into a Catalog, or as Space in a Catalog, then added to the API schema. For more information, see [Importing an OpenAPI extension into a Catalog](#) and [Adding an OpenAPI extension to an API](#).

### Enhanced SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 validation

Validation of SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 documents by is now done by the API Dev Tools Swagger Parser at stage or publish time. This also includes de-referencing of documents to ensure that included local references (that is, `$ref` properties) are valid. For more information on staging and publishing APIs, see the following topics:

- [Staging an API](#)
- [Staging a draft Product](#)

- [Publishing an API](#)
- [Publishing a draft Product](#)

Note: If you are upgrading an existing API Connect installation, you should check whether your existing OpenAPI files are parsable and considered valid by the API Dev Tools Swagger Parser. For more information see one of the following topics depending on your platform:

- [Upgrade considerations on native Kubernetes](#)
- [Upgrade considerations on OpenShift and Cloud Pak for Integration](#)
- [Upgrade considerations on VMware](#)

Directly navigate to specific APIs and operations in the Open API Explorer Documentation

You can now use the URL to navigate directly to specific APIs and operations in the OpenAPI Explorer Documentation for the API Connect REST APIs. You can also select the APIs for a specific version by using the drop-down menu in the header bar. See [Open API Explorer Documentation for Version 10 and later](#).

## What's new for API product managers

---

Transfer ownership of a Catalog or Space

You can now transfer the ownership of a Catalog or Space to another user. Optionally, you can also have the ownership of all Spaces in a Catalog transferred to the new organization owner. For more information, see [Creating and configuring Catalogs](#) and [Creating, modifying, and deleting Spaces](#).

Transfer ownership of a Consumer organization

You can now transfer the ownership of a consumer organization to another user. For more information, see [Editing a consumer organization](#).

Add member option now available when adding users to a provider organization

When you add a user to a provider organization, you can now use the Add member option to have a new or existing user added immediately without sending an activation email. For more information, see [Adding provider organization users and assigning roles](#).

Send email messages to consumer organization owners

You can now send an email message to the owners of selected consumer organizations, or to the owners of all the organizations in a consumer organization group. For more information, see [Sending messages to consumer organization owners](#) and [Working with consumer organization groups](#).

Toggle the visibility and subscribability of a Product

You can now control whether or not a Product in a Catalog is visible or subscribable with a single check box. For more information, see [Changing the availability of a Product](#).

Modify Product visibility and subscribability settings when publishing

Product visibility and subscribability settings are initially configured in the draft Product definition. However, you can now modify these settings when publishing the Product. For more information, see [Publishing a draft Product](#).

Retain Version 5 vanity endpoint behavior in a Catalog by using the API Manager user interface

In addition to the developer toolkit CLI support that was provided in Version 10.0.0.0, you can now modify your Catalog settings to retain the Version 5 vanity endpoint behavior by using the API Manager user interface. For more information, see [Retain Version 5 vanity endpoint behavior in a Catalog](#).

Migrate application subscriptions

You can now migrate application subscriptions from one Product to another Product. For more information, see [Migrating application subscriptions to another Product](#).

Additional configuration options for onboarding API consumers into a Catalog

You can now require approval for all new self service onboarding to the Developer Portal, and configure the ability for API consumers to invite collaborators and assign them to roles in the Developer Portal. For more information, see [Creating and configuring Catalogs](#).

View and edit the email notification templates in different languages

You can now view and edit the email notification templates in different languages. For more information, see [Configuring notifications in the API Manager UI](#).

Retain the OAuth **Authorization** header for a third-party OAuth provider

When configuring a third-party OAuth provider, you can now select to retain the **Authorization** header for a bearer token. For full details on configuring a third party OAuth provider, see [Configuring a third-party OAuth provider](#).

Product managers can now review API Plan subscription requests more quickly

If an API Plan has been configured to require subscription approval, the approval emails for the subscription requests now contain links that take Product managers directly to the Task page in the appropriate Catalog so that they can review the request. For more information, see [Approving Product lifecycle and subscription requests](#).

View the Client ID's for a Product subscription per application

For each Product subscription, you can now view all of the Client IDs per application. For more information, see [Working with developer applications](#) and [Working with the subscriptions in a Product](#).

View the history of Product lifecycle requests

You can now view the history of Product lifecycle requests and approvals in the API Manager UI. For more information, see [Publishing a Product](#).

Ability to view which Catalogs or Spaces a Product is published to

You can now view which Catalogs, or Spaces if applicable, a particular Product has been published to from within the Product itself. For more information, see [Publishing a draft Product](#).

## What's new for API consumers

---

New activity feed for Consumer organizations on the Developer Portal

The Developer Portal now includes an activity feed that shows Consumer organization users the details of events that occur on the organization, such as application creation, subscriptions, and so on. This activity feed is displayed by default on the navigation bar of the organization, and as an additional tab on the organization page and the application page.

## What's new for Developer Portal administrators

---

Directly navigate to a specific Product or API in the Developer Portal

You can navigate directly to a specific Product or API in the Developer Portal by using `x-ibm-name:version` in the URL. For more information, see [How to use a URL to navigate directly to a Product or API in the Developer Portal](#).

Upgrade from Drupal 8 to Drupal 9 content management system

The Developer Portal is now based on the Drupal 9 content management system. This is an in-place upgrade, so no specific steps need to be taken. However, if you are using additional contributed modules, or custom modules or sub-themes, you should check that they are compatible with Drupal 9, and not using any deprecated APIs for example. There are tools available for checking your custom code, such as [drupal\\_check](#) on GitHub, which checks Drupal code for deprecations. For information about how to make the core version of custom modules or sub-themes compatible with Drupal 9, see [Installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal](#). For more information about Drupal 9, see [About Drupal 9](#) on the drupal.org website.

New **security** and **service-ip-allowlist** commands available in the Developer Portal command-line tool

The following commands are now available in the Developer Portal command-line tool to help you manage IP addresses:

- **apic security:clear-bans** - Clear all of the banned user/IP addresses on a portal site. For more information, see [Using the security command](#).
- **service-ip-allowlist** - Add, delete, list, or remove IP addresses on the **allowlist** to manage which IP addresses are exempt from being blocked by portal security checks. For more information, see [Using the service-ip-allowlist command](#).

Configure the notifications event log settings for your Developer Portal

The Developer Portal now includes an activity feed that shows Consumer organization users the details of events that occur on the organization, and you can configure the amount of days that the events are kept for. For more information, see [Configuring the notifications event log settings](#).

## What's new for DevOps

---

Transfer ownership of a provider organization

You can now transfer the ownership of a provider organization to another user. Optionally, you can also have the ownership of all Catalogs and Spaces in the organization transferred to the new organization owner. For more information, see [Editing a provider organization](#).

Send emails to provider organization owners

You can now send an email message to the owner of a provider organization. For more information, see [Sending messages to provider organization owners](#).

Autoscaling gateway pods

Autoscaling enables the gateway deployment to scale dynamically, either vertically or horizontally, based on memory and CPU. Configure autoscaling settings in the Gateway CR. For more information, see [Gateway subsystem settings](#) (OpenShift, Cloud Pak for Integration) or [Installing the DataPower Gateway subsystem](#) (Kubernetes).

New Product information tile

In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a new Product information tile. Click this tile to find out information about your product versions, and Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

View and edit the email notification templates in different languages

You can now view and edit the email notification templates in different languages. For more information, see [Customizing email notification templates in the Cloud Manager UI](#).

Retain the OAuth **Authorization** header for a third-party OAuth provider

When configuring a third-party OAuth provider, you can now select to retain the **Authorization** header for a bearer token. For full details on configuring a third party OAuth provider, see [Configuring a third-party OAuth provider](#).

Timestamp format changed for Developer Portal restore operations

The timestamp format that is used in Developer Portal restore operations has changed from **YYYY-MM-DD HH:MM:SS** to **YYYYMMDD.HHMMSS**. For more information, see:

- [Backing up and restoring the Developer Portal in a Kubernetes environment](#)
- [Restoring Developer Portal on OpenShift and Cloud Pak for Integration](#)
- [Restoring the Developer Portal subsystem on VMware](#)

No hard analytics data retention limit

The default retention period for analytics data indexes is 90 days. Although there is no hard retention limit, we don't recommend exceeding 10 years. For more information, see [Configuring data retention and index rollover time periods](#).

## What's new for IT architects

---

Performance improvements

IBM API Connect Version 10.0.3.0 contains numerous performance enhancements to many of the main API management functions. The following list provides an overview of the key results:

Product staging and publishing

Significant improvement in these critical functions compared to Version 10.0.2.0 are delivered. Elapsed time reductions up to 80% for staging, and 70% for publishing, are observed for certain workloads.

Publish preserve subscriptions

For customers that have products with many subscriptions, and invoke the publish preserve subscriptions function, there is up to a 97% reduction in elapsed time.

IBM API Connect Version 5 parity

Significant performance gaps existed between V5 and V10 of API Connect. However, in many cases and scenarios now the performance in V10.0.3.0 is better than in V5.

Product replace

For customers that have a large number of subscriptions for a single Product, an 83% reduction in elapsed time can be observed when testing the Product replace function.

Add new subscription on top of existing subscriptions

API runtime availability on the Gateway for a new subscription that is added on top of many existing subscriptions, is improved in this release. For example, in a database with 10,000 subscriptions, a new subscription was invocable in approximately 40 seconds, as compared to 4 minutes in previous releases.

API Manager Gateway improved scalability

Significant changes have been made to the API Manager and Gateway synchronization processing, which has resulted in much reduced memory usage by the Gateways. This reduction has led to the improved scalability of subscriptions on the Gateways, and a reduced time for the subscriptions on API Manager to become available and active on the Gateways.

API Manager Gateway synchronization disaster risk reduction (DRR)

After a DRR event on a Gateway, the API Manager must re-sync all objects with the Gateway, and this sync time has been reduced. For example, in a database with 10,000 subscriptions, a DRR/sync completed in 161 seconds.

Note: These results were observed in an IBM laboratory. Results might vary in other environments, and are not guaranteed.

## What's new for security practitioners

---

Restrict the ability of users with the Member > Manage permission to assign roles

You can now apply a restriction such that, for a user with the Member\_2\_Manage permission to assign a role, they must themselves have at least all of the permissions that are applied to that role. For more information, see [API Connect user roles](#).

Create custom user registries by using the UI

You can now create custom user registries by using the Cloud Manager and API Manager UIs, in addition to using the developer toolkit CLI. Custom user registries can be used for authenticating users to the Cloud Manager, the API Manager, and the Developer Portal. For more information, see [Configuring a shared custom user registry](#).

Syslog endpoints now supported in audit logging

You can now set syslog endpoints when you configure audit settings for your API calls. For more information, see [Configuring the audit settings](#).

SSH key based backup for Postgres databases is now supported

SSH key based backup is now supported for Postgres databases. Refer to the following sections for more information:

- [Backing up and restoring on Kubernetes and OpenShift](#)
- [Backing up and restoring on VMware](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## What's new in Version 10.0.2.0

This page details the enhancements in IBM® API Connect Version 10.0.2.0 over the previous Version 10.0.1.2 release.

If you are moving to Version 10 from Version 5, also see the [What's new in Version 2018](#) page for the additional new features since Version 5.

Note: You can access the latest files from [Fix Packs Available for IBM API Connect v10](#).

---

## What's new for Developers

New Websocket Upgrade assembly policy

Use the GraphQL Websocket Upgrade policy to process API requests and responses through a WebSocket connection. This policy is supported only for a GraphQL API. For more information, see [GraphQL Websocket Upgrade](#).

Note: The Allow WebSocket Upgrade setting on the Invoke policy is deprecated in favor of this new policy.

Specify how the Invoke policy sends GraphQL payload to the back end

The Invoke policy has a new GraphQL send type property for specifying how GraphQL payload is sent to the back end. For more information, see [Invoke](#).

---

## What's new for API product managers

Designate a default Catalog

You can now designate one of your Catalogs to be the default Catalog. Then, calls to APIs that are published to the Catalog can use a shorter URL that does not include the Catalog name. For more information, see [Creating and configuring Catalogs](#).

Work with application subscriptions in a Catalog

Catalogs in the API Manager user interface now have a Subscriptions tab that allows you to work with the subscriptions to the Plans in all the Products in the Catalog. For more information, see [Working with application subscriptions](#).

Import a user-defined policy into a Catalog by using the API Manager user interface

You can now import a user-defined policy into a Catalog by using the API Manager user interface, in addition to the CLI capability that was available previously. For more information, see [Importing a user-defined policy into a Catalog](#).

Cloud Pak for Integration: test and consume APIs in a single developer portal

Publish and socialize all endpoint types to a single developer portal where app developers can test and consume in one place, decreasing their total cost of ownership with newly enhanced productivity.

Map external LDAP groups to API Connect user roles

You can configure LDAP group mapping on API Connect user roles to enable more control of user authorization by using the developer toolkit CLI. For more information, see the following topics:

- [Configuring LDAP group mapping on Cloud Manager user roles](#)
- [Configuring LDAP group mapping on API Manager user roles](#)

Upgrade from v2018 to v10 in a VMware environment

Upgrade your v2018 deployments on VMware to v10. Upgrading v2018 to v10.0.1.2 recreates your VM with the latest version of Ubuntu 20.04. You can then upgrade from v10.0.1.2 to 10.0.2.0. See [Requirements for upgrading for v10 versions on VMware](#).

---

## What's new for API consumers

---

## What's new for Developer Portal administrators

---

## What's new for DevOps

Configure Gateway server extensions by using the Cloud Manager user interface

You can now upload a Gateway server extension to a Gateway service by using the Cloud Manager user interface, in addition to the CLI capability that was available previously. For more information, see [Configuring your Gateway server extensions](#).

---

## What's new for IT architects

Analytics Subsystem updated to UBI 8

Red Hat Universal Base Images version 8 increases security and future-proofs the underlying operating system for Analytics.

Two data center disaster recovery support now available on OpenShift

Two data center disaster recovery deployment strategy is now supported when deployed on OpenShift Version 4.6, in addition to the already supported VMware and Kubernetes deployments. For more information, see [A two data center deployment strategy on Kubernetes and OpenShift](#).

---

## What's new for security practitioners

---

TLS protocol version 1.3 is now supported for TLS client and server profiles

When configuring a TLS client or TLS server profile, you can now select TLS protocol version 1.3 as one of the protocols that the profile supports. For more information on configuring TLS profiles, see the following topics:

- Cloud Manager user interface:
  - [Creating a TLS Client Profile](#)
  - [Creating a TLS Server Profile](#)
- API Manager user interface: [Creating a TLS client profile](#)

HTTP/2 is enabled automatically with the DataPower® API Gateway

In a change from previous releases, if you are using the DataPower API Gateway, HTTP/2 is enabled automatically on the API invocation endpoint.

Note: If you are using the DataPower Gateway (v5 compatible), HTTP/2 is not supported on the API invocation endpoint.

The DataPower API Gateway now supports the Compose UPN LDAP authentication method

For details on configuring an LDAP user registry in IBM API Connect, see the following topics:

- Cloud Manager user interface: [Configuring an LDAP user registry in the Cloud Manager](#)
- API Manager user interface: [Creating an LDAP user registry in API Manager](#)

LDAP user registries now support LDAP group mapping

You can map external LDAP groups to API Connect user roles to enable more control of user authorization by using the developer toolkit CLI. For more information, see the following topics:

- [Using the CLI to configure a shared LDAP user registry](#)
- [Using the CLI to create an organization-specific LDAP user registry](#)

API Connect now supports authentication with custom external user registries

You can now use a custom external user registry to authenticate users of the Cloud Manager, the API Manager, and the Developer Portal by configuring a custom user registry in API Connect. See the following topics for details:

- [Configuring a shared custom user registry](#)
- [Creating an organization-specific custom user registry](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Language versions offered by API Connect

---

API Connect is offered in several languages, as enabled by the operating platform on which the product is installed.

Note: When API Connect is deployed as a Cloud Pak for Integration capability, it is translated to the same set of languages as the Cloud Pak for Integration product.

- Brazilian Portuguese
- Chinese (Simplified)
- Chinese (Traditional)
- Czech
- Dutch
- English
- French
- German
- Italian
- Japanese
- Korean
- Polish
- Spanish
- Russian
- Turkish

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Version 10.0.x known limitations

---

This page describes the known limitations for API Connect 10.0.x.

Note: The limitations that are documented on this page will be removed as they are addressed in the IBM® API Connect product. For the most up-to-date list of product limitations, visit the English version of this page.

You cannot upgrade to API Connect 10.0.6.0 or later from any version of 10.0.4.x

A direct upgrade from any version of 10.0.4.x to API Connect 10.0.6.0 or later is not supported. You must upgrade to 10.0.5.x as an interim step before upgrading to 10.0.6.0.

Image host changing from docker.io to icr.io

API Connect is changing product image hosting services from docker.io to icr.io. API Connect images on docker.io are available but are subject to Docker rate-limiting terms after Dec 31, 2022. To prevent rate-limiting issues, complete the steps in [OpenShift: Updating ImageContentSourcePolicy to mirror API Connect images from icr.io](#).

API Designer on Windows: APIs that use WSDL might encounter errors, or fail to activate, publish, or update.

If you activate, publish, or update a REST or SOAP API that uses a WSDL file, the operation might fail and never complete. Work around the issue by using the autopublish API feature in the API editor.

Sometimes the completion of an SFTP restore on the Management subsystem does not restore the actual data.

There is a known issue where sometimes a restore from the Management subsystem's SFTP backup succeeds but the data is not restored. If this happens, run the restore again.

Cannot add comments to APIs by using the Source view in the API Designer and API Manager UIs

Comments cannot be added to APIs in the API Designer and API Manager UIs by clicking the Source icon , and using the hashtag symbol.

Changing Product visibility from Custom to Public doesn't automatically remove the Consumer organizations and groups

In the API Designer and API Manager UIs, changing Product visibility from Custom to Public doesn't automatically remove the consumer organizations and groups, so the Product publish will fail. To work around this issue, manually remove all of the consumer organizations and groups.

Upgrading from versions older than 10.0.4.0 fails if the `backrestStorageType` property is null

Upgrading API Connect from versions older than 10.0.4.0 might fail during the operator upgrade step if the `backrestStorageType` property in the `pgcluster` CR is set (or defaulted) to null. For instructions on correcting the problem, see [Troubleshooting installation and upgrade on OpenShift](#).

Import API wizard fails to import if the imported file includes a directory

In both the API Manager and API Designer, if the imported file type is a .zip and it contains a directory, then the import API wizard fails with a validation error. To work around this error, ensure all of the files in the .zip are in one single directory, and then import the .zip file by using the import API wizard.

Options menus in the Catalog might be hidden

In a Catalog, in any of the different tabs such as Consumers, or Subscriptions, when clicking on the options icon  the menu items might be hidden. To work around the issue, reload the page and the menu items will appear.

Making an API online with your own test preferences might not activate the API

When editing an API, if you use the activation slider control to bring it Online with your own test preferences for the Target catalog, Target product, Target plan, and Test application, the slider control might not change to Online, and there might not be any error message.

To work around the issue, check if the application already has a subscription to a different Plan in the same Product, as the test application can subscribe to only one Plan per Product. Then, either delete the additional subscriptions, or select a different Test application, and bring the API online again.

Approval links in emails might point to the wrong Catalog when multiple Catalogs have the same name.

If multiple provider organizations use the same name for a Catalog with the life-cycle enabled, then approval links in emails might point to the wrong Catalog. When user clicks the link, the Catalog does not display any Products or approval requests in the Task tab.

You can work around the incorrect link by clicking Manage and selecting the correct Catalog.

You cannot install a "standalone" API Connect deployment on an OpenShift cluster where Cloud Pak for Integration is present

If an OpenShift cluster has Cloud Pak for Integration installed, then all API Connect deployments on that cluster are considered to be part of the Cloud Pak for Integration deployment, which will attempt to integrate with the standalone API Connect deployments.

Analytics ingestion fails when message queue is enabled and the payload size exceeds the message size limit for the message queue

By default, the Analytics message queue has a limit of 5 megabytes (5242880 bytes) for the message size. If you enable payload activity logging, then large API request or response payloads might require a higher limit to avoid problems with analytics data ingestion. If you encounter a message like the following example, you can increase the message size limit as explained in [Overriding size limits for message queue](#) (Kubernetes, OpenShift, or Cloud Pak for Integration) and [Overriding size limits for message queue on VMware](#) (VMware).

Consumer rate limit notifications are not available in Version 10

The ability to configure notifications for applications so that API consumers are alerted when the usage of an API is nearing its rate limit is not available.

Multiple gateways not supported in Test tab

If you have multiple gateways associated with a catalog, only one gateway endpoint displays in the selection list for the GET field on the Test tab, and you can only test the API with the listed endpoint.

Cannot log in to API Manager using a Twitter OIDC if email is required

When the Email required option is enabled in the Twitter user registry as explained in [Configuring an OIDC user registry](#), then invited pOrg members and owners are unable to log in. The workaround is to leave this optional setting unselected.

If an API is published by using the auto-publish toggle, the Visibility and Subscribability of the Product always defaults to Public and Authenticated, respectively

When testing an API and using the auto-publish toggle to make the API Online, the Visibility and Subscribability of the draft Product will always default to Public and Authenticated, respectively, instead of what is set in the draft Product.

Cannot log in to the Slack OIDC user registry by using the API Designer UI

You cannot log in to the Slack OIDC user registry by using the API Designer UI.

Viewing multiple dashboards in a non-incognito browser is not supported

Either an incognito (private) browser tab or a separate browser instance is required for viewing dashboards in multiple Analytics services simultaneously.

Specifying the schedule and retention values for management subsystem local backups on VMware requires use of extra-values file

On VMware deployments, the `apicup` utility does not support setting the schedule, or retention settings, for management subsystem backups that use local backups storage. You can work around this limitation by using an extra-values file. See [Workaround for scheduling and retaining local backups on VMware](#).

Configuration update mistakes cause admission webhook errors in OpenShift and Cloud Pak for Integration

In OpenShift and Cloud Pak for Integration, configuration update errors can cause the `APIConnectCluster` instance to go into the Pending state with an underlying component throwing an admission webhook error.

```
oc get apiconnectcluster -n APIC_namespace
```

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
m1	admission	webhook	"vmanagementcluster.kb.io"	denied	the request:	
ManagementCluster.management.apiconnect.example.com "m1-mgmt" is invalid: [spec.databaseBackup.restartDB.accept: Invalid value: false: databaseBackup protocol has changed (from '' to 'objstore') and requires database restart. accept restartDB to restart database, spec.databaseBackup.restartDB.accept: Invalid value: false: databaseBackup configuration has changed and requires database restart. accept restartDB to restart database]						
				Pending	10.0.1.5-3388-eus	10.0.1.5-3388-eus
						2d6h

The 'strict' SameSite cookie causes incorrect invitations to consumer organizations

Using the 'strict' SameSite cookie might cause invitation links from emails to send users to a registration page where they are asked to create a new consumer organization instead of joining the organization they were invited to.  
The workaround is to using the 'Lax' SameSite Cookie attribute.

Performance impact when publishing products from API Designer

When you publish a product from API Designer and have 10 or more catalogs available, you might experience a performance degradation.

Limitations to the OpenAPI 3.0 support

IBM API Connect supports the OpenAPI 3.0 specification, with some limitations. For information about what is supported, see [OpenAPI 3.0 support](#).

Automatic activation of a GraphQL API fails

If you attempt to activate a GraphQL API, the publish operation fails because the automatically generated Product is created incorrectly. To workaround this problem, create your own Product and add the GraphQL API to it; you can then publish this Product successfully.

A GraphQL API that contains a `graphql-input-type-cost` rate limit fails to publish

A GraphQL API created in releases earlier than IBM API Connect Version 10.0.3.0 might contain a `graphql-input-type-cost` rate limit, which is no longer supported. If you attempt to use the automatic activation mechanism to publish the API, or manually add the API to a Product and attempt to publish that Product, the publish operation will fail. You can resolve this problem in either of the following ways:

- Remove the rate limit definition from the OpenAPI source for the API. For example, if the source is in YAML format, remove the following lines:

```
- name: graphql-input-type-cost
  operation: consume
```

- Edit the source for the Product and define a `graphql-input-type-cost` rate limit in all of the Plans that include the API.

Note: You can edit only a manually created Product, not a Product that is generated by the automatic activation mechanism.

A stancluster pod remains in non-ready state after upgrade from v10.0.1.2 to v10.0.3.0 on VMware

After upgrading from 10.0.1.2 to 10.0.3.0 on VMware, one of the management `stancluster` pods may remain in non-ready state after rebooting the VM the pod is running on. You can workaround this problem by stopping the non-ready pod. See [Workaround for stancluster pods after upgrade](#).

Analytics restore on OpenShift with `enableOverride: false` gets stuck in pending state

If you set `enableOverride: false` to avoid overwriting indices during a restore, the restore operation should fail when existing indices are encountered. However, the operation does not fail, it instead gets stuck in the pending state.

When you configure the restore operation, set `enableOverride: true` but be aware that existing indices will be overwritten.

If you attempted a restore using `enableOverride: false` and the operation is stuck, then remove that job and start a new restore operation.

Options menu is missing from items on the Product list pages

If, in the API Manager user interface, you open the Product list page in either a Catalog or a Space, the options menu icon  might be missing from alongside all of the listed Products. To resolve this problem, reload the page.

Testing an API with the Policies editor doesn't work in the API Designer UI

The API Designer UI doesn't support testing an API with the Policies editor in the Gateway tab. Instead, you can test your API by using the Test tab or the Explorer tab.

Update WSDL option is not supported in the API Designer UI

The Update WSDL option to update the configuration of an existing SOAP API from a WSDL file or a .zip archive, is supported only in the API Manager UI, or by using the developer toolkit. This option is not supported in the API Designer UI.

Upgrading a 3 node profile to IBM API Connect 10.0.3.0 might result in some `portal-db/www` pods being stuck in the `Pending` state

IBM API Connect 10.0.3.0 introduces the pod anti-affinity required rule, meaning that in a 3 node profile deployment, all 3 `db` and `www` pods can run only if there are at least 3 running worker nodes. This rule can cause some upgrades to version 10.0.3.0 to become stuck in the `Pending` state. To resolve this issue, see one of the following workarounds:

- On a Kubernetes deployment: [Troubleshooting upgrades on Kubernetes](#)
- On an OpenShift deployment: [Troubleshooting installation and upgrade on OpenShift](#)
- On a VMware deployment: [Troubleshooting upgrades on VMware](#)

A unique email address is required for all Developer Portal accounts

Remember that every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a Developer Portal user account (and associated consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in to the Developer Portal: **A user already exists with this email address.**

For example, if you configure three different user registries for a particular Developer Portal site, the email address `alice@acme.com` can be used to log in to the site from only one of the user registries.

Configured user registries incorrectly allow the unsupported `external_group_mapping_enabled: true` option

API Connect does not support a configured user registry that is based on a registry where `external_group_mapping_enabled` is set to `true`. Under certain conditions you can create a configured user registry based on a user registry with the unsupported option; if this happens you will encounter errors while onboarding users.

You can create and update user registries with the `apic user-registries:create` and `apic user-registries:update` commands. Both commands accept the `external_group_mapping_enabled` option. If you then create a configured user registry with the `configured_catalog_user-registries:create` command, the results depend on how you set the `external_group_mapping_enabled` option in the user registry.

Suppose you create a user registry (for example, call it UR) and you want to create a configured user registry (call it CUR) based on UR. Consider the following scenarios:

1. You create UR with the `external_group_mapping_enabled: false`. In this case, you can create your CUR based on that registry.
2. You create UR with `external_group_mapping_enabled: true`. In this case, you cannot base a configured user registry on it, so the creation of CUR fails.
3. You create UR with `external_group_mapping_enabled: false` and create CUR based on it, as in scenario 1. However, you then update UR and set `external_group_mapping_enabled: true`. In this case, you have a problem.  
The operation described in scenario 3 is not currently blocked, so you will successfully create an unsupported CUR and then run into errors when you attempt to onboard users. To resolve the issue, complete one of the following workarounds:
  - Update UR (the base user registry) and set `external_group_mapping_enabled: false`.
  - Leave UR with `external_group_mapping_enabled: true` but delete the configured registry (CUR) that is based on it.

A Product republish, with the Preserve Subscriptions option, fails after a consumer organization group has been removed from the visibility settings

If you remove a consumer organization group from the custom visibility settings for a Product, and that group contains a consumer organization with an application that is subscribed to the Product, an attempt to republish the Product with the Preserve Subscriptions option will fail even if that consumer organization is then added to the custom visibility settings individually.

For a secured GraphQL API, GraphQL subscriptions cannot be tested by using the Test tab in the user interfaces

For a GraphQL API that is secured by client ID, GraphQL subscriptions cannot be tested by using the Test tab in the API Designer or API Manager user interfaces. The API can still be published and used in production.

You can test GraphQL subscriptions in either of the following alternative ways:

- Remove client ID security from the API, for testing purposes, then use the Test tab.
- Use an external test tool.

A published API whose assembly contains a catch block with an invalid policy will now correctly fail to republish

Previously, policies in an assembly catch block were not validated, so if an incorrect policy configuration was coded in the OpenAPI source for an API, within an assembly catch block, the API would still publish successfully. Now, policies in an assembly catch block are validated, so such an API will fail to republish and will first need to be corrected.

Upgrade issue on OpenShift and Cloud Pak for Integration

If you upgrade from IBM API Connect V10.0.1.0 directly to V10.0.1.x on OpenShift, you will encounter a known problem with the **API Connect operator**. During the upgrade, the **API Connect operator** will be stuck in the "Upgrade available" state as shown in the following image:

Name	Managed Namespaces	Status	Last Updated
IBM DataPower Gateway 1.2.2 provided by IBM	ns e2e	✓ Succeeded Up to date	6 minutes ago
IBM API Connect 2.0.0 provided by IBM	ns e2e	✓ Succeeded Upgrade available	Feb 16, 12:49 pm
IBM Cloud Platform Common Services 3.6.3 provided by IBM	ns e2e	✓ Succeeded Up to date	Feb 16, 12:35 pm
IBM Cloud Pak for Integration Platform Navigator 4.0.3 provided by IBM	ns e2e	✓ Succeeded Up to date	Feb 16, 12:37 pm

In addition, the `catalog-operator` in the `OLM` namespace will throw the following error:

```
sync "< namespace >" failed: found more than one head for channel
```

You can work around the error by completing the following steps:

This workaround will not have a downtime impact.

1. Delete the following operators: `DataPower operator`, `Common services operator`, and `ibm-apiconnect operator`.
2. Re-install the `ibm-apiconnect operator`.

When checking cluster health on VMware, harmless warning messages might be returned

On Version 10.0.1.2-eus on VMware, the command `apicup subsys health-check` may return some warning messages. The warnings are harmless and can be ignored. The warnings occur because the CRD version for some Kubernetes resources has been deprecated, but the resources have not been removed so are still supported. For details, see [Checking cluster health on VMware](#).

An existing user cannot be added to a Space

If you attempt to add an existing user to a Space, the operation cannot be completed because the Create button is not enabled. Instead, use the invitation mechanism. For details, see [Managing Space membership](#).

Note: The invited user must use the Sign in option on the activation form, rather than completing the registration details and using Sign up.

Adding an `operation-switch` policy to an API assembly produces an incorrect warning message

If you add a Version 2.0.0 `operation-switch` policy to an API whose gateway type is DataPower® API Gateway, the API Setup page on the Design tab displays an incorrect warning stating that the policy is not valid for the gateway type. This warning message can be ignored.

Simultaneous editing of the same API by multiple users might result in changes being overwritten

If one user saves changes to an OpenAPI 3.0 API, another user who has the same API open in the API editor might have their changes overwritten.

An API developed for IBM API Connect Version 2018.4.1 that uses an `apim.getvariable('message.body')` function call fails in IBM API Connect Version 10

With the DataPower API Gateway in IBM API Connect Version 2018.4.1, the type of object returned, for XML payloads, by an `apim.getvariable('context_name.body')` function call in a GatewayScript policy in an API assembly depends on how the variable is stored in the gateway context, as follows:

- If the variable is stored as a Buffer (because the variable data was written as an XML string), an XML Nodelist is returned provided that `contextname.headers.content-type` is an XML type.
- If the variable is stored as a parsed XML Document (because the variable data was written as parsed XML, either as an XML document or an XML Nodelist), an XML document is returned.

With the DataPower API Gateway in IBM API Connect Version 10 however, the same function call always returns an XML Nodelist provided that `contextname.headers.content-type` is an XML type. Therefore, such an API developed for Version 2018.4.1 will fail in Version 10 if it is configured to expect an XML document, and will need to be reconfigured appropriately.

The problem does not occur with such an API migrated from IBM API Connect Version 5 because, with that release, `apim.getvariable('context_name.body')` also returns an XML Nodelist for XML payloads, nor does it occur if you are using the DataPower Gateway (v5 compatible).

`context_name` could be `message`, `request`, or the name of the output from an `invoke` policy.

Validate policy limitations when GraphQL response contains a GraphQL server error

When a GraphQL response contains a GraphQL server error and no data, the assembly Validate policy generates an error on the missing data and overwrites the payload. When the response contains partial data and an error, the assembly Validate action validates the data and overwrites the payload. To work around this limitation, use the condition `$not($exists(message.body.errors))` in an assembly switch condition to skip the assembly Validate policy when the response contains errors.

S3 backup type must be specified when configuring S3 backups on CP4I Platform Navigator or OpenShift Form UI

When you configure S3 backups for the Management subsystem, you must specify an S3 backup type of `ibm` or `aws`. The graphical user interfaces for CloudPak for Integration and for OpenShift incorrectly state the specification of S3 backup type is optional. In the CP4I Platform Navigator, or the OpenShift Form UI, when you configure Management System > Database Backup, be sure to select the S3 provider type menu and specify a supported value. For more information see [Configuring backup settings for fresh install of the Management subsystem](#) and the Database Backup table in the Management subsystem section of [IBM Cloud Pak for Integration](#).

A management backup remains in a `Pending` state

A management backup might remain in a `Pending` state for a long period of time, particularly after having upgraded the management subsystem. To resolve this problem, you must remove the pending backup and operation lock, and then re-run the backup CR. To remove the pending backup and operation lock, complete the following steps:

1. Verify the names of the pending backup and operation lock by running the following commands:

```
kubectl -n get mgmtb | grep Pending
```

```
kubectl -n get cm | grep oplck
```

2. Delete the pending backup by running the following command:

```
kubectl -n <namespace> delete mgmtb <name-of-backup>
```

3. Delete the operation lock by running the following command:

```
kubectl -n <namespace> delete cm <name-of-lock>
```

GraphQL API test fails when the generated example query contains variable definitions

If, when testing a GraphQL API in the Test tab, you use the Example dropdown menu to generate a Small, Medium, or Large query, and the generated query contains variable definitions, those variables are not added to the HTTP request, which then fails with the following error:

```
Parser failed with error: syntax error, variables type is neither a JSON object nor null.
```

To resolve this problem, modify the query to remove the variable definitions before re-sending the HTTP request.

Changes to parameters in an API definition aren't reflected on the Test tab

If you add or remove parameters in an API definition on the Design tab and then open the Test tab, the changes might not be reflected immediately. If you are using the API Manager user interface, either restart the browser or clear the browser cache and cookies, if you are using the API Designer user interface, restart the application. Then reopen the Test tab in the API definition.

An OpenAPI definition that contains regular expression syntax fails validation

IBM API Connect supports the [GO regular expression syntax](#). When you import an OpenAPI definition into the API Designer or API Manager user interfaces, or validate one with the `apic validate`, the validation will fail if the OpenAPI source contains unsupported regular expression syntax, with errors that include `Does not match format 'regex'`; for example:

```
- Must validate at least one schema (anyOf) (context:
(root).paths./example/types.post.parameters.0.schema.properties.items, line: 0, col: 0)
- Must validate one and only one schema (oneOf) (context: (root).paths./example/types.post.parameters.0, line: 46164, col:
21)
- paths./example/types.post.parameters.0.schema.properties.items.properties.pattern Does not match format 'regex'
(context: (root).paths./example/types.post.parameters.0.schema.properties.items.properties.pattern, line: 0, col: 0)
```

During migration, the `archive:unpack` fails to find an OAuth provider

When migrating API Connect to Version 10, the `archive:unpack` command might generate a warning like the following:

```
WARN[2020-06-04T09:29:54-04:00] Leaving a placeholder OAuth Provider which must be replaced in draft API <api name>:
Unable to find an OAuth Provider to extract from Token URL or Authorization URL <api token/authorization URL> with
basePath </base path> and scopes <scope list>.
```

A possible cause is that an OAuth provider matches the API path but is missing the necessary scopes. To resolve this problem, complete the following steps:

1. Update the API definition in the `cloud/provider-orgs/<provider_organization_name>/drafts` folder to replace the `x-ibm-oauth-provider` value 'placeholder' with `name://./<oauth_provider>`.

2. Update the API definition in the `cloud/provider-orgs/<provider_organization_name>/catalogs/<catalog_name>/products` folder to replace the `x-ibm-oauth-provider` value 'placeholder' with `name://.../..../<oauth_provider>`.
3. Update the OAuth Provider definition in the `cloud/provider-orgs/<provider_organization_name>/oauth-providers` folder to add the extra scopes from the API definition.

In addition, if the OAuth Provider references a user-registry in a `user-security` section, and this user-registry is not specified in the `cloud/provider-orgs/<provider_organization_name>/catalogs/<catalog_name>/configured-api-user-registries` folder, then add an entry of the following form to ensure that the user-registry is pushed to the Catalog:

```
api_version: 2.0.0
name: name://.../..../user-registries/<user_registry_name>/user-registry.yml
type: configured api user registry
user_registry_url: file://.../..../user-registries/<user_registry_name>/user-registry.yml
```

The migration of a user registry fails

When migrating API Connect to Version 10, a user registry might fail to be pushed to the API Manager with errors like the following:

```
ErrorLog2020-06-02T08:35:37-04:00.log:ERRO[2020-06-02T08:36:07-04:00] unable to create User registry <user registry name>
ErrorLog2020-06-02T08:35:37-04:00.log:ERRO[2020-06-02T08:36:07-04:00] orgldap: An error occurred communicating with the
ldap server at
'ldaps://<ldap-address>' (error: 'Error: self signed certificate in certificate chain').
```

To workaround this problem, for any artifacts, such as APIs or OAuth providers, that reference this user registry in their User Security section, replace the user registry with one that has been successfully migrated.

The migration of an OAuth provider push fails due to a missing TLS client profile ID

When migrating API Connect to Version 10, an OAuth Provider might fail to be pushed to the API Manager with an error like the following:

```
unable to create Oauth provider <provider name>
<provider name>: The expected path parameter 'tls-client-profile-id' is missing from the request URL.
```

and subsequently an error like the following:

```
unable to create Configured oauth provider <provider name>
<provider name>: The 'oauth_provider_url' property value '/api/orgs/<org>/oauth-providers/<provider name>' does not refer
to a known Oauth Provider.
```

This is caused by an OAuth provider containing a custom HTML form in one or more User Security sections that specifies an `ei-custom-form-tls-client-profile` or an `az-custom-form-tls-client-profile`.

To resolve this problem, use the default TLS client profile by specifying a value of ''.

When scaling down a Kubernetes cluster of DataPower gateways, the cluster might enter an unrecoverable state if the peering primary instance is lost

If you are scaling down a Kubernetes cluster of DataPower gateways, you must first complete the following steps to ensure that the peering primary instance is not lost:

1. List the pods in the cluster; for example:

```
$ kubectl get pods -n apiconnect --selector
app.kubernetes.io/component=datapower,crd.apiconnect.ibm.com/instance=gwv6
NAME      READY   STATUS    RESTARTS   AGE
gwv6-0    1/1     Running   0           3h31m
gwv6-1    1/1     Running   0           3h32m
gwv6-2    1/1     Running   0           3h34m
```

2. Enter the DataPower admin CLI for gateway 0, by entering the following command and logging in at the prompt; for example:

```
$ kubectl attach -n apiconnect -it gwv6-0
```

3. Switch to the API Connect domain and enter config mode:

```
idg# switch apiconnect
idg[apiconnect]# config
Global mode
```

4. Show the gateway peering status; for example:

```
idg[apiconnect] (config)# show gateway-peering-status
```

Address	Configuration name	Pending updates	Replication offset	Link status	Primary
1.2.3.1	gwd	0	18331896	ok	no
1.2.3.1	rate-limit	0	3091219	ok	no
1.2.3.1	subs	0	3150127	ok	no
1.2.3.1	tms	0	3063575	ok	no
1.2.3.2	gwd	0	18330948	ok	no
1.2.3.2	rate-limit	0	3091067	ok	no
1.2.3.2	subs	0	3149975	ok	no
1.2.3.2	tms	0	3063257	ok	no
1.2.3.3	gwd	0	18330948	ok	yes
1.2.3.3	rate-limit	0	3091067	ok	yes
1.2.3.3	subs	0	3149975	ok	yes
1.2.3.3	tms	0	3063257	ok	yes

5. For each of the configuration names, set gateway 0 to be the peering primary instance:

```
idg[apiconnect] (config)# gateway-peering-switch-primary gwd
The instance is now the primary in the peer group.
idg[apiconnect] (config)# gateway-peering-switch-primary rate-limit
The instance is now the primary in the peer group.
idg[apiconnect] (config)# gateway-peering-switch-primary subs
The instance is now the primary in the peer group.
```

```
idg[apiconnect] (config)# gateway-peering-switch-primary tms
The instance is now the primary in the peer group.
```

6. Show the gateway peering status to confirm the changes; for example:

```
idg[apiconnect] (config)# show gateway-peering-status
```

Address	Configuration name	Pending updates	Replication offset	Link status	Primary
1.2.3.1	gwd	0	19067953	ok	yes
1.2.3.1	rate-limit	0	3218172	ok	yes
1.2.3.1	subs	0	3277032	ok	yes
1.2.3.1	tms	0	3189160	ok	yes
1.2.3.2	gwd	0	19067953	ok	no
1.2.3.2	rate-limit	0	3218172	ok	no
1.2.3.2	subs	0	3277200	ok	no
1.2.3.2	tms	0	3189160	ok	no
1.2.3.3	gwd	0	19069241	ok	no
1.2.3.3	rate-limit	0	3218172	ok	no
1.2.3.3	subs	0	3277508	ok	no
1.2.3.3	tms	0	3189312	ok	no

Incorrect UI behavior if API changes are not saved before creating a new API version

If you make changes to an API definition and then attempt to create a new API version without first saving your changes, you are not prompted to save your changes until after you have completed the new version creation operation. If you click OK in the prompt, your new version is created but your original changes are lost; to create your new version and retain your original changes, you should click Cancel in the prompt, then click Save to save your original changes.

Truststore and keystore settings in a shared TLS client profile are not reflected in API Manager

If you create a shared TLS client profile in the Cloud Manager user interface and assign a truststore and a keystore, these truststore and keystore settings are not reflected in that TLS client profile in the API Manager user interface and cannot be set there. Furthermore, the TLS client profile list views display the value shared for the truststore and keystore rather than the correct values. To work around this problem, create the truststore, keystore, and TLS client profile separately for each provider organization in the API Manager user interface, then enable the TLS client profile in your Catalogs as required.

Login to the Cloud Manager or API Manager user interfaces might fail with error 431 if the browser has a large number of cookies

Attempts to login to the Cloud Manager or API Manager user interfaces might fail if the HTTP header or cookie size is larger than 16 KB, a limitation that is imposed for security reasons. To resolve this problem, either clear the browser cache and cookies, or open a private window, then retry.

The `apic cloud-settings:topology` command doesn't return a topology object

If you use the `apic cloud-settings:topology` command without a `--format` parameter, it returns only the string `CloudTopology` rather than the cloud topology. To retrieve the topology object, include the `--format` parameter, with a value of either `yaml` or `json` as required.

The `apic cloud-settings:mail-server-configured` command response is incorrect

If you use the `apic cloud-settings:mail-server-configured` without a `--format` parameter, it returns only the string `MailServerConfigured` rather than a boolean value to indicate whether an email server has been configured in the cloud settings. To retrieve the correct response, include the `--format` parameter, with a value of either `yaml` or `json` as required.

API Designer user interface might not open correctly if there are badly formed OpenAPI YAML files in the startup directory

If, when launching the API Designer user interface, the startup directory that you select contains one or more badly formed OpenAPI YAML files, the interface might fail to load correctly, with an error such as the following:

```
Cannot read property 'type' of null
```

To resolve this problem, remove any invalid OpenAPI YAML files from the startup directory, then restart the API Designer user interface.

Pagination setting is global across the API Connect user interfaces

If you set the Items per page value on any page in the Cloud Manager or API Manager user interface, that setting is then applied to all pages in both user interfaces in the same browser session. If you want to set the value separately for a specific page, open it in a private browser window. Such a setting in a private browser window is specific to that window and is lost when the window is closed.

Refresh tokens are not supported in the API Manager or API Designer user interfaces with an OIDC registry

The use of refresh tokens is supported in API Manager, API Designer, the Developer Portal, and the toolkit CLI, provided that the user logs in with a non-OIDC Provider user registry. If the registry type used for user login is OIDC, then refresh tokens are not supported in API Manager or API Designer. For more information, see [Specifying cloud settings for refresh tokens](#).

Setting resource limits in Kubernetes can cause containers to behave oddly at run time

In Kubernetes, you can set resource limits for each container. However, limiting CPU means that the container processes might slow down if they try to use too much. Limiting memory means that the Kubernetes code kills processes that try to allocate memory that would take the container over its limit. These limits can result in odd behavior such as the containers continually trying to start a daemon process, such as `nginx` or `node`, and exiting with success immediately.

Field validation for the Client security policy is incorrect

When configuring a Client Security policy in an API assembly in the API Designer or API Manager user interfaces, there is the following incorrect validation behavior:

- The ID Name field is required, but the API definition can be saved without entering a value in the field.
- The Secret Name field is required only when the Secret Required option is selected, but the user interface indicates that the Secret Name field is required regardless. Furthermore, when the field is required, the API definition can be saved without entering a value.
- If the Authenticate Client Method is set to Third party, the User Registry Name field is required, but the API definition can be saved without entering a value in this field.

Requests that take longer than the value of the `nginx` timeout cause a 409 error

Requests that take longer than the value of the `nginx` timeout can cause a 409 error, such as:

```
Another request is operating on portal-subsystem-03729230-4df7-4419-94c9-e7691b616382 with the same name, please try again.
```

The error occurs because the ingress controller is sending a repeat request when the previous one timed out. Your request will still continue processing in the background.

#### Adding members to a provider organization might fail

When adding members to a provider organization, the Cloud Manager user interface lists the current owner and members as well. If existing members are selected, the add action will fail.

#### Upgrading with new certificates breaks analytics ingestion

If the analytics subsystem certificates are modified after installation (by using the **apicup certs set** command, followed by the **apicup install** command to deploy the change to the cluster), the analytics ingestion ingress will no longer be recognized by the Gateway. The analytics service must be re-registered in the Cloud Manager interface so that the new certificates are recognized.

#### Users are not logged out of the user interfaces after tokens expire

If an API Manager or Cloud Manager user interface session times out, the user does not get redirected to the login page and might see an error. To redirect to the login page, refresh the browser window.

#### User interfaces are not supported in Microsoft Edge

The API Manager and Cloud Manager user interfaces are not supported in the Microsoft Edge web browser. To work in the user interfaces, use a different browser.

#### New gateways cannot connect to existing gateways after the gateway peering certificates are changed

Changing the gateway peering SSL certificates after gateway installation causes new gateways to be unable to connect to existing gateways, resulting in an outage. A full restart of the gateway StatefulSet (by deleting all the StatefulSet pods) is required for the gateways to come back online.

#### Changes to an OAuth provider are not reflected in the consuming APIs

If you modify the endpoints, scopes, or grants for an OAuth provider, the APIs that consume that OAuth provider will be affected. You might need to update the consuming APIs accordingly.

#### No option to bulk delete APIs or Products

In the API Designer and API Manager user interfaces, there is currently no option to delete multiple APIs or Products in a single operation; in the user interfaces, APIs and Products must be deleted individually. However, you can bulk delete APIs and Products by using the REST API or CLI interfaces.

#### Cannot publish an imported API that was generated with IBM API Connect Version 5.0 LoopBack®

If you import an API YAML file that was generated with IBM API Connect Version 5.0 LoopBack, attempts to publish the API fail. Before publishing, remove the catalogs section, and the invoke policy named **tls-invoke-profile**, from the YAML source of the API definition; for example:

```
catalogs:
  apic-dev:
    properties:
      runtime-url: $(TARGET_URL)
  sb:
    properties:
      runtime-url: 'http://localhost:4001'
```

#### Cannot publish an API that has duplicate security definition entries

The API Designer and API Manager user interfaces allow you to add duplicate security definitions to an API. However, attempts to publish the API will fail with OpenAPI validation errors. Ensure that the security definitions in an API are unique.

#### Kubernetes might excessively evict pods

In Kubernetes, if insufficient memory, CPU, or storage resources are provided then pods are evicted randomly. To avoid this problem, allocate sufficient resources to the pods. In addition, there are known issues with log rotation in Kubernetes that are documented here:

<https://github.com/kubernetes/kubernetes/issues/59902>. The lack of log rotation can cause logs to grow, limited only by the amount of storage on the node, eventually causing pods to restart. Therefore ensure that appropriate log levels are configured for all API Connect components.

You may also follow the instructions described here <https://success.docker.com/article/how-to-setup-log-rotation-post-installation> to set the maximum size of the log before it is rolled (max-size) and the maximum number of log files that can be present (max-files). More information about the Docker JSON File logging driver is available here: <https://docs.docker.com/config/containers/logging/json-file/>.

#### Logging in to the API Connect user interfaces fails when using the Safari web browser

If you are using the Safari web browser and a Basic Authorization header exists for the same DNS domain in which API Connect is running, attempts to log in to the API Connect user interfaces, or to sign up by using an activation link, fail. To avoid this problem, use an alternative web browser.

#### Endpoints cannot be changed by using APICUP after they have been configured in Cloud Manager

The changing of endpoints with APICUP after they have been configured in Cloud Manager is not supported. Any such endpoint changes will not be propagated to a running deployment.

#### An OAuth provider fails if the resources that it references aren't enabled in the Catalog

If you enable an OAuth provider in a Catalog then any resources that it references, such as API user registries or TLS client profiles, must be enabled in the same Catalog; if not, then although the OAuth provider might publish successfully it will fail at run time. For information on enabling resources in a Catalog, see [Creating and configuring Catalogs](#).

#### Redact conditions within **switch**, **operation-switch**, or **if** policies might not execute after converting to DataPower API Gateway

If an API Connect v5-compatible **redact** policy is found within a **switch**, **operation-switch**, or **if** policy, the migration utility does not move the **redact** policy to the beginning or end of the assembly. The difference in the response between API Connect v5 and DataPower API Gateway may prevent data from being redacted in the DataPower API Gateway.

For example, if an assembly includes a **switch** policy containing four redact conditions followed by an **invoke** policy, each redact condition redacts the response data. After porting to the API Gateway, the redact conditions remain inside the **switch** policy and target the **message.body** property for redaction. These redactions fail to execute because the **message.body** property has not yet been retrieved by the **invoke** policy. To correct this problem, you must move the **invoke** policy before the **switch** policy in the assembly.

#### Redact on invalid XPath fails after converting to DataPower API Gateway

A **redact** policy containing an XPath with a trailing slash is converted by the migration utility **apicm archive:port-to-apigw** command without removing the slash. This path is invalid. When the API containing this policy is called, an **assembly redact** error is generated.

#### Analytics ingestion stability issue

Analytics ingestion has a known stability issue when the message queue (MQ) is enabled. The events received by the Analytics subsystem from the Gateway might not display in the Analytics dashboard. This applies to fresh deployments, upgrading existing deployments, and also when switching the deployment profile from "development" to "production" while the message queue is enabled. To avoid these problems, ensure the message queue is disabled before making any changes to your analytics subsystem deployment. The message queue can be safely re-enabled once all updates to the analytics deployment have been completed.

"Test" tab's Trace feature displays blank policies list in Firefox

When you create an API, you can invoke it and debug its execution using the Test tab. The Test tab shows the API's response and includes a subtab where you can run a trace on the API's translation flow. In Firefox, the Trace tab's list of policies is empty. Use Chrome to debug your API so you can see the policies list in the trace.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## API Connect concepts

To help you get started, read about the API Connect concepts and obtain a high level understanding of the API management solution.

- [Who does what in API Connect?](#)  
Review the different functions that users can perform in API Connect, the typical set of tasks that is performed by each type of user, and the documentation most often used for each task.
- [Packaging strategy and terminology in API Connect](#)  
API Connect uses a proprietary packaging strategy for creating and publishing collections of APIs.
- [API Connect components](#)  
The API Connect components provide a unified user experience across the API lifecycle. Changes in one stage of the API lifecycle are automatically reflected in the other components of API Connect.
- [API Connect: End-to-end solution example](#)  
This example summarizes the concepts relating to the creation and use of APIs in the API Connect on-premises solution. It depicts the workflow and highlights some of the default roles for the tasks completed during the API lifecycle.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Who does what in API Connect?

Review the different functions that users can perform in API Connect, the typical set of tasks that is performed by each type of user, and the documentation most often used for each task.

### Administrators

If you use API Connect in the cloud, then systems are managed by IBM Operations and you don't need to assign anyone to perform system administration tasks.

If you deploy API Connect on premises, then your company manages the systems. Because API Connect comprises multiple servers even in an on-premises deployment, the collection of servers and services is referred to as a (local) cloud. This is unrelated to any servers and systems that are deployed in IBM® Cloud.

On premises, there are two roles for managing your deployment:

- Cloud owner: There is one cloud owner for a deployment, and that person adds other people to the server management team.
- Cloud administrator: Your deployment needs at least one cloud administrator; your company will probably assign multiple people to perform this role. Cloud administrators manage the deployment and configuration of API Connect servers and software.

In the API Connect documentation, cloud owners and administrators are primarily interested in the following sections, which introduce [concepts](#) and explain how to [deploy, maintain](#), and [configure](#) the components of an on-premises deployment.

### Users

At the highest level, API Connect users belong to organizations, which are groups of people. A *provider organization* (often shortened as *p-org*) is a group of people who create, publish, and maintain APIs that are then used by people in a *consumer organization*. Consumers develop their own applications that call the APIs created by providers. A single customer can create multiple provider organizations and consumer organizations. For example, different divisions within a large company might work with different technologies and create entirely different sets of APIs, so it makes sense to group them into different p-orgs. Each provider organization publishes their APIs to a Developer Portal that uses consumer organizations to manage the customers who use those APIs.

At a minimum, you need one provider organization if you want to publish and manage APIs with API Connect, and one consumer organization for each customer.

Provider organization

A provider organization performs many tasks during the lifecycle of an API, from developing, publishing, and maintaining APIs to managing the membership of the organization itself. Each p-org can be as large or as small as needed. A large company might create a p-org for each product team, or for each department but a small company might use a single p-org.

A person can be a member of multiple provider organizations and receive a different set of permissions for each. When the user logs in to API Connect, they select the organization whose resources they will use, and receive the appropriate permissions for that organization for the duration of the session.

The following roles are commonly associated with a provider organization but are not necessarily represented by different people. In a small company, one person might perform all of the API maintenance tasks while in a larger company, several people might take on separate roles.

- Organization Owner: Every provider organization requires one owner to ensure that a user account is associated with the organization. The organization owner has full access to all of the p-org's resources (APIs, Products, Catalogs, and so on) and role cannot be deleted. The organization owner can add people

to the organization manager role.

- **Organization Manager:** Maintaining the organization account is the job of the organization manager. In a large company, several people might share this role. Organization managers add *members* to provider organizations and assign them the permissions needed to perform their jobs. Organization owners and managers typically use the docs on [administering provider orgs](#) and [administering members and roles](#).
- **API Developer:** In API Connect, an API developer creates new APIs and updates existing APIs as needed. The API developer can configure *policies* that define security restrictions, logging rules, and quotas that control access to your company's resources. The API developer might be assigned to work with a specific *Catalog* that manages a subset of APIs, or they might receive access to all of the p-org's Catalogs and the *Spaces* within each. API developers are usually most concerned with documentation related to [developing APIs](#), [managing API settings](#), and [authoring policies for APIs](#).
- **API Administrator:** After an API developer creates a set of APIs, the API administrator manages the distribution. The API administrator defines *Plans* that determine access to the APIs, collects related APIs into *Products*, and publishes them to the consumer Developer Portals. To complete these tasks, the API administrator uses documentation focused on [managing API syndication](#) and [working with Products](#).
- **Product Manager:** A product manager controls access to the Developer Portal where customers subscribe to APIs and then tracks API usage and performance. For each customer, the product manager creates a consumer organization, assigns a customer representative as the owner, and manages the relationship between the provider organization and each consumer organization. The product manager can customize the appearance of Developer Portal for their p-org as well as provide forums and blogs for their consumers. The product manager uses the API Connect Analytics service to track API usage and performance so that the p-org knows when APIs should be updated or retired. The product manager typically uses documentation on [administering consumer organizations, using the Developer Portal](#), and [reviewing API analytics](#).

#### Consumer organization

A consumer organization creates applications that use the APIs that are developed by provider organizations. Each provider's APIs are made available to each consumer organization in the API Connect Developer Portal. Members of a consumer organization typically perform two functions:

- **Consumer Organization Owner:** The consumer organization owner also manages the organization by inviting other members and assigning permissions to each. This role additionally has permissions to customize the Developer Portal where members access APIs that the organization is subscribed to.
- **Application Developer:** Create applications that invoke APIs shared through the Developer Portal.

The only API Connect feature that API consumers use is the Developer Portal, which is managed by the API provider. There is no need for consumers to read the API Connect documentation.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Packaging strategy and terminology in API Connect

API Connect uses a proprietary packaging strategy for creating and publishing collections of APIs.

The packaging strategy supports API providers in meeting the requirements of the API consumers. An understanding of the concepts and terminology behind the packaging strategy is required before developing and deploying APIs using IBM® API Connect.

The following sections describe the concepts and terminology behind the packaging strategy for IBM API Connect:

- [APIs](#)
- [Plans and Products](#)
- [Catalog and Spaces](#)
- [Organizations and users](#)
- [LoopBack® applications](#)
- [Sample provider organization with two Catalogs](#)

---

## APIs

An Application Programming Interface (API) is an industry-standard software technology. An API is a set of routines, protocols, and tools for building software applications. An API specifies how software components interact and provides quick access to common assets and processes. APIs can be public (such as offered on GitHub), can require client credentials, or can be kept private within an application. Thus, APIs are classified as external (public), partner (protected), or internal (private), based on how they are consumed.

An API is composed of operations, called methods, which are offered in one of the following styles in API Connect:

- A REST API is structured according to the principles of Representational State Transfer. REST APIs use HTTP or HTTPS requests to PUT, GET, POST, and DELETE data (also referred to as CRUD operations). REST identifies resources using URIs. Data can be described in a variety of formats (XML, HTML, JSON, TXT, etc.), with JSON being the popular choice. REST APIs specify MIME (Multipurpose Internet Mail Extensions) types. REST is platform- and language-independent and works across firewalls using HTTPS. REST APIs leverage HTTP standards for security, caching, and status codes. HTTP clients and servers are available for all major programming languages and operating system/hardware platforms. REST implementations are easily scaled due to use of HTTP and browsers as a uniform interface.
- A SOAP (Simple Object Access Protocol) API is a web service that is exposed as an API. SOAP interfaces are described in WSDL (Web Services Description Language) format. The WSDL is an XML document describing the structure for headers, messages, URL endpoints, and datatypes used to access a web service. SOAP is considered more secure than REST as it supports WS-Security as well as SSL. SOAP also contains WS-Reliable Messaging for reliability, rather than relying on retrying the operation (as does REST). SOAP requires a client application and is better suited for enterprise applications that require secure transactions.

APIs can be versioned and packaged into multiple Products for distribution to API consumers on the Developer Portal. For information about creating and managing APIs, see [Developing your APIs and applications](#) and [Managing your APIs](#).

---

## Plans and Products

Plans and Products are proprietary packaging constructs that are unique to API Connect. API providers use Products to offer one or more APIs to the application developers who will consume the APIs (API consumers). The providers use Plans to control access to APIs and to manage API usage. Products are packages that contain

both the APIs and the accompanying Plans. See [Working with Products](#).

To make an API available to an application developer, it must be included in at least one Product and at least one Plan.

Plans perform the following functions:

- Control which APIs an application developer can use
- Make available a collection of operations from one or more APIs
- Apply rate limits to APIs to differentiate between offerings
- Implement different rate limits to specify how many requests a consuming application is allowed to make during a specified time interval

Plans can use differing rate limits to provide different levels of service to API consumers. For example, a "Demo Plan" might enforce a rate limit of ten calls per minute, while a "Full Plan" might permit up to 1000 calls per second.

A Product in API Connect bundles a set of APIs and Plans into one offering that is intended for a particular use. You can create Plans only within Products, and these Products are then published in a Catalog. The following rules apply for the relationship between Products and Plans:

- A Plan can belong to only one Product.
- A Product can have multiple Plans that each contain a different set of APIs.
- A Plan in one Product can share APIs with Plans from any other Product.

Multiple Plans within a single Product provide different levels of performance for the same offering. For example, a Product can include a "Demo Plan" that makes a single API available, and a "Full Plan" that makes several APIs available.

Products are used to manage the lifecycle of the APIs they contain. The states in the Product lifecycle include draft, staged, published, deprecated, and retired. A Product in draft state is moved to the staged state when it is staged to a *Catalog*. A Product moves to the published state when the Product is published. The APIs in a Product become accessible to API consumers when the Product is in the published state and they then become visible on a *Developer Portal*. After a Product is published, application developers can use the Developer Portal to gain access to its APIs by registering applications to one or more Plans in the Product.

The following diagram illustrates the hierarchy of Products, Plans, and APIs.

For more information about managing the lifecycle of Products, see [Working with Products in the API Manager](#).

## Catalogs and Spaces

A Catalog contains a collection of Products. Catalogs are staging targets through which Products (together with the accompanying Plans and APIs) are published on a Developer Portal. Catalogs are used to separate Products and APIs for testing before publishing them on a Developer Portal. In a typical workflow, an API provider uses a development Catalog when developing and testing APIs, and uses a production Catalog for publishing APIs that are ready for external use. Each Catalog has an associated Developer Portal for exposing the published Products. A Catalog includes runtime capability through an associated gateway service that handles any API requests for the APIs in that Catalog.

API Connect includes a syndication feature that enables API providers to partition a Catalog into multiple staging targets (or *Spaces*) for API development purposes. Each API provider development team can use its own dedicated Space to manage its Products independently of other teams. A Space has its own set of capabilities relating specifically to the Products and APIs that are created and published to that Space. Products and APIs in all Spaces in a given Catalog are published to the same Developer Portal. Spaces are not visible on the Developer Portal. Application developers who consume the APIs on the Developer Portal are unaware of the Space configuration used by the API Developers. On the Developer Portal, the APIs are seen as a coordinated offering within a Catalog.

For more information about Catalogs and Spaces, see [Working with Catalogs](#) and [Using syndication to partition Catalogs into Spaces](#).

## Organizations and users

In the context of API Connect, there are two types of organizations: provider and consumer. An organization can encompass a project team, department, or division.

A provider organization owns APIs, and associated Plans and Products, and can additionally own *provider* applications that are called by APIs. To complete the various functions in the API lifecycle, a provider organization assigns responsibilities for certain tasks. Some standard responsibilities within a provider organization include:

- A provider organization owner who has the full set of access permissions to API Connect functions, and can also commission APIs and track their business adoption.
- API developers who design and develop APIs and applications for the provider organizations to which they belong.
- An administrator who manages the lifecycles of APIs and publishes APIs for discovery and use.
- A "community" manager who manages the relationship between the provider organization and application developers, provides information about API usage, and provides support to application developers.

A consumer organization owns only *developer* applications, and consumes the APIs and applications produced by the provider organization. Standard responsibilities within a consumer organization include:

- A consumer organization owner who adds application developers to the consumer organization, views the Products and APIs that the provider organization has made available on the Developer Portal, and subscribes to APIs to use them in applications.
- Application developers who view the Products and APIs that the provider organization has made available on the Developer Portal, and subscribe to use these APIs in applications.

The provider and consumer organization responsibilities map to *roles* within API Connect. Some roles are independent of an organization; for example, an administrator who manages the cloud infrastructure and keeps the system running. For information about the full set of defined roles and access permissions, see [API Connect user roles](#).

Users have an existence in the API Connect ecosystem that is independent of an organization. A user can be a member of more than one provider or consumer organization.

There can be multiple provider organizations in one API Connect cloud, to provide an API development environment for each line of business of an enterprise. The API Connect cloud is a collection of servers that comprise an API Connect installation, including the configuration information and metadata that they contain. The cloud infrastructure is shared by all organizations, and managed independently of them (by a cloud or system administrator). The following diagram shows the relationship between the provider organizations, consumer organizations, and users. The clusters shown are logical groupings of servers with the same capability.

For more information about organizations, see [Administering provider organizations](#) and [Administering consumer organizations](#).

## LoopBack applications

In addition to APIs, provider organizations can also create applications (with associated APIs), which are built using Node.js and Java technology. When published, these APIs and applications are called by developer applications. The developer applications contain client code that accesses APIs to interact with a service, system, or content. The developer applications are typically mobile or web applications that use the HTTP protocol.

For information about creating LoopBack applications, see [Creating APIs and applications](#).

## Sample provider organization with two Catalogs

The following diagram shows an example for how APIs, Plans, Products, Catalogs, and Spaces fit within provider and consumer organizations. In this example, two Catalogs are created in the provider organization to act as staging targets for different sets of requirements.

- Catalog 1 does not require separation of the Products for use by individual provider development teams, and so does not have Spaces enabled. API developers with access to this Catalog create draft APIs, and stage and publish them as Products to the Catalog. Several consumer organizations are granted permission to explore, discover, and use the published Products and APIs. In each of the consumer organizations, the published Products and APIs from Catalog 1 are exposed on a single Developer Portal.
- Catalog 2 is partitioned into two Spaces (X and Y) so that two provider development teams can manage their Products independently. These teams stage and publish their APIs (as Products) separately to the individual Spaces, to make them accessible to application developers in multiple consumer organizations. In each of the developer organizations, the published Products and APIs from both Spaces are exposed in the same Developer Portal, and application developers who access this portal will see the APIs from both Spaces as a coordinated offering.

- **Understanding rate limits for APIs and Plans**

In API Connect, you can configure rate limiting on APIs and Plans to manage network traffic and API usage.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Understanding rate limits for APIs and Plans

In API Connect, you can configure rate limiting on APIs and Plans to manage network traffic and API usage.

### What are rate limits and burst limits?

A rate limit is the maximum number of calls you want to allow in a particular time interval. Setting rate limits enables you to manage the network traffic for your APIs and for specific operations within your APIs. API Connect supports two types of rate limiting:

#### Rate limit

A specified number of calls to be accepted within a defined time period; for example, 100 calls per minute. In API Connect, rate limits can be defined as unlimited, or with a specified number of calls per second, minute, hour, day, or week.

Rate limits can be "hard" (enforced) or "soft". If the rate limit is hard and a call exceeds the limit, then the call is aborted and an error is returned. A soft rate limit allows the call to complete but logs a warning message. When a hard rate limit is reached, no more calls are accepted from that customer until the beginning of the next time period. For example, you might want to permit a total of 1000 calls per hour (rate limit). If a customer makes 1000 calls in the first 10 minutes, they cannot complete any more calls until the hour has expired.

#### Burst limit

A rate limit that is applied to a very small time period. In API Connect, burst limits are defined for multiples of seconds or minutes. Burst limits are always hard. When a burst limit is reached, calls are not accepted until the time period has expired. Once that pause is over, calls continue to be accepted until a hard rate limit is reached. Configuring a burst limit prevents usage spikes and ensures that the rate limit is evenly spread across its overall time period. For example, you might want to permit a total of 1000 calls per hour (rate limit) and a maximum spike of 50 calls per second (burst limit).

### Where can you apply rate limits?

You can configure rate limiting at several levels of an API and the Plan containing it. Each of the rate limits is tracked separately and when a hard limit is exceeded, calls at that point are no longer accepted until the start of the next time period.

The following list explains where you can configure rate limits:

Plan: all APIs

You can define a general rate limit at the Plan level, and it affects all of the consumer orgs that use that Plan. When a rate limit is enforced for a Plan, the limit is checked before every call that involves any API contained in that Plan. If the rate limit is exceeded, APIs are not even called. For information on setting a rate limit for a Plan, see [Editing a draft Product](#).

Note: If the subscriber changes to a different Plan, only the Plan-level rates limit are reset. If there is a hard rate limit specified in the API's definition or assembly, that rate limit is still enforced under the new Plan.

Plan: API path and operation

You can define a rate limit for a specific path and operation of an API within a Plan; for example, you might allow unlimited calls to a GET operation but enforce a limit on PUT operations for the same API. You can even define multiple rate limits on the same path and operation. If the rate limit is enforced, then the limit is checked before every call that involves the API's path and operation. For more information on configuring rate limits on API paths and operations within a plan, see the following topics:

- [Defining rate limits for an API operation](#)
- [Describing Plans in your Product](#)

API definition

You can define a rate limit on an API in the API definition (the Design page in the user interface). This rate limit applies to all calls involving the API, from all consumer orgs. If the containing Plan allows the call but the API definition has a hard limit set, the call is aborted. For more information on setting a rate limit on an API definition, see [Changing an API rate limit](#).

API assembly

When you apply a rate limit to an API assembly, the limit only affects calls at that point in the assembly. This allows you to define a more granular rate limit than if you set it on the API definition. If the Plan and the API definition allow a call to proceed but a hard limit that is set on the assembly is exceeded, the call is aborted at the point in the process flow where the rate limit is set. Any actions that appear in the assembly's process flow before the rate limit policy are executed. Only the actions that appear in the flow after the rate limit policy are aborted. For more information on configuring assembly-level rate limits, see the following topics:

- [Rate Limit policy](#)
- [GatewayScript policy](#)
- [Using context variables in a GatewayScript policy](#)

## How can you test rate limits?

---

When you're ready to test rate limits on an API or Plan, make sure you deploy it in a test Catalog where automatic subscriptions are not enabled. Execute a larger number of calls than specified by your rate limit, within a shorter period of time. If you set soft rate limits, check for warning messages that indicate when each limit is exceeded. If you set hard limits, you can tell it was enforced when the API call fails. You can also check the error messages to verify which calls exceeded the limits.

The built-in test application that is used by the API Manager and API Designer Test tool is not subject to rate limits if you enabled automatic subscriptions for the Catalog where you are testing. To ensure that your rate limits are applied as intended, create a new test Catalog that requires manual subscriptions and test your API and Plan there. For more information on creating and configuring Catalogs, see [Working with Catalogs](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## API Connect components

The API Connect components provide a unified user experience across the API lifecycle. Changes in one stage of the API lifecycle are automatically reflected in the other components of API Connect.

- [Cloud Manager](#)
- [The developer toolkit](#)
- [API Manager](#)
- [API Gateways](#)
- [Runtime](#)
- [Developer Portal](#)
- [API Analytics](#)
- [Typical tasks per interface component](#)
- [API Connect server requirements](#)

---

## Cloud Manager

The API Connect Cloud Manager component is used to manage the API Connect on-premises cloud. The Cloud Administrator uses this UI to:

- Define the cluster of *Management servers*, *Gateway servers*, and *containers* that are required in the cloud, and configure the topology. For information about Management servers and Gateway servers, see [API Connect server requirements](#). For information about containers, see [Runtime](#).
- Manage (modify, move, remove, restart, reboot) the servers in the cloud.
- Monitor the health of the cloud.
- Define and manage the provider organizations that develop APIs. (Assigned managers or owners of provider organizations can also complete this task.)
- Define additional cloud administrators, or set up users with roles that enable access to specific capabilities.
- Add user registries for authenticating users and securing APIs, and configure the secure transmission of data (for example, through websites).

For more information about the Cloud Manager, see [Managing your cloud](#).

## The developer toolkit

The developer toolkit provides the tools for modeling, developing, and testing APIs and LoopBack® applications. The developer toolkit includes a command line interface (CLI). It also incorporates LoopBack, an open source Node.js framework.

API developers use the API management functions in the API Manager or the CLI to create draft API definitions for REST and SOAP APIs, or for OAuth provider endpoints that are used for OAuth 2.0 authentication. The API definitions can be configured to add the API to a Product, add a policy assembly flow (to manipulate requests/responses), and to define security options and other settings. APIs can then be tested locally prior to publishing, to ensure they are defined and implemented correctly.

Using LoopBack, an API developer can create a Node.js application, connect to a data source such as a back-end database or a REST API to be consumed, and then expose the application as a REST API by creating a model definition. A LoopBack model defines the application data, validation rules, data access capabilities, and business logic for an API, and provides a REST API by default. This REST API can then be used by a REST API definition that was created using the API Manager or CLI and exposed to your users. The API and its associated application, which are implemented as a LoopBack project, must both be published to enable the project to be run. LoopBack projects can also be tested locally by creating a local runtime environment. The following diagram illustrates the LoopBack project architecture:

Draft APIs (in their containing Products) that are created by using the API Manager, CLI, or LoopBack are published to Catalogs. Applications created using LoopBack are published to containers, from where they run when called. (For information about containers, see [Runtime](#).)

The developer toolkit is installed locally, for offline API and application development. For more information about the developer toolkit, see [Developing your APIs and applications](#). For more information about LoopBack, see [LoopBack: The Node.js API Framework](#).

## API Manager

The API Manager provides a user interface that facilitates promotion and tracking of APIs that are packaged within Products and Plans. API providers can move the Products through their lifecycle, and manage the availability and visibility of APIs and Plans.

Catalogs and Spaces are created in the API Manager to act as staging targets through which APIs, Plans, and Products are published to consumer organizations. API providers can stage their Products to Catalogs or Spaces, and then publish them to make the APIs in those Products visible on a *Developer Portal* for external discovery.

To control access to the available API management functions, users in the provider organization can be set up in the API Manager UI with assigned roles and permissions. API providers can also use the UI to manage the consumer organizations that sign up to access their APIs and Plans. *Developer communities* can additionally be created as a way of grouping together a collection of consumer organizations to whom a particular set of Products and Plans can be made available.

The API Manager UI also includes functions to manage the security of the API environment, and provides access to analytics information about API invocation metrics within customizable dashboard views.

For more information about the API Manager, see [Managing your APIs](#).

## API Gateways

Gateways enforce runtime policies to secure and control API traffic, provide the endpoints that expose APIs to the calling applications, and provide assembly functions that enable APIs to integrate with various endpoints. They also log and report all API interactions to the API Connect analytics engine, for real-time and historical analytics and reporting. The following Gateway is available for use in API Connect:

- The DataPower® Gateway is an enterprise API Gateway that is built for departments and cross-enterprise usage. This Gateway provides a comprehensive set of API policies for security, traffic management, mediation, acceleration, and non-HTTP protocol support. The DataPower Gateway is deployed on a virtual or physical DataPower appliance and supports multiple Catalogs per instance or cluster. The DataPower Gateway can handle enterprise level complex integration, and supports containers for flexible runtime management.

Your API Connect offering (or *edition*) can include a virtual DataPower Gateway, and support for a physical DataPower Gateway is also available, subject to certain conditions.

## Runtime

You can run applications and API implementations in API Connect in a containerized runtime.

### Containerized runtime

A containerized runtime environment provides a lightweight deployment location for APIs and applications. A container wraps an application in a complete file system that includes everything it needs to run, such as code, runtime, system tools, and system libraries. You can use Docker Swarm or Kubernetes containers to run your APIs and applications being managed by API Connect.

## Developer Portal

The Developer Portal provides a customizable self-service web-based portal to application developers to explore, discover, and subscribe to APIs.

When API providers publish APIs in the API Manager, those APIs are exposed in the Developer Portal for discovery and usage by application developers in consumer organizations. Application developers can access the Developer Portal UI to register their applications, discover APIs, use the required APIs in their applications (with access approval where necessary), and subsequently deploy those applications.

The Developer Portal provides additional features, such as forums, blogs, comments, and ratings, for socialization and collaboration. API consumers can also view analytics information about the APIs that are used by an application, or used within a consumer organization. For more information, see [Developer Portal: socialize your APIs](#).

## API Analytics

API Connect provides the capability to filter, sort, and aggregate your API event data. This data is then presented within correlated charts, tables, and maps, to help you manage service levels, set quotas, establish controls, set up security policies, manage communities, and analyze trends. API analytics is built on the Kibana V5.5.1 open source analytics and visualization platform, which is designed to work with the Elasticsearch real-time distributed search and analytics engine.

## API Connect server requirements

From an on-premises cloud, you can create, promote, use, and track APIs. An on-premises cloud is composed of various appliances, where each appliance is a server of a specific type. The collection of servers defines your cloud and determines how to distribute the work of managing, analyzing, routing, and storing data.

Your on-premises cloud can be a combination of new and existing physical appliances and virtual appliances, or can be entirely composed of virtual appliances. The type and quantity of servers in an API Connect environment are determined by the individual needs of each enterprise, but the minimum requirement is one Management server, one Analytics server, one Gateway server, and one server to host the Developer Portal.

The API Connect on-premises cloud includes the following server types:

- **Management server.** Stores all of the cloud configuration, and controls communication between the other servers within API Connect. Manages the operations of the various servers in the API Connect cloud and provides the tools to interface with the various servers. The Cloud Manager and API Manager user interfaces run on the Management server.
- **Analytics server.** Provides analytic functions that collect and store information about APIs and API users.
- **Gateway server.** Processes and manages security protocols and stores relevant user and appliance authentication data. The Gateway server also provides assembly functions that enable APIs to integrate with various endpoints, such as databases or HTTP-based endpoints.
- **Developer Portal server.** Provides a customizable social developer portal with a full-featured content management system, and includes clustering capability. Enables API providers to build portals for their application developers, and provides the interface for application developers to discover APIs and subscribe to usage Plans contained in the published Products for use in their applications.

Note: All Management appliances in an API Connect cloud must run at the same firmware level as each other. Gateway appliances can run on different firmware levels to each other, but it is recommended that all of the Gateway appliances run on the same level as each other.

## Typical tasks per interface component

API Connect offers both command line and graphical user interfaces. Provider and consumer organizations use different interfaces for completing typical tasks. Refer to the following table to locate the interface that corresponds to a specific task.

Table 1. API Connect Tasks per interface component

Organization Type	Interface Component	Tasks
API Provider	Command Line Interface (CLI)	Create APIs, Plans, and Products
	API Manager UI	Create APIs, Plans, and Products
	API Manager UI	Create Catalogs and Spaces; Create Consumer Organizations
	Cloud Manager UI	Create Provider Organizations
API Consumer (application developer)	Developer Portal	Access APIs to create and run applications; Create Consumer Organizations

- If self-service onboarding is enabled for a Catalog, a consumer organization is automatically created when an application developer signs up or is invited by the API provider to a Developer Portal, and the application developer then becomes the owner of that consumer organization.

## Related concepts

- [Packaging strategy and terminology in API Connect](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API Connect: End-to-end solution example

This example summarizes the concepts relating to the creation and use of APIs in the API Connect on-premises solution. It depicts the workflow and highlights some of the default roles for the tasks completed during the API lifecycle.

The following diagram shows an example of the workflow steps that are completed by the provider and consumer organizations.

## Action: 1

**Cloud Owner** **Cloud Administrator** The minimum requirements for an on-premises API Connect solution consist of one Management server to manage APIs, one Gateway server to direct API traffic, one Analytics server to analyze the APIs, and a server to host the Developer Portal. As a Cloud Owner or Cloud Administrator, you gather a collection of Management, Analytics, Gateway, and Developer Portal servers to create *clusters* to load balance and isolate traffic. A cluster has a single network address through which you can access its capabilities.

## Action: 2

**Organization Manager** **Organization Owner** With the infrastructure in place, Organization Managers and Organization Owners can manage *organizations* of users who create APIs, provider applications, and associated Products. Users belong to one or more provider organizations and individually or collectively work on the APIs or applications that belong to the organization. Project teams, departments, and company divisions are all examples of groups of users that might be members of the same provider organization in API Connect.

## Action: 3 4 5

**API Developer** Once defined as a user in a provider organization and assigned access permissions, API Developers (who might be assigned more than one role) can design, develop, and test APIs, and associate them with Plans and Products. As an API Developer, you specify policy settings to limit the usage of the APIs exposed by the Plan. You can define a single quota policy that applies to all the API resources accessed through the Plan, or you can define separate quota policies for specific API resources. You can also define policies on API resources to configure capabilities such as security, logging, routing of requests to target services, and transformation of data from one format to another. Such policies control aspects of processing in the Gateway during the handling of an API invocation, and are the building blocks of assembly flows. While developing and maintaining APIs, you can also create separate deployment targets called *Catalogs* for testing and production. Each Catalog is associated with a specific Developer Portal and endpoints. If you have administrative privileges, you can restrict deployment access to a Catalog and require actions, such as approving deployment of new API versions.

## Action: 6

**Product Manager** To control access to APIs that are ready for publication and ready to be included in applications, a Product Manager defines and manages *organizations* of users who own developer applications and call published APIs from these applications. A consumer organization is assigned an owner, and might represent a business partner, or a group of internal or external developers. Consumer organizations can also be grouped into *communities* to which one or more APIs (in their containing Plans and Products) can be collectively published. As a Product Manager, you manage access to APIs, manage the relationship between the provider organization and consumer organizations, provide support to application developers when needed, and analyze API usage.

## Action: 7 8

**API Administrator** After APIs are created and successfully tested, an API Administrator publishes one or more *Products* to expose the APIs on the Developer Portal for discovery and use. APIs are included in a *Plan*, which is contained in a *Product*, before being published, and can be published to one or more consumer organizations, thereby restricting visibility of the API. Only application developers in the specified organizations can see the API on the Developer Portal and obtain application keys to access it. The API Administrator is also responsible for managing the lifecycle of Products and their associated APIs, and uses analytics to track API usage and determine whether an API is fulfilling its intended purpose.

## Action: 9

**Consumer Organization Owner** After a consumer organization is created, its designated Consumer Organization Owner can invite other users to join the consumer organization so that they can access the Developer Portal and use the APIs that have been made available to the consumer organization. The Consumer Organization Owner, or another

user with relevant access, can also configure the Developer Portal site; for example, customize its appearance, create and control forums, post blog entries, and configure blogs.

## Action: 10 11 12

**App Developer** After a Product is published, authorized App Developers gain access to its APIs by registering applications to access the Plans in that Product. An application developer uses the Developer Portal to browse for a required API, subscribe to its associated Plan, and then includes the API in an application that can subsequently be deployed to a device.

When the API is invoked from the deployed application on a device, a sample request/response flow of the API Connect runtime interactions might be as follows:

1. The device user opens the application, which then issues the API request.
2. The request is handled by the Gateway (which performs load balancing and security validation for all API requests) and the API runtime:
  - a. The Gateway validates access policies with the API Manager and invokes the API.
  - b. The API runtime executes the API and obtains the data payload from the back-end system.
  - c. The API response is sent back to the Gateway.
  - d. The Gateway forwards the response to the calling application.
  - e. The Gateway reports usage metrics to the API Manager.
  - f. The Gateway reports analytics data to the Analytics server.

All members of the consumer organization can optionally view API analytics information relating to individual applications or the entire organization.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API Connect gateway types

IBM® API Connect provides two gateway types, DataPower® API Gateway and DataPower Gateway (v5 compatible). In addition, Event Endpoint Management in Cloud Pak for Integration provides the Event Gateway Service for handling incoming requests to consume from a stream of events.

## Event Gateway Service

Event Endpoint Management in Cloud Pak for Integration provides an Event Gateway Service to control access from clients that consume AsyncAPI events from a Kafka cluster. For more information about event endpoints and the Event Gateway Service, see the [Cloud Pak for Integration documentation](#).

## DataPower API Gateway

The DataPower API Gateway has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible). Where DataPower Gateway (v5 compatible) was built for flexibility, DataPower API Gateway is built specifically for the API use case, with resulting performance benefits.

DataPower API Gateway was built and optimized for the cloud. Use this gateway if you are running applications in a public or private cloud and want to expose them as APIs.

## DataPower Gateway (v5 compatible)

DataPower Gateway (v5 compatible) provides compatibility with the IBM DataPower Gateway that was provided with IBM API Connect Version 5 and earlier releases.

Consider using DataPower Gateway (v5 compatible) if you are an existing DataPower user and want to utilize your DataPower resources and knowledge.

## Gateway comparison

The following table compares support for features between the gateway types. For v5-compatible features and policies that are not supported in DataPower API Gateway, you can use the API Connect Migration Utility (AMU) to migrate them to an API Gateway-compatible format. For more information, see [Migrating a Version 5 deployment](#).

Table 1. Comparison of the DataPower Gateway (v5 compatible) and DataPower API Gateway

Feature	DataPower Gateway (v5 compatible)	DataPower API Gateway
Native policies	No	Yes
OAuth provider	Full OAuth 2.0 Support	Full OAuth 2.0 Support
OAuth policy	No	Yes
OpenID Connect	Supported through a template	Supported natively
Invoke policy	Yes	Yes
Custom policies	Yes	Yes
Conditional policies	if, operation-switch, switch	switch
Activity logging	Implicitly executed at the end of API assembly	Configured in the API design, outside of the API assembly.
Parse policy (threat detection)	No	Yes
Gateway extensions	Yes	Yes
Support for mutual TLS (mTLS)	Yes	Yes

Attention: Version 5 compatible gateways and DataPower API Gateways have different mechanisms for interacting with the API context for GatewayScript and XSLT policies, or if you are authoring user-defined policies. Ensure that you are using the correct mechanisms for your gateway type.

- For v5-compatible gateways and v5 compatibility for APIs created for the API Gateway, see [GatewayScript code examples](#) and [XSLT policy examples](#).
- For DataPower API Gateway, see [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API Connect user roles

The IBM® API Connect solution provides an infrastructure, tools, and facilities that allows users to create, manage, and stage APIs. The ability to perform tasks in the API Connect user interfaces is controlled through user roles, and the permissions that are assigned to those roles.

The roles described here are the default API Connect roles. In the API Manager user interface, you can create custom roles; for more information, see: [Creating custom roles](#). You can also create custom roles in the Developer Portal user interface.

The following sections describe the roles and permissions for each of the API Connect user interfaces:

- [User roles in the Cloud Manager UI](#)
- [User roles in the API Manager UI](#)
- [User roles in the Developer Portal UI](#)

## User roles and permissions in the Cloud Manager UI

The following table describes the Cloud Manager UI user permissions as configured in the base product. Certain roles can be edited as indicated in Table 2, and custom roles can be created. For instructions on how to create custom roles for the Admin organization (Cloud Manager users), see [Creating roles in the admin organization](#).

Table 1. Cloud Manager UI permissions

Permission	Action	Meaning
Cloud Settings	View	View all items on the Cloud Manager > Settings menu (except Roles)
	Manage	Add, update, and delete all items on the Cloud Manager > Settings menu (except Roles)
Member	View	View members on the members list located at Cloud Manager > Members
	Manage	Add and invite members from Cloud Manager > Members Note: By default, a user with Member > Manage permission can assign, to themselves or to another user, any role with any permission regardless of the permissions that they themselves have. However, you can apply a restriction such that, for a user to assign a role, they must themselves have at least all of the permissions that are applied to that role. To apply that restriction, complete the following steps: <ol style="list-style-type: none"> <li>1. Log in to your management server from the toolkit CLI as a member of the cloud administration organization; for details, see <a href="#">Logging in to management server</a>.</li> <li>2. Enter the following command (the terminating hyphen character means that the command takes input from the command line):               <pre>apic cloud-settings:update --server mgmt_endpoint_url -</pre>               where <code>mgmt_endpoint_url</code> is the platform API endpoint URL.             </li> <li>3. Enter the following data, followed by a new line:               <pre>restrict_member_manage_permission: true</pre> </li> <li>4. Press <b>CTRL D</b> to terminate the input.</li> </ol>
Org	View	Org:View is a permission assigned to all Roles in Cloud Manager. It does not provide access to any functionality. It allows a user to activate their membership. It is the only permission in the Member role.
Provider-Org	View	View the list of provider organizations at Cloud Manager > Provider Organizations
	Manage	Add, edit, and delete provider organizations and invite owners from Cloud Manager > Provider Organizations
Settings	View	View the items on the Cloud Manager > Resources menu plus Roles located at Cloud Manager > Settings > Roles
	Manage	Add, edit, and delete the items on the Cloud Manager > Resources menu plus Roles located at Cloud Manager > Settings > Roles
Topology	View	View the items on the Cloud Manager > Topology menu
	Manage	Add, edit, and delete the items on the Cloud Manager > Topology menu

The following table lists the various Cloud Manager UI roles and the permissions assigned to them.

Table 2. Cloud Manager UI roles

Role	Permissions	Actions	Default role provides access to	Notes
Owner	All permissions	All actions	All menus	Cannot be modified or deleted.

Role	Permissions	Actions	Default role provides access to	Notes
Administrator	All permissions	All actions	All menus	Can be modified and deleted.
Member	Org	View	Membership activation only	Cannot be modified or deleted. Member role is automatically assigned to all users when they activate their membership from the invitation. It allows them to activate but does not provide access to any menus.
Organization Manager	Org	View	N/A	Can be modified and deleted.
	Provider-Org	View, Manage	Provider Organizations menu	
Topology Administrator	Org	View	N/A	Can be modified and deleted.
	Topology	View, Manage	Topology Menu	
	Settings	View, Manage	Resources menu plus Settings > Roles	
Viewer	All permissions	View	All menus, view only	Cannot be modified or deleted.

## User roles and permissions in the API Manager UI

The following tables describe the API Manager UI user permissions.

A user with Roles permission can change the permission assignments, and can create custom roles; for more information, see [Creating custom roles](#) in the section, [Managing your APIs](#).

Note: In API Manager, the Owner role has full access and cannot be edited or deleted. All other roles, including custom roles, can be deleted. If you delete a role, users lose that role. If a user loses that role, their account remains in API Manager, enabling you to add a role to the user at a future date.

Table 3. Organization permissions

Permissions	Action	Permits the member to
Member	View	View organization's members
	Manage	<p>Manage organization's members</p> <p>Note: By default, a user with Member &gt; Manage permission can assign, to themselves or to another user, any role with any permission regardless of the permissions that they themselves have. However, you can apply a restriction such that, for a user to assign a role, they must themselves have at least all of the permissions that are applied to that role. To apply that restriction, complete the following steps:</p> <ol style="list-style-type: none"> <li>1. Log in to your management server from the toolkit CLI as a member of the cloud administration organization; for details, see <a href="#">Logging in to management server</a>.</li> <li>2. Enter the following command (the terminating hyphen character means that the command takes input from the command line): <pre>apic cloud-settings:update --server mgmt_endpoint_url -</pre> <p>where <i>mgmt_endpoint_url</i> is the platform API endpoint URL.</p> </li> <li>3. Enter the following data, followed by a new line: <pre>restrict_member_manage_permission: true</pre> </li> <li>4. Press <b>CTRL D</b> to terminate the input.</li> </ol>
Settings	View	View organization's configuration settings, including roles, TLS profiles, and user registries. View configuration settings for a Catalog or Space, including policies and OpenAPI extensions.
	Manage	Manage organization's configuration settings, including roles, TLS profiles, and user registries. Manage configuration settings for a Catalog or Space, including policies and OpenAPI extensions.
Topology	View	View topology permissions for configuring portal and gateway services. Also view the clusters.
	Manage	Manage topology permissions for configuring portal and gateway services. Also manage the clusters.
Org	View	View organization
Product-Drafts	View	View draft APIs and Products
	Edit	View draft APIs and edit draft Products
Api-Drafts	View	View draft APIs
	Edit	Edit draft APIs and view draft Products
Product	View	View Products
	Stage	Stage Product
	Manage	Manage Product
Product-Approval	View	View Product lifecycle changes
	Stage	Approve the staging of a Product
	Publish	Approve the publishing of a Product
	Supersede	Approve the superseding of a Product
	Replace	Approve the replacement a Product
	Deprecate	Approve the deprecation of a Product
	Retire	Approve the retiring of a Product

Permissions	Action	Permits the member to
Consumer-Org	View	View consumer organization and developers
	Manage	Manage consumer organization and developers
App	View	View both production and development applications.
	Manage	Manage both production and development applications. A member with this permission can also request the promotion of a development app to a production app. This request triggers a task that needs approval by a member with the App-approval Manage permission.
App-Dev	Manage	Manage development applications. This permission does not include the ability to manage production apps.
App-Approval	View	View application approvals, for requests to promote a development app to a production app.
	Manage	Manage (Approve or Decline) requests for approval to promote a development app to a production app.
Subscription	View	View application Plan subscriptions that have been created by application developers in the Developer Portal.
	Manage	Manage the application Plan subscriptions that have been created by application developers in the Developer Portal. The Manage permission includes ability to migrate a subscription to another plan.
Subscription-Approval	View	View application Plan subscription approvals
	Manage	Manage (Approve or Decline) application Plan subscriptions
Api-Analytics	View	View analytics
	Manage	Manage analytics
Child	View	At the provider organization level, view Catalogs in the provider organization. At the Catalog level, view Spaces in the Catalog.
	Create	At the provider organization level, create Catalogs in the provider organization. At the Catalog level, create Spaces in the Catalog.
	Manage	At the provider organization level, manage Catalogs in the provider organization. At the catalog level, manage Spaces in the Catalog. Management tasks including deleting a Catalog or Space, or transferring ownership of a Catalog or Space.

A user with Settings > Manage permission can change the permission assignments, and can create custom roles; for more information, see [Creating custom roles](#) in the section, [Managing your APIs](#).

Table 4. Default API Manager UI roles and the default permissions assigned to those roles.

Role	Role description	Permissions	Actions
Organization Owner	A provider organization owner has the full set of access permissions to API Connect functions, and also commission APIs and tracks their business adoption.	All permissions	All actions.
Administrator	A provider organization administrator has, by default, the full set of access permissions to API Connect functions, and also commission APIs and tracks their business adoption.	All permissions	All actions.
API Administrator	API administrators manage the lifecycle of APIs and publish APIs for discovery and use.	All permissions	All actions except cannot manage the following permissions: Member, Settings, Topology, and Child.
Community Manager	A community manager manages the relationship between the provider organization and application developers, provides information about API usage, and provides support to application developers.	Member	View
		Settings	View
		Topology	View gateway services or portal services at the provider organization.
		Org	View
		Drafts	View, Edit
		Product	View
		Product-approval	View
		Consumer-org	View, Manage
		App	View, Manage
		App-dev	Manage
		App-approval	View, Manage
		Subscription	View, Manage
		Subscription-approval	View, Manage
		Api-analytics	View, Manage
		Child	View
Developer	API developers design and develop APIs and applications for the provider organizations to which they belong. Note: The Developer role allows the creation of Products and APIs, and the staging and publishing of Products to a Catalog or Space, when assigned to a user at the provider organization level, but <b>not</b> when assigned to a user who is a member only of a Catalog or Space within a provider organization. A Developer in a Catalog or Space can, however, manage Products that have been staged or published to the Catalog or Space.	Member	View
		Settings	View
		Topology	View gateway services or portal services at the provider organization.

Role	Role description	Permissions	Actions
		Org	View
		Drafts	View, Edit
		Product	View, Stage, Manage
		Product-approval	View, Stage, Publish, Supersede, Replace, Deprecate, Retire
		Consumer-org	View
		App	View, Manage
		App-dev	Manage
		App-approval	View, Manage
		Subscription	View, Manage
		Subscription-approval	View, Manage
		Api-analytics	View, Manage
		Child	View, Create
Member	Member of a provider organization	Org	View
Viewer	Viewer of a provider organization	Member	View
		Topology	View gateway services or portal services at the provider organization.
		Org	View
		Drafts	View
		Product-approval	View
		Consumer-org	View
		App	View
		App-approval	View
		Subscription	View
		Subscription-approval	View
		Api-analytics	View
		Child	View

Note: In API Manager, the Organization Owner role has full access and cannot be edited or deleted. All other roles, including custom roles, can be deleted. If you delete a role, users lose that role. If a user loses that role, their account remains in API Manager, enabling you to add a role to the user at a future date.

## User roles in the Developer Portal UI

The following table describes the various Developer Portal UI roles that relate to working with APIs and applications. In addition, you can create custom roles for the Developer Portal site itself.

Table 5. Developer Portal UI roles

Role	Role Description	Permission	Actions
Owner	Owns and administers the app developer organization	Organization member	View, Manage
		Organization settings	View, Manage
		Organization view	View
		Consumer product	View
		Consumer app	View or Manage production or development applications
		Consumer app-dev	Manage development applications
		Consumer subscription	View or Manage the application Plan subscriptions that have been created by application developers in the Developer Portal. The Manage permission includes ability to migrate a subscription to another plan.
		Consumer app-analytics	View application analytics
Administrator	Administers the app developer organization	Organization member	View, Manage
		Organization settings	View, Manage
		Organization	View
		Consumer product	View
		Consumer app	View, Manage production or development applications

Role	Role Description	Permission	Actions
		Consumer app-dev	Manage development applications
		Consumer subscription	View or Manage the application Plan subscriptions that have been created by application developers in the Developer Portal. The Manage permission includes ability to migrate a subscription to another plan.
		Consumer app-analytics	View application analytics
Developer	Builds and manages apps in the developer organization	Organization member	View
		Organization	View
		Consumer product	View
		Consumer app	View or Manage production or development applications.
		Consumer app-dev	Manage development applications
		Consumer app-analytics	View
Member	Member of the app developer organization	Organization	View
Viewer	Viewer of the app developer organization	Organization member	View
		Organization settings	View
		Organization	View
		Consumer product	View
		Consumer app	View applications
		Consumer production-app	View production applications
		Consumer app-analytics	View application analytics

Note: A user called admin is created automatically, that has full administrator access to the Developer Portal site. The admin user can view Products and APIs but has no access to use APIs. The admin user assumes the email address of the owner of the provider organization associated with the Developer Portal.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API Connect support

If you experience a problem with IBM® API Connect that you cannot resolve, you can check the IBM Support website for the most recent technical bulletins and fixes. Otherwise, you can contact IBM Support.

For the most recent API Connect technical information, see the [IBM Support Community](#).

If you cannot find a resolution, before you contact IBM Support, you must gather information about the problem. For details of the information you must gather before contacting IBM Support, see [MustGather - Collecting data: API Connect problem determination](#).

Providing IBM Support with a good description of the problem together with the details of your API Connect configuration, helps to expedite the problem resolution.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API Connect glossary

The IBM® API Connect and Cloud Manager glossary of terms and definitions.

**API Administrator (role)**  
Manages the API product lifecycle for the Provider Organizations for which they are a member.

**API Event**  
An event captured for use by API Connect Analytics or third-party analytics, such as response time, HTTP response code, payload of the request and response body, and so on. An API event is logged each time an API operation is invoked via the Gateway server.

**API Gateway**  
Service that acts as a single entry point or “front door” for provider APIs and back-end services. An API Gateway accepts and processes concurrent API calls, and performs traffic management, authorization and access control, monitoring, and API version management. See also [IBM DataPower Gateway](#).

**API Manager**  
Graphical tool in API Connect that enables you to manage Catalogs, Spaces, and APIs, users and roles in the Provider organization, consumer organizations and communities, publish Products to the Developer Portal, and analyze API usage.

**API Designer**  
Graphical tool that runs locally on a laptop or desktop system that enables you to create and modify APIs and LoopBack® apps, and publish them to IBM Cloud or container runtimes.

**API operation**  
REST API call consisting of an HTTP verb and a URL path (endpoint). For example, `GET http://myserver.com/api/users` that returns a list of users.

**Application**  
Software that consumes (calls) an API. One or more Applications are registered by a consumer organization to subscribe to APIs. The application is allocated client ID and client secret credentials that it supplies when invoking API calls.

**assembly**  
Makes side calls to external services and then transforms and aggregates the response before a response is relayed to the calling application.

**Availability zones**  
Isolated locations within data centers from which public cloud services originate and operate. Businesses choose one or multiple worldwide availability zones for their services depending on business needs. Availability Zones provide high availability for services by providing redundancy across regions.

**Availability zone (primary)**  
For Kubernetes form factor, contains the management service. Other zones can contain other services such as the Developer Portal, but not the management service.

**Catalog**  
A staging target that behaves as a logical partition of the gateway and the Developer Portal. The URLs for API calls and for the Developer Portal are specific to a particular Catalog.

**client ID**  
A piece of information that identifies an individual application. An application can invoke an API only if it passes an application key that is recognized by the IBM API Connect system and is granted access to the API. The application key is passed by the client by using an HTTP query parameter.

**client secret**  
A piece of information used together with the application key to verify the identity of an application. An API can be configured to require that client applications supply their client secret with their client ID. The client secret functions effectively as a password known only to the application. The client secret is passed by the client by using an HTTP query parameter.

**Cloud Manager (tool)**  
Graphical tool in API Connect on-premises installation that enables you to define servers, administer and scale system resources, monitor runtime health and create Provider organizations. The Cloud Administrator is the primary user of the Cloud Manager.

**Cloud Administrator (role)**  
Manages the configuration of resources, regions, and availability zones for the Admin Organization of an on-premises installation.

**cluster**  
A collection of one or more servers that provide a specific function.

**Cold standby**  
A deployment configuration in which failover servers are in a stopped state until a failover is required, resulting in a longer time window to restore the normal operation of the solution.

**community**  
A collection of consumer organizations. It is used as a grouping construct when publishing APIs. Communities are used to restrict the visibility and accessibility of APIs. An API can be published to selected communities, which means that only application developers within those organizations can see the API.

**Community Manager (role)**  
Manages application developer communities for the Provider Organizations for which they are a member.

**Consumer organization**  
Within a catalog, representation of a business entity that wishes to consume APIs exposed by the Catalog. For example, a third-party application development company would register themselves as a consumer organization (via the Developer Portal). Each developer in their company can then be registered as a user inside that consumer organization.

**IBM DataPower® Gateway**  
API Gateway service component of API Connect that helps provide security, control, integration and optimized access to APIs. Due to its security and hardening, it is well-suited for a deployment in the demilitarized zone (DMZ) for externally-facing production scenarios. Available in physical, virtual, cloud, Linux and Docker form factors. There are two gateway types, DataPower Gateway (v5 compatible) and DataPower API Gateway; for details, see [API Connect gateway types](#).

**Developer (role)**  
Creates and configures APIs, Products, and policies for the Provider Organizations for which they are a member. An API Developer can be a member of one or more Provider Organizations. The API Developer focuses on the technical implementation of APIs more than they do on the business relationship with application developers.

**Development Catalog**  
Catalog used for testing APIs that are under development and in which approvals are bypassed for publishing and lifecycle actions. Pending approvals are canceled when a non-Development Catalog is converted to a Development Catalog.

**Developer Portal**  
Component of API Connect that provides a customizable graphical web portal for developers to discover APIs, register applications that consume APIs, subscribe to usage plans, and test and use APIs.

**Developer Toolkit**  
Locally-installed package that includes API Designer and the `apic` command-line tool that enables you to create, edit, manage, and publish APIs and apps.

**Gateway**  
See API Gateway.

**Gateway service**  
API Connect service that provides API gateway functionality, such as microgateway or IBM DataPower.

**Hot standby**  
A deployment configuration in which a set of servers are actively running ready to instantaneously take over in the event of a failure, but not actively serving traffic until that failover.

**Identity provider**

Provides identifiers for users looking to interact with a system, assert to such a system that such an identifier presented by a user is known to the provider, and possibly provide other information about the user that is known to the provider. API Connect supports LDAP, AuthURL, and Local User Registries.

**Integrations**  
Third-party tools to build on and improve your API Connect workflow; for example, Slack, Auth0, etc.

**Integration profile**  
Standard API that you can use to integrate with management services for things like identity, notifications, API analytics, and so on.

**Keystore**  
A repository of security certificates, either authorization certificates or public key certificates, and corresponding private keys, used in SSL encryption. The Keystore file has a `.jks` extension.

**LoopBack model**  
A JavaScript object that represents application data and includes validation rules, data access capabilities, and business logic. LoopBack models provide a REST API by default, and connect to data sources for access to back-end data

**LoopBack data source**  
A JavaScript object that represents a back-end service such as a database, REST API (to be consumed), or SOAP web service. Data sources are backed by connectors that communicate directly with the database or other back-end service.

**Management server**  
Stores all of the cloud configuration, and controls communication between the other servers within API Connect.

**Management service**  
Consists of one or more Management servers.

**Member (role)**  
The default role for all users in both the Admin and Provider Organization. All users are assigned the Member role in addition to other roles they may require.

**microservice**  
Modular, independently-deployable application service that communicates with other microservices through a REST API. Microservices are typically organized around capabilities, for example, recommendation, inventory, shipping, or billing.

**Mutual authentication**  
Process in which both entities on a network authenticate each other. In a network environment, the client authenticates the server and vice-versa. It is optional for TLS. Also called two-way authentication.

**Notification settings**  
How you configure notifications for API Connect users (API providers and consumers).

**Notification services**  
Integrations that provide notification capabilities, such as email.

**Notification templates**  
The configuration of the message format and wording for a notification service.

**OAuth provider**  
The OAuth provider supplies the OAuth authentication for logins. API Connect supports both Native and Third Party OAuth providers. Some common third-party OAuth providers are Google and Facebook.

**OpenAPI Components**  
Part of API specification that contains a set of reusable objects for aspects of an API specification, such as schemas, responses, requestBodies, and headers. For more information, see [OpenAPI v3 specification](<https://github.com/OAI/OpenAPI-Specification/blob/OpenAPI.next/versions/3.0.md#components-object>).

**organization**  
The entity that owns APIs or applications that use APIs. A provider organization owns APIs and associated Plans, and can additionally own applications. A consumer organization owns only applications. An organization has at least one owner. An organization can be a project team, department, or division.

**Organization Manager (role)**  
The Organization Manager manages Provider Organizations for the Admin Organization.

**Path**  
Defines the route through which users access REST APIs. A path consists of one or more HTTP operations such as GET or POST.

**Plan**  
The packaging construct by which APIs are made available to developers. A Plan makes a collection of operations from one or more APIs available, and is published to communities of application developers. Application developers gain access to APIs by registering applications to access Plans. A Plan carries with it a collection of policy settings. In the simplest form, a Plan defines a single quota policy that applies to all the API operations that are accessed through the Plan. In more advanced cases, additional policies can be associated with a Plan.

**policy**  
A configuration that controls a specific aspect of processing in the Gateway server during the handling of an API invocation at run time. Policies are the building blocks of assembly flows. Policies provide the means to configure capability, such as security, logging, routing of requests to target services, and transformation of data from one format to another. Policies can be configured in the context of an API or in the context of a Plan.

**Product**  
Provide a method by which you can group APIs into a package that is intended for a particular use. Additionally, they contain Plans, which can be used to differentiate between different offerings. You can create Plans only within Products, and these Products are then published in a Catalog.

**Provider Organization Owner**  
Owns and administers API provider organizations, manages application developer communities, authors APIs and defines products, manages the API product lifecycle. Owners are invited by the Cloud Administrator to join API Connect as an owner of a provider organization.

**proxy**  
Application programming interface that forwards requests to a user-defined back-end resource and relays responses back to the calling application.

**Region**  
A physical location (site or data center) hosting infrastructure isolated from other locations, with independent power and networking connectivity. A region may or may not have further sub-isolation characteristics such as semi-independent pods or availability zones.

**Resources (User registries, TLS Profiles, Notifications)**  
Resources supply necessary functions for the API Connect cloud, such as user authentication, SSL security, and sending system-generated emails.

**role**  
Defines permissions that can enable functionality for users. Each role has a different set of permissions.

**security definition**  
Specifies all the settings for a particular aspect of API security; for example, the user registry that you use to authenticate access to the API.

**server**  
A single appliance, such as an IBM WebSphere IBM DataPower appliance.

**service**  
A user-configurable element implemented through one or more server processes in the API Connect runtime, such as microgateway, Analytics, IBM DataPower, and Developer Portal.

**SNMP**  
Simple Network Management Protocol (SNMP) is a popular protocol for network management. It is used for collecting information from, and configuring, network devices, such as servers, printers, hubs, switches, and routers on an Internet Protocol (IP) network. The SNMP hosts are configured in the API Connect Cloud

Manager.	
Space	A subdivision of a Catalog. Each Space is used by a different API provider development team and has its own set of management capabilities relating specifically to the APIs that the associated team publishes to that Space, enabling each team to manage their APIs independently.
SSL (TLS) Profile	An SSL/TLS profile is used to secure the transmission of data through web sites. SSL certificates guarantee that information you submit to web sites will not be stolen or tampered with.
subscription	The means by which an application developer gains access to the resources provided by an API. An application developer uses the Developer Portal to subscribe to the plan in which the API is published.
TLS	Transport Layer Security - a cryptographic protocol that provides secure communication over a network to prevent eavesdropping and tampering. It is a successor to SSL and runs over TCP.
TLS Profiles	The Cloud Manager and API Manager use TLS profiles to secure transmission of data through web sites. TLS certificates guarantee that information you submit to web sites will not be stolen or tampered with. A TLS Profile consists of Server name, Protocol used (SSL or TLS), and whether Mutual Authentication is required.
Toolkit	See Developer Toolkit.
Topology administrator (role)	Configures gateway services for the Admin Organization.
Truststore	Stores certificates from trusted Certificate authorities(CA) which are used to verify certificate presented by Server in SSL/TSL Connection. While a keystore stores a server's credentials, the truststore stores certificates from a third-party CA.
User registry	A database or other collection containing credentials for users such as provider organization members, consumer organization members, and API Connect administrators. The users are authenticated by an identity provider such as LDAP. User registries authenticate users at login time when accessing the Cloud Manager or API Manager applications. User registries are also used to protect APIs so that user credentials must be supplied when an API is called.
vendor extension	An extension to OpenAPI (Swagger) specification required by a particular use case.
Visibility	Setting visibility determines whether a Provider Organization has access to an Availability Zone, or other service.
<b>Note:</b>	No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See <a href="#">support policy</a> for details. For a more recent version of CD documentation, see the <a href="#">IBM API Connect 10.0.6.x and later product documentation</a> .

## Accessibility features for IBM API Connect

Accessibility features help users who have a physical disability, such as restricted mobility or limited vision, to use information technology products successfully.

### Accessibility features

The following list includes the major accessibility features in IBM® App Connect Enterprise. You can use screen-reader software to hear what is displayed on the screen.

- Supports keyboard-only operation.
- Supports interfaces commonly used by screen readers.

Tip: This product documentation, and its related publications, are accessibility-enabled for the IBM Home Page Reader. You can operate all features by using the keyboard instead of the mouse.

If you are reading a PDF file with a screen reader, the default reading option typically returns the best results. In some cases, how the PDF file is generated might require you to select one of the other reading options. For example, Use reading order in raw print stream.

### Keyboard navigation

This product uses standard Linux® and Microsoft Windows navigation keys.

For more information about the commitments that IBM makes towards accessibility, see the [IBM Accessibility Center](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Legal information

Notices, and terms and conditions for information centers.

- [Tracking API volume for auditing and compliance](#)  
For client security reasons, IBM entrusts its clients with monitoring their own API volume and ensuring that it is within the limits of the contract.
- [Notices](#)  
This information was developed for products and services offered in the U.S.A.

- [Terms and conditions for information centers](#)

Permissions for the use of these publications are granted subject to the following terms and conditions.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Tracking API volume for auditing and compliance

For client security reasons, IBM entrusts its clients with monitoring their own API volume and ensuring that it is within the limits of the contract.

If you purchased IBM API Connect with a license metric of "API Calls", the count of total API Calls must be collected and archived by the client for audit and compliance. This includes, but is not limited to, licensed Programs: "IBM API Connect Hybrid Entitlement" and "IBM Cloud Pak for Integration - API Calls".

---

## Usage archiving

You are **required to regularly** record the number of your API calls from the Analytics **system** to maintain a record of **monthly** usage. To ensure the most accurate results, capture the counts of API Calls on a daily basis. For information about creating a query that counts API calls for **all** response status codes and for a specified time range, see [Counting total API calls for your Analytics service](#).

---

## Overage charging

If you exceed your allotted usage, it is your responsibility to report this to IBM in the form of a CSV file so that the correct overage charge can be applied. IBM has the right to audit customer usage data at any time. If unreported overages are found, there are severe penalties.

Overage is based on the measurement period. For example, overage for a contract might be measured by the year. If your API volume exceeds the entitlement after 6 months, you must either pay overages for the remaining period or purchase additional volume.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Notices

This information was developed for products and services offered in the U.S.A.

IBM® may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing  
IBM Corporation  
North Castle Drive  
Armonk, NY 10504-1785  
U.S.A.

For license inquiries regarding double-byte character set (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing  
Legal and Intellectual Property Law  
IBM Japan Ltd.  
1623-14,  
Shimotsuruma,  
Yamato-shi  
Kanagawa  
242-8502 Japan

**The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law:** INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM United Kingdom Laboratories,  
Mail Point 151,  
Hursley Park,  
Winchester,  
Hampshire,  
England  
SO21 2JN

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this information and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

#### COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs.

Each copy or any portion of these sample programs or any derivative work, must include a copyright notice as follows:

© (your company name) (year). Portions of this code are derived from IBM Corp. Sample Programs. © Copyright IBM Corp. \_enter the year or years\_. All rights reserved.

## Trademarks

---

IBM, the IBM logo, and [ibm.com](https://www.ibm.com)® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the Copyright and trademark information page at <https://www.ibm.com/legal/copytrade.shtml>.

Java™ and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Linux® is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Kubernetes is a trademark of the Linux Foundation in the United States, other countries, or both.

Microsoft and Windows are trademarks of Microsoft Corporation in the United States, other countries, or both.

OpenShift® is a trademark of Red Hat®, Inc. in the United States, other countries, or both.

VMware is a registered trademark or trademark of VMware, Inc. in the United States and other jurisdictions.

## Privacy Policy Considerations

---

IBM Software products, including software as a service solutions, (*Software Offerings*) may use cookies or other technologies to collect product usage information, to help improve the user experience, to tailor interactions with the user or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth in the following paragraphs.

Depending upon the configurations deployed, this Software Offering may use session and persistent cookies that collect each user's session ID for purposes of session management, or functional purposes. These cookies can be disabled, but disabling them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, See IBM's Privacy Policy at <https://www.ibm.com/privacy> and IBM's Online Privacy Statement at <https://www.ibm.com/privacy/details> the section entitled *Cookies, Web Beacons and Other Technologies* and the *IBM Software Products and Software-as-a-Service Privacy Statement* at <https://www.ibm.com/software/info/product-privacy>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Terms and conditions for information centers

Permissions for the use of these publications are granted subject to the following terms and conditions.

### Applicability

---

These terms and conditions are in addition to any terms of use for the IBM® website.

### Personal use

---

You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

### Commercial use

---

You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

### Rights

---

Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the aforementioned instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## IBM API Connect Considerations for GDPR Readiness

Information about features of IBM® API Connect that you can configure, and aspects of the product's use, that you should consider to help your organization with GDPR readiness.

### For PID(s): 5725-Z22 5725-Z63

---

#### Notice:

---

This document is intended to help you in your preparations for GDPR readiness. It provides information about features of API Connect that you can configure, and aspects of the product's use, that you should consider to help your organization with GDPR readiness. This information is not an exhaustive list, due to the many ways that clients can choose and configure features, and the large variety of ways that the product can be used in itself and with third-party applications and systems.

**Clients are responsible for ensuring their own compliance with various laws and regulations, including the European Union General Data Protection Regulation. Clients are solely responsible for obtaining advice of competent legal counsel as to the identification and interpretation of any relevant laws and regulations that may affect the clients' business and any actions the clients may need to take to comply with such laws and regulations.**

**The products, services, and other capabilities described herein are not suitable for all client situations and may have restricted availability. IBM does not provide legal, accounting, or auditing advice or represent or warrant that its services or products will ensure that clients are in compliance with any law or regulation.**

10. [Capability for Restricting Use of Personal Data](#)

## GDPR

---

General Data Protection Regulation (GDPR) has been adopted by the European Union ("EU") and applies from May 25, 2018.

Why is GDPR important?

GDPR establishes a stronger data protection regulatory framework for processing of personal data of individuals. GDPR brings:

- New and enhanced rights for individuals
- Widened definition of personal data
- New obligations for processors
- Potential for significant financial penalties for non-compliance
- Compulsory data breach notification

Read more about GDPR

- [Complete guide to GDPR compliance](#)
- [IBM GDPR website](#)

## Product Configuration - considerations for GDPR Readiness

---

The following sections provide considerations for configuring API Connect to help your organization with GDPR readiness.

### Configuration to support data handling requirements

The GDPR legislation requires that personal data is strictly controlled and that the integrity of the data is maintained. This requires the data to be secured against loss through system failure and also through unauthorized access or via theft of computer equipment or storage media.

IBM API Connect stores identity data in a local database. This encompasses both clients' employee identity data and end users' identity data. Direct access to this database is not available. Identity information collected is protected in transit; refer to [Creating a TLS Server Profile](#) for details on configuring TLS profiles.

API Connect supports a variety of user registry types for authenticating users. Refer to [Authenticating by using your enterprise user directory](#) for details. When using a local user registry, passwords are stored in encrypted form in the local API Connect database. If you want alternative password management, leverage a non-user registry option to manage passwords.

Administrators, that you define, can view identity information. Administrators can take backups that include identity information. It is your responsibility to protect these backups.

A core component for an API Connect deployment is the gateway. Refer to the section on [API Gateways](#) (in the *API Connect components* topic) for details about gateways. DataPower® Gateways are commonly leveraged; refer to the DataPower Gateway documentation for details. Refer to the DataPower Gateway deployment guidelines document for considerations for configuring DataPower Gateways to help your organization with GDPR readiness.

Configuration to support Data Privacy

For Developer Portal, you can customize the privacy policy statement. Refer to [Customizing the privacy policy statement](#) for details.

Configuration to support Data Security

To learn about securing your solution, use this API Connect product documentation and search for "security".

## Data Life Cycle

---

GDPR requires that personal data is:

- Processed lawfully, fairly and in a transparent manner in relation to individuals.
- Collected for specified, explicit and legitimate purposes.
- Adequate, relevant and limited to what is necessary.
- Accurate and, where necessary, kept up to date. Every reasonable step must be taken to ensure that inaccurate personal data are erased or rectified without delay.
- Kept in a form which permits identification of the data subject for no longer than necessary.

API Connect manages the life cycle of user-related data in the following ways:

User account information

API Connect collects and stores identity information, including first and last name, and email address, for the purposes of user registration. Cloud Manager and API Manager accounts are for your employees (or designated actors). Developer Portal accounts are for your consumers of your APIs. Identity information can be collected directly from users or can be copied from LDAP registries. In situations where non-local user registries are used, only the email address is copied from the LDAP registry. Developer Portal user accounts can be deleted; refer to [Deleting your Developer account](#) for details. Cloud Manager and API Manager user accounts' identity information can be anonymized by users.

Users of the API Manager UI can publish Products and APIs to the Developer Portal for Application Developers to access and use. Refer to [Developer Portal: socialize your APIs](#) to learn about Developer Portal. Developer Portal accounts are for consumers of your APIs. You can define and customize a terms and conditions statement that your users must accept before they can register to use your Developer Portal; refer to [Customizing the terms of use statement](#) for details.

API analytics

API Connect optionally logs information related to API invocations. This capability in API Connect is known as API Analytics. Refer to [API Analytics](#) for details.

The API Analytics log information can optionally include unknown / unclassified information such as query headers and request and response information related to API calls -- you control defining the APIs and data associated with API invocations.

The retention period for storing Analytics data in API Connect is configurable; refer to [Configuring data retention and index rollover time periods](#) for details. Backup capability for this information is not available.

To disable API Analytics, disassociate it from the gateway that collects event data. For information, refer to [Associating an analytics service with a gateway service](#).

#### System logs

Event-logging preferences can be configured at the API level, refer to [Activity Log](#) for details.

API Connect logs collect technical information related to service use including tracing of service execution and sequences of operation use. Other technical data related to service use includes data values that define the mechanisms used to connect to the service, for example, IP address. This data is collected for debugging and service improvement. Service diagnostics are collected during unexpected or error situations to allow the offering team to correct the situation and hopefully prevent it from occurring in the future. There is no direct access available to these logs. You can configure log settings and download the logs as explained in [Logging](#).

API Connect can generate audit events. An audit event is logged from each management node when there are changes to the API lifecycle or to the organization; for example, publishing a product or creating an organization triggers this event. Refer to [Configuring audit logging to monitor user operations](#) for details.

## Data Collection

---

Developer Portal accounts are for consumers of your APIs. You can define and customize a terms and conditions statement that your users must accept before they can register to use your Developer Portal; refer to [Customizing the terms of use statement](#) for details. You can also customize the privacy policy statement for Developer Portal; refer to [Customizing the privacy policy statement](#) for details.

#### Types of Data Collected

API Connect collects and stores identity information (including first name, last name, and email address) for the purposes of user registration. Cloud Manager and API Manager accounts are for your employees (or designated actors). Developer Portal accounts are for your consumers of your APIs. Identity information can be collected directly from users or can be copied from LDAP registries. In situations where non-local user registries are used, only the email address is copied from LDAP registry. Developer Portal user accounts can be deleted; refer to [Deleting your Developer account](#) for details. Cloud Manager and API Manager user accounts' identity information can be anonymized by users.

## Data Storage

---

Identity data is stored in API Connect local data store. There is no direct access available to this data store.

API Analytics leverages the OpenSearch real-time distributed search and analytics engine for storage of logged data. There is no direct access available to this data store.

Identity data is included in backups; refer to [Backing up and restoring](#) for details on taking backups. It is your responsibility to protect and discard backups.

## Data Access

---

Identity information can be viewed by administrators that you define.

Analytics information can be accessed through a variety of means. Refer to [Exporting API event data](#) and [Analytics in the Developer Portal](#) for details.

Analytics information can be offloaded to third-party systems. Refer to [Offloading analytics to third-party systems](#) for details. It is your responsibility to protect off-loaded data.

API Connect can generate audit events. An audit event is logged from each management node when there are changes to the API lifecycle or to the organization; for example, publishing a product or creating an organization triggers this event. Refer to [Configuring audit logging to monitor user operations](#) for details.

API Connect logs collect technical information related to service use including tracing of service execution and sequences of operation use. Other technical data related to service use includes data values that define the mechanisms used to connect to the service, for example, IP address. This data is collected for debugging and service improvement. Service diagnostics are collected during unexpected or error situations to allow the offering team to correct the situation and hopefully prevent it from occurring in the future. There is no direct access available to these logs. You can configure log settings and download the logs as explained in [Logging](#).

## Data Processing

---

Data collected by API Connect or to gateways via API invocations is protected by TLS in transit. Refer to [Creating a TLS Server Profile](#) for details.

Data is stored in API Connect local database on the API Connect appliances. There is no direct access available to this data.

Cloud Manager and API Manager administrators (defined by you) have read access to identity data.

## Data Deletion

---

#### Right to Erasure

Article 17 of the GDPR states that data subjects have the right to have their personal data removed from the systems of controllers and processors -- without undue delay -- under a set of circumstances.

#### Data Deletion characteristics

Users can delete their own Developer Portal user accounts -- refer to [Deleting your Developer account](#) for details. Cloud Manager and API Manager user account identity data can be anonymized by the users to remove association with the account data.

Technical information related to service use collected in logs is rolled over based on size and time criteria.

To disable API Analytics, disassociate it from the gateway that collects event data. For information, refer to [Associating an analytics service with a gateway service](#).

The retention period for storing Analytics data in API Connect is configurable; refer to [Configuring data retention and index rollover time periods](#) for details. Backup capability for this information is not available.

Analytics information can be offloaded to third-party systems. Refer to [Offloading analytics to third-party systems](#) for details. You are responsible for the security of off-loaded data.

Identity information for accounts is included in system backups. You manage the deletion of system backups.

## Data Monitoring

---

Customers should regularly test, assess, and evaluate the effectiveness of their technical and organizational measures to comply with GDPR. These measures should include ongoing privacy assessments, threat modeling, centralized security logging, and monitoring

API Connect can generate audit events. An audit event is logged from each management node when there are changes to the API lifecycle or to the organization; for example, publishing a product or creating an organization triggers this event. Refer to [Configuring audit logging to monitor user operations](#) for details.

## Capability for Restricting Use of Personal Data

---

Users of the API Manager UI can publish Products and APIs to the Developer Portal for Application Developers to access and use. Refer to [Developer Portal: socialize your APIs](#) to learn about Developer Portal. Developer Portal accounts are for consumers of your APIs.

You can define and customize a terms and conditions statement that your users must accept before they can register to use your Developer Portal; refer to [Customizing the terms of use statement](#) for details. You can also customize the privacy policy statement for Developer Portal; refer to [Customizing the privacy policy statement](#) for details.

Developer Portal users can modify their own account information, and can delete their account.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Essential reading

These articles by IBM® API Connect product specialists provide a wealth of supporting information on APIs and the API economy.

### [Why Become a Digital Business?](#)

Executing a Digital Transformation to become a Digital Business is among the hottest initiatives now – crossing both business and IT. But, is this just the latest buzzword or is there something to this that is different? Do you know **why** you should become a “Digital Business”?

### [Creating A Digital Ecosystem – Past, Present, and Future](#)

The ability to create a digital ecosystem is critical to digital transformation success. Your success is your network reach.

### [Agile integration](#)

Your business needs a modern, agile approach to integration. It should empower extended teams to create integrations, leverages a complete set of integration styles and capabilities, and increases overall productivity.

### [What is an API? and What is the API Economy?](#)

Businesses start to consider APIs and the API Economy at various times. Many are long down their API journeys, while others are still considering whether to start. This article looks at some of the basics that companies considering APIs might want to know.

### [What is API Management?](#)

APIs are not new. Software and hardware have had APIs (Application Programming Interfaces) for decades. However, *having* an API and *managing* an API are not the same thing.

### [Providing APIs or Managing APIs – There is a Big Difference](#)

A discussion of the potential for confusion between APIs that are provided and APIs that are managed.

### [Recommendations for an API Economy Center of Excellence](#)

What roles are required to drive a successful API initiative, how should this fit in the current organization, and how do these roles relate to existing roles in the company?

### [Focus on the API Developer](#)

A productive developer is a happy developer. One of the most frequently discussed topics in the API economy is focusing on the needs of the Application developer – the consumer target for your APIs.

### [Agile API development](#)

Agile API Development Customer expectations and behavior are continuously changing. To deliver exceptional customer experience, a business must be nimble to adapt to these changing needs.

### [API Products – Who, What, Where, When, Why and How”](#)

An API Product is an API offering made available for consumer use that is offered to a target market to satisfy a customer’s needs.

### [Changing Culture – How Committed Are You?](#)

How do we change the culture in our organization to create an API culture?

### [Plan Ahead! Don’t Build an API Superhighway into a Cul-de-sac](#)

Without proper planning, a business can start their API initiatives, build incredible excitement quickly, but find that the path they have taken leads them into a cul-de-sac (or dead end) that cannot handle the demand they have created.

### [IBM API Connect v10.x Deployment WhitePaper](#)

A technical deep dive on the deployment options for IBM API Connect.

### [Principles for API Security - White Paper](#)

API security is of paramount importance in gaining the promised benefits without exposure to negative consequences.

### [Can you trust your APIs?](#)

As enterprises are continuously expanding their digital footprint, they must ensure the API behavior is intact, as it has a far-reaching effect on an application's execution and end-user experience.

### [Istio Service Mesh and APIConnect/DataPower Gateway integration](#)

What is Istio, and how can DataPower API Gateway integrate in an Istio Service Mesh.

### [Best Practice – Monetizing API Products](#)

Ultimately the goal for almost all API initiatives is Monetization in the broad sense that crosses multiple modes from Free - to Indirect - to Direct. Most businesses using APIs successfully are monetizing APIs by speeding offerings to market, reaching new markets and new customers, innovating, and sharing assets better inside their enterprise.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Tutorials

These tutorials guide you through the steps typically required to set up, configure and run an API Connect cloud.

### Introduction

---

These tutorials are arranged according to the desired goal, such as creating and publishing an API, or managing catalogs of products, or consuming published API products. These goals can be grouped into categories as follows.

Table 1. Tutorial Categories

Category	Description
Cloud Administration	Setting up and configuring the API Connect cloud, including the creation of Provider Organizations.
API Provider Administration	Setting up and managing catalogs, inviting organization members (such as developers), creating Developer Portals, managing resources.
API Product Promotion and Usage	Managing the Developer Portal presentation and user administration, as well as consuming published API products as an external developer.

### Time required

---

Each tutorial should take approximately 20 - 30 minutes to finish. If you explore other concepts that are related to this tutorial, it might take longer.

Use the links in the following sections to access the tutorials that fit your goals.

### Cloud Administration

---

Table 2. Cloud Administration Tasks. Setting up and configuring the API Connect cloud, including the creation of Provider Organizations.

Category	Tutorials
Initial Configuration	<ul style="list-style-type: none"><li><a href="#">Initial Cloud Configuration</a></li></ul>
Provider Organization	<ul style="list-style-type: none"><li><a href="#">Creating a Provider Organization</a></li></ul>

### API Provider Administration

---

Table 3. API Provider Tasks. Setting up and managing catalogs, inviting organization members (such as developers), creating Developer Portals, managing resources.

Category	Tutorials
Developer Portal Set Up	<ul style="list-style-type: none"><li><a href="#">Creating the Portal</a></li><li><a href="#">Register a Consumer Application</a></li></ul>

### API Product Promotion and Usage through the Developer Portal

---

There are many tutorials available for the Developer Portal from getting started to advanced customization. For more information, see [Developer Portal tutorials](#).

### Prerequisites

---

- You must have a web browser available, whether you are working online or offline.
- When publishing Products in any of the tutorials you must have the permissions of an Organization Manager or Administrator. However, you can complete several of the tutorials with fewer permissions. For more information about user roles, see [Administering user access](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Installing and maintaining IBM API Connect

To ensure that your IBM® API Connect cloud functions, your cloud must have the necessary system requirements to support the installation. During the installation process, the components of IBM API Connect can be configured to satisfy your requirements.

Note: For a comprehensive technical guide to best practices, considerations, and deployment options for API Connect, see the [IBM API Connect v10.x Deployment WhitePaper](#).

- [Kubernetes, OpenShift, and Cloud Pak for Integration](#)  
Use the instructions in this section to install, upgrade, and maintain API Connect on Kubernetes, OpenShift, and IBM Cloud Pak for Integration.
- [VMware](#)  
Use the instructions in this section to install, upgrade, and maintain API Connect on VMware.
- [Migrating a Version 5 deployment](#)  
Use the Migration Utility to automate the migration of a v5 deployment to a v10 deployment.
- [Migrating v10 to another form factor](#)  
Migrate an API Connect v10 deployment from one form factor to another form factor.
- [Replacing passwords, keys, and certificates](#)  
Ensure the security of your API Connect deployment by replacing compromised passwords, keys, and certificates.
- [The API Connect operations tool: apicops](#)  
Use the apicops operations tool to check the health, troubleshoot, and run maintenance operations on your API Connect installation.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Kubernetes, OpenShift, and Cloud Pak for Integration

Use the instructions in this section to install, upgrade, and maintain API Connect on Kubernetes, OpenShift, and IBM Cloud Pak for Integration.

- [OpenShift: Updating ImageContentSourcePolicy to mirror API Connect images from icr.io](#)  
Update references to API Connect product images hosted on `docker.io` to point to `icr.io` instead.
- [Planning your deployment](#)  
Review the following topics to plan your API Connect deployment.
- [Installing API Connect](#)  
Use these instructions to install a deployment of API Connect on Kubernetes.
- [Upgrading API Connect](#)  
You can upgrade a v10 deployment of API Connect to a newer version.
- [Maintaining API Connect](#)  
You can use utilities to complete maintenance tasks such as backup, restore, and certificate management on Kubernetes.
- [Uninstalling API Connect](#)  
You can uninstall a Kubernetes deployment of API Connect.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## OpenShift: Updating ImageContentSourcePolicy to mirror API Connect images from icr.io

Update references to API Connect product images hosted on `docker.io` to point to `icr.io` instead.

---

### About this task

API Connect is changing product image hosting services from `docker.io` to `icr.io`. API Connect images on `docker.io` are available but are subject to Docker rate-limiting terms after Dec 31, 2022.

---

## Updating product image references for a connected deployment

To prevent rate-limiting issues, update your cluster's ImageContentSourcePolicy to mirror API Connect images from `icr.io/cpopen` instead of `docker.io/ibmcom`.

### About this task

Complete the following steps to create or update the cluster's ImageContentSourcePolicy and configure it to pull API Connect images from `icr.io/cpopen`.

### Procedure

1. Log in to the OpenShift cluster UI as an administrator of your cluster.
2. Click Administration > Cluster Settings > ImageContentSourcePolicy.
3. Create or edit an ImageContentSourcePolicy called `ibm-apiconnect`; use the YAML tab to edit the settings directly.
4. In the ImageContentSourcePolicy's `spec` section, add the `repositoryDigestMirrors` subsection to configure the cluster to pull images from `icr.io/cpopen` instead of `docker.io/ibmcom`.

Example:

```
apiVersion: operator.openshift.io/v1alpha1
kind: ImageContentSourcePolicy
metadata:
```

```
name: ibm-apiconnect
spec:
  repositoryDigestMirrors:
  - mirrors:
    - icr.io/cpopen
    source: docker.io/ibmcom
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Planning your deployment

Review the following topics to plan your API Connect deployment.

- [Key Concepts: Custom Resources, Operators, and Operands](#)  
API Connect uses Custom Resources (CRs) and the Kubernetes Operator pattern.
- [Deployment overview for endpoints and certificates](#)  
When deploying API Connect, you will create one or more endpoints for the subsystems and then configure certificates or mutual TLS for most endpoints.
- [Kubernetes ingress controller prerequisites](#)  
Describes the prerequisite settings for the ingress controller for a Kubernetes runtime environment.
- [Load balancer configuration in a Kubernetes deployment](#)  
When deploying API Connect for High Availability, it is recommended that you configure a cluster with at least three nodes and a load balancer. A sample configuration is provided for placing a load balancer in front of your API Connect Kubernetes deployment.
- [Firewall requirements on Kubernetes](#)  
Diagram for port configuration, and list of active ports, for an IBM® API Connect deployment on Kubernetes.
- [Planning your Analytics deployment](#)  
Plan your IBM API Connect Analytics deployment by reviewing options for topology, data modifications, and storage.
- [A two data center deployment strategy on Kubernetes and OpenShift](#)  
An overview of the two data center disaster recovery deployment strategy in API Connect.
- [Key Concepts: Cert-manager, Issuers, and Secrets](#)  
By default API Connect uses an open source product that is called [cert-manager](#) to handle the issuing and renewal of the certificates that are used by API Connect. The cert-manager has its own Kubernetes pods and runs in its own namespace. The cert-manager adds some additional resources to the Kubernetes environment. The API Connect administrator needs to be familiar with these additional resources:
- [Certificates in a Kubernetes environment](#)  
Use of cert-manager is recommended for managing certificates in a Kubernetes environment.
- [Webhooks deployed and managed by the API Connect Operator](#)  
The API Connect Operator deploys and manages various Kubernetes API webhooks in the cluster to assist in management of its custom resources.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Key Concepts: Custom Resources, Operators, and Operands

API Connect uses Custom Resources (CRs) and the Kubernetes Operator pattern.

- Kubernetes: <https://kubernetes.io/docs/concepts/extend-kubernetes/operator/>
- OpenShift: <https://developers.redhat.com/articles/2021/06/11/kubernetes-operators-101-part-1-overview-and-key-features>.

Below are some key points to understand about how API Connect implements this pattern:

- An API Connect instance is composed of two main operators and the API Connect subsystems that they manage, which in Kubernetes terminology are known as the Operands.
- The operator is responsible for monitoring the API Connect operands, ensuring that they are running as expected.
- API Connect operands can continue running without their operator, in an unmanaged state.
- The API Connect operator manages the Management Server, Portal, and Analytics subsystems. On Kubernetes each of these subsystems has its own Custom Resource, so each of these is an Operand. On OpenShift and CP4i there is also the option of having a top-level Custom Resource which manages all subsystems as a single Operand.
- The DataPower operator manages the Gateway operand.
- A single API Connect operator can manage multiple API Connect instances if the operator is installed globally and the API Connect operands are in individual namespaces. This is the recommended configuration where multiple API Connect instances are required, as opposed to a separate operator in each namespace.
- In a single OpenShift/K8S environment all API Connect instances, operands, and operators, in all namespaces must be at the same version. The only exception is during upgrade where the operators are upgraded first.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Deployment overview for endpoints and certificates

When deploying API Connect, you will create one or more endpoints for the subsystems and then configure certificates or mutual TLS for most endpoints.

### Configuring endpoints

---

The endpoints are configured by the installation Operator. They are set for each subsystem. Endpoints are also entered when configuring the Topology for the Gateway, Portal, and Analytics subsystems in Cloud Manager.

For instructions on configuring endpoints and installing into a Kubernetes environment, see [Installing API Connect](#).

Subsystem	Endpoints	Description	Certificates
Management	admin	Configured using installation Operator. Endpoint on the management server for communication with the Cloud Manager user interface.	cloud-admin-ui
	manager	Configured using the installation Operator. API Manager URL endpoint on the management server for communication with the API Manager user interface.	api-manager-ui
	consumer	Configured using the installation Operator. Platform REST API endpoint for running consumer APIs on the management server.	consumer-api
	api	Configured using the installation Operator. Platform REST API endpoint for running admin and provider APIs on the management server.	platform-api
	hub	Automated Testing Behavior UI and API endpoint. External Frontend/Ingress, port 443	hub-endpoint
	turnstile	Automated Testing Behavior UI and API endpoint. External Frontend/Ingress, port 443	turnstile-endpoint
Portal	api.portal	Configured using the installation Operator. Corresponds to Management Endpoint entered in Cloud Manager. Requires a TLS profile configured with mutual TLS.	mutual TLS
	portal	Configured using the installation Operator. Portal Web site URL entered in Cloud Manager. Used publicly to access Portal.	portal-www-ingress
Analytics	apic-a7s-client	Configured using the installation Operator. Corresponds to Management Endpoint entered in Cloud Manager. Requires a TLS profile configured with mutual TLS.	mutual TLS
	apic-a7s-ai	Configured using the installation Operator. The analytics-ingestion endpoint is used by the Gateway service to push data to the Analytics service. Requires a TLS profile configured with mutual TLS.	mutual TLS
Gateway	rgwd (API Gateway) gwd (v5-compatible Gateway service)	Configured using the installation Operator. This is the endpoint the gateway uses for network communication. Enter this endpoint as the Management Endpoint entered in Cloud Manager.	apic-gw-service-ingress

### Configuring certificates

---

The certificates are configured by the Cert-Manager. The certificates for the endpoints are usually configured as custom certificates as described in [Custom certificates on Kubernetes](#) or [Using custom certificates with IBM Kubernetes Service](#).

### Configuring mutual TLS

---

Mutual TLS is configured for TLS profiles in Cloud Manager. See [Creating a TLS Server Profile](#).

### Configuring a proxy

---

If a Developer Portal is deployed externally to the management server zone, it does not have access to the consumer and product APIs. You need to configure a proxy to enable communication. For more information, see [Configuring a proxy](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Kubernetes ingress controller prerequisites

Describes the prerequisite settings for the ingress controller for a Kubernetes runtime environment.

### Before you begin

---

Note: This article refers to third-party software that IBM does not control. As such, the software may change and this information may become outdated. These instructions assume you have a working Kubernetes environment and understand how to manage Kubernetes. Kubernetes is a platform for automated deployment, scaling, and operation of application containers across clusters of hosts, providing container-centric infrastructure. For more information, see <https://kubernetes.io>.

Kubernetes/ingress-nginx ingress controller `ingress-config.yml` settings

A Kubernetes deployment for IBM® API Connect requires the **kubernetes/ingress-nginx** ingress controller implementation (see <https://github.com/kubernetes/ingress-nginx>) with SSL passthrough enabled.

API Connect v10 does not require Helm, so it is recommended to use Helm3 for the installation of the ingress controller. Follow these steps:

1. Create a file **ingress-config.yaml** where the following values are required:  
Specify at least one SSL protocol; separate multiple protocols with a comma as shown in the example.

```
controller:
  watchIngressWithoutClass: true
  admissionWebhooks:
    enabled: false
  config:
    ssl-protocols: "TLSv1.2 TLSv1.3"
  extraArgs:
    annotations-prefix: ingress.kubernetes.io
    enable-ssl-passthrough: true
```

You may use the following sample **ingress-config.yml** file to configure the ingress controller:

```
controller:
  watchIngressWithoutClass: true
  admissionWebhooks:
    enabled: false
  config:
    hsts-max-age: "31536000"
    keepalive: "32"
    log-format: '{ "@timestamp": "$time_iso8601", "@version": "1", "clientip": "$remote_addr",
      "tag": "ingress", "remote_user": "$remote_user", "bytes": $bytes_sent, "duration":
      $request_time, "status": $status, "request": "$request_uri", "urlpath": "$uri",
      "urlquery": "$args", "method": "$request_method", "referer": "$http_referer",
      "useragent": "$http_user_agent", "software": "nginx", "version": "$nginx_version",
      "host": "$host", "upstream": "$upstream_addr", "upstream-status": "$upstream_status"
    }'
    main-snippets: load_module "modules/nginx_stream_module.so"
    proxy-body-size: "0"
    proxy-buffering: "off"
    server-name-hash-bucket-size: "128"
    server-name-hash-max-size: "1024"
    server-tokens: "False"
    ssl-ciphers: HIGH:!aNULL:!MD5
    ssl-prefer-server-ciphers: "True"
    ssl-protocols: "TLSv1.2 TLSv1.3"
    use-http2: "true"
    worker-connections: "10240"
    worker-cpu-affinity: auto
    worker-processes: "1"
    worker-rlimit-nofile: "65536"
    worker-shutdown-timeout: 5m
  daemonset:
    useHostPort: false
  extraArgs:
    annotations-prefix: ingress.kubernetes.io
    enable-ssl-passthrough: true
  hostNetwork: true
  kind: DaemonSet
  name: controller
rbac:
  create: "true"
```

2. Run the commands:

```
helm3 repo add ingress-nginx https://kubernetes.github.io/ingress-nginx
helm3 repo update
helm3 install ingress-controller ingress-nginx/ingress-nginx --namespace kube-system --values ingress-config.yaml
```

Kubernetes/ingress-nginx ingress controller **config.map** settings

To ensure that the IBM API Connect services have time to start, increase the *proxy-read-timeout* and *proxy-send-timeout* values, which are in seconds, in the **kubernetes/ingress-nginx** ingress controller *config.map* to at least the following:

- proxy-read-timeout: "240"
- proxy-send-timeout: "240"

Depending on your environment, you might need to increase these further if the IBM API Connect services do not start. If there is a load balancer in front of the worker nodes, then the load balancer configuration might also need to have extended timeouts.

System and Software Requirements

The system and software requirements are described in the Software Product Compatibility Reports. See [Detailed system requirements for a specific product](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Load balancer configuration in a Kubernetes deployment

When deploying API Connect for High Availability, it is recommended that you configure a cluster with at least three nodes and a load balancer. A sample configuration is provided for placing a load balancer in front of your API Connect Kubernetes deployment.

## About this task

API Connect can be deployed on a single node cluster. In this case the ingress endpoints are host names for which the DNS resolution points to the single IP address of the corresponding node hosting a particular subsystem, and no load balancer is required. For high availability, it is recommended to have at least a three node cluster. With three nodes, the ingress endpoints cannot resolve to a single IP address. A load balancer should be placed in front of an API Connect subsystem to route traffic.

Because it is difficult to add nodes once endpoints are configured, a good practice is to configure a load balancer even for single node deployments. With the load balancer in place, you can easily add nodes when needed. Add the node to the list of servers pointed to by the load balancer and the ingress endpoints defined during installation of API Connect can remain unchanged.

To support Mutual TLS communication between the API Connect subsystems, configure the load balancer with **SSL Passthrough** and **Layer 4** load balancing. In order for Mutual TLS to be performed directly by the API Connect subsystems, the load balancer should leave the packets unmodified, as is accomplished by Layer 4. Following is a description of the communication between the endpoints that are configured with Mutual TLS:

- API Manager (with the client certificate portal-client) communicates with the Portal Admin endpoint portal-admin (with the server certificate portal-admin-ingress)
- API Manager (with the client certificate analytics-client-client) communicates with the Analytics Client endpoint analytics-client (with the server certificate analytics-client-ingress)
- API Manager (with the client certificate analytics-ingestion-client) communicates with the Analytics Ingestion endpoint analytics-ingestion (with the server certificate analytics-ingestion-ingress)

Set endpoints to resolve to the load balancer

When configuring a load balancer in front of the API Connect subsystems, the ingress endpoints are set to host names that resolve to a load balancer, rather than to the host name of any specific node. For an overview of endpoints, see [Deployment overview for endpoints and certificates](#).

Use these example topologies as a guideline to determine the best way to configure the load balancer for your deployment.

## Procedure

- **Kubernetes cluster with wildcard DNS**

In this example, API Connect is deployed to a Kubernetes cluster with three master and six worker nodes. The master nodes have the Kubernetes API server listening on port 6443. The Kubernetes API Server is used for communicating with the kubectl command line interface. Note that it is generally not necessary for the Kubernetes API server (on port 6443 in this example) to be exposed outside the cluster through the load balancer, this is just one possible setup shown here.

The kubernetes/ingress-nginx ingress controller is deployed as a daemonset, so that every worker node in the cluster has an ingress controller pod listening on port 443. The API Connect subsystems (API Manager, Developer Portal, Analytics and Gateway) are all deployed on this same cluster.

Note:

- When you configure a load balancer in front of a Management subsystem, specify timeouts of at least 240 seconds. Note that large deployments might need larger values.

The default timeout is typically 50 or 60 seconds, which is not long enough to avoid **409 Conflict** or **504 Gateway Timeout** errors. The **409 Conflict** error can occur when the time needed to complete an operation is sufficiently long that a second request gets issued.

For example, to specify 240 seconds when using HAProxy as a load balancer, set `timeout client` and `timeout server` to **240000**.

Best practice is to ensure that the same values are specified for the timeout settings for the load balancer and for the Kubernetes ingress controller. The ingress controller timeout settings are set in the ingress controller config.map. For more information, see the `proxy-read-timeout` and `proxy-send-timeout` settings in [Kubernetes ingress controller prerequisites](#).

- Ensure that the load balancer is configured to support the cipher `TLS_ECDHE_RSA_WITH_AES256_GCM_SHA384 (0xc030)`. When the Developer Portal, as a client, calls back to platform-api-endpoint or consumer-api-endpoint of the management subsystem, it sends only a single cipher in the Client Hello. The cipher is `TLS_ECDHE_RSA_WITH_AES256_GCM_SHA384 (0xc030)`. The SSL Handshake will fail if this cipher is not configured (supported) on the client's load balancer.

A host running HAProxy acts as the load balancer, with a configuration for proxies in the HAProxy configuration file such as:

```
defaults
    log          global
    mode         http
    option       httplog
    option       dontlognull
    timeout     connect 5000
    timeout     client 240000
    timeout     server 240000
    errorfile   400 /etc/haproxy/errors/400.http
    errorfile   403 /etc/haproxy/errors/403.http
    errorfile   408 /etc/haproxy/errors/408.http
    errorfile   500 /etc/haproxy/errors/500.http
    errorfile   502 /etc/haproxy/errors/502.http
    errorfile   503 /etc/haproxy/errors/503.http
    errorfile   504 /etc/haproxy/errors/504.http

frontend apiservers
    bind *:6443
    mode tcp
    option tcplog
    option forwardfor
    default_backend k8s_apiservers

frontend ingress
    bind *:443
    mode tcp
    option tcplog
    option forwardfor
    default_backend k8s_ingress
```

```

backend k8s_apiservers
  mode tcp
  option tcplog
  option ssl-hello-chk
  option log-health-checks
  default-server inter 10s fall 2
  server cluster1-master-1 10.169.241.226:6443 check
  server cluster1-master-2 10.169.241.163:6443 check
  server cluster1-master-3 10.169.241.153:6443 check

```

```

backend k8s_ingress
  mode tcp
  option tcplog
  option ssl-hello-chk
  option log-health-checks
  default-server inter 10s fall 2
  server cluster1-worker-1 10.169.241.142:443 check
  server cluster1-worker-2 10.169.241.150:443 check
  server cluster1-worker-3 10.169.241.188:443 check
  server cluster1-worker-4 10.169.241.196:443 check
  server cluster1-worker-5 10.169.241.168:443 check
  server cluster1-worker-6 10.169.241.156:443 check

```

A wildcard DNS record allows the resolution of \*.example.com to the IP address of the HAProxy host.

The ingress endpoints are defined in the CRs (custom resources) for each API Connect subsystem. During configuration of each subsystem, you define the endpoint by specifying a host name \$STACK\_HOST in the CR. For configuration instructions, see [Installing the API Connect subsystems](#).

You can view the endpoint definitions in sample CRs:

- [Installing the Management subsystem cluster](#)
- [Installing the Developer Portal subsystem](#)
- [Installing the Analytics subsystem](#)
- [Installing the DataPower Gateway subsystem](#)

The following diagram illustrates the wildcard DNS example:

- **Kubernetes cluster without wildcard DNS**

This example uses the same topology as the previous one, except that there is no wildcard DNS resolution. Instead, individual DNS records are added, all pointing to the IP address of the load balancer. For example: portal.example.com and admin.portal.example.com resolve to the IP address of the load balancer.

- **Kubernetes cluster with xip.io or nip.io**

This example uses the same topology as the first one, except that there is no specific DNS resolution configured and instead a service such as xip.io or nip.io provides wildcard DNS resolution. It is not recommended to use this approach for a production setup, as the ingress endpoints configured during installation of API Connect would be tied to the IP address of the load balancer. This approach can be useful when configuring a test deployment in situations where access to DNS records is not practical or would introduce delay in the deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Required Ports between zones

The following network diagram example helps to explain which ports must be configured in an API Connect network. Specific ports must be configured to enable the communication between the various zones, both public and private, in a network.

The ports specified in the diagram are default ports. Check your deployment to understand which communication, if any, is configured to use non-default ports.

Table 1. Key for the network diagram example. The following table lists the port numbers with a usage description.

	Usage description	Default port number
1	API request/response – Users invoking the provided APIs.	443 HTTPS from Public zone to Gateway zone
2	DataPower® administration – Internal operators who are managing the Gateway servers.	22 SSH, 9090 HTTPS from Protected zone to Gateway zone
3	API Manager – Internal business users who are defining and monitoring APIs.	443 HTTPS from Protected zone to Management zone
4	Cloud Manager – Internal operators who are administering the Cloud.	22 SSH, 443 HTTPS from Protected zone to Management zone
5	Developer Portal administration – Internal operators who are managing the Portal servers.	22 SSH, 443 HTTPS from Protected zone to Management zone
6	Gateway servers post traffic to Analytics service.	443 HTTPS from Gateway servers to Analytics service
7	Push configuration – Management servers communicate bi-directionally with Gateway servers.	3000 and 443 HTTPS Management servers to and from Gateway servers for webhook delivery. Port 3000 is the default port for apic-gw-service, and this is the port Management uses to communicate with Gateway. Port 443 is the default port for the platform-api endpoint, which apic-gw-service uses to communicate with Management.
8	Push configuration/webhooks – Management servers push configuration and webhooks to the Developer Portal.	443 HTTPS Management servers to Developer Portal servers for webhook delivery

	Usage description	Default port number
9	Pull configuration/make API calls – Developer Portal servers pull configuration and call REST APIs.	443 HTTPS from Developer Portal servers to Management servers within Management zone
10	Developer Portal – External developers who are accessing the Developer Portal.	443 HTTPS from Public zone to Developer Portal management zone. The reverse proxy/DataPower WAF for incoming web traffic to the Developer Portal cluster must be a transparent proxy - no modification of the portal URL, port, host name or path is allowed.
11	Push API definition to Management server. Pick up credential for microservice code push.	443 HTTPS from Protected zone to Management zone
12	Analytics offload	Port will depend on type of plugin and protocol used for the offload. Some possible protocols are: HTTP, HTTPS, TCP, UDP, KAFKA
13	Analytics accesses NTP	Standard NTP
14	Analytics access DNS	Standard DNS
15	Management service queries Analytics service	443 HTTPS within Management zone
16	The Portal service invokes an API (GET) on the Analytics service to retrieve data.	443 HTTPS within Management zone
17	External billing service – Management cluster connecting to external billing service (when configured for billing). If you are using Stripe as your external billing service, you must enable connections with the Stripe API at: <a href="https://stripe.com/files/ips/ips_api.json">https://stripe.com/files/ips/ips_api.json</a> . You can also view the Stripe IP addresses at the following URL: <a href="https://stripe.com/docs/ips">https://stripe.com/docs/ips</a> .	443 HTTPS from Management zone to Public zone
18	Developer Portal cluster must be able to access its own site endpoints.	443 HTTPS from Portal zone to Public zone

## Firewall port requirements on Kubernetes

The following tables lists ports that must be open in both cluster and non-clustered deployments.

Table 2. Firewall port requirements common to all subsystems

Subsystem	Ports and description
Ports that must be open on all API Connect subsystems	<p>The following ports must be open on the Management Server, Analytics, and Developer Portal subsystems, whether in a cluster or not.</p> <ul style="list-style-type: none"> <li>• 22 (outbound) Used for SFTP backups on Management and Portal subsystems</li> <li>• 53 (outbound) DNS</li> <li>• 123 (outbound) NTP</li> <li>• 443 (inbound and outbound) Used by all subsystems for communication with other subsystems</li> <li>• 44135 (inbound and outbound)</li> </ul>

Each subsystem uses ports in addition to the ports in [Table 2](#). See the following table.

Table 3. Additional firewall port requirements for each subsystem

Subsystem	Ports and description
Management Service	<p>Management Service uses the ports in <a href="#">Table 2</a> plus:</p> <ul style="list-style-type: none"> <li>• 22 remote backup server port (configurable) If backups are configured to use another port, ensure that the port is open. See <a href="#">Backing up the management database in a Kubernetes environment</a>.</li> <li>• 161 (inbound) SNMP</li> <li>• LDAP server port (if using LDAP user registry), typically 389 (outbound)</li> <li>• 3007 (outbound) LDAP</li> </ul> <p>The Automated test behavior application must be able to invoke (outbound) any port that a test system might present an API on. It can be bound to a particular port (if it is the same in all environments) or to a range of ports (to cover all of the ports it might invoke).</p>
Developer Portal	<p>The Developer Portal uses the ports listed in <a href="#">Table 2</a>, plus:</p> <ul style="list-style-type: none"> <li>• 22 - A remote backup server port (configurable) If backups are configured to use another port, ensure that the port is open. See <a href="#">Backing up and restoring the Developer Portal in a Kubernetes environment</a>.</li> </ul>
Analytics	<p>The Analytics subsystem uses the ports listed in <a href="#">Table 2</a>.</p> <p>Analytics port usage considerations:</p> <ul style="list-style-type: none"> <li>• 161 for SNMP is required for both non-clustered and clustered deployments</li> <li>• In a non-clustered deployment, no additional ports are required.</li> <li>• Analytics supports an optional configuration for offload of data. This configuration might require additional outbound ports to be open.</li> </ul>
Gateway Server	<p>The Gateway Server uses these ports in both non-clustered and clustered deployments:</p> <ul style="list-style-type: none"> <li>• 161 (inbound and outbound) SNMP</li> <li>• 162 (outbound) SNMP traps</li> <li>• 3000 (inbound) Gateway Service local port (configurable)</li> <li>• 5550 (inbound) XML management port (configurable)</li> <li>• 5554 (inbound) REST management port (if enabled; configurable)</li> <li>• 9022 (inbound) Gateway SSH (if enabled; configurable)</li> <li>• 9090 (inbound) Web GUI console (if enabled; configurable)</li> <li>• 9443 (inbound) Gateway local port (configurable)</li> </ul>

## Communications inside the Gateway cluster

---

There are a number of important points to note regarding the communications within the Gateway cluster.

- We advise that you use the same port for all Gateway servers within a cluster.
- Gateway servers communicate with each other to synchronize invocation counts.
- All Gateway servers in a Gateway cluster must be able to reach all of the other Gateway servers in the same Gateway cluster.
- Gateway servers in a Gateway cluster do not directly communicate with Gateway servers in a different Gateway cluster.
- All Gateway servers must be able to reach the management subsystem platform API endpoint, which was configured during the installation of your API Connect environment.

## Ethernet interface usage

---

To separate network traffic, you can use two or more Ethernet interfaces on the DataPower appliance on which a Gateway server is installed. For example, you can use one interface for internal IBM API Connect communications, and another for processing incoming API calls.

## Port requirement for Stripe billing service

---

All Management servers and Developer Portal servers must be able to communicate HTTPS content with the external billing service when billing is configured. If you are using Stripe as your external billing service, you must enable HTTPS communication on port 443 with the Stripe API: [https://stripe.com/files/ips/ips\\_api.json](https://stripe.com/files/ips/ips_api.json).

Note: API Connect does not support using webhooks with Stripe. You can see a list of the Stripe IP addresses at: <https://stripe.com/docs/ips>.

## Planning your Analytics deployment

---

Plan your IBM® API Connect Analytics deployment by reviewing options for topology, data modifications, and storage.

Planning your Analytics topology is an important step in ensuring a successful and scalable solution. After you plan your overall API Connect topology, you should plan the Analytics subsystem deployment by choosing a topology, planning any data modifications, and estimating the amount internal storage that is needed for the deployment.

- [Planning the Analytics profile and storage](#)  
Begin planning your IBM API Connect Analytics deployment by choosing a deployment profile and a storage class.
- [Planning your topology](#)  
Determine the topology of your IBM API Connect Analytics deployment to take advantage of the microservices that are best suited to your needs.
- [Planning to modify your analytics data](#)  
Review how you can optionally customize the analytics data in your IBM API Connect Analytics deployment before storing it.
- [Estimating internal storage space](#)  
If you plan to store data locally in your IBM API Connect Analytics deployment, estimate disk space requirements.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Planning the Analytics profile and storage

---

Begin planning your IBM® API Connect Analytics deployment by choosing a deployment profile and a storage class.

## Deployment profile

---

The first decision you must make is which deployment **profile** you want to use. There are two choices:

- **n1xc2.m16**: development profile
- **n3xc4.m16**: production profile

The development profile describes a hardware profile of 1 node, 2 cores, and 16 GB memory. This profile deploys a single-node, non-HA, non-scalable Analytics solution. The development profile is only recommend for development and test environments.

The production profile describes a hardware profile of 3 nodes, 4 cores, and 16 GB memory. This profile deploys a three-node, HA, scalable Analytics solution. The production profile requires at least 3 nodes to work properly, and is the recommended option for production environments.

Note: Although you can deploy the development profile to a production environment, it is not recommended. This deployment option was designed to have a small impact on your hardware and as such it will not scale, and it will not perform as well as the production profile.

## Storage class

Before installing Analytics, you must choose a storage class. Ceph, Block, and Local Volume are all supported; however, Local Volume is most suitable for Analytics. The Analytics subsystem provides internal data replication and HA support, so the additional HA capabilities that Ceph or Block storage might give you are not needed. In addition, Analytics requires a high throughput of disk I/O operations to successfully handle the analytics data load from the Gateway. Local Volume is the best-performing option in this area.

Note: GlusterFS storage is not supported for Analytics. If you use this option, you might encounter severe performance degradation, and, in some cases, loss of data. For instructions on specifying a deployment profile and a storage class for your Analytics deployment, see [Installing analytics](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Planning your topology

Determine the topology of your IBM® API Connect Analytics deployment to take advantage of the microservices that are best suited to your needs.

Each Analytics topology provides a set of the Analytics microservices as well as external integrations.

## Default topology

The default topology for Analytics is useful for many organizations. It provides you with business analytics and metrics in API Manager, and consumer analytics in Portal. It is suitable for production environments and is easily scalable.

The default topology contains the following microservices:

- client: Kibana-based service for serving the Analytics UI and REST API
- cj-retention: Storage data retention service cronjob
- cj-rollover: Storage index management rollover service cronjob
- ingestion: Logstash-based data pipeline for receiving and routing data to internal or external storage
- mtl-gw: Openresty-based service for routing ingress traffic to client or ingestion
- storage-coord: Elasticsearch based service for routing and aggregating requests
- storage-data: Elasticsearch-based service for writing, reading and storing the data
- storage-master: Elasticsearch-based service for managing and monitoring cluster state and health

For the complete list of available microservices, see [Reference: Analytics microservices](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Reference: Analytics microservices

See the complete list of microservices provided by IBM® API Connect Analytics.

Table 1 provides the name, class, and a brief description of each microservice

Table 1. Analytics microservices

Name	Class	Description
client	client	Elastic Kibana-based service for serving the analytics UI and REST API
cj-retention	cronjobs	Storage data retention service cronjob
cj-rollover	cronjobs	Storage index management rollover service cronjob
ingestion	ingestion	Elastic Logstash-based data pipeline for receiving and routing data to internal or external storage

Name	Class	Description
mq-kafka	mq	Optional Apache Kafka-based data message queuing for temporarily buffering data in the pipeline.
mq-zk	mq	Optional Apache Zookeeper-based service for managing distributed mq-kafka configuration.
mtls-gw	mtls-gw	Openresty-based service for routing ingress traffic to client or ingestion
storage-coord	storage	Elastic Elasticsearch-based service for routing and aggregating requests
storage-data	storage	Elastic Elasticsearch-based service for writing, reading and storing the data
storage-master	storage	Elastic Elasticsearch-based service for managing and monitoring cluster state and health
storage-shared	storage	Elastic Elasticsearch-based service that combines the workload of storage-coord, storage-data, and storage-master into a single service

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Planning to add a message queue

Review how a message queue increases reliability in the analytics data pipeline in your IBM® API Connect Analytics deployment.

The message queue microservices are an optional component that provide additional reliability in the data pipeline. The message queue components split the ingestion data pipeline from 1 to 3 internal pipelines. The first pipeline receives the data from the Gateway and pushes this data into two topics in the mq-kafka service. Then, the other two pipelines pull data out of these topics separately and push data into internal or external storage as required.

This separation of pipelines add greater reliability in the event that either the internal or external storage service is unresponsive. Additional benefits include better handling of unexpected traffic spikes and a larger buffer to handle temporary internal storage issues (red indices). The disadvantage is that adding these optional components requires additional memory and CPU in your Analytics deployment.

Enabling the message queue adds the following microservices to your topology:

- mq-kafka
- mq-zk

For instructions on enabling the message queue, see [Adding a message queue](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Planning to offload data to a third-party system

Review the considerations for offloading data from your IBM® API Connect Analytics deployment to a third-party system for additional storage and analysis.

The analytics event data that is generated by the Gateway and collected by the analytics subsystem can be offloaded to a third-party service in real-time. The third-party service can provide enhanced monitoring, alerting, storage, and/or analysis, in addition to what the built-in Analytics subsystem provides. Multiple target systems are supported, and the data can be modified prior to offloading.

APIC supports offloading analytics data to the following third-party systems:

- HTTP(s) endpoints
- Elastic Elasticsearch v6, v7
- Apache Kafka v1.0.0
- Syslog servers

For instructions on configuring your offload settings, see [Offloading data to a third-party system](#).

If you just want to extend the existing analytics functionality by integrating with the third-party system, consider [adding a message queue](#) to your deployment. Enabling a message queue ensures that if either the internal or external storage becomes unavailable, it does not affect the other system.

If you do not need internal storage and only want to use the third-party system for working with your analytics data, consider disabling internal storage entirely as explained in [Planning to disable internal storage](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Planning to reduce storage complexity

Review considerations in scaling down the amount of services managing data storage in your IBM® API Connect Analytics deployment.

By default, the Analytics subsystem deploys an internal storage datastore under the load of three unique microservices:

- The storage-coord service manages the routing and aggregating of requests.
- The storage-data service manages the reading and writing of data, and executes complex queries and aggregations.
- The storage-master service manages cluster state and health.

This distribution allows each service to manage a finite set of tasks, and reduces the workload for individual services, thus improving performance. This distribution also allows you to scale each of the services independently. For example, if you only need to improve disk I/O performance, you could only scale the storage-data service, which manages the disk.

Although having the services split into unique roles provides benefits, it also requires additional resources and adds complexity to running and managing the internal storage datastore. If you want to reduce this complexity and scale down the amount of services running under the storage microservices set, you can have each service perform all three roles.

For example, by default a production deployment has 3 instances of storage-coord, 3 instances of storage-data, and 3 instances of storage-master, all running at the same time. Instead, it would have only 3 instances of storage-shared running. This approach greatly decreases the amount of memory and CPU that you need to run analytics storage effectively, without compromising your entire deployment by downgrading to the development topology.

Although it is recommended to run with unique roles for each storage microservice for performance gains, it is not a requirement and in some cases, it might be more than you need.

Changing your storage type to shared roles enables the storage-shared microservice, and disables the storage-coord, storage-data, and storage-master microservices.

For instructions on configuring shared roles for storage microservices, see [Reducing storage complexity](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Planning to disable internal storage

Review considerations for disabling local storage and offloading all data in your IBM® API Connect Analytics deployment.

The Analytics subsystem provides a complete solution for routing, storing and viewing the analytics data. However, you might not need the internal storage and viewing solution, especially if you are primarily using a third-party system for data offloading. In this scenario, you can greatly reduce your CPU and memory costs by disabling the internal storage and viewing components.

With this approach, data that is offloaded is not viewable in the Analytics UI in API Manager and Developer Portal, so those components can be disabled as well.

When you disable internal storage for analytics data, the following microservices are disabled:

- client
- cj-retention
- cj-rollover
- storage-coord
- storage-data
- storage-master
- storage-shared

For more information on disabling internal storage, see [Disabling internal storage](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Planning to modify your analytics data

Review how you can optionally customize the analytics data in your IBM® API Connect Analytics deployment before storing it.

You can create filters to customize the analytics data before storing in external or internal storage. Filters allow you to add new fields, modify existing fields, or remove fields from the data. You can do this globally for the entire Analytics subsystem, or you can do it conditionally for a specific API. By default, filters are defined at the global level, so unless you include conditionals, changes are applied to every piece of data flowing through the pipeline.

For information on adding filters to the Analytics CR to modify your data, see [Modifying your analytics data](#).

## What fields can you modify?

The fields that are available for you to interact with are described in [API event record fields](#). Each API defined in the Management subsystem and published to your Gateway has its own success and error log policies. The log policy settings determine what data is available for customization. Be sure to verify the existence of a field before trying to modify it; otherwise your pipeline might fail.

Modifying fields is a complex operation and can cause problems with your data. It is highly recommended that you remove fields entirely (instead of modifying them) if you need to sanitize data. If you want to change the format of an existing field, you should create a new, unique field.

**Important:** Do not change the data type of existing fields or modify fields critical to the Analytics subsystem's operations and access control. Doing so can cause problems with retrieving or storing data. The following fields are restricted (note that there might be other fields that are not included in this list):

- org\_id
- catalog\_id
- space\_id
- developer\_org\_id
- datetime
- @timestamp

The service for the data pipeline is based on Elastic Logstash, which provides [a set of predefined filter plugins](#) that you can use for modifying data. However, the plugins are third-party software that IBM does not control, so IBM cannot guarantee support for them.

## Which pipeline is affected by the filter?

The message queue and offload **enabled** settings determine which pipeline's data is affected by filters. Table 1 specifies which pipeline's data is affected when the message queue and offload settings are enabled in different combinations.

Table 1. Settings that determine which pipeline is affected by filters

	Offloading is enabled	Offloading is disabled
Message queue is enabled	<ul style="list-style-type: none"> <li>• Offload.filter applies to offloaded data</li> <li>• Ingestion.filter applies to internal data</li> </ul>	<ul style="list-style-type: none"> <li>• Offload.filter is ignored</li> <li>• Ingestion.filter applies to internal data</li> </ul>
Message queue is disabled	<ul style="list-style-type: none"> <li>• Offload.filter applies to all data</li> <li>• Ingestion.filter applies to all data</li> </ul>	<ul style="list-style-type: none"> <li>• Offload.filter is ignored</li> <li>• Ingestion.filter applies to all data</li> </ul>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Estimating internal storage space

If you plan to store data locally in your IBM® API Connect Analytics deployment, estimate disk space requirements.

This information applies only to data that is stored in API Connect Analytics and not to data that is offloaded to a third-party system. The formula and guidelines are based on known information about how the Analytics service stores data, and cannot be directly applied to any other storage system.

Use the following guidelines to calculate a rough estimate of the amount disk space you need for storing stateful data in the API Connect Analytics microservices.

## Data storage: calculate how much data you want to store

This section applies if you have chosen a topology that uses the storage-data or storage-shared microservices.

The amount of disk space needed for storing analytics data is determined by the following factors:

Number of copies of the analytics data

Each copy of the analytics data must live on a separate node. The number of nodes in your deployment (based on your chosen profile in [Planning the Analytics profile and storage](#)) determines the number of copies of analytics data that is stored in your deployment. With the **production** deployment profile, analytics data is replicated to three nodes (two replicas and one primary copy of the data) for storage. In the **development** profile, you only need to store one copy of the data. Number of copies of data:

**Copies of data = [1 | 3]**

Number of days that data is retained

By default, analytics data is retained for 90 days, but you can [modify the retention setting](#) as needed. Make sure you know how long you want to store the data before attempting to calculate required disk space.

Number of days that data is retained:

**Data retention = [90 days | preferred length]**

Amount of each type of data stored

The required storage space for each type of logging is highly dependent on your APIs and usage. For each API, you can [configure logging](#) for the API activity, header, and payload. You can also [customize the data](#) to add, redact, or remove fields, which also impacts the amount of data that you store.

To estimate storage needs, calculate the average size of each type of log. When calculating your estimates, remember that the header logging size is the sum of activity logging size and the average size of your headers. The payload logging size is the sum of the header logging size and the average size of your payloads. Typically the average size of an activity logged event is 600-1000 bytes depending on the uniqueness and complexity of your analytics data. This number is highly dependent on your APIs and your implementations. For a rough estimate, you can use an average of 800 bytes per activity logged event.

If you choose to add fields, calculate the average size of the new fields as well, and add that number to all types of log policies. If you choose to remove fields, you should not subtract this size from the log policies unless you are also removing headers and/or payloads.

Amount of each type of data that is stored:

**Activity log bytes per call = [600-1000 bytes]**  
**Header log bytes per call = Activity log bytes per call + Average size of headers**  
**Payload log bytes per call = Header log bytes per call + Average size of payloads**

Percentage of each type of data

Estimate the percentage of each type of log (activity, header, payload) for all API calls.

If you follow best practices of using only activity logging for production environments and using only payload logging for test environments, this number is easy to determine. If you use different log policies per API, and they depend on "success" or "error" factors, the percentage is more difficult to determine. Typically, if you

do not use an all-or-nothing method for logging, error rates range from 3% to 25% with subsequent payload logging in test and production environments. However, this is entirely dependent on your use case and your APIs.

Percentage of each type of data that is stored:

```
% of Activity log = [0, 100 or other estimate]
% of Header log = [0, 100 or other estimate]
% of Payload log = [0, 100 or other estimate]
```

Estimated number of API calls per month

When planning your API Connect deployment, this number is helpful. When estimating analytics storage, this number is vital because it is directly correlated to how much storage you need for your deployment.

If you do not know the number of calls per month, but you do know the number of calls per second, use the following formula to convert it to calls per month:

```
Calls per month = Calls per second * 86400 seconds per day * 30 days per month
```

Number of API calls per month:

```
Calls per month = [any estimate]
```

## Calculating your disk space requirement

Estimate the disk space requirement for each storage node by completing following calculations.

Formula

```
Bytes per call = (% of Activity Log * Activity Log bytes per call) + (% of Header Log * Header Log bytes per call) + (% of
Payload Log * Payload Log bytes per call)
Calls per retention period = Calls per month * (Number of days retained / 30 days per month)
Storage for API calls = Calls per retention period * Bytes per call * Copies of data
Total storage = Storage for API calls + Overhead
Storage per node = Total storage / Nodes
```

Details

1. Bytes per call:

Estimate the number of bytes that are logged for a single copy of each API call. This can be calculated from the prerequisites of the percentage of each data type and the amount of each data type stored.

```
Bytes per call = (% of Activity Log * Activity Log bytes per call) + (% of Header Log * Header Log bytes per call) +
(% of Payload Log * Payload Log bytes per call)
```

2. Calls per retention period:

Calculate the anticipated number of API calls per retention period. This can be calculated from the prerequisites of the estimated calls per month and your desired data retention.

```
Calls per retention period = Calls per month * (Number of days retained / 30 days per month)
```

3. Storage for API Calls:

Calculate the storage needed for all copies of your api calls for your retention period. This can be calculated from steps 1 and 2, as well as the prerequisite of your total copies of your data.

```
Storage for API calls = Calls per retention period * Bytes per call * Copies of data
```

4. Total Storage:

Calculate the total storage you need by adding buffer space to the value from step 3. The Analytics service requires some overhead space to complete its operations; for example, to contain system data and temporary debug header or payload logging. In addition, allowing extra space provides a buffer in case you underestimated the number of calls, or experience an unexpected increase.

There is no specific value for the buffer because it's based on your own situation. One approach is to use a value that rounds the Storage for API calls result from step 3 to the next whole number. Make sure the rounding leaves you with a comfortable amount of additional space. For example, if the result from step 3 is 380 GB, then adding 20 GB to reach 400 GB is probably not sufficient and you should consider rounding to a larger value such as 500 GB.

```
Total storage = Storage for API calls + Buffer
```

5. Storage per node:

Calculate the total storage amount required per storage node. The number of storage nodes is dependent on your deployment profile. For the **development** profile, use 1. For the **production** profile, it defaults to 3. If you manually scaled the storage-data or storage-shared microservices to be greater than 3, use your actual values.

```
Storage per node = Total storage / Nodes
```

Remember: This result is only an estimate. You should monitor the use of space over time and adjust storage as needed.

Save this information for when you are updating the Analytics CR for your installation. For more information on configuring the volume sizes of these services, see [Defining your internal storage space](#).

Example

Deployment information:

```
Copies of data = 3
Data retention = 90 days
Activity log bytes per call = 850 bytes
Header log bytes per call = 15k bytes
Payload log bytes per call = 30.5k bytes
% of Activity log = 100%
% of Header log = 0%
% of Payload log = 0%
Calls per month = 64 million
```

Formula:

```
Bytes per call = (% of Activity Log * Activity Log bytes per call) + (% of Header Log * Header Log bytes per call) + (% of Payload Log * Payload Log bytes per call)
Calls per retention period = Calls per month * (Number of days retained / 30 days per month)
Storage for API calls = Calls per retention period * Bytes per call * Copies of data
Total storage = Storage for API calls + Overhead
Storage per node = Total storage / Nodes
```

Details:

1. Bytes per call = 850 bytes  
 $(100\% \text{ of Activity Log} * 850 \text{ bytes}) + (0\% \text{ of Header Log} * 15k \text{ bytes}) + (0\% \text{ of Payload Log} * 30.5 \text{ bytes})$
2. Calls per retention period = 192 million calls  
 $64 \text{ million calls per month} * (90 \text{ days retained} / 30 \text{ days per month})$
3. Storage for API calls = 489.6 GB  
 $192 \text{ million calls per period} * 850 \text{ bytes per call} * 3 \text{ copies of data}$
4. Total storage = 600 GB  
**489.6GB storage + Buffer**  
Since rounding to 500 GB only provides 10.4 GB of extra space, consider rounding to 600 GB instead.
5. Storage per node = 200 GB  
**600GB Total storage / 3 nodes**

In this example, the estimated disk needed on each node for storage-data and storage-shared microservices is 200GB.

## Master storage: estimate disk space needs

---

This section applies if you are planning a topology with the storage-master microservice enabled.

For the storage-master microservice, estimating the amount of disk space you need is much easier. For a production environment, set this value to 10GB. For a development environment, you can optionally reduce the value to 5GB.

Save this information for when you are updating the Analytics CR for your installation. For more information on configuring the volume sizes of these services, see [Defining your internal storage space](#).

## MQ storage: estimate disk space needs

---

The section applies if you are planning a topology with the message queue, which uses the mq-kafka and mq-zk microservices.

For the mq-zk microservice, For a production environment, set this value to 10GB. For a development environment, you can optionally reduce the size to 5GB.

For the mq-kafka microservice, set this value to 5GB for both development and production deployments. If you want to allocate a larger temporary buffer, or are logging a significant amount of large payloads, consider increasing this volume as necessary.

Save this information for when you are updating the Analytics CR for your installation. For more information on configuring the volume sizes of these services, see [Defining your internal storage space](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## A two data center deployment strategy on Kubernetes and OpenShift

An overview of the two data center disaster recovery deployment strategy in API Connect.

### High availability versus disaster recovery

---

High availability is concerned with configuring a system so that it continues to operate, and the users and any using systems don't experience any loss of service, in the event of hardware or software failures. Whereas, disaster recovery (DR) is concerned with the configurations and procedures that allow a system to be recovered following a catastrophic hardware, software, or operator failure that's led to a loss of service. The following two important metrics should be considered for DR solutions:

Recovery Time Objective (RTO)

The RTO is the time that it is acceptable for a system to be unavailable for during a disaster.

Recovery Point Objective (RPO)

As DR solutions are usually based on some sort of data copy or backup, it is possible that a system might be recovered to a state prior to the disaster occurring, rather than the state it was in at the actual instant of the disaster. The RPO measures how far back in time the recovery point will be, and therefore how much data might be lost. An RPO of zero would assert that no data will be lost, but such a solution is often a compromise against the cost and performance of the system.

To achieve high availability in your API Connect deployment, a minimum of three data centers are required. This configuration creates a quorum of data centers, allowing automated failover in any direction, and enabling all three data centers to be active. The quorum *majority voting* algorithm, allows for a single data center to be offline, and yet still maintain data consistency and availability across the remaining two data centers as they continue to represent a majority in the deployment (avoiding split-brain

syndrome). However, when having three data centers is not possible, a two data center deployment provides a disaster recovery solution that has both a low Recovery Time Objective (RTO), and a low Recovery Point Objective (RPO). The following information provides an overview of the concepts and architecture required for configuring a two data center deployment in API Connect.

## High-level notes about the two data center disaster recovery (DR) solution

---

- Two data center DR is strictly an Active/Passive deployment for the API Manager and Developer Portal services, and must use manual failover.
- Two DataPower® gateway subsystems must be deployed to provide high availability for the gateway service. However, this scenario doesn't provide high availability for the analytics service.
- If high availability is required for the analytics service, two analytics subsystems must be configured, one per gateway subsystem, but with this configuration Developer Portal analytics isn't possible.
- Data consistency is prioritized over data availability.
- Each data center must be setup within its own Kubernetes cluster (OpenShift and VMWare are hosted on Kubernetes).
- Latency between the two data centers must be less than 80ms.
- Replication of the API Manager is asynchronous so, depending on the amount of latency between the two data centers, there is a small possibility that recent updates are not transferred in the event of a failure.
- Replication of the Developer Portal is synchronous, and therefore the latency is limited to 80ms or less.
- The API Manager and the Developer Portal services in the two data centers must either all be highly available, or none of them highly available, and the number of nodes on each data center must match.
- The deployment in each data center is effectively an instance of the same API Connect deployment - therefore, the endpoints, certificates, and Kubernetes secrets must all be the same.

## Deployment architecture

---

A two data center deployment model is optimized for data consistency ahead of data availability, and must use manual failover when a fault occurs. If data availability is also a priority, three data centers are required, and a quorum can be used for automatic failover. It is not possible to have automatic failover with only two data centers.

To have a single Kubernetes cluster span the two data centers the latency must be less than 6ms. However, as it is likely that the two data centers will be geographically disparate, a single Kubernetes cluster cannot be used to span both data centers, instead each data center must be set up within its own Kubernetes cluster. To achieve data replication in a reasonable time frame in this scenario, latency between the two data centers must still be less than 80ms, and database replication is handled outside of Kubernetes.

To achieve high availability for the DataPower Gateway, you must deploy two gateway subsystems; one subsystem in the active data center, and a separate subsystem in the standby passive data center, and then publish all Products and APIs to both gateway subsystems. The gateway subsystems are independent, and so are insulated if an issue occurs in one of them. A global dynamic router can then be used to route traffic to one gateway subsystem or the other. If high availability is also required for the analytics service, two analytics subsystems must be configured, one per gateway subsystem, but with this configuration Developer Portal analytics isn't possible.

A Catalog can have only a single Developer Portal service associated with it, and so this service needs to be highly available across both data centers. The requirement for a highly available service across both data centers also applies to the API Manager service, as it forms the core of API Connect, and is used for all user authentication and application/subscription operations in the Developer Portal.

There can be multiple Developer Portal services in an API Connect deployment (although still only one Developer Portal per Catalog), and those Developer Portal services can be in different data centers to API Manager (for example, Hybrid Cloud), so there must be the ability to monitor and failover individual services.

The deployment in each data center is effectively an instance of the same API Connect deployment – as the database is shared, all of the configuration is also shared. Therefore, the endpoints, certificates, and Kubernetes secrets all need to be the same.

### Active/Passive configuration

The data centers are run with an Active/Passive failover configuration.

### Dynamic routing

Note: A dynamic routing device, such as a load balancer, is required to route traffic to either data center. However, neither this device nor its configuration is part of the API Connect offering. Contact IBM Services if you require assistance with configuring a dynamic router.

The dynamic router configuration must handle the traffic between the subsystems, as well as between the data centers. For example, the consumer API calls from the Developer Portal to API Manager must transfer via a dynamic router so that the Developer Portal can use a single endpoint regardless of which data center API Manager is active in. The same is needed for calls to the Platform and Admin APIs from the other subsystems, as well as for incoming UI traffic for the Developer Portal UI, Cloud Manager UI, and API Manager UI.

The dynamic router must support SSL passthrough, so that it also routes the Mutual TLS (mTLS) connections between API Manager and the Developer Portal, and between API Manager and the DataPower Gateway. There should be no need to do TLS termination on the router, as it should be able to do layer 4 based routing by using SNI.

### Service status

When a failure occurs, it is common practice to display an interstitial system outage web page. The dynamic router can be configured to display this web page when there is a failure, while the manual failover to the passive data center is taking place.

### Deployment-profiles - Dev and Prod

Two data center DR deployment architecture is possible whether the Kubernetes clusters in each data center have a Dev or a Prod profile. In other words, you can still configure a two data center DR topology when there is only 1 pod of each type, as well as when there are 3 pods of each type. For more information about the deployment-profiles, see [Installing the API Connect subsystems](#) on Kubernetes, and [Requirements for initial deployment on VMWare](#).

For more information about a two data center DR deployment, see the following topics:

### Kubernetes and OpenShift

  - [Converting a single data center to a two data center deployment](#)
- [Maintaining a two data center deployment](#) (including information about normal operation data flows)
  - [Failure handling of a two data center deployment](#)
  - [Recovering from a failover of a two data center deployment](#)
  - [Backup and restore considerations for a two data center deployment](#)
  - [Upgrading a two data center deployment](#)

- [Removing a two data center deployment](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Key Concepts: Cert-manager, Issuers, and Secrets

By default API Connect uses an open source product that is called [cert-manager](#) to handle the issuing and renewal of the certificates that are used by API Connect. The cert-manager has its own Kubernetes pods and runs in its own namespace. The cert-manager adds some additional resources to the Kubernetes environment. The API Connect administrator needs to be familiar with these additional resources:

### Issuers

Issuers play the part of certificate authorities (CAs) in the local environment and issue the certificates. Issuers reside in the API Connect namespace. There are two types of Issuers:

- Self-Signed - This issuer provides the self-signed certificates, for example a root CA.
- CA - This issuer can be either the root certificate authority or an intermediate certificate authority .

Here is an example of the issuers that can be found on the Management Server:

```
kubectl get issuers
NAME                READY  AGE
abc-management-ca   True   96d
selfsigning-issuer True   96d
```

- **selfsigning-issuer** This is a SelfSigned Issuer that provides the root certificate for all default certificates that are used in API Connect.
- **abc-management-ca** This is a CA Issuer that signs all the end-entity certificates that are used by the Management Server. It is in effect an intermediate CA between the Root (selfsigning-issuer) and the end-entity certificates.

### Certificates

A certificate is a Kubernetes resource that contains a pointer to a Kubernetes secret which contains the actual TLS certificate. Certificate objects contain other information such as the certificate Issuer, renew-by date, and a status. Below are some of the Certificates that can be found on the Management Server:

```
kubectl get certificate
NAME                READY  SECRET                                AGE
abc-management-ca   True   abc-management-ca                    96d
abc-management-client True   abc-management-client                96d
abc-management-natscluster-mgmt True   abc-management-natscluster-mgmt     96d
abc-management-server True   abc-management-server                96d
...
```

The first in the list 'abc-management-ca' is the intermediate CA Certificate that is used for signing all the other certificates below it. Describing this resource observe that it is itself issued by the selfsigning-issuer mentioned earlier:

```
Issuer Ref:
Kind: Issuer
Name: selfsigning-issuer
```

Describing the subsequent certificates, observe they are all issued by the abc-management-ca:

```
Issuer Ref:
Kind: Issuer
Name: abc-management-ca
```

Key points:

- The certificates with '-ca' on the end are all CA Certificates, and they sign all the other subsystem certificates that whose names do not end with '-ca'.
- The CA certificates are also known as Issuer certificates.
- Certificates that are signed by the CA certificates are known as end-entity certificates.
- When a CA certificate is updated, all end-entity certificates that are signed by it must also be updated.

### Secrets

This is the standard Kubernetes resource for storing credentials, and for API Connect these are where the certificates are stored.

Notice the output from 'kubectl get certificate' above had a 'Secret' column. This is a shorthand way to know the certificate's corresponding Secret, as defined in its 'Secret Name' property:

```
kubectl describe certificate abc-management-client | grep "Secret Name"
Secret Name:      abc-management-client
```

Below is the describe output for above Secret, showing that it contains the tls certificates:

```
kubectl describe secret abc-management-client
Name:      abc-management-client
Namespace: default
Labels:    app.kubernetes.io/instance=abc-management
           app.kubernetes.io/managed-by=ibm-apiconnect
```

```
Annotations:  app.kubernetes.io/name=abc-management-client
              cert-manager.io/alt-names:
              cert-manager.io/certificate-name: abc-management-client
              cert-manager.io/common-name: abc-management-client
              cert-manager.io/ip-sans:
              cert-manager.io/issuer-group:
              cert-manager.io/issuer-kind: Issuer
              cert-manager.io/issuer-name: abc-management-ca
              cert-manager.io/uri-sans:
```

Type: kubernetes.io/tls

Data  
====

```
ca.crt: 1107 bytes
tls.crt: 1139 bytes
tls.key: 1675 bytes
```

The certificates themselves can be seen with `kubect1 get -o  
yaml secret abc-management-client`.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Certificates in a Kubernetes environment

Use of cert-manager is recommended for managing certificates in a Kubernetes environment.

When deploying on Kubernetes, choose one of the following methods for creating internal certificates:

- Do not specify any internal certificates. In this case, the operator generates all of the internal certificates without using a certificate manager. The CR definition to enable this option is:

```
microServiceSecurity: custom
```

- Specify some, or all, of the internal certificates yourself without using a certificate manager. In this case, any certificates that you do not create are created by the operator. You retain control over the certificates that you create. The CR definition to enable this option is:

```
microServiceSecurity: custom
```

- Configure cert-manager to generate the internal certificates. In this case, cert-manager creates and manages the certificates. The CR definition to enable this option is:

```
microServiceSecurity: certManager
```

To use cert-manager for generating the certificates, install cert-manager v1.5.1 and create an Issuer CR in the same namespace where you will install API Connect; for example:

```
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: selfsigning-issuer
spec:
  selfSigned: {}
```

In the CR for the API Connect Management subsystem, specify a `certManagerIssuer`. The `certManagerIssuer` can be configured to be a self-signing issuer, as in the following example:

```
microServiceSecurity: certManager
certManagerIssuer:
  name: selfsigning-issuer
  kind: Issuer
```

API Connect supports any other kind of Issuer supported by cert-manager, in addition to the self signed type.

In all the CRs, certs are expected at the level of any endpoint. For example, for the cloud admin endpoint of the Management subsystem you could have:

```
cloudManagerEndpoint:
  annotations:
    cert-manager.io/issuer: ingress-issuer
  hosts:
  - name: admin.example.com
    secretName: cm-endpoint
```

The previous entry lets cert-manager automatically generate a `cm-endpoint` TLS secret using the `ingress-issuer`. One way to define the `ingress-issuer` is as follows:

```
---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: selfsigning-issuer
spec:
  selfSigned: {}
---
```

```

apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: ingress-ca
spec:
  secretName: ingress-ca
  commonName: "ingress-ca"
  usages:
  - digital signature
  - key encipherment
  - cert sign
  isCA: true
  issuerRef:
    name: selfsigning-issuer
    kind: Issuer
---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: ingress-issuer
spec:
  ca:
    secretName: ingress-ca

```

Another way to configure the cloud admin endpoint would be with:

```

cloudManagerEndpoint:
  hosts:
  - name: admin.example.com
    secretName: my-cm-endpoint

```

Where `my-cm-endpoint` is the name of a secret that you previously created, and is present in the same namespace as the subsystem, and contains TLS certificate files for termination of the endpoint.

## Creating secrets and generating certificates

There is a number of "secrets" for which you can provide a name in the CRs:

- Portal admin secret.

```

portal:
  admin:
    secretName:

```

- Analytics client secret.

```

analytics:
  client:
    secretName: analytics-client-client

```

- Analytics ingestion secret.

```

analytics:
  ingestion:
    secretName: analytics-ingestion-client

```

- APIC Gateway Service TLS secret. Template entry from `gateway_cr_v6.yaml` (in the file name, "v6" refers to the API Gateway service):

```

apicGatewayServiceTLS:
  secretName:

```

- APIC Gateway Peering TLS secret. Template entry from `gateway_cr_v6.yaml` (in the file name, "v6" refers to the API Gateway service):

```

apicGatewayPeeringTLS:
  secretName:

```

You can create manually create secrets that contain the `tls.crt`, `tls.key`, and `tls.ca` files for a certificate. You can then refer to them by name in their subsystem CR. However, a simpler way to have those secrets created is by using `cert-manager`. The following example shows how to generate those certificates with `cert-manager`:

```

---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: selfsigning-issuer
spec:
  selfSigned: {}
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: ingress-ca
spec:
  secretName: ingress-ca
  commonName: "ingress-ca"
  usages:
  - digital signature
  - key encipherment
  - cert sign
  isCA: true
  issuerRef:
    name: selfsigning-issuer
    kind: Issuer

```

```

---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: ingress-issuer
spec:
  ca:
    secretName: ingress-ca
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: portal-admin-client
spec:
  commonName: portal-admin-client
  secretName: portal-admin-client
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: analytics-client-client
spec:
  commonName: analytics-client-client
  secretName: analytics-client-client
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: analytics-ingestion-client
spec:
  commonName: analytics-ingestion-client
  secretName: analytics-ingestion-client
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: gateway-service
spec:
  commonName: gateway-service
  secretName: gateway-service
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: gateway-peering
spec:
  commonName: gateway-peering
  secretName: gateway-peering
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h

```

So with the previous example, in the subsystem CRs (for Management and Gateway) the following values could be set:

- portal:
  - admin:
    - secretName: portal-admin-client

- `analytics:`  
`client:`  
`secretName: analytics-client-client`
- `analytics:`  
`ingestion:`  
`secretName: analytics-ingestion-client`
- `apicGatewayServiceTLS:`  
`secretName: gateway-service`
- `apicGatewayPeeringTLS:`  
`secretName: gateway-peering`

Also, the Client certificate should be signed by same CA as the one for the endpoint certificates, and the server side should be configured with the expected Subject DN for the client. For example:

- The `portalAdminSecret` certificate and the certificate used to terminate `portalAdminEndpoint` must have the same CA (in the example the CA is `ingress-ca` for both). Also, the `adminClientSubjectDN` in the Portal subsystem CR should be set to the Subject DN of `portal.admin.secretName`. For example:  
`adminClientSubjectDN: CN=portal-admin-client,O=cert-manager`
- Similarly, the `analyticsClientSecret` and the Analytics client endpoint certificate should share the same CA. Also, the Analytics CR `client.clientSubjectDN` should be set to the Subject DN of the `analytics.client.secretName` certificate. For example:

```
client:
  endpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: ac.example.com
        secretName: analytics-ac-endpoint
  clientSubjectDN: CN=analytics-client-client,O=cert-manager
```

- Similarly, the `analyticsIngestionSecret` and the Analytics ingestion endpoint certificate should share the same CA. The `ingestion.clientSubjectDN` should be set to the Subject DN of the `analytics.ingestion.secretName` certificate.

```
ingestion:
  endpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: ai.example.com
        secretName: analytics-ai-endpoint
  clientSubjectDN: CN=analytics-ingestion-client,O=cert-manager
```

Important: When installing more than one Analytics subsystem in the same Kubernetes namespace, all secret names must be unique.

## Creating TLS secret using openssl

Use of the cert-manager is recommended for managing certificates. However, you can choose not to use cert-manager, and instead create certificates manually. Requirements for manually created certificates:

- Extended Key Usage (EKU), either `serverAuth` or `clientAuth` depending upon the type of certificate. Certificates of type *Server* must have an Extended Key Usage with `serverAuth` purpose. Certificates of type *Client* must have an Extended Key Usage with `clientAuth` purpose.
- Subject Alternative Name (SAN) for the required hosts
- If a certificate is signed by an internal or custom CA, include the full chain in the end certificate. If you omit the full chain, then a user who uses openssl to access the endpoint will see the following error: `error:num=20:unable to get local issuer certificate`  
 The following example shows the full chain for an end certificate (signed by a custom CA):

```
-----BEGIN CERTIFICATE -----
Cert contents for end-cert
-----END CERTIFICATE -----
-----BEGIN CERTIFICATE -----
Cert contents for Intermediate-CA
-----END CERTIFICATE -----
-----BEGIN CERTIFICATE -----
Cert contents for Root CA
-----END CERTIFICATE -----
```

The following steps can be used as an alternative to using cert-manager. If you choose to create your certificates this way, you lose some of the management features of cert-manager. For example, you must manually update your certificates when their expiration date gets near.

1. Generate the custom certificate with the appropriate EKU and SAN. You will need to obtain the private key, public certificate, and CA certificates in non-password-protected PEM format for the custom certificate. Following is an example for how to generate a certificate (platform-api-example) with an EKU `serverAuth` and SAN using openssl:

```
openssl x509 -req -days 360 -in platform-api-example.csr -CA root-ca.pem -CAkey root-ca-key.pem -CAcreateserial -out
platform-api-cert -sha256
-extfile <(cat /etc/ssl/openssl.cnf <(printf
"\n[SAN]\nsubjectAltName=DNS:fqdn.myserver.com\nextendedKeyUsage=serverAuth"))
-extentions SAN
```

where

- `DNS:fqdn.myserver.com` is the fully qualified domain name of the endpoint the certificate applies to.
- `platform-api-example.csr` is the file name for the certificate signing request

Following is an example for how to generate a certificate (portal-client) with an EKU `clientAuth` and SAN using openssl:

```
openssl x509 -req -days 360 -in portal-client-example.csr -CA root-ca.pem -CAkey root-ca-key.pem -CAcreateserial -out
portal-client-cert
-sha256 -extfile <(cat /etc/ssl/openssl.cnf <(printf "\n[SAN]\nkeyUsage=critical,
digitalSignature,keyEncipherment\nextendedKeyUsage = clientAuth\nbasicConstraints=critical,
CA:FALSE\nsubjectKeyIdentifier=hash\n") -extensions SAN
```

2. Create a Kubernetes secret containing tls.cert, tls.key, and ca.cert.

## Setting an encryption-secret for the management database using openssl

You can optionally set the encryption-secret for the management database. If you do not set one, one is automatically generated for you.

1. The encryption-secret is a secure random bytes password used for field level encryption in the management database. You can generate 128 random bytes using the following command in openssl:

```
openssl rand -out /path/to/secret/encryption-secret.bin 128
```

2. Use kubectl to put the generated secret into `management-encryption-key`:

```
kubectl create secret generic management-encryption-key -n <namespace>
--from-file=/path/to/secret/encryption_secret.bin
```

where `<namespace>` is the namespace where the Management CR is going to be created)

3. Make sure that in `management_cr.yaml`, `encryptionSecret.secretName` points to the name of the secret created in the previous step.

Important: Back up the `encryption-secret.bin` file to a safe location. If this file is lost it will not be possible to access the management database or its backups.

- [Custom certificates on Kubernetes](#)  
You can use custom certificates in your Kubernetes deployment. You can optionally generate your own custom certificates.
- [Using custom certificates with IBM Kubernetes Service](#)  
Deployment of API Connect on IBM Kubernetes Service requires the use of custom certificates.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Custom certificates on Kubernetes

You can use custom certificates in your Kubernetes deployment. You can optionally generate your own custom certificates.

Note: Do not use these instructions for IBM Kubernetes Service. Instead, see [Using custom certificates with IBM Kubernetes Service](#). To deploy API Connect with Custom Certificates, some additional preparation and steps are required before any subsystem CRs are applied into the Cluster.

You can provide existing custom certificates that you already own, for example DigiCert certificates, or generate new custom certificates using a package such as Cert-Manager.

- If you have your own custom certificates, see [Configuring custom certificates before installation](#).
- If you do not already have your own custom certificates, and would like to use Cert-Manager to generate custom certificates, see [Generating custom certificates](#).
- To view a list of certificates used by API Connect, see [Custom certificates reference](#).
- [Custom certificates reference](#)  
API Connect supports custom certificates for each subsystem, and for internal communications.

Convert a front-end certificate generated by Kubernetes cert-manager to a custom certificate for an existing IBM® API Connect deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Custom certificates reference

API Connect supports custom certificates for each subsystem, and for internal communications.

Table 1. Certificates for Management Subsystem:

Certificate	Type	Notes
-------------	------	-------

Certificate	Type	Notes
analytics-client-client	Common Subsystem Communication	Must be signed by the same CA as <b>analytics-ac-endpoint</b> Certificate of Analytics Subsystem. For a two data center deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <b>CN=a7s-client-client</b> , or they could both be <b>CN=a7s-client-client, O=cert-manager</b> , but they must be identical.
analytics-ingestion-client	Common Subsystem Communication	Must be signed by the same CA as <b>analytics-ai-endpoint</b> Certificate of Analytics Subsystem. For a two data center deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <b>CN=a7s-ingestion-client</b> , or they could both be <b>CN=a7s-ingestion-client, O=cert-manager</b> , but they must be identical.
portal-admin-client	Common Subsystem Communication	Must be signed by the same CA as <b>portal-admin</b> Certificate of Portal Subsystem. For a two data center deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <b>CN=portal-admin-client</b> , or they could both be <b>CN=ptl-adm-client, O=cert-manager</b> , but they must be identical.
gateway-client-client	Common Subsystem Communication	Must be signed by the same CA as <b>gwv5-management-endpoint</b> and/or <b>gwv6-management-endpoint</b> of Gateway Subsystem
cm-endpoint	External Frontend/Ingress	
apim-endpoint	External Frontend/Ingress	
api-endpoint	External Frontend/Ingress	
consumer-endpoint	External Frontend/Ingress	
hub-endpoint	External Frontend/Ingress	
turnstile-endpoint	External Frontend/Ingress	

Note:

To generate the certificates for the endpoints used by the Automated testing behavior endpoints (**hub-endpoint** and **turnstile-endpoint**), add the following statements to the **custom-certs-external.yaml**:

```

apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: hub-endpoint
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "hub-endpoint"
  }
spec:
  commonName: hub-endpoint
  secretName: hub-endpoint
  dnsNames:
  - hub.example.com
  issuerRef:
    name: ingress-issuer
  usages:
  - "server auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
---
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: turnstile-endpoint
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "turnstile-endpoint"
  }
spec:
  commonName: turnstile-endpoint
  secretName: turnstile-endpoint
  dnsNames:
  - turnstile.example.com
  issuerRef:
    name: ingress-issuer
  usages:
  - "server auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h

```

Table 2. Certificates for Analytics Subsystem

Certificate	Type	Notes
-------------	------	-------

Certificate	Type	Notes
analytics-ac-endpoint	External Frontend/Ingress	Must be signed by the same CA as <b>analytics-client-client</b> Certificate of Management Subsystem
analytics-ai-endpoint	External Frontend/Ingress	Must be signed by the same CA as <b>analytics-ingestion-client</b> Certificate of Management Subsystem

Table 3. Certificates for Gateway Subsystem

Certificate	Type	Notes
gww5-endpoint	External Frontend/Ingress	
gww5-management-endpoint	External Frontend/Ingress	Must be signed by the same CA as <b>gateway-client-client</b> Certificate of Management Subsystem
gww6-endpoint	External Frontend/Ingress	
gww6-management-endpoint	External Frontend/Ingress	Must be signed by the same CA as <b>gateway-client-client</b> Certificate of Management Subsystem

Table 4. Certificates for Portal Subsystem

Certificate	Type	Notes
portal-admin	External Frontend/Ingress	Must be signed by the same CA as <b>portal-admin-client</b> Certificate of Management Subsystem
portal-web	External Frontend/Ingress	

Table 5. Internal Certificates

Certificate	Type (CA/Server/Client)	Subsystem
caCertificate	CA	Management, Analytics, Portal
clientCertificate	Client	Management, Analytics, Portal
serverCertificate	Server	Management, Analytics, Portal
dbServerCertificate	Server	Management
pgBouncerServerCertificate	Server	Management
PGOTLSCertificate	Server	Management
NATSTLSCertificate	Server	Management
dbClientPostgres	Client	Management
dbClientReplicator	Client	Management
dbClientPgBouncer	Client	Management
dbClientApicuser	Client	Management

Several certificates as noted above are required to be signed by the same CA as another certificate. For example, **portal-admin-client**, and **portal-admin**. This means that if the **portal-admin-client** certificate were to be customized, then the **portal-admin** certificate must also be customized, and signed by the same CA as **portal-admin-client**. To ensure that pairs of certificates like these are signed by the same CA, the Issuer for each certificate must be the same.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Generating custom certificates

You can generate custom certificates.

### About this task

If you do not already have your own custom certificates that you can provide for the installation, you can manually prepare Certificate definitions for Cert-Manager to generate the required Certificates for you.

Note: If a certificate is signed by an internal or custom CA, include the full chain in the end certificate. If you omit the full chain, then a user who uses openssl to access the endpoint will see the following error: **error:num=20:unable to get local issuer certificate**. The following example shows the full chain for an end certificate (signed by a custom CA):

```
-----BEGIN CERTIFICATE -----
Cert contents for end-cert
-----END CERTIFICATE -----
-----BEGIN CERTIFICATE -----
Cert contents for Intermediate-CA
-----END CERTIFICATE -----
-----BEGIN CERTIFICATE -----
Cert contents for Root CA
-----END CERTIFICATE -----
```

## Procedure

1. Create a Certificate Authority (CA) and an Issuer for Signing
  - a. Use the following YAML definition to generate a CA named **ingress-ca**, and an Issuer named **ingress-issuer** using that CA. Place the following definition into a file such as **ingress-ca.yaml**:

```
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
name: ingress-ca
spec:
secretName: ingress-ca
commonName: "ingress-ca"
usages:
- digital signature
```

```

- key encipherment
- cert sign
isCA: true
issuerRef:
  name: selfsigning-issuer
  kind: Issuer
---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
name: ingress-issuer
spec:
  ca:
    secretName: ingress-ca

```

b. Apply this file into the cluster:

```
kubectl apply -f ingress-ca.yaml -n <namespace>
```

This will create a CA Certificate named `ingress-ca`, and also a Secret named `ingress-ca`. This CA will be used to sign the rest of the custom certificates.

c. Verify the presence of both:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

2. Generating common subsystem communication certificates with Cert-Manager for management CR.

a. Use the following YAML definition to generate the following Common Certificates and Secrets - `analytics-client-client`, `analytics-ingestion-client`, and `portal-admin-client`. Place it into a file, for example, `common-certs.yaml`:

```

apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
name: analytics-client-client
spec:
  commonName: analytics-client-client
  secretName: analytics-client-client
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
name: analytics-ingestion-client
spec:
  commonName: analytics-ingestion-client
  secretName: analytics-ingestion-client
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
name: portal-admin-client
spec:
  commonName: portal-admin-client
  secretName: portal-admin-client
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h

```

Note that the `issuerRef` uses the Issuer created in Step 1. These certificates must be signed by the CA associated with that Issuer, `ingress-ca`.

b. Apply `common-certs.yaml` into the cluster:

```
kubectl apply -f common-certs.yaml -n <namespace>
```

This will create Client Certificates and Secrets named `analytics-client-client`, `analytics-ingestion-client`, and `portal-admin-client`.

c. Verify the presence of all of these certificates and secrets:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

3. Generating Front-end/Endpoint Certificates with Cert-Manager

a. Generate server certificates.

For each Endpoint in a subsystem CR, you can use the following YAML definition to generate a Server Certificate:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
name: <endpoint-host.secretName>
spec:
  commonName: <endpoint.host.secretName>
  secretName: <endpoint.host.secretName>
  dnsNames:
  - <endpoint.host.Name>
  issuerRef:
    name: ingress-issuer
  usages:
  - "server auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
```

Replace `<endpoint.host.secretName>` with the `secretName` in the `host` block of the `Endpoint` in the CR. For example, if the `Endpoint` in the CR is:

```
cloudManagerEndpoint:
  hosts:
  - name: admin.example.com
    secretName: cm-endpoint
```

The Certificate YAML should be updated as follows:

```
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
name: cm-endpoint
spec:
  commonName: cm-endpoint
  secretName: cm-endpoint
  dnsNames:
  - admin.example.com
  issuerRef:
    name: ingress-issuer
  usages:
  - "server auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
```

Note that the `issuerRef` uses the Issuer created in Step 1. This certificate will be signed by the CA associated with that Issuer, `ingress-ca`.

Place the edited yaml into a file, e.g. `<subsystem>-server.yaml`.

b. Apply this file into the cluster:

```
kubectl apply -f <subsystem>-server.yaml.
```

This will create a Server Certificate named `<subsystem>-server`, and also a Secret named `<subsystem>-server`.

c. Check for the presence of both with:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

d. Repeat Step 3.a, step 3.b and step 3.c for each subsystem.

In each case, the Certificates must use the same Issuer created in Step 1. This ensures that all custom certificates are signed by the same CA Certificate.

Note that the `issuerRef` uses the Issuer created in Step 1. These certificates must be signed by the CA associated with that Issuer, `ingress-ca`.

e. Place the YAML definitions for each Certificate into a YAML file, for example, `endpoint-certs.yaml`. Apply this file into the cluster:

```
kubectl apply -f endpoint-certs.yaml -n <namespace>
```

This will create Client Certificates and Secrets for each Endpoint named `<endpoint.host.secretName>`.

f. Check for the presence of all of these with:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

4. Choose one of the following actions, based on whether or not you are customizing internal API certificates:

- If you do not plan to customize internal certificates, continue with [Configuring custom certificates before installation](#).
- If you want to generate some, or all, of the internal certificates, continue with the next step.

Note: It is not recommended to customize Internal certificates unless you have a specific requirement to do so.

5. Generate custom internal certificates using `custom-certs-internal.yaml`.

Each of the Internal certificates listed in [Custom certificates reference for IKS](#) have differing strict requirements for Common Names and DNS Names (i.e. Subject Alternative Names).

To generate custom certificates that meet these requirements, use the provided `custom-certs-internal.yaml` file, which can be found in the `helper_files` installation archive. For more information, see [Obtaining product files](#).

This file contains Certificate YAML definitions for all Internal certificates, CA, and Issuer that can be customized for each subsystem of IBM API Connect. The Certificate definitions file is already populated with the recommended default values.

- a. When using custom internal certificates, you are required to specify a site name. The site name is used as the identifier for the PostgreSQL database Cluster used by API Connect. The site name chosen is added to the Management Subsystem CR YAML file before installing the Management Subsystem. In addition, this name is also required for use with the custom internal certificates, so a site name should be chosen now before proceeding.
- b. Open `custom-certs-internal.yaml` in a text-editor, and make the following changes:
  - i. Search for the `pg-bouncer-server-certificate` certificate definition. Replace `commonName` and `dns-names` with the following values:
 

```

          • commonName: management-pgo_cluster_id-postgres-pgbouncer
          • dnsNames:
            - "*".<namespace>"
            - "*".<namespace>.svc"
            - "management-pgo_cluster_id-postgres-pgbouncer.<namespace>.svc"
            - "management-pgo_cluster_id-postgres-pgbouncer"
          
```
  - ii. Find and replace each occurrence of `<namespace>` with the desired namespace for the deployment. This must be done even if the `default` namespace is to be used.
  - iii. Also in `custom-certs-internal.yaml`, replace each occurrence of `pgo_cluster_id` with the chosen site name described in Step 5.a.
- c. Apply the file to the Cluster:

```
kubectl apply -f custom-certs-internal.yaml -n <namespace>
```

6. When all desired custom certificates are created and applied into the Kubernetes Cluster as `Certificates` and `Secrets`, update the Subsystem CR YAML files to use the custom certificates. See [Configuring custom certificates before installation](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Generating custom certificates using cert-manager in a two data center deployment

You can generate custom certificates in a two data center disaster recovery deployment on Kubernetes.

### About this task

You can provide your own custom certificates when you deploy IBM API Connect, if required, instead of having the application generate and manage them for you. In most deployment cases to use the built in default Cert-Manager integration is the preferred method.

When you use the custom option, the use of Cert-Manager is the recommended method for generating custom certificates if that fits your business needs. However, use of Cert-Manager is not required, and custom certificates can be generated in any way that suit your needs.

The following example of providing custom certificates uses Cert-Manager as a model for generating them. For generating custom certificates, the minimum supported version of cert-manager is v0.12.

Note: You must complete this task for deployments to IBM Kubernetes Service.  
Requirements for deploying to IBM Kubernetes Service:

- Version v0.10.1 of cert-manager is NOT compatible with IBM API Connect when deployed onto the IBM Kubernetes Service (IKS). Do not install cert-manager v0.10.1 into the IKS cluster. Instead, use the steps that follow to install cert-manager v0.12, and create custom certificates for the deployment.
- Do not install the `ingress-ca` Issuer file `ingress-issuer-v1.yaml` as described in [Deploying operators](#). Instead, follow the steps that follow to generate a new `ingress-ca` and custom certificates for the deployment with cert-manager v0.12.
- For IKS deployments, generating/providing custom certificates **is required** for Common Subsystem Communication Certificates, and External Frontend/Ingress certificates. The replacement of Internal Certificates **is not required**. To review the list of API Connect certificates for which you can generate custom certs, see [Configuring custom certificates before installation](#).

### Procedure

1. Set `KUBECONFIG` for the target cluster:

```
export KUBECONFIG=<path_to_cluster_config_YAML_file>
```

Example path:

```
/Users/user/.kube/clusters/<cluster_name>/kube-config-<cluster_name>.yaml
```

2. Install cert-manager version 0.12 or later:
  - a. Download v0.12 from <https://github.com/jetstack/cert-manager/releases/tag/v0.12.0>.
  - b. Install cert-manager. Do not specify a namespace:

```
kubectl apply -f cert-manager.yaml
```

- c. Check the status of the `cert-manager` pods:

```
kubectl -n cert-manager get po
```

Wait for `cert-manager` pods to enter `Running 1/1` status before proceeding. There are 3 `cert-manager` pods in total.

3. Set up the customized external certificates:

For quick setup, you can use the provided yml files that are included in the `helper_files` that you expanded in [Deploying operators](#). The yml for the active data center (DC1) is called `custom-certs-external-dc1.yaml` and the yml for the passive data center (DC2) is called `custom-certs-external-dc2.yaml`.

- a. Open `custom-certs-external-dc1.yaml` and `custom-certs-external-dc2.yaml` in a text-editor. Find and replace each occurrence of `example.com` with the desired ingress subdomain for the API Connect stack.
- b. Ensure that the management CR for DC1 is ready for applying but not yet applied, make a note of the `hostname` of the site.
- c. In `custom-certs-external-dc1.yaml` find `spec.dnsNames`

For example, in DC1:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: dc1-mgmt-replication
spec:
  commonName: dc1-mgmt-replication
  secretName: dc1-mgmt-replication
  dnsNames:
  - <INSERT SITE HOSTNAME HERE. THIS WILL BE THE SAME VALUE AS IN THE MANAGEMENT CR spec.multiSiteHA.hosts.name for site 1>
  issuerRef:
    name: ingress-issuer
  usages:
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
```

- d. Replace the line that begins `- <INSERT SITE HOSTNAME HERE` with `- hostname of the site`.
- e. Ensure that the management CR for DC2 is ready for applying but not yet applied, make a note of the `hostname` of the site.
- f. In `custom-certs-external-dc2.yaml` find `spec.dnsNames` and replace the line that begins `- <INSERT SITE HOSTNAME HERE` with `- hostname of the site`.
- g. Ensure that the portal CR for DC1 is ready for applying but not yet applied, make a note of the `hostname` of the site.
- h. In `custom-certs-external-dc1.yaml` find `spec.dnsNames`

For example, in DC1:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: dc1-ptl-replication
spec:
  commonName: dc1-ptl-replication
  secretName: dc1-ptl-replication
  dnsNames:
  - <INSERT SITE HOSTNAME HERE. THIS WILL BE THE SAME VALUE AS IN THE PORTAL CR spec.multiSiteHA.hosts.name for site 1>
  issuerRef:
    name: ingress-issuer
  usages:
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
```

- i. Replace the line that begins `- <INSERT SITE HOSTNAME HERE` with `- hostname of the site`.
  - j. Ensure that the portal CR for DC2 is ready for applying but not yet applied, make a note of the `hostname` of the site.
  - k. In `custom-certs-external-dc2.yaml` find `spec.dnsNames` and replace the line that begins `- <INSERT SITE HOSTNAME HERE` with `- hostname of the site`.
4. Use the following steps to allow `ingress-ca` secrets to be the same on both data centers.

- a. On DC1 apply the file `custom-certs-external-dc1.yaml`:

```
kubectl -n <namespace> apply -f custom-certs-external-dc1.yaml
```

- b. Validate that the command succeeded:

```
kubectl get certificates -n <namespace>
```

- c. Export `ingress-ca` secret as a yaml from DC1:

```
kubectl -n <namespace> get secret ingress-ca -o yaml > ingress-ca.yaml
```

- d. Edit the `ingress-ca.yaml` file to remove all labels, annotations, `creationTimestamp`, `resourceVersion`, `uid`, and `selfLink`.

- e. Copy the `ingress-ca.yaml` from DC1 to DC2 and apply that file on DC2:

```
kubectl -n <namespace> apply -f ingress-ca.yaml
```

- f. On DC2 apply the file `custom-certs-external-dc2.yaml`:

```
kubectl -n <namespace> apply -f custom-certs-external-dc2.yaml
```

- g. Use the following commands to test that they are the same, on DC1 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc1
```

- h. On DC2 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc2
```

- i. To see the differences run:

```
diff /tmp/ingress.pem.dc1 /tmp/ingress.pem.dc2
```

The files should be the same.

- j. To ensure that the certificates are working correctly and that they are using the `ingress-ca` secret. First, get the `portal-admin-client` crt file:

```
kubectl -n <namespace> get secrets portal-admin-client -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/admin-client.crt
```

k. Test that it is working by using OpenSSL:

```
openssl verify -verbose -CAfile /tmp/ingress.pem.dc1 /tmp/admin-client.crt
```

If it is working, you should see:

```
/tmp/admin-client.crt: OK
```

5. Update the API Connect subsystem CR .yaml files to use the custom certificates. To do this, continue with [Configuring custom certificates before installation](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring custom certificates before installation

Configure custom certificates for your API Connect deployment before you begin the installation procedures.

### About this task

To deploy API Connect with custom certificates, complete the following steps to configure your custom certificates before applying any subsystem installation CRs to the cluster.

### Procedure

1. Determine which certificates you want to customize.

For a list of certificates that can be customized, see [Custom certificates reference](#).

You can customize the following types of certificates:

- Endpoint (External Frontend/Ingress) certificates:

These are the certificates for external, public-facing endpoints where users interact with API Connect. You can customize none, some, or all of the endpoint certificates.

If you initially deploy APIC using default certificates for endpoints, you can convert them to custom certificates later as explained in [Converting to custom front-end/ingress certificates after deployment](#).

- Internal (CA, Client, Server, and Common Subsystem Communication) certificates:

These are the certificates used within API Connect, so that subsystems can communicate. If you want to customize any of the internal certificates, then you must customize all of them; however you don't have to create them all yourself. Any custom certs that are not specifically named in your deployment CR will be generated automatically during installation.

If you initially deploy API Connect using default certificates for internal certificates, you cannot convert them to custom certificates later.

2. Prepare your custom certificates.

If you don't have a set of custom certificates already, you can use Kubernetes Cert-manager to generate them as explained in [Generating custom certificates](#).

When preparing your custom certificates, remember that certain pairs of certificates must be signed by the same Certificate Authority, as noted in [Custom certificates reference](#).

If you're installing a two data center disaster recovery configuration, and are using custom certificates, then the subject names of any client certificates must be the same in both data centers, as noted in [Custom certificates reference](#). For example, both data centers subject name could be `CN=portal-admin-client`, or they could both be `CN=ptl-adm-client, O=cert-manager`, but they must be identical.

3. If needed, create a Kubernetes secret for each custom certificate.

Each custom certificate that you use must be captured in a TLS secret. To create a secret, use the following command:

```
kubectl create secret generic my-tls-secret --from-file=tls.crt=<path_to_cert_file> --from-file=tls.key=<path_to_key_file> --from-file=ca.crt=<path_to_cacert_file>
```

When you create each secret, it's helpful to reference its purpose or its corresponding certificate in the secret name, to ensure you specify the correct secret for each custom certificate.

4. Edit the ingress-issuer-v1.yaml file and delete the default definitions for the certificates that you will customize.

The ingress-issuer-v1.yaml file is provided as part of the installation `helper_files` archive.

This file is used for generating the default certificates. To use a custom certificate, you must delete the default definition to ensure that API Connect uses your certificate instead of the default certificate. If you customize all of the default certificates and delete those definitions from the file, then you don't need to use the file during installation.

5. Customize endpoint (External Frontend/Ingress) certificates in the corresponding subsystem CRs.

For each custom endpoint certificate, delete the annotation that specifies the default issuer, and replace the secret name with your own custom secret name.

a. Open the subsystem CR for editing and locate the endpoint definition.

For example, the following snippet shows the definition for the `cloudManagerEndpoint` in the Management CR:

```
cloudManagerEndpoint:  
  annotations:
```

```

cert-manager.io/issuer: ingress-issuer
hosts:
- name: admin.example.com
  secretName: cm-endpoint

```

b. Delete the annotation for the `cert-manager.io/issuer`.

Delete the field name as well as the value; you can leave the `annotations:` label in place.

c. Replace the default secret name with the name of the Kubernetes secret that you created for that endpoint's custom certificate.

In the following example, `cm-endpoint` is the default secret name, which must be replaced. Make sure to reference the correct secret for the custom certificate.

```

cloudManagerEndpoint:
  annotations:
  hosts:
  - name: admin.example.com
    secretName: my_cm-endpoint

```

6. Customize internal (CA, Client, Server, and Common Subsystem Communication) certificates.

a. Open the subsystem CR for editing.

b. Set the `microServiceSecurity` setting to `custom`.

By default, the setting is configured for `certManager` as shown in the following example:

```

microServiceSecurity: certManager
certManagerIssuer:
  name: selfsigning-issuer
  kind: Issuer

```

c. Delete (or comment-out) the `certManagerIssuer` block.

In the following example, `microServiceSecurity` is set to `custom` and the `certManagerIssuer` block is commented out:

```

microServiceSecurity: custom
#certManagerIssuer:
#  name: selfsigning-issuer
#  kind: Issuer

```

7. Add the `customCertificates` block and list the secret name for each internal custom certificate that you created for the subsystem.

Each subsystem supports a different set of Common Subsystem Communication and External Frontend/Ingress certificates. You do not have to provide a custom version of every certificate supported by the subsystem. Just list the custom certificates that you created; any certificates that you omit from the list will be generated automatically during installation.

For example, your `customCertificates` list for the Management subsystem might look like the following example:

```

customCertificates:
- name: caCertificate
  secretName: my_ingress-ca
- name: clientCertificate
  secretName: my_management-client
- name: serverCertificate
  secretName: my_management-server
- name: dbServerCertificate
  secretName: my_db-server-certificate
- name: pgBouncerServerCertificate
  secretName: my_pg-bouncer-server-certificate
- name: PGOTLSCertificate
  secretName: my_pgo.tls
- name: NATSTLSCertificate
  secretName: my_management-natscluster-mgmt
- name: dbClientPostgres
  secretName: my_db-client-postgres
- name: dbClientReplicator
  secretName: my_db-client-replicator
- name: dbClientPgbouncer
  secretName: my_db-client-pgbouncer
- name: dbClientApicuser
  secretName: my_db-client-apicuser
- name: dbClientPrimaryuser
  secretName: my_db-client-primaryuser

```

## What to do next

Deploy API Connect:

- If you did not deploy the API Connect operator yet, proceed to [Deploying operators in a single-namespace API Connect cluster](#) or [Deploying operators in a multi-namespace API Connect cluster](#).
- If you already deployed the operator, proceed to [Installing the API Connect subsystems](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Converting to custom front-end/ingress certificates after deployment

Convert a front-end certificate generated by Kubernetes cert-manager to a custom certificate for an existing IBM® API Connect deployment.

## About this task

---

If you deploy IBM API Connect using certificates that were generated by Kubernetes cert-manager, you can later convert front-end (ingress) certificates to use custom certificates instead. For a list of the certificates that are generated and managed by cert-manager, see [Custom certificates reference](#).

Restriction: This task applies only to front-end certificates and is not supported for the "Common Subsystem Communication" and "Internal" type certificates.

## Procedure

---

1. Create the secrets you want to use with the `kubectl create secret` command.
2. Edit the `management_cr.yaml` and make the following changes:

- In the `annotations` section, remove the following line:

```
cert-manager.io/issuer: ingress-issuer
```

- In the `hosts` section, locate the `secretName` for the appropriate end point, and update it to the new secret that you created in step 1.

The following example shows where the updates should be made:

```
annotations:
  cert-manager.io/issuer: ingress-issuer REMOVE THIS LINE
hosts:
- name: api.example.com
  secretName: api-endpoint CHANGE THIS TO THE NEW SECRET
```

3. Apply the updated `management_cr.yaml` by running the following command:

```
kubectl apply -f 'management_cr.yaml'
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Using custom certificates with IBM Kubernetes Service

Deployment of API Connect on IBM Kubernetes Service requires the use of custom certificates.

To deploy IBM API Connect using the IBM Kubernetes Service (IKS), the use of Custom Certificates is required. Some additional preparation and steps are required before any subsystem CRs are applied into the Cluster. These steps can be broken up into two parts: providing or generating custom certificates, and updating the subsystem CRs to use those custom certificates.

Note: Topics in this section are for IBM Kubernetes Service only. If you are deploying on a Kubernetes release other than IBM Kubernetes Service, do not use these instructions. See [Custom certificates on Kubernetes](#)

You may provide your own custom certificates, or generate them using a package such as Cert-Manager.

For IKS deployments, generating/providing custom certificates **is required** for the following Certificate types:

- Common Subsystem Communication Certificates
- External Frontend/Ingress certificates.

The replacement of Internal Certificates **is not required**.

Note: Version V0.10.1 of cert-manager is NOT compatible with IBM API Connect when deployed onto IKS. For deployments to IKS, please note the following:

- **Do not** install cert-manager V0.10.1 into the IKS cluster.
- **Do not** install the file `ingress-issuer-v1-alpha1.yaml` from the installation `helper_files` archive.

To proceed:

- If you are going to provide your own custom certificates, proceed to [Installing API Connect on IKS with custom certificates](#).
- To use Cert-Manager V0.12 to generate custom certificates for you, see [Installing Cert-Manager v0.12 for IKS](#).
- To view the certificates used by API Connect, see [Custom certificates reference for IKS](#)

- [Custom certificates reference for IKS](#)

API Connect supports custom certificates for each subsystem, and for internal communications.

- [Installing Cert-Manager v0.12 for IKS](#)

You can install Cert-Manager v0.12 to support IBM Kubernetes Service (IKS).

- [Generating custom certificates using default values for IKS](#)

You can use the provided file `custom-certs-external.yaml` to generate custom certificates.

- [Generating custom certificates manually for IKS](#)

You can manually prepare Certificate definitions for use when generating custom certificates for IKS.

- [Installing API Connect on IKS with custom certificates](#)

Complete configuration steps that enable deployment of API Connect on IKS with custom certificates.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Custom certificates reference for IKS

API Connect supports custom certificates for each subsystem, and for internal communications.

Table 1. Certificates for Management Subsystem:

Certificate	Type	Notes
<code>analytics-client-client</code>	Common Subsystem Communication	Must be signed by the same CA as <code>analytics-ac-endpoint</code> Certificate of Analytics Subsystem. For a two data center deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <code>CN=a7s-client-client</code> , or they could both be <code>CN=a7s-client-client, O=cert-manager</code> , but they must be identical.
<code>analytics-ingestion-client</code>	Common Subsystem Communication	Must be signed by the same CA as <code>analytics-ai-endpoint</code> Certificate of Analytics Subsystem. For a two data center deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <code>CN=a7s-ingestion-client</code> , or they could both be <code>CN=a7s-ingestion-client, O=cert-manager</code> , but they must be identical.
<code>portal-admin-client</code>	Common Subsystem Communication	Must be signed by the same CA as <code>portal-admin</code> Certificate of Portal Subsystem. For a two data center deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <code>CN=portal-admin-client</code> , or they could both be <code>CN=ptl-adm-client, O=cert-manager</code> , but they must be identical.
<code>gateway-client-client</code>	Common Subsystem Communication	Must be signed by the same CA as <code>gwv5-management-endpoint</code> and/or <code>gwv6-management-endpoint</code> of Gateway Subsystem
<code>cm-endpoint</code>	External Frontend/Ingress	
<code>apim-endpoint</code>	External Frontend/Ingress	
<code>api-endpoint</code>	External Frontend/Ingress	
<code>consumer-endpoint</code>	External Frontend/Ingress	
<code>hub-endpoint</code>	External Frontend/Ingress	
<code>turnstile-endpoint</code>	External Frontend/Ingress	

Note:

To generate the certificates for the endpoints used by the Automated testing behavior endpoints (`hub-endpoint` and `turnstile-endpoint`), add the following statements to the `custom-certs-external.yaml`:

```
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: hub-endpoint
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "hub-endpoint"
  }
spec:
  commonName: hub-endpoint
  secretName: hub-endpoint
  dnsNames:
  - hub.example.com
  issuerRef:
    name: ingress-issuer
  usages:
  - "server auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
---
```

```
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: turnstile-endpoint
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "turnstile-endpoint"
  }
spec:
  commonName: turnstile-endpoint
  secretName: turnstile-endpoint
  dnsNames:
  - turnstile.example.com
  issuerRef:
    name: ingress-issuer
  usages:
```

```

- "server auth"
- "signing"
- "key encipherment"
duration: 17520h # 2 years
renewBefore: 48h

```

Table 2. Certificates for Analytics Subsystem

Certificate	Type	Notes
analytics-ac-endpoint	External Frontend/Ingress	Must be signed by the same CA as <code>analytics-client-client</code> Certificate of Management Subsystem
analytics-ai-endpoint	External Frontend/Ingress	Must be signed by the same CA as <code>analytics-ingestion-client</code> Certificate of Management Subsystem

Table 3. Certificates for Gateway Subsystem

Certificate	Type	Notes
gww5-endpoint	External Frontend/Ingress	
gww5-management-endpoint	External Frontend/Ingress	Must be signed by the same CA as <code>gateway-client-client</code> Certificate of Management Subsystem
gww6-endpoint	External Frontend/Ingress	
gww6-management-endpoint	External Frontend/Ingress	Must be signed by the same CA as <code>gateway-client-client</code> Certificate of Management Subsystem

Table 4. Certificates for Portal Subsystem

Certificate	Type	Notes
portal-admin	External Frontend/Ingress	Must be signed by the same CA as <code>portal-admin-client</code> Certificate of Management Subsystem
portal-web	External Frontend/Ingress	

Table 5. Internal Certificates

Certificate	Type (CA/Server/Client)	Subsystem
caCertificate	CA	Management, Analytics, Portal
clientCertificate	Client	Management, Analytics, Portal
serverCertificate	Server	Management, Analytics, Portal
dbServerCertificate	Server	Management
pgBouncerServerCertificate	Server	Management
PGOTLSCertificate	Server	Management
NATSTLSCertificate	Server	Management
dbClientPostgres	Client	Management
dbClientReplicator	Client	Management
dbClientPgouncer	Client	Management
dbClientApicuser	Client	Management

Several certificates as noted above are required to be signed by the same CA as another certificate. For example, `portal-admin-client`, and `portal-admin`. This means that if the `portal-admin-client` certificate were to be customized, then the `portal-admin` certificate must also be customized, and signed by the same CA as `portal-admin-client`. To ensure that pairs of certificates like these are signed by the same CA, the Issuer for each certificate must be the same.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing Cert-Manager v0.12 for IKS

You can install Cert-Manager v0.12 to support IBM Kubernetes Service (IKS).

### Procedure

1. Ensure `KUBECONFIG` is set for the target cluster:

```
ibmcloud ks cluster config --cluster <CLUSTER NAME>
```

2. Obtain Cert-Manager v0.12 from <https://github.com/jetstack/cert-manager/releases/tag/v0.12.0>.
3. Install cert-manager by obtaining `cert-manager.yaml` from the v0.12 distribution. Do not specify a custom namespace:

```
kubectl apply -f cert-manager.yaml
```

4. Wait for cert-manager pods to enter `Running 1/1` status before proceeding. To check status:

```
kubectl -n cert-manager get po
```

There are 3 cert-manager pods in total.

5. When cert-manager is running, create custom certificates.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Generating custom certificates using default values for IKS

You can use the provided file `custom-certs-external.yaml` to generate custom certificates.

## About this task

You can quickly generate custom certificates by using the provided file `custom-certs-external.yaml`. This file is located in the `helper_files` directory. It contains Certificate YAML definitions for every Common Subsystem Communication, and External Frontend/Ingress certificate, CA, and Issuer that can be customized for each subsystem of IBM API Connect. The definitions are already populated with the recommend default values. All that is required is to update the hostnames before applying into the cluster.

Note that the file **does not** contain Certificate YAML definitions for Internal certificates. Customization of internal certificates (for use internally by the subsystems in API Connect) is an advanced use-case, and is not recommended.

Note: As an alternative to using these instructions, you can instead manually prepare Certificate definitions for use when generating your custom certificates. The alternative process takes longer but allows more control, including modification of internal certificates. See [Generating custom certificates manually for IKS](#)

## Procedure

1. Open `custom-certs-external.yaml` in a text-editor. Find and replace each occurrence of `example.com` with the desired ingress subdomain for the API Connect stack.
2. Apply the file into the cluster:

```
kubectl apply -f custom-certs-external.yaml -n <namespace>
```

3. Continue with [Installing API Connect on IKS with custom certificates](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Generating custom certificates manually for IKS

You can manually prepare Certificate definitions for use when generating custom certificates for IKS.

## About this task

The following instructions describe how to prepare Certificate definitions manually for the purpose of using them to have Cert-Manager generate Certificates for you.

## Procedure

1. Create a Certificate Authority (CA) and an Issuer for Signing
  - a. The following YAML definition can be used to generate a CA named `ingress-ca`, and an Issuer named `ingress-issuer` using that CA:

```
---
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: ingress-ca
spec:
  secretName: ingress-ca
  commonName: "ingress-ca"
  usages:
  - digital signature
  - key encipherment
  - cert sign
  isCA: true
  issuerRef:
    name: selfsigning-issuer
    kind: Issuer
---
apiVersion: cert-manager.io/v1alpha2
kind: Issuer
metadata:
  name: ingress-issuer
spec:
  ca:
    secretName: ingress-ca
```

This should be placed into a file, e.g. `ingress-ca.yaml`.

- b. Apply this file into the Cluster:

```
kubectl apply -f ingress-ca.yaml -n
  <namespace>
```

. This will create a CA Certificate named `ingress-ca`, and also a Secret named `ingress-ca`. This CA will be used to sign the rest of the custom certificates.

- c. Verify the presence of both files:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

## 2. Generating Common Subsystem Communication Certificates with Cert-Manager for Management CR:

- a. Use the following YAML definition to generate the following Common Certificates and Secrets - `analytics-client-client`, `analytics-ingestion-client`, and `portal-admin-client`:

```
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: analytics-client-client
spec:
  commonName: analytics-client-client
  secretName: analytics-client-client
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
---
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: analytics-ingestion-client
spec:
  commonName: analytics-ingestion-client
  secretName: analytics-ingestion-client
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
---
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: portal-admin-client
spec:
  commonName: portal-admin-client
  secretName: portal-admin-client
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
---
```

Note that the `issuerRef` uses the Issuer created in Step 1. These certificates must be signed by the CA associated with that Issuer, `ingress-ca`. This should be placed into a file, e.g. `common-certs.yaml`.

- b. Apply this file into the Cluster:

```
kubectl apply -f icommon-certs.yaml -n <namespace>
```

This will create Client Certificates and Secrets named `analytics-client-client`, `analytics-ingestion-client`, and `portal-admin-client`.

- c. Verify the presence of both files:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

## 3. External Frontend/Endpoint Certificates with Cert-Manager

- a. For each Endpoint in each subsystem CR, the following YAML definition may be used to generate a Server Certificate:

```
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: <endpoint-host.secretName>
spec:
  commonName: <endpoint.host.secretName>
  secretName: <endpoint.host.secretName>
  dnsNames:
  - <endpoint.host.Name>
  issuerRef:
    name: ingress-issuer
  usages:
  - "server auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
```

Replace `<endpoint.host.secretName>` with the `secretName` in the `host` block of the `Endpoint` in the CR. For example, if the `Endpoint` in the CR is:

```
cloudManagerEndpoint:
  hosts:
  - name: admin.example.com
    secretName: cm-endpoint
```

The Certificate YAML should be updated as follows:

```
---
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: cm-endpoint
spec:
  commonName: cm-endpoint
  secretName: cm-endpoint
  dnsNames:
  - admin.example.com
  issuerRef:
    name: ingress-issuer
  usages:
  - "server auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 48h
```

Note that the `issuerRef` uses the Issuer created previously. This certificate will be signed by the CA associated with that Issuer, `ingress-ca`. This should be placed into a file, for example `<subsystem>-server.yaml`.

b. Apply this file into the Cluster:

```
kubectl apply -f <subsystem>-server.yaml -n <namespace>
```

This will create a Server Certificate named `<subsystem>-server`, and also a Secret named `<subsystem>-server`.

c. Verify the presence of both files:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

d. Repeat Steps [3.a](#), [3.b](#) and [3.c](#) for each subsystem. In each case, the Certificates must use the same Issuer created in Step [1](#). This will ensure that all custom certificates are signed by the same CA Certificate.

Note that the `issuerRef` uses the Issuer created in [1](#). These certificates must be signed by the CA associated with that Issuer, `ingress-ca`.

e. Place the YAML definitions for each Certificate into a YAML file, e.g. `endpoint-certs.yaml`. This will create Server Certificates and Secrets for each Endpoint named `<endpoint.host.secretName>`.

f. Apply this file into the Cluster:

```
kubectl apply -f endpoint-certs.yaml
```

g. Verify the presence of both:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

4. Choose one of the following actions, based on whether or not you are customizing internal API certificates:

- If you do not plan to customize internal certificates, continue with [Installing API Connect on IKS with custom certificates](#).
- If you plan to customize internal certificates, continue with Step [5](#).

Note:

- It is not recommended to customize Internal certificates unless you have a specific requirement to do so. You must also provide custom certificates for all the Common Subsystem Communication, and External Frontend/Ingress certificates described in the previous sections.
- For internal certificates, custom certificates must be provided for all internal certificates in each subsystem CR. Only providing custom certificates for some is not supported, and will be rejected by Operator validation.

5. Generate custom internal certificates using `custom-cert-ingresses-internal.yaml`

Each of the Internal certificates listed in [Custom certificates reference for IKS](#) have differing strict requirements for Common Names and DNS Names (i.e. Subject Alternative Names).

To generate custom certificates that meet these requirements, use the provided `custom-certs-internal.yaml` file, which can be found in the `helper_files` installation archive.

This file contains Certificate YAML definitions for all Internal certificates, CA, and Issuer that can be customized for each subsystem of IBM API Connect. The Certificate definitions file is already populated with the recommended default values.

a. When using custom internal certificates, you are required to specify a site name. The site name is used as the identifier for the PostgreSQL database Cluster used by API Connect. The site name chosen is added to the Management Subsystem CR YAML file before installing the Management Subsystem. In addition, this name is also required for use with the custom internal certificates, so a site name should be chosen now before proceeding.

b. Open `custom-certs-internal.yaml` in a text-editor. Find and replace each occurrence of `<namespace>` with the desired namespace for the deployment. This must be done even if the `default` namespace is to be used.

c. Also in `custom-certs-internal.yaml`, if the `default` namespace is not being used for the deployment, find the following `db-server-certificate` Certificate definition:

```
---
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: db-server-certificate
spec:
  commonName: management-pgo_cluster_id-postgres
  secretName: db-server-certificate
  dnsNames:
  - "*.default"
  - "*.default.svc"
  - "management-pgo_cluster_id-postgres.default.svc"
  - "management-pgo_cluster_id-postgres"
```

Replace the instances of `default` with the namespace being used for the deployment. For example, if a namespace called `apic` is being used, the definition should be updated to appear as follows:

```
---
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: db-server-certificate
spec:
  commonName: management-pgo_cluster_id-postgres
  secretName: db-server-certificate
  dnsNames:
  - "*.apic"
  - "*.apic.svc"
  - "*.management-pgo_cluster_id-postgres.apic.svc"
  - "management-pgo_cluster_id-postgres"
```

- d. Also in `custom-certs-internal.yaml`, replace each occurrence of `pgo_cluster_id` with the chosen site name described in Step 5.a.
- e. Apply the file to the Cluster:

```
kubectl apply -f custom-certs-internal.yaml -n <namespace>
```

- f. Continue with [Installing API Connect on IKS with custom certificates](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Installing API Connect on IKS with custom certificates

Complete configuration steps that enable deployment of API Connect on IKS with custom certificates.

---

### Before you begin

You should have custom certificates ready for use in deployment.

---

### About this task

Follow the steps below to prepare for installation.

---

### Procedure

1. Ensure you have Custom Certificates for all External Frontend/Ingress and Common Subsystem Communication Certificates.  
For an IKS installation, all of the External Frontend/Ingress certificates from the [Custom certificates reference for IKS](#) must be customized. Since some of these certificates must be signed by the same CA as the Common Subsystem Communication certificates, the Common Subsystem Certificates must also be customized.

Before proceeding, ensure that you are able to provide custom certificates for all of these. These can be certificates that you provide from your own sources, or certificates that you generated with Cert-Manager V0.12 as described in [Generating custom certificates using default values for IKS](#) or [Generating custom certificates manually for IKS](#).

2. Disable Cert-Manager V0.10.1 Dependencies  
The IBM API Connect Operator expects that Cert-Manager V0.10.1 Custom Resource Definitions (CRDs) are present on the Cluster before startup and installation, even though Cert-Manager V0.12 is being used, due to a limitation.

- a. First, check if you have the `cert-manager-0.10.1-crds.yaml` file in the `helper_files` installation archive.  
If you do, apply this into your cluster with the following command:

```
kubectl create -f cert-manager-0.10.1-crds.yaml
```

If you do not have this file, you must edit the `cert-manager-0.10.1.yaml` file in the `helper_files` installation archive file to remove all Kubernetes resources with the exception of those that are `CustomResourceDefinitions`. To do this, delete everything from this file after line 7514. Save the file, and then apply it into your cluster with the following command:

```
kubectl create -f cert-manager-0.10.1.yaml
```

- b. Next, configure the operator so that it does not try to use Cert-Manager v0.10.1.  
Open `ibm-apiconnect.yaml` from the `helper_files` installation archive, and locate the following section in the `spec.template.spec.containers.env` block:

```
- name: OPERATOR_NAME
  value: ibm-apiconnect
```

Append the following environment variable immediately after it:

```
- name: DISABLE_CERT_MANAGER
  value: "true"
```

So that the section now looks like the following example:

```
- name: OPERATOR_NAME
  value: ibm-apiconnect
```

```
- name: DISABLE_CERT_MANAGER
  value: "true"
```

3. Set **custom** Microservice Security in subsystem CRs.

When customizing all External Frontend/Ingress and Common Subsystem Communication Certificates, Cert-Manager will not be managing the certificates for the subsystems. The CRs for each subsystem must be updated for this change.

In each subsystem CR, locate **microServiceSecurity** and **certManagerIssuer** inside the **spec** block:

```
microServiceSecurity: certManager
certManagerIssuer:
  name: selfsigning-issuer
  kind: Issuer
```

Set **microServiceSecurity** to **custom**, and remove or comment-out the **certManagerIssuer** block as follows:

```
microServiceSecurity: custom
#certManagerIssuer:
# name: selfsigning-issuer
# kind: Issuer
```

4. If not using Cert-Manager V0.12, create the Kubernetes Secrets to hold the custom certificates:

If you are providing your own custom certificates, rather than using Cert-Manager V0.12 to generate them, each custom certificate that you plan to use must now be created in the Cluster as a Kubernetes Secret, of type **kubernetes.io/tls**. Secrets of this type must contain the three following **data** items: **ca.crt**, **tls.crt**, and **tls.key**.

Take note of the names that you use for each of these secrets. The names must match up with each of the **secretName** properties specified for each **Endpoint** in the subsystem CR. For example, in the Management CR YAML snippets above, the Secret holding the certificate for the **cloudManagerEndpoint** is expected to be named **cm-endpoint**. Therefore, the Kubernetes Secret containing the custom certificate for the **cloudManagerEndpoint** must be named **cm-endpoint**.

5. Take one of the following actions, based on whether or not you are customizing the API Connect internal certificates

- If you do not plan to customize all internal certificates (as recommended), once the matching **host.SecretName** values have been verified against the names of the Kubernetes Secrets for these custom certificates, apply the Subsystem CRs into the Cluster. Continue with [Installing the API Connect subsystems](#)
- If you plan to customize all internal certificates (not recommended), continue with [6](#)

Note:

- It is not recommended to customize internal certificates unless you have a specific requirement to do so. You must also provide custom certificates for all the Common Subsystem Communication, and External Frontend/Ingress certificates.
- For internal certificates, custom certificates must be provided for all internal certificates in each subsystem CR. Only providing custom certificates for some is not supported, and will be rejected by Operator validation

6. Customizing internal certificates in Management, Analytics, and Portal CRs.

a. Customize the Common Subsystem Communication and External Frontend/Ingress Certificates.

If Internal Certificates are to be customized, then you must customize all the Common Subsystem Communication and External Frontend/Ingress certificates found in [Custom certificates reference for IKS](#). To do this, follow the instructions in [Generating custom certificates manually for IKS](#).

This step is required because Cert-Manager must be completely turned off in the Subsystem CRs when internal certificates are to be customized.

b. Create the Kubernetes Secrets to Hold the Custom Certificates if not using Cert-Manager V0.12

If you plan to provide these custom certificates yourself, and not generate them using Cert-manager, use **custom-certs-internal.yaml** in the **helper\_files** installation archive as a guide to set the required Common Names and DNS Names (inserted into the certificates as Subject Alternative Names) for each Internal certificate listed in [Custom certificates reference for IKS](#).

Each customized Internal certificate that you provide and plan to use must now be created in the Cluster as a Kubernetes Secret, of type **kubernetes.io/tls**. Secrets of this type must contain the three following data items: **ca.crt**, **tls.crt**, and **tls.key**. The names of each of these Secrets **must** match the names listed in [Custom certificates reference for IKS](#).

c. Disable Cert-Manager V0.10.1 Dependencies

The IBM API Connect Operator expects that Cert-Manager V0.10.1 Custom Resource Definitions (CRDs) are present on the Cluster before startup and installation - this will not be the case for an IKS installation using Cert-Manager V0.12. To override this, if you have not already done so, open **ibm-apiconnect.yaml** from the **helper\_files** installation archive, and add the following environment variable to the **spec.template.spec.containers.env** block:

```
- name: DISABLE_CERT_MANAGER
  value: "true"
```

To make this easier, search for the following:

```
- name: OPERATOR_NAME
  value: ibm-apiconnect
```

Append the new environment variable immediately afterward, so that it looks as follows:

```
- name: OPERATOR_NAME
  value: ibm-apiconnect
- name: DISABLE_CERT_MANAGER
  value: "true"
```

d. Set **custom** Microservice Security in Subsystem CRs.

When customizing all External Frontend/Ingress, Common Subsystem Communication, and Internal Certificates, Cert-Manager will not be managing the certificates for the subsystems. The CRs for each subsystem must be updated for this change.

If you have not done so already, in each subsystem CR, locate **microServiceSecurity** and **certManagerIssuer** inside the **spec** block:

```
microServiceSecurity: certManager
certManagerIssuer:
  name: selfsigning-issuer
  kind: Issuer
```

Set **microServiceSecurity** to **custom**, and remove or comment-out the **certManagerIssuer** block as follows:

```

microServiceSecurity: custom
#certManagerIssuer:
#   name: selfsigning-issuer
#   kind: Issuer

```

e. Add the Custom Certificates Block to the Subsystem CR

- For Management CR:

```

customCertificates:
- name: caCertificate
  secretName: ingress-ca
- name: clientCertificate
  secretName: management-client
- name: serverCertificate
  secretName: management-server
- name: dbServerCertificate
  secretName: db-server-certificate
- name: pgBouncerServerCertificate
  secretName: pg-bouncer-server-certificate
- name: PGOtlSCertificate
  secretName: pgo.tls
- name: NATSTLSCertificate
  secretName: management-natscluster-mgmt
- name: dbClientPostgres
  secretName: db-client-postgres
- name: dbClientReplicator
  secretName: db-client-replicator
- name: dbClientPgBouncer
  secretName: db-client-pgbouncer
- name: dbClientApicuser
  secretName: db-client-apicuser
- name: dbClientPrimaryuser
  secretName: db-client-primaryuser

```

- For Analytics and Portal CRs

Replace <subsystem> with `analytics` or `portal` as required:

```

customCertificates:
- name: caCertificate
  secretName: ingress-ca
- name: clientCertificate
  secretName: <subsystem>-client
- name: serverCertificate
  secretName: <subsystem>-server

```

The `secretName` field for each custom certificate **must** match the name of the Kubernetes Secret in the Cluster that contains that custom certificate. The values of `secretName` in all the previous cases are **required** secret names for all certificates, and should not differ from the `secretNames` provided.

7. Once the `customCertificates` block has been added, the Subsystem CRs can be applied into the Cluster. Continue with [Installing the API Connect subsystems](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Webhooks deployed and managed by the API Connect Operator

The API Connect Operator deploys and manages various Kubernetes API webhooks in the cluster to assist in management of its custom resources.

The webhooks included admission controllers and conversion webhooks.

### Defaulting webhook

- Purpose

The defaulting webhook is a type of [Mutating Admission Webhook](#) which runs against Custom Resources (CRs) at **CREATE** or **UPDATE** time to populate default values in the CR's `spec`.

- Creation

Currently the defaulting webhook runtime is part of the API Connect Operator runtime, that is it exists within the API Connect Operator pod and container. When the operator boots, it creates `MutatingWebhookConfiguration` resources for each CRD (listed below). This `MutatingWebhookConfiguration` is a cluster-scope resource, but the configuration within will be specific to the namespace and operator instance which created it. If more than one instance of the API Connect Operator is deployed across a cluster (in different namespaces) there will be a set of webhook configurations for each API Connect Operator instance and namespace.

The name for the `MutatingWebhookConfiguration` resource for each CRD will take the following form:

```
<namespace>.<crd-name>.defaulter[.<component>].apiconnect.ibm.com
```

The following CustomResourceDefinitions utilize a defaulting webhook:

```

AnalyticsCluster
ApiconnectCluster
GatewayCluster
ManagementBackup
ManagementCluster

```

ManagementDBUpgrade  
ManagementRestore  
PortalCluster

- Lifecycle  
While the defaulting webhook runtime itself lives within the API Connect Operator pod, the **MutatingWebhookConfiguration** is a cluster-scope resource and is stand-alone. When it is created, an **ownerReference** is set on it that references the API Connect Operator's **ClusterRole**. Thus, the lifecycle of the **MutatingWebhookConfiguration** resources will be linked with the **ClusterRole**, which is linked with the installation of the operator itself.

When the operator is uninstalled, the **MutatingWebhookConfiguration** resources for that operator instance are also removed.

- Example  
The below output shows the defaulting webhook configurations created for an operator deployed in the **apiconnect-operator** namespace. One can be seen for each CRD.

```
$ oc get mutatingwebhookconfiguration
NAME                                                                 WEBHOOKS  AGE
apiconnect-operator.analyticsclusters.default.analytics.apiconnect.ibm.com 1          4d4h
apiconnect-operator.apiconnectclusters.default.apiconnect.ibm.com          1          4d4h
apiconnect-operator.gatewayclusters.default.gateway.apiconnect.ibm.com     1          4d4h
apiconnect-operator.managementbackups.default.management.apiconnect.ibm.com 1          4d4h
apiconnect-operator.managementclusters.default.management.apiconnect.ibm.com 1          4d4h
apiconnect-operator.managementdbupgrades.default.management.apiconnect.ibm.com 1          4d4h
apiconnect-operator.managementrestores.default.management.apiconnect.ibm.com 1          4d4h
apiconnect-operator.portalclusters.default.portal.apiconnect.ibm.com        1          4d4h
```

## Validating webhook

- Purpose  
The validating webhook is a type of **ValidatingAdmissionWebhook** which runs against Custom Resources (CRs) at **CREATE** or **UPDATE** time to validate the CR contains a configuration which will yield an operable cluster. The CustomResourceDefinitions use OpenAPI schema validation for basic property checks (such as integer bounds and non-empty strings), but more complex validation of the configuration is done via the webhook.
- Creation  
Currently the validating webhook runtime is part of the API Connect Operator runtime, i.e. it exists within the API Connect Operator pod and container. When the operator boots, it creates **ValidatingWebhookConfiguration** resources for each CRD (listed below). This **ValidatingWebhookConfiguration** is a cluster-scope resource, but the configuration within will be specific to the namespace and operator instance which created it. If more than one instance of the API Connect Operator is deployed across a cluster (in different namespaces) there will be a set of webhook configurations for each API Connect Operator instance and namespace.

The name for the **ValidatingWebhookConfiguration** resource for each CRD will take the following form:

```
<namespace>.<crd-name>.validator[.<component>].apiconnect.ibm.com
```

The following CustomResourceDefinitions utilize a validating webhook:

AnalyticsCluster  
ApiconnectCluster  
GatewayCluster  
ManagementBackup  
ManagementCluster  
ManagementDBUpgrade  
ManagementRestore  
PortalCluster

- Lifecycle  
While the validating webhook runtime itself lives within the API Connect Operator pod, the **ValidatingWebhookConfiguration** is a cluster-scope resource and is stand-alone. When it is created, an **ownerReference** is set on it that references the API Connect Operator's **ClusterRole**. Thus, the lifecycle of the **ValidatingWebhookConfiguration** resources will be linked with the **ClusterRole**, which is linked with the installation of the operator itself.

When the operator is uninstalled, the **ValidatingWebhookConfiguration** resources for that operator instance are also removed.

- Example  
The below output shows the validating webhook configurations created for an operator deployed in the **apiconnect-operator** namespace. One can be seen for each CRD.

```
validatingwebhookconfiguration
NAME                                                                 WEBHOOKS  AGE
apiconnect-operator.analyticsclusters.validator.analytics.apiconnect.ibm.com 1          4d4h
apiconnect-operator.apiconnectclusters.validator.apiconnect.ibm.com          1          4d4h
apiconnect-operator.gatewayclusters.validator.gateway.apiconnect.ibm.com     1          4d4h
apiconnect-operator.managementbackups.validator.management.apiconnect.ibm.com 1          4d4h
apiconnect-operator.managementclusters.validator.management.apiconnect.ibm.com 1          4d4h
apiconnect-operator.managementdbupgrades.validator.management.apiconnect.ibm.com 1          4d4h
apiconnect-operator.managementrestores.validator.management.apiconnect.ibm.com 1          4d4h
apiconnect-operator.portalclusters.validator.portal.apiconnect.ibm.com        1          4d4h
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing API Connect

Use these instructions to install a deployment of API Connect on Kubernetes.

To deploy API Connect, complete the tasks in the order below.

- [Deployment requirements](#)  
Describes the system requirements for deploying into the Kubernetes, OpenShift, and Cloud Pak for Integration runtime environments.
- [Deployment procedures](#)  
You can use these procedures to deploy API Connect on either native Kubernetes or OpenShift.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Deployment requirements

Describes the system requirements for deploying into the Kubernetes, OpenShift, and Cloud Pak for Integration runtime environments.

### Before you begin

Note: This article refers to third-party software that IBM does not control. As such, the software may change and this information may become outdated. Kubernetes is a platform for automated deployment, scaling, and operation of application containers across clusters of hosts, providing container-centric infrastructure. For more information, see <https://kubernetes.io>.

These instructions assume you have a working Kubernetes environment and understand how to manage Kubernetes.

### About this task

Review all the requirements listed in the following steps before starting your API Connect deployment.

Note: If you plan to install the Automated API behavior testing application, review the *Before you begin* section in [Installing the Automated API behavior testing application](#) because the requirements might have an impact on your deployment choices for API Connect.

### Procedure

1. Verify that you have supported software.
  - Refer to the IBM Software Product Compatibility Reports site for detailed requirements for operating systems, supporting software, and other prerequisites. See [Detailed system requirements for a specific product](#).
  - For new installations, the API Connect operators and operands must be from the same version of API Connect. This requirement applies to native Kubernetes and OpenShift installations.
    - Note that the API Connect operator version *number* does not match the API Connect release version *number*. You can view a mapping of API Connect release number to API Connect operator version numbers in [Deploying operators](#).
    - For API Connect operands (Management, Portal, Analytics, and Gateway subsystems), the version number matches the API Connect release version number.
    - For example, API Connect 10.0.4.0 includes API Connect operator 2.4.0. This means that API Connect operator 2.4.0 support API Connect 10.0.4.0 operands.
2. Verify that your Kubernetes environment is running and meets the configuration requirements for API Connect:
  - When using IBM Cloud Kubernetes Service, ingress-nginx is required.
  - Specify settings for the ingress controller for a Kubernetes runtime environment. See [Kubernetes ingress controller prerequisites](#).
  - The timezone for API Connect pods is set to UTC. Do not change the timezone for the pods.
  - To ensure the API Connect services have time to start, we recommend increasing the *proxy-read-timeout* and *proxy-send-timeout* values in the *config.map* used to configure the `kubernetes/ingress-nginx` ingress controller. The following settings should be increased:
    - `proxy-read-timeout: "240"`
    - `proxy-send-timeout: "240"`240 seconds (4 minutes) is a recommended minimum; actual value will vary depending upon your environment. If there is a load balancer in front of the worker node(s), then the load balancer configuration may also need to have extended timeouts.
  - Storage type:
    - When selecting storage type, review the following considerations:
      - Management subsystem requires block storage.
      - Developer Portal subsystem supports block storage or local volume storage.
      - Analytics subsystem supports block storage or local volume storage.

Supported storage types

- Block storage  
Select a block storage format of your choosing in order for API Connect components to be supported. Supported block storage types include, but are not limited to:
  - Rook Ceph  
Note: `cephrbd` (RADOS Block Device) is recommended over `cephfs` file system
  - OpenShift Container Storage
  - Portworx
  - IBM Cloud Block Storage
  - AWS: the `gp2`, `io1`, and `io2` types of Elastic Block Storage (EBS) are supported.
  - IBM Spectrum Scale with Block Storage

- Azure Premium Storage
- GCE Persistent Disk

See also the **API Connect v10 WhitePaper 1.5** for information on limitations observed with other block storage solutions:

<https://community.ibm.com/community/user/integration/viewdocument/api-connect-deployment-whitepaper-v?CommunityKey=2106cca0-a9f9-45c6-9b28-01a28f4ce947&tab=librarydocuments&LibraryFolderKey=&DefaultView=folder>

- Local volume storage

Management subsystem and Developer Portal subsystem

All subsystems will run on local volume storage but it is not recommended for the Management subsystem and Developer Portal subsystem because it has severe performance impacts for high availability deployments, and for pod allocation.

Note also that local volume storage is not available in most cloud environments, and might incur limitations in disaster recovery scenarios, since it is tied to the node on which the pod is run. This means that use of LVS might be adequate for deployments with a development profile, but inadequate for deployments with a production profile.

Analytics subsystem

For Analytics subsystems, transactions per second (TPS) is three times faster with local volume storage than with Ceph block storage. In a production scenario, you will have multiple analytics-storage (Elasticsearch) nodes forming a storage cluster. Elasticsearch will manage data replication across its cluster and ensure high availability, thus mitigating possible local volume storage drawbacks with disaster recovery.

Non-supported storage

- NFS  
API Connect v10 cannot be deployed on NFS.
- GlusterFS  
GlusterFS is not recommended as a storage option due to severe performance degradation and in some cases, loss of data. There are known GlusterFS issues that affect Elasticsearch (which is used in the API Connect analytics service), the Developer Portal and the Management subsystem

- Storage class configuration:

In your Kubernetes cluster configuration, you must create storage classes with the setting:

```
volumeBindingMode: WaitForFirstConsumer
```

This setting is needed to avoid volume node **affinity** conflicts, such as those caused by **requiredPodAntiAffinity** restrictions. If **WaitForFirstConsumer** is the binding mode, PVCs (PersistentVolumeClaims) are only bound once the pod is actually created.

By contrast, when the binding mode is immediate (**volumeBindingMode:**

**Immediate**), the PVCs are bound to PVs (PersistentVolumes) as soon as the PV is created.

- Example:  
The Postgres operator creates the PVC first and then deploys the deployments. In immediate mode, PVCs are bound to PVs as soon as the PV is created. The **pgbackrest** pod starts successfully, but because **requiredPodAntiAffinity** restrictions are set, and the **postgres** pod is **NOT ALLOWED** to schedule on the same node as **pgbackrest** pod, Kubernetes cannot schedule the pod in node **eu-west-1c**. Also, because the volume attached to the pod is at **eu-west-1c**, Kubernetes cannot move the pod to any other node, thus causing **volume node affinity** conflict.
- Example:  
When deploying to a multi-zone cluster, you must use StorageClass with **WaitForFirstConsumer** because when binding mode is immediate, successful deployment is indeterminate because of interactions between pod/node affinity and the Kubernetes provisioning of the PV on the right node where the pod is being provisioned.

For more information, see "Volume Binding Mode" on <https://kubernetes.io/docs/concepts/storage/storage-classes/>.

Note: During deployment, you are required to specify the name of the storage class you created. You can either use the setting **storageClassName:** **\$STORAGE\_CLASS** in the applicable CR (such as apiconnect top-level CR or an individual subsystem CR), or you can use a configuration UI such as Platform Navigator UI or OpenShift Container Platform (OCP) UI.

- When the Analytics service is configured to store data, (that is, it is not configured for ingestion-only), the service depends on Elasticsearch, which requires map counts higher than the operating system defaults. See: [Installing the Analytics subsystem](#).  
If you are deploying on OpenShift, the map count is preconfigured (**vm.max\_map\_count = 1027580**) with a value that is sufficiently large for Elasticsearch so you do not need to modify this setting.
- Ensure that your Kubernetes deployment addresses known security vulnerabilities with SSH to prevent the use of weak SSH Message Authentication Code (MAC) and Key exchange algorithms (KexAlgorithms) with TCP over port 22. Use of weak algorithms can allow an attacker to recover the plain text message from the encrypted text. If you have not yet addressed the security vulnerabilities with weak MACs and KexAlgorithms, update your configuration manually by adding the following lines to `/etc/ssh/sshd_config`:  

```
KexAlgorithms curve25519-sha256@libssh.org,diffie-hellman-group-exchange-sha256
MACs hmac-sha2-512-etm@openssh.com,hmac-sha2-256-etm@openssh.com,umac-128-etm@openssh.com,hmac-sha2-512,hmac-sha2-256,umac-128@openssh.com
```
- IBM API Connect requires a number of container registry repositories to be added to your container registry service if automatic repository creation is not supported. Follow the procedure in Step 4 of [Obtaining product files](#).
- Logging:
  - Configure a remote server for logging. Follow these instructions: [Configuring remote logging for a Kubernetes deployment](#). Pods are terminated during an upgrade, and the logs will be lost if not stored remotely.
  - Configure the log rotation by setting the **max-size** and **max-files** values to a setting appropriate for your deployment. In a Kubernetes deployment, insufficient values for max-size and max-files can cause logs to grow too large and eventually force pods to restart.  
For more information, visit the Docker documentation and search for "JSON File logging driver".

3. Ensure your deployment meets the DNS requirements for API Connect domain names, host names, and endpoints.

You specify endpoints when you edit the custom resource templates for each subsystem, and when you use the Cloud Manager UI to configure the services for your cloud. The domain names you use for the endpoints must be recognized by your DNS configuration. DNS entries must meet these requirements:

Important: For API Connect on native Kubernetes and OpenShift, do not use coredns 1.8.1 through 1.8.3. These releases have a defect that can prevent pods for Developer Portal from starting. See <https://coredns.io/>.

- Endpoints cannot contain the underscore character "\_" or uppercase characters.
- Host names that are used to create endpoints cannot contain the underscore character "\_" or uppercase letters.
- DNS must be configured with domain names that correspond to the endpoints configured at installation time for each subsystem.
- Host names and DNS entries may not be changed on a cluster after the initial installation.
- Kubernetes ingress limits the character set for DNS names to not support the underscore character "\_". This means you cannot specify underscores in domain names that are used as endpoints. For example, `my_domain.abc.com` and `my.domain_abc.com` are not supported for `<xxx>.<hostname>.<domainname>`, and will cause an error:

```
Invalid value: "my_domain.abc.com": a DNS-1123 subdomain must consist of lowercase alphanumeric characters, '-' or '.', and must start and end with an alphanumeric character (e.g. 'example.com', regex used for validation is '[a-z0-9]([-a-z0-9]*[a-z0-9])?(\.[a-z0-9]([-a-z0-9]*[a-z0-9])?)*')
```

- We recommend that you keep a record of the DNS entries and endpoint names, as you will need to map the DNS entries and use the same endpoints when restoring a backup of the management database. Note that endpoints are FQDNs, entered in all lowercase. For an overview on endpoints, review [Deployment overview for endpoints and certificates](#)
- Specifying domain names when deploying CRs (custom resources) for each subsystem:  
The custom resource templates provide endpoint settings that consist of a default endpoint prefix and a variable `$STACK_HOST` that you set to specify your domain name, as part of [Installing the API Connect subsystems](#).

Table 1. Endpoints with domain names that must be configured in DNS

Default endpoint name	Description
<code>admin.\$STACK_HOST</code>	Cloud Manager URL endpoint for the Management subsystem
<code>manager.\$STACK_HOST</code>	API Manager URL endpoint for the Management subsystem
<code>api.\$STACK_HOST</code>	Platform REST API Endpoint for admin and provider APIs
<code>consumer.\$STACK_HOST</code>	Platform REST API Endpoint for consumer APIs for the Management subsystem.
<code>rgw.\$STACK_HOST</code>	Gateway Endpoint for API invocation for DataPower API Gateway
<code>rgwd.\$STACK_HOST</code>	Gateway Management Endpoint for DataPower API Gateway
<code>gw.\$STACK_HOST</code>	Gateway Endpoint for API invocation for DataPower Multi-Protocol Gateway (v5-compatible)
<code>gwd.\$STACK_HOST</code>	Gateway Management Endpoint for DataPower Multi-Protocol Gateway (v5-compatible)
<code>ac.\$STACK_HOST</code>	Analytics client endpoint for the Analytics subsystem
<code>ai.\$STACK_HOST</code>	Analytics ingestion endpoint for the Analytics subsystem
<code>api.portal.\$STACK_HOST</code>	Developer Portal admin endpoint
<code>portal.\$STACK_HOST</code>	Developer Portal UI endpoint

- Specifying endpoints using the Cloud Manager interface  
After initial deployment of the Kubernetes custom resource for each subsystem, you will also enter the endpoints in the Cloud Manager user interface when defining each service as part of [Defining your topology](#).

4. The Cloud Provider for the target Kubernetes platform must provide Ingress Controller support for SSL Passthrough. For example, if the Cloud Provider uses or suggests the use of the NGINX Community Ingress, then the `--enable-ssl-passthrough` flag would need to be provided at runtime, as described at <https://kubernetes.github.io/ingress-nginx/user-guide/tls/#ssl-passthrough>. For IBM Cloud Kubernetes Service, see [https://cloud.ibm.com/docs/containers?topic=containers-ingress-user\\_managed\\_](https://cloud.ibm.com/docs/containers?topic=containers-ingress-user_managed_).

5. Determine your strategy for using certificates and cert-manager with API Connect.  
If you haven't already, review the topics in the section [Certificates in a Kubernetes environment](#).

Consider the following:

- Will you use a cert-manager (recommended) or manually manage your certificates?  
API Connect provides a cert-manager and default certificates. If you use these, you can follow default configuration steps. See [Deploying operators](#).
- Will you use custom certificates rather than default certificates? See [Custom certificates on Kubernetes](#).
- Will you use IBM Kubernetes Service (IKS)? With IKS, you cannot use the cert-manager distributed with API Connect. Instead, you must use Cert-Manager 0.12. See [Using custom certificates with IBM Kubernetes Service](#).

6. If you plan to deploy API Connect on Kubernetes with DataPower Gateway in a *non-Kubernetes* environment, such as a DataPower appliance, review the API Connect requirements for operation with DataPower Gateway:

- When deploying with a DataPower appliance, configure a Gateway Service Management Endpoint and API invocation Endpoint in DataPower. See [Configuring API Connect Gateway Service](#).
- Ensure that DataPower Gateway firmware version you plan to install is compatible with the API Connect Management server version.

Note:

For API Connect Version 10.x, DataPower and API Connect releases must be within one release of each other. For example, API Connect v10.0.n runs with DataPower Gateway 10.0.n, v10.0.n-1, or v10.0.n+1.

However, before you install, best practice is to review the latest compatibility support for your version of API Connect. To view compatibility support, follow the instructions in [IBM API Connect Version 10 software product compatibility requirements](#) to access API Connect information on the Software Product Compatibility Reports website. Once you access information for your version of API Connect, select Supported Software... Integration Middleware, and view the list of compatible DataPower Gateway versions.

7. If you plan to deploy the API Connect management subsystem and the DataPower Gateway subsystem on a Kubernetes deployment, managed by the DataPower and API Connect Operators, review the compatibility requirements between the API Connect management subsystem and the gateway subsystem:

For API Connect Version 10.x, the version of the gateway subsystem must either match the API Connect version, or be one release older. The gateway subsystem version cannot be newer than the API Connect subsystem version.

If API Connect is on version *n*, only DataPower versions *n* or *n-1* are supported. DataPower version *n+1* is not supported. For example:

- API Connect and DataPower are both running 10.0.3.0.
- You can upgrade API Connect to 10.0.4.0, and leave DataPower at 10.0.3.0.
- You can later upgrade the gateway subsystem at any time to 10.0.4.0. But note that API Connect 10.0.4.0 supports running with DataPower 10.0.3.0.

8. Observe namespace restrictions:

- OpenShift  
Only one top level CR (APIConnectCluster) can be deployed in each namespace.
  - Cloud Pak for Integration  
In the Platform Navigator UI, only one APIConnect capability can be deployed in each namespace.
  - Native Kubernetes  
Only one instance of a subsystem can be deployed in each namespace. Deploying multiple similar subsystems in a single namespace is not supported. For example, there is no support for deploying two management subsystems, `mgmt1`, `mgmt2` in a single namespace where apiconnect operator is installed.
9. The following kernel or Kubernetes node limits for the Developer Portal subsystem must be set correctly:
- Ensure that your kernel or Kubernetes node has the value of its `inotify` watches set high enough so that the Developer Portal can monitor and maintain the files for each Developer Portal site. If set too low, the Developer Portal containers might fail to start or go into a `non-ready` state when this limit is reached. If you have many Developer Portal sites, or if your sites contain a lot of content, for example, many custom modules and themes, then a larger number of `inotify` watches are required. You can start with a value of 65,000, but for large deployments, this value might need to go up as high as 1,000,000. The Developer Portal containers take `inotify` watches only when they need them. The full number is not reserved or held, so it is acceptable to set this value high.
  - Ensure that your kernel or Kubernetes node has a value of `nproc` (maximum number of processes) that applies to the user ID of the Portal pods that have been assigned, and that it is high enough to allow all of the Portal processes to execute. For smaller installations this might be as low as 16384, but for larger installations that have more concurrent web calls, you might need as many as 125205. If the number is too low, you will see errors like `"fork: retry: Resource temporarily unavailable"` in the Portal logs. Note that this value might need to be even higher if other, non-Portal, pods are sharing the same user ID.
  - Ensure that your kernel or Kubernetes node has a value of `nofiles` (maximum number of open file descriptors) that applies to the user ID of the Portal pods that have been assigned, and that it is high enough to allow the Portal to open all of the files that it requires. For smaller installations this might be as low as 16384, but for larger installations that have more concurrent web calls and Portal web sites, you might need as many as 1048576. If the number is too low, you will see errors like `"too many open files"` in the Portal logs. Note that this value might need to be even higher if other, non-Portal, pods are sharing the same user ID.
- [IBM API Connect Version 10 software product compatibility requirements](#)  
Ensure that you install the minimum API Connect operating system requirements. Use the IBM Software Product Compatibility Reports site to generate a requirements report appropriate for your API Connect version and environment.
  - [API Connect licenses](#)  
When you install a new version of API Connect, you must accept a license for the API Connect program that you purchased.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## IBM API Connect Version 10 software product compatibility requirements

Ensure that you install the minimum API Connect operating system requirements. Use the IBM® Software Product Compatibility Reports site to generate a requirements report appropriate for your API Connect version and environment.

To generate an API Connect requirements report, complete the following steps:

1. Open the [Detailed system requirements for a specific product](#) page on the IBM Software Product Compatibility Reports site.
2. Search for the IBM API Connect product.
3. In the Search results list, select IBM API Connect.
4. From the Version list, select the required version.
5. Use the Filters to refine the contents of the requirements report.
6. Click Submit to generate your requirements report.

The following tables provide a quick reference of the supported Kubernetes and OpenShift versions for each API Connect release:

Table 1. API Connect and Kubernetes (K8S) compatibility matrix

API Connect version	K8S 1.19	K8S 1.20	K8S 1.21	K8S 1.22
10.0.2.0	✓	✓		
10.0.3.0	✓	✓		
10.0.4.0		✓	✓	✓
10.0.4.0-ifix2 or later		✓	✓	✓

Table 2. API Connect and OpenShift Container Platform (OCP) compatibility matrix

API Connect version	OCP 4.6	OCP 4.7	OCP 4.8	OCP 4.9	OCP 4.10
10.0.2.0	✓	✓			
10.0.3.0	✓	✓			
10.0.4.0	✓	✓	✓		
10.0.4.0-ifix2 or later	✓	✓	✓	✓	✓

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API Connect licenses

When you install a new version of API Connect, you must accept a license for the API Connect program that you purchased.

Each license has a unique identifier called a **License ID**. This topic provides links to the procedures where you specify a License ID for your deployment, and lists the valid License IDs.

- Procedures:
  - Installing on native Kubernetes:
 

Edit each subsystem CR to add the appropriate License ID. Obtain your License ID from the appropriate table, and specify it as instructed in the following procedures:

    - [Installing the Management subsystem cluster](#)
    - [Installing the Developer Portal subsystem](#)
    - [Creating the Analytics CR](#)
    - [Installing the DataPower Gateway subsystem](#)

Example CR entry to accept the license for a production system and accept a License ID:

```
license:
  accept: true
  use: production
  license: L-RJON-BZ5LSE
```
  - Installing on OpenShift or Cloud Pak for Integration:
    - [Installing API Connect](#)
    - [Installing with a bastion host](#)
    - [Installing with a portable computer](#)
    - [Installing with a portable storage device](#)
- License IDs:
  - [API Connect 10.0.5.0 licenses](#)
  - [API Connect 10.0.4.0 licenses](#)
  - [API Connect 10.0.3.0 licenses](#)
  - [API Connect 10.0.2.0 licenses](#)

## API Connect 10.0.5.0 licenses

Licenses for API Connect 10.0.5 are listed on the [API Connect licenses](#) page in the API Connect 10.0.5 documentation.

## API Connect 10.0.4.0 licenses

License ID	Program Name	URL
L-RJON-C7BJ42	IBM API Connect Enterprise V10.0.4.0 If you purchased Cloud Pak for Integration, accept the API Connect Enterprise license when you purchase your Virtual Processor Cores.	<a href="https://ibm.biz/BdfVgj">https://ibm.biz/BdfVgj</a>
L-RJON-C7QFWS	IBM Cloud Pak for Integration - API Calls 2021.4.1 If you purchased Cloud Pak for Integration - API Calls (which is an add-on product), select the CP4I API Calls license, which entitles you to track usage by the monthly number of API calls instead of the number of installed Virtual Processor Cores.	<a href="https://ibm.biz/BdfVbn">https://ibm.biz/BdfVbn</a>
L-RJON-C7BHYD	IBM API Connect Enterprise Monthly Subscription V10.0.4.0	<a href="https://ibm.biz/BdfVg2">https://ibm.biz/BdfVg2</a>
L-RJON-C7BHZU	IBM API Connect Enterprise Add-on for IBM Products V10.0.4.0	<a href="https://ibm.biz/BdfVgY">https://ibm.biz/BdfVgY</a>
L-RJON-C7BHW9	IBM API Connect Professional PVU V10.0.4.0	<a href="https://ibm.biz/BdfVgq">https://ibm.biz/BdfVgq</a>
L-RJON-C7BHXD	IBM API Connect Professional Monthly Subscription V10.0.4.0	<a href="https://ibm.biz/BdfVgz">https://ibm.biz/BdfVgz</a>
L-RJON-C7BJ35	IBM API Connect Lite V10.0.4.0	<a href="https://ibm.biz/BdfVgZ">https://ibm.biz/BdfVgZ</a>

## API Connect 10.0.3.0 licenses

License ID	Program Name	URL
L-RJON-C2YLG8	IBM API Connect Enterprise V10.0.3.0 If you purchased Cloud Pak for Integration, accept the API Connect Enterprise license when you purchase your Virtual Processor Cores.	<a href="https://ibm.biz/BdfyTv">https://ibm.biz/BdfyTv</a>
L-RJON-BZEP9N	IBM Cloud Pak for Integration - API Calls 2021.2.1 If you purchased Cloud Pak for Integration - API Calls (which is an add-on product), select the CP4I API Calls license, which entitles you to track usage by the monthly number of API calls instead of the number of installed Virtual Processor Cores.	<a href="https://ibm.biz/BdfyTm">https://ibm.biz/BdfyTm</a>
L-RJON-C2YLB8	IBM API Connect Enterprise Monthly Subscription V10.0.3.0	<a href="https://ibm.biz/BdfyTK">https://ibm.biz/BdfyTK</a>
L-RJON-C2YLCZ	IBM API Connect Enterprise Add-on for IBM Products V10.0.3.0	<a href="https://ibm.biz/BdfyTa">https://ibm.biz/BdfyTa</a>
L-RJON-C2YL9M	IBM API Connect Professional V10.0.3.0	<a href="https://ibm.biz/BdfyTG">https://ibm.biz/BdfyTG</a>
L-RJON-C2YLAP	IBM API Connect Professional Monthly Subscription V10.0.3.0	<a href="https://ibm.biz/BdfyTe">https://ibm.biz/BdfyTe</a>
L-RJON-C2YLEA	IBM API Connect Lite V10.0.3.0	<a href="https://ibm.biz/BdfyTb">https://ibm.biz/BdfyTb</a>

## API Connect 10.0.2.0 licenses

License ID	Program Name	URL
L-RJON-BXWP45	IBM Cloud Pak for Integration - API Calls 2021.1.1	<a href="https://ibm.biz/Bdf7n">https://ibm.biz/Bdf7n</a>
L-RJON-BZ5LTP	IBM API Connect Lite V10.0.2.0	<a href="https://ibm.biz/BdfZBZ">https://ibm.biz/BdfZBZ</a>
L-RJON-BZ5LSE	IBM API Connect Enterprise PVU Add-on for IBM Products V10.0.2.0	<a href="https://ibm.biz/BdfZBf">https://ibm.biz/BdfZBf</a>
L-RJON-BZ5LR2	IBM API Connect Enterprise Monthly Subscription V10.0.2.0	<a href="https://ibm.biz/BdfZBM">https://ibm.biz/BdfZBM</a>
L-RJON-BZ5LPB	IBM API Connect Professional Monthly Subscription V10.0.2.0	<a href="https://ibm.biz/BdfZBS">https://ibm.biz/BdfZBS</a>
L-RJON-BZ5LMW	IBM API Connect Professional PVU V10.0.2.0	<a href="https://ibm.biz/BdfZBv">https://ibm.biz/BdfZBv</a>
L-RJON-BZ5LJ5	IBM API Connect Enterprise PVU V10.0.2.0	<a href="https://ibm.biz/BdfZBm">https://ibm.biz/BdfZBm</a>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Deployment procedures

You can use these procedures to deploy API Connect on either native Kubernetes or OpenShift.

- [Deploying on Kubernetes](#)  
Use the procedures in this section to install API Connect on native Kubernetes distributions.
- [Deploying on OpenShift and Cloud Pak for Integration](#)  
You can install API Connect in an OpenShift environment or as the API Management capability in IBM Cloud Pak for Integration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Deploying on Kubernetes

Use the procedures in this section to install API Connect on native Kubernetes distributions.

- [Obtaining product files](#)  
Obtain the product files, upload the images to a Docker registry, and decompress the operators and templates.
- [Deploying operators](#)  
Deploy the Kubernetes operator files.
- [Installing the API Connect subsystems](#)  
Deploy the API Connect subsystem custom resources.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Obtaining product files

Obtain the product files, upload the images to a Docker registry, and decompress the operators and templates.

## Before you begin

- Ensure you have supported hardware and software. See [IBM API Connect Version 10 software product compatibility requirements](#).
- Complete the [Deployment requirements](#)
- Install and run Docker on the local machine being used for API Connect installation. Log in to your image registry.

## About this task

From the [IBM Fix Central](#) site, download the Docker image-tool file of the API Connect subsystems. Next, you will upload the image-tool file to your Docker local registry. If necessary, you can populate a remote container registry with repositories. Then you can push the images from the local registry to the remote registry.

You will also download the Kubernetes operators, API Connect Custom Resource (CR) templates, and Certificate Manager, for use during deployment configuration.

Note:

- If you plan to migrate from Version 5 to Version 10, review [Migrating a Version 5 deployment](#) before you start the installation process.
- If you have API Connect installed and want to upgrade your release version, follow the upgrade instructions: [Upgrading API Connect in a Kubernetes runtime environment](#)

## Procedure

1. Obtain the API Connect files:
  - a. Go to the [What's New in the latest version](#) information page.
  - b. Locate the Note: *You can access the latest files from <URL link>*. Select the <URL link> to go directly to the Announce page on Fix Central, where you can download files for the *latest version* of API Connect.

The following files are used for initial deployment on native Kubernetes:

### IBM® API Connect <version> for Containers

- Docker images for all API Connect subsystems
- IBM® API Connect <version> Operator Release Files for Containers
  - Kubernetes operators and API Connect Custom Resource (CR) templates
- IBM® API Connect <version> Toolkit for <operating\_system\_type>
  - Toolkit command line utility. Packaged standalone, or with API Designer or Loopback:
    - IBM® API Connect <version> Toolkit for <operating\_system\_type>
    - IBM® API Connect <version> Toolkit with Loopback for <operating\_system\_type>
    - IBM® API Connect <version> Toolkit Designer with Loopback for <operating\_system\_type>
  - Not required during initial installation. After installation, you can download directly from the Cloud Manager UI and API Manager UI. See [Installing the toolkit](#).
- IBM® API Connect <version> Local Test Environment
  - Optional test environment. See [Testing an API with the Local Test Environment](#)
- IBM® API Connect <version> Security Signature Bundle File
  - Checksum files that you can use to verify the integrity of your downloads.

2. Optionally, you can verify the integrity of the downloaded files to ensure that they originated from IBM and are not modified. See [Signature verification by using PGP](#).
3. Load the image-tool image in your Docker local registry. The image is contained in the IBM® API Connect <version> for Containers download file. For example:

```
docker load < apiconnect-image-tool-<version>.tar.gz
```

Ensure that the registry has sufficient disk space for the files.

4. If your Docker registry requires repositories to be created before images can be pushed, create the repositories for each of the images listed by the image tool. (If your Docker registry does not require creation of repositories, skip this step and go to Step 5.)
  - a. Run the following command to get a list of the images from image-tool:

```
docker run --rm apiconnect-image-tool-<version> version --images
```

- b. From the output of each entry of the form <image-name>:<image-tag>, use your Docker registry repository creation command to create a repository for <image-name>.

For example in the case of AWS ECR the command would be for each <image-name>:

```
aws ecr create-repository --repository-name <image-name>
```

5. Upload the image:

- If you do not need to authenticate with the docker registry, use:

```
docker run --rm apiconnect-image-tool-<version> upload <registry-url>
```

- Otherwise, if your docker registry accepts authentication with username and password arguments, use:

```
docker run --rm apiconnect-image-tool-<version> upload <registry-url> --username <username> --password <password>
```

- Otherwise, such as with IBM Container Registry, if you need the image-tool to use your local Docker credentials, first authenticate with your Docker registry, then upload images with the command:

```
docker run --rm -v ~/.docker:/root/.docker --user 0 apiconnect-image-tool-<version> upload <registry-url>
```

Note: The previous command does not work on macOS if Docker is configured to use the `osxkeychain` credential store. In this case, complete the following steps:

- Disable **Docker > Preferences... > Securely store Docker logins in the macOS keychain**.
- Inspect `~/.docker/config.json` to make sure that it does not contain `"credStore": "osxkeychain"`, as some versions of Docker-for-mac may handle the setting correctly per <https://github.com/docker/for-mac/issues/4192>.
- Authenticate with the Docker registry you intend to upload to.
- Run the command:

```
docker run --rm -v ~/.docker:/root/.docker --user 0 apiconnect-image-tool-<version> upload <registry-url>
```

- Once the upload of images is successful you may enable **Docker > Preferences... > Securely store Docker logins in the macOS keychain**.

Docker authentication notes:

- Both HTTPS and HTTP are supported. Best practice for Docker registry security is to use HTTPS by utilizing standard Docker load tools, to ensure your images and platform are protected. However, when necessary you can use HTTP by specifying the `--tls-verify=false` flag.
- When using a Docker registry on `localhost`, you might encounter that the image-tool Docker container is on the Docker network and typically without access to `localhost`. You can work around this issue by using the `--network host` argument to the Docker command. Note that `--network host` is a Docker argument, not an image-tool argument.
- Example of using `--network host` and `--tls-verify=false`:

```
$ docker run -d -p 5000:5000 --name registry registry:2
...
$ docker run --rm --network host apiconnect-image-tool-<version> upload localhost:5000 --tls-verify=false
...
```

Providing a certificate for verification, or disabling TLS verification

See the sample output of the tool usage for options to provide a certificate for verification or to disable TLS verification:

```
$ docker run --rm apiconnect-image-tool-<version> upload --help
upload docker images
```

**Usage:**

```
image-tool upload REGISTRY [flags]
```

**Flags:**

```
--cert-dir string  Directory with destination registry certificate tls.crt file
--username string  User name
-h, --help         help for upload
--password         password for <username>
--tls-verify       Verify TLS on destination registry (default true)
```

**Global Flags:**

```
--accept-license  Accept the license for API Connect
--debug           Enable debug logging
```

**Notes:**

- `--username=<username>` and `--password=<password>` can be used to specify credentials for authentication with the destination Docker registry.
- `--tls-verify=false` can be used to disable verification of the destination Docker registry certificate
- `--cert-dir <path>` can be used to provide a `tls.crt` file to be used for validation of the destination Docker registry certificate. For example:

```
docker run --rm -v <path-to-folder-with-tls.crt-file>:/cert apiconnect-image-tool-<version> upload <registry> --cert-dir /cert
```

6. Download the file IBM® API Connect <version> Operator Release Files for Containers

a. Decompress the downloaded Operator Release Files for Containers

Contents:

- API Connect Operator operator custom resource definition (CRDs).
- API Connect Operator Deployment and required resources CRDs.
- API Connect Operator Deployment and required resources CRDs, for multiple-namespace installations.
- DataPower Gateway Operator operator custom CRDs.
- API Connect custom resource templates, and Certificate Manager

The Operator Release Files for Containers files will be used later in deployment instructions.

Note: The Operator Release files may include catalog and operator source for OpenShift. These files are not used when deploying on native Kubernetes.

b. To access the API Connect custom resource templates and Certificate Manager, decompress the archive `helper_files.zip`.

The zip file contains custom resource templates for:

- Deployment of each subsystem.
- Backup and restore of each subsystem
- Custom certificates, both external and internal, for either standard deployments or 2-site HA deployments
- Certificate support for multi-namespace deployments
- Multi-site secret generation in a two data center deployment on Kubernetes.
- Ingress Issuer and Subsystem Certificates Resources, for either standard deployments or 2-site HA deployments
- Setting an administrator secret for DataPower Gateway

The templates will be used later in deployment instructions.

## What to do next

Continue with [Deploying operators](#).

- [Signature verification by using PGP](#)

You can verify the integrity of files to ensure that they originated from IBM and are not modified.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Signature verification by using PGP

You can verify the integrity of files to ensure that they originated from IBM and are not modified.

### About this task

You can use code signatures to verify that a downloaded file was created by IBM and that no bits in the file were changed. The signature files that are used are `*.asc`. The key/cert file is `APICHURSLEY.pub.pgp`.

### Procedure

1. Import the public key.

```
$ gpg --import APICHURSLEY.pub.pgp
gpg: key D43AB29897005BF2: public key "APICHURSLEY" imported
```

```

gpg: Total number processed: 1
gpg:          imported: 1

$ gpg --list-key --fingerprint APICHURSLEY
pub  rsa2048 2020-02-17 [SCEA]
    1467 C004 A754 4718 7C6B 19DF D43A B298 9700 5BF2
uid  [ unknown] APICHURSLEY

```

When the key is imported, it does not need to be imported again. It is not signed, but you should make a note of the fingerprint so you can compare to make sure that the key is IBM's:

```
1467 C004 A754 4718 7C6B 19DF D43A B298 9700 5BF2
```

2. Verify the files.

```

$ $ gpg --verify helper_files.zip.asc
gpg: assuming signed data in 'helper_files.zip'
gpg: Signature made Mon 28 Sep 17:35:17 2020 PDT
gpg:          using RSA key D43AB29897005BF2
gpg: Good signature from "APICHURSLEY" [unknown]
gpg: WARNING: This key is not certified with a trusted signature!
gpg:          There is no indication that the signature belongs to the owner.
Primary key fingerprint: 1467 C004 A754 4718 7C6B 19DF D43A B298 9700 5BF2

```

The verification shows that the key matches the signature and that shows the fingerprint of the key, which should match the import:

```
1467 C004 A754 4718 7C6B 19DF D43A B298 9700 5BF2
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Deploying operators

Deploy the Kubernetes operator files.

### Before you begin

You must have completed the following installation tasks before you deploy the operators:

1. Review the installation requirements. See [Deployment requirements](#).
2. Obtain the API Connect product files. See [Obtaining product files](#).

### About this task

Table 1 lists the operator that applies to each release of API Connect.

Table 1. Operators and operands for API Connect

API Connect release	API Connect operator version	DataPower operator version
10.0.4.0-ifix1	2.4.1	1.5.0
10.0.4.0	2.4.0	1.5.0
10.0.3.0	2.3.0	1.4.0
10.0.2.0	2.2.0	1.3.0

The deployment procedures differ depending on whether your deployment cluster uses a single namespace or multiple namespaces. Follow the instructions that apply to your deployment cluster:

- [Deploying operators in a single-namespace API Connect cluster](#)  
Deploy the Kubernetes operator files in a single namespace cluster.
- [Deploying operators in a multi-namespace API Connect cluster](#)  
Deploy the Kubernetes operator files in multi-namespace cluster.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Deploying operators in a single-namespace API Connect cluster

Deploy the Kubernetes operator files in a single namespace cluster.

### Before you begin

- Ensure you completed the prerequisite tasks for installing operators. See [Deploying operators](#).
- Be sure to review your strategy for using certificates with API Connect. See [Deployment requirements](#).

Note: If you are deploying a multi-namespace API Connect cluster, do not use these instructions. Instead, go to [Deploying operators in a multi-namespace API Connect cluster](#).

## Procedure

1. Ensure `KUBECONFIG` is set for the target cluster:

```
export KUBECONFIG=<path_to_cluster_config_YAML_file>
```

An example path is `/Users/user/.kube/clusters/<cluster_name>/kube-config-<cluster_name>.yaml`

2. Decide on a namespace to be used for installation.

If not using the default namespace, create the namespace in the Kubernetes cluster where the API Connect deployment will take place. Use the following command, replacing `<namespace>` with the namespace for the deployment:

```
kubectl create ns <namespace>
```

3. Install a cert-manager.

Use of a certificate manager adds convenience to the generation and management of certificate, but is not required. Whenever a custom resource (CR) takes a certificate secret name as input, you can point to any secret name, as long as the secret exists before deploying the CR, and the secret contains relevant certificate data. Typically, this is `tls.crt`, `tls.key`, and `ca.crt` files. See [Certificates in a Kubernetes environment](#).

Note:

**Do not** use this step to install a cert-manager if:

- You want to use custom certificates. See [Custom certificates on Kubernetes](#)
- You are deploying with IBM Kubernetes Service. See [Using custom certificates with IBM Kubernetes Service](#).
- You are deploying a two data center disaster recovery deployment on Kubernetes, see [Installing cert-manager and certificates in a two data center deployment](#).

Note that when using custom certificates or IBM Kubernetes Service, you will use a different version of cert-manager and the `ingress-issuer` yaml file.

After you complete one of the alternate sets of instructions in the links in this Note, continue with Step 4.

- a. Obtain the certificate manager.

API Connect v10 uses cert-manager v1.5.1 of cert-manager, which is a native [Kubernetes](#) certificate management controller.

You can obtain cert-manager v1.5.1 from the API Connect v10 distribution `helper_files.zip` archive.

Note: cert-manager is bundled as a common service in IBM CloudPack for Integration.

- b. Apply the CR:

```
kubectl apply -f cert-manager-1.5.1.yaml
```

Do not specify a custom namespace.

See <https://cert-manager.io/docs/release-notes/release-notes-1.5/>.

- c. Wait for `cert-manager` pods to enter `Running 1/1` status before proceeding. To check the status:

```
kubectl get po -n cert-manager
```

There are 3 `cert-manager` pods in total.

4. Create a registry secret with credentials to be used to pull down product images.

Use the following command, replacing `<namespace>` with the namespace for your deployment, and replacing `<registry_server>` with the location of the Docker Registry where the installation product images were pushed:

```
kubectl create secret docker-registry apic-registry-secret  
--docker-server=<registry_server>  
--docker-username=<username@example.com> --docker-password=<password> --docker-email=<username@example.com> -n <namespace>
```

5. Create a registry secret for the DataPower registry with the credentials to be used to pull down product images.

Use the following command, replacing `<namespace>` with the desired namespace for the deployment:

```
kubectl create secret docker-registry datapower-docker-local-cred  
--docker-server=<docker_server> --docker-username=<username@example.com> --docker-password=<password> --docker-email=  
<username@example.com> -n <namespace>
```

6. Create a DataPower admin secret.

Use the following command, replacing `<namespace>` with the desired namespace for the deployment:

```
kubectl create secret generic datapower-admin-credentials --from-literal=password=admin -n <namespace>
```

The admin secret will be used for `$ADMIN_USER_SECRET` when deploying the gateway CR.

7. If you are using a namespace other than `default`, open `ibm-apiconnect.yaml` in a text editor. Replace each occurrence of `default` with the namespace for your deployment.

8. Open `ibm-apiconnect.yaml` in a text editor. Replace the value of each `image:` key with the location of the apiconnect operator images (from the `ibm-apiconnect` container and the `ibm-apiconnect-init` container), either uploaded to your own registry or pulled from a public registry.

```
serviceAccountName: ibm-apiconnect  
imagePullSecrets:  
- name: apic-registry-secret  
initContainers:  
- name: ibm-apiconnect-init  
  image: <My_registry_or_public_registry>/ibm-apiconnect-operator-  
init@sha256:0d3bbac7c67372ad013407a8049c69dbd08b1559b59a7606fcd87eb0f4519ce1
```

```
...
containers:
- name: ibm-apiconnect
  image: <My_registry_or_public_registry>/ibm-apiconnect-
operator@sha256:a7473ee26c252fca4931b682cd95d73b4149e4b5b773834408f9f22d0246a76c
```

9. Required: If you are using the IBM Kubernetes Service (IKS) and setting up a two data center disaster recovery deployment, edit the `ibm-apiconnect.yaml` file. After the line `spec.affinity.containers.env`, insert:

```
- name: DISABLE_CERT_MANAGER
  value: "true"
```

Note: This step is not required for normal Kubernetes.

10. If DataPower Gateway is desired in this installation, and if you are using a namespace other than `default`, open `ibm-datapower.yaml` in a text editor. Replace each occurrence of `default` with the namespace for your deployment.
11. Open `ibm-datapower.yaml` in a text editor.
- Locate the `image`: key in the containers section of the deployment yml immediately after `imagePullSecrets`: . Replace the value of the `image`: key with the location of the `datapower` operator image, either uploaded to your own registry or pulled from a public registry.
  - Update the `IBM_DOCKER_HUB` and `IBM_ENTITLED_REGISTRY` value in the `env` section with the registry address where the images were uploaded with the `image-tool` in [Obtaining product files](#).
- For example, the default entries are:

```
- name: IBM_ENTITLED_REGISTRY
  value: "cp.icr.io/cp/datapower"
- name: IBM_DOCKER_HUB
  value: "cp.icr.io/cp/datapower"
```

12. Install the `ibm-apiconnect` CRDs.

```
kubectl apply -f ibm-apiconnect-crds.yaml
```

13. Install the `ibm-apiconnect` Kubernetes deployment.

```
kubectl apply -f ibm-apiconnect.yaml
```

14. If DataPower Gateway is desired in this installation, install the `ibm-datapower` Kubernetes deployment for DataPower Gateway, with the following command, replacing `<namespace>` with the desired namespace for the deployment (`-n <namespace>` may be omitted if default namespace is being used for installation):

```
kubectl apply -f ibm-datapower.yaml -n <namespace>
```

Note: There is a known issue on Kubernetes version 1.19.4 or higher that can cause the DataPower operator to fail to start. In this case, the DataPower Operator pods can fail to schedule, and will display the status message: `no nodes match pod topology spread constraints (missing required label)`. For example:

```
0/15 nodes are available: 12 node(s) didn't match pod topology spread constraints (missing required label),
3 node(s) had taint {node-role.kubernetes.io/master: }, that the pod didn't tolerate.
```

You can work around the issue by editing the DataPower operator deployment and re-applying it, as follows:

- a. Delete the DataPower operator deployment, if deployed already:

```
kubectl delete -f ibm-datapower.yaml -n <namespace>
```

- b. Open `ibm-datapower.yaml`, and locate the `topologySpreadConstraints`: section. For example:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: zone
  whenUnsatisfiable: DoNotSchedule
```

- c. Replace the values for `topologyKey`: and `whenUnsatisfiable`: with the corrected values shown in the example below:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: topology.kubernetes.io/zone
  whenUnsatisfiable: ScheduleAnyway
```

- d. Save `ibm-datapower.yaml` and deploy the file to the cluster:

```
kubectl apply -f ibm-datapower.yaml -n <namespace>
```

15. Install the `ingress-ca` Issuer to be used by `cert-manager`.

Note:

If you are installing a two data center disaster recovery deployment, skip this step as you already have the `ingress-ca` installed as described here: [Installing cert-manager and certificates in a two data center deployment](#).

If you are using IBM Kubernetes Service (IKS) skip this step. When using IKS, the installation of `cert-manager` V0.12 is required and custom certificates must be generated or provided, and used. The custom certificates must exist prior to installing the API Connect subsystems. See [Using custom certificates with IBM Kubernetes Service](#).

- a. Use the following command, replacing `<namespace>` with the desired namespace for the deployment:

```
kubectl apply -f ingress-issuer-v1.yaml -n <namespace>
```

The file `ingress-issuer-v1.yaml` is supplied by `cert-manager`.

- b. Validate that the command succeeded:

```
kubectl get certificates -n <namespace>
```

Example output indicating success:

NAME	READY	SECRET	AGE
analytics-client-client	True	analytics-client-client	70s
analytics-ingestion-client	True	analytics-ingestion-client	70s
gateway-peering	True	gateway-peering	69s
gateway-service	True	gateway-service	69s
ingress-ca	True	ingress-ca	71s
portal-admin-client	True	portal-admin-client	71s
portal-tunnel-client	True	portal-tunnel-client	70s

The list of certificates might vary based on your deployment.

16. Continue with [Installing the API Connect subsystems](#).

- [Installing cert-manager and certificates in a two data center deployment](#)

Additional instructions explaining how to install a cert-manager and certificates in a two data center disaster recovery deployment on Kubernetes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Installing cert-manager and certificates in a two data center deployment

Additional instructions explaining how to install a cert-manager and certificates in a two data center disaster recovery deployment on Kubernetes.

### Before you begin

Before you install a cert-manager, you should know your strategy for using certificates with API Connect. Review the certificate requirements in [Deployment requirements](#).

You should also have already completed [Obtaining product files](#).

Important: **Do not** install a cert-manager if you are deploying on OpenShift. Instead, start the instructions from [Step 2](#).

You must not install a cert-manager if API Connect is installed on OpenShift, whether the deployment is part of IBM® Cloud Pak for Integration, or independently. When API Connect is installed on OpenShift, a cert-manager is pulled in from common services automatically.

### About this task

You must create certificates and keys for API Manager and the Developer Portal on both data centers, dc1 and dc2, and ensure that they match on both.

Use these instructions to install the supplied cert-manager and `ingress-issuer-v1.yaml`. Use these instructions if you are *not* using custom certificates.

Note that `ingress-issuer-v1.yaml` is supplied by cert-manager.

Note:

**Do not** use these instructions if:

- You want to use custom certificates. See [Custom certificates on Kubernetes](#)
- You are deploying with IBM Kubernetes Service. See [Using custom certificates with IBM Kubernetes Service](#).

In both cases, you use a different version of cert-manager and the `ingress-issuer` yaml file.

### Procedure

1. Install a cert-manager.

Note: If you are deploying on OpenShift, don't install a cert-manager. Instead, start the instructions from [Step 2](#).

Use of a certificate manager adds convenience to the generation and management of certificate, but is not required. Whenever a custom resource (CR) takes a certificate secret name as input, you can point to any secret name, on condition that the secret exists before you deploy the CR, and that the secret contains relevant certificate data. Typically, this is `tls.crt`, `tls.key`, and `ca.crt` files. See [Certificates in a Kubernetes environment](#).

a. Obtain the certificate manager.

API Connect v10 uses cert-manager v1.5.1 of cert-manager, which is a native [Kubernetes](#) certificate management controller.

You can obtain cert-manager v1.5.1 from the API Connect v10 distribution `helper_files.zip` archive.

Note: cert-manager is bundled as a common service in IBM CloudPack for Integration.

b. Apply the CR:

```
kubectl apply -f cert-manager-1.5.1.yaml
```

Do not specify a custom namespace.

See <https://cert-manager.io/docs/release-notes/release-notes-1.5/>.

c. Wait for `cert-manager` pods to enter `Running 1/1` status before proceeding. To check the status:

```
kubectl get po -n cert-manager
```

There are 3 `cert-manager` pods in total.

2. Use the following steps to allow `ingress-ca` secrets to be the same on both data centers.

a. On DC1 apply the file `ingress-issuer-v1-dc1.yaml`:

```
kubectl -n <namespace> apply -f ingress-issuer-v1-dc1.yaml
```

b. Validate that the command succeeded:

```
kubectl get certificates -n <namespace>
```

c. Export `ingress-ca` secret as a yaml from DC1:

```
kubectl -n <namespace> get secret ingress-ca -o yaml > ingress-ca.yaml
```

d. Edit the `ingress-ca.yaml` file to remove all `annotations`, `labels`, `creationTimestamp`, `managedFields`, `manager`, `operation`, `time`, `resourceVersion`, `selfLink`, and `uid`. Also, if you are using a different `namespace` in DC2, then update the `namespace` field.

e. Copy the `ingress-ca.yaml` from DC1 to DC2 and apply that file on DC2:

```
kubectl -n <namespace> apply -f ingress-ca.yaml
```

f. On DC2 apply the file `ingress-issuer-v1-dc2.yaml`:

```
kubectl -n <namespace> apply -f ingress-issuer-v1-dc2.yaml
```

g. Use the following commands to test that they are the same, on DC1 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | grep -v 'f:tls' | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc1
```

h. On DC2 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | grep -v 'f:tls' | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc2
```

i. To see the differences run:

```
diff /tmp/ingress.pem.dc1 /tmp/ingress.pem.dc2
```

The files should be the same.

j. On DC2, to ensure that the certificates are working correctly and that they are using the `ingress-ca` secret. First, get the `portal-admin-client.crt` file:

```
kubectl -n <namespace> get secrets portal-admin-client -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/admin-client.crt
```

k. Test that it is working by using OpenSSL:

```
openssl verify -verbose -CAfile /tmp/ingress.pem.dc1 /tmp/admin-client.crt
```

If it is working, you should see:

```
/tmp/admin-client.crt: OK
```

3. Continue with [Deploying operators](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Deploying operators in a multi-namespace API Connect cluster

Deploy the Kubernetes operator files in multi-namespace cluster.

### Before you begin

- Ensure you completed the prerequisite tasks for installing operators. See [Deploying operators](#).
- Be sure to review your strategy for using certificates with API Connect. See [Deployment requirements](#).

### About this task

Note: If you are deploying a single-namespace API Connect cluster, do not use these instructions. Instead, go to [Deploying operators in a single-namespace API Connect cluster](#).

- These instructions apply only to native k8s deployments. They do not apply to OpenShift deployments.
- The `apiconnect` operator is deployed as a cluster-scoped operator which watches every namespace in the cluster. The `apiconnect` operator can be installed in any namespace, although it is recommended that the API Connect operator is installed in its own dedicated namespace.
- The `DataPower` operator must be deployed in a namespace where `gateway subsystem install` is planned.
- Single `ingress-ca` certificate must be installed and used across the various namespaces where subsystems will be installed.

### Procedure

1. Prepare your environment:
  - a. Ensure `KUBECONFIG` is set for the target cluster:

```
export KUBECONFIG=<path_to_cluster_config_YAML_file>
```

An example path is `/Users/user/.kube/clusters/<cluster_name>/kube-config-<cluster_name>.yaml`

- b. Create namespaces on which subsystems are planned to be installed.

The required namespaces are:

- Apiconnect operator namespace
- Gateway subsystem namespace
- Management subsystem namespace
- Portal subsystem namespace
- Analytics subsystem namespace

The following example values and deployment are used throughout these instructions:

- An apiconnect operator is installed in `operator` namespace
- A DataPower operator and gateway subsystem is installed in `gtw` namespace
- The Management subsystem is installed in `mgmt` namespace
- The Portal subsystem is installed in `portal` namespace
- The Analytics subsystem is installed in `a7s` namespace

- c. Multi-namespace templates are provided in `helper_files.zip`, inside the `release_files.zip` you downloaded in [Obtaining product files](#):

```
helper_files_unpack/multi-ns-support/
```

2. Install cert-manager and configure certificates:

Use of a certificate manager adds convenience to the generation and management of certificate, but is not required. Whenever a custom resource (CR) takes a certificate secret name as input, you can point to any secret name, as long as the secret exists before deploying the CR, and the secret contains relevant certificate data. Typically, this is `tls.crt`, `tls.key`, and `ca.crt` files. See [Certificates in a Kubernetes environment](#).

- a. Install cert-manager v1.5.1, do not specify a custom namespace as cert manager will be installed in its own namespace.

Note:

**Do not** use Step [2.a](#) to install a cert-manager if:

- You want to use custom certificates. See [Custom certificates on Kubernetes](#)
- You are deploying with IBM Kubernetes Service. See [Using custom certificates with IBM Kubernetes Service](#).
- You are deploying a two data center disaster recovery deployment on Kubernetes, see [Installing cert-manager and certificates in a two data center deployment](#)

Note that when using custom certificates or IBM Kubernetes Service, you will use a different version of cert-manager and the `ingress-issuer` yaml file.

i. `kubectl apply -f cert-manager-1.5.1.yaml`

- ii. Wait for cert-manager pods to enter `Running 1/1` status before proceeding. Use the following command to check:

```
kubectl -n cert-manager get po
```

There are 3 cert-manager pods in total.

- b. Install `ingress-ca` certificate:

- Locate `ingress-ca` certificate at `helper_files/multi-ns-support/ingress-ca-cert.yaml`
- Create `ingress-ca` certificate in one of the subsystems. For example, if we choose `mgmt` namespace:

```
kubectl -n mgmt apply -f ingress-ca-cert.yaml
```

- c. Install common issuers on all the namespaces:

- Locate `common-issuer.yaml` in `helper_files/multi-ns-support/`
- Create `common-issuer.yaml` in all namespaces:

```
kubectl create -f common-issuer.yaml -n mgmt
kubectl create -f common-issuer.yaml -n gtw
kubectl create -f common-issuer.yaml -n ptl
kubectl create -f common-issuer.yaml -n a7s
```

- d. Obtain the `ingress-ca` secret created by cert manager and create the secret on all namespaces:

Note:

The instructions in this step result in having a `selfsigning-issuer` in every namespace. This issuer is typically referenced by an API Connect CR in the namespace with:

```
...
microServiceSecurity: certManager
certManagerIssuer:
  name: selfsigning-issuer
  kind: Issuer
...
```

This issuer (and associated root certificate) does not need to be the same in every namespace, nor does it need to be the same for 2 CRs in the same namespace. Each subsystem can use its own `selfsigning-issuer`, because it is only used for certificates that are internal to the subsystem.

To ensure that the `ingress-issuer` is in sync across namespaces, it should be backed by the same `ingress-ca` certificate. This enables, for example, APIM to use a client certificate that matches the CA of the portal-admin ingress endpoint. The sync is achieved by copying around the `ingress-ca` certificate in each namespace, as shown in the following steps. It does not matter that it is the same issuer, or whether it has a different name. However it is important is that the `ingress-ca` is the same for all the "ingress-issuer" that are going to be used by the subsystems.

- i. Make sure `ingress-ca` certificate `READY` status is set to true:

```
kubectl get certificate ingress-ca -n mgmt
NAME      READY   SECRET      AGE
ingress-ca  True    ingress-ca  9m24s
```

- ii. Cert-manager creates a secret called `ingress-ca` in `mgmt` namespace which represents the certificate we created in Step [2.c](#).

iii. Use the following command to obtain the yaml format of the secret:

```
kubectl get secret ingress-ca -n <namespace-where-ingress-ca-cert-is-created> -o yaml > ingress-ca-secret-in-cluster.yaml
```

iv. Remove unwanted content from the secret yaml:

```
cat ingress-ca-secret-in-cluster.yaml | grep -v 'creationTimestamp' | grep -v 'namespace' | grep -v 'uid' | grep -v 'resourceVersion' > ingress-ca-secret.yaml
```

v. Create the secret using the yaml we prepared in previous step on rest of the subsystem namespaces. In this example, in the **gtw**, **a7s** and **ptl** namespaces.

```
kubectl create -f ingress-ca-secret.yaml -n gtw
kubectl create -f ingress-ca-secret.yaml -n ptl
kubectl create -f ingress-ca-secret.yaml -n a7s
```

e. Install management certs in management namespace:

- i. Locate **management-certs.yaml** in **helper\_files/multi-ns-support/**
- ii. Create **management-certs.yaml** in the **mgmt** namespace:

```
kubectl create -f management-certs.yaml -n mgmt
```

f. Install gateway certs in the gateway namespace:

- i. Locate **gateway-certs.yaml** in **helper\_files/multi-ns-support/**
- ii. Create **gateway-certs.yaml** in the **gtw** namespace:

```
kubectl create -f gateway-certs.yaml -n gtw
```

3. Install the apiconnect operator:

a. Install the **ibm-apiconnect** CRDs with the following command. Do not specify a namespace:

```
kubectl apply -f ibm-apiconnect-crds.yaml
```

b. Create a registry secret with the credentials to be used to pull down product images with the following command, replacing **<namespace>** with the desired namespace for the apiconnect operator deployment.

```
kubectl -n <namespace> create secret docker-registry apic-registry-secret
--docker-server=<registry_server>
--docker-username=<username@example.com> --docker-password=<password>
--docker-email=<username@example.com>
```

- For example, replace **<namespace>** with **operator**.
- **docker-password** can be your artifactory API key.
- **-n <namespace>** may be omitted if **default** namespace is being used for installation

c. Locate and open **ibm-apiconnect-distributed.yaml** in a text editor of choice. Then, find and replace each occurrence of **\$OPERATOR\_NAMESPACE** with **<namespace>**, replacing **<namespace>** with the desired namespace for the deployment. In this example, the namespace is **operator**.

d. Also in **ibm-apiconnect-distributed.yaml**, locate the **image:** keys in the containers sections of the deployment yaml right below **imagePullSecrets:**. Replace the placeholder values **REPLACE-DOCKER-REGISTRY** of the **image:** keys with the docker registry host location of the apiconnect operator image (either uploaded to own registry or pulled from public registry).

e. Install **ibm-apiconnect-distributed.yaml** with the following command

```
kubectl apply -f ibm-apiconnect-distributed.yaml
```

4. Install DataPower operator:

Deployment of the DataPower operator is only needed if you have at least one API Connect v10 Gateway subsystem (whether v5 compatible or not) to upgrade. If you are using DataPower in a different form factor such as an Appliance, you will not have an API Connect v10 Gateway subsystem to upgrade, and will not need the DataPower operator for your upgrade.

Note: The DataPower Operator supports multiple instances of DataPower in the same cluster, separated by namespace. When deploying into multiple namespaces, ensure that any cluster-scoped resources are created with unique names for separate installations, such that they are not overwritten by subsequent installations. For example, DataPower cluster-scoped resources include **ClusterRoleBindings**.

a. Create a registry secret for the DataPower registry with the credentials to be used to pull down product images with the following command, replacing **<namespace>** with the desired namespace for the deployment. (In this case **gtw**):

```
kubectl -n <namespace> create secret docker-registry datapower-docker-local-cred
--docker-server=<registry_server>
--docker-username=<username@example.com> --docker-password=<password>
--docker-email=<username@example.com>
```

- For example, replace **<namespace>** with **gtw**.
- **docker-password** can be your artifactory API key.
- **-n <namespace>** may be omitted if **default** namespace is being used for installation

b. Create a DataPower admin secret, replacing **<namespace>** with the desired namespace for the deployment. For example, **gtw**. This secret will be used for **\$ADMIN\_USER\_SECRET** later in the Gateway CR:

```
kubectl -n <namespace> create secret generic datapower-admin-credentials --from-literal=password=admin
-n
```

**<namespace>** may be omitted if **default** namespace is being used for installation.

c. Locate and open **ibm-datapower.yaml** in a text editor of choice. Then, find and replace each occurrence of **default** with **<namespace>**, replacing **<namespace>** with the desired namespace for the deployment. For example, **gtw**.

d. Install **ibm-datapower.yaml** with the following command:

```
kubectl -n <namespace> apply -f ibm-datapower.yaml
```

Note: There is a known issue on Kubernetes version 1.19.4 or higher that can cause the DataPower operator to fail to start. In this case, the DataPower Operator pods can fail to schedule, and will display the status message: **no nodes match pod topology spread**

constraints (missing required label). For example:

```
0/15 nodes are available: 12 node(s) didn't match pod topology spread constraints (missing required label),
3 node(s) had taint {node-role.kubernetes.io/master: }, that the pod didn't tolerate.
```

You can work around the issue by editing the DataPower operator deployment and re-applying it, as follows:

- i. Delete the DataPower operator deployment, if deployed already:

```
kubectl delete -f ibm-datapower.yaml -n <namespace>
```

- ii. Open `ibm-datapower.yaml`, and locate the `topologySpreadConstraints`: section. For example:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: zone
  whenUnsatisfiable: DoNotSchedule
```

- iii. Replace the values for `topologyKey`: and `whenUnsatisfiable`: with the corrected values shown in the example below:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: topology.kubernetes.io/zone
  whenUnsatisfiable: ScheduleAnyway
```

- iv. Save `ibm-datapower.yaml` and deploy the file to the cluster:

```
kubectl apply -f ibm-datapower.yaml -n <namespace>
```

5. Next, install the subsystems. Continue with [Installing the API Connect subsystems](#).

Note: Unless otherwise stated, when performing the individual subsystem upgrades the `<namespace>` value of example `kubectl` commands for a given subsystem should be set to the namespace for the particular subsystem component they are acting on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Installing the API Connect subsystems

Deploy the API Connect subsystem custom resources.

---

### Before you begin

Before you do this task you should have already completed:

1. [Obtaining product files](#)
2. [Deploying operators](#)

---

### About this task

Use the CR (custom resource) files to install the Management, Gateway, Analytics, and Portal subsystems for your API Connect cloud. CRs are extensions of the Kubernetes API. API Connect installs its subsystems using individual CRs. One CR is deployed per one managed subsystem. The API Connect operator manages the lifecycle of the subsystem CRs and deploys and manages the microservice for each one.

CR templates are provided in the `helper_files` archive to install each API Connect subsystem. You uncompressed these files into an installation folder of your choosing in [Obtaining product files](#).

- The API Connect operators and operands must be from the same version of API Connect. For example, the API Connect operator 10.0.4.0 does not successfully deploy the API Connect management subsystem (operand) from Version 10.0.3.0.
- You can deploy multiple instances of API Connect into the same cluster by using different namespaces.
- Deploying multiple similar subsystems in a single namespace is not supported. For example, deploying two management subsystems, `mgmt1`, `mgmt2` in a single namespace where `apiconnect operator` is installed.
- For more information on Custom Resources in Kubernetes see <https://kubernetes.io/docs/concepts/extend-kubernetes/api-extension/custom-resources/>.
- For details on how the API Connect operator manages the CRs using the Kubernetes operator pattern, see <https://kubernetes.io/docs/concepts/extend-kubernetes/operator/>.
- For guidance on choosing object names and IDs in Kubernetes, see <https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names>.

---

### Procedure

Complete each of the following instructions:

1. [Installing the Management subsystem cluster](#).
2. [Installing the DataPower Gateway subsystem](#).
3. [Installing the Developer Portal subsystem](#).
4. [Installing the Analytics subsystem](#).
5. When all subsystems are running, verify you can access the API Connect Cloud Manager. Enter the Cloud Manager endpoint URL in your browser.

Tip:

You can find your Cloud Manager endpoint URL as follows:

The property `cloudManagerEndpoint` is specified in the management CR (`management_cr.yaml`). When you edited the template, you specified a value for `$STACK_HOST`:

```
cloudManagerEndpoint:
  annotations:
    cert-manager.io/issuer: ingress-issuer
  hosts:
  - name: admin.$STACK_HOST
    secret: cm-endpoint
```

The template URL is `https://admin.<STACK_HOST>/admin`. The `/admin` suffix at the end is the name of the Cloud Manager administrator.

For example, if `$STACK_HOST` is `myhost.subnet.example.com`, the Cloud Manager endpoint URL is:

```
https://admin.myhost.subnet.example.com/admin
```

The first time that you access the Cloud Manager user interface, you enter `admin` for the user name and `7iron-hide` for the password. You will be prompted to change the Cloud Administrator password and email address. See [Accessing the Cloud Manager user interface](#).

## What to do next

---

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

- [Installing the Management subsystem cluster](#)  
Install the Management subsystem cluster
- [Installing the Developer Portal subsystem](#)  
Install the Developer Portal subsystem.
- [Installing the DataPower Gateway subsystem](#)  
Install the DataPower Gateway subsystem
- [Installing the Analytics subsystem](#)  
Install the IBM API Connect Analytics subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Installing the Management subsystem cluster

Install the Management subsystem cluster

### Before you begin

---

Before you start this task, you should have already:

- Reviewed the Kubernetes requirements in [Pre-installation requirements](#)
- Completed [Deploying operators](#)

### About this task

---

Edit the custom resource template for the Management system, apply the resource, verify that the pods are up and running, and verify that you can connect to the API Connect Cloud Manager.

### Procedure

---

1. Edit the `management_cr` template CR, to replace the placeholders with values for your deployment.

`$APP_PRODUCT_VERSION`  
API Connect application version for the subsystems.

```
version: <version_number>
```

Example version number: 10.0.4.0-ifix3

`$SECRET_NAME`  
Use for image pull.

```
imagePullSecrets:
- apic-registry-secret
```

`$PROFILE`  
Select either a non-production (development) profile or a production profile.

While it is possible to use a non-production profile in a production deployment, it is not recommended. The non-production profiles do not provide the failover resiliency nor the downtime guarantee that is needed to maintain high availability (HA) production deployments.

The supported profiles values for the Management subsystem are:

- Non-production profile

```
profile: n1xc4.m16
```

- Describes a hardware profile of 1 node, 4 cores, and 16 GB memory
- Deploys a subsystem with the scale of one; a single node, non-HA subsystem. Recommended for development and testing.

- Non-production profile (reduced CPU)

```
profile: n1xc2.m16
```

- Describes a hardware profile of 1 node, 2 cores, and 16 GB memory.
- For use when the deployment environment has limited CPU resources.
- Deploys a subsystem with the scale of one; a single node, non-HA subsystem. Recommended for development and testing.

- Production profile

```
profile: n3xc4.m16
```

- Describes a hardware profile of 3 nodes, 4 cores, and 16 GB memory
- Deploys in HA mode for a production environment.
- Supported for installation of three or more nodes. Not supported for less than three nodes.

- Production profile (reduced CPU)

```
profile: n3xc2.m16
```

- Describes a hardware profile of 3 nodes, 2 cores, and 16 GB memory
- For use when the deployment environment has limited CPU resources.
- Deploys in HA mode for a production environment.
- Supported for installation of three or more nodes. Not supported for less than three nodes.

#### **\$DOCKER\_REGISTRY**

The host name of the Docker Registry to which you uploaded the installation images. For example:

```
my.docker.registry.domain.example.com.
```

#### **\$STACK\_HOST**

The desired ingress subdomain for the API Connect stack. Used when specifying endpoints. Domain names that are used for endpoints cannot contain the underscore "\_" character. You can do one of the following:

- Subdomain customization only

Accept the prefixes predefined for the ingress hostnames to use and just replace all instances of **STACK\_HOST** to be the desired ingress subdomain for the API Connect stack. For example, if your host is `myhost.subnet.example.com`:

```
cloudManagerEndpoint:
  < ... >
  hosts:
    - name: admin.myhost.subnet.example.com
      secret: cm-endpoint

apiManagerEndpoint:
  < ... >
  hosts:
    - name: manager.myhost.subnet.example.com
      secret: apim-endpoint

platformAPIEndpoint:
  < ... >
  hosts:
    - name: api.myhost.subnet.example.com
      secret: api-endpoint

consumerAPIEndpoint:
  < ... >
  hosts:
    - name: consumer.myhost.subnet.example.com
      secret: consumer-endpoint
```

- Complete hostname customization

Change both the predefined prefixes and the **STACK\_HOST** subdomain to match your desired hostnames.

For example, for `cloudManagerEndpoint`, you can replace `admin.$STACK_HOST` with `my.cloudmgr.myhost.subnet.example.com`, where `my.cloudmgr` replaces `admin`, and `myhost.subnet.example.com` replaces `STACK_HOST`. For example:

```
cloudManagerEndpoint:
  < ... >
  hosts:
    - name: my.cloudmgr.myhost.subnet.example.com
      secret: cm-endpoint
```

You can do this for some or all of the hostnames, depending on your customization requirements.

#### **\$STORAGE\_CLASS**

The Kubernetes storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: `kubectl get sc`.

```
storageClassName: local-storage
```

#### 2. Edit the `license` setting:

- Set `accept`: to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.
- Set `metric`: to track your product usage. Enter the unit of measure that is used for your program license:
  - `PROCESSOR_VALUE_UNIT` - Default value. If you leave the field blank, this value is used.
  - `MONTHLY_API_CALL` - Applies only to the IBM API Connect Hybrid Entitlement program.

For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).

- c. Set `use`: to either `production` or `nonproduction`, to match the license you purchased.
- d. Set `license`: to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```
license:
  accept: true
  metric: PROCESSOR_VALUE_UNIT
  use: production
  license: L-RJON-BZ5LSE
```

3. If installing with custom internal certificates, specify a site name.
  - The site name is used as the identifier for the PostgreSQL database cluster used by API Connect. This name should already have been decided upon and used to update the `custom-certs-internal.yaml` file as described in [Generating custom certificates](#) or [Generating custom certificates manually for IKS](#).
  - You must now add your chosen site name to `management_cr.yaml`, by creating a `siteName` property anywhere inside the `spec` block, set to the chosen site name:

```
siteName: <site_name>
```

Replace `<site_name>` with your chosen site name.

4. It is recommended to allocate 100Gi for write-ahead logging (WAL) storage. The default storage is:

- Development profile - 30Gi
- Production profile - 47Gi

For best performance, edit the CR to add the following entries, and set `volumeSize`: to 100Gi:

```
spec:
  dbArchiveVolumeClaimTemplate:
    storageClassName: <storage-class>
    volumeSize: <volume-size>
```

5. Configure backups for the management subsystem.

Important: Note that in order to restore your deployment in the event of a disaster where you must redeploy a new cluster, you must take specific configuration actions **before** installing the Management subsystem. See [Preparing the management subsystem for disaster recovery](#). You can review the backup and restore features here: [Configuring backup settings for fresh install of the Management subsystem](#)
6. Optional: If you are installing as part of a two data center disaster recovery set up, complete the steps in [Installing a two data center deployment](#) before you apply the edited file.
7. Install the management Custom Resource, replacing `<namespace>` with the target installation namespace in the Kubernetes cluster.

```
kubectl apply -f management_cr.yaml -n <namespace>
```

8. Verify that the Management subsystem is fully installed:

```
kubectl get ManagementCluster -n <namespace>
```

The installation has completed when the `READY` status is `True`, and the `SUMMARY` reports that all services are online (e.g. 9/9). For example:

NAME	READY	SUMMARY	VERSION	RECONCILED	VERSION	AGE
management	True	16/16	<version>		<version-build>	7m17s

9. Retain the encryption secret and database credential secrets in a safe location, in case you need to restore during a disaster recovery scenario. Complete the steps in [Preparing the management subsystem for disaster recovery](#).

Important: If you do not complete the steps in [Preparing the management subsystem for disaster recovery](#), you will not be able to restore your management subsystem to a new cluster during a disaster recovery scenario.
10. Check your connection to the Cloud Manager user interface on the Management subsystem on your Cloud Manager endpoint.

For example, if you accepted the default prefix of `admin`, and you set `$STACK_HOST` to `myhost.subnet.example.com`, the Cloud Manager endpoint URL is:

```
https://admin.myhost.subnet.example.com/admin
```

The first time that you access the Cloud Manager user interface, you enter `admin` for the user name and `7iron-hide` for the password. You will be prompted to change the Cloud Administrator password and email address. For further details, see [Accessing the Cloud Manager user interface](#).

## What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing the Developer Portal subsystem

Install the Developer Portal subsystem.

## About this task

### Important:

- To enable effective high availability for your Portal service, you need a latency that is less than 50 ms between all portal-db pods to avoid the risk of performance degradation. Servers with uniform specifications are required, as any write actions occur at the speed of the slowest portal-db pod, as the write actions are synchronous across the cluster of portal-db pods. It is recommended that there are three servers in each cluster of portal-db pods for the high availability configuration. The three servers can be situated in the same availability zone, or across three availability zones to ensure the best availability. However, you can configure high availability with two availability zones.
- The Portal does not do certain operations if the free space on certain volumes falls beneath predefined limits. In particular:  
The `databaseVolumeClaimTemplate` needs at least 4GB of free space to create new sites, restore site backups, or upgrade or change the URL of existing sites.  
The `webVolumeClaimTemplate` needs at least 256MB free space to create new sites, restore site backups, or upgrade or change the URL of existing sites.
- Ensure that your kernel or Kubernetes node has the value of its `inotify` watches set high enough so that the Developer Portal can monitor and maintain the files for each Developer Portal site. If set too low, the Developer Portal containers might fail to start or go into a `non-ready` state when this limit is reached. If you have many Developer Portal sites, or if your sites contain a lot of content, for example, many custom modules and themes, then a larger number of `inotify` watches are required. You can start with a value of 65,000, but for large deployments, this value might need to go up as high as 1,000,000. The Developer Portal containers take `inotify` watches only when they need them. The full number is not reserved or held, so it is acceptable to set this value high.
- Ensure that your kernel or Kubernetes node has a value of `nproc` (maximum number of processes) that applies to the user ID of the Portal pods that have been assigned, and that it is high enough to allow all of the Portal processes to execute. For smaller installations this might be as low as 16384, but for larger installations that have more concurrent web calls, you might need as many as 125205. If the number is too low, you will see errors like `"fork: retry: Resource temporarily unavailable"` in the Portal logs. Note that this value might need to be even higher if other, non-Portal, pods are sharing the same user ID.
- Ensure that your kernel or Kubernetes node has a value of `nofiles` (maximum number of open file descriptors) that applies to the user ID of the Portal pods that have been assigned, and that it is high enough to allow the Portal to open all of the files that it requires. For smaller installations this might be as low as 16384, but for larger installations that have more concurrent web calls and Portal web sites, you might need as many as 1048576. If the number is too low, you will see errors like `"too many open files"` in the Portal logs. Note that this value might need to be even higher if other, non-Portal, pods are sharing the same user ID.

The Portal endpoints values are used when you configure a Portal service in the Cloud Manager. See [Registering a Portal service](#).

- `portalAdminEndpoint` - This is the Management Endpoint that is defined in Cloud Manager, which is used for communicating with API Manager.
- `portalUIEndpoint` - This is the Portal website URL defined in Cloud Manager. It determines the URL for the site that is created for each catalog. It is used for public access to the Portal from a browser.

## Procedure

1. Edit the `portal_cr` template CR to replace the placeholders with values for your deployment.

### `$APP_PRODUCT_VERSION`

API Connect application version for the subsystems.

```
version: <version_number>
```

Example version number: 10.0.4.0-ifix3

### `$PROFILE`

Select either a development profile or a production profile.

- Development profiles deploy a subsystem with the scale of one; a single node, non-HA subsystem. Development profiles are recommended for development or testing.  
While it is possible to use a development profile installation in a production deployment, it is not recommended. The development profiles do not provide the failover resiliency nor the downtime guarantee that is needed to maintain high availability (HA) production deployments.
- Production profiles deploys in HA mode for a production environment. Production profiles are supported for installation of three or more nodes. Not supported for fewer than three nodes.

The supported profiles values for the Portal subsystem are:

- Development profile

```
profile: n1xc8.m16
```

Describes a hardware profile of 1 node, 8 cores, and 16 GB memory

- Development profile (reduced CPU)

```
profile: n1xc4.m16
```

Describes a hardware profile of 1 node, 4 cores, and 16 GB memory. For use when the deployment environment has limited CPU resources.

- Development profile (minimal CPU and Memory)

```
profile: n1xc2.m8
```

Describes a hardware profile of 1 node, 2 cores, and 8 GB memory. For use when the deployment environment has minimal CPU and Memory resources.

- Production profile

```
profile: n3xc8.m16
```

Describes a hardware profile of 3 nodes, 8 cores, and 16 GB memory.

- Production profile (reduced CPU and Memory)

```
profile: n3xc4.m8
```

Describes a hardware profile of 3 nodes, 4 cores, and 8 GB memory. For use when the deployment environment has limited CPU and Memory resources.

#### `$$SECRET_NAME`

Use for image pull.

```
imagePullSecrets:
- apic-registry-secret
```

#### `$$DOCKER_REGISTRY`

The host name of the Docker Registry to which you uploaded the installation images. For example:

```
my.docker.registry.domain.example.com.
```

#### `$$STACK_HOST`

The desired ingress subdomain for the API Connect stack. Used when you specify endpoints. Domain names that are used for endpoints cannot contain the underscore "\_" character. You can do one of the following:

- Subdomain customization only  
Accept the prefixes predefined for the ingress hostnames to use and replace all instances of `$$STACK_HOST` to be the desired ingress subdomain for the API Connect stack. For example, for a subdomain of `myhost.subnet.example.com`:

```
portalAdminEndpoint:
  < ... >
  hosts:
  - name: api.portal.myhost.subnet.example.com
    secret: portal-admin

portalUIEndpoint:
  < ... >
  hosts:
  - name: portal.myhost.subnet.example.com
    secret: portal-web
```

- Complete hostname customization  
Change both the predefined prefixes and the `$$STACK_HOST` subdomain to match your desired hostnames.

For example, for `portalAdminEndpoint`, you can replace `api.portal.$$STACK_HOST` with `my.api.portal.myhost.subnet.example.com`, where `my.api.portal` replaces `api.portal`, and `myhost.subnet.example.com` replaces `$$STACK_HOST`:

```
portalAdminEndpoint:
  < ... >
  hosts:
  - name: my.api.portal.myhost.subnet.example.com
    secret: cm-endpoint
```

You can do this for some or all of the hostnames, depending on your customization requirements.

#### `$$STORAGE_CLASS`

The Kubernetes storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: `kubectl get sc`. For example, for local storage:

```
databaseVolumeClaimTemplate:
  storageClassName: $$STORAGE_CLASS
  volumeSize: 120Gi
databaseLogsVolumeClaimTemplate:
  storageClassName: $$STORAGE_CLASS
  volumeSize: 12Gi
webVolumeClaimTemplate:
  storageClassName: $$STORAGE_CLASS
  volumeSize: 200Gi
backupVolumeClaimTemplate:
  storageClassName: $$STORAGE_CLASS
  volumeSize: 300Gi
adminVolumeClaimTemplate:
  storageClassName: $$STORAGE_CLASS
  volumeSize: 20Gi
certVolumeClaimTemplate:
  storageClassName: $$STORAGE_CLASS
  volumeSize: 4Gi
```

Note:

- The `databaseVolumeClaimTemplate` has a minimum value of 30Gi. The `webVolumeClaimTemplate` has a minimum value of 20Gi. The `backupVolumeClaimTemplate` has a minimum value of 30Gi. However, all three need to be sized according to the installation.
- The `adminVolumeClaimTemplate` and `databaseLogsVolumeClaimTemplate` in this example have their minimum values and you do not need to change them.
- The `certVolumeClaimTemplate` is used by the `nginx` pod and in `2dcha` (two data center high availability) mode it is also by the `tunnel`, `db-remote` and `www-remote` pods. It can be sized small, just like the `adminVolumeClaimTemplate`, and does not need to be increased based on the number of sites.

#### 2. Edit the `license` setting:

- Set `accept`: to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.
- Set `metric`: to track your product usage. Enter the unit of measure that is used for your program license:
  - `PROCESSOR_VALUE_UNIT` - Default value. If you leave the field blank, this value is used.
  - `MONTHLY_API_CALL` - Applies only to the IBM API Connect Hybrid Entitlement program.For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).
- Set `use`: to either `production` or `nonproduction`, to match the license you purchased.
- Set `license`: to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```
license:
  accept: true
  metric: PROCESSOR_VALUE_UNIT
  use: production
  license: L-RJON-BZ5LSE
```

- Optional: If you are installing as part of a two data center disaster recovery set up, complete the steps in [Installing a two data center deployment](#) before you apply the edited file.
- Install the Portal Custom Resource, replacing `<namespace>` with the target installation namespace in the Kubernetes cluster:

```
kubectl apply -f portal_cr.yaml -n <namespace>
```

- Verify that the Portal subsystem is fully installed:

```
kubectl get PortalCluster -n <namespace>
```

The installation is complete when the **READY** status is **True**, and the **SUMMARY** reports that all services are online (3/3). Example:

NAME	READY	SUMMARY	VERSION	RECONCILED	VERSION	AGE
portal	True	3/3	<version>	<version-build>		7m47s

There is no need to wait for the **READY** status to be **True** you move on to the next Subsystem installation.

- We highly recommend that you retain the Portal subsystem encryption secret in a safe location, in case you need to restore the Portal subsystem during a disaster recovery scenario.

The encryption secret is created when the Portal subsystem is initially deployed. You can obtain the name of the encryption secret from the Portal subsystem custom resource once the installation is complete. For example:

- Obtain the name of the encryptionSecret:

```
kubectl get ptl portal -o yaml | grep encryptionSecret
encryptionSecret: portal-enc-key
```

The name of encryption secret is `portal-enc-key`.

- Save the secret yaml in a safe location:

```
kubectl get secret portal-enc-key -o yaml > portal-enc-key.yaml
```

- Backup the Portal installation. See [Backing up and restoring the Developer Portal in a Kubernetes environment](#).

## What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you completed the installation of all the required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

- [Defining multiple portal endpoints for a Kubernetes environment](#)  
Multiple public facing endpoints (portal-www) can be defined for the Developer Portal.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining multiple portal endpoints for a Kubernetes environment

Multiple public facing endpoints (portal-www) can be defined for the Developer Portal.

### About this task

You can override the single endpoint definition for portal-WWW, and the associated portal-www-ingress TLS certificate, to support multiple portal-www endpoints.

For information about the endpoints for the Developer Portal, see [Installing the Developer Portal subsystem](#).

Following are the example endpoints for configuring different sites served by the same Developer Portal service, as configured in this task:

- `https://banking.example.com/loans`
- `https://insurance.example.com/vehicle`

These unique endpoints allow Developer Portal sites to be defined on the Developer Portal service with different host names and domains. They replace endpoints that distinguish different sites by sub paths, as shown in the following examples:

- `https://www.example.com/banking/loans`
- `https://www.example.com/insurance/vehicle`

### Procedure

Edit your `portal_cr` template. You can add multiple entries for your endpoints in the `hosts` element:  
For example:

```
spec:
  portalUIEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: ptl.host1.example.com
        secretName: portal-web-host1
      - name: ptl.host2.example.com
        secretName: portal-web-host2
      - name: ptl.host3.example.com
        secretName: portal-web-host3
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing the DataPower Gateway subsystem

Install the DataPower Gateway subsystem

### Before you begin

If you plan to install the Gateway subsystem in a remote cluster, be sure to satisfy the following requirements:

- Install both the API Connect and the DataPower operators.  
The versions of the operators on the remote cluster and the version of the Gateway operand must exactly match the versions used in the main cluster.
- Make sure the remote cluster has the certificates:
  - If you are using certificate manager, ensure that the ingress-ca is synced between sites.
  - If you are not using certificate manager, copy the client gateway certificates to the remote cluster and reference them in the Gateway CR.

### About this task

Note: An alternate deployment scenario is to use a physical DataPower appliance for the gateway. If you are using an appliance for the gateway, do not install using API Connect Kubernetes CRs, since you do not need to configure a gateway subsystem in your Kubernetes cluster when using an appliance. For an appliance-based gateway, you must configure two endpoints in DataPower to be used as the Gateway Service Management Endpoint and the API invocation Endpoint. Enter these endpoints in the Configure Gateway Service screen in Cloud Manager. See [Configuring DataPower Gateway for API Connect](#) for instructions for configuring a DataPower appliance. The installation folder where the `helper_files.zip` was extracted contains two templates for Gateway service. The `v5cgateway_cr.yaml` template is for the v5 compatible Gateway, and the `apigateway_cr.yaml` template is for the API Gateway.

## Procedure

1. Edit the template CR, either `apigateway_cr.yaml` or `v5cgateway_cr.yaml`, to replace the placeholders with values for your deployment.

#### `$APP_PRODUCT_VERSION`

API Connect application version for the subsystems.

`version: <version_number>`

Example version number: 10.0.4.0-ifix3

#### `$PROFILE`

- Non-production profile

`profile: n1xc4.m8`

- Describes a hardware profile of 1 nodes, 4 cores, and 8 GB memory
- Deploys a subsystem with the scale of one; a single node, non-HA subsystem.
- Recommended use of this profile is for development and testing.

- Non-production profile (reduced CPU)

`n1xc1.m8`

- Describes a hardware profile of 1 nodes, 1 cores, and 8 GB memory
- Deploys a subsystem with the scale of one; a single node, non-HA subsystem.
- Recommended use of this profile is for development and testing.

- Production profile

`profile: n3xc4.m8`

- Describes a hardware profile of 3 nodes, 4 cores, and 8 GB memory
- Deploys in HA mode for a production environment.
- Supported for installation of three or more nodes. Not supported for less than three nodes.

- Production profile (reduced CPU)

`profile: n3xc1.m8`

- Describes a hardware profile of 3 nodes, 1 cores, and 8 GB memory
- Deploys in HA mode for a production environment.
- Supported for installation of three or more nodes. Not supported for less than three nodes.

Note:

- While it is possible to use `n1xc4.m8` profile installations in a production deployment, it is not recommended. The `n1xc4.m8` profile does not provide the failover resiliency nor the downtime guarantee that is needed to maintain high availability (HA) production deployments.
- The only supported values for the Gateway subsystem are `n1xc4.m8` and `n3xc4.m8`.

#### `$SECRET_NAME`

Use for image pull.

```
imagePullSecrets:
- apic-registry-secret
```

#### `$DOCKER_REGISTRY`

The host name of the Docker Registry to which you uploaded the installation images. For example:

```
my.docker.registry.domain.example.com.
```

#### `$STACK_HOST`

The desired ingress subdomain for the API Connect stack. Used when specifying endpoints. Domain names that are used for endpoints cannot contain the underscore " " character. You can do one of the following:

- Subdomain customization only  
Accept the prefixes predefined for the ingress hostnames to use and just replace all instances of `STACK_HOST` to be the desired ingress subdomain for the API Connect stack. For example, if your host is `myhost.subnet.example.com`:

```
gatewayEndpoint:
  < ... >
  hosts:
  - name: rgw.myhost.subnet.example.com
    secret: gwv6-endpoint

gatewayManagerEndpoint:
  < ... >
  hosts:
  - name: rgwd.myhost.subnet.example.com
    secret: gwv6-manager-endpoint
```

- Complete hostname customization  
Change both the predefined prefixes and the `STACK_HOST` subdomain to match your desired hostnames.

For example, for `gatewayEndpoint`, you can replace `rgw.$STACK_HOST` with `my.gateway.endpoint.myhost.subnet.example.com`, where `my.gateway.endpoint` replaces `rgw`, and `myhost.subnet.example.com` replaces `$STACK_HOST`:

```
gatewayEndpoint:
  < ... >
  hosts:
  - name: my.gateway.endpoint.myhost.subnet.example.com
    secret: gwv6-endpoint
```

You can do this for some or all of the hostnames, depending on your customization requirements.

#### `$STORAGE_CLASS`

The Kubernetes storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: `kubectl get sc`.

```
storageClassName: local-storage
```

#### `$ADMIN_USER_SECRET`

Edit `$ADMIN_USER_SECRET` to set the value you created in [Deploying operators](#).

```
adminUserSecret: $ADMIN_USER_SECRET
```

#### 2. Edit the `license` setting:

- Set `accept`: to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.
- Set `metric`: to track your product usage. Enter the unit of measure that is used for your program license:
  - `PROCESSOR_VALUE_UNIT` - Default value. If you leave the field blank, this value is used.
  - `MONTHLY_API_CALL` - Applies only to the IBM API Connect Hybrid Entitlement program.For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).
- Set `use`: to either `production` or `nonproduction`, to match the license you purchased.
- Set `license`: to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```
license:
  accept: true
  metric: PROCESSOR_VALUE_UNIT
  use: production
  license: L-RJON-BZ5LSE
```

#### 3. Optional: If applicable to your deployment, you can override the resource settings for CPU and memory.

- CPU override

When you specify `spec.license.use: nonproduction` and a single node Development profile `profile: n1xc4.m8`, the default CPU request for the gateway pod is 1 CPU. You can manually override this setting. For example, to request 2 CPUs:

```
template:
- name: datapower
  containers:
  - name: gateway
    resources:
      requests:
        cpu: 2
```

- When you specify `spec.license.use: production` and a single node Development profile `profile: n1xc4.m8`, the default CPU request for the gateway pod is 4 CPUs.
- The CPU limit cannot be specified separately from the CPU request. The value for the CPU request is used as both CPU request and CPU limit in the Gateway CR.
- Memory override  
The default memory limit and request is 8Gi. The memory limit should always be greater than or equal to the memory request.

For example, to request 10Gi and set a limit of 12Gi:

```
template:
- name: datapower
  containers:
  - name: gateway
    resources:
      limits:
        memory: 12Gi
      requests:
        cpu: 2
        memory: 10Gi
```

Note: The override mechanism is specific only to the CPU and memory values, and cannot be used for other resource requests in the DataPower Gateway CR.

4. For `apigateway_cr.yaml` only, you can optionally enable `openTracing`.
  - a. Edit the CR to add the following properties, and supply values for each:

```
openTracing:
  enabled: false # if true provide below details
  odTracingRegistrationHostname: $OD_TRACING_REGISTRATION_HOSTNAME
  odTracingDataHostname: $OD_TRACING_HOSTNAME
  imageAgent: $AGENT_IMAGE
  imageCollector: $COLLECTOR_IMAGE
```

Where:

enabled

```
enabled: true
```

`$OD_TRACING_REGISTRATION_HOSTNAME`

```
odTracingRegistrationHostname: icp4i-od.tracing.svc
The hostname of the registration server for OpenTracing.
```

`$OD_TRACING_HOSTNAME`

```
odTracingDataHostname: od-store-od.tracing.svc
The hostname of the data server for OpenTracing.
```

`$AGENT_IMAGE`

```
imageAgent: icp4i_od_agent:1.0.0-amd64
Image will be pulled from the imageRegistry of this CR.
```

`$COLLECTOR_IMAGE`

```
imageCollector: icp4i_od_collector:1.0.0-amd64
Image will be pulled from the imageRegistry of this CR.
```

- b. During the OpenTracing registration process, name the secret that stores credentials `icp4i-od-store-cred`, and add it to the cluster and into the installation namespace.

5. Enable or disable `syslogConfig`.

```
syslogConfig:
  enabled: false # if true, provide below details
  # remoteHost: $DATAPOWER_SYSLOG_TCP_REMOTE_HOST # must be a string
  # remotePort: $DATAPOWER_SYSLOG_TCP_REMOTE_PORT # must be an int
  # secretName: $DATAPOWER_SYSLOG_TCP_TLS_SECRET # must be a string
```

- To disable syslog, remove the `syslogConfig` block from `apigateway_cr.yaml` and `v5cgateway_cr.yaml`. Alternatively, you can set `syslogConfig.enabled` to `false`.
- To enable `syslogConfig` in the Gateways, set the following values in `apigateway_cr.yaml` and `v5cgateway_cr.yaml`:

enabled

```
enabled: true
```

`$DATAPOWER_SYSLOG_TCP_REMOTE_HOST`

```
remoteHost: <remote.host>
String. The hostname of the server for syslogConfig.
```

`$DATAPOWER_SYSLOG_TCP_REMOTE_PORT`

```
remotePort: <remote_port_number>
Integer. The port number of the server for syslogConfig.
```

`$DATAPOWER_SYSLOG_TCP_TLS_SECRET`

```
secretName: <secret>
String. The TLS secret name of the server for syslogConfig.
```

6. Optional: If applicable to your deployment, update the GatewayCluster CR to configure `DataPowerService` APIs to customize your DataPower deployment. See [Customizing a DataPower deployment](#).
7. Optional: Enable autoscaling of gateway pods to ensure high availability of DataPower pods. See [Enabling autoscaling of gateway pods](#).
8. Install the Gateway Custom Resource by applying the Gateway template file:  
For a DataPower API Gateway, run the following command:

```
kubectl apply -f apigateway_cr.yaml -n <namespace>
```

For a DataPower Gateway (v5 compatible), run the following command:

```
kubectl apply -f v5gateway_cr.yaml -n <namespace>
```

9. To verify that the Gateway subsystem(s) are fully installed, run the following command:

```
kubectl get GatewayCluster -n <namespace>
```

The installation has completed when the **READY** status is **True**, and the **SUMMARY** reports that all services are online ( 2/2) for all the Gateway subsystems that were installed. Example:

NAME	READY	SUMMARY	VERSION	RECONCILED VERSION	AGE
gww5	True	2/2	<version>	<version-build>	7m31s
gww6	True	2/2	<version>	<version-build>	7m32s

There is no need to wait for the **READY** status to be **True** before moving on to the next Subsystem installation.

## What to do next

---

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Installing the Analytics subsystem

Install the IBM® API Connect Analytics subsystem.

### Before you begin

---

Review the section on [Planning your Analytics deployment](#) to ensure that you understand the choices for configuring the topology, disk space, and other elements of the Analytics subsystem.

### Procedure

---

If you plan to store any analytics data locally, complete the following change in your environment to prepare for installing Analytics:

Increase the default map count on every Kubernetes node.

If you plan to store any analytics data locally (that is, do you not intend to disable local storage and offload all data), then you must change the default map counts. When the Analytics service is configured to store data, it uses Elasticsearch, which requires map counts higher than the operating system defaults. The minimum recommended value is **262144**.

If you are deploying on OpenShift, the map count is preconfigured (`vm.max_map_count = 1027580`) with a value that is sufficiently large for Elasticsearch so you do not need to modify this setting.

- To change the map counts on the live system, run the following command on every Kubernetes node:

```
sudo sysctl -w vm.max_map_count=262144
```

- To persist this change when node restarts occur, add the following setting to the `/etc/sysctl.conf` file:

```
vm.max_map_count = 262144
```

For more information, see [Virtual memory](#) in the Elasticsearch documentation.

- [Creating the Analytics CR](#)  
Create the installation CR for IBM API Connect Analytics so that you can deploy the Analytics subsystem.
- [Configuring your topology](#)  
Update the Analytics CR to configure the topology of your IBM API Connect Analytics deployment.
- [Modifying your analytics data](#)  
Update the Analytics CR to customize data in your IBM API Connect Analytics deployment.
- [Defining your internal storage space](#)  
Update the Analytics CR to define the internal storage space for your IBM API Connect Analytics deployment.
- [Installing analytics](#)  
Deploy the Analytics CR to install the Analytics subsystem in your IBM API Connect deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating the Analytics CR

Create the installation CR for IBM® API Connect Analytics so that you can deploy the Analytics subsystem.

## About this task

To install the Analytics subsystem, create a Custom Resource (CR) in a `.yaml` file. The file contains all of your configuration settings for the Analytics deployment. Use the file to install, upgrade, and update the configuration of your Analytics subsystem.

## Procedure

1. Create or copy the `analytics_cr.yaml` file containing the Analytics CR.

You can copy the example CR and customize it for your deployment. You can add new sections to the file if you want to configure additional settings that are not already included. Be sure to honor the spacing used in the file.

Note: The `analytics_cr.yaml` template file is stored in the directory where you extracted `helper_files.zip`.

2. Edit the `analytics_cr.yaml` and update at least the following settings, which are placeholders:

You cannot install the Analytics subsystem until the placeholders are replaced with real values for your environment.

### `$APP_PRODUCT_VERSION`

API Connect application version for the subsystems.

```
version: <version_number>
```

Example version number: 10.0.4.0-ifix3

### `$PROFILE`

The deployment profile you selected in [Planning the Analytics profile and storage](#):

- For **development** use:

```
profile: n1xc2.m16
```

- For **production** use:

```
profile: n3xc4.m16
```

Note: The only supported values for the Analytics subsystem are `n1xc2.m16` and `n3xc4.m16`.

### `$SECRET_NAME`

The name of the secret used to pull images from the Docker registry.

```
imagePullSecrets:  
- apic-registry-secret
```

### `$DOCKER_REGISTRY`

The host name of the Docker Registry to which you uploaded the installation images. For example:

```
my.docker.registry.domain.example.com.
```

### `$STACK_HOST`

The desired ingress subdomain for the API Connect stack. Used when specifying endpoints. Domain names that are used for endpoints cannot contain the underscore "\_" character. You can customize the subdomain or the complete host name:

- Subdomain customization only  
Accept the prefixes predefined for the ingress host names to use and replace all instances of `$STACK_HOST` with the desired ingress subdomain for the API Connect stack. For example, if your host is `myhost.subnet.example.com`:

```
client:  
  endpoint:  
    < ... >  
  hosts:  
    - name: ac.myhost.subnet.example.com  
      secret: analytics-ac-endpoint  
    < ... >  
  ingestion:  
    endpoint:  
      < ... >  
    hosts:  
      - name: ai.myhost.subnet.example.com  
        secret: analytics-ai-endpoint  
      < ... >
```

- Complete hostname customization  
Change both the predefined prefixes and the `$STACK_HOST` subdomain to match your desired host names.

For example, for `client` endpoint, you can replace `admin.$STACK_HOST` with `my.analytics.client.myhost.subnet.example.com`, where `my.analytics.client` replaces `ac`, and `myhost.subnet.example.com` replaces `STACK_HOST`.

```
client:  
  endpoint:  
    < ... >  
  hosts:  
    - name: my.analytics.client.myhost.subnet.example.com  
      secret: analytics-ac-endpoint  
    < ... >
```

### `$STORAGE_CLASS`

The Kubernetes storage class to be used for persistent volume claims (for more information, see [Planning the Analytics profile and storage](#)). Find the available storage classes in the target cluster by running the following command: `kubectl get sc`.

```

storage:
  data:
    volumeClaimTemplate:
      storageClassName: local-storage
  master:
    volumeClaimTemplate:
      storageClassName: local-storage

```

`$DATA_VOLUME_SIZE`

Size of storage allocated for data. If `$DATA_VOLUME_SIZE` is not specified, it defaults to 50Gi. See [Reference: Fields in the Analytics CR](#).

```

storage:
  data:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
      volumeSize: 50Gi
  master:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
      volumeSize: 10Gi

```

3. Edit the `license` setting:

a. Set `accept` to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.

b. Set `metric` to track your product usage. Enter the unit of measure that is used for your program license:

- `PROCESSOR_VALUE_UNIT` - Default value. If you leave the field blank, this value is used.
- `MONTHLY_API_CALL` - Applies only to the IBM API Connect Hybrid Entitlement program.

For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).

c. Set `use` to either `production` or `nonproduction`, to match the license you purchased.

d. Set `license` to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```

license:
  accept: true
  metric: PROCESSOR_VALUE_UNIT
  use: production
  license: L-RJON-BZ5LSE

```

4. Save the file.

## Results

You now have an Analytics CR that is configured with the default Analytics topology described in [Planning your topology](#).

## What to do next

If you do not want to add any more configuration options, skip to the topic on [Defining your internal storage space](#), which is the last step before running the installation.

Otherwise, add configuration options to the CR as explained in the following topics.

- [Reference: Fields in the Analytics CR](#)

Use the table of Analytics-specific fields to configure the CR for installing your IBM API Connect Analytics subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Reference: Fields in the Analytics CR

Use the table of Analytics-specific fields to configure the CR for installing your IBM® API Connect Analytics subsystem.

Table 1 lists the Analytics-specific fields in the `analytics_cr.yaml` file and describes each field. In Table 1, fields are shown using dot notation to indicate nested sections. For example, the field specified in Table 1 as `storage.data.volumeClaimTemplate.volumeSize` should be formatted in the CR as follows:

```

storage:
  data:
    volumeClaimTemplate:
      volumeSize:

```

Table 1. Fields in the Analytics CR that apply to installing the Analytics subsystem

Field	Type	Required	Default value	Description	Comments
<code>client.enabled</code>	boolean	no	<code>true</code>	Whether to deploy this microservice	This microservice serves the Analytics UI and REST API. Only disable it if you do not need the Analytics views in API Connect.
<code>client.endpoint</code>	object	only if <code>client.enabled</code> is <code>true</code>	-	FQDN and TLS Secrets for client endpoint.	Identifies the endpoint that enables the Cloud Manager, API Manager, and Developer Portal to communicate with the Analytics subsystem.

Field	Type	Required	Default value	Description	Comments
client.clientSubjectDN	string	only if client.enabled is <b>true</b>	-	Subject DN (distinguished name) for authenticating with client endpoint (RFC 2253)	
client.style	<b>carbon, bx</b>	no	<b>carbon</b>	UI style for Analytics views	Setting to <b>bx</b> reverts the Analytics UI styles to the v2018 styles. Not recommended.
client.rateLimitEnabled	boolean	no	<b>false</b>	Enabled saved object creation rate limiting	Saved objects refer to dashboards, visualizations, and searches in the UI. This setting enforces a limit on how many can be created per provider organization.
client.rateLimitLimit	integer > 0	no	<b>1000</b>	Max limit of saved objects when enabled	See <b>client.rateLimitEnabled</b> .
client.basePath	string	no	<b>/analytics</b>	Base path of the Analytics web server	Modifying this without modifying unexposed settings in the analytics-proxy causes errors. Not recommended.
client.clientAuthEnabled	boolean	no	<b>true</b>	Whether to enable client auth	Changing this to false causes security issues with the Analytics service. Not recommended.
cronjobs.enabled	boolean	no	<b>true</b>	Whether to deploy this microservice	This microservice manages indexes and data retention in storage. Only disable it if internal storage is also disabled.
cronjobs.retentionSchedule	string	no	<b>30 1 * * *</b>	Cron schedule for <b>cj-retention</b> cronjob	This cronjob cleans up all indices older than the configured data retention age. If you need to run this more or less often based on your data retention settings, configure it here.
cronjobs.rolloverSchedule	string	no	<b>15,45 * * *</b>	Cron schedule for <b>cj-rollover</b> cronjob	This cronjob attempts to rollover the storage index. If you need to run this more or less often based on your index rollover settings, configure it here.
ingestion.enabled	boolean	no	<b>true</b>	Whether to deploy this microservice	This microservice routes analytics data to internal or external storage. There is no supported topology of Analytics that disables this microservice.
ingestion.endpoint	object	if ingestion.enabled == <b>true</b>	-	FQDN and TLS Secrets for client endpoint	Identifies the endpoint that enables the Gateway to push your analytics data. Must be different from the <b>client.endpoint</b>
ingestion.clientSubjectDN	string	if ingestion.enabled == <b>true</b>	-	Subject DN (distinguished name) for authenticating with ingestion endpoint (RFC 2253)	
ingestion.geoIPEnabled	boolean	no	<b>false</b>	Whether to decorate API event data with geoip data	This populates the client_geoip and gateway_geoip fields using the IPs in client_ip and gateway_ip, respectively.
ingestion.filter	string	no	<b>"</b>	Filter to modify all API event data	See <a href="#">Modifying your analytics data</a> for more information.
ingestion.pipelineWorkers	4 <= integer <= 128	no	<b>24</b>	Number of pipeline workers	More workers means more CPU and memory requirements, but gives you the benefit of additional threads to pull data off the ingestion http interface and process it for storage. This has diminishing returns as the size increases, and should usually be multiple of the number of cores on your hardware. Adjust with caution.
ingestion.pipelineBatchSize	10 <= integer <= 10000	no	<b>250</b>	Batch size of a pipeline worker	Pulling more or less data off the http interface per worker can have benefits. Ideally this would limit impedance on match batches sent from the gateway, but that is not a proven result. Recommended values are <b>125, 250, and 500</b> . Increasing the value requires more memory. Adjust with caution.
ingestion.pipelineBatchDelay	10 <= integer <= 5000	no	<b>50</b>	Batch delay of a pipeline worker	How long to wait for the batch size to fill before leaving the http interface to process for storage. Having threads wait too long causes idle threads in your system; however, setting this value too low decreases performance. Adjust with caution.
ingestion.pipelineUnsafeShutdown	boolean	no	<b>false</b>	Whether to allow unsafe shutdown of the pipeline	Typically, the pipeline attempts to empty all workers' batches before shutting down, to prevent data loss. You might need to enable this setting if the pipeline is badly configured and refuses to respond to kill requests (extremely uncommon). Adjust with caution.
ingestion.configReloadAutomatic	boolean	no	<b>true</b>	Whether to automatically reload the pipeline on configuration changes	Typically, when the underlying files for the pipeline are modified, the pipeline process automatically reloads and picks up the changes. However, in Kubernetes environments where the pipeline is mapped to configmaps, this is unreliable. Ingestion microservice restarts are usually required.
ingestion.clientAuthEnabled	boolean	no	<b>true</b>	Whether to enable client auth	Setting this to false does not improve performance and makes Analytics extremely insecure. Not recommended at this time.
mq.enabled	boolean	no	<b>false</b>	Whether to deploy these microservices	See <a href="#">Adding a message queue</a> for more information.

Field	Type	Required	Default value	Description	Comments
mq.kafka.volumeClaimTemplate.storageClassName	string	no	default	Storage class name	Name of the storage class configured to use for creating the microservice persistent volume.
mq.kafka.volumeClaimTemplate.volumeSize	string	no	5Gi	Volume size	Size of the volume used for kafka. See <a href="#">MQ storage: estimate disk space needs</a> for more information.
mq.zk.volumeClaimTemplate.storageClassName	string	no	default	Storage class name	Name of the storage class configured to use for creating the microservice persistent volume.
mq.zk.volumeClaimTemplate.volumeSize	string	no	5Gi	Volume size	Size of the volume used for zk. See <a href="#">MQ storage: estimate disk space needs</a> for more information.
storage.enabled	boolean	no	true	Whether to deploy this microservice	this microservice is used for storing and aggregating your data. only disable if you are only offloading and do not need internal storage
storage.type	unique,shared	no	unique	Type of storage deployment	See <a href="#">Reducing storage complexity</a> for more information.
storage.coord.clientAuthEnabled	boolean	no	true	Whether to enabled client auth	Setting this to false does not improve performance and makes Analytics extremely insecure. Not recommended.
storage.data.volumeClaimTemplate.storageClassName	string	no	default	Storage class name	Name of the storage class configured to use for creating the microservice persistent volume
storage.data.volumeClaimTemplate.volumeSize	string	no	50Gi	Volume size	Size of the volume used for data storage. See <a href="#">Estimating internal storage space</a> for more information.
storage.data.clientAuthEnabled	boolean	no	true	Whether to enabled client auth	Setting this to false does not improve performance and makes Analytics extremely insecure. Not recommended.
storage.master.volumeClaimTemplate.storageClassName	string	no	default	Storage class name	Name of the storage class configured to use for creating the microservice persistent volume.
storage.master.volumeClaimTemplate.volumeSize	string	no	5Gi	Volume size	Size of the volume used for data storage. See <a href="#">Estimating internal storage space</a> for more information.
storage.master.clientAuthEnabled	boolean	no	true	Whether to enabled client auth	Setting this to false does not improve performance and makes Analytics extremely insecure. Not recommended.
storage.shared.volumeClaimTemplate.storageClassName	string	no	default	Storage class name	Name of the storage class configured to use for creating the microservice persistent volume
storage.shared.volumeClaimTemplate.volumeSize	string	no	50Gi	Volume size	Size of the volume used for data storage. See <a href="#">Estimating internal storage space</a> for more information.
storage.shared.clientAuthEnabled	boolean	no	true	Whether to enabled client auth	Setting this to false does not improve performance and makes Analytics extremely insecure. Not recommended.
external.offload.enabled	boolean	no	false	Whether to enable this integration	See <a href="#">Offloading data to a third-party system</a> for more information.
external.offload.filter	string	no	" "	Filter configuration for external offload	See <a href="#">Offloading data to a third-party system</a> for more information.
external.offload.output	string	no	" "	Output configuration for external offload	See <a href="#">Offloading data to a third-party system</a> for more information.
external.offload.secretName	string	no	" "	Name of secret for mounting files to use in external offload configuration	See <a href="#">Offloading data to a third-party system</a> for more information.
databaseBackup.host	string	no	" "	The URL to your S3 storage.	See <a href="#">Configuring backup settings for Analytics</a>
databaseBackup.path	string	no	" "	The path to your S3 storage at the URL specified by <code>databaseBackup.host</code>	See <a href="#">Configuring backup settings for Analytics</a>
databaseBackup.schedule	string	no	" "	Specifies the frequency of automatic backups, using any valid <code>cron</code> string.	See <a href="#">Configuring backup settings for Analytics</a>

Field	Type	Required	Default value	Description	Comments
databaseBackup.credentials	string	no	""	The name of the secret used for authenticating with your S3 storage	See <a href="#">Configuring backup settings for Analytics</a>
databaseBackup.enableCompression	boolean	no	true		See <a href="#">Configuring backup settings for Analytics</a>
databaseBackup.chunkSize	string	no	1Gi		See <a href="#">Configuring backup settings for Analytics</a>
databaseBackup.enableServerSideEncryption	boolean	no			See <a href="#">Configuring backup settings for Analytics</a>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring your topology

Update the Analytics CR to configure the topology of your IBM® API Connect Analytics deployment.

### About this task

Based on the decisions you made while [defining your topology](#), configure your the deployment options by completing the steps in the following topics to add a message queue, configure data offloading, and reduce storage complexity.

- [Adding a message queue](#)  
Enable a message queue to increase reliability in the analytics data pipeline in your IBM API Connect Analytics deployment.
- [Offloading data to a third-party system](#)  
Update the Analytics CR to configure data offloading from your IBM API Connect Analytics deployment to a third-party system.
- [Reducing storage complexity](#)  
Update the Analytics CR to scale down the amount of services managing data storage in your IBM API Connect Analytics deployment.
- [Disabling internal storage](#)  
Update the Analytics CR to offload all data and disable local storage in your IBM API Connect Analytics deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Adding a message queue

Enable a message queue to increase reliability in the analytics data pipeline in your IBM® API Connect Analytics deployment.

### About this task

For information about using a message queue in your Analytics deployment, see [Planning to add a message queue](#).

### Procedure

1. Open the analytics\_cr.yaml file for editing.
2. Add the following section to the `spec` section of the CR:

```
mq:
  enabled: true
  kafka:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
  zk:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
```

where `$STORAGE_CLASS` is the Kubernetes storage class to be used for persistent volume claims (for more information, see [Planning the Analytics profile and storage](#)).

Find the available storage classes in the target cluster by running the following command: `kubectl get sc`.

```
storage:
  data:
    volumeClaimTemplate:
      storageClassName: local-storage
```

```
master:
  volumeClaimTemplate:
    storageClassName: local-storage
```

3. Save the file.
4. Optional: If you want to increase the message size limit for the message queue, see [Overriding size limits for message queue](#).

## What to do next

If you do not want to add any more configuration options, skip to the topic on [Defining your internal storage space](#), which is the last step before running the installation.

Otherwise, continue adding configuration options to the CR as explained in the following topics.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Offloading data to a third-party system

Update the Analytics CR to configure data offloading from your IBM® API Connect Analytics deployment to a third-party system.

### About this task

On Kubernetes, add your changes to the `spec` section of the Analytics CR. On OpenShift or Cloud Pak for Integration, add your changes to the `spec.analytics` section of the top-level CR.

For information about offloading data from your Analytics deployment, see [Planning to offload data to a third-party system](#).

### Procedure

1. Open the `analytics_cr.yaml` file for editing.
2. Add the following section to the `spec` section of the CR:  
Kubernetes:

```
spec:
  external:
    offload:
      enabled: true
      output: |
        $EXTERNAL_OFFLOAD_OUTPUT
```

OpenShift and Cloud Pak for Integration:

```
spec:
  analytics:
    external:
      offload:
        enabled: true
        output: |
          $EXTERNAL_OFFLOAD_OUTPUT
```

where `$EXTERNAL_OFFLOAD_OUTPUT` is the plugin output for the target third-party system.

For example, the following example enables offloading to HTTP from a Kubernetes deployment:

```
spec:
  external:
    offload:
      enabled: true
      output: |
        http {
          url => "example.com"
          http_method => "post"
          codec => "json"
          content_type => "application/json"
          id => "offload_http"
        }
```

For examples of output plugins, see [Sample output plugins for offloading data](#).

3. Optional: Modify the output plugin to include certificates for connecting to a secure endpoint.  
If your third-party endpoint requires a particular certificate, you can configure the certificate and then reference it in the offload plugin. Include the `secretName` as well as the `caCert`, `client_cert`, and `client_key` settings.

For example, the following output plugin enables offloading to HTTP from a Kubernetes deployment, and provides information on the certificate that is needed for authenticating with the endpoint:

```
spec:
```

```

external:
  offload:
    secretName: offload-certificates
    enabled: true
    output: |
      http {
        url => "https://example.com:443"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload_http"
        cacert => "/etc/velox/external_certs/offload/cacert.pem"
        client_cert => "/etc/velox/external_certs/offload/client.pem"
        client_key => "/etc/velox/external_certs/offload/client.key"
      }

```

The secret and its defined files are mounted to the `/etc/velox/external_certs/offload` directory.

For information on creating a secret to store the certificates, see [Providing a custom certificate for Analytics offload](#).

4. Optional: Add a `filter` after the output plugin to modify data prior to offloading it.

The following example filter for a Kubernetes deployment removes the `query_string` field:

```

spec:
  external:
    offload:
      enabled: true
      output: |
        http {
          url => "example.com"
          http_method => "post"
          codec => "json"
          content_type => "application/json"
          id => "offload_http"
        }
      filter: |
        ruby {
          remove_field => ["query_string"]
        }

```

For information about modifying offloaded data, see [Planning to modify your analytics data](#).

5. Save the file.

## What to do next

If you do not want to add any more configuration options, skip to the topic on [Defining your internal storage space](#), which is the last step before running the installation.

Otherwise, continue adding configuration options to the CR as explained in the following topics.

- [Sample output plugins for offloading data](#)  
Review sample output plugins to see how to code your own plugins for offloading data from IBM API Connect Analytics.
- [Providing a custom certificate for Analytics offload](#)  
Prepare a private or self-signed certificate for offloading data and then add it to the IBM API Connect Analytics deployment on Kubernetes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Sample output plugins for offloading data

Review sample output plugins to see how to code your own plugins for offloading data from IBM® API Connect Analytics.

Configure output plugins that direct analytics data to your third-party systems. An output plugin specifies where analytics data is offloaded, plus any information required to access that system, such as certificate information. The output plugin for displaying analytics data in the Analytics user interface is configured by default.

Note: If your third-party system requires a private or self-signed certificate, configure it as explained in [Providing a custom certificate for Analytics offload](#) and include a reference to the certificate in your output plugin. See the second HTTP output plugin for an example of how to reference the certificate.

## HTTP

To configure data offload to an HTTP server, you must provide the server URL. You can optionally add standardized or custom HTTP headers to define additional operating parameters.

The following example configures an HTTP output plugin.

```

http {
  url => "example.com"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  id => "offload_http"
}

```

The following example configures an HTTP output plugin that references a custom certificate for accessing the third-party endpoint.

```
http {
  url => "https://example.com:443"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  id => "offload_http"
  cacert => "/etc/velox/external_certs/offload/cacert.pem"
  client_cert => "/etc/velox/external_certs/offload/client.pem"
  client_key => "/etc/velox/external_certs/offload/client.key"
}
```

For more information on offloading to HTTP, refer to the Logstash documentation on configuring the [HTTP output plugin](#).

## Elasticsearch V6, V7

---

To configure data offload to an Elasticsearch cluster, you must provide one or more server URLs, define how indices should be created by specifying a dynamically configured name, specify the number of primary shards for storing the indexed documents, and specify a number of replica shards for redundancy. You can optionally specify server authentication credentials.

The naming syntax that you specify for your indices determines how many indices are created and how they are characterized. For example, you can define indices that are created based on a date pattern (for example, daily or weekly), or indices that are created to store data by provider organization or by API name.

The following example configures an Elasticsearch output plugin.

```
elasticsearch {
  hosts => "https://example.com:443"
  index => "apiconnect"
  ssl => true
  cacert => "/etc/pki/tls/cert.pem"
}
```

For more information on offloading to Elasticsearch, refer to the Elasticsearch documentation on the [Elasticsearch output plugin](#).

## Apache Kafka V1.0.0

---

To configure data offload to a Kafka cluster, you must provide host and port connection details for one or more servers, and the name of the Kafka topic to which you want to publish the offloaded data. For logging and monitoring purposes within Kafka, you can optionally specify a string identifier by which API Connect can be uniquely identified.

The following example configures a Kafka output plugin.

```
kafka {
  topic_id => "test"
  bootstrap_servers => "example.com:9093"
  codec => "json"
  id => "kafka_offload"
  ssl_truststore_location => "/usr/share/logstash/jdk/lib/security/cacerts"
  ssl_truststore_password => "changeit"
  ssl_truststore_type => "JKS"
  security_protocol => SSL
}
```

For more information on offloading to Apache Kafka, refer to the Logstash documentation on the [Kafka output plugin](#). Note that the Logstash plugin is based on kafka-client version 2.3.1 and not v2.1.0 as specified in the Logstash documentation.

## Syslog

---

To configure data offload to Syslog, you must provide host and port connection details for the server.

Restriction: Syslog does not support the use of chained client certificates for TLS profiles.

The following example configures a Syslog output plugin.

```
syslog {
  host => "example.com"
  port => 601
  protocol => "ssl-tcp"
  id => "offload_syslog"
  appname => "apiconnect"
  msgid => "%{org_id}"
  facility => "log_audit"
  severity => "informational"
  codec => "json"
  ssl_cacert => "/etc/pki/tls/cert.pem"
}
```

Attention: Due to a third-party issue with Logstash, most of the facility values are not set correctly on the offload server. As a temporary workaround, set the facility to "user-level" to ensure that the corresponding value is correctly sent to the offload server. When Logstash corrects this problem, you must update the offload configuration to change the value to a more appropriate setting.

For more information on offloading to Syslog, refer to the Logstash documentation on the [Syslog output plugin](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Reducing storage complexity

Update the Analytics CR to scale down the amount of services managing data storage in your IBM® API Connect Analytics deployment.

### About this task

---

For information about reducing storage requirements in your Analytics deployment, see [Planning to reduce storage complexity](#).

### Procedure

---

1. Open the `analytics_cr.yaml` file for editing.
2. Replace the existing `storage` section in your analytics CR with the following snippet:

```
storage:
  type: shared
  shared:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
```

where `$STORAGE_CLASS` is the Kubernetes storage class to be used for persistent volume claims (for more information, see [Planning the Analytics profile and storage](#)). Find the available storage classes in the target cluster by running the following command: `kubectl get sc`.

```
storage:
  data:
    volumeClaimTemplate:
      storageClassName: local-storage
  master:
    volumeClaimTemplate:
      storageClassName: local-storage
```

3. Save the file.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Disabling internal storage

Update the Analytics CR to offload all data and disable local storage in your IBM® API Connect Analytics deployment.

### About this task

---

For information about disabling internal storage in your Analytics deployment, see [Planning to disable internal storage](#).

### Procedure

---

1. Required: Configure data offloading as explained in [Offloading data to a third-party system](#). Before you disable internal storage, ensure that data is offloading properly to your third-party system. Then complete the remaining steps to disable internal storage of analytics data.
2. Open the `analytics_cr.yaml` file for editing.
3. In the `spec` section, locate the `client` section and replace it with the following lines:

```
client:
  enabled: false
```

4. Add the following section into the `spec` section of the file:  
You can append the new section to the end of the file. Be sure to follow the spacing that is already in use in the file.

```
cronjobs:
  enabled: false
```

5. Locate the `storage` section and replace it with the following lines:

```
storage:
  enabled: false
```

6. Save the file.

---

## What to do next

If you do not want to add any more configuration options, skip to the topic on [Defining your internal storage space](#), which is the last step before running the installation.

Otherwise, continue adding configuration options to the CR as explained in the following topics.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Modifying your analytics data

Update the Analytics CR to customize data in your IBM® API Connect Analytics deployment.

### Before you begin

Review the use of filters for modifying analytics data, and make sure that you understand the restrictions. For information about customizing data, see [Planning to modify your analytics data](#).

### About this task

Customizing the analytics data is optional. You can enable the inclusion of geoIP information, and define filters that add, modify, or remove other fields.

Upgrade note: In V2018, multiple configuration files were used for defining filters that were applied at different points in the ingestion pipeline. In V10, you define filters in the `analytics_cr.yaml` file.

### Procedure

1. Open the `analytics_cr.yaml` file for editing.
2. Enable the inclusion of geoIP fields in your analytics data by looking in the `ingestion` section, locating the `ingestion` section, and inserting the following lines:

```
spec:
  ingestion:
    ...
    geoIPEnabled: true
```

By default the `client_geoip` and `gateway_geoip` fields are not included in the analytics data. These are calculated from the `client_ip` and `gateway_ip` fields, respectively. Setting `geoIPEnabled` to `true` enables this feature.

3. Locate the appropriate `filter` section and add a filter definition. You can add filters for `ingestion` and for `offloading`, so be sure to add your filter to the correct section. For information about where to add filters for local data and offloaded data, see [Which pipeline is affected by the filter?](#)

For example filters, see [Sample filters for modifying analytics data](#).

For example, you can add a filter into the `ingestion` section, just after the `geoip` filter added in the previous step. The following example filter removes the `query_string` field:

```
spec:
  ingestion:
    ...
    geoIPEnabled: true
    filter: |
      mutate {
        remove_field => ["query_string"]
      }
```

4. Save the file.

### What to do next

Proceed to the topic on [Defining your internal storage space](#), which is the last step before running the installation.

- [Sample filters for modifying analytics data](#)  
Review sample filters to see how to code your own filters for refining IBM API Connect Analytics data by adding fields, removing fields, or modifying field contents.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Sample filters for modifying analytics data

Review sample filters to see how to code your own filters for refining IBM® API Connect Analytics data by adding fields, removing fields, or modifying field contents.

You can use these sample filters in the `ingestion.filter` and the `external.offload.filter` configurations.

## Adding a new field

You can add custom data to API event data by adding a field to the logging document. For example, if you want to search or visualize data that is stored in request and response headers, you can add fields to a filter to include that information.

To avoid naming conflicts with future or current analytics fields, include a prefix that ensures your new field name is unique. For example, instead of naming the field `employee_num` you might name it `x_mycompany_employee_num`.

The following example copies the contents of the `X-Employee-Num` field from the request header and adds it to the `x_mycompany_employee_num` field in the event data. Adding the field to the event data enables you to use the information in visualizations.

```
if [request_http_headers] {
  ruby {
    code => "event.get(['request_http_headers']).collect {|i| event.set(['x_mycompany_employee_num'], i['X-Employee-Num']) if
i.has_key?('X-Employee-Num')}"
  }
}
```

## Modifying an existing field

Sometimes you don't want to remove a field entirely from your data, you just want to redact sensitive information such as IDs to prevent them from being exposed in visualizations. You can modify the contents of a field and replace information with a symbols or a message.

Remember: The following fields should not be modified if the data is being written to internal analytics storage: `org_id`, `catalog_id`, `space_id`, `developer_org_id`, `datetime`, and `@timestamp`.

The following example replaces sensitive information in the `X-Employee-Name` and `X-Employee-ID` request headers with the string: `*****sanitized*****`.

```
if [request_http_headers] {
  ruby {
    code => "headers=['X-Employee-Name','X-Employee-ID']; newHeaders = event.get(['request_http_headers']).collect {|i|
headers.each {|header| i[header] = '*****sanitized*****' if i.has_key?(header)}; i}; event.set(['request_http_headers'],
newHeaders)"
  }
}
```

## Removing an existing field

Use the mutate `remove_field` operation to delete a field from the Analytics data. To remove multiple fields, delimit the field names with commas.

The following example removes multiple fields (`request_http_headers`, `response_http_headers`, `request_body`, `response_body`, and `query_string`) from the Analytics data:

```
mutate {
  remove_field => ["request_http_headers", "response_http_headers", "request_body", "response_body", "query_string"]
}
```

## Filter and output plugin for splunk

When you create a filter for use with splunk, you must also create an output plugin for it.

Filter:

```
if "apicapievent" in [tags] {
  ruby {
    code => "event.set(['@metadata][newevent]', event.to_json)"
  }
}
```

Output plugin:

```
http {
  url => "http://your-domain/services/collector/event"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  id => "offload_http"
  format => "message"
  message => '{"event": "%{[@metadata][newevent]}", "index": "applications-int-ms", "sourcetype": "json:apimlogs"}'
  headers => ["Authorization", "Splunk XXXX"]
}
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining your internal storage space

Update the Analytics CR to define the internal storage space for your IBM® API Connect Analytics deployment.

## Before you begin

This task only applies to deployments that use internal storage or have a message queue enabled. If you disabled internal storage but did not enable the message queue, then skip this task.

Review [Estimating internal storage space](#) to make sure you know how much disk space to allocate for internal storage. If you disabled internal storage, skip this task.

## About this task

For information about offloading data from your Analytics deployment, see [Planning to offload data to a third-party system](#).

The steps that you complete to define your internal storage allocations depend on the deployment options that you configured.

### Data & Master storage

Complete the following steps only if you did not configure shared storage (described in [Reducing storage complexity](#)).

1. Open the `analytics_cr.yaml` file for editing.
2. In the CR, locate the `storage.data.volumeClaimTemplate` section and add the `volumeSize` field as shown in the following example.

```
storage:
  data:
    volumeClaimTemplate:
      storageClassName: ...
      volumeSize: $DATA_VOLUME_SIZE
```

Replace `$DATA_VOLUME_SIZE` with the value that you calculated for `Storage per node` in [Data storage: calculate how much data you want to store](#).

3. Next, locate the `storage.master.volumeClaimTemplate` section and add the `volumeSize` field as shown in the following example.

```
storage:
  master:
    volumeClaimTemplate:
      storageClassName: ...
      volumeSize: $VOLUME_SIZE
```

Replace `$VOLUME_SIZE` with the value that you calculated in [Master storage: estimate disk space needs](#).

4. Save the file.
5. Skip to the section for MQ storage.

### Shared storage

Complete the following steps only if you configured shared storage by completing the steps in [Reducing storage complexity](#) to set `storage.type: shared`.

1. Open the `analytics_cr.yaml` file for editing.
2. In the CR, locate the `storage.shared.volumeClaimTemplate` section and add the `volumeSize` field as shown in the following example.

```
storage:
  shared:
    volumeClaimTemplate:
      storageClassName: ...
      volumeSize: $STORAGE_PER_NODE
```

Replace `$STORAGE_PER_NODE` with the value that you calculated for `Storage per node` in [Data storage: calculate how much data you want to store](#).

3. Save the file.
4. Continue to the section for MQ storage.

### MQ storage

Complete this procedure only if you added a message queue to your Analytics topology by setting `mq.enabled: true` as explained in [Adding a message queue](#).

1. In the CR, locate the `mq.zk.volumeClaimTemplate` section and add the `volumeSize` field as shown in the following example.

```
mq:
  zk:
    volumeClaimTemplate:
      storageClassName: ...
      volumeSize: $VOLUME_SIZE
```

Replace `$VOLUME_SIZE` with the value that you calculated for `mq-zk` in [MQ storage: estimate disk space needs](#).

2. In the CR, locate the `mq.kafka.volumeClaimTemplate` section and add the `volumeSize` field as shown in the following example.

```
mq:
  kafka:
    volumeClaimTemplate:
      storageClassName: ...
      volumeSize: $VOLUME_SIZE
```

Replace `$VOLUME_SIZE` with the value that you calculated for `mq-kafka` in [MQ storage: estimate disk space needs](#).

3. Save and close the file.

## What to do next

Your Analytics configuration is complete. Proceed to [Installing analytics](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing analytics

Deploy the Analytics CR to install the Analytics subsystem in your IBM® API Connect deployment.

### Before you begin

Now that you have a complete analytics custom resource file, you should double-check it for accuracy. In particular, verify that:

- No placeholder values remain in the analytics\_cr.yaml file.
- You configured all the topology options that you plan to deploy.
- You configured appropriate volume sizes for storage and message queue.

### Procedure

1. Run the following command to apply the analytics\_cr.yaml:

```
kubectl apply -f path/to/analytics-cr -n namespace
```

where:

- `path/to/analytics-cr` is the path to your saved analytics\_cr.yaml file
- `namespace` is the name of your namespace

2. Verify that the analytics subsystem is fully installed by running the following command:

```
kubectl get AnalyticsCluster -n namespace
```

where `namespace` is the name of your namespace.

The installation is complete when the **READY** status is **True** and the **SUMMARY** reports that all services are online. Example:

NAME	READY	SUMMARY	VERSION	RECONCILED	VERSION	AGE
analytics	True	8/8	<version>	<version-build>		7m39s

The **SUMMARY** total count is based on your configured topology. Both numbers are be equal when the installation is complete.

### Results

Table 1 lists the number of microservices that should deploy, along with notes on which topologies might not include each microservice.

Table 1. Number of microservices deployed in typical Analytics subsystems

Expected	Microservice	Note
3	client	Not expected if disabled internal storage
n/a	cj-retention	Not expected if disabled internal storage
n/a	cj-rollover	Not expected if disabled internal storage
3	ingestion	Always expected
3	mq-kafka	Not expected if did not add message queue
3	mq-zk	Not expected if did not add message queue
3	mtls-gw	Always expected
3	storage-coord	Not expected if disabled internal storage or reduced storage complexity
3	storage-data	Not expected if disabled internal storage or reduced storage complexity
3	storage-master	Not expected if disabled internal storage or reduced storage complexity
3	storage-shared	Not expected if disabled internal storage or did not reduce storage complexity

Depending on your configured topology, some of the microservices in Table 1 are not expected to deploy. Refer to the appropriate planning topic for your topology option to check whether a particular microservice should exist.

The **development** profile only expects 1 (instead of 3) of each microservice.

The microservices **cj-retention** and **cj-rollover** are only created when needed on a cron schedule. They will probably not be included in the initial installation results.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Deploying on OpenShift and Cloud Pak for Integration

You can install API Connect in an OpenShift environment or as the API Management capability in IBM Cloud Pak for Integration.

If you are deploying multiple API Connect instances in the same OpenShift cluster, all of them should be at the same version. The recommended configuration is to have a single operator in the global namespace, managing multiple API Connect instances in separate namespaces.

- [Preparing for installation](#)  
Set up your OpenShift or Cloud Pak for Integration environment in preparation for deploying API Connect.
- [Installing with the top-level CR](#)  
Use the single, top-level `APIConnectCluster` CR to deploy API Connect on OpenShift or Cloud Pak for Integration.
- [Troubleshooting installation and upgrade on OpenShift](#)  
Review the following troubleshooting tips if you encounter a problem while installing or upgrading API Connect on OpenShift, including as a component of IBM Cloud Pak for Integration (CP4I).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Preparing for installation

Set up your OpenShift or Cloud Pak for Integration environment in preparation for deploying API Connect.

---

### About this task

Ensure that your environment meets the all prerequisites, plan your deployment, and download files for installation.

---

### Procedure

1. Ensure that your environment meets the following prerequisites:
  - [IBM API Connect Version 10 software product compatibility requirements](#)
  - [Deployment requirements](#)
  - API Connect installation requires an OpenShift 4.6.16 (or later) cluster and the `oc` command line utility. If you want to use the OpenShift web console, Cluster admin access is required.
  - API Connect requires `block storage` as the storage class for all subsystems.
  - Set the default SCC (security context constraint) to `restricted`. API Connect supports only the `restricted` SCC on OpenShift.
  - If your OpenShift deployment uses a `LimitRange` and a CPU `maxLimitRequestRatio` is set, then its value must be at least 25; otherwise some API Connect pods might fail to start.
2. Plan your deployment as explained in [Planning your deployment](#).
3. Review [Operator, operand, and CASE versions](#) to determine the operator, operand, and CASE versions that you need for your deployment.
4. Download files for installation as explained in [Obtaining product files](#).
5. Optional: Specify additional settings in each subsystem CR to define the deployment's configuration before beginning the installation. In particular, consider increasing the timeout value for Management endpoints as explained in [Configuring timeouts for management endpoints](#).

For information on other configuration settings, see [API Connect configuration settings](#).

Tip: If you choose not to specify configuration settings now, you can modify the installation CRs later and then re-apply them to update the deployment.

- [Operator, operand, and CASE versions](#)  
When you install API Connect on OpenShift or Cloud Pak for Integration, each release of API Connect supports a new combination of operator and operand, as well as a new CASE version for air-gapped installations.
- [API Connect configuration settings](#)  
Specify configuration settings for API Connect in the CR on OpenShift, and in the CR or the Automation Platform UI in Cloud Pak for Integration.
- [Configuring timeouts for management endpoints](#)  
Adjust the timeout settings for management endpoints by updating the CR.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Operator, operand, and CASE versions

When you install API Connect on OpenShift or Cloud Pak for Integration, each release of API Connect supports a new combination of operator and operand, as well as a new CASE version for air-gapped installations.

Table 1 lists the operator, operand, and CASE information that applies to each release of API Connect in the 10.0.x stream through 10.0.4.x

Note: For information on operators, operands, and CASE versions for the latest version of API Connect, see the [corresponding topic in the API Connect 10.0.5.x documentation](#).

Table 1. Operators and operands for API Connect

API Connect release	Operator channel	Operator version	Operand version	CASE	DataPower operator channel
10.0.4.0-ifix3	v2.5	2.5.1	10.0.4.0-ifix3	3.0.7	v1.5
10.0.4.0-ifix2	v2.5	2.5.0	10.0.4.0-ifix2	3.0.6	v1.5
10.0.4.0-ifix1	v2.4	2.4.1	10.0.4.0-ifix1	3.0.5	v1.5
10.0.4.0	v2.4	2.4.0	10.0.4.0	3.0.4 (replaced 3.0.3)	v1.5
10.0.3.0	v2.3	2.3.0	10.0.3.0	3.0.1	v1.4
10.0.2.0	v2.2	2.2.0	10.0.2.0	3.0.0	v1.3

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API Connect configuration settings

Specify configuration settings for API Connect in the CR on OpenShift, and in the CR or the Automation Platform UI in Cloud Pak for Integration.

You can use the IBM Cloud Pak Platform UI or OpenShift web console to specify advanced configuration options for API Connect. The following topics describe the available configuration options.

Attention: A mistake in a configuration update can result in an admission webhook error when `APIConnectCluster` is updated, or the `APIConnectCluster` can get stuck in a pending state with a webhook error message.

- Example of an admission webhook error when the `APIConnectCluster` update is rejected:  
In this example, the user attempted to change the deployment profile to `n12xc4.m12-incorrect` and the result looked like the following example:

```
oc edit apiconnectcluster
```

```
error: apiconnectclusters.apiconnect.ibm.com "production" could not be patched: admission webhook "vapiconnectcluster.kb.io" denied the request: APIConnectCluster.apiconnect.ibm.com "production" is invalid: spec.Profile: Invalid value: "n12xc4.m12-incorrect": invalid profile. Options are: [n3xc4.m16 n12xc4.m12]
```

- Example of when the `APIConnectCluster` update is allowed, but is the state changes pending due to an underlying webhook error:

```
oc get apiconnectcluster -n apic
```

```
NAME   READY STATUS      VERSION      RECONCILED VERSION  AGE
m1     admission webhook "vmanagementcluster.kb.io" denied the request: ManagementCluster.management.apiconnect.ibm.com "m1-mgmt" is invalid: [spec.databaseBackup.restartDB.accept: Invalid value: false: databaseBackup protocol has changed (from ' ' to 'objstore') and requires database restart. accept restartDB to restart database, spec.databaseBackup.restartDB.accept: Invalid value: false: databaseBackup configuration has changed and requires database restart. accept restartDB to restart database] Pending  10.0.1.5-3388-eus  10.0.1.5-3388-eus  2d6h
```

Basic configuration

- [Basic configuration settings](#)

Advanced configuration

To enable access to the advanced configuration settings with Platform UI, toggle the Advanced Options slider.

- [Analytics subsystem settings](#)
- [Gateway subsystem settings](#)
- [Management subsystem settings](#)
- [Developer Portal subsystem settings](#)
- [Additional Kubernetes settings](#)

Additional configuration

You must edit the yaml file to set additional properties.

- [Basic configuration settings](#)  
You can specify the API Connect basic configuration settings.
- [Management subsystem settings](#)  
You can specify advanced configuration settings for the Management subsystem
- [Gateway subsystem settings](#)  
You can specify advanced configuration settings for the Gateway subsystem.
- [Developer Portal subsystem settings](#)  
You can specify advanced configuration options for the Developer Portal subsystem.
- [Analytics subsystem settings](#)  
You can specify advanced configuration settings for the Analytics subsystem.
- [Additional Kubernetes settings](#)  
For each API Connect subsystem, you can specify additional settings for annotations and pod management.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Basic configuration settings

You can specify the API Connect basic configuration settings.

Review the tables for information on configuration settings for the following areas:

- [Details](#)
- [License](#)
- [Deployment profiles for installing with a single, top-level CR](#)
- [Product version](#)
- [Storage class](#)

### Details

Table 1. Details

Field	Type	Required	Description
Name	String	Yes	Name this instance using only lowercase alphanumeric characters plus the underscore "-". Maximum of 54 characters. Default: none

### License

Table 2. License

Field	Type	Required	Description
License acceptance	Boolean	Yes	The license agreement <a href="https://ibm.biz/apictoolkitlic">https://ibm.biz/apictoolkitlic</a> must be accepted before you can install the API Connect capability. Default value: <code>false</code> (off). In the UI, click the License acceptance toggle to enable it. In the CR, set the <code>accept:</code> field to <code>true</code> to accept the license.
License use	String	Yes	Select <code>production</code> or <code>nonproduction</code> , to match the license you purchased. Default: <code>nonproduction</code>
License metric	Enumerated	No	Enter the unit of measure that is used for your program license:  OpenShift <ul style="list-style-type: none"><li>• <code>PROCESSOR_VALUE_UNIT</code> - Default value. If you leave the field blank, this value is used.</li><li>• <code>MONTHLY_API_CALL</code> - Applies only to the IBM API Connect Hybrid Entitlement program.</li></ul> Cloud Pak for Integration <ul style="list-style-type: none"><li>• <code>VIRTUAL_PROCESSOR_CORE</code> - Default value. If you leave the field blank, this value is used.</li><li>• <code>MONTHLY_API_CALL</code> - Applies only to the IBM Cloud Pak for Integration - API Calls add-on program.</li></ul> For information on tracking monthly call volume, see <a href="#">Tracking API volume for auditing and compliance</a> .
License ID	String	Yes	Select the license that you purchased for this instance of API Connect. Valid licenses are based on the selected value in the Product version field (see Table 4). When deploying the standalone IBM API Connect product, you must select the License ID for the API Connect program that you purchased. To view all License IDs, see <a href="#">API Connect licenses</a> .

### Deployment profiles for installing with a single, top-level CR

Select a deployment profile for the new installation. Refer to Table 3 for descriptions of the profiles.

Table 3. Deployment profiles

Field	Type	Required	Description
Deployment profile	Enumerated	Yes, 1 profile for the entire deployment	Select the type of API Connect profile that you want to install for the deployment: <ul style="list-style-type: none"><li>• <code>n3xc4.m16</code> - Non-production, 1 node</li><li>• <code>n1xc10.m48</code> - Non-production, 1 node, reduced CPU for API Connect subsystems</li><li>• <code>n1xc7.m48</code> - Non-production, 1 node, reduced CPU for API Connect subsystems and for Gateway firmware (1 per firmware, instead of 3)</li><li>• <code>n12xc4.m12</code> - Production, 3 nodes</li><li>• <code>n3xc14.m48</code> - Production, 3 nodes, reduced CPU for API Connect subsystems</li><li>• <code>n3xc11.m48</code> - Production, 3 nodes, reduced CPU for API Connect subsystems and for Gateway firmware (1 per firmware, instead of 3)</li></ul> Note: While it is possible to use a non-production profile installation in a production deployment, it is not recommended.

For information on switching to a different deployment profile after installation, see the following topics:

- [Changing the deployment profile on Cloud Pak for Integration](#)
- [Changing deployment profiles on OpenShift](#)

## Product version

Table 4. Product version

Field	Type	Required	Description
Product version	Enumerated	No	Select the product version to be installed in the system. Warning: Do not select a channel here instead of the API Connect version. Selecting a channel will result in any API Connect interim fix updates being applied automatically and without warning.

## Storage class

Table 5. Storage class

Field	Type	Required	Description
Default Storage Class	Enumerated	No	Specify the RWO block storage class to use for persistence storage. This will be used when creating a PVC. Specification of the storage class is optional, but is highly recommended. If not specified the default cluster storage class is used.  See the IBM Cloud Pak documentation for guidance for Storage class selection. Go to the following page and select your Cloud Pak release level: <a href="https://www.ibm.com/support/knowledgecenter/SSGT7J">https://www.ibm.com/support/knowledgecenter/SSGT7J</a> . In the navigation panel, select System Requirements, > Storage.  To review API Connect storage support, see <a href="#">Storage classes</a> .

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Management subsystem settings

You can specify advanced configuration settings for the Management subsystem

The IBM Cloud Pak Platform UI enables you to specify settings for the following areas:

- [Database backup](#)
- [Database persistence](#)
- [Site name](#)
- [Test and Monitor](#)
- [Billing](#)

For annotations, labels, node selectors, and tolerations, see [Additional Kubernetes settings](#)

Note: Optionally, you might want to increase the timeout settings for management endpoints, particularly for large deployments. See [Configuring timeouts for management endpoints](#).

## Database backup

Table 1. Database backup

Field	Type	Required	Description
Credentials	Drop down menu	No. Optional	<ul style="list-style-type: none"><li>• For <b>objstore</b> type backups, the name of the Kubernetes secret containing your S3 Access Key / Key Secret</li><li>• For <b>SFTP</b> type backups, the name of the Kubernetes secret containing your SFTP Username/password</li></ul> Default: (Generated Value) See <a href="#">Configuring backup settings for fresh install of the Management subsystem</a> .
Server hostname	String	No. Optional	The backups host: <ul style="list-style-type: none"><li>• For <b>objstore</b> type backup, specify S3 endpoint with the corresponding S3 region in the format <b>&lt;S3endpoint&gt;/&lt;S3region&gt;</b>. For example: <b>s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard</b></li><li>• For <b>sftp</b> type, the SFTP server hostname. For example: <b>203.0.113.0</b> or <b>example.com</b></li><li>• Not required for local storage backups</li></ul> Default: none See <a href="#">Configuring backup settings for fresh install of the Management subsystem</a> .

Field	Type	Required	Description
Path	String	No. Optional	<p>The path to the location of the backup:</p> <ul style="list-style-type: none"> <li>For <b>objstore</b> backups, the name of your S3 bucket to store backup data. For example, <b>bucket-name/folder</b>. The use of subdirectories in the bucket name is not supported. Ensure that <b>bucket-name/folder</b> is empty. If the folder was previously used for backups, the folder will not be empty, and stanza create might encounter an error.</li> <li>For <b>sftp</b> type, the folder name on the SFTP server. For example: <b>mgmt_backup</b>.</li> <li>Not required for local storage backups</li> </ul> <p>Default: none</p> <p>See <a href="#">Configuring backup settings for fresh install of the Management subsystem</a>.</p>
Server port	String	No. Optional	<p>Backup server port</p> <p>The port for the protocol to connect to the <b>host</b>. The backup port is not required for object storage. Default: 22</p> <p>See <a href="#">Configuring backup settings for fresh install of the Management subsystem</a>.</p>
Protocol	String	No	<p>The type of the backup. Supported types:</p> <ul style="list-style-type: none"> <li><b>objstore</b></li> <li><b>sftp</b> The default value is <b>sftp</b>.</li> <li>Local storage backups For local backups, do not specify this parameter. When the parameter is set to "", the backup type is set to local storage backup.</li> </ul> <p>See <a href="#">Configuring backup settings for fresh install of the Management subsystem</a>.</p>
Restart database	Toggle Switch	No. Optional	<p>Flag to accept database reconfiguration. Restarting the database is required when changing the backup configuration. When marked true and the new backup configuration differs, the operator will stop the database and any dependent services, apply the change, and restart the stopped components.</p> <p>Defaults to Off.</p> <p>For more information on restarting the database, see <a href="#">Reconfiguring or adding backup settings after installation of the management subsystem</a></p>
Retries	String	No. Optional	<p>For <b>sftp</b> type backups only, the number of times the <b>ibm-apiconnect</b> Operator attempts backups in the event of a failed SFTP backup.</p> <p>Not used for <b>objstore</b> or local storage backup.</p> <p>Default value: 0.</p> <p>See <a href="#">Configuring backup settings for fresh install of the Management subsystem</a>.</p>
S3 provider type	Drop down menu	Required when using s3 provider.	<p>Name of the S3 provider to use. Not required for local backups or SFTP backups.</p> <p>If you are configuring backups with an <b>s3provider</b>, you must specify one of the supported values of <b>aws</b> or <b>ibm</b>.</p> <p>See <a href="#">Configuring backup settings for fresh install of the Management subsystem</a>.</p>
Schedule	String	No. Optional	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> <li>* * * * *</li> <li>-----</li> <li>     </li> <li>      +----- day of week (0 - 6) (Sunday=0)</li> <li>    +----- month (1 - 12)</li> <li>   +----- day of month (1 - 31)</li> <li>  +----- hour (0 - 23)</li> <li>+----- min (0 - 59)</li> </ul> <p>The backup schedule defaults to 0 0 * * *. This means a backup is run every day at midnight and minute zero UTC.</p> <p>When you configure a host, if you do not specify a value for <b>schedule</b>, the default backup schedule is automatically set. Note that the default backup schedule is not set, and scheduled backups not enabled, until host configuration is completed.</p> <p>See <a href="#">Configuring backup settings for fresh install of the Management subsystem</a>.</p>

## Database persistence

Table 2. Database persistence

Field	Type	Required	Description
Storage Class	Drop down menu	No. Optional	<p>Specify the RWO block storage class to use for persistence storage. This will be used when creating a PVC. Specification of the storage class is highly recommended.</p> <p>If not specified the default cluster storage class is used.</p> <p>See the IBM Cloud Pak documentation for guidance for Storage class selection. Go to the following page and select your Cloud Pak release level: <a href="https://www.ibm.com/support/knowledgecenter/SSGT7J">https://www.ibm.com/support/knowledgecenter/SSGT7J</a>. In the navigation panel of the KC, select System Requirements &gt; Storage.</p> <p>To review API Connect storage support, see <a href="#">Storage classes</a>.</p>

Field	Type	Required	Description
Volume size	Integer	No. Optional	Represents the size of the Database volume. Defaults to 120G for <code>n1xc4.m16</code> installation profile, 180G for <code>n3xc4.m16</code> installation profile.

## Site name

Table 3. Site Name

Field	Type	Required	Description
Site name	string	No. Optional	Site name is the logical name of this failure domain. Typically site name is the name of your data center, such as Amazon AZ. Default: randomly generated name.  This will be the site name of the management deployment. For example, given the site name of <code>test</code> your management deployment will look like <code>management-test-postgres</code> .

## Test and Monitor

Table 4. Test and Monitor

Field	Type	Required	Description
Enable Test and Monitor	Boolean. Toggle off/on	No. Optional	Test and Monitor automatically generates API test assertions. It contains dashboards for monitoring API test assertions and getting alerts on the health of your APIs. Default: off  See <a href="#">Installing the Automated API behavior testing application</a> .

## Billing

Table 5. Billing

Field	Type	Required	Description
Enable Billing	Boolean. Toggle off/on	No. Optional	To enable the monetization of your Product Plans, you must add a billing integration resource in your API Connect provider organization that defines the configuration data needed to synchronize with an external subscription billing system. Default: off  See <a href="#">Adding a billing integration resource</a> .

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Gateway subsystem settings

You can specify advanced configuration settings for the Gateway subsystem.

The IBM Cloud Pak Platform UI enables you to specify settings for the following areas:

- [v5 compatibility mode](#)
- [Operations Dashboard](#)
- [Token management service](#)
- [Autoscaling gateway pods](#)

For annotations, labels, node selectors, and tolerances, see [Additional Kubernetes settings](#)

## v5 compatibility mode

Table 1. v5 compatibility mode

Field	Type	Required	Description
V5 comparability mode	Toggle Switch off/on	No. Optional	Enabling this provides v5 compatibility (trading off some performance) with the IBM DataPower Gateway that was provided with IBM API Connect Version 5 and earlier releases. Consider using this DataPower Gateway (v5 compatible) if you are an existing DataPower user and want to utilize your DataPower resources and knowledge. Default: off  To review v5 compatibility, see <a href="#">API Connect gateway types</a> .

## Operations Dashboard

Table 2. Operations Dashboard

Field	Type	Required	Description
-------	------	----------	-------------

Field	Type	Required	Description
Enable Operations Dashboard tracing	Toggle Switch off/on	No. Optional	Enable or disable cross-component transaction tracing to allow troubleshooting and investigating errors and latency issues. Default: disabled (off)  To review the Operations Dashboard, see <a href="https://www.ibm.com/support/knowledgecenter/SSGT7J_20.3/tracing/operations_dashboard.html">https://www.ibm.com/support/knowledgecenter/SSGT7J_20.3/tracing/operations_dashboard.html</a> For information on configuring the Operations Dashboard, see <a href="https://ibm.github.io/datapower-operator-doc/apis/datapowerservice/v1beta2/#odtracing">https://ibm.github.io/datapower-operator-doc/apis/datapowerservice/v1beta2/#odtracing</a> .
Operations Dashboard namespace	string	No. Optional	Namespace where the IBM Cloud Pak for Integration Operations Dashboard has been deployed. Default: none
Replica count	string	No. Optional	Specify the number of instances of the Gateway that should be deployed. For production high-availability, a minimum of 3 replicas (one per node) is recommended. Default: none

## Token management service

Table 3. Token management service

Field	Type	Required	Description
Advanced: Enable TMS	Toggle Switch	No. Optional	Enable or disable token management service (TMS) to use the DataPower to manage the token lifecycle.. Default: disabled (off)  The Token Management Service uses the DataPower distributed cache to manage the token lifecycle which includes when to revoke access rights. For more information, see <a href="#">Token management with DataPower API Gateway</a> .
Advanced: Storage Class	string	No. Optional	Specify the RWO block storage class to use for persistence storage. This will be used when creating a PVC. Specification of the storage class is highly recommended. If not specified the default cluster storage class is used.  See the IBM Cloud Pak documentation for guidance for Storage class selection. Go to the following page and select your Cloud Pack release level: <a href="https://www.ibm.com/support/knowledgecenter/SSGT7J">https://www.ibm.com/support/knowledgecenter/SSGT7J</a> . In the navigation panel of the KC, select System Requirements > Storage.  To review DataPower storage configuration, see <a href="https://ibm.github.io/datapower-operator-doc/apis/datapowerservice/v1beta2/#storage">https://ibm.github.io/datapower-operator-doc/apis/datapowerservice/v1beta2/#storage</a> .
Advanced: Volume size	string	No. Optional	Resources represents the minimum resources the volume should have. For example, 10Gi.Default: none To review DataPower storage configuration, see <a href="#">storage API</a> in the DataPower documentation.

## Autoscaling gateway pods

Autoscaling enables the gateway deployment to scale dynamically, either vertically or horizontally. It is not possible to use both horizontal and vertical pod scaling simultaneously. You must configure either **HPA** (for horizontal scaling) or **VPA** (for vertical scaling) as the scaling method.

Note: DataPower Gateway supports long-lived connections such as GraphQL subscriptions or other websockets connections. These long-lived connections might not be preserved when pods are scaled down based on defined CPU or memory thresholds. Workloads with long-lived connections are more vulnerable to failed API transactions when auto-scaling is occurring.

To learn more about HPA and VPA autoscaling, see the following topics in the DataPower documentation:

- [Autoscaling DataPower Pods](#)
- [podAutoScaling API](#)

You can configure autoscaling for Gateway pods by inserting a new subsection in the **spec gateway** section of the top-level CR, or by filling in the corresponding fields in the OpenShift or IBM Cloud Pak Platform UI. Settings are described in Table 4.

The following example configures HPA autoscaling in the gateway section of the top-level API Connect CR:

```
spec:
  gateway:
    podAutoScaling:
      hpa:
        maxReplicas: 5
        minReplicas: 3
        targetCPUUtilizationPercentage: 90
        targetMemoryUtilizationPercentage: 80
      method: HPA
```

Table 4. Autoscaling configuration settings

UI Field name / CR Setting	Autoscaling method	Required	Description
<ul style="list-style-type: none"> <li>• Scaling method</li> <li>• <b>method</b></li> </ul>	All	Yes	Select the autoscaling method to be used: either <b>HPA</b> (Horizontal Pod Autoscaling) or <b>VPA</b> (Vertical Pod Autoscaling). To disable autoscaling, leave <b>method</b> blank, or omit the <b>podAutoScaling</b> section from the CR.
<ul style="list-style-type: none"> <li>• Minimum pods</li> <li>• <b>minReplicas</b></li> </ul>	HPA	Yes	Minimum number of pods that can be scaled down to by the horizontal pod autoscaler.
<ul style="list-style-type: none"> <li>• Maximum pods</li> <li>• <b>maxReplicas</b></li> </ul>	HPA	Yes	Maximum number of pods that can be scaled up to by the horizontal pod autoscaler. Must be a value greater than <b>minReplicas</b> .

UI Field name / CR Setting	Autoscaling method	Required	Description
<ul style="list-style-type: none"> <li>Target CPU Utilization Percentage</li> <li><code>targetCPUUtilizationPercentage</code></li> </ul>	HPA	No	Percent threshold on average CPU usage by pods for triggering horizontal scaling.
<ul style="list-style-type: none"> <li>Target Memory Utilization Percentage</li> <li><code>targetMemoryUtilizationPercentage</code></li> </ul>	HPA	No	Percent threshold on average memory usage by pods for triggering horizontal scaling.
<ul style="list-style-type: none"> <li>Maximum CPU</li> <li><code>maxAllowedCPU</code></li> </ul>	VPA	No	Maximum value for CPU resource that can be assigned to a DataPower container when scaling vertically. Minimum value is set from <code>DataPowerRequestsSpec.ResourceCPU</code>
<ul style="list-style-type: none"> <li>Maximum Memory</li> <li><code>maxAllowedMemory</code></li> </ul>	VPA	No	Maximum amount of memory that can be assigned to a DataPower container when scaling vertically. Minimum value is set from <code>DataPowerRequestsSpec.ResourceMemory</code>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Developer Portal subsystem settings

You can specify advanced configuration options for the Developer Portal subsystem.

The IBM Cloud Pak Platform UI enables you to specify settings for the following areas:

- [Database backups](#)
- [Site name](#)

For annotations, labels, node selectors, and tolerations, see [Additional Kubernetes settings](#)

Known limitation: When deployed on OpenShift or Cloud Pak for Integration, the API Connect Developer Portal subsystem does not support multiple hosts for the `portalUIEndpoint` endpoint, due to a limitation of Routes in OCP.

## Database backups

Table 1. Database backup settings

Field	Type	Description
Credentials	String	For <code>objstore</code> , this is the name of your Kubernetes secret that was generated with your username and password for your backup database. For <code>sftp</code> , this is the secret that contains the credentials for your <code>sftp</code> username and password. Required if configuring backups. See also <a href="#">Backing up and restoring the Developer Portal in a Kubernetes environment</a> .
Backup host	String	The S3 endpoint with the corresponding S3 region in the format <code>&lt;S3endpoint&gt;/&lt;S3region&gt;</code> . For example: <code>s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard</code> For <code>sftp</code> , this is the <code>sftp</code> server host name. Required if configuring backups. See also <a href="#">Backing up and restoring the Developer Portal in a Kubernetes environment</a> .
Backup path	String	For <code>objstore</code> , the name of your S3 bucket to store backup data. For example: <code>test-bucket/restore-test</code> . For <code>sftp</code> , this is the path to the folder on the <code>sftp</code> server. Required if configuring backups. See also <a href="#">Backing up and restoring the Developer Portal in a Kubernetes environment</a> .
Backup port	Integer	This is the port for the protocol to connect to the host. There is no default. See also <a href="#">Backing up and restoring the Developer Portal in a Kubernetes environment</a> .
Backup protocol	String	Choose the protocol ( <code>sftp</code> or <code>objstore</code> ) you wish to use to communicate with your remote backup endpoint. <code>Objstore</code> is recommended for most reliability. There is no default. This field must be set to either <code>sftp</code> or <code>objstore</code> to configure backups. See also <a href="#">Backing up and restoring the Developer Portal in a Kubernetes environment</a> .
Backup schedule	String	This is the schedule in cron string format for how often automatic Developer Portal backups are run. For example: <code>0 /3 * * *</code> means at minute 0 past every 3rd hour. There is no default. Required if configuring backups. See also <a href="#">Backing up and restoring the Developer Portal in a Kubernetes environment</a> .

## Site name

Table 2. Site name

Field	Type	Description
Site name	string	Site name is the logical name of the failure domain of this portal subsystem. Typically site name is the name of your data center, such as Amazon AZ. The default is a randomly generated name.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Analytics subsystem settings

You can specify advanced configuration settings for the Analytics subsystem.

The IBM Cloud Pak Platform UI enables you to specify settings for the following areas:

- [Backups](#)
- [Storage](#)

For annotations, labels, node selectors, and tolerations, see [Additional Kubernetes settings](#)

## Backups

Table 1. Database backup

Field	Type	Required	Description
Backup chunk size in GB	integer	No. Optional	<b>chunkSize</b> specifies how large files are stored. Large files can be stored as chunks when the snapshot is created. This setting specifies the size of the chunks as GB, MB, or KB. Default value is 1GB. See <a href="#">Configuring backup settings for Analytics</a> .
Credentials	string	No. Optional	Backup credentials is the name of the Kubernetes secret you created for accessing your S3-compatible storage. No default. See <a href="#">Configuring backup settings for Analytics</a> .
Compress	boolean: off/on	No. Optional	Determines whether metadata files are stored in compressed format. Default value is false (off) . See <a href="#">Configuring backup settings for Analytics</a> .
Enable server side encryption	boolean: off/on	No Optional	Determines whether files are encrypted. When set to true (on), files are encrypted on the server side using AES256. Default is false (off). See <a href="#">Configuring backup settings for Analytics</a> .
Analytics server hostname	string	No. Optional	The URL to your S3 storage. No default. See <a href="#">Configuring backup settings for Analytics</a> .
Backup Path	string	No. Optional	The path to your S3 storage at the URL specified by Analytics server hostname.host. No default. See <a href="#">Configuring backup settings for Analytics</a> .
Schedule cron expression	string	No. Optional	The schedule that determines how often backups will be invoked automatically. The format for the schedule is any valid <b>cron</b> string. Default: <code>"*/20 * * * *"</code> See <a href="#">Configuring backup settings for Analytics</a> .

## Storage

Table 2. Coord

Field	Type	Required	Description
Storage Class	string	No Optional	Name of the StorageClass required by the claim. The Coord persistent storage serves the microservice that manages the routing and aggregating of requests. When you select the Storage Class, a local-volume storage is recommended for best performance, although block-storage is usable as well.  Select from the drop down. If none selected, the default storage class of your cluster will be selected.  See <a href="#">Planning the Analytics profile and storage</a> .
Volume size	integer > 0	No Optional	Specify how much persistent disk storage is allocated for Coord data storage (in Gi). The default at 1Gi is recommended, but you can calculate how much storage you will need. See <a href="#">Estimating internal storage space</a> .

Table 3. Data

Field	Type	Required	Description
Storage Class	string	No Optional	The Data persistent storage serves the microservice that manages the reading and writing of data, and executes complex queries and aggregations. Configuring the Data storage can lead to a significant increase in performance, as it has the most workload. When you select the Storage Class, a local-volume storage is recommended for best performance.  Select from the drop down. If none selected, the default storage class of your cluster will be selected.  See <a href="#">Planning the Analytics profile and storage</a> .
Volume size	integer > 0	No Optional	With the Volume Size, you can control how much persistent disk storage is allocated for Data (in Gi). The default is 50Gi, but it is HIGHLY recommended you calculate how much storage you will need. See <a href="#">Estimating internal storage space</a>

Table 4. Master

Field	Type	Required	Description
Storage Class	string	No Optional	The Master persistent storage serves the microservice that manages cluster state and health. When you select the Storage Class, a local-volume storage is recommended for best performance, although block storage is usable as well. Select from the drop down. If none selected, the default storage class of your cluster will be selected. See <a href="#">Planning the Analytics profile and storage</a> .
Volume size	integer > 0	No Optional	Specifies how much persistent disk storage is allocated for Master (in Gi). The default is 5Gi, but you can calculate how much storage you will need. See <a href="#">Estimating internal storage space</a>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Additional Kubernetes settings

For each API Connect subsystem, you can specify additional settings for annotations and pod management.

The additional settings are generic Kubernetes configuration settings. The Platform Navigator advanced configuration option for API Connect enables you to set them specifically for each subsystem.

## Annotations

The annotations field serves as a pass-through for all the resources managed by the CR. You can add any annotation to this field. The annotations here overwrite the default annotations.

See <https://kubernetes.io/docs/concepts/overview/working-with-objects/annotations/>.

## Labels

The labels field serves as a pass-through for Pod labels. You can add any label to this field and have it apply to the pod. The labels here overwrite the default labels provided. For example, if the label 'mylabel=1' was provided, it would apply to all kubernetes resources managed by this CR.

See <https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/>.

## Node Selector

This field allows you to specify a set of key value pair that must be matched against the node labels to decide which API Connect pods can be scheduled on that node. Only nodes matching all of these key value pairs in their labels will be selected for scheduling API Connect pods.

See <https://kubernetes.io/docs/concepts/scheduling-eviction/assign-pod-node/>.

## Tolerations

This field allows you to select which nodes API Connect pods can be scheduled or not scheduled. By specifying a set of matching tolerations, you can control whether specific nodes can be used for scheduling API Connect Pods.

Effect (optional)

Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.

Key (optional)

Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.

Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.

Operator (optional)

Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.

Toleration seconds (optional)

TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.

Value (optional)

Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

See <https://kubernetes.io/docs/concepts/scheduling-eviction/taint-and-toleration/>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring timeouts for management endpoints

Adjust the timeout settings for management endpoints by updating the CR.

### About this task

---

On large deployments, or with large API usage, you might encounter timeout issues when deployed with the default timeout setting of 30 seconds. To avoid timeout issues, increase the setting for the management endpoints used in routing.

### Procedure

---

Edit the CR to set the timeout to 240 seconds.

The instructions for editing depend on whether you install API Connect using subsystem CRs or a single top-level CR:

- If you are installing API Connect using subsystem CRs, edit `management_CR.yaml`:

```
cloudManagerEndpoint:
  annotations:
    haproxy.router.openshift.io/timeout: 240s
  hosts:
    - name: admin.example.com
      secretName: cm-endpoint
apiManagerEndpoint:
  annotations:
    haproxy.router.openshift.io/timeout: 240s
  hosts:
    - name: manager.example.com
      secretName: apim-endpoint
platformAPIEndpoint:
  annotations:
    haproxy.router.openshift.io/timeout: 240s
  hosts:
    - name: api.example.com
      secretName: api-endpoint
consumerAPIEndpoint:
  annotations:
    haproxy.router.openshift.io/timeout: 240s
  hosts:
    - name: consumer.example.com
      secretName: consumer-endpoint
```

- If you are installing API Connect using a top-level CR, the management subsystem settings are embedded in the top-level APICoconnectCluster CR. Edit the endpoint settings under `spec:management:` as follows:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APICoconnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-minimum
  name: <name_of_your_instance>
  namespace: ${NAMESPACE}
spec:
  ...
  management:
    cloudManagerEndpoint:
      annotations:
        haproxy.router.openshift.io/timeout: 240s
      hosts:
        - name: admin.example.com
          secretName: cm-endpoint
    apiManagerEndpoint:
      annotations:
        haproxy.router.openshift.io/timeout: 240s
      hosts:
        - name: manager.example.com
          secretName: apim-endpoint
    platformAPIEndpoint:
      annotations:
        haproxy.router.openshift.io/timeout: 240s
      hosts:
        - name: api.example.com
          secretName: api-endpoint
    consumerAPIEndpoint:
      annotations:
        haproxy.router.openshift.io/timeout: 240s
      hosts:
        - name: consumer.example.com
          secretName: consumer-endpoint
  ...
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Installing with the top-level CR

Use the single, top-level `APIConnectCluster` CR to deploy API Connect on OpenShift or Cloud Pak for Integration.

### About this task

---

When you deploy API Connect with a top-level CR, all of the subsystems are deployed in the same namespace. The CR contains a section for each subsystem; configure deployment settings in the appropriate section for each subsystem.

- [Connected installation](#)  
Install API Connect on OpenShift using a single, top-level Custom Resource while connected to the internet.
- [Air-gapped installation](#)  
You can install API Connect Operator on OpenShift in an air-gapped scenario where your cluster is not connected to the internet.
- [Installing on IBM Cloud Pak for Integration](#)  
The API Management capability of IBM Cloud Pak for Integration uses IBM API Connect.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Connected installation

Install API Connect on OpenShift using a single, top-level Custom Resource while connected to the internet.

### About this task

---

Complete the following tasks in the sequence shown:

1. [Installing operators](#)  
Install operators for API Connect, DataPower, and common services so that you can deploy API Connect.
2. [Installing API Connect](#)  
Use the top-level `APIConnectCluster` CR to install all of the API Connect subsystems into a shared namespace on OpenShift while connected to the internet.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Installing operators

Install operators for API Connect, DataPower, and common services so that you can deploy API Connect.

### Before you begin

---

The API Connect operator and operand must be from the same release and fix pack level. Table 1 lists the current version of the operator and operand for API Connect.

Table 1. API Connect operator and operand versions

API Connect (operand)	Operator channel version	Highest operator version
10.0.4.0-ifix3	v2.5	2.5.1

The version of the gateway subsystem must either match the API Connect version, or be one release older. The gateway subsystem version cannot be newer than the API Connect subsystem version. If API Connect is on version `n`, only DataPower Gateway versions `n` or `n-1` are supported. DataPower Gateway version `n+1` is not supported.

### Procedure

---

1. Obtain an entitlement key for the Entitled Registry:
  - a. Log in to the [IBM Container Library](#).
  - b. In the Container software library, select Get entitlement key.
  - c. After the Access your container software heading, click Copy key.
  - d. Copy the key to a safe location.
2. Create a global pull secret:
  - a. Open the OpenShift web console, click Workloads, > Secrets.
  - b. Select the project `openshift-config`.
  - c. Select `pull-secret` from the secret list.
  - d. Select Actions, > Edit Secret, > Add Credentials.
  - e. Set Registry Server Address to `cp.icr.io`.
  - f. Set Username to `cp`.
  - g. Set Password to the entitlement key generated in Step 1.

h. Click Save.

Note: On OpenShift v4.6 the cluster nodes will restart as part of this step.

3. Add the IBM Operator Catalog source:

- In the OpenShift web console, and click + (in the page banner) to open the Import YAML dialog box.
- Paste the following resource definition into the dialog box:

```
apiVersion: operators.coreos.com/v1alpha1
kind: CatalogSource
metadata:
  name: ibm-operator-catalog
  namespace: openshift-marketplace
spec:
  displayName: "IBM Operator Catalog"
  publisher: IBM
  sourceType: grpc
  image: icr.io/cpopen/ibm-operator-catalog
  updateStrategy:
    registryPoll:
      interval: 45m
```

c. Click Create.

4. Create the namespace where API Connect will be installed, either by selecting Project->Create Project in the UI, or via the command line:

```
oc create ns <APIC-namespace>
```

The namespace where you install API Connect must meet the following requirements:

- OpenShift restricts the use of default namespaces for installing non-cluster services. The following namespaces cannot be used to install API Connect: **default**, **kube-system**, **kube-public**, **openshift-node**, **openshift-infra**, **openshift**.
- OpenShift: Only one top-level CR (APIConnectCluster) can be deployed in each namespace.
- Cloud Pak for Integration: Only one API Connect capability can be deployed in each namespace.

5. If you are installing the operator into a single namespace, create an OperatorGroup object.

Attention: If you are installing the operator into all namespaces, skip this step because the **openshift-operators** namespace already has an appropriate Operator group in place.

- Create the apiconnect-operator-group.yaml file with an OperatorGroup object that identifies the namespace in which RBAC permissions for the IBM API Connect Operator will be generated, and where the CSV will be available:

```
apiVersion: operators.coreos.com/v1
kind: OperatorGroup
metadata:
  name: <operator-group-name>
  namespace: <APIC-namespace>
spec:
  targetNamespaces:
  - <APIC-namespace>
```

- Apply the OperatorGroup object with the following command:

```
oc apply -f apiconnect-operator-group.yaml
```

6. Create the **apiconnect** subscription.

- Create the **apiconnect** subscription with the appropriate channel by creating a file called **apic-sub.yaml** and pasting in the below contents, updating the namespace as required:

```
apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: ibm-apiconnect
  namespace: <set to 'openshift-operators' if step 5 not done, otherwise set to the namespace created in step 4>
spec:
  channel: v2.5
  installPlanApproval: Manual
  name: ibm-apiconnect
  source: ibm-operator-catalog
  sourceNamespace: openshift-marketplace
```

Warning: Do not set **installPlanApproval: Automatic**. If set to Automatic then the operator updates automatically whenever a newer API Connect interim fix is available within the selected channel. When the API Connect operator is updated then all API Connect subsystems must be updated, which is a manual operation. When set to **Manual** a notice displays that a new version is available and gives the option to upgrade.

- Apply the subscription with the following command:

```
oc apply -f apic-sub.yaml
```

Wait for **IBM API Connect**, **IBM DataPower Gateway**, and **IBM Common Service Operator** operators to install. The **IBM DataPower Gateway** operator is a prerequisite to API Connect and must not be removed.

Note: There is a known issue on Kubernetes version 1.19.4 or higher that can cause the DataPower operator to fail to start. In this case, the DataPower Operator pods can fail to schedule, and will display the status message: **no nodes match pod topology spread constraints (missing required label)**. For example:

```
0/15 nodes are available: 12 node(s) didn't match pod topology spread constraints (missing required label),
3 node(s) had taint {node-role.kubernetes.io/master: }, that the pod didn't tolerate.
```

You can work around the issue by completing the following steps to replace the operator with a newer version:

- Uninstall the DataPower operator deployment:
  - In the OpenShift Form UI, click Operators > Installed Operators.
  - Type **datapower** in the Filter by name field (or scroll until you locate the operator).
  - Select the operator and click Actions > Uninstall Operator.
- Get a newer version of the operator by downloading and decompressing the IBM API Connect release files from IBM Fix Central:

`apiconnect-operator-release-files_version.zip`

iii. Install the newer DataPower operator by running the following command:

```
oc apply -f ibm-datapower.yaml
```

Next topic: [Installing API Connect](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing API Connect

Use the top-level `APICConnectCluster` CR to install all of the API Connect subsystems into a shared namespace on OpenShift while connected to the internet.

### Before you begin

Review installation considerations and complete and prerequisite tasks as explained in:

1. [Preparing for installation](#)
2. [Installing operators](#)

### Procedure

1. Install the subsystems by using the OpenShift web console.

API Connect uses a single top-level `apiconnectcluster` CR to quickly deploy all of the subsystems. With the top-level CR, you provide values for a small number of properties, and then the install logic chooses sensible defaults for you while deploying all of the subsystems.

- a. Click Create Instance on the API Connect cluster tile to install the top level Custom Resource. Selecting API Connect cluster installs all the API Connect subsystems with the default configuration. The API Connect subsystems are Management, Developer Portal, Gateway, and Analytics.

b. Provide values for the following fields.

Table 1. Properties for the API Connect top-level CR

Input	Value
Name	The name to be used when deploying the API Connect cluster Custom Resource
License acceptance	Required. Click to accept the license. You must accept the license to install API Connect.
License use	Required. Select production or nonproduction to match the type of license that you purchased.
License metric	Optional. Enter the unit of measurement that is used for your program license: <ul style="list-style-type: none"><li>• PROCESSOR_VALUE_UNIT - Default value. If you leave the field blank, this value is used.</li><li>• MONTHLY_API_CALL - Applies only to the IBM API Connect Hybrid Entitlement program.</li></ul>
License ID	Required. Select the license ID for the API Connect program that you purchased. To view all license IDs, see <a href="#">API Connect licenses</a> .
Deployment profile	The profile of the installation you want in the system. Options are: <ul style="list-style-type: none"><li>• n1xc10.m48 Deploys 1 replica of each pod, so this profile is most suitable for a small, non-HA system. Recommended use of this profile is for development and testing.</li><li>• n3xc14.m48 Deploys 3 or more replicas of each pod, so this profile is most suitable for larger systems and for production environments. This profile is supported for installation on a cluster with three or more nodes. It is not supported on a cluster with fewer than three nodes.</li></ul>
Product version	Optional. The API Connect application version. Defaults to the latest version available.
Default storage class name	Default name of the storage class to use as the persistent volume for subsystem microservices. If the default storage class is not already set, add <code>StorageClassName</code> in the <code>spec</code> section for the top-level CR yaml.

Note: You can also set the storage class name with the following command:

```
oc patch storageclass <storage class name> -p '{"metadata": {"annotations": {"storageclass.kubernetes.io/is-default-class": "true"}}}'
```

c. If you want to configure additional settings, click Advanced and see [API Connect configuration settings](#) for information on the advanced settings.

Notes:

- Before installing API Connect, you can customize the configuration of the Analytics subsystem. Review the information in [Planning your Analytics deployment](#) to choose configuration options, and then configure the settings as explained in [Installing the Analytics subsystem](#). Remember that OpenShift uses a single, top-level CR for installation, so you will add your configuration settings to the `spec.analytics` section of the CR.
- When setting additional values, you cannot specify more than one host for the `portalUIEndpoint` endpoint, due to a limitation of the Routes in OCP. If you require multiple `portalUIEndpoint` hosts to provide public access to multiple catalogs, deploy a new Portal service for each host name.

2. To verify your API Connect cluster is successfully installed, run `oc get apic -n <APIC-namespace>`.

Note: There is known problem where the management subsystem can remain in the `Pending` state, when deployed with custom internal certificates. You can workaround this problem. See [Workaround: Management subsystem status remains Pending when deployed with custom internal certificates](#).

3. Verify that you can log in to the API Connect Cloud Manager UI:

- To determine the location for logging in, view all the endpoints:

```
oc get routes -n <APIC-namespace>
```

- Locate the `mgmt-admin-apic` endpoint, and access the Cloud Manager UI
- login as `admin`. When you install with the top-level CR, the password is auto-generated. To get the password:

```
oc get secret -n <APIC-namespace> | grep mgmt-admin-pass
```

```
oc get secret -n <APIC-namespace> <secret_name_from_previous_command> -o jsonpath="{.data.password}" | base64 -d && echo ""
```

4. Optional: Increase the timeout settings for management endpoints, particularly for large deployments. See [Configuring timeouts for management endpoints](#).

5. Optional tasks:

- Toolkit  
You can optionally download the API Connect toolkit from the Cloud Manager UI or API Manager UI after installation is completed. See [Installing the toolkit](#).

- Local Test Environment

You can install this optional test environment after initial installation. See [Testing an API with the Local Test Environment](#).

Note: You can also install the Toolkit and Local Test Environment from IBM Fix Central. For a link to the latest files on Fix Central, see [What's new in the latest release](#).

---

## What to do next

When you finish installing API Connect, [prepare your deployment for disaster recovery](#) so that your data can be restored in the event of an emergency.

**Previous topic:** [Installing operators](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Air-gapped installation

You can install API Connect Operator on OpenShift in an air-gapped scenario where your cluster is not connected to the internet.

---

## About this task

Select one of the following methods for installing API Connect using a top-level CR in an airgap environment:

- [Installing with a bastion host](#)

You can use a bastion host to perform an air-gapped installation of IBM® API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

- [Installing with a portable computer](#)

You can use a portable computer to perform an air-gapped installation of IBM API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

- [Installing with a portable storage device](#)

Use a portable storage device to perform an air-gapped installation of IBM API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Installing with a bastion host

You can use a bastion host to perform an air-gapped installation of IBM® API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

---

## Before you begin

Ensure that your environment is ready for API Connect by [preparing for installation](#).

---

## About this task

A bastion host is a machine that has connectivity both to the internet and to the cluster in the restricted environment.

Notes:

- This task requires you to use Red Hat Skopeo for moving container images. Skopeo is not available for Microsoft Windows, so you cannot perform this task on Windows.
- Don't use the tilde ~ within double quotation marks in any command because the tilde doesn't expand and your commands might fail.

---

## Procedure

1. Prepare a local Docker registry for use with the cluster in the restricted environment.

A local Docker registry is used to store all images in your restricted environment. You must create such a registry and ensure that it meets the following requirements:

- Supports [Docker Manifest V2, Schema 2](#).  
The internal Red Hat OpenShift registry is not compliant with Docker Manifest V2, Schema 2, so it is not suitable for use as a private registry for restricted environments.
- Is accessible from your OpenShift cluster nodes.
- Has the username and password of a user who can write to the target registry from the internal host.
- Has the username and password of a user who can read from the target registry that is on the OpenShift cluster nodes.
- Allows path separators in the image name.

An example of a simple registry is included in [Mirroring images for a disconnected installation](#) in the OpenShift documentation.

Verify that you have the following credentials available:

- The credentials of a user who can write and create repositories. The internal host uses these credentials.
- The credentials of a user who can read all repositories. The OpenShift cluster uses these credentials.

2. Prepare a bastion host that can be connected to the internet.

The host must be on a Linux x86\_64 platform, or any operating system that the IBM Cloud Pak CLI, the OpenShift CLI, and RedHat Skopeo support.

Complete the following steps to set up your bastion host:

a. Install OpenSSL version 1.1.1 or higher.

b. Install Docker or Podman:

- To install Docker (for example, on Red Hat® Enterprise Linux®), run the following commands:

```
yum check-update
yum install docker
```

- To install Podman, see [Podman Installation Instructions](#).

c. Install `httpd-tools` by running the following commands:

```
yum install httpd-tools
```

d. Install the IBM Cloud Pak CLI by completing the following steps:

Install the latest version of the binary file for your platform. For more information, see [cloud-pak-cli](#).

i. Download the binary file by running the following command:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/<binary_file_name>
```

For example:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/cloudctl-linux-amd64.tar.gz
```

ii. Extract the binary file by running the following command:

```
tar -xf <binary_file_name>
```

iii. Run the following commands to modify and move the file:

```
chmod 755 <file_name>
mv <file_name> /usr/local/bin/cloudctl
```

iv. Confirm that `cloudctl` is installed by running the following command:

```
cloudctl --help
```

The `cloudctl` usage is displayed.

e. Install the `oc` OpenShift Container Platform CLI tool.

For more information, see [Getting started with the CLI](#) in the Red Hat OpenShift documentation.

f. Install RedHat Skopeo CLI version 1.0.0 or higher.

For more information, see [Installing Skopeo from packages](#).

g. Run the following command to create a directory that serves as the offline store.

The following example creates a directory called "offline", which is used in the subsequent steps.

```
mkdir $HOME/offline
```

Note: This offline store must be persistent to avoid transferring data more than once. The persistence also helps to run the mirroring process multiple times or on a schedule.

3. Log in to the cluster as a cluster administrator.

Following is an example command to log in to the OpenShift Container Platform cluster:

```
oc login <cluster_host:port> --username=<cluster_admin_user> --password=<cluster_admin_password>
```

4. Create a namespace where you will install API Connect.

Create an environment variable with a namespace, and then create the namespace. For example:

```
export NAMESPACE=<APIC-namespace>
oc create namespace $NAMESPACE
```

where `<APIC-namespace>` is the namespace where you will install API Connect.

The namespace where you install API Connect must meet the following requirements:

- OpenShift restricts the use of default namespaces for installing non-cluster services. The following namespaces cannot be used to install API Connect: `default`, `kube-system`, `kube-public`, `openshift-node`, `openshift-infra`, `openshift.`
- OpenShift: Only one top-level CR (APICConnectCluster) can be deployed in each namespace.
- Cloud Pak for Integration (Platform Navigator): Only one API Connect capability can be deployed in each namespace.

5. On the bastion host, create environment variables for the installer and image inventory.

Create the following environment variables with the installer image name and the image inventory. For example:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=3.0.7
export CASE_ARCHIVE=${CASE_NAME}-${CASE_VERSION}.tgz
export CASE_INVENTORY_SETUP=apiconnectOperatorSetup
export OFFLINEDIR=$HOME/offline
export OFFLINEDIR_ARCHIVE=offline.tgz
export CASE_REMOTE_PATH=https://github.com/IBM/cloud-pak/raw/master/repo/case/${CASE_NAME}/${CASE_VERSION}/${CASE_ARCHIVE}
export CASE_LOCAL_PATH=${OFFLINEDIR}/${CASE_ARCHIVE}

export BASTION_DOCKER_REGISTRY_HOST=localhost
export BASTION_DOCKER_REGISTRY_PORT=443
export BASTION_DOCKER_REGISTRY=${BASTION_DOCKER_REGISTRY_HOST}:${BASTION_DOCKER_REGISTRY_PORT}
export BASTION_DOCKER_REGISTRY_USER=username
export BASTION_DOCKER_REGISTRY_PASSWORD=password
export BASTION_DOCKER_REGISTRY_PATH=${OFFLINEDIR}/imageregistry
```

Note: Set `CASE_VERSION` to the value for your API Connect release. See [Operator, operand, and CASE versions](#).

- Download the API Connect installer and image inventory by running the following command:

```
cloudctl case save \
--case $CASE_REMOTE_PATH \
--outputdir $OFFLINEDIR
```

- Mirror the images from the ICR (source) registry to the bastion (destination) registry.

- a. Store the credentials for the ICR (source) registry.

The following command stores and caches the IBM Entitled Registry credentials in a file on your file system in the `$HOME/.airgap/secrets` location:

```
cloudctl case launch \
--case $OFFLINEDIR/${CASE_ARCHIVE} \
--inventory $CASE_INVENTORY_SETUP \
--action configure-creds-airgap \
--namespace $NAMESPACE \
--args "--registry cp.icr.io --user cp --pass <entitlement-key> --inputDir $OFFLINEDIR"
```

- b. Store the credentials for the bastion (destination) registry.

The following command stores and caches the Docker registry credentials in a file on your file system in the `$HOME/.airgap/secrets` location:

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action configure-creds-airgap \
--args "--registry $BASTION_DOCKER_REGISTRY --user $BASTION_DOCKER_REGISTRY_USER --pass $BASTION_DOCKER_REGISTRY_PASSWORD"
```

- c. If needed, start the Docker registry service on the bastion host.

If you are using the same bastion host that you used for installing API Connect, the Docker registry service might already be running.

- i. Initialize the Docker registry by running the following command:

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action init-registry \
--args "--registry $BASTION_DOCKER_REGISTRY_HOST --user $BASTION_DOCKER_REGISTRY_USER --pass $BASTION_DOCKER_REGISTRY_PASSWORD --dir $BASTION_DOCKER_REGISTRY_PATH"
```

- ii. Start the Docker registry by running the following command:

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action start-registry \
--args "--registry $BASTION_DOCKER_REGISTRY_HOST --port $BASTION_DOCKER_REGISTRY_PORT --user $BASTION_DOCKER_REGISTRY_USER --pass $BASTION_DOCKER_REGISTRY_PASSWORD --dir $BASTION_DOCKER_REGISTRY_PATH"
```

- d. Mirror the images to the registry on the bastion host.

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action mirror-images \
--args "--registry $BASTION_DOCKER_REGISTRY --inputDir $OFFLINEDIR"
```

- Optional: Save the Docker registry image that you stored on the bastion host.

If your air-gapped network doesn't have a Docker registry image, you can save the image on the bastion host and copy it later to the host in your air-gapped environment.

```
docker save docker.io/library/registry:2.6 -o $BASTION_DOCKER_REGISTRY_PATH/registry-image.tar
```

- Configure the image pull secret and verify node status.

- a. Configure a global image pull secret and ImageContentSourcePolicy.

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--namespace $NAMESPACE \
--inventory $CASE_INVENTORY_SETUP \
--action configure-cluster-airgap \
--args "--registry $LOCAL_DOCKER_REGISTRY --inputDir $OFFLINEDIR"
```

Note: In OpenShift Container Platform version 4.6, this step restarts all cluster nodes. The cluster resources might be unavailable until the new pull secret is applied.

b. Verify that the ImageContentSourcePolicy resource is created.

```
oc get imageContentSourcePolicy
```

c. Optional: If you use an insecure registry, you must add the local registry to the cluster insecureRegistries list.

```
oc patch image.config.openshift.io/cluster --type=merge -p '{"spec":{"registrySources":{"insecureRegistries":["LOCAL_DOCKER_REGISTRY"]}}}'
```

d. Verify your cluster node status.

```
oc get nodes
```

After the `imageContentsourcePolicy` and global image pull secret are applied, you might see the node status as `Ready`, `Scheduling`, or `Disabled`. Wait until all the nodes show a `Ready` status.

## 10. Create the CatalogSource.

API Connect can be installed by adding the `CatalogSource` for the mirrored operators to your cluster and then using OLM to install the operators.

a. Install the catalog by running the following command:

This command adds the `CatalogSource` for the components to your cluster, so the cluster can access them from the private registry:

```
cloudctl case launch \  
  --case $OFFLINEDIR/$CASE_ARCHIVE \  
  --inventory $CASE_INVENTORY_SETUP \  
  --action install-catalog \  
  --namespace $NAMESPACE \  
  --args "--registry $LOCAL_DOCKER_REGISTRY --inputDir $OFFLINEDIR --recursive"
```

b. Verify that the `CatalogSource` for the API Connect installer operator is created by running the following commands:

```
oc get pods -n openshift-marketplace  
oc get catalogsource -n openshift-marketplace
```

Known issue: In version 10.0.4.0-ifix2, the `install-catalog` action installs the `CatalogSource` with the public host (`icr.io`) still attached to the image name. To fix this, patch the `ibm-apiconnect-catalog` `CatalogSource` with the following command:

```
oc patch catalogsource ibm-apiconnect-catalog -n openshift-marketplace --type=merge -p '{"spec":{"image": "${LOCAL_DOCKER_REGISTRY}/copen/ibm-apiconnect-catalog:latest-amd64"}}'
```

## 11. Install the API Connect Operator by running the following command:

```
cloudctl case launch \  
  --case $OFFLINEDIR/$CASE_ARCHIVE \  
  --inventory $CASE_INVENTORY_SETUP \  
  --action install-operator \  
  --namespace $NAMESPACE
```

Known issues:

- If you are installing API Connect version 10.0.4-ifix2 or 10.0.4-ifix3, you might encounter the following error while installing the operator:

```
Message: unpack job not completed: Unpack pod(openshift-marketplace/e9f169cee8bfffac9ab35d276a48b7207d9606e2b7a0a8087bc58b4ff7tx221) container(pull) is pending. Reason: ImagePullBackOff, Message: Back-off pulling image "ibmcom/ibm-apiconnect-operator-bundle@sha256:ef0ce455270189c37a5dc0500219061959c041f88110f601f6e7bf8072df4943" Reason: JobIncomplete
```

Resolve the error by completing the following steps to update the `ImageContentSourcePolicy` for your deployment:

- Log in to the OpenShift cluster UI as an administrator of your cluster.
- Click `Search > Resources` and search for `ICSP`.
- In the list of ICSPs, click `ibm-apiconnect` to edit it.
- In the `ibm-apiconnect` ICSP, click the `YAML` tab.
- In the `spec.repositoryDigestMirrors` section, locate the `-mirrors:` subsection containing `source: docker.io/ibmcom`.
- Add a new mirror ending with `/ibmcom` to the section as in the following example:

```
- mirrors:  
  - <AIRGAP_REGISTRY_ADDRESS>/ibmcom  
  - <AIRGAP_REGISTRY_ADDRESS>/copen  
  source: docker.io/ibmcom
```

- If the job does not automatically continue, uninstall and reinstall the API Connect operator.
- There is a known issue on Kubernetes version 1.19.4 or higher that can cause the `DataPower` operator to fail to start. In this case, the `DataPower` Operator pods can fail to schedule, and will display the status message: `no nodes match pod topology spread constraints (missing required label)`. For example:

```
0/15 nodes are available: 12 node(s) didn't match pod topology spread constraints (missing required label), 3 node(s) had taint {node-role.kubernetes.io/master: }, that the pod didn't tolerate.
```

You can work around the issue by completing the following steps:

- Uninstall the `DataPower` operator deployment.
- Download the `DataPower` case bundle with `DataPower` operator v1.2.1 or later. These versions fix the limitation. Follow these instructions: <https://ibm.github.io/datapower-operator-doc/install/case>. You can download the `DataPower` CASE bundle tar file from the following location: <https://github.com/IBM/cloud-pak/raw/master/repo/case/ibm-datapower-operator-cp4i/1.2.1>

## 12. Install API Connect (the operand).

API Connect provides one top-level CR that includes all of the API Connect subsystems (Management, Developer Portal, Analytics, and Gateway Service).

Attention: Before installing API Connect, you can customize the configuration of the Analytics subsystem. Review the information in [Planning your Analytics deployment](#) to choose configuration options, and then configure the settings as explained in [Installing the Analytics subsystem](#). Remember that OpenShift uses a single, top-level CR for installation, so you will add your configuration settings to the `spec.analytics` section of the CR.

- a. Create a YAML file to use for deploying the top-level CR. Use the template that applies to your deployment (non-production or production).

Note: The values shown in the following examples might not be suitable for your deployment. For information on the license, profile, and version settings, as well as additional configuration settings, see [API Connect configuration settings](#).

- Example CR settings for a non-production deployment:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-minimum
  name: <name_of_your_instance>
  namespace: <APIC-namespace>
spec:
  license:
    accept: true
    license: L-RJON-C7BJ42
    metric: PROCESSOR_VALUE_UNIT
    use: nonproduction
  profile: nlxc10.m48
  version: 10.0.4.0-ifix3
  storageClassName: <default-storage-class>
```

- Example CR settings for a production deployment:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-production
  name: <name_of_your_instance>
  namespace: <APIC-namespace>
spec:
  license:
    accept: true
    license: L-RJON-C7BJ42
    metric: PROCESSOR_VALUE_UNIT
    use: production
  profile: n3xc14.m48
  version: 10.0.4.0-ifix3
  storageClassName: <default-storage-class>
```

b. Apply the YAML file:

```
oc apply -f <your_yaml_file>
```

c. To verify your API Connect cluster is successfully installed, run the following command:

```
oc get apic -n <APIC-namespace>
```

d. Verify that you can log in to the API Connect Cloud Manager UI:  
To determine the location for logging in, view all the endpoints:

```
oc get routes -n <APIC-namespace>
```

e. Locate the `mgmt-admin-apic` endpoint, and access the Cloud Manager UI.

f. Login as the API Connect administrator.

When you install with the top-level CR, the password is auto-generated. To get the password:

```
oc get secret -n <APIC-namespace> | grep mgmt-admin-pass
oc get secret -n <APIC-namespace> <secret_name_from_previous_command> -o jsonpath="{.data.password}" | base64 -d &&
echo
```

13. Optional: Increase the timeout settings for the API Connect management endpoints, particularly for large deployments. See [Configuring timeouts for management endpoints](#).

## What to do next

---

When you finish installing API Connect, [prepare your deployment for disaster recovery](#) so that your data can be restored in the event of an emergency.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Installing with a portable computer

You can use a portable computer to perform an air-gapped installation of IBM® API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

## Before you begin

---

Ensure that your environment is ready for API Connect by [preparing for installation](#).

## About this task

You can store the product code and images to a portable computer and transfer them to a local, air-gapped network. By doing so, you can install in your air-gapped environment without using a bastion host.

Notes:

- This task requires you to use Red Hat Skopeo for moving container images. Skopeo is not available for Microsoft Windows, so you cannot perform this task on Windows.
- Don't use the tilde ~ within double quotation marks in any command because the tilde doesn't expand and your commands might fail.

## Procedure

1. Prepare a local Docker registry for use with the cluster in the restricted environment.

A local Docker registry is used to store all images in your restricted environment. You must create such a registry and ensure that it meets the following requirements:

- Supports [Docker Manifest V2, Schema 2](#).  
The internal Red Hat OpenShift registry is not compliant with Docker Manifest V2, Schema 2, so it is not suitable for use as a private registry for restricted environments.
- Is accessible from your OpenShift cluster nodes.
- Has the username and password of a user who can write to the target registry from the internal host.
- Has the username and password of a user who can read from the target registry that is on the OpenShift cluster nodes.
- Allows path separators in the image name.

An example of a simple registry is included in [Mirroring images for a disconnected installation](#) in the OpenShift documentation.

Verify that you have the following credentials available:

- The credentials of a user who can write and create repositories. The internal host uses these credentials.
- The credentials of a user who can read all repositories. The OpenShift cluster uses these credentials.

2. Prepare a portable host that can be connected to the internet.

- The external host must be on a Linux x86\_64 platform, or any operating system that the IBM Cloud Pak CLI, the OpenShift CLI, and RedHat Skopeo support.
- The external host `locale` must be set to English.
- The portable device must have sufficient storage to hold all of the software that is to be transferred to the local Docker registry.

Complete the following steps to set up your external host:

- a. Install OpenSSL version 1.1.1 or higher.

- b. Install Docker or Podman:

- To install Docker (for example, on Red Hat® Enterprise Linux®), run the following commands:

```
yum check-update
yum install docker
```

- To install Podman, see [Podman Installation Instructions](#).

- c. Install `httpd-tools` by running the following commands:

```
yum install httpd-tools
```

- d. Install the IBM Cloud Pak CLI by completing the following steps:

Install the latest version of the binary file for your platform. For more information, see [cloud-pak-cli](#).

- i. Download the binary file by running the following command:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/<binary_file_name>
```

For example:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/cloudctl-linux-amd64.tar.gz
```

- ii. Extract the binary file by running the following command:

```
tar -xf <binary_file_name>
```

- iii. Run the following commands to modify and move the file:

```
chmod 755 <file_name>
mv <file_name> /usr/local/bin/cloudctl
```

- iv. Confirm that `cloudctl` is installed by running the following command:

```
cloudctl --help
```

The `cloudctl` usage is displayed.

- e. Install the `oc` OpenShift Container Platform CLI tool.

For more information, see [Getting started with the CLI](#) in the Red Hat OpenShift documentation.

- f. Install RedHat Skopeo CLI version 1.0.0 or higher.

For more information, see [Installing Skopeo from packages](#).

- g. Run the following command to create a directory that serves as the offline store.

The following example creates a directory called "offline", which is used in the subsequent steps.

```
mkdir $HOME/offline
```

Note: This offline store must be persistent to avoid transferring data more than once. The persistence also helps to run the mirroring process multiple times or on a schedule.

3. Log in to the cluster as a cluster administrator.

Following is an example command to log in to the OpenShift Container Platform cluster:

```
oc login <cluster_host:port> --username=<cluster_admin_user> --password=<cluster_admin_password>
```

4. Create a namespace where you will install API Connect.

Create an environment variable with a namespace, and then create the namespace. For example:

```
export NAMESPACE=<APIC-namespace>
oc create namespace $NAMESPACE
```

where **<APIC-namespace>** is the namespace where you will install API Connect.

The namespace where you install API Connect must meet the following requirements:

- OpenShift restricts the use of default namespaces for installing non-cluster services. The following namespaces cannot be used to install API Connect: `default`, `kube-system`, `kube-public`, `openshift-node`, `openshift-infra`, `openshift`. =
- OpenShift: Only one top-level CR (APICConnectCluster) can be deployed in each namespace.
- Cloud Pak for Integration (Platform Navigator): Only one API Connect capability can be deployed in each namespace.

5. On the bastion host, create environment variables for the installer and image inventory.

Create the following environment variables with the installer image name and the image inventory. For example:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=3.0.7
export CASE_ARCHIVE=$CASE_NAME-$CASE_VERSION.tgz
export CASE_INVENTORY_SETUP=apiconnectOperatorSetup
export OFFLINEDIR=$HOME/offline
export OFFLINEDIR_ARCHIVE=offline.tgz
export CASE_REMOTE_PATH=https://github.com/IBM/cloud-pak/raw/master/repo/case/$CASE_NAME/$CASE_VERSION/$CASE_ARCHIVE
export CASE_LOCAL_PATH=$OFFLINEDIR/$CASE_ARCHIVE

export BASTION_DOCKER_REGISTRY_HOST=localhost
export BASTION_DOCKER_REGISTRY_PORT=443
export BASTION_DOCKER_REGISTRY=$BASTION_DOCKER_REGISTRY_HOST:$BASTION_DOCKER_REGISTRY_PORT
export BASTION_DOCKER_REGISTRY_USER=username
export BASTION_DOCKER_REGISTRY_PASSWORD=password
export BASTION_DOCKER_REGISTRY_PATH=$OFFLINEDIR/imageregistry
```

Note: Set `CASE_VERSION` to the value for your API Connect release. See [Operator, operand, and CASE versions](#).

6. Connect the portable host to the internet.

Connect the portable host to the internet and disconnect it from the local, air-gapped network.

7. Download the API Connect installer and image inventory by running the following command:

```
cloudctl case save \
--case $CASE_REMOTE_PATH \
--outputdir $OFFLINEDIR
```

8. Mirror the images from the ICR (source) registry to the portable device's (destination) registry

a. Store the credentials for the ICR (source) registry.

The following command stores and caches the registry credentials in a file on your file system in the `$HOME/.airgap/secrets` location:

```
cloudctl case launch \
--case $OFFLINEDIR/$CASE_ARCHIVE \
--inventory $CASE_INVENTORY_SETUP \
--action configure-creds-airgap \
--namespace $NAMESPACE \
--args "--registry cp.icr.io --user cp --pass <entitlement-key> --inputDir $OFFLINEDIR"
```

b. Store authentication credentials of the Docker registry that is running on the host.

The following command stores and caches the registry credentials in a file on your file system in the `$HOME/.airgap/secrets` location:

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action configure-creds-airgap \
--args "--registry $PORTABLE_DOCKER_REGISTRY --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD"
```

c. Run a Docker registry service on localhost.

i. Initialize the Docker registry.

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action init-registry \
--args "--registry $PORTABLE_DOCKER_REGISTRY_HOST --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD --dir $PORTABLE_DOCKER_REGISTRY_PATH"
```

ii. Start the Docker registry.

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action start-registry \
--args "--registry $PORTABLE_DOCKER_REGISTRY_HOST --port $PORTABLE_DOCKER_REGISTRY_PORT --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD --dir $PORTABLE_DOCKER_REGISTRY_PATH"
```

d. Mirror the images to the registry on the portable device.

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action mirror-images \
--args "--registry $PORTABLE_DOCKER_REGISTRY --inputDir $OFFLINEDIR"
```

9. Optional: Save the Docker registry image

If your air-gapped network doesn't have a Docker registry image, you can save the image on the portable device and copy it later to the host in your air-gapped environment.

```
docker save docker.io/library/registry:2.6 -o $PORTABLE_DOCKER_REGISTRY_PATH/registry-image.tar
```

10. Connect the portable host to the air-gapped network.

Connect the portable host to the air-gapped network and disconnect it from the internet.

11. Mirror the images and configure the cluster

Note:

Don't use the tilde ~ within double quotation marks in any command. For example, don't use:

```
args "--registry <registry> --user <registry_userid> --pass {registry password} --inputDir ~/offline"
```

The tilde doesn't expand and your commands might fail.

a. Create environment variables with the local Docker registry connection information.

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=3.0.7
export CASE_ARCHIVE=$CASE_NAME-$CASE_VERSION.tgz
export CASE_INVENTORY_SETUP=apiconnectOperatorSetup
export OFFLINEDIR=$HOME/offline
export OFFLINEDIR_ARCHIVE=offline.tgz
export CASE_REMOTE_PATH=https://github.com/IBM/cloud-pak/raw/master/repo/case/$CASE_NAME/$CASE_VERSION/$CASE_ARCHIVE
export CASE_LOCAL_PATH=$OFFLINEDIR/$CASE_ARCHIVE

export LOCAL_DOCKER_REGISTRY_HOST=<IP_or_FQDN_of_local_docker_registry>
export LOCAL_DOCKER_REGISTRY_PORT=443
export LOCAL_DOCKER_REGISTRY=$LOCAL_DOCKER_REGISTRY_HOST:$LOCAL_DOCKER_REGISTRY_PORT
export LOCAL_DOCKER_REGISTRY_USER=username>
export LOCAL_DOCKER_REGISTRY_PASSWORD=password>
```

b. Set up registry credentials for mirroring.

Store credentials of the registry that is running on the internal host (created in previous step)

```
cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --inventory $CASE_INVENTORY_SETUP \
  --action configure-creds-airgap \
  --args "--registry $LOCAL_DOCKER_REGISTRY --user $LOCAL_DOCKER_REGISTRY_USER --pass
$LOCAL_DOCKER_REGISTRY_PASSWORD"
```

c. Configure a global image pull secret and ImageContentSourcePolicy.

```
cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --namespace $NAMESPACE \
  --inventory $CASE_INVENTORY_SETUP \
  --action configure-cluster-airgap \
  --args "--registry $LOCAL_DOCKER_REGISTRY --inputDir $OFFLINEDIR"
```

Note: In OpenShift Container Platform version 4.6, this step restarts all cluster nodes. The cluster resources might be unavailable until the time the new pull secret is applied.

d. Verify that the ImageContentSourcePolicy resource is created.

```
oc get imageContentSourcePolicy
```

e. Optional: If you use an insecure registry, you must add the local registry to the cluster insecureRegistries list.

```
oc patch image.config.openshift.io/cluster --type=merge -p '{"spec":{"registrySources":{"insecureRegistries":
["'$LOCAL_DOCKER_REGISTRY'"]}}}'
```

f. Verify your cluster node status.

```
oc get nodes
```

After the `imageContentSourcePolicy` and global image pull secret are applied, you might see the node status as `Ready`, `Scheduling`, or `Disabled`. Wait until all the nodes show a `Ready` status.

12. Create the CatalogSource.

API Connect can be installed by adding the `CatalogSource` for the mirrored operators to your cluster and then using OLM to install the operators.

a. Install the catalog by running the following command:

This command adds the `CatalogSource` for the components to your cluster, so the cluster can access them from the private registry:

```
cloudctl case launch \
  --case $OFFLINEDIR/$CASE_ARCHIVE \
  --inventory $CASE_INVENTORY_SETUP \
  --action install-catalog \
  --namespace $NAMESPACE \
  --args "--registry $LOCAL_DOCKER_REGISTRY --inputDir $OFFLINEDIR --recursive"
```

b. Verify that the `CatalogSource` for the API Connect installer operator is created by running the following commands:

```
oc get pods -n openshift-marketplace
oc get catalogsource -n openshift-marketplace
```

Known issue: In version 10.0.4.0-ifix2, the `install-catalog` action installs the `CatalogSource` with the public host (`icr.io`) still attached to the image name. To fix this, patch the `ibm-apiconnect-catalog` `CatalogSource` with the following command:

```
oc patch catalogsource ibm-apiconnect-catalog -n openshift-marketplace --type=merge -p='{ "spec":
{"image": "'${LOCAL_DOCKER_REGISTRY}'/cpopen/ibm-apiconnect-catalog:latest-amd64"}'}
```

13. Install the API Connect Operator by running the following command:

```
cloudctl case launch \
--case $OFFLINEDIR/$CASE_ARCHIVE \
--inventory $CASE_INVENTORY_SETUP \
--action install-operator \
--namespace $NAMESPACE
```

Known issues:

- If you are installing API Connect version 10.0.4-ifix2 or 10.0.4-ifix3, you might encounter the following error while installing the operator:

```
Message: unpack job not completed: Unpack pod (openshift-
marketplace/e9f169cee8bfffacf9ab35d276a48b7207d9606e2b7a0a8087bc58b4ff7tx221) container (pull) is pending. Reason:
ImagePullBackOff, Message: Back-off pulling image "ibmcom/ibm-apiconnect-operator-
bundle@sha256:ef0ce455270189c37a5dc0500219061959c041f88110f601f6e7bf8072df4943" Reason: JobIncomplete
```

Resolve the error by completing the following steps to update the ImageContentSourcePolicy for your deployment:

- Log in to the OpenShift cluster UI as an administrator of your cluster.
- Click Search > Resources and search for ICSP.
- In the list of ICSPs, click `ibm-apiconnect` to edit it.
- In the `ibm-apiconnect` ICSP, click the YAML tab.
- In the `spec.repositoryDigestMirrors` section, locate the `-mirrors:` subsection containing `source: docker.io/ibmcom`.
- Add a new mirror ending with `/ibmcom` to the section as in the following example:

```
- mirrors:
  - <AIRGAP_REGISTRY_ADDRESS>/ibmcom
  - <AIRGAP_REGISTRY_ADDRESS>/cpopen
  source: docker.io/ibmcom
```

- If the job does not automatically continue, uninstall and reinstall the API Connect operator.
- There is a known issue on Kubernetes version 1.19.4 or higher that can cause the DataPower operator to fail to start. In this case, the DataPower Operator pods can fail to schedule, and will display the status message: `no nodes match pod topology spread constraints (missing required label)`. For example:

```
0/15 nodes are available: 12 node(s) didn't match pod topology spread constraints (missing required label),
3 node(s) had taint {node-role.kubernetes.io/master: }, that the pod didn't tolerate.
```

You can work around the issue by completing the following steps:

- Uninstall the DataPower operator deployment.
- Download the DataPower case bundle with DataPower operator v1.2.1 or later. These versions fix the limitation. Follow these instructions: <https://ibm.github.io/datapower-operator-doc/install/case>. You can download the DataPower CASE bundle tar file from the following location: <https://github.com/IBM/cloud-pak/raw/master/repo/case/ibm-datapower-operator-cp4i/1.2.1>

14. Install API Connect (the operand).

API Connect provides one top-level CR that includes all of the API Connect subsystems (Management, Developer Portal, Analytics, and Gateway Service).

Attention: Before installing API Connect, you can customize the configuration of the Analytics subsystem. Review the information in [Planning your Analytics deployment](#) to choose configuration options, and then configure the settings as explained in [Installing the Analytics subsystem](#). Remember that OpenShift uses a single, top-level CR for installation, so you will add your configuration settings to the `spec.analytics` section of the CR.

- Create a YAML file to use for deploying the top-level CR. Use the template that applies to your deployment (non-production or production).

Note: The values shown in the following examples might not be suitable for your deployment. For information on the license, profile, and version settings, as well as additional configuration settings, see [API Connect configuration settings](#).

- Example CR settings for a non-production deployment:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-minimum
  name: <name_of_your_instance>
  namespace: <APIC-namespace>
spec:
  license:
    accept: true
    license: L-RJON-C7BJ42
    metric: PROCESSOR_VALUE_UNIT
    use: nonproduction
  profile: nlxc10.m48
  version: 10.0.4.0-ifix3
  storageClassName: <default-storage-class>
```

- Example CR settings for a production deployment:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-production
  name: <name_of_your_instance>
  namespace: <APIC-namespace>
spec:
  license:
    accept: true
```

```
license: L-RJON-C7BJ42
metric: PROCESSOR_VALUE_UNIT
use: production
profile: n3xc14.m48
version: 10.0.4.0-ifix3
storageClassName: <default-storage-class>
```

b. Apply the YAML file:

```
oc apply -f <your_yaml_file>
```

c. To verify your API Connect cluster is successfully installed, run the following command:

```
oc get apic -n <APIC-namespace>
```

d. Verify that you can log in to the API Connect Cloud Manager UI:

To determine the location for logging in, view all the endpoints:

```
oc get routes -n <APIC-namespace>
```

e. Locate the `mgmt-admin-apic` endpoint, and access the Cloud Manager UI.

f. Login as the API Connect administrator.

When you install with the top-level CR, the password is auto-generated. To get the password:

```
oc get secret -n <APIC-namespace> | grep mgmt-admin-pass
oc get secret -n <APIC-namespace> <secret_name_from_previous_command> -o jsonpath="{.data.password}" | base64 -d &&
echo
```

15. Optional: Increase the timeout settings for the API Connect management endpoints, particularly for large deployments. See [Configuring timeouts for management endpoints](#).

## What to do next

---

When you finish installing API Connect, [prepare your deployment for disaster recovery](#) so that your data can be restored in the event of an emergency.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Installing with a portable storage device

Use a portable storage device to perform an air-gapped installation of IBM® API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

## Before you begin

---

Ensure that your environment is ready for API Connect by [preparing for installation](#).

## About this task

---

You can store the product code and images to a portable storage device and transfer them to a local, air-gapped network. By doing so, you can install in your air-gapped environment without using a bastion host.

Notes:

- This task requires you to use Red Hat Skopeo for moving container images. Skopeo is not available for Microsoft Windows, so you cannot perform this task on Windows.
- Don't use the tilde ~ within double quotation marks in any command because the tilde doesn't expand and your commands might fail.

## Procedure

---

1. Prepare a local Docker registry for use with the cluster in the restricted environment.

A local Docker registry is used to store all images in your restricted environment. You must create such a registry and ensure that it meets the following requirements:

- Supports [Docker Manifest V2, Schema 2](#).  
The internal Red Hat OpenShift registry is not compliant with Docker Manifest V2, Schema 2, so it is not suitable for use as a private registry for restricted environments.
- Is accessible from your OpenShift cluster nodes.
- Has the username and password of a user who can write to the target registry from the internal host.
- Has the username and password of a user who can read from the target registry that is on the OpenShift cluster nodes.
- Allows path separators in the image name.

An example of a simple registry is included in [Mirroring images for a disconnected installation](#) in the OpenShift documentation.

Verify that you have the following credentials available:

- The credentials of a user who can write and create repositories. The internal host uses these credentials.
- The credentials of a user who can read all repositories. The OpenShift cluster uses these credentials.

2. Prepare a portable host that can be connected to the internet.

Attach a portable storage device to the host. The storage device is later connected to the local Docker registry in the air-gapped environment.

- The external host must be on a Linux x86\_64 platform, or any operating system that the IBM Cloud Pak CLI and the OpenShift CLI supports.
- The external host `locale` must be set to English.

The portable storage device must have sufficient storage to hold all of the software that is to be transferred to the local Docker registry.

Complete the following steps to set up your external host:

a. Install OpenSSL version 1.1.1 or higher.

b. Install Docker or Podman:

- To install Docker (for example, on Red Hat® Enterprise Linux®), run the following commands:

```
yum check-update
yum install docker
```

- To install Podman, see [Podman Installation Instructions](#).

c. Install `httpd-tools` by running the following commands:

```
yum install httpd-tools
```

d. Install the IBM Cloud Pak CLI by completing the following steps:

Install the latest version of the binary file for your platform. For more information, see [cloud-pak-cli](#).

i. Download the binary file by running the following command:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/<binary_file_name>
```

For example:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/cloudctl-linux-amd64.tar.gz
```

ii. Extract the binary file by running the following command:

```
tar -xf <binary_file_name>
```

iii. Run the following commands to modify and move the file:

```
chmod 755 <file_name>
mv <file_name> /usr/local/bin/cloudctl
```

iv. Confirm that `cloudctl` is installed by running the following command:

```
cloudctl --help
```

The `cloudctl` usage is displayed.

e. Install the `oc` OpenShift Container Platform CLI tool.

For more information, see [Getting started with the CLI](#) in the Red Hat OpenShift documentation.

f. Install RedHat Skopeo CLI version 1.0.0 or higher.

For more information, see [Installing Skopeo from packages](#).

g. Run the following command to create a directory that serves as the offline store.

The following example creates a directory called "offline", which is used in the subsequent steps.

```
mkdir $HOME/offline
```

Note: This offline store must be persistent to avoid transferring data more than once. The persistence also helps to run the mirroring process multiple times or on a schedule.

3. Log in to the cluster as a cluster administrator.

Following is an example command to log in to the OpenShift Container Platform cluster:

```
oc login <cluster_host:port> --username=<cluster_admin_user> --password=<cluster_admin_password>
```

4. Create a namespace where you will install API Connect.

Create an environment variable with a namespace, and then create the namespace. For example:

```
export NAMESPACE=<APIC-namespace>
oc create namespace $NAMESPACE
```

where `<APIC-namespace>` is the namespace where you will install API Connect.

The namespace where you install API Connect must meet the following requirements:

- OpenShift restricts the use of default namespaces for installing non-cluster services. The following namespaces cannot be used to install API Connect:

```
default, kube-system, kube-public, openshift-node, openshift-infra, openshift. =
```

- OpenShift: Only one top-level CR (APIConnectCluster) can be deployed in each namespace.
- Cloud Pak for Integration (Platform Navigator): Only one API Connect capability can be deployed in each namespace.

5. On the bastion host, create environment variables for the installer and image inventory.

Create the following environment variables with the installer image name and the image inventory. For example:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=3.0.7
export CASE_ARCHIVE=$CASE_NAME-$CASE_VERSION.tgz
export CASE_INVENTORY_SETUP=apiconnectOperatorSetup
export OFFLINEDIR=$HOME/offline
export OFFLINEDIR_ARCHIVE=offline.tgz
export CASE_REMOTE_PATH=https://github.com/IBM/cloud-pak/raw/master/repo/case/$CASE_NAME/$CASE_VERSION/$CASE_ARCHIVE
export CASE_LOCAL_PATH=$OFFLINEDIR/$CASE_ARCHIVE
```

```
export BASTION_DOCKER_REGISTRY_HOST=localhost
export BASTION_DOCKER_REGISTRY_PORT=443
export BASTION_DOCKER_REGISTRY=$BASTION_DOCKER_REGISTRY_HOST:$BASTION_DOCKER_REGISTRY_PORT
```

```
export BASTION_DOCKER_REGISTRY_USER=username
export BASTION_DOCKER_REGISTRY_PASSWORD=password
export BASTION_DOCKER_REGISTRY_PATH=$OFFLINEDIR/imageregistry
```

Note: Set `CASE_VERSION` to the value for your API Connect release. See [Operator, operand, and CASE versions](#).

6. Download the API Connect installer and image inventory by running the following command:

```
cloudctl case save \
--case $CASE_REMOTE_PATH \
--outputdir $OFFLINEDIR
```

7. Mirror the images from the ICR (source) registry to the portable device's (destination) registry.

- a. Store the credentials for the ICR (source) registry.

The following command stores and caches the registry credentials in a file on your file system in the `$HOME/.airgap/secrets` location:

```
cloudctl case launch \
--case $OFFLINEDIR/$CASE_ARCHIVE \
--inventory $CASE_INVENTORY_SETUP \
--action configure-creds-airgap \
--namespace $NAMESPACE \
--args "--registry cp.icr.io --user cp --pass <entitlement-key> --inputDir $OFFLINEDIR"
```

- b. Store authentication credentials of the Docker registry that is running on the host.

The following command stores and caches the registry credentials in a file on your file system in the `$HOME/.airgap/secrets` location:

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action configure-creds-airgap \
--args "--registry $PORTABLE_DOCKER_REGISTRY --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD"
```

- c. Run a Docker registry service on localhost.

- i. Initialize the Docker registry.

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action init-registry \
--args "--registry $PORTABLE_DOCKER_REGISTRY_HOST --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD --dir $PORTABLE_DOCKER_REGISTRY_PATH"
```

- ii. Start the Docker registry.

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action start-registry \
--args "--registry $PORTABLE_DOCKER_REGISTRY_HOST --port $PORTABLE_DOCKER_REGISTRY_PORT --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD --dir $PORTABLE_DOCKER_REGISTRY_PATH"
```

- d. Mirror the images to the registry on the external host.

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action mirror-images \
--args "--registry $PORTABLE_DOCKER_REGISTRY --inputDir $OFFLINEDIR"
```

8. Optional: Save the Docker registry image

If your air-gapped network doesn't have a Docker registry image, you can save the image on the portable device and copy it later to the host in your air-gapped environment.

```
docker save docker.io/library/registry:2.6 -o $PORTABLE_DOCKER_REGISTRY_PATH/registry-image.tar
```

9. Copy the saved offline data to an external storage device

- a. Connect the portable storage device, such as a USB drive or external HDD, to this external host.

Archive the offline data for transfer:

```
tar -cvzf $OFFLINEDIR_ARCHIVE -C $OFFLINEDIR .
```

- b. Copy the preceding TAR file to the portable storage.

This portable storage device should be physically transferred from the machine that has a public internet connection to the machine that has no internet connectivity.

10. Log in to the internal host that has access to the OpenShift Container Platform cluster.

Note: The following steps need to be run from this internal host, which is in your air-gapped network, unless otherwise noted.

The internal host must be connected to both the portable storage device and the OpenShift Container Platform cluster.

11. Prepare the internal host and extract images

- a. Create environment variables with the local Docker registry connection information.

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=3.0.7
export CASE_ARCHIVE=$CASE_NAME-$CASE_VERSION.tgz
export CASE_INVENTORY_SETUP=apiconnectOperatorSetup
export OFFLINEDIR=$HOME/offline
export OFFLINEDIR_ARCHIVE=offline.tgz
export CASE_REMOTE_PATH=https://github.com/IBM/cloud-pak/raw/master/repo/case/$CASE_NAME/$CASE_VERSION/$CASE_ARCHIVE
export CASE_LOCAL_PATH=$OFFLINEDIR/$CASE_ARCHIVE

export PORTABLE_DOCKER_REGISTRY_HOST=localhost
export PORTABLE_DOCKER_REGISTRY_PORT=443
```

```

export PORTABLE_DOCKER_REGISTRY=$PORTABLE_DOCKER_REGISTRY_HOST:$PORTABLE_DOCKER_REGISTRY_PORT
export PORTABLE_DOCKER_REGISTRY_USER=username
export PORTABLE_DOCKER_REGISTRY_PASSWORD=password
export PORTABLE_DOCKER_REGISTRY_PATH=$OFFLINEDIR/imageregistry

export LOCAL_DOCKER_REGISTRY_HOST=<IP_or_FQDN_of_local_docker_registry>
export LOCAL_DOCKER_REGISTRY_PORT=443
export LOCAL_DOCKER_REGISTRY=$LOCAL_DOCKER_REGISTRY_HOST:$LOCAL_DOCKER_REGISTRY_PORT
export LOCAL_DOCKER_REGISTRY_USER=username
export LOCAL_DOCKER_REGISTRY_PASSWORD=password

```

- b. Extract the transferred offline data from the portable storage device.

```

mkdir -p $OFFLINEDIR
tar -xvf $OFFLINEDIR_ARCHIVE -C $OFFLINEDIR

```

- c. Set up the docker registry.

Run the local, Docker registry as a container. The registry then points to the Docker file system directory that is transferred from the external host.

```

cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --inventory $CASE_INVENTORY_SETUP \
  --action start-registry \
  --args "--registry $PORTABLE_DOCKER_REGISTRY_HOST --port $PORTABLE_DOCKER_REGISTRY_PORT --user
$PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD --dir $PORTABLE_DOCKER_REGISTRY_PATH"

```

- d. Set up registry credentials for mirroring.

- Store credentials of the registry that is running on the internal host.

```

cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --inventory $CASE_INVENTORY_SETUP \
  --action configure-creds-airgap \
  --args "--registry $PORTABLE_DOCKER_REGISTRY --user $PORTABLE_DOCKER_REGISTRY_USER --pass
$PORTABLE_DOCKER_REGISTRY_PASSWORD"

```

- Store credentials of the registry that will serve images to the cluster/workloads.

```

cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --inventory $CASE_INVENTORY_SETUP \
  --action configure-creds-airgap \
  --args "--registry $LOCAL_DOCKER_REGISTRY --user $LOCAL_DOCKER_REGISTRY_USER --pass
$LOCAL_DOCKER_REGISTRY_PASSWORD"

```

## 12. Mirror the images and configure the cluster

Mirror the images to the target registry that is on your OpenShift cluster and configure the cluster.

- a. Mirror the images from the internal host registry to the target registry on your cluster.

```

cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --inventory $CASE_INVENTORY_SETUP \
  --action mirror-images \
  --args "--fromRegistry $PORTABLE_DOCKER_REGISTRY --registry $LOCAL_DOCKER_REGISTRY --inputDir $OFFLINEDIR"

```

- b. Configure a global image pull secret and ImageContentSourcePolicy.

```

cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --namespace $NAMESPACE \
  --inventory $CASE_INVENTORY_SETUP \
  --action configure-cluster-airgap \
  --args "--registry $LOCAL_DOCKER_REGISTRY --inputDir $OFFLINEDIR"

```

Note: In OpenShift Container Platform version 4.6, this step restarts all cluster nodes. The cluster resources might be unavailable until the time the new pull secret is applied.

- c. Verify that the ImageContentSourcePolicy resource is created.

```

oc get imageContentSourcePolicy

```

- d. Optional: If you use an insecure registry, you must add the local registry to the cluster insecureRegistries list.

```

oc patch image.config.openshift.io/cluster --type=merge -p '{"spec":{"registrySources":{"insecureRegistries":
["'$LOCAL_DOCKER_REGISTRY'"]}}}'

```

- e. Verify your cluster node status.

```

oc get nodes

```

After the `imageContentsourcePolicy` and global image pull secret are applied, you might see the node status as `Ready`, `Scheduling`, or `Disabled`. Wait until all the nodes show a `Ready` status.

## 13. Create the CatalogSource.

API Connect can be installed by adding the `CatalogSource` for the mirrored operators to your cluster and then using OLM to install the operators.

- a. Install the catalog by running the following command:

This command adds the `CatalogSource` for the components to your cluster, so the cluster can access them from the private registry:

```

cloudctl case launch \
  --case $OFFLINEDIR/$CASE_ARCHIVE \
  --inventory $CASE_INVENTORY_SETUP \
  --action install-catalog \

```

```
--namespace $NAMESPACE \
--args "--registry $LOCAL_DOCKER_REGISTRY --inputDir $OFFLINEDIR --recursive"
```

b. Verify that the `CatalogSource` for the API Connect installer operator is created by running the following commands:

```
oc get pods -n openshift-marketplace
oc get catalogsource -n openshift-marketplace
```

Known issue: In version 10.0.4.0-ifix2, the `install-catalog` action installs the `CatalogSource` with the public host (`icr.io`) still attached to the image name. To fix this, patch the `ibm-apiconnect-catalog` `CatalogSource` with the following command:

```
oc patch catalogsource ibm-apiconnect-catalog -n openshift-marketplace --type=merge -p='{"spec":
{"image": "'$LOCAL_DOCKER_REGISTRY' /cpopen/ibm-apiconnect-catalog:latest-amd64"}}'
```

14. Install the API Connect Operator by running the following command:

```
cloudctl case launch \
--case $OFFLINEDIR/$CASE_ARCHIVE \
--inventory $CASE_INVENTORY_SETUP \
--action install-operator \
--namespace $NAMESPACE
```

Known issues:

- If you are installing API Connect version 10.0.4-ifix2 or 10.0.4-ifix3, you might encounter the following error while installing the operator:

```
Message: unpack job not completed: Unpack pod(openshift-
marketplace/e9f169cee8bfffac9ab35d276a48b7207d9606e2b7a0a8087bc58b4ff7tx221) container(pull) is pending. Reason:
ImagePullBackOff, Message: Back-off pulling image "ibmcom/ibm-apiconnect-operator-
bundle@sha256:ef0ce455270189c37a5dc0500219061959c041f88110f601f6e7bf8072df4943" Reason: JobIncomplete
```

Resolve the error by completing the following steps to update the `ImageContentSourcePolicy` for your deployment:

- Log in to the OpenShift cluster UI as an administrator of your cluster.
- Click `Search > Resources` and search for `ICSP`.
- In the list of ICSPs, click `ibm-apiconnect` to edit it.
- In the `ibm-apiconnect` ICSP, click the `YAML` tab.
- In the `spec.repositoryDigestMirrors` section, locate the `-mirrors:` subsection containing `source: docker.io/ibmcom`.
- Add a new mirror ending with `/ibmcom` to the section as in the following example:

```
- mirrors:
  - <AIRGAP_REGISTRY_ADDRESS>/ibmcom
  - <AIRGAP_REGISTRY_ADDRESS>/cpopen
  source: docker.io/ibmcom
```

- If the job does not automatically continue, uninstall and reinstall the API Connect operator.
- There is a known issue on Kubernetes version 1.19.4 or higher that can cause the `DataPower` operator to fail to start. In this case, the `DataPower` Operator pods can fail to schedule, and will display the status message: `no nodes match pod topology spread constraints (missing required label)`. For example:

```
0/15 nodes are available: 12 node(s) didn't match pod topology spread constraints (missing required label),
3 node(s) had taint {node-role.kubernetes.io/master: }, that the pod didn't tolerate.
```

You can work around the issue by completing the following steps:

- Uninstall the `DataPower` operator deployment.
- Download the `DataPower` case bundle with `DataPower` operator v1.2.1 or later. These versions fix the limitation. Follow these instructions: <https://ibm.github.io/datapower-operator-doc/install/case>. You can download the `DataPower` CASE bundle tar file from the following location: <https://github.com/IBM/cloud-pak/raw/master/repo/case/ibm-datapower-operator-cp4i/1.2.1>

15. Install API Connect (the operand).

API Connect provides one top-level CR that includes all of the API Connect subsystems (Management, Developer Portal, Analytics, and Gateway Service).

Attention: Before installing API Connect, you can customize the configuration of the Analytics subsystem. Review the information in [Planning your Analytics deployment](#) to choose configuration options, and then configure the settings as explained in [Installing the Analytics subsystem](#). Remember that OpenShift uses a single, top-level CR for installation, so you will add your configuration settings to the `spec.analytics` section of the CR.

- Create a YAML file to use for deploying the top-level CR. Use the template that applies to your deployment (non-production or production).

Note: The values shown in the following examples might not be suitable for your deployment. For information on the license, profile, and version settings, as well as additional configuration settings, see [API Connect configuration settings](#).

- Example CR settings for a non-production deployment:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-minimum
  name: <name_of_your_instance>
  namespace: <APIC-namespace>
spec:
  license:
    accept: true
    license: L-RJON-C7BJ42
    metric: PROCESSOR_VALUE_UNIT
    use: nonproduction
  profile: nlxc10.m48
  version: 10.0.4.0-ifix3
  storageClassName: <default-storage-class>
```

- Example CR settings for a production deployment:

```

apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-production
  name: <name_of_your_instance>
  namespace: <APIC-namespace>
spec:
  license:
    accept: true
    license: L-RJON-C7BJ42
    metric: PROCESSOR_VALUE_UNIT
    use: production
  profile: n3xc14.m48
  version: 10.0.4.0-ifix3
  storageClassName: <default-storage-class>

```

b. Apply the YAML file:

```
oc apply -f <your_yaml_file>
```

c. To verify your API Connect cluster is successfully installed, run the following command:

```
oc get apic -n <APIC-namespace>
```

d. Verify that you can log in to the API Connect Cloud Manager UI:  
To determine the location for logging in, view all the endpoints:

```
oc get routes -n <APIC-namespace>
```

e. Locate the `mgmt-admin-apic` endpoint, and access the Cloud Manager UI.

f. Login as the API Connect administrator.

When you install with the top-level CR, the password is auto-generated. To get the password:

```

oc get secret -n <APIC-namespace> | grep mgmt-admin-pass
oc get secret -n <APIC-namespace> <secret_name_from_previous_command> -o jsonpath="{.data.password}" | base64 -d &&
echo

```

16. Optional: Increase the timeout settings for the API Connect management endpoints, particularly for large deployments. See [Configuring timeouts for management endpoints](#).

## What to do next

When you finish installing API Connect, [prepare your deployment for disaster recovery](#) so that your data can be restored in the event of an emergency.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing on IBM Cloud Pak for Integration

The API Management capability of IBM Cloud Pak for Integration uses IBM API Connect.

For information on deploying API Connect as a component of Cloud Pak for Integration, see the "API management deployment" section in the [Cloud Pak for Integration documentation](#).

For information on setting Advanced Configuration options in the Cloud Pak Automation Platform UI, see [API Connect configuration settings](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting installation and upgrade on OpenShift

Review the following troubleshooting tips if you encounter a problem while installing or upgrading API Connect on OpenShift, including as a component of IBM Cloud Pak for Integration (CP4I).

- [Operator upgrade fails with error from API Connect operator and Postgres operator](#)
- [Upgrade error when the CRD for the new certificate manager is not found](#)
- [You see the denied: insufficient scope error during an air-gapped deployment](#)
- [Apiconnect operator crashes](#)
- [Upgrading a 3 node profile to IBM API Connect 10.0.3.0 might result in some portal-db/www pods being stuck in the Pending state](#)
- [Issues when installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal](#)

Note: In the [Help](#) page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

## Operator upgrade fails with error from API Connect operator and Postgres operator

If you encounter the following error condition during the upgrade from an API Connect version earlier than 10.0.4.0, complete the workaround steps to patch the pgcluster CR, and then upgrade the API Connect operator again.

1. Check for the following errors:  
From the API Connect operator:

```
upgrade cluster failed: Could not upgrade cluster: there exists an ongoing upgrade task: [minimum-mgmt-56616911-postgres-upgrade]. If you believe this is an error, try deleting this pgtask
```

```
{ "level": "info", "ts": 1659638932.470165, "logger": "UpgradeCluster: ", "msg": "Postgres DB version is less than pgoVersion. Performing upgrade ", "pgoVersion": ": "4.7.4", "postgresDBVersion": ": "4.5.2", "clusterName": "minimum-mgmt-56616911-postgres" }
```

And from the postgres operator:

```
time="2022-08-04T22:05:42Z" level=error msg="Namespace Controller: error syncing Namespace 'cp4i': unsuccessful pgcluster version check: Pgcluster.crunchydata.com "minimum-mgmt-56616911-postgres" is invalid: spec.backrestStorageTypes: Invalid value: "null": spec.backrestStorageTypes in body must be of type array: "null"
```

The errors are caused by a null value for the property in the pgcluster CR. The workaround is to patch the `pgcluster` CR and correct the property.

remove the `null` value for `backrestStorageTypes`: under `spec`, if found and add appropriate value mentioned below. Or if `backrestStorageTypes` doesn't show up in pgcluster add the below values according to the backup type used

2. Get the pgcluster name and edit the CR:

```
oc get pgcluster -n <APIC_namespace>
oc edit pgcluster <pgcluster_name> -n <APIC_namespace>
```

3. Add a value for the `backrestStorageTypes` in the `spec`: section:  
Example for S3 backups:

```
backrestStorageTypes:
- s3
```

Example for local and SFTP backups:

```
backrestStorageTypes:
- posix
```

4. Save and apply the CR with the `wq` command.

## Upgrade error when the CRD for the new certificate manager is not found

The certificate manager was upgraded in Version 10.0.4.0 and you might encounter an upgrade error if the CRD for the new certificate manager is not found; for example:

```
ibm-apiconnect-5fb55f5c5c-hdks4 ibm-apiconnect error {"level":"error","ts":1637587218.9319391,"logger":"controller-runtime.source","msg":"if kind is a CRD, it should be installed before calling Start","kind":"Certificate.cert-manager.io","error":"no matches for kind \"Certificate\" in version \"cert-manager.io/v1\"","stacktrace":"sigs.k8s.io/controller-runtime/pkg/source.(*Kind).Start\n\t/go/pkg/mod/sigs.k8s.io/controller-runtime@v0.6.3/pkg/source/source.go:117\nsigs.k8s.io/controller-runtime/pkg/internal/controller.(*Controller).Start.func1\n\t/go/pkg/mod/sigs.k8s.io/controller-runtime@v0.6.3/pkg/internal/controller/controller.go:143\nsigs.k8s.io/controller-runtime/pkg/internal/controller.(*Controller).Start\n\t/go/pkg/mod/sigs.k8s.io/controller-runtime@v0.6.3/pkg/internal/controller/controller.go:184\nsigs.k8s.io/controller-runtime/pkg/manager.(*controllerManager).startRunnable.func1\n\t/go/pkg/mod/sigs.k8s.io/controller-runtime@v0.6.3/pkg/manager/internal.go:661"}
```

To resolve the error, delete the IBM API Connect operator and re-install it. If you find that the operator is stuck in the "deleting" state in the web console, delete it manually by running the following commands in the project (namespace) where the operator is located:

```
oc delete subscription ibm-apiconnect
oc delete csv ibm-apiconnect.v2.4.0
```

If you installed the operator in all namespaces, the project is called `openshift-operators`.

## You see the denied: insufficient scope error during an air-gapped deployment

Problem: You encounter the `denied: insufficient scope` message while mirroring images during an air-gapped installation or upgrade.

Reason: This error occurs when a problem is encountered with the entitlement key used for obtaining images.

Solution: Obtain a new entitlement key by completing the following steps:

1. Log in to the [IBM Container Library](#).
2. In the Container software library, select Get entitlement key.
3. After the Access your container software heading, click Copy key.
4. Copy the key to a safe location.

## Apiconnect operator crashes

Problem: During installation (or upgrade), the Apiconnect operator crashes with the following message:

```
Warning FailedScheduling 10s (x4 over 2m59s) default-scheduler 0/3 nodes are available: 1 node(s) didn't match pod affinity/anti-affinity, 1 node(s) didn't match pod anti-affinity rules, 2 node(s) had volume node affinity conflict.
```

To resolve this situation you need to delete the PVCs for each pod, and then delete the pod itself, so that Kubernetes will regenerate the PVCs and schedule the pod on the worker node that does not have the anti-affinity conflict.

Therefore, for the `db-1` pod the following commands must be run:

```
$ oc get pvc | grep ejs-portal-sitel-db-1
db-ejs-portal-sitel-db-1      Bound      local-pv-fa445e30    250Gi      RWO          local-storage    15m
dblogs-ejs-portal-sitel-db-1 Bound      local-pv-d57910e7    250Gi      RWO          local-storage    15m
```

```
$ oc delete pvc db-ejs-portal-sitel-db-1 dblogs-ejs-portal-sitel-db-1
persistentvolumeclaim "db-ejs-portal-sitel-db-1" deleted
persistentvolumeclaim "dblogs-ejs-portal-sitel-db-1" deleted
```

```
$ oc delete po ejs-portal-sitel-db-1
pod "ejs-portal-sitel-db-1" deleted
```

For the `www-2` pod the following commands must be run:

```
$ oc get pvc | grep ejs-portal-sitel-www-2
admin-ejs-portal-sitel-www-2 Bound      local-pv-48799536    245Gi      RWO          local-storage    51m
backup-ejs-portal-sitel-www-2 Bound      local-pv-a93f5607    245Gi      RWO          local-storage    51m
web-ejs-portal-sitel-www-2   Bound      local-pv-facd4489    245Gi      RWO          local-storage    51m
```

```
$ oc delete pvc admin-ejs-portal-sitel-www-2 backup-ejs-portal-sitel-www-2 web-ejs-portal-sitel-www-2
persistentvolumeclaim "admin-ejs-portal-sitel-www-2" deleted
persistentvolumeclaim "backup-ejs-portal-sitel-www-2" deleted
persistentvolumeclaim "web-ejs-portal-sitel-www-2" deleted
```

```
$ oc delete po ejs-portal-sitel-www-2
pod "ejs-portal-sitel-www-2" deleted
```

If the PVC has `persistentVolumeReclaimPolicy: Delete` set on it, no cleanup is necessary, as the old data will have been deleted on the worker node that is no longer running the `db-1` and `www-2` pods. However, if you are using `local-storage` in a Kubernetes installation, then there might be some cleanup to do to remove the old data from the worker node that had the anti-affinity conflict.

Kubernetes can now reschedule the pods. All pods with persistent storage are now spread across the available worker nodes, and the pods whose PVCs were deleted will get a full copy of the data from the existing running pods. The following pod list is now observed in our example:

```
$ oc get po -o wide
NAME                                READY   STATUS    RESTARTS   AGE   IP              NODE                                NOMINATED NODE
READINESS GATES
ejs-portal-nginx-84f57ffd8c-f85wm  1/1    Running   0           30s   888.16.29.136   apimdev1066                       <none>         <none>

```

## Issues when installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal

From IBM API Connect 10.0.3.0, the Developer Portal is based on the Drupal 9 content management system. If you want to install Drupal 8 custom modules or sub-themes into the Drupal 9 based Developer Portal, you must ensure that they are compatible with Drupal 9, including any custom code that they contain, and not using any deprecated APIs, for example. There are tools available for checking your custom code, such as [drupal\\_check](#) on GitHub, which checks Drupal code for deprecations.

For example, any Developer Portal sites that contain modules or sub-themes that don't contain a Drupal 9 version declaration will fail to upgrade, and errors like the following output will be seen in the `admin` logs:

```
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: emeraldgreen
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for emeraldgreen
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: rubyred

core_version_requirement '8.x' found for rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Found themes incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: /tmp/restore_site.355ec8 is NOT
Drupal 9 compatible
...
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Found modules incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: sitel.com is NOT Drupal 9
compatible
```

To fix version compatibility errors, all custom modules and sub-themes should declare a `core_version_requirement` key in their `*.info.yml` file that indicates Drupal 9 compatibility. For example:

```
name: Example module
type: module
description: Purely an example
core: 8.x
core_version_requirement: '^8 || ^9'
package: Example module
```

```
# Information added by Drupal.org packaging script on 2020-05-31
version: '8.x-1.3'
project: 'example_module'
datestamp: 1590905415
```

This example specifies that the module is compatible with all versions of Drupal 8 and 9. For more information, see [Let Drupal know about your module with an .info.yml file](#) on the drupal.org website.

If you have a backup of a site that you need to restore, and are getting the version compatibility error, but the module or theme \*.info.yml file cannot be changed easily, then you have two options. Either:

- Add an environment variable into the portal CR for the `www` pod of the `admin` container stating `SKIP_D9_COMPAT_CHECK: "true"`. However, if you choose this method, you must be positive that all of the custom modules and themes for your sites are Drupal 9 compatible, as otherwise the sites may end up inaccessible after the upgrade or restore. On OpenShift or IBM Cloud Pak for Integration, edit the top level CR by using the UI, and add the environment variable as shown in the following CR snippet:

```
spec:
  ...
  portal:
    template:
      - containers:
        - env:
          - name: SKIP_D9_COMPAT_CHECK
            value: "true"
          name: admin
          name: www
```

Or:

- Extract the site backup, edit the relevant files inside it, and then tar the backup file again. Note that this procedure will overwrite the original backup file, so ensure that you keep a separate copy of the original file before you start the extraction. For example:

```
1. mkdir /tmp/backup
2. cd /tmp/backup
3. tar xzf path_to_backup.tar.gz
4. Edit the custom module and theme files to make them Drupal 9 compatible, and add the correct core_version_requirement setting.
5. rm -f path_to_backup.tar.gz
6. tar cfz path_to_backup.tar.gz
7. cd /
8. rm -rf /tmp/backup
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading API Connect

You can upgrade a v10 deployment of API Connect to a newer version.

### About this task

Select from the following sections to find detailed information about upgrading your API Connect deployment.

Note: For information about how to maintain a two data center deployment, including upgrade considerations, see [Maintaining a two data center deployment](#).

- [Upgrading on Kubernetes](#)  
Upgrade API Connect on native Kubernetes distributions.
- [Upgrading on OpenShift and Cloud Pak for Integration](#)  
You can upgrade API Connect in an OpenShift environment and as part of IBM Cloud Pak for Integration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading on Kubernetes

Upgrade API Connect on native Kubernetes distributions.

After reviewing the overview, use the procedures in this section to upgrade API Connect on native Kubernetes distributions.

Note: For upgrading from v5, see [Migrating a Version 5 deployment](#).

- [Upgrade considerations on native Kubernetes](#)  
Review the supported versions, requirements, and limitations for upgrading API Connect on Kubernetes.
- [Upgrading subsystems on native Kubernetes](#)  
Upgrade your API Connect subsystems to the latest version on native Kubernetes.
- [Troubleshooting upgrades on Kubernetes](#)  
Review the following troubleshooting guidance if you encounter a problem while upgrading API Connect on Kubernetes.
- [Migrating API test data](#)  
Back up API testing data before upgrading your IBM® API Connect to V10.0.1, and then restore the data after the upgrade is complete.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Upgrade considerations on native Kubernetes

Review the supported versions, requirements, and limitations for upgrading API Connect on Kubernetes.

Contents:

- [Supported upgrade paths](#)
- [Disable Analytics data collection before upgrading](#)
- [Disable the Analytics message queue feature before upgrading](#)
- [Validating an API definition file with the API Dev Tools Swagger Parser](#)
- [x-ibm-gateway-cors-allow-credentials-when-no-cors-policy API property is deprecated](#)

## Supported upgrade paths

Restriction: A direct upgrade from any version of 10.0.4.x to API Connect 10.0.6.0 or later is not supported. You must upgrade to 10.0.5.x as an interim step before upgrading to 10.0.6.0.

Important: If you are upgrading from v10.0.1.x, it is recommended to upgrade directly to v10.0.5.x. see the documentation for v10.0.5: [https://www.ibm.com/docs/en/SSMNE1\\_10.0.5/com.ibm.apic.install.doc/topic\\_upgrade\\_Kubernetes\\_supported\\_versions.html](https://www.ibm.com/docs/en/SSMNE1_10.0.5/com.ibm.apic.install.doc/topic_upgrade_Kubernetes_supported_versions.html).

Table 1. Supported upgrade paths on Kubernetes

Upgrade from:	How to upgrade to 10.0.4.0-ifix3
10.0.x: <ul style="list-style-type: none"> <li>• 10.0.4.0-ifix2</li> <li>• 10.0.4.0-ifix1</li> <li>• 10.0.4.0</li> <li>• 10.0.3.0-ifix1</li> <li>• 10.0.3.0</li> <li>• 10.0.2.0</li> </ul> 10.0.1.x: <ul style="list-style-type: none"> <li>• 10.0.1.6-eus</li> <li>• 10.0.1.5-ifix4-eus</li> <li>• 10.0.1.5-ifix3-eus</li> <li>• 10.0.1.5-eus</li> <li>• 10.0.1.4-ifix1-eus</li> <li>• 10.0.1.4-eus</li> <li>• 10.0.1.2-ifix2-eus</li> <li>• 10.0.1.2-ifix1-eus</li> <li>• 10.0.1.2-eus</li> </ul>	Complete the procedure in <a href="#">Upgrading subsystems on native Kubernetes</a> .
<ul style="list-style-type: none"> <li>• 10.0.1.1</li> <li>• 10.0.1.0</li> <li>• 10.0.0.0-ifix2</li> </ul>	Complete two upgrades. First upgrade to 10.0.1.2-eus. Next, upgrade to the latest version. Complete the procedures in: <ol style="list-style-type: none"> <li>1. <a href="#">Upgrading from Version 10 to 10.0.1.2-ifix1-eus on Kubernetes</a></li> <li>2. <a href="#">Upgrading subsystems on native Kubernetes</a></li> </ol>
2018 FP19	Complete two upgrades. First upgrade to 10.0.1.2-eus. Next, upgrade to the latest version. Complete the procedures in: <ol style="list-style-type: none"> <li>1. <a href="#">Upgrading from Version 2018 to 10.0.1.2-eus on Kubernetes</a>.</li> <li>2. <a href="#">Upgrading subsystems on native Kubernetes</a></li> </ol>

## Disable Analytics data collection before upgrading

Temporarily [stop the Analytics data collection](#) to avoid losing event data during the upgrade. After the upgrade is complete, you can [start Analytics data collection](#) again.

## Disable the Analytics message queue feature before upgrading

If you enabled the analytics message queue feature, you must disable it before upgrading. You can re-enable the message queue feature after the profile change is complete.

To disable the message queue:

1. Edit the Analytics CR:

```
kubectl edit AnalyticsCluster -n <namespace>
```

2. Locate the `mq` subsection and change the `enabled` setting to `false`:

```
mq:
  enabled: false
```

3. Save and apply the changes.

## Validating an API definition file with the API Dev Tools Swagger Parser

From IBM® API Connect Version 10.0.3.0 or later, SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 documents that form API definition files are now validated at stage or publish time by the API Dev Tools Swagger Parser. Before upgrading, you should ensure that your existing API definition files are parsable and considered valid by the Swagger Parser tool. Note that any API definitions that are already staged or published are not impacted, but would undergo Swagger Parser validation again should they be re-staged or re-published in the future.

You can use either of the following techniques to ensure that existing API definition files are parsable and considered valid by the Swagger Parser:

- Download and install the `swagger-parser-cli` tool (see <https://www.npmjs.com/package/swagger-cli>). This tool includes a `validate` command that can validate local API definition files against the SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 schemas, in both JSON and YAML formats.
- Use the browser-based Swagger Parser Validator available at <https://apitools.dev/swagger-parser/online/>; this accepts a URL to existing files available online, or can accept text copied and pasted into the tool, in both JSON and YAML formats. It can likewise validate against the SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 schemas.

Note: Staging or publishing an API in API Connect results in additional syntactic validation of IBM extensions to SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0, as well as semantic validation to make sure that policies and other resources that the API refers to are valid within the context of the staging or publishing operation. Any errors associated with this additional validation will not be caught by the local or online Swagger Parser tool, nor will they be caught by the `apic validate` toolkit CLI command.

The Swagger Parser tool will report an invalid OpenAPI document. For example, if a document is missing a mandatory section such as `info` or `paths`, the following error is reported:

```
[object Object] is not a valid Swagger API definition
```

If a required property is missing from a given section, a specific error is reported. For example, if the `info` section is missing the required `version` property, the following error is reported:

```
Swagger schema validation failed.
Missing required property: version at #/info
```

```
JSON_OBJECT_VALIDATION_FAILED
```

Additionally, if the document contains any local references (that is, values of `$ref` properties) that do not resolve to an existing reference within the document (known as de-referencing), this is also be flagged as an error. For example, if a document contains the following as a reference:

```
schema:
  $ref: '#/definitions/Pet'
```

then the definition of `Pet` (that is, `#/definitions/Pet`) **must** exist in the same document, at the given path (`definitions` section in this example), similar to the following:

```
definitions:
  Pet:
    type: object
    required:
    - name
    properties:
      id:
        type: integer
        format: int64
```

If the local reference is not found within the document, the following de-referencing error is reported:

```
Token "Pet" does not exist.
```

## x-ibm-gateway-cors-allow-credentials-when-no-cors-policy API property is deprecated

In v2018, when cross-origin resource sharing (CORS) is enabled for an API, every response to a CORS request contains the header:

```
Access-Control-Allow-Credentials: true
```

Inclusion of Access-Control-Allow-Credentials (ACAC) does not provide optimal security, so starting with v2018.4.1.17, an API property can be set to prevent this header from being returned:

```
Name: x-ibm-gateway-cors-allow-credentials-when-no-cors-policy
Collection: *
Value (string): off
```

The `Collection` property refers to a specific Catalog to which a property value applies. The `*` value means the value applies to all catalogs. You can either specify `*` or a Catalog (collection) name.

The property can also be set by using the DataPower CLI:

```
api-definition myAPI
  property x-ibm-gateway-cors-allow-credentials-when-no-cors-policy * off
exit
```

Important: The value of this property must be exactly the string `off` (case-sensitive) in order to remove the header.

It is only possible to turn off this header, or leave it on, for an entire API. In order to have more control, such as returning the header for some origins and not others, you must upgrade to v10 and use the CORS policy feature. For more info, see:

- [Enabling CORS support for an API](#)
- OpenAPI 3.0 editor: [Setting API properties](#)
- OpenAPI 2.0 editor: [Setting API properties](#)

In API Connect 10.0.3.0 or later, the `x-ibm-gateway-cors-allow-credentials-when-no-cors-policy` property works, but only for API definitions which do NOT contain a cors-policy. You cannot define both this property and a CORS Policy on the same API definition.

**This property is deprecated in v10:** a warning will be written to the log for every CORS request received by an API whose definition contains this property.

For v10, the recommended way to ensure the ACAC header does not appear in CORS responses is to add a CORS policy to the API definition. In v10, any API definition which has a cors-policy defined will NOT return the ACAC header by default. Note that it is possible in the CORS policy rules to explicitly return the ACAC header for some or all origins.

If you move your configuration from Version 2018 to 10.0.3.0 or later, and have this custom property defined in your API definitions, you will not see any change in behavior, other than new warnings in the log. This property will remove the ACAC header for any API definition where it appears.

Note: To upgrade from 2018 to 10.0.4.0-ifix3, you must first upgrade to 10.0.1.2-ifix2-eus, and then upgrade to 10.0.4.0-ifix3.

If, when you move your configuration from Version 2018 to Version 10, you want to have the ACAC header present in the CORS responses, you can leave the API definitions as-is (without the new property defined) and the ACAC header will be returned, as long as a cors-policy is not added to the API definition. Note also that even with a CORS policy defined for an API, the ACAC header can be returned if desired by explicitly allowing it in the rules of the CORS policy.

Note that the `x-ibm-gateway-cors-allow-credentials-when-no-cors-policy` property in an API definition:

- Will cause a commit-time error in v10 if a cors-policy is also present in the same API definition
- Will NOT work in v10 or v2018 to turn ON the ACAC header; it can ONLY be used to turn OFF the header. Explanation:
  - In v2018, ACAC is on by default
  - In v10, without cors-policy, ACAC is on by default
  - In v10, with cors-policy, ACAC can be turned on for specific origins via rules in cors-policy

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading subsystems on native Kubernetes

Upgrade your API Connect subsystems to the latest version on native Kubernetes.

### Before you begin

- To ensure operator compatibility, upgrade API Connect management subsystem first and DataPower gateway subsystem second. This requirement applies to all upgrade scenarios. The Gateway subsystem remains available during the upgrade of the Management, Portal, and Analytics subsystems.
- Check your installed Kubernetes version and ensure it is supported by the latest API Connect 10.0.1.x-eus release you are upgrading to, check [IBM API Connect Version 10 software product compatibility requirements](#). If your current Kubernetes version is not supported then upgrade Kubernetes before API Connect.

### Procedure

1. Complete the prerequisites:

a. Ensure you are upgrading from a supported version and reviewed the upgrade requirements and limitations. See [Upgrade considerations on native Kubernetes](#).

b. Verify that the `pgcluster` is healthy:

i. Get the name of the `pgcluster`:

```
kubectl get pgcluster -n <APIC_namespace>
```

The response displays the name of the postgres cluster running in the specified namespace.

ii. Check the status of the `pgcluster`:

```
kubectl get pgcluster <pgcluster_name> -n <APIC_namespace> -o yaml | grep status -A 2 | tail -n3
```

The response for a healthy `pgcluster` looks like the following example, where the state is `Initialized`:

```
status:
  message: Cluster has been initialized
  state: pgcluster Initialized
```

Important: If the `pgcluster` returns any other state, it is not healthy and an upgrade will fail.

- If there are any ongoing backup or restore jobs, wait until they complete and then check the status again. Do not proceed with the upgrade until the status is `Initialized`.
  - If all of the background jobs complete but the `pgcluster` remains unhealthy, contact IBM Support for assistance.
- c. Backup the current deployment. Wait until the backup completes before starting the upgrade.
- Do not start an upgrade if a backup is scheduled to run within a few hours.

- Do not perform maintenance tasks such as rotating key-certificates, restoring from a backup, or starting a new backup, at any time while the upgrade process is running.
- d. If you used any microservice image overrides in the management CR during a fresh install, you must remove the image overrides prior to upgrade. Important: When upgrading, if you used any microservice image overrides in the management CR during a fresh install then prior to upgrade these image overrides will be automatically removed by the operator during upgrade. You can apply them again after the upgrade is complete.
  - e. Back up API test data in the Automated API behavior testing application as explained in [Backing up API test data](#). After the upgrade is complete, you can migrate the data as explained in [Restoring API test data](#).
2. Run the pre-upgrade health check:
    - a. Verify that the **apicops** utility is installed by running the following command to check the current version of the utility:

```
apicops --version
```

If the response indicates that **apicops** is not available, install it now. See [The API Connect operations tool: apicops](#) in the API Connect documentation.

- b. Run the following command to set the KUBECONFIG environment.

```
export KUBECONFIG=/path/to/kubeconfig
```

- c. Run the following command to execute the pre-upgrade script:

```
apicops version:pre-upgrade -n <namespace>
```

If the system is healthy, the results will not include any errors.

3. Obtain the API Connect files from IBM Fix Central.

From the [IBM Fix Central](#) site, download the Docker image-tool file of the API Connect subsystems. Next, you will upload the image-tool file to your Docker local registry. If necessary, you can populate a remote container registry with repositories. Then you can push the images from the local registry to the remote registry.

You will also download the Kubernetes operators, API Connect Custom Resource (CR) templates, and Certificate Manager, for use during deployment configuration.

The following files are used for deployment on native Kubernetes:

#### IBM® API Connect <version> for Containers

Docker images for all API Connect subsystems

IBM® API Connect <version> Operator Release Files for Containers

Kubernetes operators and API Connect Custom Resource (CR) templates

IBM® API Connect <version> Toolkit for <operating\_system\_type>

Toolkit command line utility. Packaged standalone, or with API Designer or Loopback:

- IBM® API Connect <version> Toolkit for <operating\_system\_type>
- IBM® API Connect <version> Toolkit with Loopback for <operating\_system\_type>
- IBM® API Connect <version> Toolkit Designer with Loopback for <operating\_system\_type>

Not required during initial installation. After installation, you can download directly from the Cloud Manager UI and API Manager UI. See [Installing the toolkit](#).

IBM® API Connect <version> Local Test Environment

Optional test environment. See [Testing an API with the Local Test Environment](#)

IBM® API Connect <version> Security Signature Bundle File

Checksum files that you can use to verify the integrity of your downloads.

4. Backup the API Connect subsystems.

The upgrade supports rollback if the upgrade encounters problems.

5. Next, upload the image files that you obtained from Fix Central in Step 3.

- a. Load the image-tool for the new version into your Docker local registry:

```
docker load < apiconnect-image-tool-<version>.tar.gz
```

Ensure that the registry has sufficient disk space for the files.

- b. If your Docker registry requires repositories to be created before images can be pushed, create the repositories for each of the images listed by the image tool. If your Docker registry does not require creation of repositories, skip this step and go to Step 5.c.

- i. Run the following command to get a list of the images from image-tool:

```
docker run --rm apiconnect-image-tool-<version> version --images
```

- ii. From the output of each entry of the form <image-name>:<image-tag>, use your Docker registry repository creation command to create a repository for <image-name>.

For example in the case of AWS ECR the command would be for each <image-name>:

```
aws ecr create-repository --repository-name <image-name>
```

- c. Upload the image:

- If you do not need to authenticate with the docker registry, use:

```
docker run --rm apiconnect-image-tool-<version> upload <registry-url>
```

- Otherwise, if your docker registry accepts authentication with username and password arguments, use:

```
docker run --rm apiconnect-image-tool-<version> upload <registry-url> --username <username> --password <password>
```

- Otherwise, such as with IBM Container Registry, if you need the image-tool to use your local Docker credentials, first authenticate with your Docker registry, then upload images with the command:

```
docker run --rm -v ~/.docker:/root/.docker --user 0 apiconnect-image-tool-<version> upload <registry-url>
```

If necessary, review the following installation notes:

- [Alternative Docker command for macOS if Docker is configured to use osxkeychain](#)

- [Docker authentication notes](#)
  - [Providing a certificate for verification, or disabling TLS verification](#)
- Download and decompress IBM® API Connect <version> Operator Release Files for Containers.  
Make a directory `helper_files` and extract the contents of `helper_files.zip` from the `release_files.zip` into `helper_files`.
  - Upgrade cert-manager from v0.10.1 to v1.5.1.
    - Backup the existing certificates and issuers

```
kubectl get --all-namespaces -oyaml issuer,clusterissuer,cert > backup.yaml
```

- Delete the old issuer and certs

```
kubectl delete issuers.certmanager.k8s.io selfsigning-issuer ingress-issuer -n <namespace>
kubectl delete certs.certmanager.k8s.io ingress-ca -n <namespace>
kubectl delete certs.certmanager.k8s.io portal-admin-client gateway-client-client analytics-client-client analytics-ingestion-client -n <namespace>
```

- Delete the old cert-manager resources including the namespace:

```
kubectl delete -f helper_files/cert-manager-0.10.1-deploy.yaml
```

Note that the old cert-manager CRDs are not deleted.

Wait and make sure namespace `cert-manager` has been deleted:

```
$ kubectl get ns cert-manager
Error from server (NotFound): namespaces "cert-manager" not found
```

- Install the new cert-manager v1.5.1

```
kubectl apply -f helper_files/cert-manager-1.5.1.yaml
```

- Apply the new CRDs from the version you just extracted:

```
kubectl apply -f ibm-apiconnect-crds.yaml
```

- Apply the new DataPower Operator YAML into the namespace where the DataPower Operator is running.

- If the operator is not running in the `default` namespace, open the `ibm-datapower.yaml` file in a text editor and find and replace all references to `default` the name of your namespace. You do not need to take this action when using Operator Lifecycle Manager (OLM).
- Open `ibm-datapower.yaml` in a text editor. Locate the `image:` key in the containers section of the deployment yaml immediately after `imagePullSecrets:`. Replace the value of the `image:` key with the location of the datapower-operator image, either uploaded to your own registry or pulled from a public registry.
- `kubectl apply -f ibm-datapower.yaml -n <namespace>`

The Gateway CR goes to Pending state when the operator is updated. The state of the Gateway CR will change to Running after installation of the API Connect operator in the next step.

Note: There is a known issue on Kubernetes version 1.19.4 or higher that can cause the DataPower operator to fail to start. In this case, the DataPower Operator pods can fail to schedule, and will display the status message: `no nodes match pod topology spread constraints (missing required label)`. For example:

```
0/15 nodes are available: 12 node(s) didn't match pod topology spread constraints (missing required label), 3 node(s) had taint {node-role.kubernetes.io/master: }, that the pod didn't tolerate.
```

You can workaround the issue by editing the DataPower operator deployment and re-applying it, as follows:

- Delete the DataPower operator deployment, if deployed already:

```
kubectl delete -f ibm-datapower.yaml -n <namespace>
```

- Open `ibm-datapower.yaml`, and locate the `topologySpreadConstraints:` section. For example:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: zone
  whenUnsatisfiable: DoNotSchedule
```

- Replace the values for `topologyKey:` and `whenUnsatisfiable:` with the corrected values shown in the example below:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: topology.kubernetes.io/zone
  whenUnsatisfiable: ScheduleAnyway
```

- Save `ibm-datapower.yaml` and deploy the file to the cluster:

```
kubectl apply -f ibm-datapower.yaml -n <namespace>
```

- Clean up the webhook configuration before deploying the newer apiconnect operator

```
kubectl get mutatingwebhookconfiguration,validatingwebhookconfiguration | grep ibm-apiconnect
kubectl delete mutatingwebhookconfiguration/ibm-apiconnect-<namespace>-mutating-webhook-configuration
kubectl delete validatingwebhookconfiguration/ibm-apiconnect-<namespace>-validating-webhook-configuration
```

- Install the new issuers:

```
kubectl apply -f helper_files/ingress-issuer-v1.yaml -n <namespace>
```

- Apply the new API Connect operator yaml into the namespace where the API Connect operator is running.

- For single namespace deployment:
  - If the operator is not running in the `default` namespace, open the `ibm-apiconnect.yaml` file in a text editor and find and replace all references to `default` the name of your namespace. You do not need to take this action when using Operator Lifecycle Manager (OLM).

- Open `ibm-apiconnect.yaml` in a text editor. Replace the value of each `image:` key with the location of the apiconnect operator images (from the `ibm-apiconnect` container and the `ibm-apiconnect-init` container), either uploaded to your own registry or pulled from a public registry.
  - `kubectl apply -f ibm-apiconnect.yaml -n <namespace>`
- For multi-namespace deployment:
    - Locate and open the newly downloaded `ibm-apiconnect-distributed.yaml` in a text editor of choice. Then, find and replace each occurrence of `$OPERATOR_NAMESPACE` with `<namespace>`, replacing `<namespace>` with the desired namespace for the deployment. In this example, the namespace is `operator`.
    - Also in `ibm-apiconnect-distributed.yaml`, locate the `image:` keys in the containers sections of the deployment yaml right below `imagePullSecrets:`. Replace the placeholder values `REPLACE-DOCKER-REGISTRY` of the `image:` keys with the docker registry host location of the apiconnect operator image (either uploaded to own registry or pulled from public registry).
    - Install `ibm-apiconnect-distributed.yaml` with the following command
 

```
kubectl apply -f ibm-apiconnect-distributed.yaml
```
- Use `apicops` to validate the certificates.
    - Run the following command:
 

```
apicops upgrade:stale-certs -n <namespace>
```
    - Delete any stale certificates that are managed by cert-manager.
 

If a certificate failed the validation and it is managed by cert-manager, you can delete the stale certificate secret, and let cert-manager regenerate it. Run the following command:

```
kubectl delete secret <stale-secret> -n <namespace>
```
    - Restart the corresponding so that it can pick up the new secret.
 

To determine which pod to restart, see the following topics:

      - [List of external certificates](#)
      - [List of internal certificates](#)

For information on the `apicops` tool, see [The API Connect operations tool: apicops](#).
  - Verify that both operators are restarted.
  - Run the following command to delete the Postgres pods, which refreshes the new certificate:
 

```
kubectl get pod -n <namespace> --no-headers=true | grep postgres | grep -v backup | awk '{print $1}' | xargs kubectl delete pod -n <namespace>
```
  - Prior to upgrading the operands (subsystems), ensure that the apiconnect operator re-created the necessary microservices as part of the label updates in step [12](#):
 

```
kubectl get apic -n <my-cluster-name>
```
  - Upgrade the operands (subsystems):
    - [Upgrading Management subsystem on native Kubernetes](#)
    - [Upgrading Portal subsystem on native Kubernetes](#)
    - [Upgrading Analytics subsystem on native Kubernetes](#)
    - [Upgrading Gateway subsystem on native Kubernetes](#)
  - Optional: For the optional components API Connect Toolkit and API Connect Local Test Environment, install the latest version of each after you complete upgrade of the subsystems.
    - [Upgrading Management subsystem on native Kubernetes](#)  
Upgrade the management subsystem to the latest version of API Connect.
    - [Upgrading Portal subsystem on native Kubernetes](#)  
Upgrade the Portal subsystem to the latest version of API Connect.
    - [Upgrading Analytics subsystem on native Kubernetes](#)  
Upgrade the Analytics subsystem to the latest version of API Connect.
    - [Upgrading Gateway subsystem on native Kubernetes](#)  
Upgrade the Gateway subsystem to the latest version of API Connect.
    - [Enabling gateway peering and verifying cluster status](#)  
To complete the operand upgrade, restart the gateway pods to enable gateway peering.
    - [Enabling Analytics after upgrading](#)  
After the upgrade successfully completes, enable the Analytics message queue and restart Analytics data collection.
- Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading Management subsystem on native Kubernetes

Upgrade the management subsystem to the latest version of API Connect.

### Before you begin

Complete all steps in [Upgrading subsystems on native Kubernetes](#) prior to the step that links to this topic.

### About this task

When upgrading to a new mod release the version must be changed to the latest mod release version on each CR. This change will be picked up by the operator, and the operator will then start the upgrade.

## Procedure

1. Optional: Update endpoint ingress-issuer to new cert-manager API group.

Change the following annotations from

```
```\n  annotations:\n    certmanager.k8s.io/issuer: ingress-issuer\n```\n
```

to:

```
```\n  annotations:\n    cert-manager.io/issuer: ingress-issuer\n```\n
```

2. Update `version:` in the CR:

```
kubectl -n $NAMESPACE edit mgmt <CLUSTERNAME>
```

where `CLUSTERNAME` is the name specified in the subsystem CR at installation time.

Example result:

```
version: <version>
```

Example version: `10.0.4.0-ifix3`

On the operand version change to `10.0.4.0-ifix3`, you might see the following webhook error message:

```
admission webhook "vmanagementcluster.kb.io" denied the request:\nManagementCluster.management.apiconnect.ibm.com "management" is invalid:\nspec.license.license: Invalid value: "L-RJON-BYGHM4":\nLicense L-RJON-BYGHM4 is invalid for the chosen version 10.0.4.0-ifix3.\nPlease refer license document https://ibm.biz/apiclicenses
```

To fix the webhook error, edit the license setting as described in the next step.

3. Edit the `license:` setting:

- a. Set `accept:` to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.

- b. Set `metric:` to track your product usage. Enter the unit of measure that is used for your program license:

- `PROCESSOR_VALUE_UNIT` - Default value. If you leave the field blank, this value is used.
- `MONTHLY_API_CALL` - Applies only to the IBM API Connect Hybrid Entitlement program.

For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).

- c. Set `use:` to either `production` or `nonproduction`, to match the license you purchased.

- d. Set `license:` to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

- e. Reapply the CR.

Example entry to accept the license for a production system:

```
license:\n  accept: true\n  metric: PROCESSOR_VALUE_UNIT\n  use: production\n  license: L-RJON-C2YLGB
```

4. Example output after upgrading Management subsystem:

```
$ kubectl get apic -n <namespace>\nNAME                                READY   STATUS    VERSION           RECONCILED VERSION   AGE\nmanagementcluster.management.apiconnect.ibm.com/ml  16/16   Running   <version>         <version-build>     162m\n\nNAME                                STATUS    MESSAGE\nAGE\nmanagementdbupgrade.management.apiconnect.ibm.com/management-up-8c28g  Running   Upgrade is running (DB Schema/data are up-to-date)  13m
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading Portal subsystem on native Kubernetes

Upgrade the Portal subsystem to the latest version of API Connect.

### Before you begin

Complete all steps in [Upgrading subsystems on native Kubernetes](#) prior to the step that links to this topic.

### About this task

When upgrading to a new mod release the version must be changed to the latest mod release version on each CR. This change will be picked up by the operator, and the operator will then start the upgrade.

## Procedure

---

1. Update **version:** in the CR:

```
kubectl -n $NAMESPACE edit ptl <CLUSTERNAME>
```

where **CLUSTERNAME** is the name specified in the subsystem CR at installation time.

```
version: <version>
```

Example result:

```
version: 10.0.3.0
```

2. Edit the **license:** setting:

- a. Set **accept:** to **true** to accept the license. Note that the default value is **false**. If you do not accept the license, the Operator will not install the subsystem.

- b. Set **metric:** to track your product usage. Enter the unit of measure that is used for your program license:

- **PROCESSOR\_VALUE\_UNIT** - Default value. If you leave the field blank, this value is used.
- **MONTHLY\_API\_CALL** - Applies only to the IBM API Connect Hybrid Entitlement program.

For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).

- c. Set **use:** to either **production** or **nonproduction**, to match the license you purchased.

- d. Set **license:** to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```
license:
  accept: true
  metric: PROCESSOR_VALUE_UNIT
  use: production
  license: L-RJON-C2YLGB
```

3. Example output after upgrading Portal:

```
kubectl get apic -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
portalcluster.portal.apiconnect.ibm.com/portal	3/3	Running	<version>	<version-build>	139m	

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading Analytics subsystem on native Kubernetes

Upgrade the Analytics subsystem to the latest version of API Connect.

### Before you begin

---

Complete all steps in [Upgrading subsystems on native Kubernetes](#) prior to the step that links to this topic.

### About this task

---

When upgrading to a new mod release the version must be changed to the latest mod release version on each CR. This change will be picked up by the operator, and the operator will then start the upgrade.

## Procedure

---

1. Update **version:** in the CR:

```
kubectl -n $NAMESPACE edit a7s <CLUSTERNAME>
```

where **CLUSTERNAME** is the name specified in the subsystem CR at installation time.

```
version: <version>
```

Example result:

```
version: 10.0.3.0
```

2. Edit the **license:** setting:

- a. Set **accept:** to **true** to accept the license. Note that the default value is **false**. If you do not accept the license, the Operator will not install the subsystem.

- b. Set **metric:** to track your product usage. Enter the unit of measure that is used for your program license:

- **PROCESSOR\_VALUE\_UNIT** - Default value. If you leave the field blank, this value is used.
- **MONTHLY\_API\_CALL** - Applies only to the IBM API Connect Hybrid Entitlement program.

For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).

- c. Set **use:** to either **production** or **nonproduction**, to match the license you purchased.

d. Set `license`: to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).  
Example entry to accept the license for a production system:

```
license:
  accept: true
  metric: PROCESSOR_VALUE_UNIT
  use: production
  license: L-RJON-C2YLGB
```

3. Example output after upgrading the Analytics subsystem:

```
kubectl get apic -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED	VERSION
analyticscluster.analytics.apiconnect.ibm.com/analytics	8/8	Running	<version>	<version-build>	121m

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Upgrading Gateway subsystem on native Kubernetes

Upgrade the Gateway subsystem to the latest version of API Connect.

### Before you begin

- Complete all steps in [Upgrading subsystems on native Kubernetes](#) prior to the step that links to this topic.
- Ensure your upgrade path is supported:
  - To ensure operator compatibility, upgrade the API Connect management subsystem before you upgrade the DataPower gateway subsystem. This requirement applies to all upgrade scenarios.
  - When upgrading from 10.0.1.2-eus to 10.0.4.0-ifix3, you must upgrade the gateway subsystem to 10.0.4.0-ifix3, to match the management subsystem.
  - When upgrading from 10.0.3.0 to 10.0.4.0-ifix3, you can either upgrade the gateway subsystem to 10.0.4.0-ifix3 or leave it at 10.0.3.0. Both scenarios are supported. Note that you cannot upgrade the gateway subsystem to 10.0.4.0-ifix3 unless the management subsystem was previously upgraded to 10.0.4.0-ifix3.

3. When you upgrade a cluster of gateway pods in Kubernetes, a small number of API transactions may fail. During the upgrade, Kubernetes removes the pod from the load balancer configuration, deletes the pod and then starts a new pod. The steps are repeated for each pod. Socket hang ups occur on transactions that are in process at the time the pod is killed.

The number of transactions that fail depends on the rate of incoming transactions and the length of time needed to complete each transaction. Typically the number of failures is a very small percentage. This behavior is expected during an upgrade. If the failure level is not acceptable, schedule the upgrade during an off-hours maintenance window.

Note also that DataPower Gateway supports long-lived connections such as GraphQL subscriptions or other websockets connections. These long-lived connections might not be preserved when upgrading. Workloads with long-lived connections are more vulnerable to failed API transactions during upgrading.

Starting with 10.0.3.0, you can limit the number of failed API transactions during the upgrade by using the DataPower Operator's `lifecycle` property to configure the `preStop` container lifecycle hook on the gateway pods. This approach mitigates the risk of API failures during the rolling update of the gateway StatefulSet by sleeping the pod for a span of time, allowing in-flight transactions to complete prior to the SIGTERM being delivered to the container. While this feature does not guarantee that no in-flight APIs would fail, it does provide some mitigation for in-flight transactions that can complete successfully within the configured time window. For more information, see [Delaying SIGTERM with preStop](#) in the DataPower documentation.

- When upgrading a high-availability cluster, ensure that you meet the requirements:
  - Gateways must be updated one at a time.
  - Before starting the upgrade, a single gateway must be running as primary for all gateway-peering definitions.
  - When upgrading multiple gateways, the primary gateway must be upgraded last.
  - Ensure that the pod with a name like `gww6-0` or `gww5-0` is the primary because it is the last node to be upgraded.

To determine which gateway is running as primary, use either the `show gateway-peering-status` command in the DataPower CLI, or use the Gateway Peering Status display in the WebGUI in the API Connect application domain. To move the primary to the DataPower on which you're currently working, you can issue the `gateway-peering-switch-primary <peering-object-name>` command.

To access the DataPower CLI or WebGUI, use:

```
kubectl attach -it <podname>
```

### About this task

When upgrading to a new mod release the version must be changed to the latest mod release version on each CR. This change will be picked up by the operator, and the operator will then start the upgrade.

### Procedure

- Delete the old Gateway certificates before changing the Gateway operand to 10.0.4.0-ifix3

```
kubectl delete certs.certmanager.k8s.io gateway-service gateway-peering -n gtw -n <namespace>
```

- Update `version`: in the CR:

```
kubectl -n $NAMESPACE edit gw <CLUSTERNAME>
```

where **CLUSTERNAME** is the name specified in the subsystem CR at installation time.

```
version: <version>
```

Example result:

```
version: 10.0.4.0-ifix3
```

3. Edit the **license** setting:
  - a. Set **accept**: to **true** to accept the license. Note that the default value is **false**. If you do not accept the license, the Operator will not install the subsystem.
  - b. Set **metric**: to track your product usage. Enter the unit of measure that is used for your program license:
    - **PROCESSOR\_VALUE\_UNIT** - Default value. If you leave the field blank, this value is used.
    - **MONTHLY\_API\_CALL** - Applies only to the IBM API Connect Hybrid Entitlement program.For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).
  - c. Set **use**: to either **production** or **nonproduction**, to match the license you purchased.
  - d. Set **license**: to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).
  - e. In the **spec.gateway** section, delete the **template** override section, if it exists. You cannot perform an upgrade if the CR contains an override.

Example entry to accept the license for a production system:

```
license:
  accept: true
  metric: PROCESSOR_VALUE_UNIT
  use: production
  license: L-RJON-C2YLGB
```

4. Example output after upgrading the Gateway subsystem:

```
kubectl get apic -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
gatewaycluster.gateway.apiconnect.ibm.com/gw1	2/2	Running	<version>	<version-build>	100m

5. Continue with [Enabling gateway peering and verifying cluster status](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Enabling gateway peering and verifying cluster status

To complete the operand upgrade, restart the gateway pods to enable gateway peering.

### About this task

Follow these steps to fix gateway peering. Due to the ingress issuer changes, the gateway pods must be scaled down and back up. This process will cause 5 to 10 minutes of API downtime.

### Procedure

1. After operand upgrade completes, wait for Management, Portal and Analytics subsystems to report **Running** status.
2. Scale down the gateway firmware containers by editing the Gateway CR and setting **replicaCount** to 0:

```
kubectl edit gw <gw-cr-name>
```

For example:

```
...
spec:
  replicaCount: 0
...
```

3. Wait for the Gateway firmware pods to scale down and terminate. Ensure that the Gateway firmware pods are terminated before moving to next step.
4. Scale up the Gateway firmware containers back to their original value, or remove the **replicaCount** field if none was there before.

```
kubectl edit gw <gw-cr-name>
```

5. Your operands should all have an upgraded version. To verify, wait for the cluster status to become **Running**, and Reconciled version to show the new version number.

For example:

```
kubectl get apic -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
analyticscluster.analytics.apiconnect.example.com/analytics	8/8	Running	10.0.4.0	10.0.4.0-1074	121m

NAME	PHASE	READY	SUMMARY	VERSION	AGE
datapowerservice.datapower.example.com/gw1	Running	True	StatefulSet replicas ready: 1/1	10.0.4.0	100m

NAME	PHASE	LAST EVENT	WORK PENDING	WORK IN-PROGRESS	AGE
------	-------	------------	--------------	------------------	-----

```
datapowermonitor.datapower.example.com/gw1 Running false false 100m
```

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
gatewaycluster.gateway.apiconnect.example.com/gw1	2/2	Running	10.0.4.0	10.0.4.0-1074	100m	

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
managementcluster.management.apiconnect.example.com/ml	16/16	Running	10.0.4.0	10.0.4.0-1074	162m	

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
portalcluster.portal.apiconnect.example.com/portal	3/3	Running	10.0.4.0	10.0.4.0-1074	139m	

Note: Troubleshooting if Gateway pods not in sync with Management after upgrade

A rare failure has been seen during upgrade where some API Connect manager tasks are unable to run after the upgrade. Check if the API Connect 'taskmanager' pods log has the following error message. It would start 15 minutes after upgrade and repeat every 15 minutes for any stuck task.

**TASK: Stale claimed task set to errored state:**

If these errors are reported, restart all the `management-natscluster` pods, for example: `management-natscluster-1`.

```
kubectl -n <namespace> delete pod management-natscluster-1 management-natscluster-2 management-natscluster-3
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Enabling Analytics after upgrading

After the upgrade successfully completes, enable the Analytics message queue and restart Analytics data collection.

### Procedure

1. If you disabled the Analytics message queue before upgrading, enable it now by completing the following steps:
  - a. Edit the Analytics CR by running the following command:

```
kubectl edit AnalyticsCluster -n <namespace>
```

- b. In the `mq` section, change the `enabled` setting to `true`.
- c. Save and apply the change.

2. [Start Analytics data collection](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting upgrades on Kubernetes

Review the following troubleshooting guidance if you encounter a problem while upgrading API Connect on Kubernetes.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

## Upgrading a 3 node profile to IBM API Connect 10.0.3.0 or later might result in some `portal-db/www` pods being stuck in the `Pending` state

IBM® API Connect 10.0.3.0 introduces the pod anti-affinity required rule, meaning that in a 3 node profile deployment, all 3 db and www pods can run only if there are at least 3 running worker nodes. This rule can cause some upgrades to version 10.0.3.0 or later to become stuck in the `Pending` state, in which case some extra steps are needed during the upgrade to workaround the issue. See the following example for detailed information about the issue, and how to continue with the upgrade.

Important: You must have a backup of your current deployment before starting the upgrade.

The following example shows 3 worker nodes:

```
$ kubectl get nodes
NAME          STATUS    ROLES    AGE   VERSION
apimdev0103   Ready    worker   42m   v1.20.0
apimdev0129   Ready    worker   45m   v1.20.0
apimdev1066   Ready    worker   39m   v1.20.0
```

The pods have been scheduled across only 2 of the 3 worker nodes due to a transient problem with `apimdev1066`, as shown in the following pod list. Pods without persistent storage, such as `nginx-X`, can be rescheduled to `apimdev1066` as soon as they are restarted, but any pods with persistent local storage, such as `db-X` and `www-X`, have to be rescheduled onto the same worker node as that is where their files live.

```
$ kubectl get po -o wide
NAME READY STATUS RESTARTS AGE IP NODE NOMINATED NODE
READINESS GATES
ejs-portal-nginx-84f57ffd8c-hbf66 1/1 Running 0 5m12s 888.16.109.208 apimdev0103 <none> <none>
ejs-portal-nginx-84f57ffd8c-mvq96 1/1 Running 0 5m12s 888.16.142.215 apimdev0129 <none> <none>
ejs-portal-nginx-84f57ffd8c-vpmtl 1/1 Running 0 5m12s 888.16.142.214 apimdev0129 <none> <none>
ejs-portal-sitel-db-0 2/2 Running 0 4m39s 888.16.109.209 apimdev0103 <none> <none>
ejs-portal-sitel-db-1 2/2 Running 0 6m37s 888.16.109.206 apimdev0103 <none> <none>
ejs-portal-sitel-db-2 2/2 Running 0 4m39s 888.16.142.216 apimdev0129 <none> <none>
ejs-portal-sitel-ww-0 2/2 Running 0 4m9s 888.16.109.210 apimdev0103 <none> <none>
ejs-portal-sitel-ww-1 2/2 Running 0 6m37s 888.16.142.213 apimdev0129 <none> <none>
ejs-portal-sitel-ww-2 2/2 Running 0 4m9s 888.16.142.217 apimdev0129 <none> <none>
ibm-apiconnect-75b47f9f87-p25dd 1/1 Running 0 5m12s 888.16.109.207 apimdev0103 <none> <none>
```

The upgrade to version 10.0.3.0 is started and the following pod list is observed:

```
$ kubectl get po -o wide
NAME READY STATUS RESTARTS AGE IP NODE NOMINATED NODE
READINESS GATES
ejs-portal-nginx-84f57ffd8c-hbf66 1/1 Running 0 10m 888.16.109.208 apimdev0103 <none> <none>
ejs-portal-nginx-84f57ffd8c-mvq96 1/1 Running 0 10m 888.16.142.215 apimdev0129 <none> <none>
ejs-portal-nginx-84f57ffd8c-vpmtl 1/1 Running 0 10m 888.16.142.214 apimdev0129 <none> <none>
ejs-portal-sitel-db-0 2/2 Running 0 10m 888.16.109.209 apimdev0103 <none> <none>
ejs-portal-sitel-db-1 0/2 Pending 0 91s <none> <none> <none>
ejs-portal-sitel-db-2 2/2 Running 0 2m41s 888.16.142.218 apimdev0129 <none> <none>
ejs-portal-sitel-ww-0 2/2 Running 0 9m51s 888.16.109.210 apimdev0103 <none> <none>
ejs-portal-sitel-ww-1 2/2 Running 0 12m 888.16.142.213 apimdev0129 <none> <none>
ejs-portal-sitel-ww-2 0/2 Pending 0 111s <none> <none> <none>
ibm-apiconnect-75b47f9f87-p25dd 1/1 Running 0 10m 888.16.109.207 apimdev0103 <none> <none>
```

The pod list shows that `db-2` has restarted, and has been rescheduled to `apimdev0129` as there were no other db pods running on that node. However, `db-1` and `ww-2` are both stuck in `Pending` state, as there is already a pod of the same type running on the worker node that is hosting the local storage that they are bound to. If you run a `describe` command of either pod you will see the following output:

```
Events:
Type Reason Age From Message
----
Warning FailedScheduling 10s (x4 over 2m59s) default-scheduler 0/3 nodes are available: 1 node(s) didn't match pod affinity/anti-affinity, 1 node(s) didn't match pod anti-affinity rules, 2 node(s) had volume node affinity conflict.
```

To resolve this situation you need to delete the PVCs for each pod, and then delete the pod itself, so that Kubernetes will regenerate the PVCs and schedule the pod on the worker node that does not have the anti-affinity conflict.

Therefore, for the `db-1` pod the following commands must be run:

```
$ kubectl get pvc | grep ejs-portal-sitel-db-1
db-ejs-portal-sitel-db-1 Bound local-pv-fa445e30 250Gi RWO local-storage 15m
dblogs-ejs-portal-sitel-db-1 Bound local-pv-d57910e7 250Gi RWO local-storage 15m
```

```
$ kubectl delete pvc db-ejs-portal-sitel-db-1 dblogs-ejs-portal-sitel-db-1
persistentvolumeclaim "db-ejs-portal-sitel-db-1" deleted
persistentvolumeclaim "dblogs-ejs-portal-sitel-db-1" deleted
```

```
$ kubectl delete po ejs-portal-sitel-db-1
pod "ejs-portal-sitel-db-1" deleted
```

For the `ww-2` pod the following commands must be run:

```
$ kubectl get pvc | grep ejs-portal-sitel-ww-2
admin-ejs-portal-sitel-ww-2 Bound local-pv-48799536 245Gi RWO local-storage 51m
backup-ejs-portal-sitel-ww-2 Bound local-pv-a93f5607 245Gi RWO local-storage 51m
web-ejs-portal-sitel-ww-2 Bound local-pv-facd4489 245Gi RWO local-storage 51m
```

```
$ kubectl delete pvc admin-ejs-portal-sitel-ww-2 backup-ejs-portal-sitel-ww-2 web-ejs-portal-sitel-ww-2
persistentvolumeclaim "admin-ejs-portal-sitel-ww-2" deleted
persistentvolumeclaim "backup-ejs-portal-sitel-ww-2" deleted
persistentvolumeclaim "web-ejs-portal-sitel-ww-2" deleted
```

```
$ kubectl delete po ejs-portal-sitel-ww-2
pod "ejs-portal-sitel-ww-2" deleted
```

If the PVC has `persistentVolumeReclaimPolicy: Delete` set on it, no cleanup is necessary, as the old data will have been deleted on the worker node that is no longer running the `db-1` and `ww-2` pods. However, if you are using local-storage in a Kubernetes installation, then there might be some cleanup to do to remove the old data from the worker node that had the anti-affinity conflict.

Kubernetes can now reschedule the pods. All pods with persistent storage are now spread across the available worker nodes, and the pods whose PVCs were deleted will get a full copy of the data from the existing running pods. The following pod list is now observed in our example:

```
$ kubectl get po -o wide
NAME READY STATUS RESTARTS AGE IP NODE NOMINATED NODE
READINESS GATES
ejs-portal-nginx-84f57ffd8c-f85wm 1/1 Running 0 30s 888.16.29.136 apimdev1066 <none> <none>
ejs-portal-nginx-84f57ffd8c-k5k1b 1/1 Running 0 103s 888.16.142.220 apimdev0129 <none> <none>
ejs-portal-nginx-84f57ffd8c-lhqqs 1/1 Running 0 1m53s 888.16.109.212 apimdev0103 <none> <none>
ejs-portal-sitel-db-0 2/2 Running 0 6m43s 888.16.109.211 apimdev0103 <none> <none>
ejs-portal-sitel-db-1 2/2 Running 0 8m20s 888.16.29.134 apimdev1066 <none> <none>
ejs-portal-sitel-db-2 2/2 Running 0 14m 888.16.142.218 apimdev0129 <none> <none>
ejs-portal-sitel-ww-0 2/2 Running 0 93s 888.16.109.213 apimdev0103 <none> <none>
ejs-portal-sitel-ww-1 2/2 Running 0 3m55s 888.16.142.219 apimdev0129 <none> <none>
ejs-portal-sitel-ww-2 2/2 Running 0 7m27s 888.16.29.135 apimdev1066 <none> <none>
ibm-apiconnect-75b47f9f87-p25dd 1/1 Running 0 22m 888.16.109.207 apimdev0103 <none> <none>
```

## Issues when installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal

From IBM API Connect 10.0.3.0, the Developer Portal is based on the Drupal 9 content management system. If you want to install Drupal 8 custom modules or sub-themes into the Drupal 9 based Developer Portal, you must ensure that they are compatible with Drupal 9, including any custom code that they contain, and not using any deprecated APIs, for example. There are tools available for checking your custom code, such as [drupal\\_check](#) on GitHub, which checks Drupal code for deprecations.

For example, any Developer Portal sites that contain modules or sub-themes that don't contain a Drupal 9 version declaration will fail to upgrade, and errors like the following output will be seen in the `admin` logs:

```
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: emeraldgreen
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for emeraldgreen
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Found themes incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: /tmp/restore_site.355ec8 is NOT
Drupal 9 compatible
...
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Found modules incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: sitel.com is NOT Drupal 9
compatible
```

To fix version compatibility errors, all custom modules and sub-themes should declare a `core_version_requirement` key in their `*.info.yml` file that indicates Drupal 9 compatibility. For example:

```
name: Example module
type: module
description: Purely an example
core: 8.x
core_version_requirement: '^8 || ^9'
package: Example module
```

```
# Information added by Drupal.org packaging script on 2020-05-31
version: '8.x-1.3'
project: 'example_module'
datestamp: 1590905415
```

This example specifies that the module is compatible with all versions of Drupal 8 and 9. For more information, see [Let Drupal know about your module with an .info.yml file](#) on the drupal.org website.

If you have a backup of a site that you need to restore, and are getting the version compatibility error, but the module or theme `*.info.yml` file cannot be changed easily, then you have two options. Either:

- Add an environment variable into the portal CR for the `www` pod of the `admin` container stating `SKIP_D9_COMPAT_CHECK: "true"`. However, if you choose this method, you must be positive that all of the custom modules and themes for your sites are Drupal 9 compatible, as otherwise the sites may end up inaccessible after the upgrade or restore. The following example shows the portal CR snippet for skipping the Drupal 9 check:

```
spec:
  ...
  template:
    - containers:
      - env:
        - name: SKIP_D9_COMPAT_CHECK
          value: "true"
        name: admin
      name: www
```

On Kubernetes, edit the portal CR by using the `kubect1 edit pt1 <portal-cr-name>` command.

Or:

- Extract the site backup, edit the relevant files inside it, and then tar the backup file again. Note that this procedure will overwrite the original backup file, so ensure that you keep a separate copy of the original file before you start the extraction. For example:
  1. `mkdir /tmp/backup`
  2. `cd /tmp/backup`
  3. `tar xfz path_to_backup.tar.gz`
  4. Edit the custom module and theme files to make them Drupal 9 compatible, and add the correct `core_version_requirement` setting.
  5. `rm -f path_to_backup.tar.gz`
  6. `tar cfz path_to_backup.tar.gz`
  7. `cd /`
  8. `rm -rf /tmp/backup`

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Migrating API test data

Back up API testing data before upgrading your IBM® API Connect to V10.0.1, and then restore the data after the upgrade is complete.

### About this task

---

Starting with V10.0.1, the Automated API behavior testing application no longer uses MongoDB to store data. When you upgrade from V10 to V10.0.1 on Kubernetes, you must migrate data that is currently stored in MongoDB into the internal database storage used by API Connect.

You can migrate the following types of API test data:

- Snapshots
- Project environments
- Vault entities, vault variables (password fields cannot be migrated)
- Tests, test variables (test results cannot be migrated)

To migrate data, complete the following tasks:

1. [Backing up API test data](#)  
Before upgrading your IBM API Connect to V10.0.1, back up your API test data from the Automated API behavior testing application.
2. [Restoring API test data](#)  
After you complete the upgrade of IBM API Connect to V10.0.1, restore your API test data.
3. [Uninstalling Percona Server for MongoDB](#)  
After you restore API test data in IBM API Connect V10.0.1, uninstall Percona Server for MongoDB.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Backing up API test data

Before upgrading your IBM® API Connect to V10.0.1, back up your API test data from the Automated API behavior testing application.

Open the Automated API behavior testing application and then complete the steps in the following sections to back up each type of API test data.

### Snapshots

---

Back up each snapshot by completing the following steps:

1. Select HTTP Client.
2. Select a snapshot and load it into the client.
3. Copy the following snapshot properties to a text file:
  - Name
  - Description
  - Method
  - URL
  - Headers
  - Body
4. Save the file.

Repeat the steps for each additional snapshot that you want to migrate.

### Project environments

---

Back up each project environment by completing the following steps:

1. Click Vault > *project name*.
2. Click Environments > Open Presets Editor.
3. Select an environment to back up.
4. Copy the following properties to a text file:
  - Name of the environment
  - Each Key:Value pair
5. Save the file.

Repeat the steps for each additional project environment that you want to migrate.

### Vault entities

---

Back up each vault entity by completing the following steps:

1. Click Vault > *project name* > Snippets.
2. Select a snippet and copy the following properties to a text file:
  - Name

- Description
  - Code
3. Repeat step 4 for each snippet in the vault.
  4. Save the file.

Repeat this procedure for each additional vault entity that you want to migrate.

## Vault variables

---

Back up each vault variable by completing the following steps:

1. Click Vault > *project name* > Variables.
2. Select a variable and copy the following properties to a text file:
  - Name
  - Value
3. Repeat step 2 for each variable in the vault.
4. Save the file.

Repeat the steps for each additional vault variable that you want to migrate.

## Tests and test variables

---

Back up each test with all of its test variables in a text file by completing the following steps:

Test

1. Click Vault > *project name* > Tests.
2. Edit a test.
3. Select Source.
4. Copy the entire test document to a text file.
5. Save the file.

Test variable

To make restoring easier, use the same text file to contain a test document and the related test variables.

1. Edit the test that you just backed up.
2. Select Data Sets.
3. Go to a set of variables (such as **Global**) and note the scope in your file.
4. For each variable in the data set, copy the following properties to the file containing the corresponding test document:
  - Name
  - ValueFor each data set, you should have a scope noted, plus a list of name/value pairs.
5. Repeat steps 3 and 4 for each set of variables.
6. Save the file.

Repeat the steps for each additional test or test variable that you want to migrate.

**Next topic:** [Restoring API test data](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Restoring API test data

After you complete the upgrade of IBM® API Connect to V10.0.1, restore your API test data.

Open the Automated API behavior testing application and then complete the steps in the following sections to restore each type of API test data.

## Snapshots

---

Restore each saved snapshot by completing the following steps:

1. Open the file containing a snapshot's data.
2. In the test application, select HTTP Client.
3. Copy the following snapshot properties into the client fields:
  - Name
  - Description
  - Method
  - URL
  - Headers
  - Body
4. Submit the request.
5. Save the snapshot.

Repeat the steps for each additional snapshot that you want to restore.

## Project environments

---

Restore each project environment by completing the following steps:

1. Click Vault > *project name* > Tests.
2. Click New Preset.
3. Add an environment.
4. Copy the following data from the text file to the environment properties:
  - Name of the environment
  - Each Key:Value pair
5. Save the environment.

Repeat the steps for each additional project environment that you want to restore.

## Vault entities

---

Restore each vault entity by completing the following steps to recreate the snippet:

1. Click Vault > *project name* > Tests.
2. Create a test within the project.
3. Edit the test, and select From Scratch.
4. Go to the Source view of the test and paste the snippet's code from your text file.
5. Go to the Code view and select all Components.
6. Select Vault and click the Add icon.
7. Save the snippet with the same name and description as the original.
8. Delete the test.

Repeat this procedure for each additional vault entity that you want to restore.

## Vault variables

---

Restore each vault variable by completing the following steps:

1. Click Vault > *project name* > New Variable.
2. Paste the name and value from the file into the variable, and save it.

Repeat the steps for each additional vault variable that you want to restore.

## Tests and test variables

---

Restore each test and its test variables by completing the following steps:

Test

1. Click Vault > *project name* > Tests.
2. Create a test with the same name as the original.
3. Select Source and paste the copied code into the source.
4. Save the new test.

Test variable

1. Select a test and click Data sets.
2. Refer to your notes and set the scope of the test variable.
3. Create the variable by copying the name and value from your file.

Repeat the steps for each additional test or test variable that you want to restore.

**Previous topic:** [Backing up API test data](#)

**Next topic:** [Uninstalling Percona Server for MongoDB](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Uninstalling Percona Server for MongoDB

After you restore API test data in IBM® API Connect V10.0.1, uninstall Percona Server for MongoDB.

### About this task

---

After your API test data is migrated, you don't need Percona Server for MongoDB (PSMDB). Uninstall PSMDB by completing running the commands described in the following steps.

### Procedure

---

1. Delete PSMDB, as well as the backup and restore CRs:

```
kubectl -n namespace delete psmdb --all
```

where *namespace* is the namespace where PSMDB was installed.

2. Delete the PSMDB Operator deployments:

```
kubectl -n namespace delete deployment percona-server-mongodb-operator
```

where *namespace* is the namespace where PSMDB was installed.

3. Delete the PSMDB service account:

```
kubectl -n namespace delete sa percona-server-mongodb-operator
```

where *namespace* is the namespace where PSMDB was installed.

4. Delete the PSMDB secrets:

```
kubectl -n namespace delete secret ibm-apiconnect-mongo-cluster-secrets
kubectl -n namespace delete secret ibm-apiconnect-mongo-cluster-ssl
kubectl -n namespace delete secret ibm-apiconnect-mongo-cluster-ssl-internal
kubectl -n namespace delete secret ibm-apiconnect-mongodb-encryption-key
```

where *namespace* is the namespace where PSMDB was installed.

5. Delete the PSMDB role binding:

```
kubectl -n namespace delete rolebindings service-account-percona-server-mongodb-operator
```

where *namespace* is the namespace where PSMDB was installed.

6. Delete the PSMDB role

```
kubectl -n namespace delete role
percona-server-mongodb-operator
```

where *namespace* is the namespace where PSMDB was installed.

7. Delete the PSMDB PVCs:

```
kubectl -n namespace delete pvc pvc_name
```

where:

- *namespace* is the namespace where PSMDB was installed.
- *pvc\_name* is the name of a Persistent Volume Claim that is used by PSMDB.
- The PVCs use the following naming pattern: `mongod-data-ibm-apiconnect-mongo-cluster-rs0-...`

8. Delete the PSMDB CRDs:

```
kubectl delete crds perconaservermongodbackup.kubernetes.psmdb.percona.com
kubectl delete crds perconaservermongodrestore.kubernetes.psmdb.percona.com
kubectl delete crds perconaservermongodbs.kubernetes.psmdb.percona.com
```

**Previous topic:** [Restoring API test data](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading on OpenShift and Cloud Pak for Integration

You can upgrade API Connect in an OpenShift environment and as part of IBM Cloud Pak for Integration.

- [Upgrade considerations on OpenShift and Cloud Pak for Integration](#)  
Review the supported upgrade paths and other upgrade considerations on OpenShift or Cloud Pak for Integration.
- [Preparing to upgrade on OpenShift and Cloud Pak for Integration](#)  
Prepare your OpenShift or Cloud Pak for Integration deployment for upgrading to the new version of API Connect 10.0.x.
- [Upgrading on OpenShift and Cloud Pak for Integration in an online environment](#)  
Perform an online (connected to the internet) upgrade of IBM® API Connect on OpenShift Container Platform or IBM Cloud Pak for Integration.
- [Upgrading on OpenShift in an air-gapped environment](#)  
You can upgrade API Connect on OpenShift in an air-gapped scenario where your cluster is not connected to the internet.
- [Enabling Analytics after upgrading](#)  
After the upgrade successfully completes, enable the Analytics message queue and restart Analytics data collection.
- [Troubleshooting installation and upgrade on OpenShift](#)  
Review the following troubleshooting tips if you encounter a problem while installing or upgrading API Connect on OpenShift, including as a component of IBM Cloud Pak for Integration (CP4I).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Upgrade considerations on OpenShift and Cloud Pak for Integration

Review the supported upgrade paths and other upgrade considerations on OpenShift or Cloud Pak for Integration.

- [Supported upgrade paths](#)
- [Supported DataPower Gateway versions](#)
- [x-ibm-gateway-cors-allow-credentials-when-no-cors-policy deprecated](#)
- [API transactions might fail during the upgrade of gateway pods.](#)
- [What to do next](#)

## Supported upgrade paths

Restriction: A direct upgrade from any version of 10.0.4.x to API Connect 10.0.6.0 or later is not supported. You must upgrade to 10.0.5.x as an interim step before upgrading to 10.0.6.0.

Important: If you are upgrading from v10.0.1.x, it is recommended to upgrade directly to v10.0.5.x. see the documentation for v10.0.5:

[https://www.ibm.com/docs/en/SSMNED\\_10.0.5/com.ibm.apic.install.doc/topic\\_upgrade\\_OpenShift\\_consider.html](https://www.ibm.com/docs/en/SSMNED_10.0.5/com.ibm.apic.install.doc/topic_upgrade_OpenShift_consider.html).

To ensure data integrity, first upgrade to 10.0.4.0-ifix3. Then, subsequent upgrades to the latest version can be performed. Table 1 lists the supported releases of IBM® API Connect v10 that can be upgraded directly to the new version of API Connect.

Table 1. Supported versions of API Connect for upgrading

API Connect version	Direct upgrade to 10.0.4.0-ifix3 ?
<ul style="list-style-type: none"><li>• 10.0.4.0-ifix2</li><li>• 10.0.4.0-ifix1</li><li>• 10.0.4.0</li></ul>	Yes
10.0.3.0	Yes
10.0.2.0	Yes
<ul style="list-style-type: none"><li>• 10.0.1.6-eus</li><li>• 10.0.1.5-ifix4-eus</li><li>• 10.0.1.5-ifix3-eus</li><li>• 10.0.1.5-ifix2-eus</li><li>• 10.0.1.5-ifix1-eus</li><li>• 10.0.1.5-eus</li></ul>	Yes
<ul style="list-style-type: none"><li>• 10.0.1.4-ifix1-eus</li><li>• 10.0.1.4-eus</li></ul>	Yes
<ul style="list-style-type: none"><li>• 10.0.1.2-ifix2-eus</li><li>• 10.0.1.2-ifix1-eus</li><li>• 10.0.1.2-eus</li></ul>	No Upgrade to 10.0.1.4-ifix1-eus first.
10.0.1.1-eus	No Upgrade to 10.0.1.4-ifix1-eus first.
10.0.1.0	No
10.0.0.0-ifix2	No

For information on the operator, operand, and CASE version used with each API Connect release, see [Operator, operand, and CASE versions](#).

## Upgrading Multiple Instances

Where the API Connect operator manages multiple API Connect instances, those instances should all be upgraded after upgrading the operator. Do not leave API Connect operands running on a version older than the operator for any longer than necessary to complete the upgrades, which should be done sequentially.

## Supported DataPower Gateway versions

For API Connect Version 10.x, DataPower and API Connect releases must be within one release of each other. For example, API Connect v10.0.n runs with DataPower Gateway 10.0.n, v10.0.n-1, or v10.0.n+1.

However, before you install, best practice is to review the latest compatibility support for your version of API Connect. To view compatibility support, follow the instructions in [IBM API Connect Version 10 software product compatibility requirements](#) to access API Connect information on the Software Product Compatibility Reports website. Once you access information for your version of API Connect, select Supported Software, Integration Middleware, and view the list of compatible DataPower Gateway versions.

## x-ibm-gateway-cors-allow-credentials-when-no-cors-policy deprecated

The `x-ibm-gateway-cors-allow-credentials-when-no-cors-policy` API property is deprecated because it is replaced with the new CORS policy feature. For more information on configuring the CORS policy in v10, see the following topics:

- [Enabling CORS support for an API](#)
- OpenAPI 3 editor: [Setting API properties](#)
- OpenAPI 2 editor: [Setting API properties](#)

For information on how the new policy replaces the deprecated API property, review the following summary.

Using CORS in v2018

In v2018, when cross-origin resource sharing (CORS) is enabled for an API, every response to a CORS request contains the header:

```
Access-Control-Allow-Credentials: true
```

Inclusion of Access-Control-Allow-Credentials (ACAC) does not provide optimal security, so starting with v2018.4.1.17, an API property can be set to prevent this header from being returned:

```
Name: x-ibm-gateway-cors-allow-credentials-when-no-cors-policy
Collection: *
Value (string): off
```

The **Collection** setting refers to a specific Catalog to which a property value applies. The "\*" value means the value applies to all catalogs. You can either specify \* or a Catalog (collection) name.

The property can also be set by using the DataPower CLI:

```
api-definition myAPI
  property x-ibm-gateway-cors-allow-credentials-when-no-cors-policy * off
exit
```

It is only possible to turn off this header, or leave it on, for an entire API.

Important: The value of this property must be exactly the string `off` (case-sensitive) in order to remove the header.

#### Using CORS in V10

In API Connect 10.0.3.0 or later, the `x-ibm-gateway-cors-allow-credentials-when-no-cors-policy` property works, but only for API definitions which do NOT contain a `cors-policy`. You cannot define both this property and a CORS Policy on the same API definition.

**This property is deprecated in v10:** a warning will be written to the log for every CORS request received by an API whose definition contains this property.

For v10, the recommended way to ensure the ACAC header does not appear in CORS responses is to add a CORS policy to the API definition. In v10, any API definition which has a `cors-policy` defined will NOT return the ACAC header by default. Note that it is possible in the CORS policy rules to explicitly return the ACAC header for some or all origins.

If you move your configuration from Version 2018 to Version 10.0.1.4-eus or later, and have this custom property defined in your API definitions, you will not see any change in behavior, other than new warnings in the log. This property will remove the ACAC header for any API definition where it appears.

If, when you move your configuration from v2018 to v10, you want to have the ACAC header present in the CORS responses, you can leave the API definitions as-is (without the new property defined) and the ACAC header will be returned, as long as a `cors-policy` is not added to the API definition. Note also that even with a CORS policy defined for an API, the ACAC header can be returned if desired by explicitly allowing it in the rules of the CORS policy.

Note that the `x-ibm-gateway-cors-allow-credentials-when-no-cors-policy` property in an API definition:

- Will cause a commit-time error in v10 if a `cors-policy` is also present in the same API definition
- Will NOT work in v10 or v2018 to turn ON the ACAC header; it can ONLY be used to turn OFF the header. Explanation:
  - In v2018, ACAC is on by default
  - In v10, without `cors-policy`, ACAC is on by default
  - In v10, with `cors-policy`, ACAC can be turned on for specific origins (by using rules in `cors-policy`)

## API transactions might fail during the upgrade of gateway pods.

Consider scheduling the upgrade during off-hours to avoid transaction failures.

When you upgrade a cluster of gateway pods in Kubernetes, a small number of API transactions may fail. During the upgrade, Kubernetes removes the pod from the load balancer configuration, deletes the pod, and then starts a new pod. The steps are repeated for each pod. Socket hang ups occur on transactions that are in process at the time the pod is deleted.

The number of transactions that fail depends on the rate of incoming transactions and the length of time needed to complete each transaction. Typically the number of failures is a very small percentage. This behavior is expected during an upgrade. If the failure level is not acceptable, schedule the upgrade during an off-hours maintenance window.

Note also that DataPower Gateway supports long-lived connections such as GraphQL subscriptions or other websockets connections. These long-lived connections might not be preserved when upgrading. Workloads with long-lived connections are more vulnerable to failed API transactions during upgrading.

Starting with 10.0.3.0, you can limit the number of failed API transactions during the upgrade by using the DataPower Operator's `lifecycle` property to configure the `preStop` container lifecycle hook on the gateway pods. This approach mitigates the risk of API failures during the rolling update of the gateway StatefulSet by sleeping the pod for a span of time, allowing in-flight transactions to complete prior to the SIGTERM being delivered to the container. While this feature does not guarantee that no in-flight APIs would fail, it does provide some mitigation for in-flight transactions that can complete successfully within the configured time window. For more information, see [Delaying SIGTERM with preStop](#) in the DataPower documentation.

## What to do next

Proceed to [Preparing to upgrade on OpenShift and Cloud Pak for Integration](#) to prepare your deployment for upgrading.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Preparing to upgrade on OpenShift and Cloud Pak for Integration

Prepare your OpenShift or Cloud Pak for Integration deployment for upgrading to the new version of API Connect 10.0.x.

## Before you begin

Review the [Upgrade considerations on OpenShift and Cloud Pak for Integration](#) to ensure that you are following a supported upgrade path and that you understand important changes that might affect your deployment.

## About this task

Complete the following steps to prepare your deployment for upgrading to the newest version of API Connect.

## Procedure

1. Temporarily [stop the Analytics data collection](#) to avoid losing event data during the upgrade.
2. Verify that the `pgcluster` is healthy:

- a. Get the name of the `pgcluster`:

```
oc get pgcluster -n <APIC_namespace>
```

The response displays the name of the postgres cluster running in the specified namespace.

- b. Check the status of the `pgcluster`:

```
oc get pgcluster <pgcluster_name> -n <APIC_namespace> -o yaml | grep status -A 2 | tail -n3
```

The response for a healthy `pgcluster` looks like the following example, where the state is `Initialized`:

```
status:
  message: Cluster has been initialized
  state: pgcluster Initialized
```

If the cluster is healthy, proceed to the next step.

Important: If the `pgcluster` is not healthy ( returns any other state):

The cluster is not healthy and an upgrade will fail. Complete the following steps:

- a. If there are any ongoing backup or restore jobs, wait until they complete and then check the status again. Do not proceed with the upgrade until the status is `Initialized`.
  - b. If all of the background jobs complete but the `pgcluster` remains unhealthy, contact IBM Support for assistance.
3. (Upgrading from v10.0.1.2-eus only) Resolve the PgBouncer DNS error.

If you are running IBM® API Connect 10.0.1.2-eus, your deployment might be experiencing DNS errors in pgbouncer. Complete the following steps to determine whether your deployment is experiencing DNS errors with pgbouncer, and to replace the pgbouncer image if needed.

Note: This issue only affects IBM API Connect 10.0.1.2-eus. If you are running a different version of IBM API Connect (including fix packs), your deployment is not affected, so you can skip this step.

Determine whether your v10.0.1.2-eus deployment is experiencing the problem:

- a. Get the pgbouncer pod name:

```
oc get pods -n <APIC_namespace> | grep 'pgbouncer'
```

where `<APIC_namespace>` is the namespace where you installed IBM API Connect.

- b. Check the pgbouncer log for the `server DNS lookup failed` error message:

```
oc logs <pgbouncer-pod-name> -n <APIC_namespace> | grep 'server DNS lookup failed'
```

If the `server DNS lookup failed` message appears in the log, then your deployment is impacted and you must replace the pgbouncer image. If other errors appear, this procedure will not correct them and you should contact IBM Support for assistance. If no errors appear, you can skip the rest of this task and proceed with the upgrade.

Replace the pgbouncer image:

- a. Get the new pgbouncer image format from the registry where the 10.0.4.0-ifix3 images were pushed; for example:

```
<registry-name>/ibm-apiconnect-management-crunchy-  
pgbouncer@sha256:4a5caaf4e5cd4056ccb3de7d39b8e343b0c4ebce7cae694ccbfbef80924d98752
```

For CP4I, the default `registry-name` is `icr`.

- b. Get the pgbouncer deployment name:

```
oc get deploy -n <APIC_namespace> | grep 'pgbouncer'
```

- c. Edit the pgbouncer deployment:

```
oc edit deploy <pgbouncer-deploy-name> -n <APIC_namespace>
```

- d. In the deployment, replace the container image section with the new image that you downloaded.

- e. Wait for the pgbouncer pod to restart.

- f. Exec into the pgbouncer pod:

```
oc exec -it <pgbouncer-pod> -n <APIC_namespace> -- bash
```

- g. Execute `pgbouncer --version` and make sure the response matches the following information:

```
bash-4.4$ pgbouncer --version  
PgBouncer 1.15.0
```

```
libevent 2.1.8-stable
adns: evdns2
tls: OpenSSL 1.1.1g FIPS 21 Apr 2020
systemd: yes
```

h. Verify that the `server DNS lookup failed` no longer appears in the `pgbouncer` log:

```
oc logs <pgbouncer-pod-name> -n <APIC_namespace> | grep 'server DNS lookup failed'
```

i. Delete back-end microservices to force a restart:

- i. Get the `apim` microservices pod name: `oc get pods -n <APIC_namespace> | grep 'apim'`
- ii. Delete the `apim` pod: `oc delete pod <apim-pod> -n <APIC_namespace>`
- iii. Get the `lur` microservices pod name: `oc get pods -n <APIC_namespace> | grep 'lur'`
- iv. Delete the `lur` pod: `oc delete pod <lur-pod> -n <APIC_namespace>`
- v. Get the `task manager` microservice pod name: `oc get pods -n <APIC_namespace> | grep 'task'`
- vi. Delete the `task manager` pod: `oc delete pod <task-manager-pod> -n <APIC_namespace>`

j. Make sure the deployment is up and running.

4. Run the pre-upgrade health check:

a. Verify that the `apicops` utility is installed by running the following command to check the current version of the utility:

```
apicops --version
```

If the response indicates that `apicops` is not available, install it now. See [The API Connect operations tool: apicops](#) in the API Connect documentation.

b. Run the following command to set the KUBECONFIG environment.

```
export KUBECONFIG=/path/to/kubeconfig
```

c. Run the following command to execute the pre-upgrade script:

```
apicops version:pre-upgrade -n <namespace>
```

If the system is healthy, the results will not include any errors.

5. (v10.0.1.2-ifix2-eus and earlier) Validate your API definitions.

SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 documents that form API definition files are validated at stage or publish time by the API Dev Tools Swagger Parser. Before upgrading, ensure that your existing API definition files can be parsed and are considered valid by the Swagger Parser tool. Note that any API definitions that are already staged or published are not impacted, but will undergo Swagger Parser validation again if they are re-staged or re-published in the future.

You can use either of the following techniques to ensure that existing API definition files can be parsed and are considered valid by the Swagger Parser:

- Download and install the `swagger-parser-cli` tool (see <https://www.npmjs.com/package/swagger-cli>). This tool includes a `validate` command that can validate local API definition files against the SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 schemas, in both JSON and YAML formats.
- Use the browser-based Swagger Parser Validator available at <https://apitools.dev/swagger-parser/online/>; this accepts a URL to existing files available online, or can accept text copied and pasted into the tool, in both JSON and YAML formats. It can likewise validate against the SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 schemas.

Note: Staging or publishing an API in API Connect results in additional syntactic validation of IBM extensions to SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0, as well as semantic validation to make sure that policies and other resources that the API refers to are valid within the context of the staging or publishing operation. Any errors associated with this additional validation will not be caught by the local or online Swagger Parser tool, nor will they be caught by the `apic validate` toolkit CLI command.

The Swagger Parser tool will report an invalid OpenAPI document. For example, if a document is missing a mandatory section such as `info` or `paths`, the following error is reported:

```
[object Object] is not a valid Swagger API definition
```

If a required property is missing from a given section, a specific error is reported. For example, if the `info` section is missing the required `version` property, the following error is reported:

```
Swagger schema validation failed.
Missing required property: version at #/info
```

```
JSON_OBJECT_VALIDATION_FAILED
```

Additionally, if the document contains any local references (that is, values of `$ref` properties) that do not resolve to an existing reference within the document (known as *de-referencing*), this is also be flagged as an error. For example, if a document contains the following as a reference:

```
schema:
  $ref: '#/definitions/Pet'
```

then the definition of `Pet` (that is, `#/definitions/Pet`) **must** exist in the same document, at the given path (`definitions` section in this example), similar to the following:

```
definitions:
  Pet:
    type: object
    required:
      - name
    properties:
      id:
        type: integer
        format: int64
```

If the local reference is not found within the document, the following de-referencing error is reported:

```
Token "Pet" does not exist.
```

6. [Back up the current deployment](#) in case the upgrade fails and you need to perform a roll back.
7. Cloud Pak for Integration only: If you use the Operations Dashboard with the API management capability, complete the following tasks:
  - a. Verify that you are using the latest version of the Operations Dashboard.  
For information, see "Upgrading Integration tracing" in the [Upgrading capabilities](#) section of the [Cloud Pak for Integration documentation](#) for the appropriate release.
  - b. Update the image map paths in the API Connect Cluster CR's `spec.gateway.openTracing` section.  
For information, see step 2 of "Enabling open tracing for API management." in the [Installing and Deploying instances of capabilities](#) section of the same documentation.
8. If you are upgrading to 10.0.4 or later from a version earlier than 10.0.4, update the CR for the new Certificate Manager.  
In 10.0.4, the Certificate Manager was upgraded to 1.5.1. In the CR, modify the `annotations` statements for the endpoint ingress-issuers as follows:
  - a. Edit the top-level `APIConnectCluster` CR.
  - b. In the `spec` section, locate the subsection for each API Connect subsystem, and then locate modify the annotations from:

```
annotations:  
  certmanager.k8s.io/issuer: ingress-issuer
```

to:

```
annotations:  
  cert-manager.io/issuer: ingress-issuer
```

- c. Save and apply the change.
9. Disable the analytics message queue feature.  
If you enabled the analytics message queue feature, you must disable it before upgrading. You can re-enable the message queue feature after the profile change is complete.

To disable the message queue:

- a. Edit the top-level `APIConnectCluster` CR.
- b. In the `spec.analytics` section, locate the `mq` subsection and change the `enabled` setting to `false`:

```
spec:  
  analytics:  
    mq:  
      enabled: false
```

- c. Save and apply the change.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading on OpenShift and Cloud Pak for Integration in an online environment

Perform an online (connected to the internet) upgrade of IBM® API Connect on OpenShift Container Platform or IBM Cloud Pak for Integration.

### Before you begin

- If you are upgrading an air-gapped (disconnected from the internet) installation, see [Upgrading on OpenShift in an air-gapped environment](#).
- The Gateway subsystem remains available during the upgrade of the Management, Portal, and Analytics subsystems.

Attention: If you plan to upgrade to API Connect 10.0.5, first upgrade to API Connect to 10.0.4-ifix3, and then upgrade OpenShift to 4.10 as explained in this procedure.

### Procedure

1. [Back up the current deployment](#) in case the upgrade fails and you need to perform a roll back.
2. Ensure your IBM API Connect deployment is ready to upgrade:
  - Your API Connect release (operand) supports a direct upgrade to this release.
  - The DataPower operator version is correct for the currently deployed version of API Connect.For information on the operator and operand version used with each API Connect release, see [Operator, operand, and CASE versions](#).  
For information on upgrade paths and supported versions of DataPower Gateway, see [Upgrade considerations on OpenShift and Cloud Pak for Integration](#).
3. Cloud Pak for Integration only: Update the operator channels.
  - a. If needed, upgrade the IBM Cloud Pak foundational services (previously called Common Services) operator to channel `v3`.
  - b. If needed, complete the following steps to upgrade the Platform Navigator operator (supports the Automation Platform UI) to channel `v5`:
    - i. Upgrade the Platform Navigator operator to channel `v5` and wait for the Platform Navigator pods to restart.
    - ii. Edit the yaml of the Platform Navigator instance and make the following changes:
      - Add the license ID value for the license that you purchased; for example, `L-RJON-BXUPZ2`.
      - Add the RWX storage class; for example `rook-cephfs`
      - Change the operand version to `2021.4.1`.

For example:

```

apiVersion: integration.ibm.com/v1beta1
kind: PlatformNavigator
metadata:
  name: cp4i-navigator
  namespace: apic
spec:
  license:
    accept: true
    license: L-RJON-BXUPZ2
  mqDashboard: true
  replicas: 3
  storage:
    class: rook-cephfs
    version: 2021.4.1

```

iii. Again, wait for the Platform Navigator pods to upgrade, and for the Platform Navigator to go to a **Green** or **Ready** state.

4. Update the operator channels for DataPower and API Connect.

a. If needed, upgrade the DataPower operator channel to v1.5.

Attention: Upgrade the DataPower operator before upgrading the IBM API Connect operator, to ensure that dependencies are satisfied.

- If you previously chose automatic subscriptions, the operator version will upgrade automatically.

- If you previously chose manual subscriptions and the operator channel is already on the previous version, OpenShift (OLM) will notify you that an upgrade is available. You must manually approve the upgrade before proceeding.

Wait for the operator to update, for the pods to restart, and for a **Ready** status.

Known issue:

When upgrading the DataPower operator, you might see messages appear in the log on the `datapower-operator` pod indicating that the pod is waiting for the lock to be removed:

```

{"level": "info", "ts": "2021-03-08T19:29:53.432Z", "logger": "leader", "msg": "Not the leader. Waiting."}
{"level": "info", "ts": "2021-03-08T19:29:57.971Z", "logger": "leader", "msg": "Leader pod has been deleted, waiting for garbage collection to remove the lock."}

```

If you see these messages, the DataPower operator cannot be upgraded until you resolve the problem as explained in the [DataPower operator documentation](#).

b. If your IBM API Connect operator channel is not at v2.5, update it now.

- If you previously chose automatic subscriptions, the Operator version will upgrade automatically.

- If you previously chose manual subscriptions and if the operator channel is already on the previous version, OpenShift (OLM) will notify you that an upgrade is available. You must manually approve the upgrade before proceeding.

Known issues:

- The certificate manager was upgraded in Version 10.0.4.0 and you might encounter an upgrade error if the CRD for the new certificate manager is not found. For information on the errors messages that indicate this problem, and steps to resolve it, see [Upgrade error when the CRD for the new certificate manager is not found](#) in the *Troubleshooting installation and upgrade on OpenShift* topic.

- A null value for the `backrestStorageType` property in the `pgcluster` CR causes an error during the operator upgrade from versions earlier than 10.0.4.0. For information on the errors messages that indicate this problem, and steps to resolve it, see [Operator upgrade fails with error from API Connect operator and Postgres operator](#) in the *Troubleshooting installation and upgrade on OpenShift* topic.

5. Check for certificate errors, and then recreate issuers and certificates if needed.

In 10.0.4, API Connect upgraded its certificate manager, which might cause some errors during the upgrade. Complete the following steps to check for certificate errors and correct them.

a. Check the new API Connect operator's log for an error similar to the following example:

```

{"level": "error", "ts": 1634966113.8442025, "logger": "controllers.AnalyticsCluster", "msg": "Failed to set owner reference on certificate request", "analyticscluster": "apic/<instance-name>-a7s", "certificate": "<instance-name>-a7s-ca", "error": "Object apic/<instance-name>-a7s-ca is already owned by another Certificate controller <instance-name>-a7s-ca",

```

To correct this problem, delete all issuers and certificates generated with `certmanager.k8s.io/v1alpha1`. For certificates used by route objects, you must also delete the route and secret objects.

b. Run the following commands to delete the issuers and certificates that were generated with `certmanager.k8s.io/v1alpha1`:

```

oc delete issuers.certmanager.k8s.io <instance-name>-self-signed <instance-name>-ingress-issuer <instance-name>-mgmt-ca <instance-name>-a7s-ca <instance-name>-ptl-ca

oc delete certs.certmanager.k8s.io <instance-name>-ingress-ca <instance-name>-mgmt-ca <instance-name>-ptl-ca <instance-name>-a7s-ca

```

In the examples, `<instance-name>` is the instance name of the top-level `apiconnectcluster`.

When you delete the issuers and certificates, the new certificate manager generates replacements; this might take a few minutes.

c. Verify that the new CA certs are refreshed and ready.

Run the following command to verify the certificates:

```

oc get certs <instance-name>-ingress-ca <instance-name>-mgmt-ca <instance-name>-ptl-ca <instance-name>-a7s-ca

```

The CA certs are ready when `AGE` is "new" and the `READY` column shows `True`.

d. Delete the remaining old certificates, routes, and secret objects corresponding to those routes.

Run the following commands:

```

oc get certs.certmanager.k8s.io | awk '/<instance-name>/{print $1}' | xargs oc delete certs.certmanager.k8s.io

oc delete certs.certmanager.k8s.io postgres-operator

oc get routes --no-headers -o custom-columns=":metadata.name" | grep ^<instance-name>- | xargs oc delete routes

```

Note: The following command deletes the secrets for the routes. Do not delete any other secrets.

```
oc get routes --no-headers -o custom-columns=":metadata.name" | grep ^<instance-name>- | xargs oc delete secrets
```

e. Verify that no old issuers or certificates from your top-level instance remain.

Run the following commands:

```
oc get issuers.certmanager.k8s.io | grep <instance-name>
```

```
oc get certs.certmanager.k8s.io | grep <instance-name>
```

Both commands should report that no resources were found.

6. Use `apicops` to validate the certificates.

a. Run the following command:

```
apicops upgrade:stale-certs -n <APIC_namespace>
```

b. Delete any stale certificates that are managed by cert-manager.

If a certificate failed the validation and it is managed by cert-manager, you can delete the stale certificate secret, and let cert-manager regenerate it. Run the following command:

```
kubectl delete secret <stale-secret> -n <APIC_namespace>
```

c. Restart the corresponding so that it can pick up the new secret.

To determine which pod to restart, see the following topics:

- [List of external certificates](#)
- [List of internal certificates](#)

For information on the `apicops` tool, see [The API Connect operations tool: apicops](#).

7. Run the following command to delete the Postgres pods, which refreshes the new certificate:

```
oc get pod -n <namespace> --no-headers=true | grep postgres | grep -v backup | awk '{print $1}' | xargs oc delete pod -n <namespace>
```

8. If needed, delete the `portal-wwv`, `portal-db` and `portal-nginx` pods to ensure they use the new secrets.

If you have the Developer Portal deployed, then the `portal-wwv`, `portal-db`, and `portal-nginx` pods might require deleting to ensure that they pick up the newly generated secrets when restarted. If the pods are not showing as "ready" in a timely manner, then delete all the pods at the same time (this will cause down time).

Run the following commands to get the name of the portal CR and delete the pods:

```
oc project <APIC_namespace>
```

```
oc get ptl
```

```
oc delete po -l app.kubernetes.io/instance=<name_of_portal_CR>
```

9. If needed, renew the internal certificates for the analytics subsystem.

If you see `analytics-storage-*` or `analytics-mq-*` pods in the `CrashLoopBackOff` state, then renew the internal certificates for the analytics subsystem and force a restart of the pods.

a. Switch to the project/namespace where analytics is deployed and run the following command to get the name of the analytics CR (AnalyticsCluster):

```
oc project <APIC_namespace>
```

```
oc get a7s
```

You need the CR name for the remaining steps.

b. Renew the internal certificates (CA, client, and server) by running the following commands:

```
oc get certificate <name_of_analytics_CR>
-ca -o=jsonpath='{.spec.secretName}' | xargs oc delete secret
```

```
oc get certificate <name_of_analytics_CR>
-client -o=jsonpath='{.spec.secretName}' | xargs oc delete secret
```

```
oc get certificate <name_of_analytics_CR>
-server -o=jsonpath='{.spec.secretName}' | xargs oc delete secret
```

c. Force a restart of all analytics pods by running the following command:

```
oc delete po -l app.kubernetes.io/instance=<name_of_analytics_CR>
```

10. Ensure that the operators and operands are healthy before proceeding.

Operators: Verify that the OpenShift UI indicates that all operators are in the **Succeeded** state without any warnings.

Operands:

- To verify whether operands are healthy, run the following command: `oc get apic`  
Make sure that the `apiconnectcluster` custom resource reports **READY**.
- Cloud Pak for Integration only: Wait until the IBM API Connect capability shows **READY** (green check) in the Automation UI.  
Known issue: Status toggles between **Ready** and **Warning**  
There is a known issue where the IBM API Connect operator toggles the overall status of the IBM API Connect deployment in Platform Navigator between **Ready** and **Warning**. Look at the full list of conditions and when **Ready** is **True**, you can proceed to the next step even if **Warning** is also true.

11. Update the operand version:

- OpenShift: Complete the following steps:

- Edit the top-level `apiconnectcluster` CR by running the following command:
 

```
oc -n <APIC_namespace> edit apiconnectcluster
```
- Change the `version` setting to `10.0.4.0-ifix3`.
  - In the `spec.gateway` section, delete the `template` override section, if it exists. You cannot perform an upgrade if the CR contains an override.
  - Save and close the CR.
- Cloud Pak for Integration: Open the Automation Platform UI and complete the following steps:
  - In the Automation Platform UI, click the Integration instances tab.
  - Click `:` at the end of the current row, and then click Change version.
  - Click Select a new channel or version, and then select `10.0.4.0-ifix3` in the Channel field. Selecting the new channel ensures that both DataPower Gateway and IBM API Connect are upgraded.
  - Click Save to save your selections and start the upgrade. In the instances table, the Status column for the instance displays the "Upgrading" message. The upgrade is complete when the Status is "Ready" and the Version displays the new version number.

Known issue: Webhook error for incorrect license.

If you did not update the license ID in the CR, then when you change the operand version change, the following webhook error might display:

```
admission webhook "vapiconnectcluster.kb.io" denied the request:
APICConnectCluster.apiconnect.ibm.com "<instance-name>" is invalid: spec.license.license:
Invalid value: "L-RJON-BYGHM4": License L-RJON-BYGHM4 is invalid for the chosen version.
Please refer license document https://ibm.biz/apiclicenses
```

To resolve the error, visit <https://ibm.biz/apiclicenses> and select the appropriate License IDs for your deployment. Update the CR with the new license value as in the following example:

```
spec:
  license:
    accept: true
    use: production
    license: L-RJON-BZ5LJ5
```

Then, apply the updated CR.

## 12. Resolve gateway peering issues by completing the following steps.

Due to the ingress issuer changes, the gateway pods must be scaled down and then back up. This process will cause 5 to 10 minutes of down time.

- Run the following command to verify that the management, portal, and analytics subsystems are `Running`:

```
oc get apic --all-namespaces
```

The response looks like the following example, with the gateway pods showing as `Pending`.

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
analyticscluster.analytics.apiconnect.ibm.com/<instance-name>-a7s	8/8	Running	10.0.4.0	10.0.4.0	10.0.4.0-2221	7d1h
apiconnectcluster.apiconnect.ibm.com/<instance-name>	6/7	Pending	10.0.4.0	10.0.3.0-ifix1	351	47h
NAME	PHASE	READY	SUMMARY	VERSION	AGE	
datapowerservice.datapower.ibm.com/<instance-name>-gw	Pending	True	StatefulSet replicas ready: 1/1	10.0.4.0	46h	
NAME	PHASE	LAST EVENT	WORK PENDING	WORK IN-PROGRESS	AGE	
datapowermonitor.datapower.ibm.com/<instance-name>-gw	Pending		false	false	46h	
NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
gatewaycluster.gateway.apiconnect.ibm.com/<instance-name>-gw	0/2	Pending	10.0.4.0	10.0.4.0	10.0.4.0-2221	46h
NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
managementcluster.management.apiconnect.ibm.com/<instance-name>-mgmt	16/16	Running	10.0.4.0	10.0.4.0	10.0.4.0-2221	47h
NAME	STATUS	MESSAGE				
managementdbupgrade.management.apiconnect.ibm.com/<instance-name>-mgmt-up-pxl77	Complete	Fresh install is Complete (DB Schema/data are up-to-date)				
managementdbupgrade.management.apiconnect.ibm.com/management-up-87fcz	Complete	Upgrade is Complete (DB Schema/data are up-to-date)				
NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
portalcluster.portal.apiconnect.ibm.com/<instance-name>-ptl	3/3	Running	10.0.4.0	10.0.4.0	10.0.4.0-2221	46h

- Scale down the gateway firmware containers by editing the top-level APICConnectCluster CR and setting the replica count to 0.

OpenShift:

- Run the following command to edit the CR:

```
oc edit apiconnectcluster <apic-cr-name>
```

- In the `spec.gateway` section, set the `replicaCount` setting to 0:

```
...
spec:
```

```
gateway:
  replicaCount: 0
...
```

If the setting is not already included in the CR, add it now as shown in the example.

iii. Save and exit the CR.

Cloud Pak for Integration:

- i. In the Automation Platform UI, edit the API Connect instance.
  - ii. Click Advanced.
  - iii. In the Gateway subsystem section, set the Advance Replica count field to 0.
- c. Wait for the gateway firmware pods to scale down and terminate.  
Do not proceed to the next step until the pods are terminated.

d. Reset the replica count to its original value.

If the replica count setting was not used previously, then:

- OpenShift: Delete the setting from the CR.
- Cloud Pak for Integration: Clear the Advance Replica count field.

13. Ensure the upgrade is completed and the status of the top-level CR is **READY**:

- OpenShift: Run the following command :

```
oc get apiconnectcluster
```

and make sure it reports **READY**.

- CP4I: Make sure that the IBM API Connect capability reports **READY** in the Automation Platform UI.

Known issue: Management subsystem remains in **Pending** state after upgrade

There is known problem where the management subsystem can remain in the **Pending** state after an upgrade if it was originally deployed in 10.0.1.0 with custom internal certificates. You can work around this problem as explained in [Workaround: Management subsystem status remains Pending when upgrading with custom internal certificates](#).

If the management upgrade fails, the `apiconnect-operator` performs a rollback procedure if possible.

14. Upgrade the OpenShift cluster to OpenShift 4.10.

API Connect 10.0.5 requires that your cluster be on OpenShift 4.10 before you begin that upgrade.

Upgrading OpenShift requires that you move to interim minor releases instead of upgrading directly from 4.6 to 4.10. For more information, see the [Red Hat OpenShift documentation](#). In the "Documentation" banner, select the version of OpenShift that you want to upgrade to, and then expand the "Updating clusters" section in the navigation list.

## What to do next

---

Optionally, you can install the newer Toolkit and Local Test Environment, from IBM Fix Central. For a link to the latest files on Fix Central, see [What's new in the latest release](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading on OpenShift in an air-gapped environment

You can upgrade API Connect on OpenShift in an air-gapped scenario where your cluster is not connected to the internet.

### About this task

---

Choose one of the following methods to upgrade API Connect on OpenShift in an air-gapped environment. If you previously deployed or upgraded API Connect in an air-gapped environment, you can use the same host as before and just update the product information for the new release.

- [Upgrading API Connect on OpenShift using a bastion host](#)  
You can use a bastion host to perform an air-gapped upgrade of IBM® API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.
- [Upgrading on OpenShift using a portable computer](#)  
You can use a portable computer to perform an air-gapped upgrade of IBM API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.
- [Upgrading on OpenShift using portable storage](#)  
You can use a portable storage device to perform an air-gapped upgrade of IBM API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Upgrading API Connect on OpenShift using a bastion host

You can use a bastion host to perform an air-gapped upgrade of IBM® API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

## Before you begin

If you are upgrading an installation that is connected to the internet, see [Upgrading on OpenShift and Cloud Pak for Integration in an online environment](#).

Attention: If you plan to upgrade to API Connect 10.0.5, first upgrade to API Connect to 10.0.4-ifix3, and then upgrade OpenShift to 4.10 as explained in this procedure.

- This upgrade procedure uses a single, top-level API Connect Cluster CR to deploy a newer version of API Connect. Only use these instructions if your current deployment was also installed with the top-level CR.
- The Gateway subsystem remains available during the upgrade of the Management, Portal, and Analytics subsystems.
- The upgrade procedure requires you to use Red Hat Skopeo for moving container images. Skopeo is not available for Microsoft Windows, so you cannot perform this task using a Windows host.

## About this task

A bastion host is a machine that has connectivity both to the internet and to the cluster in the restricted environment.

Notes:

- This task requires you to use Red Hat Skopeo for moving container images. Skopeo is not available for Microsoft Windows, so you cannot perform this task on Windows.
- Don't use the tilde ~ within double quotation marks in any command because the tilde doesn't expand and your commands might fail.

## Procedure

1. Ensure that you have completed all of the steps in [Preparing to upgrade on OpenShift and Cloud Pak for Integration](#), including reviewing the [Upgrade considerations on OpenShift and Cloud Pak for Integration](#).

Do not attempt an upgrade until you have reviewed the considerations and prepared your deployment.

2. Prepare a host that can be connected to the internet.

Note: If you are using the same host that you used for installing API Connect, skip this step.

The host must satisfy the following requirements:

- The host must be on a Linux x86\_64 platform, or any operating system that the IBM Cloud Pak CLI, the OpenShift CLI, and Red Hat Skopeo support.
- The host `locale` must be set to English.
- The host must have sufficient storage to hold all of the software that is to be transferred to the local Docker registry.

Complete the following steps to set up your external host:

- a. Install OpenSSL version 1.1.1 or higher.
- b. Install Docker or Podman:

- To install Docker (for example, on Red Hat® Enterprise Linux®), run the following commands:

```
yum check-update
yum install docker
```

- To install Podman, see [Podman Installation Instructions](#).

- c. Install `httpd-tools` by running the following commands:

```
yum install httpd-tools
```

- d. Install the IBM Cloud Pak CLI by completing the following steps:

Install the latest version of the binary file for your platform. For more information, see [cloud-pak-cli](#).

- i. Download the binary file by running the following command:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/<binary_file_name>
```

For example:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/cloudctl-linux-amd64.tar.gz
```

- ii. Extract the binary file by running the following command:

```
tar -xf <binary_file_name>
```

- iii. Run the following commands to modify and move the file:

```
chmod 755 <file_name>
mv <file_name> /usr/local/bin/cloudctl
```

- iv. Confirm that `cloudctl` is installed by running the following command:

```
cloudctl --help
```

The `cloudctl` usage is displayed.

- e. Install the `oc` OpenShift Container Platform CLI tool.

For more information, see [Getting started with the CLI](#) in the Red Hat OpenShift documentation.

- f. Install Red Hat Skopeo CLI version 1.0.0 or higher.

For more information, see [Installing Skopeo from packages](#).

- g. Run the following command to create a directory that serves as the offline store.

The following example creates a directory called "upgrade\_offline", which is used in the subsequent steps.

```
mkdir $HOME/upgrade_offline
```

Notes:

- The `$HOME/upgrade_offline` store must be persistent to avoid transferring data more than once. The persistence also helps to run the mirroring process multiple times or on a schedule.
- The `$HOME/upgrade_offline` store must not use the same name that you used for the previous installation. If you use the same name as original directory (`$HOME/upgrade_offline`), then the `api-connect-catalog` tag will not get updated correctly, the catalog source pods will not pick up the new image, and as a result, the operator will not upgrade. The environment variable should be updated in all the steps.

3. On the bastion host, create environment variables for the installer and image inventory.

Note: If you are using the same bastion host that you used for installing API Connect, you can re-use the environment variables from the installation, but you must update the following variables for the new release:

- `CASE_VERSION` - update to the newest CASE.
- `OFFLINEDIR` - update to reflect new folder created for upgrade; for example, `$HOME/upgrade_offline`.

Create the following environment variables with the installer image name and the image inventory. Set the `CASE_VERSION` to the value for the new API Connect release. The CASE version shown in the example might not be correct for your deployment – refer to [Operator, operand, and CASE versions](#) for the correct CASE version.

For example:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=3.0.7
export CASE_ARCHIVE=$CASE_NAME-$CASE_VERSION.tgz
export CASE_INVENTORY_SETUP=apiconnectOperatorSetup
export OFFLINEDIR=$HOME/upgrade_offline
export OFFLINEDIR_ARCHIVE=offline.tgz
export CASE_REMOTE_PATH=https://github.com/IBM/cloud-pak/raw/master/repo/case/$CASE_NAME/$CASE_VERSION/$CASE_ARCHIVE
export CASE_LOCAL_PATH=$OFFLINEDIR/$CASE_ARCHIVE

export BASTION_DOCKER_REGISTRY_HOST=localhost
export BASTION_DOCKER_REGISTRY_PORT=443
export BASTION_DOCKER_REGISTRY=$BASTION_DOCKER_REGISTRY_HOST:$BASTION_DOCKER_REGISTRY_PORT
export BASTION_DOCKER_REGISTRY_USER=username
export BASTION_DOCKER_REGISTRY_PASSWORD=password
export BASTION_DOCKER_REGISTRY_PATH=$OFFLINEDIR/imageregistry
```

4. Download the API Connect installer and image inventory by running the following command:

```
cloudctl case save \
  --case $CASE_REMOTE_PATH \
  --outputdir $OFFLINEDIR
```

5. Mirror the images from the ICR (source) registry to the bastion (destination) registry.

a. Store the credentials for the ICR (source) registry.

The following command stores and caches the IBM Entitled Registry credentials in a file on your file system in the `$HOME/.airgap/secrets` location:

```
cloudctl case launch \
  --case $OFFLINEDIR/$CASE_ARCHIVE \
  --inventory $CASE_INVENTORY_SETUP \
  --action configure-creds-airgap \
  --namespace $NAMESPACE \
  --args "--registry cp.icr.io --user cp --pass <entitlement-key> --inputDir $OFFLINEDIR"
```

b. Store the authentication credentials for the Docker registry that is located on the bastion host.

The following command stores and caches the Docker registry credentials in a file on your file system in the `$HOME/.airgap/secrets` location:

```
cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --inventory $CASE_INVENTORY_SETUP \
  --action configure-creds-airgap \
  --args "--registry $BASTION_DOCKER_REGISTRY --user $BASTION_DOCKER_REGISTRY_USER --pass $BASTION_DOCKER_REGISTRY_PASSWORD"
```

c. If needed, start the Docker registry service on the bastion host.

If you are using the same bastion host that you used for installing API Connect, the Docker registry service might already be running.

i. Initialize the Docker registry by running the following command:

```
cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --inventory $CASE_INVENTORY_SETUP \
  --action init-registry \
  --args "--registry $BASTION_DOCKER_REGISTRY_HOST --user $BASTION_DOCKER_REGISTRY_USER --pass $BASTION_DOCKER_REGISTRY_PASSWORD --dir $BASTION_DOCKER_REGISTRY_PATH"
```

ii. Start the Docker registry by running the following command:

```
cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --inventory $CASE_INVENTORY_SETUP \
  --action start-registry \
  --args "--registry $BASTION_DOCKER_REGISTRY_HOST --port $BASTION_DOCKER_REGISTRY_PORT --user $BASTION_DOCKER_REGISTRY_USER --pass $BASTION_DOCKER_REGISTRY_PASSWORD --dir $BASTION_DOCKER_REGISTRY_PATH"
```

d. Mirror the images to the registry on the bastion host.

```
cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --inventory $CASE_INVENTORY_SETUP \
  --action mirror-images \
  --args "--registry $BASTION_DOCKER_REGISTRY --inputDir $OFFLINEDIR"
```

6. Optional: Save the Docker registry image that you stored on the bastion host.

If your air-gapped network doesn't have a Docker registry image, you can save the image on the bastion host and copy it later to the host in your air-gapped environment.

```
docker save docker.io/library/registry:2.6 -o $BASTION_DOCKER_REGISTRY_PATH/registry-image.tar
```

7. Configure access to the local registry for installation.

a. Create environment variables with the local Docker registry connection information.

Note: If you are using the same bastion host that you used for installing API Connect, you can re-use the environment variables from the installation, but you must update the `CASE_VERSION` variable for the new release.

Create the following environment variables with the installer image name and the image inventory. Set the `CASE_VERSION` to the same value for the new API Connect release that you used in step 3.

For example:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=3.0.7
export CASE_ARCHIVE=$CASE_NAME-$CASE_VERSION.tgz
export CASE_INVENTORY_SETUP=apiconnectOperatorSetup
export OFFLINEDIR=$HOME/upgrade_offline
export OFFLINEDIR_ARCHIVE=offline.tgz
export CASE_REMOTE_PATH=https://github.com/IBM/cloud-pak/raw/master/repo/case/$CASE_NAME/$CASE_VERSION/$CASE_ARCHIVE
export CASE_LOCAL_PATH=$OFFLINEDIR/$CASE_ARCHIVE

export LOCAL_DOCKER_REGISTRY_HOST=<IP_or_FQDN_of_local_docker_registry>
export LOCAL_DOCKER_REGISTRY_PORT=443
export LOCAL_DOCKER_REGISTRY=$LOCAL_DOCKER_REGISTRY_HOST:$LOCAL_DOCKER_REGISTRY_PORT
export LOCAL_DOCKER_REGISTRY_USER=username
export LOCAL_DOCKER_REGISTRY_PASSWORD=password
```

b. Set up local registry credentials for mirroring.

Store the credentials of the registry that is running on the internal host.

```
cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --inventory $CASE_INVENTORY_SETUP \
  --action configure-creds-airgap \
  --args "--registry $LOCAL_DOCKER_REGISTRY --user $LOCAL_DOCKER_REGISTRY_USER --pass $LOCAL_DOCKER_REGISTRY_PASSWORD"
```

c. If you use an insecure registry, add the local registry to the cluster's insecureRegistries list.

```
oc patch image.config.openshift.io/cluster --type=merge -p '{"spec":{"registrySources":{"insecureRegistries":["$LOCAL_DOCKER_REGISTRY"]}}}'
```

8. If you are upgrading from any version prior to 10.0.4.0-ifix2, patch the CatalogSource named `ibm-apiconnect-catalog` to update the registry namespace. In version 10.0.4.0-ifix2, the registry namespace in the image name used for the CatalogSource `ibm-apiconnect-catalog` changed from `ibmcom` to `cpopen`. Patch the CatalogSource by running the following command:

```
oc patch catalogsource ibm-apiconnect-catalog -n openshift-marketplace --type=merge -p '{"spec":{"image":{"$LOCAL_DOCKER_REGISTRY}/cpopen/ibm-apiconnect-catalog:latest-amd64}}}'
```

9. Update the operator channel:

- Confirm that the pod `ibm-apiconnect-catalog-xxxx` in the `openshift-marketplace` namespace was updated.
- Open the OpenShift web console and click Operators > Installed Operators > IBM API connect > Subscriptions.
- Change the channel to the new version (v2.5), which triggers an upgrade of the API Connect operator.

Known issues:

- If you are upgrading to API Connect version 10.0.4-ifix2 or 10.0.4-ifix3, you might encounter the following error while updating the operator:

```
Message: unpack job not completed: Unpack pod(openshift-marketplace/e9f169cee8bfff9ab35d276a48b7207d9606a2b7a0a8087bc58b4ff7tx221) container(pull) is pending. Reason: ImagePullBackOff, Message: Back-off pulling image "ibmcom/ibm-apiconnect-operator-bundle@sha256:ef0ce455270189c37a5dc0500219061959c041f88110f601f6e7bf8072df4943" Reason: JobIncomplete
```

Resolve the error by completing the following steps to update the ImageContentSourcePolicy for your deployment:

- Log in to the OpenShift cluster UI as an administrator of your cluster.
- Click Search > Resources and search for ICSP.
- In the list of ICSPs, click `ibm-apiconnect` to edit it.
- In the `ibm-apiconnect` ICSP, click the YAML tab.
- In the `spec.repositoryDigestMirrors` section, locate the `-mirrors` subsection containing `source: docker.io/ibmcom`.
- Add a new mirror ending with `/ibmcom` to the section as in the following example:

```
- mirrors:
  - <AIRGAP_REGISTRY_ADDRESS>/ibmcom
  - <AIRGAP_REGISTRY_ADDRESS>/cpopen
  source: docker.io/ibmcom
```

- If the job does not automatically continue, uninstall and reinstall the API Connect operator.
  - The certificate manager was upgraded in Version 10.0.4.0 and you might encounter an upgrade error if the CRD for the new certificate manager is not found. For information on the errors messages that indicate this problem, and steps to resolve it, see [Upgrade error when the CRD for the new certificate manager is not found](#) in the *Troubleshooting installation and upgrade on OpenShift* topic.
  - A null value for the `backrestStorageType` property in the `pgcluster` CR causes an error during the operator upgrade from versions earlier than 10.0.4.0. For information on the errors messages that indicate this problem, and steps to resolve it, see [Operator upgrade fails with error from API Connect operator and Postgres operator](#) in the *Troubleshooting installation and upgrade on OpenShift* topic.
- When the IBM API Connect operator is updated, the new pod starts automatically.

10. Verify that the API Connect operator was updated by completing the following steps:

- Get the name of the pod that hosts the operator by running the following command:

```
oc get po -n <APIC_namespace> | grep apiconnect
```

The response looks like the following example:

```
ibm-apiconnect-7bdb795465-8f7rm 1/1 Running 0 4m23s
```

b. Get the API Connect version deployed on that pod by running the following command:

```
oc describe po <ibm-apiconnect-operator-podname> -n <APIC_namespace> | grep -i productversion
```

The response looks like the following example:

```
productVersion: 10.0.4.0-ifix3
```

11. Check for certificate errors, and then recreate issuers and certificates if needed.

In Version 10.0.4.0, API Connect upgraded its certificate manager, which might cause some certificate errors during the upgrade. Complete the following steps to check for certificate errors and correct them.

a. Check the new API Connect operator's log for an error similar to the following example:

```
{"level": "error", "ts": 1634966113.8442025, "logger": "controllers.AnalyticsCluster", "msg": "Failed to set owner reference on certificate request", "analyticscluster": "apic/minimum-a7s", "certificate": "minimum-a7s-ca", "error": "Object apic/minimum-a7s-ca is already owned by another Certificate controller minimum-a7s-ca",
```

To correct this problem, delete all issuers and certificates generated with certmanager.k8s.io/v1alpha1. For certificates used by route objects, you must also delete the route and secret objects.

b. Run the following commands to delete the issuers and certificates that were generated with certmanager.k8s.io/v1alpha1:

```
oc delete issuers.certmanager.k8s.io minimum-self-signed minimum-ingress-issuer minimum-mgmt-ca minimum-a7s-ca minimum-ptl-ca
```

```
oc delete certs.certmanager.k8s.io minimum-ingress-ca minimum-mgmt-ca minimum-ptl-ca minimum-a7s-ca
```

In the examples, *minimum* is the instance name of the top-level apiconnectcluster.

When you delete the issuers and certificates, the new certificate manager generates replacements; this might take a few minutes.

c. Verify that the new CA certs are refreshed and ready.

Run the following command to verify the certificates:

```
oc get certs minimum-ingress-ca minimum-mgmt-ca minimum-ptl-ca minimum-a7s-ca
```

The CA certs are ready when **AGE** is "new" and the **READY** column shows **True**.

d. Delete the remaining old certificates, routes, and secret objects.

Run the following commands:

```
oc get certs.certmanager.k8s.io | awk '/minimum/{print $1}' | xargs oc delete certs.certmanager.k8s.io
```

```
oc delete certs.certmanager.k8s.io postgres-operator
```

```
oc get routes --no-headers -o custom-columns=":metadata.name" | grep ^minimum- | xargs oc delete secrets
```

```
oc get routes --no-headers -o custom-columns=":metadata.name" | grep ^minimum- | xargs oc delete routes
```

e. Verify that no old issuers or certificates from your top-level instance remain.

Run the following commands:

```
oc get issuers.certmanager.k8s.io | grep minimum
```

```
oc get certs.certmanager.k8s.io | grep minimum
```

Both commands should report that no resources were found.

12. Use **apicops** to validate the certificates.

a. Run the following command:

```
apicops upgrade:stale-certs -n <APIC_namespace>
```

b. Delete any stale certificates that are managed by cert-manager.

If a certificate failed the validation and it is managed by cert-manager, you can delete the stale certificate secret, and let cert-manager regenerate it. Run the following command:

```
kubectl delete secret <stale-secret> -n <APIC_namespace>
```

c. Restart the corresponding so that it can pick up the new secret.

To determine which pod to restart, see the following topics:

- [List of external certificates](#)
- [List of internal certificates](#)

For information on the **apicops** tool, see [The API Connect operations tool: apicops](#).

13. Run the following command to delete the Postgres pods, which refreshes the new certificate:

```
oc get pod -n <namespace> --no-headers=true | grep postgres | grep -v backup | awk '{print $1}' | xargs oc delete pod -n <namespace>
```

14. If needed, delete the portal-www, portal-db and portal-nginx pods to ensure they use the new secrets.

If you have the Developer Portal deployed, then the portal-www, portal-db and portal-nginx pods might require deleting to ensure that they pick up the newly generated secrets when restarted. If the pods are not showing as "ready" in a timely manner, then delete all the pods at the same time (this will cause down time).

Run the following commands to get the name of the portal CR and delete the pods:

```
oc project <APIC_namespace>
```

```
oc get ptl
oc delete po -l app.kubernetes.io/instance=<name_of_portal_CR>
```

15. If needed, renew the internal certificates for the analytics subsystem.

If you see analytics-storage-\* or analytics-mq-\* pods in the `CrashLoopBackOff` state, then renew the internal certificates for the analytics subsystem and force a restart of the pods.

a. Switch to the project/namespace where analytics is deployed and run the following command to get the name of the analytics CR (AnalyticsCluster):

```
oc project <APIC_namespace>
oc get a7s
```

You need the CR name for the remaining steps.

b. Renew the internal certificates (CA, client, and server) by running the following commands:

```
oc get certificate <name_of_analytics_CR>
-ca -o=jsonpath='{.spec.secretName}' | xargs oc delete secret

oc get certificate <name_of_analytics_CR>
-client -o=jsonpath='{.spec.secretName}' | xargs oc delete secret

oc get certificate <name_of_analytics_CR>
-server -o=jsonpath='{.spec.secretName}' | xargs oc delete secret
```

c. Force a restart of all analytics pods by running the following command:

```
oc delete po -l app.kubernetes.io/instance=<name_of_analytics_CR>
```

16. Update the top-level API Connect Cluster CR:

a. Update the `version` field.

For example:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APICConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-production
  name: prod
  namespace: APIC_namespace
spec:
  license:
    accept: true
    use: production
  profile: n12xc4.m12
  version: 10.0.4.0-ifix3
  storageClassName: rook-ceph-block
```

Specify the currently deployed `profile` and `use` values, which might not match the example. If you want to change to a different profile, you can do it after completing the upgrade (for instructions, see [Changing deployment profiles on OpenShift](#).)

b. In the `spec.gateway` section, delete the `template` override section, if it exists. You cannot perform an upgrade if the CR contains an override.

17. Apply the updated top-level CR to upgrade the API Connect operand by running the following command:

```
oc apply -f CR_file_name.yaml
```

The response looks like the following example:

```
apiconnectcluster.apiconnect.ibm.com/prod configured
```

18. If needed, resolve gateway peering issues by completing the following steps.

Due to the ingress issuer changes, the gateway pods must be scaled down and then back up. This process will cause 5 to 10 minutes of down time.

a. Run the following command to verify that the management, portal, and analytics subsystems are `Running`:

```
oc get apic --all-namespaces
```

The response looks like the following example, with the gateway pods showing as `Pending`.

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
analyticscluster.analytics.apiconnect.ibm.com/minimum-a7s	8/8	Running	10.0.4.0	10.0.4.0-2221	7d1h
apiconnectcluster.apiconnect.ibm.com/minimum	6/7	Pending	10.0.4.0	10.0.3.0-ifix1-351	47h
NAME	PHASE	READY	SUMMARY	VERSION	AGE
datapowerservice.datapower.ibm.com/minimum-gw	Pending	True	StatefulSet replicas ready: 1/1	10.0.4.0	46h
NAME	PHASE	LAST EVENT	WORK PENDING	WORK IN-PROGRESS	AGE
datapowermonitor.datapower.ibm.com/minimum-gw	Pending		false	false	46h
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
gatewaycluster.gateway.apiconnect.ibm.com/minimum-gw	0/2	Pending	10.0.4.0	10.0.4.0-2221	46h
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
managementcluster.management.apiconnect.ibm.com/minimum-mgmt	16/16	Running	10.0.4.0	10.0.4.0-2221	47h
NAME	STATUS	MESSAGE			

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
managementdbupgrade.management.apiconnect.ibm.com/minimum-mgmt-up-pxl77	Complete	Fresh install is Complete (DB Schema/data are up-to-date)	46h			
managementdbupgrade.management.apiconnect.ibm.com/management-up-87fcz	Complete	Upgrade is Complete (DB Schema/data are up-to-date)	8h			

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
portalcluster.portal.apiconnect.ibm.com/minimum-pt1	3/3	Running	10.0.4.0	10.0.4.0-2221		46h

b. Scale down the gateway firmware containers by editing the top-level APIConnectCluster CR and setting the replica count to 0.  
OpenShift:

i. Run the following command to edit the CR:

```
oc edit apiconnectcluster <apic-cr-name>
```

ii. In the `spec.gateway` section, set the `replicaCount` setting to 0:

```
...
spec:
  gateway:
    replicaCount: 0
...
```

If the setting is not already included in the CR, add it now as shown in the example.

iii. Save and exit the CR.  
Cloud Pak for Integration:

- i. In the Automation Platform UI, edit the API Connect instance.
- ii. Click Advanced.
- iii. In the Gateway subsystem section, set the Advance Replica count field to 0.

c. Wait for the gateway firmware pods to scale down and terminate.  
Do not proceed to the next step until the pods are terminated.

d. Reset the replica count to its original value.  
If the replica count setting was not used previously, then:

- OpenShift: Delete the setting from the CR.
- Cloud Pak for Integration: Clear the Advance Replica count field.

19. Validate that the upgrade was successfully deployed by running the following command:

```
oc get apic -n APIC_namespace
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
analyticscluster.analytics.apiconnect.ibm.com/prod-a7s	8/8	Running	10.0.4.0-ifix3	10.0.4.0-ifix3		21h

20. Upgrade the OpenShift cluster to OpenShift 4.10.

API Connect 10.0.5 requires that your cluster be on OpenShift 4.10 before you begin that upgrade.

Upgrading OpenShift requires that you move to interim minor releases instead of upgrading directly from 4.6 to 4.10. For more information, see the [Red Hat OpenShift documentation](#). In the "Documentation" banner, select the version of OpenShift that you want to upgrade to, and then expand the "Updating clusters" section in the navigation list.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Upgrading on OpenShift using a portable computer

You can use a portable computer to perform an air-gapped upgrade of IBM® API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

### Before you begin

If you are upgrading an installation that is connected to the internet, see [Upgrading on OpenShift and Cloud Pak for Integration in an online environment](#).

Attention: If you plan to upgrade to API Connect 10.0.5, first upgrade to API Connect to 10.0.4-ifix3, and then upgrade OpenShift to 4.10 as explained in this procedure.

- This upgrade procedure uses a single, top-level API Connect Cluster CR to deploy a newer version of API Connect. Only use these instructions if your current deployment was also installed with the top-level CR.
- The Gateway subsystem remains available during the upgrade of the Management, Portal, and Analytics subsystems.
- The upgrade procedure requires you to use Red Hat Skopeo for moving container images. Skopeo is not available for Microsoft Windows, so you cannot perform this task using a Windows host.

### About this task

You can store the product code and images to a portable computer and transfer them to a local, air-gapped network. By doing so, you can install in your air-gapped environment without using a bastion host.

Notes:

- This task requires you to use Red Hat Skopeo for moving container images. Skopeo is not available for Microsoft Windows, so you cannot perform this task on Windows.
- Don't use the tilde ~ within double quotation marks in any command because the tilde doesn't expand and your commands might fail.

### Procedure

1. Ensure that you have completed all of the steps in [Preparing to upgrade on OpenShift and Cloud Pak for Integration](#), including reviewing the [Upgrade considerations on OpenShift and Cloud Pak for Integration](#).

Do not attempt an upgrade until you have reviewed the considerations and prepared your deployment.

2. Prepare a host that can be connected to the internet.

Note: If you are using the same host that you used for installing API Connect, skip this step.

The host must satisfy the following requirements:

- The host must be on a Linux x86\_64 platform, or any operating system that the IBM Cloud Pak CLI, the OpenShift CLI, and RedHat Skopeo support.
- The host `locale` must be set to English.
- The host must have sufficient storage to hold all of the software that is to be transferred to the local Docker registry.

Complete the following steps to set up your external host:

a. Install OpenSSL version 1.1.1 or higher.

b. Install Docker or Podman:

- To install Docker (for example, on Red Hat® Enterprise Linux®), run the following commands:

```
yum check-update
yum install docker
```

- To install Podman, see [Podman Installation Instructions](#).

c. Install `httpd-tools` by running the following commands:

```
yum install httpd-tools
```

d. Install the IBM Cloud Pak CLI by completing the following steps:

Install the latest version of the binary file for your platform. For more information, see [cloud-pak-cli](#).

- Download the binary file by running the following command:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/<binary_file_name>
```

For example:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/cloudctl-linux-amd64.tar.gz
```

ii. Extract the binary file by running the following command:

```
tar -xf <binary_file_name>
```

iii. Run the following commands to modify and move the file:

```
chmod 755 <file_name>
mv <file_name> /usr/local/bin/cloudctl
```

iv. Confirm that `cloudctl` is installed by running the following command:

```
cloudctl --help
```

The `cloudctl` usage is displayed.

e. Install the `oc` OpenShift Container Platform CLI tool.

For more information, see [Getting started with the CLI](#) in the Red Hat OpenShift documentation.

f. Install RedHat Skopeo CLI version 1.0.0 or higher.

For more information, see [Installing Skopeo from packages](#).

g. Run the following command to create a directory that serves as the offline store.

The following example creates a directory called "upgrade\_offline", which is used in the subsequent steps.

```
mkdir $HOME/upgrade_offline
```

Notes:

- The `$HOME/upgrade_offline` store must be persistent to avoid transferring data more than once. The persistence also helps to run the mirroring process multiple times or on a schedule.
- The `$HOME/upgrade_offline` store must not use the same name that you used for the previous installation. If you use the same name as original directory (`$HOME/upgrade_offline`), then the `api-connect-catalog` tag will not get updated correctly, the catalog source pods will not pick up the new image, and as a result, the operator will not upgrade. The environment variable should be updated in all the steps.

3. On the bastion host, create environment variables for the installer and image inventory.

Note: If you are using the same bastion host that you used for installing API Connect, you can re-use the environment variables from the installation, but you must update the following variables for the new release:

- `CASE_VERSION` - update to the newest CASE.
- `OFFLINEDIR` - update to reflect new folder created for upgrade; for example, `$HOME/upgrade_offline`.

Create the following environment variables with the installer image name and the image inventory. Set the `CASE_VERSION` to the value for the new API Connect release. The CASE version shown in the example might not be correct for your deployment – refer to [Operator, operand, and CASE versions](#) for the correct CASE version.

For example:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=3.0.7
export CASE_ARCHIVE=$CASE_NAME-$CASE_VERSION.tgz
export CASE_INVENTORY_SETUP=apiconnectOperatorSetup
export OFFLINEDIR=$HOME/upgrade_offline
export OFFLINEDIR_ARCHIVE=offline.tgz
export CASE_REMOTE_PATH=https://github.com/IBM/cloud-pak/raw/master/repo/case/$CASE_NAME/$CASE_VERSION/$CASE_ARCHIVE
export CASE_LOCAL_PATH=$OFFLINEDIR/$CASE_ARCHIVE

export BASTION_DOCKER_REGISTRY_HOST=localhost
export BASTION_DOCKER_REGISTRY_PORT=443
export BASTION_DOCKER_REGISTRY=$BASTION_DOCKER_REGISTRY_HOST:$BASTION_DOCKER_REGISTRY_PORT
export BASTION_DOCKER_REGISTRY_USER=username
export BASTION_DOCKER_REGISTRY_PASSWORD=password
export BASTION_DOCKER_REGISTRY_PATH=$OFFLINEDIR/imageregistry
```

4. Connect the portable host to the internet.

Connect the portable host to the internet and disconnect it from the local, air-gapped network.

5. Download the API Connect installer and image inventory by running the following command:

```
cloudctl case save \
--case $CASE_REMOTE_PATH \
--outputdir $OFFLINEDIR
```

6. Mirror the images from the ICR (source) registry to the portable device's (destination) registry.

a. Store the credentials for the ICR (source) registry.

The following command stores and caches the IBM Entitled Registry credentials in a file on your file system in the `$HOME/.airgap/secrets` location:

```
cloudctl case launch \
--case $OFFLINEDIR/$CASE_ARCHIVE \
--inventory $CASE_INVENTORY_SETUP \
--action configure-creds-airgap \
--namespace $NAMESPACE \
--args "--registry cp.icr.io --user cp --pass <entitlement-key> --inputDir $OFFLINEDIR"
```

b. Store the credentials for the portable device's (destination) registry.

The following command stores and caches the Docker registry credentials in a file on your file system in the `$HOME/.airgap/secrets` location:

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action configure-creds-airgap \
```

```
--args "--registry $PORTABLE_DOCKER_REGISTRY --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD"
```

c. If needed, start the Docker registry service on the portable device.

If you are using the same portable device that you used for installing API Connect, the Docker registry service might already be running.

i. Initialize the Docker registry by running the following command:

```
cloudctl case launch \  
  --case $CASE_LOCAL_PATH \  
  --inventory $CASE_INVENTORY_SETUP \  
  --action init-registry \  
  --args "--registry $PORTABLE_DOCKER_REGISTRY_HOST --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD --dir $PORTABLE_DOCKER_REGISTRY_PATH"
```

ii. Start the Docker registry by running the following command:

```
cloudctl case launch \  
  --case $CASE_LOCAL_PATH \  
  --inventory $CASE_INVENTORY_SETUP \  
  --action start-registry \  
  --args "--registry $PORTABLE_DOCKER_REGISTRY_HOST --port $PORTABLE_DOCKER_REGISTRY_PORT --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD --dir $PORTABLE_DOCKER_REGISTRY_PATH"
```

d. Mirror the images to the registry on the portable device.

```
cloudctl case launch \  
  --case $CASE_LOCAL_PATH \  
  --inventory $CASE_INVENTORY_SETUP \  
  --action mirror-images \  
  --args "--registry $PORTABLE_DOCKER_REGISTRY --inputDir $OFFLINEDIR"
```

7. Optional: Save the Docker registry image that you stored on the portable device.

If your air-gapped network doesn't have a Docker registry image, you can save the image on the bastion host and copy it later to the host in your air-gapped environment.

```
docker save docker.io/library/registry:2.6 -o $PORTABLE_DOCKER_REGISTRY_PATH/registry-image.tar
```

8. Configure access to the local registry for installation.

a. Create environment variables with the local Docker registry connection information.

Note: If you are using the same bastion host that you used for installing API Connect, you can re-use the environment variables from the installation, but you must update the `CASE_VERSION` variable for the new release.

Create the following environment variables with the installer image name and the image inventory. Set the `CASE_VERSION` to the same value for the new API Connect release that you used in step [#topic\\_upgrade\\_OpenShift\\_portable\\_compute\\_d125e286](#).

For example:

```
export CASE_NAME=ibm-apiconnect  
export CASE_VERSION=3.0.7  
export CASE_ARCHIVE=$CASE_NAME-$CASE_VERSION.tgz  
export CASE_INVENTORY_SETUP=apiconnectOperatorSetup  
export OFFLINEDIR=$HOME/upgrade_offline  
export OFFLINEDIR_ARCHIVE=offline.tgz  
export CASE_REMOTE_PATH=https://github.com/IBM/cloud-pak/raw/master/repo/case/$CASE_NAME/$CASE_VERSION/$CASE_ARCHIVE  
export CASE_LOCAL_PATH=$OFFLINEDIR/$CASE_ARCHIVE  
  
export LOCAL_DOCKER_REGISTRY_HOST=<IP_or_FQDN_of_local_docker_registry>  
export LOCAL_DOCKER_REGISTRY_PORT=443  
export LOCAL_DOCKER_REGISTRY=$LOCAL_DOCKER_REGISTRY_HOST:$LOCAL_DOCKER_REGISTRY_PORT  
export LOCAL_DOCKER_REGISTRY_USER=username  
export LOCAL_DOCKER_REGISTRY_PASSWORD=password
```

b. Set up local registry credentials for mirroring.

Store the credentials of the registry that is running on the internal host.

```
cloudctl case launch \  
  --case $CASE_LOCAL_PATH \  
  --inventory $CASE_INVENTORY_SETUP \  
  --action configure-creds-airgap \  
  --args "--registry $LOCAL_DOCKER_REGISTRY --user $LOCAL_DOCKER_REGISTRY_USER --pass $LOCAL_DOCKER_REGISTRY_PASSWORD"
```

c. If you use an insecure registry, add the local registry to the cluster's `insecureRegistries` list.

```
oc patch image.config.openshift.io/cluster --type=merge -p '{"spec":{"registrySources":{"insecureRegistries":["'$LOCAL_DOCKER_REGISTRY'"]}}}'
```

9. If you are upgrading from any version prior to 10.0.4.0-ifix2, patch the CatalogSource named `ibm-apiconnect-catalog` to update the registry namespace.

In version 10.0.4.0-ifix2, the registry namespace in the image name used for the CatalogSource `ibm-apiconnect-catalog` changed from `ibmcom` to `cpopen`.

Patch the CatalogSource by running the following command:

```
oc patch catalogsource ibm-apiconnect-catalog -n openshift-marketplace --type=merge -p '{"spec":{"image":"'$LOCAL_DOCKER_REGISTRY'/cpopen/ibm-apiconnect-catalog:latest-amd64"}}'
```

10. Update the operator channel:

a. Confirm that the pod `ibm-apiconnect-catalog-xxxx` in the `openshift-marketplace` namespace was updated.

b. Open the OpenShift web console and click `Operators` > `Installed Operators` > `IBM API connect` > `Subscriptions`.

c. Change the channel to the new version (`v2.5`), which triggers an upgrade of the API Connect operator.

Known issues:

- If you are upgrading to API Connect version 10.0.4-ifix2 or 10.0.4-ifix3, you might encounter the following error while updating the operator:

```
Message: unpack job not completed: Unpack pod(openshift-
marketplace/e9f169cee8bfffac9ab35d276a48b7207d9606e2b7a0a8087bc58b4ff7tx221) container(pull) is pending. Reason:
ImagePullBackOff, Message: Back-off pulling image "ibmcom/ibm-apiconnect-operator-
bundle@sha256:ef0ce455270189c37a5dc0500219061959c041f88110f601f6e7bf8072df4943" Reason: JobIncomplete
```

Resolve the error by completing the following steps to update the ImageContentSourcePolicy for your deployment:

- Log in to the OpenShift cluster UI as an administrator of your cluster.
- Click Search, Resources and search for ICSP.
- In the list of ICSPs, click `ibm-apiconnect` to edit it.
- In the `ibm-apiconnect` ICSP, click the YAML tab.
- In the `spec.repositoryDigestMirrors` section, locate the `-mirrors:` subsection containing `source: docker.io/ibmcom`.
- Add a new mirror ending with `/ibmcom` to the section as in the following example:

```
- mirrors:
  - <AIRGAP_REGISTRY_ADDRESS>/ibmcom
  - <AIRGAP_REGISTRY_ADDRESS>/copen
  source: docker.io/ibmcom
```

- If the job does not automatically continue, uninstall and reinstall the API Connect operator.
- The certificate manager was upgraded in Version 10.0.4.0 and you might encounter an upgrade error if the CRD for the new certificate manager is not found. For information on the errors messages that indicate this problem, and steps to resolve it, see [Upgrade error when the CRD for the new certificate manager is not found](#) in the *Troubleshooting installation and upgrade on OpenShift* topic.
- A null value for the `backrestStorageType` property in the `pgcluster` CR causes an error during the operator upgrade from versions earlier than 10.0.4.0. For information on the errors messages that indicate this problem, and steps to resolve it, see [Operator upgrade fails with error from API Connect operator and Postgres operator](#) in the *Troubleshooting installation and upgrade on OpenShift* topic.

When the IBM API Connect operator is updated, the new pod starts automatically.

11. Verify that the API Connect operator was updated by completing the following steps:

a. Get the name of the pod that hosts the operator by running the following command:

```
oc get po -n <APIC_namespace> | grep apiconnect
```

The response looks like the following example:

```
ibm-apiconnect-7bdb795465-8f7rm          1/1      Running    0          4m23s
```

b. Get the API Connect version deployed on that pod by running the following command:

```
oc describe po <ibm-apiconnect-operator-podname> -n <APIC_namespace> | grep -i productversion
```

The response looks like the following example:

```
productVersion: 10.0.4.0-ifix3
```

12. Check for certificate errors, and then recreate issuers and certificates if needed.

In Version 10.0.4.0, API Connect upgraded its certificate manager, which might cause some certificate errors during the upgrade. Complete the following steps to check for certificate errors and correct them.

a. Check the new API Connect operator's log for an error similar to the following example:

```
{"level": "error", "ts": 1634966113.8442025, "logger": "controllers.AnalyticsCluster", "msg": "Failed to set owner reference on certificate request", "analyticscluster": "apic/minimum-a7s", "certificate": "minimum-a7s-ca", "error": "Object apic/minimum-a7s-ca is already owned by another Certificate controller minimum-a7s-ca",
```

To correct this problem, delete all issuers and certificates generated with `certmanager.k8s.io/v1alpha1`. For certificates used by route objects, you must also delete the route and secret objects.

b. Run the following commands to delete the issuers and certificates that were generated with `certmanager.k8s.io/v1alpha1`:

```
oc delete issuers.certmanager.k8s.io minimum-self-signed minimum-ingress-issuer minimum-mgmt-ca minimum-a7s-ca minimum-ptl-ca
```

```
oc delete certs.certmanager.k8s.io minimum-ingress-ca minimum-mgmt-ca minimum-ptl-ca minimum-a7s-ca
```

In the examples, `minimum` is the instance name of the top-level `apiconnectcluster`.

When you delete the issuers and certificates, the new certificate manager generates replacements; this might take a few minutes.

c. Verify that the new CA certs are refreshed and ready.

Run the following command to verify the certificates:

```
oc get certs minimum-ingress-ca minimum-mgmt-ca minimum-ptl-ca minimum-a7s-ca
```

The CA certs are ready when `AGE` is "new" and the `READY` column shows `True`.

d. Delete the remaining old certificates, routes, and secret objects.

Run the following commands:

```
oc get certs.certmanager.k8s.io | awk '/minimum/{print $1}' | xargs oc delete certs.certmanager.k8s.io
```

```
oc delete certs.certmanager.k8s.io postgres-operator
```

```
oc get routes --no-headers -o custom-columns=":metadata.name" | grep ^minimum- | xargs oc delete secrets
```

```
oc get routes --no-headers -o custom-columns=":metadata.name" | grep ^minimum- | xargs oc delete routes
```

e. Verify that no old issuers or certificates from your top-level instance remain.

Run the following commands:

```
oc get issuers.certmanager.k8s.io | grep minimum
```

```
oc get certs.certmanager.k8s.io | grep minimum
```

Both commands should report that no resources were found.

13. Use `apicops` to validate the certificates.

a. Run the following command:

```
apicops upgrade:stale-certs -n <APIC_namespace>
```

b. Delete any stale certificates that are managed by cert-manager.

If a certificate failed the validation and it is managed by cert-manager, you can delete the stale certificate secret, and let cert-manager regenerate it. Run the following command:

```
kubectl delete secret <stale-secret> -n <APIC_namespace>
```

c. Restart the corresponding so that it can pick up the new secret.

To determine which pod to restart, see the following topics:

- [List of external certificates](#)
- [List of internal certificates](#)

For information on the `apicops` tool, see [The API Connect operations tool: apicops](#).

14. Run the following command to delete the Postgres pods, which refreshes the new certificate:

```
oc get pod -n <namespace> --no-headers=true | grep postgres | grep -v backup | awk '{print $1}' | xargs oc delete pod -n <namespace>
```

15. If needed, delete the portal-www, portal-db and portal-nginx pods to ensure they use the new secrets.

If you have the Developer Portal deployed, then the portal-www, portal-db and portal-nginx pods might require deleting to ensure that they pick up the newly generated secrets when restarted. If the pods are not showing as "ready" in a timely manner, then delete all the pods at the same time (this will cause down time).

Run the following commands to get the name of the portal CR and delete the pods:

```
oc project <APIC_namespace>
```

```
oc get ptl
```

```
oc delete po -l app.kubernetes.io/instance=<name_of_portal_CR>
```

16. If needed, renew the internal certificates for the analytics subsystem.

If you see `analytics-storage-*` or `analytics-mq-*` pods in the `CrashLoopBackOff` state, then renew the internal certificates for the analytics subsystem and force a restart of the pods.

a. Switch to the project/namespace where analytics is deployed and run the following command to get the name of the analytics CR (AnalyticsCluster):

```
oc project <APIC_namespace>
```

```
oc get a7s
```

You need the CR name for the remaining steps.

b. Renew the internal certificates (CA, client, and server) by running the following commands:

```
oc get certificate <name_of_analytics_CR>
-ca -o=jsonpath='{.spec.secretName}' | xargs oc delete secret
```

```
oc get certificate <name_of_analytics_CR>
-client -o=jsonpath='{.spec.secretName}' | xargs oc delete secret
```

```
oc get certificate <name_of_analytics_CR>
-server -o=jsonpath='{.spec.secretName}' | xargs oc delete secret
```

c. Force a restart of all analytics pods by running the following command:

```
oc delete po -l app.kubernetes.io/instance=<name_of_analytics_CR>
```

17. Update the top-level API Connect Cluster CR:

a. Update the `version` field.

For example:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-production
  name: prod
  namespace: APIC_namespace
spec:
  license:
    accept: true
    use: production
  profile: n12xc4.m12
  version: 10.0.4.0-ifix3
  storageClassName: rook-ceph-block
```

Specify the currently deployed `profile` and `use` values, which might not match the example. If you want to change to a different profile, you can do it after completing the upgrade (for instructions, see [Changing deployment profiles on OpenShift](#).)

b. In the `spec.gateway` section, delete the `template` override section, if it exists. You cannot perform an upgrade if the CR contains an override.

18. Apply the updated top-level CR to upgrade the API Connect operand by running the following command:

```
oc apply -f CR_file_name.yaml
```

The response looks like the following example:

**apiconnectcluster.apiconnect.ibm.com/prod configured**

19. If needed, resolve gateway peering issues by completing the following steps.

Due to the ingress issuer changes, the gateway pods must be scaled down and then back up. This process will cause 5 to 10 minutes of down time.

a. Run the following command to verify that the management, portal, and analytics subsystems are **Running**:

```
oc get apic --all-namespaces
```

The response looks like the following example, with the gateway pods showing as **Pending**.

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
analyticscluster.analytics.apiconnect.ibm.com/minimum-a7s	8/8	Running	10.0.4.0	10.0.4.0-2221	7d1h
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
apiconnectcluster.apiconnect.ibm.com/minimum	6/7	Pending	10.0.4.0	10.0.3.0-ifix1-351	47h
NAME	PHASE	READY	SUMMARY	VERSION	AGE
datapowerservice.datapower.ibm.com/minimum-gw	Pending	True	StatefulSet replicas ready: 1/1	10.0.4.0	46h
NAME	PHASE	LAST EVENT	WORK PENDING	WORK IN-PROGRESS	AGE
datapowermonitor.datapower.ibm.com/minimum-gw	Pending		false	false	46h
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
gatewaycluster.gateway.apiconnect.ibm.com/minimum-gw	0/2	Pending	10.0.4.0	10.0.4.0-2221	46h
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
managementcluster.management.apiconnect.ibm.com/minimum-mgmt	16/16	Running	10.0.4.0	10.0.4.0-2221	47h
NAME	STATUS	MESSAGE			
managementdbupgrade.management.apiconnect.ibm.com/minimum-mgmt-up-px177	Complete	Fresh install is Complete (DB Schema/data are up-to-date) 46h			
managementdbupgrade.management.apiconnect.ibm.com/management-up-87fcz	Complete	Upgrade is Complete (DB Schema/data are up-to-date) 8h			
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
portalcluster.portal.apiconnect.ibm.com/minimum-ptl	3/3	Running	10.0.4.0	10.0.4.0-2221	46h

b. Scale down the gateway firmware containers by editing the top-level APIConnectCluster CR and setting the replica count to 0.

OpenShift:

i. Run the following command to edit the CR:

```
oc edit apiconnectcluster <apic-cr-name>
```

ii. In the `spec.gateway` section, set the `replicaCount` setting to 0:

```
...
spec:
  gateway:
    replicaCount: 0
...
```

If the setting is not already included in the CR, add it now as shown in the example.

iii. Save and exit the CR.

Cloud Pak for Integration:

i. In the Automation Platform UI, edit the API Connect instance.

ii. Click Advanced.

iii. In the Gateway subsystem section, set the Advance Replica count field to 0.

c. Wait for the gateway firmware pods to scale down and terminate.

Do not proceed to the next step until the pods are terminated.

d. Reset the replica count to its original value.

If the replica count setting was not used previously, then:

- OpenShift: Delete the setting from the CR.
- Cloud Pak for Integration: Clear the Advance Replica count field.

20. Validate that the upgrade was successfully deployed by running the following command:

```
oc get apic -n APIC_namespace
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
analyticscluster.analytics.apiconnect.ibm.com/prod-a7s	8/8	Running	10.0.4.0-ifix3	10.0.4.0-ifix3	21h

21. Upgrade the OpenShift cluster to OpenShift 4.10.

API Connect 10.0.5 requires that your cluster be on OpenShift 4.10 before you begin that upgrade.

Upgrading OpenShift requires that you move to interim minor releases instead of upgrading directly from 4.6 to 4.10. For more information, see the [Red Hat OpenShift documentation](#). In the "Documentation" banner, select the version of OpenShift that you want to upgrade to, and then expand the "Updating clusters" section in the navigation list.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Upgrading on OpenShift using portable storage

You can use a portable storage device to perform an air-gapped upgrade of IBM® API Connect on OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

### Before you begin

If you are upgrading an installation that is connected to the internet, see [Upgrading on OpenShift and Cloud Pak for Integration in an online environment](#).

Attention: If you plan to upgrade to API Connect 10.0.5, first upgrade to API Connect to 10.0.4-ifix3, and then upgrade OpenShift to 4.10 as explained in this procedure.

- This upgrade procedure uses a single, top-level API Connect Cluster CR to deploy a newer version of API Connect. Only use these instructions if your current deployment was also installed with the top-level CR.
- The Gateway subsystem remains available during the upgrade of the Management, Portal, and Analytics subsystems.
- The upgrade procedure requires you to use Red Hat Skopeo for moving container images. Skopeo is not available for Microsoft Windows, so you cannot perform this task using a Windows host.

### About this task

You can store the product code and images to a portable storage device and transfer them to a local, air-gapped network. By doing so, you can install in your air-gapped environment without using a bastion host.

Notes:

- This task requires you to use Red Hat Skopeo for moving container images. Skopeo is not available for Microsoft Windows, so you cannot perform this task on Windows.
- Don't use the tilde ~ within double quotation marks in any command because the tilde doesn't expand and your commands might fail.

### Procedure

1. Ensure that you have completed all of the steps in [Preparing to upgrade on OpenShift and Cloud Pak for Integration](#), including reviewing the [Upgrade considerations on OpenShift and Cloud Pak for Integration](#).

Do not attempt an upgrade until you have reviewed the considerations and prepared your deployment.

2. Prepare a host that can be connected to the internet.

Note: If you are using the same host that you used for installing API Connect, skip this step.

The host must satisfy the following requirements:

- The host must be on a Linux x86\_64 platform, or any operating system that the IBM Cloud Pak CLI, the OpenShift CLI, and RedHat Skopeo support.
- The host `locale` must be set to English.
- The host must have sufficient storage to hold all of the software that is to be transferred to the local Docker registry.

Complete the following steps to set up your external host:

a. Install OpenSSL version 1.1.1 or higher.

b. Install Docker or Podman:

- To install Docker (for example, on Red Hat® Enterprise Linux®), run the following commands:

```
yum check-update
yum install docker
```

- To install Podman, see [Podman Installation Instructions](#).

c. Install `httpd-tools` by running the following commands:

```
yum install httpd-tools
```

d. Install the IBM Cloud Pak CLI by completing the following steps:

Install the latest version of the binary file for your platform. For more information, see [cloud-pak-cli](#).

i. Download the binary file by running the following command:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/<binary_file_name>
```

For example:

```
wget https://github.com/IBM/cloud-pak-cli/releases/latest/download/cloudctl-linux-amd64.tar.gz
```

ii. Extract the binary file by running the following command:

```
tar -xf <binary_file_name>
```

iii. Run the following commands to modify and move the file:

```
chmod 755 <file_name>
mv <file_name> /usr/local/bin/cloudctl
```

iv. Confirm that `cloudctl` is installed by running the following command:

```
cloudctl --help
```

The `cloudctl` usage is displayed.

e. Install the `oc` OpenShift Container Platform CLI tool.

For more information, see [Getting started with the CLI](#) in the Red Hat OpenShift documentation.

f. Install RedHat Skopeo CLI version 1.0.0 or higher.

For more information, see [Installing Skopeo from packages](#).

g. Run the following command to create a directory that serves as the offline store.

The following example creates a directory called "upgrade\_offline", which is used in the subsequent steps.

```
mkdir $HOME/upgrade_offline
```

Notes:

- The `$HOME/upgrade_offline` store must be persistent to avoid transferring data more than once. The persistence also helps to run the mirroring process multiple times or on a schedule.
- The `$HOME/upgrade_offline` store must not use the same name that you used for the previous installation. If you use the same name as original directory (`$HOME/upgrade_offline`), then the `api-connect-catalog` tag will not get updated correctly, the catalog source pods will not pick up the new image, and as a result, the operator will not upgrade. The environment variable should be updated in all the steps.

3. On the bastion host, create environment variables for the installer and image inventory.

Note: If you are using the same bastion host that you used for installing API Connect, you can re-use the environment variables from the installation, but you must update the following variables for the new release:

- `CASE_VERSION` - update to the newest CASE.
- `OFFLINEDIR` - update to reflect new folder created for upgrade; for example, `$HOME/upgrade_offline`.

Create the following environment variables with the installer image name and the image inventory. Set the `CASE_VERSION` to the value for the new API Connect release. The CASE version shown in the example might not be correct for your deployment – refer to [Operator, operand, and CASE versions](#) for the correct CASE version.

For example:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=3.0.7
export CASE_ARCHIVE=$CASE_NAME-$CASE_VERSION.tgz
export CASE_INVENTORY_SETUP=apiconnectOperatorSetup
export OFFLINEDIR=$HOME/upgrade_offline
export OFFLINEDIR_ARCHIVE=offline.tgz
export CASE_REMOTE_PATH=https://github.com/IBM/cloud-pak/raw/master/repo/case/$CASE_NAME/$CASE_VERSION/$CASE_ARCHIVE
export CASE_LOCAL_PATH=$OFFLINEDIR/$CASE_ARCHIVE

export BASTION_DOCKER_REGISTRY_HOST=localhost
export BASTION_DOCKER_REGISTRY_PORT=443
```

```
export BASTION_DOCKER_REGISTRY=$BASTION_DOCKER_REGISTRY_HOST:$BASTION_DOCKER_REGISTRY_PORT
export BASTION_DOCKER_REGISTRY_USER=username
export BASTION_DOCKER_REGISTRY_PASSWORD=password
export BASTION_DOCKER_REGISTRY_PATH=$OFFLINEDIR/imageregistry
```

4. Connect the portable host to the internet.  
Connect the portable host to the internet and disconnect it from the local, air-gapped network.
5. Download the API Connect installer and image inventory by running the following command:

```
cloudctl case save \
--case $CASE_REMOTE_PATH \
--outputdir $OFFLINEDIR
```

6. Mirror the images from the ICR (source) registry to the portable device's (destination) registry.
  - a. Store the credentials for the ICR (source) registry.  
The following command stores and caches the IBM Entitled Registry credentials in a file on your file system in the \$HOME/.airgap/secrets location:

```
cloudctl case launch \
--case $OFFLINEDIR/$CASE_ARCHIVE \
--inventory $CASE_INVENTORY_SETUP \
--action configure-creds-airgap \
--namespace $NAMESPACE \
--args "--registry cp.icr.io --user cp --pass <entitlement-key> --inputDir $OFFLINEDIR"
```

- b. Store the credentials for the portable device's (destination) registry.  
The following command stores and caches the Docker registry credentials in a file on your file system in the \$HOME/.airgap/secrets location:

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action configure-creds-airgap \
--args "--registry $PORTABLE_DOCKER_REGISTRY --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD"
```

- c. If needed, start the Docker registry service on the portable device.  
If you are using the same portable device that you used for installing API Connect, the Docker registry service might already be running.

- i. Initialize the Docker registry by running the following command:

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action init-registry \
--args "--registry $PORTABLE_DOCKER_REGISTRY_HOST --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD --dir $PORTABLE_DOCKER_REGISTRY_PATH"
```

- ii. Start the Docker registry by running the following command:

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action start-registry \
--args "--registry $PORTABLE_DOCKER_REGISTRY_HOST --port $PORTABLE_DOCKER_REGISTRY_PORT --user $PORTABLE_DOCKER_REGISTRY_USER --pass $PORTABLE_DOCKER_REGISTRY_PASSWORD --dir $PORTABLE_DOCKER_REGISTRY_PATH"
```

- d. Mirror the images to the registry on the portable device.

```
cloudctl case launch \
--case $CASE_LOCAL_PATH \
--inventory $CASE_INVENTORY_SETUP \
--action mirror-images \
--args "--registry $PORTABLE_DOCKER_REGISTRY --inputDir $OFFLINEDIR"
```

7. Optional: Save the Docker registry image that you stored on the portable device.  
If your air-gapped network doesn't have a Docker registry image, you can save the image on the bastion host and copy it later to the host in your air-gapped environment.

```
docker save docker.io/library/registry:2.6 -o $PORTABLE_DOCKER_REGISTRY_PATH/registry-image.tar
```

8. Configure access to the local registry for installation.
  - a. Create environment variables with the local Docker registry connection information.  
Note: If you are using the same bastion host that you used for installing API Connect, you can re-use the environment variables from the installation, but you must update the `CASE_VERSION` variable for the new release.  
Create the following environment variables with the installer image name and the image inventory. Set the `CASE_VERSION` to the same value for the new API Connect release that you used in step [#topic\\_upgrade\\_OpenShift\\_portable\\_storage\\_d125e286](#).

For example:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=3.0.7
export CASE_ARCHIVE=$CASE_NAME-$CASE_VERSION.tgz
export CASE_INVENTORY_SETUP=apiconnectOperatorSetup
export OFFLINEDIR=$HOME/upgrade_offline
export OFFLINEDIR_ARCHIVE=offline.tgz
export CASE_REMOTE_PATH=https://github.com/IBM/cloud-pak/raw/master/repo/case/$CASE_NAME/$CASE_VERSION/$CASE_ARCHIVE
export CASE_LOCAL_PATH=$OFFLINEDIR/$CASE_ARCHIVE

export LOCAL_DOCKER_REGISTRY_HOST=<IP_or_FQDN_of_local_docker_registry>
export LOCAL_DOCKER_REGISTRY_PORT=443
export LOCAL_DOCKER_REGISTRY=$LOCAL_DOCKER_REGISTRY_HOST:$LOCAL_DOCKER_REGISTRY_PORT
export LOCAL_DOCKER_REGISTRY_USER=username
export LOCAL_DOCKER_REGISTRY_PASSWORD=password
```

- b. Set up local registry credentials for mirroring.  
Store the credentials of the registry that is running on the internal host.

```
cloudctl case launch \
  --case $CASE_LOCAL_PATH \
  --inventory $CASE_INVENTORY_SETUP \
  --action configure-creds-airgap \
  --args "--registry $LOCAL_DOCKER_REGISTRY --user $LOCAL_DOCKER_REGISTRY_USER --pass
$LOCAL_DOCKER_REGISTRY_PASSWORD"
```

- c. If you use an insecure registry, add the local registry to the cluster's insecureRegistries list.

```
oc patch image.config.openshift.io/cluster --type=merge -p '{"spec":{"registrySources":{"insecureRegistries":
["$LOCAL_DOCKER_REGISTRY"]}}}'
```

9. If you are upgrading from any version prior to 10.0.4.0-ifix2, patch the CatalogSource named `ibm-apiconnect-catalog` to update the registry namespace. In version 10.0.4.0-ifix2, the registry namespace in the image name used for the CatalogSource `ibm-apiconnect-catalog` changed from `ibmcom` to `cpopen`. Patch the CatalogSource by running the following command:

```
oc patch catalogsource ibm-apiconnect-catalog -n openshift-marketplace --type=merge -p '{"spec":
{"image": "'${LOCAL_DOCKER_REGISTRY}'/cpopen/ibm-apiconnect-catalog:latest-amd64"}'}
```

10. Update the operator channel:

- a. Confirm that the pod `ibm-apiconnect-catalog-xxxx` in the `openshift-marketplace` namespace was updated.
- b. Open the OpenShift web console and click Operators > Installed Operators > IBM API connect > Subscriptions.
- c. Change the channel to the new version (v2.5), which triggers an upgrade of the API Connect operator.

Known issues:

- If you are upgrading to API Connect version 10.0.4-ifix2 or 10.0.4-ifix3, you might encounter the following error while updating the operator:

```
Message: unpack job not completed: Unpack pod(openshift-
marketplace/e9f169cee8bffa9ab35d276a48b7207d9606e2b7a0a8087bc58b4ff7tx221) container (pull) is pending. Reason:
ImagePullBackOff, Message: Back-off pulling image "ibmcom/ibm-apiconnect-operator-
bundle@sha256:ef0ce455270189c37a5dc0500219061959c041f88110f601f6e7bf8072df4943" Reason: JobIncomplete
```

Resolve the error by completing the following steps to update the ImageContentSourcePolicy for your deployment:

- Log in to the OpenShift cluster UI as an administrator of your cluster.
- Click Search > Resources and search for ICSP.
- In the list of ICSPs, click `ibm-apiconnect` to edit it.
- In the `ibm-apiconnect` ICSP, click the YAML tab.
- In the `spec.repositoryDigestMirrors` section, locate the `-mirrors:` subsection containing `source: docker.io/ibmcom`.
- Add a new mirror ending with `/ibmcom` to the section as in the following example:

```
- mirrors:
  - <AIRGAP_REGISTRY_ADDRESS>/ibmcom
  - <AIRGAP_REGISTRY_ADDRESS>/cpopen
  source: docker.io/ibmcom
```

- If the job does not automatically continue, uninstall and reinstall the API Connect operator.
- The certificate manager was upgraded in Version 10.0.4.0 and you might encounter an upgrade error if the CRD for the new certificate manager is not found. For information on the errors messages that indicate this problem, and steps to resolve it, see [Upgrade error when the CRD for the new certificate manager is not found](#) in the *Troubleshooting installation and upgrade on OpenShift* topic.
- A null value for the `backrestStorageType` property in the `pgcluster` CR causes an error during the operator upgrade from versions earlier than 10.0.4.0. For information on the errors messages that indicate this problem, and steps to resolve it, see [Operator upgrade fails with error from API Connect operator and Postgres operator](#) in the *Troubleshooting installation and upgrade on OpenShift* topic.

When the IBM API Connect operator is updated, the new pod starts automatically.

11. Verify that the API Connect operator was updated by completing the following steps:

- a. Get the name of the pod that hosts the operator by running the following command:

```
oc get po -n <APIC_namespace> | grep apiconnect
```

The response looks like the following example:

```
ibm-apiconnect-7bdb795465-8f7rm          1/1      Running    0          4m23s
```

- b. Get the API Connect version deployed on that pod by running the following command:

```
oc describe po <ibm-apiconnect-operator-podname> -n <APIC_namespace> | grep -i productversion
```

The response looks like the following example:

```
productVersion: 10.0.4.0-ifix3
```

12. Check for certificate errors, and then recreate issuers and certificates if needed.

In Version 10.0.4.0, API Connect upgraded its certificate manager, which might cause some certificate errors during the upgrade. Complete the following steps to check for certificate errors and correct them.

- a. Check the new API Connect operator's log for an error similar to the following example:

```
{"level": "error", "ts": 1634966113.8442025, "logger": "controllers.AnalyticsCluster", "msg": "Failed to set owner reference
on certificate request", "analyticscluster": "apic/minimum-a7s", "certificate": "minimum-a7s-ca", "error": "Object
apic/minimum-a7s-ca is already owned by another Certificate controller minimum-a7s-ca",
```

To correct this problem, delete all issuers and certificates generated with `certmanager.k8s.io/v1alpha1`. For certificates used by route objects, you must also delete the route and secret objects.

- b. Run the following commands to delete the issuers and certificates that were generated with `certmanager.k8s.io/v1alpha1`:

```
oc delete issuers.certmanager.k8s.io minimum-self-signed minimum-ingress-issuer minimum-mgmt-ca minimum-a7s-ca
minimum-ptl-ca
```

```
oc delete certs.certmanager.k8s.io minimum-ingress-ca minimum-mgmt-ca minimum-ptl-ca minimum-a7s-ca
```

In the examples, *minimum* is the instance name of the top-level `apiconnectcluster`.

When you delete the issuers and certificates, the new certificate manager generates replacements; this might take a few minutes.

- c. Verify that the new CA certs are refreshed and ready.  
Run the following command to verify the certificates:

```
oc get certs minimum-ingress-ca minimum-mgmt-ca minimum-ptl-ca minimum-a7s-ca
```

The CA certs are ready when `AGE` is "new" and the `READY` column shows `True`.

- d. Delete the remaining old certificates, routes, and secret objects.  
Run the following commands:

```
oc get certs.certmanager.k8s.io | awk '/minimum/{print $1}' | xargs oc delete certs.certmanager.k8s.io
```

```
oc delete certs.certmanager.k8s.io postgres-operator
```

```
oc get routes --no-headers -o custom-columns=:metadata.name | grep ^minimum- | xargs oc delete secrets
```

```
oc get routes --no-headers -o custom-columns=:metadata.name | grep ^minimum- | xargs oc delete routes
```

- e. Verify that no old issuers or certificates from your top-level instance remain.  
Run the following commands:

```
oc get issuers.certmanager.k8s.io | grep minimum
```

```
oc get certs.certmanager.k8s.io | grep minimum
```

Both commands should report that no resources were found.

13. Use `apicops` to validate the certificates.

- a. Run the following command:

```
apicops upgrade:stale-certs -n <APIC_namespace>
```

- b. Delete any stale certificates that are managed by cert-manager.

If a certificate failed the validation and it is managed by cert-manager, you can delete the stale certificate secret, and let cert-manager regenerate it. Run the following command:

```
kubectl delete secret <stale-secret> -n <APIC_namespace>
```

- c. Restart the corresponding so that it can pick up the new secret.

To determine which pod to restart, see the following topics:

- [List of external certificates](#)
- [List of internal certificates](#)

For information on the `apicops` tool, see [The API Connect operations tool: apicops](#).

14. Run the following command to delete the Postgres pods, which refreshes the new certificate:

```
oc get pod -n <namespace> --no-headers=true | grep postgres | grep -v backup | awk '{print $1}' | xargs oc delete pod -n <namespace>
```

15. If needed, delete the portal-www, portal-db and portal-nginx pods to ensure they use the new secrets.

If you have the Developer Portal deployed, then the portal-www, portal-db and portal-nginx pods might require deleting to ensure that they pick up the newly generated secrets when restarted. If the pods are not showing as "ready" in a timely manner, then delete all the pods at the same time (this will cause down time).

Run the following commands to get the name of the portal CR and delete the pods:

```
oc project <APIC_namespace>
```

```
oc get ptl
```

```
oc delete po -l app.kubernetes.io/instance=<name_of_portal_CR>
```

16. If needed, renew the internal certificates for the analytics subsystem.

If you see `analytics-storage-*` or `analytics-mq-*` pods in the `CrashLoopBackOff` state, then renew the internal certificates for the analytics subsystem and force a restart of the pods.

- a. Switch to the project/namespace where analytics is deployed and run the following command to get the name of the analytics CR (AnalyticsCluster):

```
oc project <APIC_namespace>
```

```
oc get a7s
```

You need the CR name for the remaining steps.

- b. Renew the internal certificates (CA, client, and server) by running the following commands:

```
oc get certificate <name_of_analytics_CR>
-ca -o=jsonpath='{.spec.secretName}' | xargs oc delete secret
```

```
oc get certificate <name_of_analytics_CR>
-client -o=jsonpath='{.spec.secretName}' | xargs oc delete secret
```

```
oc get certificate <name_of_analytics_CR>
-server -o=jsonpath='{.spec.secretName}' | xargs oc delete secret
```

- c. Force a restart of all analytics pods by running the following command:

```
oc delete po -l app.kubernetes.io/instance=<name_of_analytics_CR>
```

17. Update the top-level API Connect Cluster CR:

- a. Update the `version` field.

For example:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APICConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-production
  name: prod
  namespace: APIC_namespace
spec:
  license:
    accept: true
    use: production
  profile: n12xc4.m12
  version: 10.0.4.0-ifix3
  storageClassName: rook-ceph-block
```

Specify the currently deployed `profile` and `use` values, which might not match the example. If you want to change to a different profile, you can do it after completing the upgrade (for instructions, see [Changing deployment profiles on OpenShift](#).)

- b. In the `spec.gateway` section, delete the `template` override section, if it exists. You cannot perform an upgrade if the CR contains an override.

18. Apply the updated top-level CR to upgrade the API Connect operand by running the following command:

```
oc apply -f CR_file_name.yaml
```

The response looks like the following example:

```
apiconnectcluster.apiconnect.ibm.com/prod configured
```

19. If needed, resolve gateway peering issues by completing the following steps.

Due to the ingress issuer changes, the gateway pods must be scaled down and then back up. This process will cause 5 to 10 minutes of down time.

- a. Run the following command to verify that the management, portal, and analytics subsystems are **Running**:

```
oc get apic --all-namespaces
```

The response looks like the following example, with the gateway pods showing as **Pending**.

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
analyticscluster.analytics.apiconnect.ibm.com/minimum-a7s	8/8	Running	10.0.4.0	10.0.4.0-2221	7d1h
apiconnectcluster.apiconnect.ibm.com/minimum	6/7	Pending	10.0.4.0	10.0.3.0-ifix1-351	47h
NAME	PHASE	READY	SUMMARY	VERSION	AGE
datapowerservice.datapower.ibm.com/minimum-gw	Pending	True	StatefulSet replicas ready: 1/1	10.0.4.0	46h
NAME	PHASE	LAST EVENT	WORK PENDING	WORK IN-PROGRESS	AGE
datapowermonitor.datapower.ibm.com/minimum-gw	Pending		false	false	46h
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
gatewaycluster.gateway.apiconnect.ibm.com/minimum-gw	0/2	Pending	10.0.4.0	10.0.4.0-2221	46h
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
managementcluster.management.apiconnect.ibm.com/minimum-mgmt	16/16	Running	10.0.4.0	10.0.4.0-2221	47h
NAME	STATUS	MESSAGE			
managementdbupgrade.management.apiconnect.ibm.com/minimum-mgmt-up-px177	Complete	Fresh install is Complete (DB Schema/data are up-to-date) 46h			
managementdbupgrade.management.apiconnect.ibm.com/management-up-87fcz	Complete	Upgrade is Complete (DB Schema/data are up-to-date) 8h			
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
portalcluster.portal.apiconnect.ibm.com/minimum-ptl	3/3	Running	10.0.4.0	10.0.4.0-2221	46h

- b. Scale down the gateway firmware containers by editing the top-level APICConnectCluster CR and setting the replica count to 0.

OpenShift:

- i. Run the following command to edit the CR:

```
oc edit apiconnectcluster <apic-cr-name>
```

- ii. In the `spec.gateway` section, set the `replicaCount` setting to 0:

```
...
spec:
  gateway:
    replicaCount: 0
...
```

If the setting is not already included in the CR, add it now as shown in the example.

- iii. Save and exit the CR.

Cloud Pak for Integration:

- i. In the Automation Platform UI, edit the API Connect instance.

- ii. Click Advanced.
- iii. In the Gateway subsystem section, set the Advance Replica count field to 0.
- c. Wait for the gateway firmware pods to scale down and terminate.  
Do not proceed to the next step until the pods are terminated.
- d. Reset the replica count to its original value.  
If the replica count setting was not used previously, then:

- OpenShift: Delete the setting from the CR.
- Cloud Pak for Integration: Clear the Advance Replica count field.

20. Validate that the upgrade was successfully deployed by running the following command:

```
oc get apic -n APIC_namespace
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
analyticscluster.analytics.apiconnect.ibm.com/prod-a7s	8/8	Running	10.0.4.0-ifix3	10.0.4.0-ifix3		21h

21. Upgrade the OpenShift cluster to OpenShift 4.10.

API Connect 10.0.5 requires that your cluster be on OpenShift 4.10 before you begin that upgrade.

Upgrading OpenShift requires that you move to interim minor releases instead of upgrading directly from 4.6 to 4.10. For more information, see the [Red Hat OpenShift documentation](#). In the "Documentation" banner, select the version of OpenShift that you want to upgrade to, and then expand the "Updating clusters" section in the navigation list.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Enabling Analytics after upgrading

After the upgrade successfully completes, enable the Analytics message queue and restart Analytics data collection.

## Procedure

1. If you disabled the Analytics message queue before upgrading, enable it now by completing the following steps:
  - a. Edit the top-level `APIConnectCluster` CR.
  - b. In the `spec.analytics` section, locate the `mq` subsection and change the `enabled` setting to `true`.
  - c. Save and apply the change.
2. [Start Analytics data collection.](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting installation and upgrade on OpenShift

Review the following troubleshooting tips if you encounter a problem while installing or upgrading API Connect on OpenShift, including as a component of IBM Cloud Pak for Integration (CP4I).

- [Operator upgrade fails with error from API Connect operator and Postgres operator](#)
- [Upgrade error when the CRD for the new certificate manager is not found](#)
- [You see the denied: insufficient scope error during an air-gapped deployment](#)
- [Apiconnect operator crashes](#)
- [Upgrading a 3 node profile to IBM API Connect 10.0.3.0 might result in some portal-db/www pods being stuck in the Pending state](#)
- [Issues when installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal](#)

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

## Operator upgrade fails with error from API Connect operator and Postgres operator

If you encounter the following error condition during the upgrade from an API Connect version earlier than 10.0.4.0, complete the workaround steps to patch the `pgcluster` CR, and then upgrade the API Connect operator again.

1. Check for the following errors:

From the API Connect operator:

```
upgrade cluster failed: Could not upgrade cluster: there exists an ongoing upgrade task: [minimum-mgmt-56616911-postgres-upgrade]. If you believe this is an error, try deleting this pgtask
```

```
{ "level": "info", "ts": 1659638932.470165, "logger": "UpgradeCluster: ", "msg": "Postgres DB version is less than pgoVersion. Performing upgrade ", "pgoVersion": "4.7.4", "postgresDBVersion": "4.5.2", "clusterName": "minimum-mgmt-56616911-postgres" }
```

And from the postgres operator:

```
time="2022-08-04T22:05:42Z" level=error msg="Namespace Controller: error syncing Namespace 'cp4i': unsuccessful pgcluster version check: Pgcluster.crunchydata.com "minimum-mgmt-56616911-postgres" is invalid: spec.backrestStorageTypes: Invalid value: "null": spec.backrestStorageTypes in body must be of type array: "null"
```

The errors are caused by a null value for the property in the `pgcluster` CR. The workaround is to patch the `pgcluster` CR and correct the property.

remove the `null` value for `backrestStorageTypes`: under `spec`, if found and add appropriate value mentioned below. Or if `backrestStorageTypes` doesn't show up in `pgcluster` add the below values according to the backup type used

2. Get the `pgcluster` name and edit the CR:

```
oc get pgcluster -n <APIC_namespace>
oc edit pgcluster <pgcluster_name> -n <APIC_namespace>
```

3. Add a value for the `backrestStorageTypes` in the `spec`: section:

Example for S3 backups:

```
backrestStorageTypes:
- s3
```

Example for local and SFTP backups:

```
backrestStorageTypes:
- posix
```

4. Save and apply the CR with the `wq` command.

## Upgrade error when the CRD for the new certificate manager is not found

The certificate manager was upgraded in Version 10.0.4.0 and you might encounter an upgrade error if the CRD for the new certificate manager is not found; for example:

```
ibm-apiconnect-5fb55f5c5c-hdks4 ibm-apiconnect error {"level":"error","ts":1637587218.9319391,"logger":"controller-runtime.source","msg":"if kind is a CRD, it should be installed before calling Start","kind":"Certificate.cert-manager.io","error":"no matches for kind \"Certificate\" in version \"cert-manager.io/v1\"","stacktrace":"sigs.k8s.io/controller-runtime/pkg/source.(*Kind).Start\n\t/go/pkg/mod/sigs.k8s.io/controller-runtime@v0.6.3/pkg/source/source.go:117\nsigs.k8s.io/controller-runtime/pkg/internal/controller.
```

```
(*Controller) .Start.func1\n\t/go/pkg/mod/sigs.k8s.io/controller-
runtime@v0.6.3/pkg/internal/controller/controller.go:143\nsigs.k8s.io/controller-runtime/pkg/internal/controller.
(*Controller) .Start\n\t/go/pkg/mod/sigs.k8s.io/controller-
runtime@v0.6.3/pkg/internal/controller/controller.go:184\nsigs.k8s.io/controller-runtime/pkg/manager.
(*controllerManager) .startRunnable.func1\n\t/go/pkg/mod/sigs.k8s.io/controller-runtime@v0.6.3/pkg/manager/internal.go:661"}

```

To resolve the error, delete the IBM API Connect operator and re-install it. If you find that the operator is stuck in the "deleting" state in the web console, delete it manually by running the following commands in the project (namespace) where the operator is located:

```
oc delete subscription ibm-apiconnect
oc delete csv ibm-apiconnect.v2.4.0
```

If you installed the operator in all namespaces, the project is called `openshift-operators`.

## You see the denied: insufficient scope error during an air-gapped deployment

Problem: You encounter the `denied: insufficient scope` message while mirroring images during an air-gapped installation or upgrade.

Reason: This error occurs when a problem is encountered with the entitlement key used for obtaining images.

Solution: Obtain a new entitlement key by completing the following steps:

1. Log in to the [IBM Container Library](#).
2. In the Container software library, select Get entitlement key.
3. After the Access your container software heading, click Copy key.
4. Copy the key to a safe location.

## Apiconnect operator crashes

Problem: During installation (or upgrade), the Apiconnect operator crashes with the following message:

```
panic: unable to build API support: unable to get Group and Resources: unable to retrieve the complete list of server APIs:
packages.operators.coreos.com/v1: the server is currently unable to handle the request

goroutine 1 [running]:
github.ibm.com/velox/apiconnect-operator/operator-utils/v2/apiversions.GetAPISupport(0x0)
operator-utils/v2/apiversions/api-versions.go:89 +0x1e5
main.main()
ibm-apiconnect/cmd/manager/main.go:188 +0x4ee
```

Additional symptoms:

- Apiconnect operator is in crash loopback status
- Kube apiserver pods log the following information:

```
E1122 18:02:07.853093 18 available_controller.go:437] v1.packages.operators.coreos.com failed with:
failing or missing response from https://10.128.0.3:5443/apis/packages.operators.coreos.com/v1:
bad status from https://10.128.0.3:5443/apis/packages.operators.coreos.com/v1: 401
```

- The IP logged here belongs to the `package server` pod present in the `openshift-operator-lifecycle-manager` namespace
- Package server pods log the following: `/apis/packages.operators.coreos.com/v1` API call is being rejected with 401 issue

```
E1122 18:10:25.614179 1 authentication.go:53] Unable to authenticate the request due to an error: x509:
certificate signed by unknown authority I1122 18:10:25.614224 1 httplog.go:90]
verb="GET" URI="/apis/packages.operators.coreos.com/v1" latency=161.243µs resp=401
UserAgent="Go-http-client/2.0" srcIP="10.128.0.1:41370":
```

- Problem is intermittent

Solution:

- If you find the exact symptoms as described, the solution is to delete package server pods in the `openshift-operator-lifecycle-manager` namespace.
- New package server pods will log the `200 Success` message for the same API call.

## Upgrading a 3 node profile to IBM API Connect 10.0.3.0 might result in some portal-db/www pods being stuck in the Pending state

IBM® API Connect 10.0.3.0 introduces the pod anti-affinity required rule, meaning that in a 3 node profile deployment, all 3 db and www pods can run only if there are at least 3 running worker nodes. This rule can cause some upgrades to version 10.0.3.0 to become stuck in the `Pending` state, in which case some extra steps are needed during the upgrade to workaround the issue. See the following example for detailed information about the issue, and how to continue with the upgrade.

Important: You must have a backup of your current deployment before starting the upgrade.

The following example shows 3 worker nodes:

```
$ oc get nodes
NAME           STATUS   ROLES    AGE   VERSION
apimdev0103   Ready   worker   42m   v1.20.0
apimdev0129   Ready   worker   45m   v1.20.0
apimdev1066   Ready   worker   39m   v1.20.0
```

The pods have been scheduled across only 2 of the 3 worker nodes due to a transient problem with `apimdev1066`, as shown in the following pod list. Pods without persistent storage, such as `nginx-X`, can be rescheduled to `apimdev1066` as soon as they are restarted, but any pods with persistent local storage, such as `db-X` and `www-X`, have to be rescheduled onto the same worker node as that is where their files live.

```
$ oc get po -o wide
NAME           READY   STATUS    RESTARTS   AGE   IP           NODE           NOMINATED NODE
READINESS GATES
```

ejs-portal-nginx-84f57ffd8c-hbf66	1/1	Running	0	5m12s	888.16.109.208	apimdev0103	<none>	<none>
ejs-portal-nginx-84f57ffd8c-mvq96	1/1	Running	0	5m12s	888.16.142.215	apimdev0129	<none>	<none>

ejs-portal-sitel-db-2	2/2	Running	0	2m41s	888.16.142.218	apimdev0129	<none>	<none>
ejs-portal-sitel-www-0	2/2	Running	0	9m51s	888.16.109.210	apimdev0103	<none>	<none>
ejs-portal-sitel-www-1	2/2	Running	0	12m	888.16.142.213	apimdev0129	<none>	<none>
ejs-portal-sitel-www-2	0/2	Pending	0	111s	<none>	<none>	<none>	<none>
ibm-apiconnect-75b47f9f87-p25dd	1/1	Running	0	10m	888.16.109.207	apimdev0103	<none>	<none>

The pod list shows that **db-2** has restarted, and has been rescheduled to **apimdev0129** as there were no other db pods running on that node. However, **db-1** and **www-2** are both stuck in **Pending** state, as there is already a pod of the same type running on the worker node that is hosting the local storage that they are bound to. If you run a **describe** command of either pod you will see the following output:

Events:

Type	Reason	Age	From	Message
Warning	FailedScheduling	10s (x4 over 2m59s)	default-scheduler	0/3 nodes are available: 1 node(s) didn't match pod affinity/anti-affinity, 1 node(s) didn't match pod anti-affinity rules, 2 node(s) had volume node affinity conflict.

To resolve this situation you need to delete the PVCs for each pod, and then delete the pod itself, so that Kubernetes will regenerate the PVCs and schedule the pod on the worker node that does not have the anti-affinity conflict.

Therefore, for the **db-1** pod the following commands must be run:

```
$ oc get pvc | grep ejb-portal-sitel-db-1
db-ejs-portal-sitel-db-1          Bound          local-pv-fa445e30    250Gi         RWO           local-storage      15m
dblogs-ejs-portal-sitel-db-1    Bound          local-pv-d57910e7    250Gi         RWO           local-storage      15m

$ oc delete pvc db-ejs-portal-sitel-db-1 dblogs-ejs-portal-sitel-db-1
persistentvolumeclaim "db-ejs-portal-sitel-db-1" deleted
persistentvolumeclaim "dblogs-ejs-portal-sitel-db-1" deleted

$ oc delete po ejb-portal-sitel-db-1
pod "ejb-portal-sitel-db-1" deleted
```

For the **www-2** pod the following commands must be run:

```
$ oc get pvc | grep ejb-portal-sitel-www-2
admin-ejs-portal-sitel-www-2    Bound          local-pv-48799536    245Gi         RWO           local-storage      51m
backup-ejs-portal-sitel-www-2   Bound          local-pv-a93f5607    245Gi         RWO           local-storage      51m
web-ejs-portal-sitel-www-2      Bound          local-pv-facd4489    245Gi         RWO           local-storage      51m

$ oc delete pvc admin-ejs-portal-sitel-www-2 backup-ejs-portal-sitel-www-2 web-ejs-portal-sitel-www-2
persistentvolumeclaim "admin-ejs-portal-sitel-www-2" deleted
persistentvolumeclaim "backup-ejs-portal-sitel-www-2" deleted
persistentvolumeclaim "web-ejs-portal-sitel-www-2" deleted

$ oc delete po ejb-portal-sitel-www-2
pod "ejb-portal-sitel-www-2" deleted
```

If the PVC has **persistentVolumeReclaimPolicy: Delete** set on it, no cleanup is necessary, as the old data will have been deleted on the worker node that is no longer running the **db-1** and **www-2** pods. However, if you are using **local-storage** in a Kubernetes installation, then there might be some cleanup to do to remove the old data from the worker node that had the anti-affinity conflict.

Kubernetes can now reschedule the pods. All pods with persistent storage are now spread across the available worker nodes, and the pods whose PVCs were deleted will get a full copy of the data from the existing running pods. The following pod list is now observed in our example:

```
$ oc get po -o wide
```

## Issues when installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal

From IBM API Connect 10.0.3.0, the Developer Portal is based on the Drupal 9 content management system. If you want to install Drupal 8 custom modules or sub-themes into the Drupal 9 based Developer Portal, you must ensure that they are compatible with Drupal 9, including any custom code that they contain, and not using any deprecated APIs, for example. There are tools available for checking your custom code, such as [drupal\\_check](#) on GitHub, which checks Drupal code for deprecations.

For example, any Developer Portal sites that contain modules or sub-themes that don't contain a Drupal 9 version declaration will fail to upgrade, and errors like the following output will be seen in the **admin** logs:

```
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: emeraldgreen

[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Found themes incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: /tmp/restore_site.355ec8 is NOT
Drupal 9 compatible
...
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Found modules incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: site1.com is NOT Drupal 9
compatible
```

To fix version compatibility errors, all custom modules and sub-themes should declare a `core_version_requirement` key in their `*.info.yml` file that indicates Drupal 9 compatibility. For example:

```
name: Example module
type: module
description: Purely an example
core: 8.x
core_version_requirement: '^8 || ^9'
package: Example module

# Information added by Drupal.org packaging script on 2020-05-31
version: '8.x-1.3'
project: 'example_module'
datestamp: 1590905415
```

This example specifies that the module is compatible with all versions of Drupal 8 and 9. For more information, see [Let Drupal know about your module with an .info.yml file](#) on the drupal.org website.

If you have a backup of a site that you need to restore, and are getting the version compatibility error, but the module or theme `*.info.yml` file cannot be changed easily, then you have two options. Either:

- Add an environment variable into the portal CR for the `www` pod of the `admin` container stating `SKIP_D9_COMPAT_CHECK: "true"`. However, if you choose this method, you must be positive that all of the custom modules and themes for your sites are Drupal 9 compatible, as otherwise the sites may end up inaccessible after the upgrade or restore. On OpenShift or IBM Cloud Pak for Integration, edit the top level CR by using the UI, and add the environment variable as shown in the following CR snippet:

```
spec:
  ...
  portal:
    template:
      - containers:
        - env:
          - name: SKIP_D9_COMPAT_CHECK
            value: "true"
          name: admin
        name: www
```

Or:

- Extract the site backup, edit the relevant files inside it, and then tar the backup file again. Note that this procedure will overwrite the original backup file, so ensure that you keep a separate copy of the original file before you start the extraction. For example:
  1. `mkdir /tmp/backup`
  2. `cd /tmp/backup`
  3. `tar xzf path_to_backup.tar.gz`
  4. Edit the custom module and theme files to make them Drupal 9 compatible, and add the correct `core_version_requirement` setting.
  5. `rm -f path_to_backup.tar.gz`
  6. `tar cfz path_to_backup.tar.gz`
  7. `cd /`
  8. `rm -rf /tmp/backup`

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Maintaining API Connect

You can use utilities to complete maintenance tasks such as backup, restore, and certificate management on Kubernetes.

Note: When maintaining API Connect, do not use `kubect1 exec` or `oc exec` commands to access API Connect pods unless advised by IBM.

- [Advanced configuration](#)  
You can optionally install and configure advanced features.
- [Backing up and restoring](#)  
You can backup and restore API Connect subsystems.
- [Disaster recovery](#)  
Prepare for, or recover from, a disaster affecting an API Connect deployment running on Kubernetes, OpenShift, or Cloud Pak for Integration.
- [Disabling the Analytics subsystem on Kubernetes](#)  
During maintenance of an API Connect cluster, you can shut down the Analytics subsystem by disabling the client, ingestion, and storage microservices so that those processes are not running and there is no way to reach them.
- [Disabling the Analytics subsystem on OpenShift and Cloud Pak for Integration](#)  
During maintenance of an API Connect cluster, you can shut down the Analytics subsystem by disabling the client, ingestion, and storage microservices so that those processes are not running and there is no way to reach them.
- [Maintaining a two data center deployment](#)  
How to maintain a two data center disaster recovery (DR) deployment on Kubernetes and OpenShift, including information about normal operation, failure handling, and recovery.
- [Monitoring and health checks](#)  
Monitor your deployment and complete health checks on subsystems.
- [Logging](#)  
Configure logging for your deployment on Kubernetes.
- [Troubleshooting](#)  
Troubleshoot API Connect subsystems on Kubernetes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Advanced configuration

You can optionally install and configure advanced features.

See:

- [Installing License Service](#)  
License Service helps you assess whether your IBM® API Connect deployment in a Kubernetes environment is compliant with licensing requirements.
- [Installing the Automated API behavior testing application](#)  
Update the custom resource for installing IBM API Connect to deploy the Automated API behavior testing application on Kubernetes.
- [Installing the toolkit](#)
- [Changing deployment profiles on Kubernetes](#)  
You can change an API Connect installation to use different deployment profiles.
- [Changing deployment profiles on OpenShift](#)  
You can change an API Connect installation to use different deployment profiles.
- [Replica override for microservices](#)  
Modify the replica count for microservices by using template overrides for Custom Resources.
- [Changing the deployment profile on Cloud Pak for Integration](#)  
You can change an API Connect installation to use a different deployment profile.
- [Enabling UI feature flags on Kubernetes](#)  
Use a template override to update the installation CR with settings that control UI features.
- [Enabling UI feature flags on OpenShift and Cloud Pak for Integration](#)  
Use a template override to update the installation CR with settings that control UI features.
- [Installing a two data center deployment](#)  
Additional installation instructions explaining how to deploy a two data center disaster recovery (DR) deployment on Kubernetes and OpenShift.
- [Advanced configuration for the management subsystem](#)  
Specify advanced configuration for the management subsystem.
- [Advanced configuration for the gateway subsystem](#)  
Specify advanced configuration for the gateway subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Installing License Service

License Service helps you assess whether your IBM® API Connect deployment in a Kubernetes environment is compliant with licensing requirements.

### About this task

License Service provides useful features for managing virtualized environments and measuring license utilization. License Service discovers the software that is installed in your infrastructure, helps you to analyze the consumption data, and allows you to generate audit reports. Each report provides you with different information about your

infrastructure, for example the computer groups, software installations, and the content of your software catalog.

By default, every License Service audit report presents data from the previous 90 days. You can customize the type and amount of information that is displayed in a report by using filters, and save your personal settings for future use. You can also export the reports to .csv or .pdf format, and schedule report emails so that specified recipients are notified when important events occur.

When you install API Connect, the `license-use` setting that is configured in the `ibm-apiconnect` operator CR (custom resource) for a particular subsystem is reflected in the Pod annotations. For the Analytics, Portal, and Management subsystems the `license-use` value can be "production" or "nonproduction". For the Gateway subsystem, the `license-use` value can be "production", "nonproduction", or "developer". The subsystem pod annotations are scanned by the `ibm-licensing-operator`, which reports license and CPU usage for each subsystem.

For more information, see [License Service](#).

## Procedure

Install License Service as explained in [Manually installing ibm-licensing-operator with a stand-alone IBM Containerized Software](#).

The instructions describe the License Service installation for API Connect deployments, and apply to the Analytics, Portal, Management, and Gateway subsystems.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing the Automated API behavior testing application

Update the custom resource for installing IBM® API Connect to deploy the Automated API behavior testing application on Kubernetes.

### About this task

You can install the Automated API behavior testing application as part of a new IBM API Connect deployment, or you can add it to an existing deployment:

- [Adding the Automated API behavior testing application to an existing deployment](#)
- [Including the Automated API behavior testing application in a new deployment](#)

## Adding the Automated API behavior testing application to an existing deployment

### Before you begin

Make sure that the following requirements are met before attempting to deploy the Automated API behavior testing application:

- The IBM API Connect subsystems are installed.
- The cert-manager is installed for use with IBM API Connect and you are using the default certificates that it generates.  
The Automated API behavior testing application requires that the IBM API Connect deployment use the cert-manager and the default certificates. Custom certificates are not supported and if used, the Automated API behavior testing application will not install correctly.

### About this task

Edit the deployed CR (custom resource) for the Management subsystem and add the settings for the Automated API behavior testing application.

### Procedure

1. Retrieve the name of the deployed Management subsystem's deployed CR by running the following command:

```
kubectl get managementcluster -n <management_namespace>
```

2. Edit the deployed CR by running the following command:

```
kubectl edit managementcluster <management-cr-name> -n <management_namespace>
```

3. Append the new `testAndMonitor` definition at the end of the `spec` section, making sure to adhere to the spacing used in the file.  
Attention: The hub and turnstile endpoints should be distinct and must not overlap with any of the 4 management endpoints.

```
testAndMonitor:
  enabled: true
  hubEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: hub.$STACK_HOST
        secretName: hub-endpoint
  turnstileEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: turnstile.$STACK_HOST
        secretName: turnstile-endpoint
```

`$STACK_HOST` is the ingress subdomain for the API Connect stack, as documented in [Installing the Management subsystem cluster](#).

4. Save the update.

The Automated API behavior testing application will be installed into the existing Management subsystem.

5. Check the Hub and Turnstile pods periodically until their "READY" values are both "1/1" and their "STATUS" are both "Running". Verify that the Hub and Turnstile pods are running, by executing the following command:

```
kubect1 get pods -n <management_namespace>
```

Look for pods with names similar to `management-hub-XXXX-XXXX` and `management-turnstile-XXXX-XXXX`. The following example shows how the response might look:

NAME	READY	STATUS	RESTARTS	AGE
management-hub-68745dc4b7-gmlkk	1/1	Running	0	29m
management-turnstile-b7d978b56-jghvn	1/1	Running	0	24m

## Including the Automated API behavior testing application in a new deployment

### Before you begin

Make sure that the cert-manager is installed for use with IBM API Connect and you are using the default certificates that it generates. The Automated API behavior testing application requires that the IBM API Connect deployment use the cert-manager and the default certificates. Custom certificates are not supported and if used, the Automated API behavior testing application will not install correctly.

### About this task

Edit the CR (custom resource) for the Management subsystem and add the settings for the Automated API behavior testing application.

### Procedure

1. Edit the `ManagementCluster` custom resource (CR) and add the following definition for the Automated API behavior testing application. Append the new definition at the end of the `spec` section, making sure to adhere to the spacing used in the file.

```
testAndMonitor:
  enabled: true
  hubEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: hub.$STACK_HOST
        secretName: hub-endpoint
  turnstileEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: turnstile.$STACK_HOST
        secretName: turnstile-endpoint
```

`$STACK_HOST` is the ingress subdomain for the API Connect stack, as documented in [Installing the Management subsystem cluster](#).

Attention: The hub and turnstile endpoints should be distinct and must not overlap with any of the 4 management endpoints.

2. Apply the updated CR by running the following command:

```
kubect1 apply -f management_cr.yaml -n <management_namespace>
```

where `namespace` is the name of the target installation namespace in the Kubernetes cluster.

The Automated API behavior testing application will be installed with the Management subsystem.

3. Check the Hub and Turnstile pods periodically until their "READY" values are both "1/1" and their "STATUS" are both "Running". Verify that the Hub and Turnstile pods are running, by executing the following command:

```
kubect1 get pods -n <management_namespace>
```

Look for pods with names similar to `management-hub-XXXX-XXXX` and `management-turnstile-XXXX-XXXX`. The following example shows how the response might look:

NAME	READY	STATUS	RESTARTS	AGE
management-hub-68745dc4b7-gmlkk	1/1	Running	0	29m
management-turnstile-b7d978b56-jghvn	1/1	Running	0	24m

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing the toolkit

You can install the toolkit that provides CLI commands, and the API Designer user interface, for IBM® API Connect.

### About this task

The toolkit is provided as executable files, so no actual installation is necessary, you just need to download the required compressed file and extract the contents.

There are two toolkit options available:

- CLI: provides a command line environment for working with IBM API Connect.

- CLI + LoopBack + Designer: provides a command line environment for working with IBM API Connect, including LoopBack® support, and the API Designer application.

To install the toolkit, download the compressed file that is appropriate for your chosen toolkit option and platform, then extract the contents to a chosen location on your local machine. The compressed file contains an executable file for running CLI commands and, if you choose the CLI + LoopBack + Designer option, an executable file for launching the API Designer application.

You can download the toolkit from one of the following locations:

- From IBM Fix Central.
- From the Cloud Manager or API Manager user interface.

## Procedure

To install and run the toolkit, complete the following steps:

### 1. Download the toolkit compressed file.

- To download the toolkit from IBM Fix Central, complete the following steps:
  - Open the [IBM Fix Central site](#) in your browser.
  - In the Product selector field, enter `API Connect`, then select IBM API Connect from the drop down list.
  - Select your Installed Version and click Continue. If you do not know your installed IBM API Connect version, contact your administrator.
  - In the Text field, enter `toolkit`, then click Continue.
  - Select the toolkit file that you want to download.
  - Click Continue, then follow the instructions to complete the download operation.
- To download the toolkit from Cloud Manager or API Manager user interface, complete the following steps:
  - Open the Cloud Manager or API Manager user interface.
  - On the welcome page, click the Download Toolkit tile. The two toolkit options are listed.
  - Click your platform alongside either the CLI option or the CLI + LoopBack + Designer option as required, then save the associated compressed file to your local file system.
  - To download the API Designer credentials (Client ID and Client Secret), click Download alongside API Designer Credentials, then save the `designer_credentials.json` file to your local file system. A command is provided for installing the credentials, as described in detail in [step 6](#).
  - To download the toolkit credentials (Client ID and Client Secret), click Download alongside Credential, then save the `credentials.json` file to your local file system. A command is provided for installing the credentials, as described in detail in [step 5](#).
  - Close the Install API Connect Toolkit window.

### 2. Extract the contents of the toolkit compressed file to a folder of your choice.

The contents of the file depend on the your chosen toolkit option and platform, as follows:

- The `apic-slim` or `apic-slim.exe` file is the CLI for IBM API Connect.
- The `apic` or `apic.exe` file is the CLI for IBM API Connect including LoopBack support.
 

Tip: If you are using the CLI option, then if you rename the `apic-slim` file to `apic`, or the `apic-slim.exe` file to `apic.exe`, you can run the CLI commands exactly as documented, copy and paste sample commands from the documentation, and use any command scripts as-is if you later move to the CLI + LoopBack + Designer option.
- The `api_designer-platform` file is the API Designer user interface application for the specified platform.

### 3. Optional: Delete the `$HOME/.apiconnect/node_cli` directory.

You need to do this only if you replaced a version of `apic` or `apic.exe` and are using the `apic lb4` command. You need to delete the directory `get apic` to unpack the new loopback.

On Windows, `$HOME` is defined by environment `USERPROFILE`.

### 4. Run the CLI.

- For the Mac OSX or Linux® platforms, complete the following steps:
  - Open a terminal instance and navigate to the folder where you extracted the contents of the toolkit compressed file.
  - Make the CLI file an executable file by entering the following command:

```
chmod +x download_name
```

Where `download_name` is the name of the toolkit file that you downloaded, either `apic` or `apic-slim`.

- Run CLI commands as follows:

```
./apic command_name_and_parameters
```

or

```
./apic-slim command_name_and_parameters
```

For details of the CLI commands, see [apic](#).

- For the Windows platform, complete the following steps:
  - Open a command prompt and navigate to the folder where you extracted the contents of the toolkit compressed file.
  - Run CLI commands as follows:

```
apic command_name_and_parameters
```

or

```
apic-slim command_name_and_parameters
```

For details of the CLI commands, see [apic](#).

Tip: Add the folder location of your CLI file to your `PATH` variable so that you can run CLI commands from anywhere in your file system.

### 5. Install the toolkit credentials.

If you do not install the toolkit credentials that are provided for download, as detailed previously in the [toolkit credentials download instructions](#), API Connect uses a default set of credentials that are identical for all deployments. However, the downloaded credentials were generated during the deployment of your API Connect system and are unique to your installation. To install the credentials into your local toolkit, run the following command:

```
apic client-creds:set toolkit_credentials_file_path/credentials.json
```

where `credentials_file_path` is the location to which you downloaded the toolkit credentials JSON file. After you have run this command, your toolkit uses these new credentials to authenticate with the management server.

Note: At any one time, you can use only one set of toolkit credentials for login to a management server from the toolkit CLI. If you want to log in to a different management server you must install the toolkit credentials from that management server.

To revert to the default toolkit credentials for all login operations from the toolkit CLI, use the following command:

```
apic client-creds:clear
```

For increased security, an administrator can remove the default credentials from the management server by completing the following steps:

- a. Log in to the management server as an administrator; see [Logging in to a management server](#).
- b. Delete the default credentials by running the following commands:

```
apic registrations:delete toolkit --server mgmt_endpoint_url
apic registrations:delete consumer-toolkit --server mgmt_endpoint_url
```

#### 6. Install the API Designer credentials.

If you do not install the API Designer credentials that are provided for download, as detailed previously in the [API Designer credentials download instructions](#), API Connect uses a default set of credentials that are identical for all deployments. However, the downloaded credentials were generated during the deployment of your API Connect system and are unique to your installation. To install the custom credentials into your local API Designer, set the `APIC_DESIGNER_CREDENTIALS` environment variable to the credentials download location, using the mechanism appropriate for your operating system.

After you have set the `APIC_DESIGNER_CREDENTIALS` environment variable, your API Designer uses the new credentials to authenticate with the management server.

- Windows:

If you are using Windows, create an environment variable using one of the following methods:

- Create a permanent environment variable so that you can start API Designer from any location on your computer:
  - Open the Environment Variables page: Click Start, Settings, System and in the "Related Settings" section of the page, click Advanced System Settings.
  - On the Advanced tab of the System Properties dialog box, click Environment Variables.
  - In the "User variables" section, click New and create an environment variables with the following settings:
    - Variable: `APIC_DESIGNER_CREDENTIALS`
    - Value: `<designer_credentials_file_path>\designer_credentials.json` where `<designer_credentials_file_path>` is the location where you stored the `designer_credentials.json` file.
  - Click OK to save the new environment variable, and then exit the dialog box.
- If you don't have the required permissions to create a permanent environment variable, you can create a temporary one that will only be used while you are running the API Designer application. The following steps must be performed every time you start API Designer:
  - Open the Windows command prompt.
  - Run the following command to set the temporary environment variable:

```
set APIC_DESIGNER_CREDENTIALS=<designer_credentials_file_path>\designer_credentials.json
```

where `<designer_credentials_file_path>` is the location where you stored the `designer_credentials.json` file.

Note: Leave the command prompt open for the next step. You must set the temporary variable and start the API Designer within the same Windows command session.

- Now run the following command to start API Designer:

```
C:\>"Program Files\API Designer\API Designer.exe"
```

By default, API Designer is installed in the C:\Program Files\API Designer folder as shown in the example. If you installed it into a different location, use your own location in the command. Note that the path and file name are enclosed in quotation marks because they contain spaces.

- Mac:

If you are using Mac OS X, create an environment variable using one of the following methods:

- Run the following command to set the global environment variable:

```
launchctl setenv APIC_DESIGNER_CREDENTIALS <designer_credentials_file_path>/designer_credentials.json
```

where `<designer_credentials_file_path>` is the location where you stored the API Designer credentials JSON file.

- Pass in the environment variable while starting API Designer from the command line. With this method, you must run the following command every time you start API Designer:

```
APIC_DESIGNER_CREDENTIALS=<designer_credentials_file_path>/designer_credentials.json open
<designer_application_file_path>/API Designer.app'
```

where:

- `<designer_credentials_file_path>` is the location to which you downloaded the API Designer credentials JSON file.
- `<designer_application_file_path>` is the location to which you downloaded and uncompressed the API Designer application.

#### 7. Start the API Designer application from the location to where you stored the extracted file.

Note:

- To uninstall the API Designer application on a Windows platform with a non Administrator account, complete the following steps:
  - In Windows File Explorer, navigate to the `USER_HOME\AppData\Local\Programs\api-designer` folder.
  - Run the **Uninstall API Designer application** application. Do **not** use the **Add or remove programs** window.
- To uninstall the API Designer application on a Windows platform with an Administrator account, you can either run the **Uninstall API Designer application** application, or you can use the **Add or remove programs** window.

## Results

The IBM API Connect toolkit CLI and, if selected, the API Designer user interface application are installed on your local system.

For information on using the API Designer user interface, see [Developing your APIs and applications](#).

For information on using the toolkit CLI, see [Using the developer toolkit command-line tool](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Changing deployment profiles on Kubernetes

You can change an API Connect installation to use different deployment profiles.

### About this task

---

After you complete initial installation of the API Connect subsystems, you can change to another of the deployment profiles that are supported for the subsystem.

Important considerations:

- If you are changing from a development profile to a production profile, ensure that you have production profile hardware (3 nodes).
- While it is possible to use a development profile installation in a production deployment, it is not recommended.
  - For the management subsystem, the portal subsystem, and the gateway subsystem, the development profiles do not provide the failover resiliency nor the downtime guarantee that is needed to maintain high availability (HA) production deployments.
  - For the analytics subsystem, the development deployment option was designed to have a small impact on your hardware and as such it will not scale, and it will not perform as well as the production profile.
- Based on the resources configured for each microservice in the profile, there might be downtime during the profile change.
- If you enabled the analytics message queue feature, you must disable it before changing to another deployment profile. You can re-enable the message queue feature after the profile change is complete.

To disable the message queue:

1. Edit the Analytics CR:

```
kubectl edit AnalyticsCluster -n <namespace>
```

2. Locate the `mq` subsection and change the `enabled` setting to `false`.

```
mq:
  enabled: false
```

3. Save and apply the change.

To re-enable the message queue:

1. Edit the Analytics CR:

```
kubectl edit AnalyticsCluster -n <namespace>
```

2. Locate the `mq` subsection and change the `enabled` setting to `true`.

3. Save and apply the change.

Supported profiles:

Management subsystem

- Development profile

```
profile: n1xc4.m16
```

Describes a hardware profile of 1 node, 4 cores, and 16 GB memory. Deploys a subsystem with the scale of one; a single node, non-HA subsystem. Recommended for development and testing.

- Development profile (reduced CPU)

```
profile: n1xc2.m16
```

Describes a hardware profile of 1 node, 2 cores, and 16 GB memory. For use when the deployment environment has limited CPU resources. Deploys a subsystem with the scale of one; a single node, non-HA subsystem. Recommended for development and testing.

- Production profile

```
profile: n3xc4.m16
```

Describes a hardware profile of 3 nodes, 4 cores, and 16 GB memory. Deploys in HA mode for a production environment. Not supported for fewer than three nodes.

- Production profile (reduced CPU)

```
profile: n3xc2.m16
```

Describes a hardware profile of 3 nodes, 2 cores, and 16 GB memory. For use when the deployment environment has limited CPU resources. Deploys in HA mode for a production environment. Not supported for fewer than three nodes.

Portal subsystem

- Development profiles deploy a subsystem with the scale of one; a single node, non-HA subsystem. Development profiles are recommended for development or testing.
- Production profiles deploys in HA mode for a production environment. Not supported for fewer than three nodes.

- For Multi Site HA you can use a different profile in each site and change them at will.
- Development profile  
**profile: n1xc8.m16**  
 Describes a hardware profile of 1 node, 8 cores, and 16 GB memory
- Development profile (reduced CPU)  
**profile: n1xc4.m16**  
 Describes a hardware profile of 1 node, 4 cores, and 16 GB memory. For use when the deployment environment has limited CPU resources.
- Development profile (minimal CPU and Memory)  
**profile: n1xc2.m8**  
 Describes a hardware profile of 1 node, 2 cores, and 8 GB memory. For use when the deployment environment has minimal CPU and Memory resources.
- Production profile  
**profile: n3xc8.m16**  
 Describes a hardware profile of 3 nodes, 8 cores, and 16 GB memory.
- Production profile (reduced CPU and Memory)  
**profile: n3xc4.m8**  
 Describes a hardware profile of 3 nodes, 4 cores, and 8 GB memory. For use when the deployment environment has limited CPU and Memory resources.

#### Analytics subsystem

- Development profile  
**n1xc2.m16**  
 Describes a hardware profile of 1 node, 2 cores, and 16 GB memory. Deploys a single-node, non-HA, non-scalable Analytics solution. The development profile is only recommend for development and test environments.
- Production profile  
**n3xc4.m16**  
 Describes a hardware profile of 3 nodes, 4 cores, and 16 GB memory. Deploys a three-node, HA, scalable Analytics solution. The production profile requires at least 3 nodes to work properly, and is the recommended option for production environments.

#### Gateway subsystem

- Development profile  
**profile: n1xc4.m8**  
 Describes a hardware profile of 1 nodes, 4 cores, and 8 GB memory. Deploys a subsystem with the scale of one; a single node, non-HA subsystem. Recommended use of this profile is for development and testing.
- Production profile  
**profile: n3xc4.m8**  
 Describes a hardware profile of 3 nodes, 4 cores, and 8 GB memory. Deploys in HA mode for a production environment. Not supported for fewer than three nodes.

## Procedure

---

### 1. Management subsystem:

- Verify that subsystem is in **Running** state.

```
kubectl get ManagementCluster -n <namespace>
```

- Edit the CR:

```
kubectl edit ManagementCluster -n <namespace>
```

Change **spec.profile** value to the new profile you want to use.

- When switching from development profile to a production profile, wait for the microservice to scale up. When switching from a production profile to a development profile, wait for the microservice to scale down.
- Verify that subsystem is in **Running** state.

```
kubectl get ManagementCluster -n <namespace>
```

### 2. Developer Portal subsystem:

- Verify that subsystem is in **Running** state.

```
kubectl get PortalCluster -n <namespace>
```

- Edit the CR:

```
kubectl edit PortalCluster -n <namespace>
```

Change `spec.profile` value to the new profile you want to use.

- c. When switching from development profile to a production profile, wait for the microservice to scale up. When switching from a production profile to a development profile, wait for the microservice to scale down.
- d. Verify that subsystem is in **Running** state.

```
kubectl get PortalCluster -n <namespace>
```

3. Analytics subsystem:

- a. To avoid data loss, it is recommended that data collection be stopped while the profile switch is in progress. See [Stopping Analytics data collection](#).
- b. Verify that subsystem is in **Running** state.

```
kubectl get AnalyticsCluster -n <namespace>
```

c. Edit the Analytics CR:

```
kubectl edit AnalyticsCluster -n <namespace>
```

Change `spec.profile` value to the new profile you want to use.

- d. When switching from development profile to a production profile, wait for the microservice to scale up. When switching from a production profile to a development profile, wait for the microservice to scale down.
- e. Verify that subsystem is in **Running** state.

```
kubectl get AnalyticsCluster -n <namespace>
```

- f. Restart analytics data collection as explained in the topic, [Restarting Analytics pods and data collection](#).

4. Gateway subsystem

- a. Verify that subsystem is in **Running** state.

```
kubectl get GatewayCluster -n <namespace>
```

b. Edit the CR:

```
kubectl edit GatewayCluster -n <namespace>
```

Change `spec.profile` value to the new profile you want to use.

- c. When switching from development profile to a production profile, wait for the microservice to scale up. When switching from a production profile to a development profile, wait for the microservice to scale down.
- d. Verify that subsystem is in **Running** state.

```
kubectl get GatewayCluster -n <namespace>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Changing deployment profiles on OpenShift

You can change an API Connect installation to use different deployment profiles.

### Before you begin

This task assumes that you have already deployed an API Connect cluster as explained in [Deploying on OpenShift and Cloud Pak for Integration](#). If you are changing from a development profile to a production profile, ensure that you have production profile hardware (3 nodes) available.

### About this task

Important considerations:

- While it is possible to use a non-production profile installation in a production deployment, it is not recommended.
- Based on the resources configured for each microservice in the profile, there might be downtime during the profile change.
- For a list of supported profiles, see the "Deployment profiles" section in [Basic configuration settings](#).
- If you enabled the analytics message queue feature, you must disable it before changing to another deployment profile. You can re-enable the message queue feature after the profile change is complete.

To disable the message queue:

1. Edit the top-level `APIConnectCluster` CR.
2. In the `spec.analytics` section, locate the `mq` subsection and change the `enabled` setting to `false`.

```
spec:
  analytics:
    mq:
      enabled: false
```

3. Save and apply the change.

To re-enable the message queue:

1. Edit the top-level `APIConnectCluster` CR.
2. In the `spec.analytics` section, locate the `mq` subsection and change the `enabled` setting to `true`.

3. Save and apply the change.

## Procedure

1. Verify that the API Connect cluster is in the **Ready** state by running the following command:

```
oc get apiconnectcluster -n <APIC_namespace>
```

2. Update the API Connect Cluster CR:

- a. Open the API Connect Cluster CR in edit mode by running the following command:

```
oc edit apiconnectcluster <APIC-instance-name> -n <APIC_namespace>
```

- b. In the CR, change the `spec.profile` value to the profile that you want to use.

For example, to switch from the development profile to the production profile, change `n3xc4.m16` to `n12xc4.m12`.

- c. Save the change by running the following command: `:wq`

3. Wait for microservice to scale up, or scale down, as needed.

4. Verify that the API Connect cluster is in the **Ready** state by running the following command:

```
oc get apiconnectcluster -n <APIC_namespace>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Replica override for microservices

Modify the replica count for microservices by using template overrides for Custom Resources.

When API Connect is deployed, the deployment profile you select drives the number of replicas to be used for most deployment. For development profiles, typically specified by `n1x...`, the replica count is 1. For production profiles, typically specified by `n3x...`, replica count is 3. Note, however, that for Cloud Pak for Integration the API Connect Cluster profile `n3xc4.m16` replica count is 1.

You can override the replica count for individual deployments by using template overrides.

- Template overrides are a piece of yaml that should be added to the Kubernetes custom resource. The examples provided in this topic show only that the `template:` element should be under the main `spec:` element of a CR. The rest of the CR is not shown.
- Specification of microservice overrides in CP4I requires prefixing the microservice name with a designator for the subsystem type, as follows:
  - Management subsystem: `mgmt-`
  - Gateway: `gw-`
  - Analytics: `a7s-`

For example, for the `apim` Management microservice, use `apim` when defining the override for OpenShift (or Kubernetes), but use `mgmt-apim` for a CP4I override.

## Management subsystem

For a Management CR in Kubernetes or OpenShift, the following override specifies 5 replicas for the `apim` deployment:

```
spec:
  template:
    - name: apim
      replicaCount: 5
```

You can also configure replicate count through a similar template override for:

- `juhu`
- `ldap`
- `lur`

The same override for CP4I:

```
spec:
  template:
    - name: mgmt-apim
      replicaCount: 5
```

On CP4I, you can also configure replicate count through a similar template override for:

- `mgmt-juhu`
- `mgmt-ldap`
- `mgmt-lur`

## Gateway subsystem

The following override is supported for a Gateway CR in Kubernetes or OpenShift:

```
spec:
  template:
    - name: datapower
      replicaCount: 5
```

The same override for CP4I:

```
spec:
  template:
  - name: gw-datapower
    replicaCount: 5
```

## Analytics subsystem

---

The Analytics microservices that can be scaled using template override are:

- `client`
- `ingestion`
- `mq-kafka`
- `mq-zk`
- `mtls-gw`
- `storage-coord`
- `storage-data`
- `storage-master`

Note that this microservice cannot be scaled below 2 replicas when using a 3 node (production) deployment profile. Also, when using this **unique** storage type, you must have at least 1 replica available for the 3 storage roles (coord, data and master).

- `storage-shared`

On CP4I, you can also configure replicate count through a similar template override for:

- `a7s-client`
- `a7s-ingestion`
- `a7s-mq-kafka`
- `a7s-mq-zk`
- `a7s-mtls-gw`
- `a7s-storage-coord`
- `a7s-storage-data`
- `a7s-storage-master`

Note that this microservice cannot be scaled below 2 replicas when using a 3 node (production) deployment profile. Also, when using this **unique** storage type, you must have at least 1 replica available for the 3 storage roles (coord, data and master).

- `a7s-storage-shared`

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Changing the deployment profile on Cloud Pak for Integration

You can change an API Connect installation to use a different deployment profile.

### Before you begin

---

This task assumes that you have already deployed an API Connect cluster as explained in [Deploying on OpenShift and Cloud Pak for Integration](#). If you are switching from a development profile to a production profile, ensure that you have production profile hardware (3 nodes) available.

### About this task

---

Important considerations:

- While it is possible to use a development profile installation in a production deployment, it is not recommended.
- Based on the resources configured for each microservice in the profile, there might be downtime during the profile change.
- Supported profiles:
  - Development: n3xc4.m16
  - Production: n12xc4.m12
- If you enabled the analytics message queue feature, you must disable it before changing to another deployment profile. You can re-enable the message queue feature after the profile change is complete.

To disable the message queue:

1. In the Cloud Pak Automation UI, click the overflow menu next to the API Connect capability and select Edit.
2. Click the YAML tab to edit the top-level `APIConnectCluster` CR.
3. In the `spec.analytics` section, locate the `mq` subsection and change the `enabled` setting to `false`.

```
spec:
  analytics:
    mq:
      enabled: false
```

4. Click Update to save and apply the change.

To re-enable the message queue:

1. In the Cloud Pak Automation UI, click the overflow menu next to the API Connect capability and select Edit.

2. Click the YAML tab to edit the top-level `APIConnectCluster` CR.
3. In the `spec.analytics` section, locate the `mq` subsection and change the `enabled` setting to `true`.
4. Click Update to save and apply the change.

## Procedure

1. Verify that the API Connect cluster is in the **Ready** state.  
Open the IBM Cloud Pak Platform UI, locate the API Management capability on the Integration instances tab, and verify that the state displays as **Ready**. Leave the page open for the next step.
2. Update the API Management instance:
  - a. In the Platform UI, click the overflow menu next to the instance and select Edit.
  - b. In the Details section of the deployment pages, navigate to the Deployment profile field.
  - c. Click the field and select the new deployment profile.  
For example, to switch from the development profile to the production profile, `n12xc4.m12`.
3. Click Update to save the change.
4. Wait for microservice to scale up, or scale down, as needed.
5. Verify that the status for the API Management instance displays as **Ready**.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Enabling UI feature flags on Kubernetes

Use a template override to update the installation CR with settings that control UI features.

### About this task

You can add a template override to the Management subsystem CR and use it to control whether specific features are available in the UI. Some features can be optionally disabled by users (by disabling them in the browser) provided you have enabled the feature for the cluster as a whole. Table 1 describes the available feature flags.

Table 1. Flags and settings for controlling UI features

Feature ID	Default Value	Partial Override For	Description
<code>ffAdvancedPublish</code>	<code>true</code>		Enable advanced publish option (deprecated)
<code>allOmniSearch</code>	<code>true</code>		Enables OmniSearch for all lists. This flag is used in conjunction with other flags.
<code>draftsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for drafts list
<code>catalogProductsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for catalog
<code>orgsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for org lists
<code>appsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for apps
<code>subscriptionsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for subscriptions, if disabled, subscription lists will be removed from catalog list
<code>requestedApprovalsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for requested approvals
<code>approvalTasksOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for approvals
<code>productApisOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for apis within products
<code>membersOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for member lists

## Procedure

1. If you already deployed API Connect, retrieve the name of the deployed CR for the Management subsystem by running the following command:

```
kubectl get managementcluster -n <management_namespace>
```

If you did not deploy API Connect yet, skip this step.

2. Edit the `management` CR by running the following command:

```
kubectl edit managementcluster <management-cr-name> -n <management_namespace>
```

3. In the editor, append the feature-flag definition to the end of the `spec:` section, making sure to adhere to the spacing used in the file. The following example enables the OmniSearch feature on all possible UI pages.

```
spec:
  template:
    - name: ui
      containers:
        - name: ui
          env:
            - name: APIC_UI_FEATURES
              value: allOmniSearch=always
```

**APIC\_UI\_FEATURES** is a URL-encoded string. Each parameter is formed as `featureId=$featureValue`, and you can list multiple parameters with the `&` delimiter (`featureId=$featureValue&featureId=$featureValue`).

Use the `featureId` values from Table 1. For each feature, specify one of the following `featureValue` settings:

- **true** - On by default, but can be overridden by the user, for their browser alone
- **false** - Off by default, but can be overridden by the user, for their browser alone
- **never** - Off regardless of browser setting, disabled in feature flag page
- **always** - On regardless of browser setting, disabled in feature flag page

4. Save the update.

The cluster is updated to enable or disable features as specified.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Enabling UI feature flags on OpenShift and Cloud Pak for Integration

Use a template override to update the installation CR with settings that control UI features.

### About this task

You can add a template override to the Management subsystem CR and use it to control whether specific features are available in the UI. Some features can be optionally disabled by users (by disabling them in the browser) provided you have enabled the feature for the cluster as a whole. Table 1 describes the available feature flags.

Table 1. Flags and settings for controlling UI features

Feature ID	Default Value	Partial Override For	Description
<code>ffAdvancedPublish</code>	<code>true</code>		Enable advanced publish option (deprecated)
<code>allOmniSearch</code>	<code>true</code>		Enables OmniSearch for all lists. This flag is used in conjunction with other flags.
<code>draftsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for drafts list
<code>catalogProductsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for catalog
<code>orgsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for org lists
<code>appsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for apps
<code>subscriptionsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for subscriptions, if disabled, subscription lists will be removed from catalog list
<code>requestedApprovalsOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for requested approvals
<code>approvalTasksOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for approvals
<code>productApisOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for apis within products
<code>membersOmniSearch</code>	<code>true</code>	<code>allOmniSearch</code>	Enable OmniSearch for member lists

### Procedure

1. If you already deployed API Connect, retrieve the name of the deployed CR by running the following command:

```
oc get apiconnectcluster -n <APIC_namespace>
```

If you did not deploy API Connect yet, skip this step.

2. Edit the `apiconnectcluster` CR by running the following command:

```
oc edit apiconnectcluster <APIC_instance_name> -n <APIC_namespace>
```

3. In the CR, append the feature-flag definition to the end of the `spec.management` section, making sure to adhere to the spacing used in the file. The following example enables the OmniSearch feature on all possible UI pages.

```
spec:
  management:
    template:
      - name: ui
        containers:
          - name: ui
            env:
              - name: APIC_UI_FEATURES
                value: allOmniSearch=always
```

**APIC\_UI\_FEATURES** is a URL-encoded string. Each parameter is formed as `featureId=$featureValue`, and you can list multiple parameters with the `&` delimiter (`featureId=$featureValue&featureId=$featureValue`).

Use the `featureId` values from Table 1. For each feature, specify one of the following `featureValue` settings:

- **true** - On by default, but can be overridden by the user, for their browser alone
- **false** - Off by default, but can be overridden by the user, for their browser alone
- **never** - Off regardless of browser setting, disabled in feature flag page
- **always** - On regardless of browser setting, disabled in feature flag page

4. Close and save the file with the following command:

:wq

The cluster is updated to enable or disable features as specified.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing a two data center deployment

Additional installation instructions explaining how to deploy a two data center disaster recovery (DR) deployment on Kubernetes and OpenShift.

### Before you begin

Ensure that you understand the concepts of two data center disaster recovery in API Connect. For more information, see [A two data center deployment strategy on Kubernetes and OpenShift](#).

You must download the operator files and custom resource definitions for use during installation onto both of your data centers. Ensure that you complete the instructions for [Deploying operators](#).

Familiarize yourself with the instructions in [Installing the API Connect subsystems](#). You will need to complete these instructions in conjunction with the additional steps in this topic that are specific to installing a two data center disaster recovery deployment.

### About this task

Installing API Connect as a two data center disaster recovery deployment is very similar to a single installation, as the deployment in each data center is effectively an instance of the same API Connect deployment. The following endpoints must be the same on both data centers:

Management subsystem endpoints

- `cloudManagerEndpoint`
- `apiManagerEndpoint`
- `platformAPIEndpoint`
- `consumerAPIEndpoint`

Portal subsystem endpoints

- `portalAdminEndpoint`
- `portalUIEndpoint`

For more information about how to set the endpoints, see [Installing the Management subsystem cluster](#) on Kubernetes, [Installing the Developer Portal subsystem](#) on Kubernetes, or [Deploying on OpenShift and Cloud Pak for Integration](#).

The main difference is that the custom resource (CR) files for both the Management subsystem and the Developer Portal subsystem on each data center must include a `multiSiteHA` configuration section, and it's this section that determines the two data center DR deployment. It's also this section that's used to control the deployment in the future, for example in failover and recovery situations.

The following codeblocks show examples of completed `multiSiteHA` sections in the `PortalCluster` CR files for two data centers, one *active* and one *passive*. Both the `ManagementCluster` and the `PortalCluster` CR templates have a `multiSiteHA` section containing the placeholder `$MULTI_SITE_HA`, and it is this placeholder that must be replaced with the values for your deployment.

<pre>siteName: dallas multiSiteHA:   mode: active   replicationEndpoint:     annotations:       cert-manager.io/issuer: ingress-issuer   hosts:     - name: ptlreplicationdallas.cluster1.example.com       secretName: dallas-ptl-replication-worker-1   replicationPeerFQDN:     ptlreplicationraleigh.cluster2.example.com   tlsClient:     secretName: ptl-replication-client ...</pre>	<pre>siteName: raleigh multiSiteHA:   mode: passive   replicationEndpoint:     annotations:       cert-manager.io/issuer: ingress-issuer   hosts:     - name: ptlreplicationraleigh.cluster2.example.com       secretName: raleigh-ptl-replication-worker-1   replicationPeerFQDN:     ptlreplicationdallas.cluster1.example.com   tlsClient:     secretName: ptl-replication-client ...</pre>
---	--

The configuration properties are described in the following table.

Table 1. The configuration properties of the multi-site HA section in the CR file

Configuration property	Description
<code>mode</code>	The state of the data center in the context of the two data center deployment. Valid values are: <ul style="list-style-type: none"><li>• <code>active</code> - indicates the primary data center</li><li>• <code>passive</code> - indicates the standby data center</li></ul>
<code>replicationEndpoint</code> <code>annotations:</code> <code>cert-manager.io/issuer:</code> <code>ingress-issuer</code> <code>hosts:</code> <code>- name:</code> <code>secretName:</code>	Contains details of the external ingress name for the subsystem in the current data center in the two data center deployment. The hosts <code>name</code> is a unique fully qualified hostname that the other data center uses to communicate with the current data center.

Configuration property	Description
<code>replicationPeerFQDN</code>	The ingress hostname for the other data center in the two data center deployment. This information is required so that the two data centers can communicate with each other.
<code>tlsClient:</code> <code>secretName</code>	The TLS client secret for the subsystem.

The `siteName` property is a unique descriptive name for the Portal subsystem, and the Management subsystem, in each data center, for example `dallas` on data center 1, and `raleigh` on data center 2. You must set different a `siteName` on the active data center, to the one set on the passive data center. This name is used in the hostnames, and so can contain only `a-z` and `0-9` characters. Note that you can set a `siteName` in the `ManagementCluster` or `PortalCluster` CR only when the subsystems are first deployed, and you cannot change the name after deployment. If you don't set a `siteName` at first deployment, an automated `siteName` is created for you. For example, if you are converting an existing single Management cluster to a two data center Management cluster by adding the multi-site HA values, you will not be able to configure a `siteName` for the existing Management cluster.

To install a two data center disaster recovery deployment, you must set all of the placeholder properties in the CR file for both the Management and the Developer Portal subsystems as detailed in the relevant topics in the [Installing the API Connect subsystems](#) section, as well as the properties in the multi-site HA section that are detailed here. Some examples of complete CR files are shown in the [Example](#) section.

See the following instructions for information about how to configure a two data center DR deployment:

- [Installing to an active data center](#)
- [Installing to a passive data center](#)
- [Validating your two data center deployment](#)

## Procedure

### • Installing to an active data center

The following example shows how to set the multi-site HA CR values for deploying to an active data center (DC). In this instance, we are deploying to a local data center called `dallas` (DC1) that has a remote data center called `raleigh` (DC2).

1. Set Dallas to be active for the API Manager service on DC1.  
Edit the `ManagementCluster` CR file `management_cr` for DC1, and set the multi-site HA section properties, for example:

```
siteName: dallas
multiSiteHA:
  mode: active
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: mgrreplicationdallas.cluster1.example.com
        secretName: dcl-mgmt-replication
  replicationPeerFQDN: mgrreplicationraleigh.cluster2.example.com
  tlsClient:
    secretName: dcl-mgmt-replication-client
```

2. Set Dallas to be active for the Developer Portal service on DC1.  
Edit the `PortalCluster` CR file `portal_cr` for DC1, and set the multi-site HA section properties, for example:

```
multiSiteHA:
  mode: active
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: ptlreplicationdallas.cluster1.example.com
        secretName: dallas-ptl-replication-worker-1
  replicationPeerFQDN: ptlreplicationraleigh.cluster2.example.com
  tlsClient:
    secretName: ptl-replication-client
...
siteName: dallas
```

3. Create a secret called `ptl-encryption-key` on the active and passive data centers.  
You must create a secret on the active and passive sites that use the same random string, run the following command:

```
kubectl create secret generic ptl-encryption-key --from-literal=encryption_secret=<RANDOM STRING> -n <namespace>
```

The string can consist of uppercase letters, lowercase letters, and numbers, and must be at least 64 characters and no more than 100 characters.

4. When the secrets are created on both DC1 and DC2, update the Portal CR on DC1 and DC2 to include in the `spec` object:

```
encryptionSecret:
  secretName: ptl-encryption-key
```

Warning: Ensure that you add the secret to the `spec` object and not to the `multiSiteHA` object.

5. Create a secret called `mgmt-encryption-key` on the active and passive data centers.  
You must create a secret on the active and passive sites that use the same random string, run the following command:  
Note: You must not use the same random string that you used to create the secret for `ptl-encryption-key`.

```
kubectl create secret generic mgmt-encryption-key --from-literal=encryption_secret.bin=<RANDOM STRING> -n <namespace>
```

The string can consist of uppercase letters, lowercase letters, and numbers, and must be at least 64 characters and no more than 100 characters.

6. When the secrets are created on both DC1 and DC2, update the Management CR on DC1 and DC2 to include in the `spec` object:

```
encryptionSecret:
  secretName: mgmt-encryption-key
```

Warning: Ensure that you add the secret to the `spec` object and not to the `multiSiteHA` object.

7. Apply the CR files to the subsystems in DC1.

For example, to apply the `ManagementCluster` CR file to the DC1 cluster, run the following command:

```
kubectl apply -f management_cr.yaml -n <namespace>
```

Where `<namespace>` is the target installation namespace in the Kubernetes cluster for DC1. Repeat this process to apply the updated `PortalCluster` CR file to DC1.

You can verify that the updated CR files have been applied by running the following command:

```
kubectl get ManagementCluster -n <namespace>
```

Change `ManagementCluster` to `PortalCluster` to verify the Developer Portal installation. For more information, see [Installing the API Connect subsystems](#).

8. Set your dynamic router to direct all traffic to DC1.

This includes setting the four endpoints for the API Manager cluster, and the two endpoints for the Developer Portal cluster.

- **Installing to a passive data center**

The following example shows how to set the multi-site HA CR values for the remote data center called `raleigh` (DC2), which is being installed as the passive, standby location. You must use the same encryption key on both sites.

Ensure that the installation of the active data center is complete before you start the installation of the passive data center.

1. Set Raleigh to be passive for the API Manager service on DC2.

Edit the `ManagementCluster` CR file `management_cr` for DC2, and set the multi-site HA section properties, for example:

```
multiSiteHA:
  mode: passive
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: mgrreplicationraleigh.cluster2.example.com
        secretName: raleigh-mgr-replication-worker-1
  replicationPeerFQDN: mgrreplicationdallas.cluster1.example.com
  tlsClient:
    secretName: mgr-replication-client
  ...
siteName: raleigh
```

2. Set Raleigh to be passive for the Developer Portal service on DC2.

Edit the `PortalCluster` CR file `portal_cr` for DC2, and set the multi-site HA section properties, for example:

```
multiSiteHA:
  mode: passive
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: ptlreplicationraleigh.cluster2.example.com
        secretName: raleigh-ptl-replication-worker-1
  replicationPeerFQDN: ptlreplicationdallas.cluster1.example.com
  tlsClient:
    secretName: ptl-replication-client
  ...
siteName: raleigh
```

3. Ensure that you completed the steps that are in the **Installing to an active data center** section to create a secret called `ptl-encryption-key` on DC1 and DC2, and to update the Portal CR on DC1 and DC2 to include the `ptl-encryption-key` in the `spec` object.

4. Apply the CR files to the subsystems in DC2.

For example, to apply the `ManagementCluster` CR file to the DC2 cluster, run the following command:

```
kubectl apply -f management_cr.yaml -n <namespace>
```

Where `<namespace>` is the target installation namespace in the Kubernetes cluster for DC2. Repeat this process to apply the updated `PortalCluster` CR file to DC2.

You can verify that the updated CR files are applied by running the following command:

```
kubectl get ManagementCluster -n <namespace>
```

Change `ManagementCluster` to `PortalCluster` to verify the Developer Portal installation. For more information, see [Installing the API Connect subsystems](#).

- **Validating your two data center deployment**

To validate that your two data center deployment is working, execute a test failover, and confirm that all of the expected data is present and correct on the newly active site. See [Failure handling of a two data center deployment](#) for details.

## Example

Example of a `ManagementCluster` CR file for an active data center:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementCluster
metadata:
  name: management
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "management"
  }
spec:
  siteName: dc1
  multiSiteHA:
```

```

mode: passive
replicationEndpoint:
  hosts:
    - name: mgrreplicationfrankfurt.apic-2ha-frankfur-683198-xxxxxxx950db7077951d4-0000.eu-de.containers.appdomain.cloud
      secretName: dc1-mgmt-replication
  replicationPeerFQDN: mgrreplicationdallas.apic-2ha-dallas-xxxxxxx950db7077951d4-0000.us-south.containers.appdomain.cloud
  tlsClient:
    secretName: dc1-mgmt-replication-client
version: 10.0.1.0
imagePullSecrets:
- apic-registry-secret
imageRegistry: apic-dev-docker-local.artifactory.swg-devops.com

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Converting a single data center to a two data center deployment

Instructions on how to convert a single data center to a two data center disaster recovery (DR) deployment on Kubernetes and OpenShift.

## Before you begin

Ensure that you understand the concepts of two data center disaster recovery in API Connect. For more information, see [A two data center deployment strategy on Kubernetes and OpenShift](#).

You must download the operator files and custom resource definitions for use during installation onto both of your data centers; complete [Deploying operators](#).

Familiarize yourself with the instructions in [Installing the API Connect subsystems](#). You will need to complete these instructions in conjunction with the additional steps in this topic that are specific to installing a two data center disaster recovery deployment.

## About this task

You can convert a single data center API Connect to a two data center disaster recovery deployment. Both data centers must have the same `portal-admin` and `portal-www` endpoints. The main difference is that the custom resource (CR) files for both the Management subsystem and the Developer Portal subsystem on each data center must include a `multiSiteHA` configuration section, and it's this section that determines the two data center DR deployment. It's also this section that's used to control the deployment in the future, for example in failover and recovery situations.

The following codeblocks show examples of completed `multiSiteHA` sections in the `PortalCluster` CR files for two data centers, one *active* and one *passive*. Both the `ManagementCluster` and the `PortalCluster` CR templates have a `multiSiteHA` section containing the placeholder `$MULTI_SITE_HA`, and it is this placeholder that must be replaced with the values for your deployment.

<pre>siteName: dallas multiSiteHA:   mode: active   replicationEndpoint:     annotations:       cert-manager.io/issuer: ingress-issuer   hosts:     - name: ptlreplicationdallas.cluster1.example.com       secretName: dallas-ptl-replication-worker-1   replicationPeerFQDN:     ptlreplicationraleigh.cluster2.example.com   tlsClient:     secretName: ptl-replication-client   ...</pre>	<pre>siteName: raleigh multiSiteHA:   mode: passive   replicationEndpoint:     annotations:       cert-manager.io/issuer: ingress-issuer   hosts:     - name: ptlreplicationraleigh.cluster2.example.com       secretName: raleigh-ptl-replication-worker-1   replicationPeerFQDN:     ptlreplicationdallas.cluster1.example.com   tlsClient:     secretName: ptl-replication-client   ...</pre>
---	--

The configuration properties are described in the following table.

Table 1. The configuration properties of the multi-site HA section in the CR file

Configuration property	Description
<code>mode</code>	<p>The state of the data center in the context of the two data center deployment. Valid values are:</p> <ul style="list-style-type: none"> <li>• <b>active</b> - indicates the primary data center</li> <li>• <b>passive</b> - indicates the standby data center</li> </ul>

Configuration property	Description
<code>replicationEndpoint</code>  <code>annotations:</code> <code>cert-manager.io/issuer</code> <code>hosts:</code> <code>- name:</code>  <code>secretName:</code>	Contains details of the external ingress name for the subsystem in the current data center in the two data center deployment. The hosts <code>name</code> is a unique fully qualified hostname that the other data center uses to communicate with the current data center.
<code>replicationPeerFQDN</code>	The ingress hostname for the other data center in the two data center deployment. This information is required so that the two data centers can communicate with each other.
<code>tlsClientSecretName</code>	The TLS client secret for the subsystem.
<code>siteName</code>	A descriptive name for the Portal subsystem, and the Management subsystem, in the current data center, for example <code>dallas</code> . This name is used in the hostnames, and so can contain only <code>a-z</code> and <code>0-9</code> characters. Note that you can set a <code>siteName</code> in the <code>ManagementCluster</code> or <code>PortalCluster</code> CR only when the subsystems are first deployed, and you cannot change the name after deployment. If you don't set a <code>siteName</code> at first deployment, an automated <code>siteName</code> is created for you. For example, if you are converting an existing single Management cluster to a two data center Management cluster by adding the multi-site HA values, you will not be able to configure a <code>siteName</code> for the existing Management cluster.

To install a two data center disaster recovery deployment, you must set all of the placeholder properties in the CR file for both the Management and the Developer Portal subsystems as detailed in the relevant topics in the [Installing the API Connect subsystems](#) section, as well as the properties in the multi-site HA section that are detailed here. Some examples of complete CR files are shown in the [Example](#) section.

## Procedure

- **Converting a single data center deployment to two data centers**

When converting a single data center deployment into a two data center deployment, it is best practice to use the existing data center as the active one, and add a new passive data center elsewhere. This practice ensures that the data is retained.

Remember:

- Both data centers must have the same `portal-admin` and `portal-www` endpoints.
- You cannot configure a `siteName` for the existing Management or Portal cluster because the `siteName` property can be configured only at first deployment.

The following example shows how to update the multi-site HA CR values for making the local data center called `dallas` (DC1) active, and for setting the new remote data center called `raleigh` (DC2) as passive.

- Install a cert-manager.

Use of a certificate manager adds convenience to the generation and management of certificate, but is not required. Whenever a custom resource (CR) takes a certificate secret name as input, you can point to any secret name, on condition that the secret exists before you deploy the CR, and that the secret contains relevant certificate data. Typically, this is `tls.crt`, `tls.key`, and `ca.crt` files. See [Certificates in a Kubernetes environment](#).

Note: For deployments to IBM Kubernetes Service (IKS) there are other requirements. For more information, see [Generating custom certificates using cert-manager in a two data center deployment](#).

Note: Run these steps on DC1 only if you don't already have cert-manager running.

1. Obtain the certificate manager.

API Connect v10 uses cert-manager v1.5.1 of cert-manager, which is a native [Kubernetes](#) certificate management controller.

You can obtain cert-manager v1.5.1 from the API Connect v10 distribution `helper_files.zip` archive, or from <https://github.com/jetstack/cert-manager>.

Note: Cert-manager is bundled as a common service in IBM CloudPack for Integration.

2. Apply the CR:

```
kubectl apply -f cert-manager-1.5.1.yaml
```

Do not specify a custom namespace.

See <https://docs.cert-manager.io/en/release-0.10/getting-started/install/kubernetes.html>.

3. Wait for `cert-manager` pods to enter `Running` 1/1 status before proceeding. To check the status:

```
kubectl get po -n cert-manager
```

There are 3 `cert-manager` pods in total.

- Use the following steps to allow `ingress-ca` secrets to be the same on both data centers.

1. On DC1 apply the file `ingress-issuer-v1-dc1.yaml`:

```
kubectl -n <namespace> apply -f ingress-issuer-v1-dc1.yaml
```

2. Validate that the command succeeded:

```
kubectl get certificates -n <namespace>
```

3. Export `ingress-ca` secret as a yaml from DC1:

```
kubectl -n <namespace> get secret ingress-ca -o yaml > ingress-ca.yaml
```

4. Edit the `ingress-ca.yaml` file to remove all labels, annotations, `creationTimestamp`, `resourceVersion`, `uid`, and `selfLink`.

5. Copy the `ingress-ca.yaml` from DC1 to DC2 and apply that file on DC2:

```
kubectl -n <namespace> apply -f ingress-ca.yaml
```

6. On DC2 apply the file `ingress-issuer-v1-dc2.yaml`:

```
kubectl -n <namespace> apply -f ingress-issuer-v1-dc2.yaml
```

7. Use the following commands to test that they are the same, on DC1 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc1
```

8. On DC2 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc2
```

9. To see the differences run:

```
diff /tmp/ingress.pem.dc1 /tmp/ingress.pem.dc2
```

The files should be the same.

10. To ensure that the certificates are working correctly and that they are using the `ingress-ca` secret. First, get the `portal-admin-client` crt file:

```
kubectl -n <namespace> get secrets portal-admin-client -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/admin-client.crt
```

11. Test that it is working by using OpenSSL:

```
openssl verify -verbose -CAfile /tmp/ingress.pem.dc1 /tmp/admin-client.crt
```

If it is working, you should see:

```
/tmp/admin-client.crt: OK
```

#### • Installing to an active data center

The following example shows how to set the multi-site HA CR values for deploying to an active data center (DC). In this instance, we are deploying to a local data center called `dallas` (DC1) that has a remote data center called `raleigh` (DC2).

1. Set Dallas to be active for the API Manager service on DC1.

As the API Manager service already exists, you cannot set the `siteName` property. Add the multi-site HA section properties to the existing `ManagementCluster` CR file for DC1. For example:

```
multiSiteHA:
  mode: active
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: mgrreplicationdallas.cluster1.example.com
        secretName: dcl-mgmt-replication
  replicationPeerFQDN: mgrreplicationraleigh.cluster2.example.com
  tlsClient:
    secretName: dcl-mgmt-replication-client
```

2. Set Dallas to be active for the Developer Portal service on DC1.

As the Developer Portal service already exists, you cannot set the `siteName` property. Add the multi-site HA section properties to the existing `PortalCluster` CR file for DC1. For example:

```
multiSiteHA:
  mode: active
  replicationEndpoint:
    annotations:
      cert-manage.io/issuer: ingress-issuer
    hosts:
      - name: ptlreplicationdallas.cluster1.example.com
        secretName: dallas-ptl-replication-worker-1
  replicationPeerFQDN: ptlreplicationraleigh.cluster2.example.com
  tlsClient:
    secretName: ptl-replication-client
```

3. Create a secret called `ptl-encryption-key` on the active and passive data centers.

You must create a secret on the active and passive sites that use the same random string, run the following command:

```
kubectl create secret generic ptl-encryption-key --from-literal=encryption_secret=<RANDOM STRING> -n <namespace>
```

The string can consist of uppercase letters, lowercase letters, and numbers, and must be at least 64 characters and no more than 100 characters.

4. When the secrets are created on both DC1 and DC2, update the Portal CR on DC1 and DC2 to include in the `spec` object:

```
encryptionSecret:
  secretName: ptl-encryption-key
```

Warning: Ensure that you add the secret to the `spec` object and not to the `multiSiteHA` object.

5. Apply the CR files to the subsystems in DC1.

For example, to apply the `ManagementCluster` CR file to the DC1 cluster, run the following command:

```
kubectl apply -f management_cr.yaml -n <namespace>
```

Where `<namespace>` is the target installation namespace in the Kubernetes cluster for DC1. Repeat this process to apply the updated `PortalCluster` CR file to DC1.

You can verify that the updated CR files have been applied by running the following command:

```
kubectl get ManagementCluster -n <namespace>
```

Change `ManagementCluster` to `PortalCluster` to verify the Developer Portal installation. For more information, see [Installing the API Connect subsystems](#).

6. Set your dynamic router to direct all traffic to DC1.

This includes setting the four endpoints for the API Manager cluster, and the two endpoints for the Developer Portal cluster.

- **Installing to a passive data center**

The following example shows how to set the multi-site HA CR values for the remote data center called **raleigh** (DC2), which is being installed as the passive, standby location. You must use the same encryption key on both sites.

1. Get the encryption key from Dallas the **active** (DC1) site:

- a. Run the command `kubect1 get mgmt -o yaml | grep enc` to get the db encryption key on the **active** site, for example:

```
$ kubect1 -n <namespace> get mgmt -o yaml | grep enc
```

An example of possible output:

```
encryptionSecret: dallas-enc-key
```

Make a note of the secret name. In this case, it's **dallas-enc-key**.

- b. Run `kubect1 get secret dallas-enc-key -o yaml`, an example of possible output:

```
apiVersion: v1
data:
  encryption_secret.bin:
VKBNFj7sAOizxvE1H6i+9P31oJHvWwsO+x*****EGe/K+x6b3D7FEWGgoyG1WBUJKB4+T21My2iR5rBTov
pyLiY5g*****tSiRcQKegMPNBPg1829SVBCxuv3I=
kind: Secret
metadata:
  creationTimestamp: "2020-08-28T12:53:41Z"
  labels:
    app.kubernetes.io/instance: m1
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: dallas-enc-key
  name: dallas-enc-key
  namespace: default
  resourceVersion: "43039"
  selflink: /api/v1/namespaces/default/secrets/m1-enc-key
  uid: 46c92395-9cc2-4421-b2c4-48e472c0cbb1
type: Opaque
```

- c. Copy the output that you got and put it into a new file. Delete the contents of **metadata**: and add back in a **name**: attribute, in this case **dc1-enc-key**. An example of the format is here:

```
apiVersion: v1
data:
  encryption_secret.bin:
VKBNFj7sAOizxvE1H6i+9P31oJHvWwsO+x*****EGe/K+x6b3D7FEWGgoyG1WBUJKB4+T21My2iR5rBTov
pyLiY5g*****tSiRcQKegMPNBPg1829SVBCxuv3I=
kind: Secret
metadata:
  name: dc1-enc-key
type: Opaque
```

- d. Save the file. In this example, it's called **dc1-enc-key.yaml**.

2. On Raleigh the (DC2) site:

- a. Copy the yaml file that you just saved that contains the **encryption\_secret.bin** from Dallas the **active** (DC1) site.

- b. Run `kubect1 create -f dc1-enc-key.yaml` to create the same secret with the same key on the Raleigh (DC2) site. For example:

```
$ kubect1 -n <namespace> create -f /tmp/dc1-enc-key.yaml
```

An example of possible output:

```
secret/dc1-enc-key created
```

- c. In the management CR for Raleigh the (DC2) site, add the following entry to the **spec**.

```
encryptionSecret:
  secretName: dc1-enc-key
```

3. Set Raleigh to be passive for the API Manager service on DC2.

Edit the **ManagementCluster** CR file `management_cr` for DC2, and set the multi-site HA section properties, for example:

```
multiSiteHA:
  mode: passive
  replicationEndpoint:
    annotations:
      cert-manage.io/issuer: ingress-issuer
    hosts:
      - name: mgrreplicationraleigh.cluster2.example.com
        secretName: raleigh-mgr-replication-worker-1
  replicationPeerFQDN: mgrreplicationdallas.cluster1.example.com
  tlsClient:
    secretName: mgr-replication-client
...
siteName: raleigh
```

4. Set Raleigh to be passive for the Developer Portal service on DC2.

Edit the **PortalCluster** CR file `portal_cr` for DC2, and set the multi-site HA section properties, for example:

```
multiSiteHA:
  mode: passive
  replicationEndpoint:
    annotations:
      cert-manage.io/issuer: ingress-issuer
    hosts:
      - name: ptlreplicationraleigh.cluster2.example.com
        secretName: raleigh-ptl-replication-worker-1
  replicationPeerFQDN: ptlreplicationdallas.cluster1.example.com
  tlsClient:
```

```
secretName: ptl-replication-client
...
siteName: raleigh
```

5. Ensure that you completed the steps that are in the **Installing to an active data center** section to create a secret called `ptl-encryption-key` on DC1 and DC2, and to update the Portal CR on DC1 and DC2 to include the `ptl-encryption-key` in the `spec` object.
6. Apply the CR files to the subsystems in DC2.

For example, to apply the `ManagementCluster` CR file to the DC2 cluster, run the following command:

```
kubectl apply -f management_cr.yaml -n <namespace>
```

Where `<namespace>` is the target installation namespace in the Kubernetes cluster for DC2. Repeat this process to apply the updated `PortalCluster` CR file to DC2.

You can verify that the updated CR files are applied by running the following command:

```
kubectl get ManagementCluster -n <namespace>
```

Change `ManagementCluster` to `PortalCluster` to verify the Developer Portal installation. For more information, see [Installing the API Connect subsystems](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Advanced configuration for the management subsystem

---

Specify advanced configuration for the management subsystem.

See:

- [Configuring maximum size of client requests to the Management subsystem](#)  
You can configure the maximum allowed size of the client request body for requests made to the Management subsystem.
- [Setting rate limits for public APIs on the management service for a Kubernetes environment](#)  
Describes the procedure for setting a rate limit for public APIs on the management service. Rate limits provide protection from DDoS (distributed denial of service) attacks.
- [Configuring monetization on Kubernetes](#)  
You can optionally configure monetization in API Connect on a Kubernetes deployment by enabling the billing microservice.
- [Overriding resources for Postgres components on Kubernetes](#)  
In 10.0.4.0 and greater, you can optionally override the CPU and Memory resources used by postgres database components.
- [Overriding resources for Postgres components on OpenShift](#)  
In 10.0.4.0 and greater, you can optionally override the CPU and Memory resources used by postgres database components.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring maximum size of client requests to the Management subsystem

---

You can configure the maximum allowed size of the client request body for requests made to the Management subsystem.

### About this task

---

The default maximum size is 8 megabytes. You can increase this value.

Increasing the setting can be useful if you get errors when using the CLI to import a large API. Example error:

```
HTTP/1.1 413 Request Entity Too Large
```

### Procedure

---

1. Edit the Management CR. Refer to the Management CR templates:

```
spec:
  ...
  ...
  template:
  - name: juhu
    containers:
    - name: juhu
      env:
      - name: CLIENT_MAX_BODY_SIZE
        value: "12m"
```

Note that the default value is "8m". The `template:` entry must be indented two spaces, and be located within the `spec:` element.

2. Apply the changes:

```
kubectl -n <namespace> apply -f management_cr.yaml
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Setting rate limits for public APIs on the management service for a Kubernetes environment

Describes the procedure for setting a rate limit for public APIs on the management service. Rate limits provide protection from DDoS (distributed denial of service) attacks.

### Before you begin

Note: This article refers to third-party software that IBM does not control. As such, the software may change and this information may become outdated. These instructions assume you have a working Kubernetes environment with the `kubectl` command-line tool installed, and that you understand how to manage Kubernetes. For more information, see <https://kubernetes.io>.

### About this task

Rate limits can be set for public APIs on the management service. Rate limits on APIs help provide protection from DDoS (distributed denial of service) attacks. Without a rate limit, API calls from public APIs are unlimited.

The rate limit configuration requires that the header contains the actual client IP address. Any load balancer or proxy (for example, HAProxy) that is installed in front of the management service must be configured to pass the actual client IP address.

This procedure must be performed on a running API Connect deployment.

Rate limits are calculated as requests per seconds per client.

Note: If the rate limit has been reached on the management subsystem, the client will get an HTTP error: **429 Too Many Requests**.

### Procedure

- Configure the `ingress-nginx-ingress-controller` to pass the real client IP address:
  - Set the `use-proxy-protocol` parameter to `true` by entering the following command:

```
kubectl edit ConfigMap -n kube-system ingress-nginx-ingress-controller
```

- In the `ConfigMap`, set the following: `use-proxy-protocol:`  
`"true"`

- Set a rate limit:
  - You can add a `template:` value in your subsystem CR to provide an override. For example, the Management CR template value can be:

```
spec:
  ...
  template:
  - name: juhu
    containers:
    - name: juhu
      env:
      - name: RATE_LIMIT_PER_CLIENT
        value: "10"
      - name: LIMIT_REQUEST_OPTION
        value: "burst=10 nodelay"
```

Note that the `template:` entry must be indented two spaces, and must be located in the `spec:` element.

In this example, the first option sets the rate to 10 requests per second (10r/s). The second option allows 10 requests boosted without delay within < 1 second. You can customize as needed.

The `rateLimitPerClient` property sets `rate`, and `limitRequestOption` sets `[burst=number] [nodelay | delay=number]` in the following `nginx` configuration:

```
limit_req_zone key zone=name:size rate=rate;
limit_req zone=name [burst=number] [nodelay | delay=number];
```

Note that `zone` has been pre-defined and can't be configured. For more details, see the nginx doc [http://nginx.org/en/docs/http/ngx\\_http\\_limit\\_req\\_module.html](http://nginx.org/en/docs/http/ngx_http_limit_req_module.html).

2. Apply the changes:

```
kubectl -n <namespace> apply -f management_cr.yaml
```

3. Validate that the juhu pod has restarted by listing the pods:

```
kubectl get pods -n <namespace> | grep juhu
```

4. Check the AGE column to ensure a new juhu pod has started.

5. If the older juhu pod is still running, delete it with the following command:

```
kubectl delete pods -n <namespace> <old-juhu-pod>
```

• Disable a rate limit:

1. Validate that the juhu pod has restarted by listing the pods:

```
kubectl get pods -n <namespace> | grep juhu
```

2. Check the AGE column to ensure a new juhu pod has started.

3. If the older juhu pod is still running, delete it with the following command:

```
kubectl delete pods -n <namespace> <old-juhu-pod>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring monetization on Kubernetes

You can optionally configure monetization in API Connect on a Kubernetes deployment by enabling the billing microservice.

### About this task

API Connect includes a subscription billing microservice that allows API providers to define pricing plans in their API Products, and monetize their API offerings. If a Product contains a pricing plan, API Consumers must enter their payment information into the Developer Portal before they can subscribe to that plan. API Connect supports integration with Stripe Subscription Billing, an independent cloud service that manages monetized product plans, customers, their payment information, and their subscription history, in order to generate monthly invoices and charge customers automatically. With this integration, Stripe serves as both the subscription billing system and the payment processing system.

Note:

- These instructions apply only to Kubernetes installations. For VMware installations, see [Configuring monetization on VMware](#).
- To use Stripe as your credit card processing vendor, you must have port 443 open to HTTPS communication between the Stripe API and your Developer Portal management and the Management cluster servers. See [Firewall requirements on Kubernetes](#) and [Firewall requirements on VMware](#) for more information about this requirement.
- Provider organizations cannot add any billing integrations until the billing microservice is enabled.
- After provider organizations have added billing integrations, the billing microservice must not be disabled.

To enable or disable the billing microservice, you must configure the Management subsystem custom resource (CR) file. See the following instructions:

- [Enabling the billing microservice as part of a new deployment](#)
- [Enabling the billing microservice as part of an existing deployment](#)
- [Disabling the billing microservice](#)

### Procedure

- **Enabling the billing microservice as part of a new deployment**

Edit the CR file for the Management subsystem and add the settings for the billing microservice.

1. Edit the `ManagementCluster` CR and add the following definition for the billing microservice. Append the billing definition to the end of the `spec:` section, making sure to adhere to the spacing used in the file.

```
spec:
  ...
  billing:
    enabled: true
```

2. Apply the updated CR by running the following command as part of the standard Management subsystem installation (see [Installing the Management subsystem cluster](#) for details):

```
kubectl apply -f management_cr.yaml -n <management_namespace>
```

Where `management_namespace` is the name of the target installation namespace in the Kubernetes cluster. The billing microservice will be enabled with the Management subsystem.

3. You can monitor your Kubernetes deployments by running the following command:

```
kubectl get deployments -n <management_namespace>
```

The installation is complete when the `management-billing` pod is shown in the list of returned values. After the billing microservice is enabled, provider organization owners can create billing integration resources for API providers in the API Manager UI. For more information, see [Monetizing your Products](#).

#### • Enabling the billing microservice as part of an existing deployment

Edit the deployed CR for the Management subsystem and add the settings for the billing microservice.

1. Retrieve the name of the deployed CR for the Management subsystem by running the following command:

```
kubectl get managementcluster -n <management_namespace>
```

Where `management_namespace` is the name of the target installation namespace in the Kubernetes cluster.

2. Edit the deployed CR by running the following command:

```
kubectl edit managementcluster <management-cr-name> -n <management_namespace>
```

Where:

- `management-cr-name` is the name of the deployed CR for the Management subsystem.
- `management_namespace` is the name of the target installation namespace in the Kubernetes cluster.

3. In the editor, append the billing definition to the end of the `spec:` section, making sure to adhere to the spacing used in the file.

```
spec:
  ...
  billing:
    enabled: true
```

4. Save the update.

The billing microservice is enabled in the Management subsystem.

5. You can monitor your Kubernetes deployments by running the following command:

```
kubectl get deployments -n <management_namespace>
```

The installation is complete when the `management-billing` pod is shown in the list of returned values. After the billing microservice is enabled, provider organization owners can create billing integration resources for API providers in the API Manager UI. For more information, see [Monetizing your Products](#).

#### • Disabling the billing microservice

Important: After provider organizations have added billing integrations, the billing microservice must not be disabled. Edit the deployed CR for the Management subsystem and update the settings for the billing microservice.

1. Retrieve the name of the deployed CR for the Management subsystem by running the following command:

```
kubectl get managementcluster -n <management_namespace>
```

Where `management_namespace` is the name of the target installation namespace in the Kubernetes cluster.

2. Edit the deployed CR by running the following command:

```
kubectl edit managementcluster <management-cr-name> -n <management_namespace>
```

Where:

- `management-cr-name` is the name of the deployed CR for the Management subsystem.
- `management_namespace` is the name of the target installation namespace in the Kubernetes cluster.

3. In the editor, change the billing definition to `enabled:`

```
false.

spec:
  ...
  billing:
    enabled: false
```

4. Save the update.

The billing microservice is disabled in the Management subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Overriding resources for Postgres components on Kubernetes

In 10.0.4.0 and greater, you can optionally override the CPU and Memory resources used by postgres database components.

## About this task

There are three postgres components:

- `postgres`
- `pgBouncer`
- `pgBackRest`

The default resources used in `postgrespgBouncer` and `pgBackRest` components are:

Table 1. Postgres component default resources

Resource	Postgres DB	pgBouncer	pgBackRest
Memory Request	512Mi	24Mi	48Mi
Memory Limit	8Gi	128Mi	128Mi
CPU Request	600m	80m	80m
CPU Limit	1500m	200m	200m

## Procedure

To override resources, complete the following procedure

1. Prepare a patch yaml.

- Ensure that you specify the name of the container for the resource you want to override. Names:
  - `postgres`
  - `pgBouncer`
  - `pgBackRest`
- You can override multiple postgres components in parallel. Adding one container section under `pgcluster` template.
- You can override just a single value, such as CPU limit.

Examples:

- Example yaml, to replace all postgres DB resources:

```
spec:
  template:
  - name: pgcluster
    containers:
    - name: postgres
      resources:
        requests:
          cpu: 1500m
          memory: 8Gi
        limits:
          cpu: 600m
          memory: 512Mi
```

- Example yaml, to replace all pgBouncer resources:

```
spec:
  template:
  - name: pgcluster
    containers:
    - name: pgBouncer
      resources:
        requests:
          cpu: 200m
          memory: 128Mi
        limits:
          cpu: 300m
          memory: 256Mi
```

- Example yaml, to replace CPU limit of `postgres` database:

```
spec:
  template:
  - name: pgcluster
    containers:
    - name: postgres
      resources:
        limits:
          cpu: 1000m
```

- Example yaml, to replace CPU limits of `postgres` DB and `pgBouncer`:

```
spec:
  template:
  - name: pgcluster
    containers:
    - name: postgres
      resources:
        limits:
          cpu: 1000m
    - name: pgBouncer
      resources:
        limits:
          cpu: 1000m
```

2. Apply the patch yaml:

```
kubectl patch mgmt <mgmt-cr-name> --type merge --patch "$(cat patch.yaml) "
```

## Results

The postgres components will restart with updated values.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Overriding resources for Postgres components on OpenShift

In 10.0.4.0 and greater, you can optionally override the CPU and Memory resources used by postgres database components.

### About this task

There are three postgres components:

- `postgres`
- `pgBouncer`
- `pgBackRest`

The default resources used in `postgrespgBouncer` and `pgBackRest` components are:

Table 1. Postgres component default resources

Resource	Postgres DB	pgBouncer	pgBackRest
Memory Request	512Mi	24Mi	48Mi
Memory Limit	8Gi	128Mi	128Mi
CPU Request	600m	80m	80m
CPU Limit	1500m	200m	200m

### Procedure

To override resources, complete the following procedure

1. Prepare a patch yaml.

- Ensure that you specify the name of the container for the resource you want to override. Names:
  - `postgres`
  - `pgBouncer`
  - `pgBackRest`
- You can override multiple postgres components in parallel. Adding one container section under `mgmt-pgcluster` template.
- You can override just a single value, such as CPU limit.

Examples:

- Example yaml, to replace all postgres DB resources:

```
spec:
  template:
  - name: mgmt-pgcluster
    containers:
    - name: postgres
      resources:
        requests:
          cpu: 1500m
          memory: 8Gi
        limits:
          cpu: 600m
          memory: 512Mi
```

- Example yaml, to replace all `pgBouncer` resources:

```
spec:
  template:
  - name: mgmt-pgcluster
    containers:
    - name: pgBouncer
      resources:
        requests:
          cpu: 200m
          memory: 128Mi
        limits:
          cpu: 300m
          memory: 256Mi
```

- Example yaml, to replace CPU limit of `postgres` database:

```
spec:
  template:
  - name: mgmt-pgcluster
    containers:
```

```
- name: postgres
  resources:
    limits:
      cpu: 1000m
```

- Example yaml, to replace CPU limits of `postgres` DB and `pgBouncer`:

```
spec:
  template:
    - name: mgmt-pgcluster
      containers:
        - name: postgres
          resources:
            limits:
              cpu: 1000m
        - name: pgBouncer
          resources:
            limits:
              cpu: 1000m
```

2. Apply the patch yaml:

```
oc patch apiconnectcluster <apiconnectcluster-cr-name> --type merge --patch "$(cat patch.yaml)"
```

## Results

The postgres components will restart with updated values.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Advanced configuration for the gateway subsystem

Specify advanced configuration for the gateway subsystem.

See:

- [Customizing a DataPower deployment](#)  
Update the GatewayCluster CR to configure `DataPowerService` APIs to customize your DataPower deployment.
- [Enabling autoscaling of gateway pods](#)  
Enable autoscaling of gateway pods to ensure high availability of DataPower pods.
- [Dynamically re-registering and reconfiguring a Gateway service in a Kubernetes deployment](#)  
In API Connect, Gateway services do not persist their configuration settings by default. Instead, the master configuration is stored on the Management server and the *Dynamic Reregistration and Reconfiguration* (DRR) mechanism resynchronizes configuration data when needed. The DRR process is used when proper High Availability/Disaster Recovery (HA/DR) is not configured, or if a manual resynchronization is required.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Customizing a DataPower deployment

Update the GatewayCluster CR to configure `DataPowerService` APIs to customize your DataPower deployment.

You can set the following properties in the CR. Note that each GatewayCluster CR property has a corresponding DataPowerService API. Refer to the IBM DataPower Operator Documentation link for each property:

Table 1. Mapping of GatewayCluster properties to DataPowerService properties

GatewayCluster property	DataPowerService property	DataPowerService API Docs
<code>AdditionalDomainConfig</code>	<code>domains</code>	<a href="#">Domains</a> For domain configuration, see also: <ul style="list-style-type: none"> <li>• <a href="#">Guides: Domain Configuration</a></li> <li>• <a href="#">Features: Configuration Management</a></li> </ul>
<code>AdditionalExtraExe</code>	<code>extraExe</code>	<a href="#">extraExe</a>
<code>AdditionalInitCmds</code>	<code>initCmds</code>	<a href="#">initCmds</a>
<code>lifecycle</code>	<code>lifecycle</code>	<a href="#">lifecycle</a>

Examples of how to add the DataPower service properties to a GatewayCluster CR, in an API Connect deployment on native Kubernetes:

- Adding `additionalDomainConfig`:

```
spec:
  additionalDomainConfig:
    - name: "default"
```

```

certs:
- certType: "usrcerts"
  secret: "default-cert"
- certType: "sharedcerts"
  secret: "shared-cert"
dpApp:
  config:
  - "default-config"
  local:
  - "default-local"

```

- Extending the `apiconnect` domain:

```

spec:
  additionalDomainConfig:
  - name: "apiconnect"
    dpApp:
      config:
      - "custom-apiconnect-config"
      local:
      - "custom-apiconnect-local"

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Enabling autoscaling of gateway pods

Enable autoscaling of gateway pods to ensure high availability of DataPower pods.

Autoscaling enables the gateway deployment to scale dynamically, either vertically or horizontally.

It is not possible to use both horizontal and vertical pod scaling simultaneously. You must configure either **HPA** (for horizontal scaling) or **VPA** (for vertical scaling) as scaling method.

- To enable HPA, add the following fields to the CR:  
In OpenShift or Cloud Pak for Integration, add the fields to the `spec.gateway` section of the API Connect Cluster CR.

```

podAutoScaling:
  hpa:
    maxReplicas: 5
    minReplicas: 3
    targetCPUUtilizationPercentage: 90
    targetMemoryUtilizationPercentage: 80
  method: HPA

```

- To enable VPA, add the following fields to the CR:  
In OpenShift or Cloud Pak for Integration, add the fields to the `spec.gateway` section of the API Connect Cluster CR.

```

podAutoScaling:
  method: VPA
  vpa:
    maxAllowedCPU: 4
    maxAllowedMemory: 16G

```

Note that the values shown in the CR entries are just examples.

Table 1. Autoscaling configuration settings

Setting	Description
<code>method</code>	Specifies either Horizontal Pod Autoscaling or Vertical Pod Autoscaling Value must be either <b>HPA</b> or <b>VPA</b> .  To disable autoscaling, leave <code>method</code> blank or omit the <code>podAutoScaling</code> section from the CR.
<code>maxReplicas</code>	HPA. Maximum pods that can be scaled up to by the horizontal pod autoscaler. Must be a value greater than <code>minReplicas</code> .
<code>minReplicas</code>	HPA. Minimum pods that can be scaled down to by the horizontal pod autoscaler.
<code>targetCPUUtilizationPercentage</code>	HPA. Percent threshold on average CPU usage by pods for triggering horizontal scaling.
<code>targetMemoryUtilizationPercentage</code>	HPA. Percent threshold on average memory usage by pods for triggering horizontal scaling.
<code>maxAllowedCPU</code>	VPA. Maximum value for CPU resource that can be assigned to a DataPower container when scaling vertically. Minimum value is set from <code>DataPowerRequestsSpec.ResourceCPU</code>
<code>maxAllowedMemory</code>	VPA. Maximum amount of memory that can be assigned to a DataPower container when scaling vertically. Minimum value is set from <code>DataPowerRequestsSpec.ResourceMemory</code>

Note:

DataPower Gateway supports long-lived connections such as GraphQL subscriptions or other websockets connections. These long-lived connections might not be preserved when pods are scaled down based on defined CPU or memory thresholds. Workloads with long-lived connections are more vulnerable to failed API transactions when auto-scaling is occurring.

To learn more about HPA and VPA autoscaling, see

- <https://ibm.github.io/datapower-operator-doc/features/pod-auto-scaling/>
- <https://ibm.github.io/datapower-operator-doc/apis/datapowerservice/v1beta3#podautoscaling>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Dynamically re-registering and reconfiguring a Gateway service in a Kubernetes deployment

In API Connect, Gateway services do not persist their configuration settings by default. Instead, the master configuration is stored on the Management server and the *Dynamic Reregistration and Reconfiguration* (DRR) mechanism resynchronizes configuration data when needed. The DRR process is used when proper High Availability/Disaster Recovery (HA/DR) is not configured, or if a manual resynchronization is required.

If a Gateway service is not configured properly for resiliency and is restarted, the gateways in the Gateway service will lose the configuration from the Management server. Configuration data from the Management server is maintained on the gateway service according to the gateway peering configuration on the gateways.

---

### Preventing the loss of configuration data

For high availability in production environments, use a minimum of three gateways in the Gateway service.

---

### Forcing re-population of the configuration data

To repopulate the configuration data, complete the steps in the following section to trigger an outage-less DRR.

---

### Triggering an outage-less DRR

To force a Dynamic Reregistration and Reconfiguration across a peer group from within the gateway service without requiring a restart, complete the following steps using the CLI. This process flushes the primary peering object configured for the apic-gw-service. This task can only be performed with CLI, and requires the default admin ID for running the `diag` command.

1. Access the gateway service:
  - For a virtual gateway, run the following command to access the DataPower CLI:

```
kubectl attach -it <pod_name>
```

- For a physical gateway, use `ssh` to connect to the gateway service.

2. Switch to the API Connect application:

```
switch <APIC_APP_DOMAIN>
```

3. Show the current gateway-peering-status:

```
show gateway-peering-status
```

4. If the server that you connected to is not primary for the apic-gw-service gateway-peering object, force this server to become primary:

```
config; gateway-peering-switch-primary <gateway-peering-name-for-apic-gw-service>;
```

5. Flush the apic-gw-service gateway-peering object:

```
diag; gateway-peering-flush <gateway-peering-name-for-apic-gw-service>; exit
```

When prompted, confirm the operation.

6. Disable and then re-enable the apic-gw-service object for every member of the gateway service:

```
config; apic-gw-service; admin-state disabled; exit  
apic-gw-service; admin-state enabled; exit; exit
```

7. Confirm that the apic-gw-service was flushed and is now waiting for gateway service registration:

Look in the debug log target for the apic-gw-service, located in `logtemp:///` and check for a message similar to the following example:

```
20200618T232339.332Z [0x88e000d7][apic-gw-service][notice]  
apic-gw-service(default): tid(2653): Waiting for gateway service registration.
```

The DRR will be triggered by the next arrival of a webhook event. The Management server sends a heartbeat to the gateway at five-minute intervals, prompting the gateway to check whether it has lost its configuration and if so, trigger a DRR. In addition, if the Management server has previously marked a Catalog or cloud as being unavailable for a particular gateway service, a successful heartbeat triggers synchronization for that Catalog or cloud on that gateway service.

8. If you attached to a virtual gateway, you can detach by pressing Ctrl+P and then pressing Ctrl+Q.

9. (Optional) Force a BAU webhook event to be sent from API Manager to trigger the DRR:

If you do not want to wait for the Management server to send a heartbeat, you can trigger the DRR manually by completing the following steps:

- a. Open the API Manager.
- b. Open the Catalog.
- c. Click Settings > Edit.
- d. Update the Summary field with some text so that it is modified.
- e. Click Save.

When the event is received, the DRR is initiated.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Backing up and restoring

You can backup and restore API Connect subsystems.

API Connect Version 10 uses Kubernetes operators to back up and restore databases.

- **Manual backups**  
For the management database, the backup configuration is specified in a Management CR (custom resource). You create the backup CR manually. Once the backup CR is created, the `apiconnect` operator performs backup and updates the status into the backup CR.
- **Scheduled backups**  
For scheduled backups, you can add a backup schedule to the backup configuration details in the management CR. The `apiconnect` operator will then trigger and perform backups as specified in the custom `cron` schedule. A backup CR is created for every individual backup invocation as described in the cron schedule. You can view each backup CR to determine the status of each backup.
- **Restore**  
For restore, you update the backup Management CR. You then create a restore CR with the backup ID (timestamp) in it. You can list the backup CRs and determine the backup ID by looking at individual backup CR. The `apiconnect` operator performs the restore.
- You must backup both the Management and Portal subsystems at the same time, to ensure synchronicity across the services.
- If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. The backups of the Management and Portal must be taken at the same time to ensure that the Portal sites are consistent with Management database.
- When restoring, the Gateway and all deployed subsystems (Management, Analytics, and Developer Portal) must be at the same version level.

Note: For information about how to maintain a two data center deployment, see [Maintaining a two data center deployment](#).

- [Backups on Kubernetes](#)  
Use the procedures in this section to backup and restore API Connect on generic Kubernetes distributions.
- [Backups on OpenShift](#)  
You can backup and restore API Connect subsystems on OpenShift and Cloud Pak for Integration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Backups on Kubernetes

Use the procedures in this section to backup and restore API Connect on generic Kubernetes distributions.

- [Backing up and restoring the management subsystem](#)  
You can use the following instructions to back up and restore your Management subsystem on API Connect.
- [Backing up and restoring the Developer Portal in a Kubernetes environment](#)  
You can back up and restore your Developer Portal service in your Kubernetes environment.
- [Backing up and restoring the analytics database](#)  
The IBM® API Connect Analytics database can be backed up and restored from an S3 repository. S3 compatible object storage is required; for example, IBM Cloud Object Storage.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Backing up and restoring the management subsystem

You can use the following instructions to back up and restore your Management subsystem on API Connect.

- To complete a backup and restore of your Management subsystem, you must have the `custom resource` configured with the `databaseBackup` subsection in the management subsystem custom resource.
- Backups can be scheduled or generated manually (on-demand). You can then list what backups are available and then use one to restore your Management subsystem if required:

```
kubectl get mgmtb -n <namespace>
```

- Postgres replica pods depend on a successful completed backup. If backup configuration is not correct, replica pods won't come up.
- Custom resource (CR) templates are provided in the `helper_files` archive to install each API Connect subsystem. You decompressed these files into an installation folder of your choosing in [Obtaining product files](#).

- For points to consider when backing up and restoring a two data center disaster recovery deployment on Kubernetes, see [Backup and restore considerations for a two data center deployment](#).
- Restoring a backup restores the registration credentials (client\_ID, client\_secret) that were in use at the time that the selected backup was created. For information on the registration credentials, see [Changing the registration client\\_id and client\\_secret for applications](#).

Note: You must backup both the Management and Portal subsystems at the same time, to ensure synchronicity across the services.

## Types of backups supported

---

- Cloud-based S3 storage
  - IBM Cloud Object Storage
  - AWS S3
  - **v10.0.2.0 or greater:** Any custom S3, such as minIO.
- SFTP
- Local storage backups
- [Configuring backup settings for fresh install of the Management subsystem](#)  
You can configure backups for your Management subsystem in your Kubernetes environment. Use the instructions for your backup type:
- [Reconfiguring or adding backup settings after installation of the management subsystem](#)  
You can reconfigure the backup settings after installation of the management subsystem.
- [Generating a manual backup of the management subsystem](#)  
You can generate a manual (non-scheduled) backup of the management subsystem
- [Restoring the management subsystem \(v10.0.1.1 or later\)](#)  
You can restore your Management subsystem in your Kubernetes environment.
- [Troubleshooting management subsystem backups](#)  
You can troubleshoot failures of the management subsystem backups.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring backup settings for fresh install of the Management subsystem

---

You can configure backups for your Management subsystem in your Kubernetes environment. Use the instructions for your backup type:

- [Configuring S3 backup settings for fresh install of the Management subsystem](#)  
You can configure backups for your Management subsystem in your Kubernetes environment.
- [Configuring SFTP backup settings for fresh install of the Management subsystem](#)  
You can configure backups for your Management subsystem in your Kubernetes environment.
- [Configuring local backup settings for fresh install of the Management subsystem](#)  
You can configure backups for your Management subsystem in your Kubernetes environment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring S3 backup settings for fresh install of the Management subsystem

---

You can configure backups for your Management subsystem in your Kubernetes environment.

### Before you begin

---

Review [Backing up and restoring the management subsystem](#).

### About this task

---

If you haven't already, configure your Management subsystem `custom` **resource** with the `databaseBackup` subsection.

Note: `S3Provider` supports `custom` S3 solutions in 10.0.2.0 and greater. The support includes new backup parameters `backupCerts` and `backups3URISyle`.

Important: For S3 backups of the management subsystem, do not use retention features provided by Cloud-based S3 storage providers. Use of such features can result in periodic deletion of archived backups, which can cause backup corruptions which can cause database restores to fail.

### Procedure

---

1. Create a backup secret.  
The backup secret is a Kubernetes secret that contains your username and password for your S3 backup database.

For examples of how to generate the appropriate access key and secret for two of them, see:

- IBM (Cloud Object Storage): [Service credentials](#).
- AWS: [Managing access keys](#).
- Custom: See documentation for your S3 provider. For example, minIO.

The secret can be created with the following command:

```
$ kubectl create secret generic mgmt-backup-secret --from-literal=key='<YOUR ACCESS KEY>' \
--from-literal=keysecret='<YOUR ACCESS KEY SECRET>' -n <namespace_of_management_subsystem>
```

2. Ensure that your Management subsystem `custom resource` is configured with the `databaseBackup` subsection.

For example:

```
databaseBackup:
  protocol: objstore
  s3provider: ibm
  host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
  path: apic-backup
  credentials: mgmt-backup-secret
  backupCerts: <custom-s3-server-CA-cert>
  backups3URISyle: host(default)/path
  schedule: "0 3 * * *"
  repoRetentionFull: 2
```

Note: `backupCerts` and `backups3URISyle` are used for custom s3 only, on **v10.0.2.0 or greater**.

Table 1. Backup configuration settings

Setting	Description
<code>protocol</code>	The type of the backup. For s3 storage: <code>objstore</code> . When the parameter is not set, the backup type defaults to local storage backup.
<code>s3provider</code>	Name of the S3 provider to use. You must specify one of the supported values of <code>aws</code> , <code>ibm</code> , or <code>custom</code> . Support for <code>custom</code> is available in <b>v10.0.2.0 or greater</b> . Note: The public certificate on the S3 storage provider must be signed by a known certificate authority that is trusted by API Connect. Use of an untrusted authority can cause the following error during backup upload: <code>x509: certificate signed by unknown authority</code> .
<code>host</code>	For <code>objstore</code> type backup, specify S3 endpoint with the corresponding S3 region in the format <code>&lt;S3endpoint&gt;/&lt;S3region&gt;</code>
<code>path</code>	The path to the location of the backup: For <code>objstore</code> backups, the name of your S3 bucket to store backup data. For example, <code>bucket-name/folder</code> . The use of subdirectories in the bucket name is not supported. Note: When your deployment includes a management subsystem in two different clusters (with active databases), the two management subsystems cannot use the same s3 bucket name in the database backup configurations. Each management subsystem must use a unique s3 bucket name. Ensure that <code>bucket-name/folder</code> is empty. If the folder was previously used for backups, the folder will not be empty, and stanza create might encounter an error.  <b>Explanation:</b> Once a folder is used, <code>archive.info</code> and <code>backup.info</code> files are created. During stanza creation, the process compares the database version and database system id between the two info files and the current Postgres database cluster. Stanza creation fails if there is a mismatch. To prevent this possibility, remove all files from the folder before configuring.
<code>credentials</code>	For <code>objstore</code> type backups, the name of the Kubernetes secret containing your S3 Access Key / Key Secret
<code>backupCerts</code>	<b>v10.0.2.0 or greater</b>  Custom certificate. Used only when <code>s3Provider</code> is set to <code>custom</code> . Most of the custom S3 providers are created based on custom CA certificate.  This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be <code>ca.crt</code> and value should be base64 encoded value of CA certificate.  The API Connect management subsystem validates the custom S3 certificate against the customer-provided CA certificate.  Sample bash script to create the Kubernetes secret:  <pre>cat &gt;customs3ca.yaml &lt;&lt;EOF apiVersion: v1 data:   ca.crt: \$(base64 &lt;path-to-ca-certificate&gt;   tr -d '\n' ) kind: Secret metadata:   name: custom-server-ca type: generic EOF</pre> <code>kubectl apply -f customs3ca.yaml -n &lt;namespace&gt;</code>
<code>backups3URISyle</code>	<b>v10.0.2.0 or greater</b> Valid values: <code>host</code> and <code>path</code> .  Only allowed if <code>s3Provider</code> is set to <code>custom</code> .  Some custom S3 providers require URI style to be set to <code>path</code> . For example, minIO supports both <code>host</code> and <code>path</code> style setup. You can create a minIO S3 server to only accept <code>path</code> style client communications.  <b>Important:</b> Contact your custom S3 administrator before configuring this field. If not properly configured, upstream custom S3 can reject connections from the client, such as API Connect management subsystem.

Setting	Description
<code>schedule</code>	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> <li>• <code>*****</code></li> <li>• <code>-----</code></li> <li>• <code>     </code></li> <li>• <code>     +-----</code> day of week (0 - 6) (Sunday=0)</li> <li>• <code>    +-----</code> month (1 - 12)</li> <li>• <code>   +-----</code> day of month (1 - 31)</li> <li>• <code>  +-----</code> hour (0 - 23)</li> <li>• <code>+-----</code> min (0 - 59)</li> </ul> <p>The timezone for backups is that of the node on which the postgres-operator pod is scheduled.</p> <p>There is no default backup schedule set. Be sure to set your backup schedule.</p> <p>All scheduled Management subsystem backups are of type <code>full</code> only.</p>
<code>repoRetentionFull</code>	<p><b>v10.0.3.0 or later</b> - The number of full S3 backups to retain. When the next full backup successfully completes, and the specified number of retained backups is reached, the oldest full backup is deleted. All incremental backups and archives associated with the oldest full backup also expire. Incremental backups are not counted for this setting. Applies to both manual backups and scheduled backups.</p> <p>Minimum value: 1</p> <p>Maximum value: 9999999</p> <p>Default: none</p>

3. Verify that the configuration deploys successfully.

When you configure Management subsystem backups, the operator runs a `stanza-create` job. This job creates the stanza (Postgres cluster configuration) on the upstream S3 server, which is used for backup and archive procedures. The job also brings up the necessary pod.

Check the status of the `stanza-create` job:

```
kubectl get jobs -n <namespace> | grep stanza
```

- On success:

- The `stanza-create` job status is 1/1:

```
kubectl get jobs | grep stanza
m1-b722e361-postgres-stanza-create      1/1      5s      127m
```

- The `stanza-create` job shows `status: "True"` and `type: Complete`:

```
kubectl get job m1-b722e361-postgres-stanza-create -o yaml
```

```
status:
  completionTime: "2021-04-13T18:38:50Z"
  conditions:
    - lastProbeTime: "2021-04-13T18:38:50Z"
      lastTransitionTime: "2021-04-13T18:38:50Z"
        status: "True"
        type: Complete
  startTime: "2021-04-13T18:38:45Z"
  succeeded: 1
```

- The `stanza-create` pod is in `Completed` state:

```
kubectl get pods | grep stanza
m1-b722e361-postgres-stanza-create-q4fvp 0/1      Completed 0      127m
```

- Exec into the pod:

```
kubectl exec -it <backrest-shared-repo-pod> -- bash
```

- The `pgbackrest` command returns the S3 contents in valid JSON:

```
pgbackrest info --output json --repol-type s3
{"backup":{"held":false},"message":"ok"}] [pgbackrest@m1-b722e361-postgres-backrest-shared-repo-69cdfdd5-rs882/
```

- On failure, see [Troubleshooting stanza-create job for S3 backup configuration](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring SFTP backup settings for fresh install of the Management subsystem

You can configure backups for your Management subsystem in your Kubernetes environment.

### Before you begin

## About this task

If you haven't already, configure your Management subsystem `custom resource` with the `databaseBackup` subsection.

## Procedure

### 1. Create a backup secret.

The backup secret is a Kubernetes secret that contains your credentials for accessing the SFTP backup database. Supported credentials types:

- Username and password (v10.0.2.0 or later).
- Username and SSH-key (v10.0.3.0 or later). Only OpenSSH keys are supported.<sup>1</sup>

Use one of the following commands to create the secret:

- Username and password credentials

```
$ kubectl create secret generic mgmt-backup-secret --from-literal=username='<YOUR USERNAME>'
--from-literal=password='<YOUR PASSWORD>' -n <namespace-of-mgmt-subsystem>
```

- **Version 10.0.3.0 or later:** Username and SSH-key credentials:

```
$ kubectl create secret generic mgmt-backup-secret --from-literal=username='<YOUR USERNAME>'
--from-file=ssh-privatekey='<YOUR PRIVATEKEY FILE>' -n <namespace-of-mgmt-subsystem>
```

### 2. Ensure that your Management subsystem `custom resource` is configured with the `databaseBackup` subsection.

For example:

```
databaseBackup:
  protocol: sftp
  host: <SFTP-host-name>
  port: <SFTP-port>
  path: apic-backup
  retries: 0
  credentials: mgmt-backup-secret
  schedule: "0 3 * * *"
```

Table 1. Backup configuration settings

Setting	Description
<code>protocol</code>	The type of the backup. For SFTP storage: <code>sftp</code> .
<code>host</code>	The backups host. For <code>sftp</code> type, the SFTP server hostname
<code>port</code>	The SFTP server port. Optional. Default: <code>22</code> .
<code>path</code>	The path to the location of the backup. For <code>sftp</code> type, the full absolute path of the folder on the SFTP server, beginning with <code>/</code> .
<code>retries</code>	The number of times the <code>ibm-apiconnect</code> Operator attempts backups in the event of a failed SFTP backup. Default value: <code>0</code> .
<code>credentials</code>	Name of the Kubernetes secret containing your SFTP Username/password. For Version 10.0.3.0 or later, the Kubernetes secret can contain your SFTP Username and SSH key.
<code>schedule</code>	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> <li>• <code>*****</code></li> <li>• <code>-----</code></li> <li>• <code>     </code></li> <li>• <code>     +-----</code> day of week (0 - 6) (Sunday=0)</li> <li>• <code>    +-----</code> month (1 - 12)</li> <li>• <code>    +-----</code> day of month (1 - 31)</li> <li>• <code>  +-----</code> hour (0 - 23)</li> <li>• <code>+-----</code> min (0 - 59)</li> </ul> <p>The timezone for backups is that of the node on which the <code>postgres-operator</code> pod is scheduled.</p> <p>There is no default backup schedule set. Be sure to set your backup schedule.</p> <p>All scheduled Management subsystem backups are of type <code>full</code> only.</p>

<sup>1</sup> PuTTY style keys can be converted to OpenSSH by using the PuTTY Key Generator (PuTTYgen) application; see <https://www.puttygen.com/>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring local backup settings for fresh install of the Management subsystem

You can configure backups for your Management subsystem in your Kubernetes environment.

### Before you begin

## About this task

If you haven't already, configure your Management subsystem `custom resource`.

## Procedure

Configure your Management subsystem `custom resource` with the `databaseBackup` subsection. For local backups, you need specify only the `schedule`. For Version 10.0.3.0 or later, you can also optionally specify `repoRetentionFull`:

```
databaseBackup:
  schedule: "0 3 * * *"
  repoRetentionFull: 2
```

Table 1. Backup configuration settings

Setting	Description
<code>schedule</code>	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"><li>• <code>*****</code></li><li>• <code>-----</code></li><li>• <code>     </code></li><li>• <code>    +-----</code> day of week (0 - 6) (Sunday=0)</li><li>• <code>   +-----</code> month (1 - 12)</li><li>• <code>   +-----</code> day of month (1 - 31)</li><li>• <code>  +-----</code> hour (0 - 23)</li><li>• <code>+-----</code> min (0 - 59)</li></ul> <p>The timezone for backups is that of the node on which the postgres-operator pod is scheduled.</p> <p>There is no default backup schedule set. Be sure to set your backup schedule.</p> <p>All scheduled Management subsystem backups are of type <code>full</code> only.</p>
<code>repoRetentionFull</code>	<p><b>v10.0.3.0 or later</b>- The number of full local backups to retain. When the next full backup successfully completes, and the specified number of retained backups is reached, the oldest full backup is deleted. All incremental backups and archives associated with the oldest full backup also expire. Incremental backups are not counted for this setting. Applies to both manual backups and scheduled backups.</p> <p>Minimum value: 1</p> <p>Maximum value: <b>9999999</b></p> <p>Default: none</p>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Reconfiguring or adding backup settings after installation of the management subsystem

You can reconfigure the backup settings after installation of the management subsystem.

## Procedure

1. Make sure that the management cluster status is `Running` and the READY condition displays the same value before and after the `"/"`. For example:

```
k get mgmt
NAME   READY   STATUS    VERSION   RECONCILED VERSION   AGE
mgmt   16/16   Running   10.0.2.0   10.0.2.0-xxxx   19h
```

2. Create backup secret as described in [Configuring backup settings for fresh install of the Management subsystem](#).
3. Complete the following steps, based on your storage type:

- S3 storage

In 10.0.1.0 and greater, you can change or add the `DatabaseBackup` s3 configuration via the Management Cluster CR after fresh install. However, doing so requires a reconfiguration of the database and a brief downtime. The operator restarts the database with the new backup configurations as soon as the new configuration in the management CR is saved.

Note:

If you have an `APIConnectCluster` custom resource installed, do not modify the `ManagementCluster` CR. Instead, modify the `APIConnectCluster` CR.

You can verify if you have an `apiconnectcluster` CR with the command

```
$ kubectl get apiconnectcluster -n <your-namespace>
```

Configuration of s3 backups uses a new parameter `restartDB` is required when changing the backup configuration. This parameter is in addition to the parameters described in [Configuring backup settings for fresh install of the Management subsystem](#).

Example CR:

```
databaseBackup:
  protocol: objstore
  s3provider: ibm
  host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
  path: apic-backup
  credentials: mgmt-backup-secret
  schedule: "0 3 * * *"
  restartDB:
    accept: true
```

Table 1. Additional parameter for S3 backup type reconfiguration

Parameter	Description
<code>restartDB:</code> <code>accept: &lt;value&gt;</code>	Required when changing the backup configuration. The parameter <code>accept</code> is a boolean: <code>&lt;value&gt;</code> can be <code>true</code> or <code>false</code> . When <code>accept</code> is <code>true</code> , and a new configuration for management CR is saved, the operator: <ul style="list-style-type: none"><li>• Stops the database and any dependent services</li><li>• Applies the change</li><li>• Restarts the stopped components.</li></ul> Note: <code>restartDB</code> is not required for initial deployments, only for modifications after the cluster is deployed.

- SFTP

You can change/add the `DatabaseBackup` SFTP configuration via the Management Cluster CR after fresh install. This process does not involve any downtime. The same backup settings are used for reconfiguring as for initial configuration. For complete description of backup settings, see [Configuring backup settings for fresh install of the Management subsystem](#).

Example CR:

```
protocol: sftp
host: <SFTP-hostname>
port: <SFTP-port>
path: apic-backup
retries: 0
credentials: mgmt-backup-secret
schedule: "0 3 * * *"
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Generating a manual backup of the management subsystem

You can generate a manual (non-scheduled) backup of the management subsystem

### Procedure

1. Make sure that the management cluster status is Running and the READY condition displays the same value before and after the "/>".  
For example:

```
kubectl get mgmt
NAME   READY   STATUS    VERSION   RECONCILED VERSION   AGE
mgmt   16/16   Running   10.0.2.0   10.0.2.0-xxxx        19h
```

Note: Be sure `READY` status is `16/16`. If you have just configured or reconfigured the backup settings, there is a period of time when the postgres pods are taken offline and brought back up with the new configuration. During this time, the `kubectl get mgmt` command will show `11/11` instead of `16/16`. If you start a backup before the Management cluster is on `16/16`, the backup attempt might stall indefinitely.

2. Decide which of the two types of manual backups you want to do:
  - `full`: backs up the entire Management Subsystem database.
  - `incr`: backs up any data that has not been backed up since the last `full` or `incr` backup.
3. You generate a backup manually by creating a `managementBackup` custom resource which is detected by the `ibm-apiconnect` operator that then triggers the backup process.

You can use `mgmtbackup_cr.yaml` in the `helper_files` directory as an example:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementBackup
metadata:
  generateName: management-
spec:
  type: full
  crType: create
  clusterName: management
```

Table 1 lists the CR settings for a manual backup.

Table 1. CR settings for manual backup

Setting	Description
---------	-------------

Setting	Description
type	The type of backup to be done. Valid arguments are: <ul style="list-style-type: none"> <li><b>full</b> Backs up the entire Management subsystem database</li> <li><b>incr</b> Backs up any data that has not been backed up since the last <b>full</b> or <b>incr</b> backup.</li> </ul>
crType	Use <b>create</b> to trigger a backup process.
clusterName	The name of the target ManagementCluster you want to backup.

4. Create the ManagementBackup custom resource in the namespace of your Management Subsystem to trigger the backup process:

```
$ kubectl create -f mgmtbackup_cr.yaml -n <namespace-of-mgmt-subsystem>
```

5. (Optional): You can list current backups by using the command:

```
$ kubectl get managementbackup -n <namespace-of-mgmt-subsystem> --sort-by=.metadata.creationTimestamp
```

Here is an example of some possible output:

NAME	STATUS	ID	CLUSTER	TYPE	CR TYPE	AGE
m1-e46bbac4	Ready	20201023-183005F	m1	full	record	66m
mgmt-backup-dnvwx	Ready	20201023-193137F	m1	full	create	9m37s

6. (Optional): You can get a detailed view of a specific backup by using the command:

```
$ kubectl get managementbackup <bup-name> -n <namespace-of-mgmt-subsystem> -o yaml
```

Here is an example of some possible output:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementBackup
metadata:
  creationTimestamp: "2020-10-23T18:34:11Z"
  generation: 1
  labels:
    app.kubernetes.io/instance: m1
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: m1-e46bbac4
  name: m1-e46bbac4
  namespace: default
  resourceVersion: "6869"
  selfLink: /apis/management.apiconnect.ibm.com/v1beta1/namespaces/default/managementbackups/m1-e46bbac4
  uid: b7b6be9c-82d4-4737-984f-58584a3fe582

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Restoring the management subsystem (v10.0.1.1 or later)

You can restore your Management subsystem in your Kubernetes environment.

## Before you begin

You must have backups of the management subsystem in order to restore. See [Configuring backup settings for fresh install of the Management subsystem](#) and [Generating a manual backup of the management subsystem](#).

## About this task

To trigger a restore, you will create a **ManagementRestore** custom resource. When the **ibm-apiconnect** operator detects the new CR, it starts the restore process.

- Ensure that the backup method that you used is complete before you attempt a restore. The backup data that is stored in the remote server is used for restoring the Management subsystem data back to a previous state. Ensure that these backups are on your remote server before you attempt a restore, and that the backup ID in the selected backup exists in remote storage.
- Restoring a backup restores the registration credentials (client\_ID, client\_secret) that were in use at the time that the selected backup was created. For information on the registration credentials, see [Changing the registration client id and client secret for applications](#).
- If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. The backups of the Management and Portal must be taken at the same time to ensure that the Portal sites are consistent with Management database.

Note: There is a known issue where sometimes a restore from the Management subsystem's SFTP backup succeeds but the data is not restored. If this happens, run the restore again.

## Procedure

1. Obtain a list of the available backups, and decide which one to restore your Management subsystem:

```
kubectl get mgmtb -n <your-namespace>
```

For example:

```
$ kubectl get mgmtb
NAME                                STATUS  ID                                CLUSTER  TYPE  CR TYPE  AGE
management-3aa3bebf                Ready  20200929-152150F                management  full  record  10h
management-3c4ca8df                Ready  20200929-115520F                management  full  record  20h
management-5tbxj                    Ready  20200929-224349F                management  full  create  17h
management-f10af337                Ready  20200925-133703F                management  full  record  5d2h
management-jtlcd                    Ready  20200929-224349F                management  full  create  25h
management-zxjtz                    Ready  20200929-224349F                management  full  create  28h
```

Attention: You can restore the Management subsystem from any backup where the STATUS is Ready; however, you should avoid restoring to the initial system backup. During installation, the Management database is used for an initial system backup before certain database schema jobs are complete. Restoring to this backup will result in an unstable system.

You will use one of the values in the **NAME** column.

2. Configure **mgmtrestore\_cr.yaml**. Use the copy in the **helper\_files** directory as an example:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementRestore
metadata:
  generateName: management-
spec:
  backupName: management-3aa3bebf
```

**backupName** is the name of the backup custom resource you want to restore to. Note that the sample uses example output from the previous step, to specify the backup named **management-3aa3bebf**:

```
backupName: management-3aa3bebf
```

3. Create the ManagementRestore custom resource in the namespace of the Management Subsystem to trigger the restore process:

```
$ kubectl create -f mgmtrestore_cr.yaml -n <namespace-of-mgmt-susbystem>
```

4. You can list current restores using the following command:

```
$ kubectl get managementrestore -n <namespace-of-mgmt-subsystem> --sort-by=.metadata.creationTimestamp
```

Here is an example of some possible output:

- SFTP:

NAME	PITR	AGE	STATUS	BACKUP	CLUSTER	MESSAGE
mgmt-restore-ptx6d		6m31s	Complete	mgmt-backup-w4h8c	m1	Restore process completed (DB Restore + DRR job)

- S3

NAME	PITR	STATUS	BACKUP	CLUSTER	MESSAGE
mgmt-restore-hr9zx		Complete	mgmt-backup-xnjkl	m1	Restore process completed (DB Restore + DRR job)
2020-11-23 23:08:32+00		9m8s			

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Troubleshooting management subsystem backups

You can troubleshoot failures of the management subsystem backups.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from. See:

- [Troubleshooting resiliency issues](#)  
Resolve resiliency issues with API Connect management system backups.
- [Troubleshooting stanza-create job for S3 backup configuration](#)  
Troubleshoot configuration of s3 backups when the stanza-create job fails.
- [Restore failure with bootstrap pod error](#)  
Postgres bootstrap pod reports an error and restore does not progress.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Troubleshooting resiliency issues

Resolve resiliency issues with API Connect management system backups.

### pgbackrest-shared-repo resiliency problems

If the Kubernetes node hosting pgbackrest-shared-repo pod is down and the PVC attached to the pod has strict zone requirements (for example, in AWS or other clouds) or if the storage class is set to `local-storage`, then pgbackrest-shared-repo pod will not get rescheduled to another Kubernetes node.

As a result, there is a single point of failure and the following conditions might occur:

- Backups of the management database fails
- Disk space fills with accumulated Postgres wal (Write-Ahead Logging) files

To avoid this problem, monitor the disk usage: [Monitoring Postgres disk usage](#).

When the Kubernetes node comes back up, the pod is scheduled and all the processes should resume properly.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Troubleshooting stanza-create job for S3 backup configuration

Troubleshoot configuration of s3 backups when the stanza-create job fails.

When you configure Management subsystem backups for s3 providers, the operator runs a `stanza-create` job. This job creates the stanza (Postgres cluster configuration) on the upstream S3 server, which is used for backup and archive procedures. The job also brings up the necessary pod.

Check the status of the `stanza-create` job:

```
kubectl get jobs -n <namespace> | grep stanza
```

On failure:

- `stanza-create` pods fail, and job status is 0/1:

```
kubectl get jobs | grep stanza
m1-3bfe12ac-postgres-stanza-create      0/1      32m      32m
```

- Listing all pods brought up by `stanza-create` job shows multiple pods because a job tries `backoffLimit` times to complete the job. By default, there will be 7 pods in error state:

```
kubectl get pods | grep stanza
m1-3bfe12ac-postgres-stanza-create-726z4 0/1      Error    0      11m
```

m1-3bfe12ac-postgres-stanza-create-9vq4n	0/1	Error	0	22m
m1-3bfe12ac-postgres-stanza-create-gbtgb	0/1	Error	0	30m
m1-3bfe12ac-postgres-stanza-create-gl5g5	0/1	Error	0	17m
m1-3bfe12ac-postgres-stanza-create-q8qhw	0/1	Error	0	26m
m1-3bfe12ac-postgres-stanza-create-t84zs	0/1	Error	0	8m54s
m1-3bfe12ac-postgres-stanza-create-z8tfs	0/1	Error	0	12m

Note: In some cases, the pods are cleaned by Kubernetes and the logs of these pods can be lost.

- Pod log errors show a reason for the failure. For example, when a hostname is not valid:

```
kubectl logs m1-3bfe12ac-postgres-stanza-create-gbtgb

time="2021-04-13T20:01:19Z" level=info msg="pgo-backrest starts"
time="2021-04-13T20:01:19Z" level=info msg="debug flag set to false"
time="2021-04-13T20:01:19Z" level=info msg="backrest stanza-create command requested"
time="2021-04-13T20:01:19Z" level=info msg="s3 flag enabled for backrest command"
time="2021-04-13T20:01:19Z" level=info msg="command to execute is [pgbackrest stanza-create --db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --repol-type=s3]"
time="2021-04-13T20:01:19Z" level=info msg="command is pgbackrest stanza-create --db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --repol-type=s3"
time="2021-04-13T20:05:21Z" level=error msg="command terminated with exit code 49"
time="2021-04-13T20:05:21Z" level=info msg="output=[]"
```

- Job status is set to `type: Failed` and `status: "True"`, with `reason: BackoffLimitExceeded`:

```
kubectl get job m1-3bfe12ac-postgres-stanza-create -o yaml

status:
  conditions:
  - lastProbeTime: "2021-04-13T20:28:03Z"
    lastTransitionTime: "2021-04-13T20:28:03Z"
    message: Job has reached the specified backoff limit
    reason: BackoffLimitExceeded
    status: "True"
    type: Failed
    failed: 7
  startTime: "2021-04-13T20:01:18Z"
```

- If pod logs are lost, you can execute a command inside the `backrest-shared-repo` pod:
  - Obtain the `backrest-shared-repo` pod name:

```
kubectl get pods -n <namespace> | grep backrest-shared-repo
```

For example:

```
kubectl get pods | grep backrest-shared-repo
m1-eb8edc18-postgres-backrest-shared-repo-98dd46cc6-tw195 1/1 Running
```

- Exec into the pod:

```
kubectl exec -it <backrest-shared-repo-pod> -- bash
```

- Run:

```
pgbackrest info --output json --repol-type s3
```

For example, for invalid hostname:

```
ERROR: [049]: unable to get address for 'test1-v10-backup.s3.exampleaws.com': [-2] Name or service not knownCopy
```

The exact **ERROR**: will vary depending on the misconfiguration. Common errors:

- Invalid access key
- Invalid access key secret
- Invalid bucket region
- Invalid bucket or folder path

- To fix the incorrect settings, see [Reconfiguring or adding backup settings after installation of the management subsystem](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Restore failure with bootstrap pod error

Postgres bootstrap pod reports an error and restore does not progress.

### Symptoms

The postgres bootstrap pod goes into an error state. Subsequent bootstrap pods come up showing `running`, but the restore does not progress. The logs of the postgres bootstrap pod show:

```

2022-08-01 15:03:58,337 INFO: Lock owner: None; I am management-09384302-postgres-bootstrap-v6xwz
2022-08-01 15:03:58,337 INFO: not healthy enough for leader race

patroni.exceptions.PatroniFatalException: 'Failed to bootstrap cluster'

```

## Resolution

Delete the Kubernetes API Connect ManagementCluster oplock and restore job, then start the restore again:

```

kubectl delete cm <cr name>-oplock
kubectl delete mgmtr <restoreCR name>

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Backing up and restoring the Developer Portal in a Kubernetes environment

You can back up and restore your Developer Portal service in your Kubernetes environment.

### Before you begin

Important: If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. The backups of the Management and Portal must be taken at the same time to ensure that the Portal sites are consistent with Management database.

### About this task

To complete a backup and restore of your Developer Portal, you must have the **custom resource** configured with the **portalBackup** subsection. Backups can be scheduled or generated manually (on-demand). You can then list what backups are available and then use one to restore your Developer Portal if required. Ensure that your backup **path** has the correct permissions to allow your backup user to be able to read and write to it from within the Developer Portal. CR, **custom resource**, templates are provided in the **helper\_files** archive to install each API Connect subsystem. You decompressed these files into an installation folder of your choosing in [Deploying operators](#).

Note: For points to consider when you are backing up and restoring a two data center disaster recovery deployment on Kubernetes, see [Backup and restore considerations for a two data center deployment](#).

The default Developer Portal backup schedule is once every 24 hours, but the schedule can be changed in the backup settings. The Developer Portal saves all system and site backups locally, and also saves them remotely based on the configured SFTP and s3 settings.

The local backups are automatically maintained so that the latest three backups of each site and of the system are kept, and older backups are removed. This maintenance means that the Developer Portal retains the latest three backups for each site and for the system however old they are, but there is no deletion of the old backups on the remote server. If a site is deleted, then all of the local backups for that site are also deleted, as otherwise the backup volume might become full of old site backups. For remote backups, you can configure a retention policy on your remote server to remove the old backup files as required.

### Procedure

- If you haven't already, configure your Developer Portal **custom resource** with the **portalBackup** subsection.
  1. Create your Developer Portal backup secret.
 

The backup secret is a Kubernetes secret that contains your credentials for accessing the s3 or SFTP backup database.

    - s3

Only password-based authentication is supported for s3, not authentication based on public certificates and private keys. Password-based authentication for s3 requires that you generate an access key and secret. For example:

- IBM (Cloud Object Storage): [Service credentials](#).
- AWS: [Managing access keys](#).

The secret can be created with the following command:

```
kubectl create secret generic portal-backup-secret --from-literal=username='<YOUR ACCESS KEY OR USER NAME>'
--from-literal=password='<YOUR ACCESS KEY SECRET OR PASSWORD>' -n <namespace-of-portal-subsystem>
```

- SFTP

Supported credentials types:

- Username and password (v10.0.2.0 or later).
- Username and SSH-key (v10.0.3.0 or later). Only OpenSSH keys are supported.<sup>1</sup>

Use one of the following commands to create the secret:

- Username and password credentials

```
$ kubectl create secret generic portal-backup-secret --from-literal=username='<YOUR USERNAME>'
--from-literal=password='<YOUR PASSWORD>' -n <namespace-of-portal-subsystem>
```

- Version 10.0.3.0 or later: Username and SSH-key credentials:

```
$ kubectl create secret generic portal-backup-secret --from-literal=username='<YOUR USERNAME>'
--from-file=ssh-privatekey='<YOUR PRIVATEKEY FILE>' -n <namespace-of-portal-subsystem>
```

2. Ensure that your Developer Portal **custom resource** is configured with the **portalBackup** subsection.

- All of your settings must be added in the **spec**: section of the file.
- To schedule automated backups, specify values for the **schedule** setting.

An example when you use **protocol**:

**objstore**.

```
spec:
  portalBackup:
    credentials: portal-backup-secret
    host: s3.eu-gb.cloud-object-storage.appdomain.cloud/
    path: test-bucket/restore-test
    port: 443
    protocol: objstore
    backupCerts: <custom-s3-server-CA-cert>
    backups3URISyle: <host-or-path>
    schedule: '0 2 * * *'
```

An example when you use **protocol**:

**sftp**.

```
spec:
  portalBackup:
    credentials: portal-backup-secret
    host: sftp-service.example.com
    path: /home/fvtuser/site-backups
    port: 22
    protocol: sftp
    schedule: '0 2 * * *'
```

Notes about **portalBackup**: entry:

- If **portalBackup**: entry is not present or contain nothing, just **local** backups will be taken if a backup CR is created. If the **schedule** exists, backups are taken at the scheduled time.
- For S3 and SFTP, **portalBackup**: entry must contain host, credentials, protocol, and path.
- For s3, the **portalBackup**: section can optionally also contain either, or both, of **backupCerts** and **backups3URISyle**.

Table 1. Developer Portal backup settings

Setting	Description
<b>credentials</b>	<p>The name of the secret you created.</p> <p>Supported credential types:</p> <ul style="list-style-type: none"> <li>• s3 Only password-based authentication is supported for s3, not authentication based on public certificates and private keys. Password-based authentication for s3 requires that you generate an access key and secret.</li> <li>• SFTP <ul style="list-style-type: none"> <li>• Username and password (v10.0.2.0 or later)</li> <li>• Username and SSH-key (v10.0.3.0 or later)</li> </ul> </li> </ul> <p>To create a secret, see step <a href="#">1</a>.</p>
<b>host</b>	<ul style="list-style-type: none"> <li>• s3 - <b>host</b>: is the S3 endpoint with the corresponding S3 region in the format <b>&lt;S3endpoint&gt;</b>, or with an optional S3 region in the format <b>&lt;S3endpoint&gt;/&lt;S3region&gt;</b>.</li> <li>• sftp - the hostname of the sftp server</li> </ul>
<b>path</b>	<ul style="list-style-type: none"> <li>• S3 - the name of your S3 bucket to store backup data, optionally followed by a / and then any subdirectories inside the bucket. Valid examples: <b>bucket</b> <b>bucket/path</b> <b>bucket/lots/of/paths</b></li> <li>• sftp - the full absolute path of the folder on the SFTP server, beginning with /.</li> </ul>

Setting	Description
<code>port</code>	The port for the protocol to connect to the host. <ul style="list-style-type: none"> <li>S3 - Ignored for S3 (because objstore always uses port 443)</li> <li>SFTP - Defaults to 22 if not specified</li> <li>local - Ignored for local</li> </ul>
<code>protocol</code>	The protocol that is used to communicate with your remote backup endpoint. Specify one of the following values: <ul style="list-style-type: none"> <li><code>sftp</code> - for secure file transfer protocol.</li> <li><code>objstore</code> - for S3 compatible object storage.</li> </ul>
<code>backupCerts</code>	(S3 storage only) <code>backupCerts</code> is the name of a custom certificate that contains your upstream custom S3 CA certificate. Supported beginning with 10.0.2. Note: If you use a public certificate for the S3 storage provider, it must be signed by a known certificate authority that is trusted by API Connect. Use of an untrusted authority can cause the following error during backup upload: <pre>x509: certificate signed by unknown authority</pre> This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be <code>ca.crt</code> and the value is the base64-encoded value of the CA certificate. If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Portal subsystem already trusts the server certificate. You can test this by configuring the Portal backup to your S3/object-store server without providing the CA certificate. If you do need to provide the CA certificate then you must provide the entire chain in the <code>ca.crt</code> member of the secret, as follows: <pre>intermediate-certificate-1 intermediate-certificate-2 . . . intermediate-certificate-n root-certificate</pre> Where the first certificate in the <code>ca.crt</code> member (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the <code>ca.crt</code> member is the issuer of the preceding certificate. The root certificate in the <code>ca.crt</code> member must be self-signed. If there are no intermediate certificates involved, then the <code>ca.crt</code> member contains only the root certificate. The following sample bash script creates the Kubernetes secret: <pre>cat &gt;customs3ca.yaml &lt;&lt;EOF apiVersion: v1 data:   ca.crt: \$(base64 &lt;path-to-ca-certificate&gt;   tr -d '\n' ) kind: Secret metadata:   name: custom-server-ca   type: generic EOF kubectl apply -f customs3ca.yaml -n &lt;namespace&gt;</pre>
<code>backups3URIS</code> <code>style</code>	(S3 storage only) Optional - <code>backups3URIS</code> indicates whether URIs to your S3 backup should use specify a host or a path value. When not specified, default to <code>host</code> . Supported beginning with 10.0.2. Valid values: <code>host</code> and <code>path</code> . Some custom S3 providers require URI style to be set to <code>path</code> . For example, MinIO supports both <code>host</code> and <code>path</code> style setup. You can create a MinIO S3 server to only accept <code>path</code> style client communications. <b>Important:</b> Contact your custom S3 administrator before configuring this field. If not properly configured, an upstream custom S3 can reject connections from the client, such as the API Connect Management subsystem.
<code>schedule</code>	The schedule for how often automatic Developer Portal backups are run. The format for the schedule is any valid cron string. The timezone for backups is UTC. Valid for all backup types: s3, sftp, and local. <pre>spec:   portalBackup:     credentials: portal-backup-secret     host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard     path: test-bucket/restore-test     port: 443     protocol: objstore     schedule: '0 2 * * *'</pre>

- Reconfiguring Developer Portal backups  
You can edit the deployed Developer Portal `custom` resource You might want to do an edit if you did not include a `portalBackup` section before the installation. Or, if you made a mistake in your `portalBackup`, or if you'd like to change the `portalBackup` config.To edit your `portalcluster` CR:
  - Get the name of your `portalcluster` CR:  

```
kubectl get portalcluster -n <namespace-of-portal-subsystem>
```
  - Edit your `portalcluster` CR:  

```
kubectl edit portalcluster <name-of-portal-cr> -n <namespace-of-portal-subsystem>
```
  - Inside the `spec`, add the `portalBackup` section as explained in step 2.
  - Write and quit `wq`.
- How to generate a manual backup.

You can use these steps to configure a Developer Portal with backups that use IBM's Cloud Object Storage S3, AWS S3, or SFTP.

Decide which of the three types of manual backups you want to do:

- o **all**: backs up the Developer Portal system and all its sites to the remote server
- o **system**: backs up the Developer Portal system to the remote server
- o **site**: backs up a Developer Portal site to the remote server

1. You generate a backup manually by creating a `portalBackup custom resource` that is detected by the `ibm-apiconnect` operator that then triggers the backup process.

You can use `portalbackup_cr.yaml` in the `helper_files` directory as an example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  generateName: portal-bup-
spec:
  type: all
  crType: create
  comment: "test comment"
```

- **type**: is the type of backup to be done. Valid arguments are:
  - `all`
  - `system`
  - `site`
- **crType**: Use `create` to trigger a backup process. When the backup is created, the operator generates another backup CR with **crType**: `record`, which represents the stored backup that you can use for a restore operation.
- **comment**: you can optionally add a comment to the CR before you create a backup.
- **siteName**: used only when you take a site backup. Valid arguments are:
  - `site uuid or url` - back up that site only to the remote server
  - `installed` - backups all installed sites to the remote server

2. Create the `PortalBackup custom resource` in the `namespace` of your Developer Portal to trigger the backup process:

```
kubectl create -f portalbackup_cr.yaml -n <ns-of-portal-subsystem>
```

3. Optional: You can list current backups by using the command:

```
kubectl get portalbackup -n <ns-of-portal-subsystem>
```

Here is an example of some possible output:

NAME	ID	STATUS	TYPE	CR TYPE	AGE	COMMENT
p1-bup-gqz8f	20200526.142449	Ready	system	record	55m	
p1-bup-jx4vc	20200526.142458	Ready	site	record	54m	
p1-bup-st412		Ready	all	create	56m	y
p1-bup-th2dm		Ready	all	create	4h51m	y

Tip: If you want to order your `portalbackups` by ID, you can use the Kubernetes keyword `--sort-by`. For example:

```
kubectl get pb -n <ns> --sort-by=.status.backupId
```

4. Optional: You can get a detailed view of a specific backup by using the command:

```
kubectl get portalbackup <bup-name> -n <ns-of-portal-subsystem> -o yaml
```

Here is an example of some possible output:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  creationTimestamp: "2020-10-01T10:00:16Z"
  generateName: portal-bup-
  generation: 1
  name: portal-bup-g66gv
  namespace: default
  resourceVersion: "8940"
  selfLink: /apis/portal.apiconnect.ibm.com/v1beta1/namespaces/default/portalbackups/portal-bup-g66gv
  uid: b1d5b295-b966-48f2-b6ef-dfcd1c499741
spec:

```

- How to restore a Developer Portal subsystem.  
Ensure that the backup method that you used is complete before you attempt a restore. The backup data that is stored in the remote server is used for restoring the Developer Portal subsystem data back to a previous state. Ensure that these backups are on your remote server before you attempt a restore.

There are three types of restores:

- **all**: restores the Developer Portal system and all the sites that are found on the remote server by using the latest backup.
- **system**: restores the Developer Portal system to the remote server
- **site**: restores the Developer Portal site from the remote server

1. Decide on the options to use for your **PortalRestore custom resource**. The **PortalRestore custom resource** is detected by the **ibm-apiconnect** operator that then triggers the backup process.

You can use **portalrestore\_cr.yaml** in the **helper\_files** directory as an example:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  generateName: portal-restore-
spec:
  type: all
  dryRun: true
  timestamp: now
  priorityList:
  - myportal-critical-site.com
  - myportal-important.com

```

- **type**: is the type of restore to be done. Valid arguments are:
  - all
  - system
  - site
- **siteName**: used only when you took a site backup. Valid arguments are:
  - ID, for example 20200526.142458: the backup ID of a portal backup CR. The ID must be taken from a portal backup that is of **type site**, and **crType record**.
  - site-1234.tgz: restore the site by using this file name that exists on the local file system or remote server.
  - myportal.com: find the latest backup for this URL (locally or remotely) and restore it.
  - all: restore all sites that are found on the remote server by using the latest backup.
  - site uuid or url - back up that site only to the remote server
  - installed - backups all installed sites to the remote server.
- **systemName** - Valid arguments are:
  - ID, for example 20200526.142449: the backup ID of a portal backup CR. The ID must be taken from a portal backup that is of **type system**, and **crType record**.
  - system\_backup-1234.tgz: restores the system from the given file that exists on the pod's local file system or the remote server.
  - latest: restores from latest system backup that is found from either local file system or remote server.
- **timestamp** - Valid arguments are:
  - now: use the latest backups available.
  - < TIMESTAMP >: in 'YYYYMMDD.HHMMSS' format, specify a timestamp to retrieve the backup from. The nearest backup, searching backwards from this timestamp, is used.

Note: From IBM® API Connect Version 10.0.3.0, the timestamp format changed to **YYYYMMDD.HHMMSS**. For Version 10.0.2.0 and earlier, the timestamp format is **YYYY-MM-DD HH:MM:SS**.
- **dryRun** - Valid arguments are:
  - true: runs a dry run of the command, returning the actions that will be taken. These actions can be found in the custom resource by following step 4.
  - false: runs the command, restoring and replacing the system files and all sites. Any existing sites are reinstalled.
- **priorityList** - Prioritizes the restore of any sites. The sites are listed in the order in which they are provided. They are queued for restore first, followed by any remaining sites present in the backup location. Valid arguments are:
  - myportalsite.com
  - mysecondportalsite.com

Table 2. The options that are needed for each Developer Portal restore

	all	system	site
type	X	X	X
siteName			X
systemName		X	
timestamp	X		
dryRun	X		
priorityList	X		

2. Create the **PortalRestore** custom resource in the namespace of the Developer Portal subsystem to trigger the restore process:

```
kubectl create -f portalrestore_cr.yaml -n <ns-of-portal-susbystem>
```

3. Optional: You can list current restores by using the command:

```
kubectl get portalrestore -n <ns-of-portal-susbystem>
```

Here is an example of some possible output:

```

NAME                READY   AGE
portal-restore-twjrp Ready   28s

```

4. Optional: You can get a detailed view of a specific restore by using the command:

```
kubectl get portalrestore <restore-name> -n <ns-of-portal-susbystem> -o yaml
```

Here is an example of some possible output:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  creationTimestamp: "2020-11-11T10:14:39Z"

```

- Troubleshooting

1. Check the Developer Portal backup CR or restore CR.  
Use command:

```
kubectl get <portalbackup/portalrestore> <bup-name/restore-name> -n <namespace> -o yaml
```

Here is an example of some possible output:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  creationTimestamp: "2020-05-26T13:10:46Z"
  generateName: portal-restore-
  generation: 1
  name: portal-restore-x2bf9
  namespace: portal
  resourceVersion: "1493471"
  selfLink: /apis/portal.apiconnect.ibm.com/v1beta1/namespaces/portal/portalrestores/portal-restore-x2bf9
  uid: 9f6ale22-55ab-4595-8b98-bdfaec40d58c
spec:
  type: site
status:
  backupId: ""
  commentLeft: ""
  conditions:
  - lastTransitionTime: "2020-05-26T13:10:49Z"
    message: |
      Please provide a site to restore. To restore all sites use value 'all' in the CR
    status: Failed
    type: Ready
  fullBackupName: ""
  id: ""
  message: ""

```

Read the message inside the conditions of the Developer Portal backup CR or the restore CR.

2. Retrieving logs

Look for information in the logs of the `ibm-apiconnect` pod:

- Locate the `ibm-apiconnect` pod with:

```
kubectl get pods -n <namespace-of-portal-subsystem>
```

- View the logs with:

```
kubectl logs <ibm-apiconnect-pod-NAME> -n <namespace-of-portal-subsystem>
```

<sup>1</sup> PuTTY style keys can be converted to OpenSSH by using the PuTTY Key Generator (PuTTYgen) application; see <https://www.puttygen.com/>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Backing up and restoring the analytics database

The IBM® API Connect Analytics database can be backed up and restored from an S3 repository. S3 compatible object storage is required; for example, IBM Cloud Object Storage.

### About this task

Before you can initiate a backup or restore operation, you must update the Analytics CR (custom resource) to configure your settings. Generating a backup for Analytics is performed on demand by deploying a backup CR. You can deploy a restore CR to start the restoration of a previously generated backup.

- [Configuring backup settings for Analytics](#)  
Configure the IBM API Connect Analytics subsystem on Kubernetes to support backing up and restoring the Analytics database.
- [Running a backup of the Analytics database](#)  
Deploy the `analyticsbackup_cr.yaml` CR to initiate a backup of the IBM API Connect Analytics database on Kubernetes.
- [Restoring the Analytics database](#)  
Deploy the `analyticsrestore_cr.yaml` CR to initiate restoration of a backup of the IBM API Connect Analytics database on Kubernetes.
- [Troubleshooting Analytics backup and restore](#)  
If you encounter problems when backing up or restoring the IBM API Connect Analytics database on Kubernetes, review the following troubleshooting tips.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring backup settings for Analytics

Configure the IBM® API Connect Analytics subsystem on Kubernetes to support backing up and restoring the Analytics database.

### About this task

The Analytics database can be backed up and restored from an S3 repository. S3-compatible object storage is required; for example, IBM Cloud Object Storage. Generating a backup for Analytics is performed on demand by creating the a backup CR (custom resource). You can create a restore CR to start the restoration of a previously generated backup.

Note: You can only run one backup or restore process at a time.

### Procedure

1. Create the analytics backup secret for your S3-compatible storage:
  - a. Obtain an access key and corresponding access key secret from your S3 provider.  
For example, you might obtain the key and secret from one of the following providers, using the instructions found on their sites:
    - [IBM Cloud Object Storage](#)
    - [AWS](#)
  - b. Create the Kubernetes secret by running the following command and filling in your access key, access key secret, and namespace:

```
kubectl create secret generic analytics-backup-secret --from-literal=username='Your_Access_Key' --from-literal=password='Your_access_key_secret' -n Namespace_of_Analytics_Subsystem
```
2. Add the backup configuration to the Analytics CR:
  - a. Open the `analytics_cr.yaml` file for editing.  
If you already installed Analytics without configuring backup settings, run the following command to open the deployed version of the Analytics CR:

```
kubectl edit analyticscluster analytics_cr -n namespace
```

where:
    - `analytics_cr` is the name of the YAML file containing the Analytics CR
    - `namespace` is the name of the Analytics namespace
  - b. In the `spec` section, add a `databaseBackup` section and configure the backup settings as shown in the following example:

```
spec:
  databaseBackup:
    credentials: analytics-backup-secret
    host: s3.eu-gb.cloud-object-storage.appdomain.cloud
    path: my-s3-bucket/apic-analytics-backups
    backupCerts: <custom-s3-server-CA-cert>
    schedule: "0 2 * * *"
    enableCompression: true
```

```
chunkSize: 1GB
enableServerSideEncryption: false
```

where:

- **credentials** is the name of the Kubernetes secret you created in step 1
- **host** is the S3 endpoint with the corresponding S3 region in the format:  
`s3.s3region.s3domain`  
Attention: A path style host value (formatted as `S3endpoint/S3region`) is not supported.
- **path** is a combination of the S3 bucket and the base path within the bucket, using the format: `bucket_name/path`
- **backupCerts** is the name of a custom certificate that contains your upstream custom S3 CA certificate. Supported beginning with 10.0.2. This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be `ca.crt` and the value is the base64-encoded value of the CA certificate.

If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Analytics subsystem already trusts the server certificate. You can test this by configuring the Analytics backup to your S3/object-store server without providing the CA certificate.

If you do need to provide the CA certificate then you must provide the entire chain in the `ca.crt` member of the secret, as follows:

```
intermediate-certificate-1
intermediate-certificate-2
.
.
intermediate-certificate-n
root-certificate
```

Where the first certificate in the `ca.crt` member (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the `ca.crt` member is the issuer of the preceding certificate. The root certificate in the `ca.crt` member must be self-signed.

If there are no intermediate certificates involved, then the `ca.crt` member contains only the root certificate.

The following sample bash script creates the Kubernetes secret:

```
cat >customs3ca.yaml <<EOF
apiVersion: v1
data:
  ca.crt: $(base64 <path-to-ca-certificate> | tr -d '\n' )
kind: Secret
metadata:
  name: custom-server-ca
type: generic
EOF

kubect1 apply -f customs3ca.yaml -n <namespace>
```

- **schedule** is the schedule that determines how often backups will be invoked automatically. The format for the schedule is any valid `cron` string. The timezone for backups is that of the kube-controller-manager. Backing up once a day is probably sufficient; remember that the more frequently you run backups, the more storage space you need.
- Optional: **enableCompression** determines whether metadata files are stored in compressed format. Default value is true.
- Optional: **chunkSize** specifies how large files are stored. Large files can be stored as chunks when the snapshot is created. This setting specifies the size of the chunks as GB, MB, or KB. Default value is 1GB.
- Optional: **enableServerSideEncryption** determines whether files are encrypted. When set to true, files are encrypted on the server side using AES256. Default value is false.

3. Save and close the file.

4. Install or modify the Analytics subsystem with the updated CR as explained in [Installing analytics](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Running a backup of the Analytics database

Deploy the `analyticsbackup_cr.yaml` CR to initiate a backup of the IBM® API Connect Analytics database on Kubernetes.

### Before you begin

[Configure backup settings for Analytics](#).

### About this task

A backup is triggered by creating the `analyticsbackup_cr.yaml` CR. The new CR is detected by the `ibm-apiconnect` operator, which requests a new backup.

### Procedure

1. Create the **AnalyticsBackup** CR for your deployment in a file called `analyticsbackup_cr.yaml`. The following code shows the sample `analyticsbackup_cr.yaml`, which is stored in the `helper_files` directory:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsBackup
metadata:
  generateName: a7s-bup-
spec:
  crType: create
  comment: "test comment"
  indices:
  - ui
  enableIgnoreUnavailable: true
```

2. In your copy of the CR, update the following settings:
  - **crType** - Use `create` to trigger a backup process. When the backup is created, the operator generates another backup CR with **crType**: `record`, which represents the stored backup that you can use for a restore operation.
  - Optional: **comment** - You can use this field to describe the back up for later reference.
  - Optional: **indices** - A list of index names or keywords, indicating which indices you want to back up. If no indices are specified, then all indices are backed up. The following supported keywords are mapped to indices or aliases in Elasticsearch:
    - **all** - Backup all data. This is equivalent to listing all of the remaining keywords (**apievents**, **ui**, **config**).
    - **apievents** - Backup all analytics data.
    - **ui** - Backup all UI visualizations and dashboards.
    - **config** - Backup all configuration information, such as the retention period.
  - Optional: **enableIgnoreUnavailable** - Default value is `false`. If set to `false`, the backup fails if a specified index is not present. If set to `true`, missing indices are skipped and the backup continues.
3. Deploy your CR by running the following command to create it in the namespace for your Analytics subsystem:

```
kubectl create -f analyticsbackup_cr.yaml -n namespace
```

where `namespace` is the name of the Analytics namespace.

The backup's name and ID are generated when the backup operation runs.

4. To get a list of available backups, run the following command:

```
kubectl get analyticsbackup -n namespace
```

The response looks like the following example:

NAME	STATUS	ID	CR TYPE	INDICES	AGE	COMMENT
a7s-bup-266p8	Ready		create	[all]	20h	Y
a7s-bup-pffd8	Ready		create	[all]	34h	Y
analytics-bup-kxwq5	Ready	analytics-all-2020-09-07t03:49:15utc	record	[ui apievents config]	34h	
analytics-bup-p29z8	Ready	analytics-all-2020-09-07t18:04:03utc	record	[ui apievents config]	20h	

5. Display the details for a particular backup by running the following command:  
Use the backup name from the results in step 4.

```
kubectl get analyticsbackup backup_NAME -n namespace -o yaml
```

The result looks like the following example:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsBackup
metadata:
  creationTimestamp: "2020-05-20T16:18:05Z"
  generateName: a7s-bup-
  generation: 1
  name: a7s-bup-gb6s5
  namespace: my-namespace
  resourceVersion: "867329"
  selfLink: /apis/analytics.apiconnect.ibm.com/v1beta1/namespaces/my-namespace/analyticsbackups/a7s-bup-gb6s5
  uid: f43b8400-733d-411a-9e9a-de2166bbfb0a
spec:
  indices:
  - ui
status:
  conditions:
  - lastTransitionTime: "2020-05-20T16:18:24Z"
    message: SUCCESS
    status: Complete

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Restoring the Analytics database

Deploy the `analyticsrestore_cr.yaml` CR to initiate restoration of a backup of the IBM® API Connect Analytics database on Kubernetes.

## Before you begin

[Create a backup.](#)

## About this task

A restore operation is triggered by creating the `analyticsrestore_cr.yaml` CR. The new CR is detected by the `ibm-apiconnect` operator, which requests a restore of the specified backup.

Note: You can only run one backup or restore process at a time.

## Procedure

1. Get a list of available backups by running the following command:

```
kubectl get analyticsbackup -n namespace
```

where `namespace` is the name of the Analytics namespace.

The response looks like the following example. Note down the ID of the backup that you want to restore.

NAME	STATUS	ID	CR TYPE	INDICES	AGE	COMMENT
a7s-bup-266p8	Ready		create	[all]	20h	y
a7s-bup-pffdh	Ready		create	[all]	34h	y
analytics-bup-kxwq5	Ready	analytics-all-2020-09-07t03:49:15utc	record	[ui apievents config]	34h	
analytics-bup-p29z8	Ready	analytics-all-2020-09-07t18:04:03utc	record	[ui apievents config]	20h	

2. Get the ID of the backup that you want to restore:

Note: You can only restore the Analytics subsystem from backups where the `CR TYPE` is `record`.

```
kubectl describe a7b analytics-bup-kxwq5 -n namespace
```

where:

- `analytics-bup-kxwq5` is the NAME of a backup of CR type `record`
- `namespace` is the name of the Analytics namespace

The response looks like the following example. Note down the ID.

```
Successful: 7}}
```

```
Id: analytics-all-2020-09-07t03:49:15utc
Phase: Ready
State:
```

3. Create the `AnalyticsRestore` CR for your deployment in a file called `analyticsrestore_cr.yaml`.

The following code shows the sample `analyticsrestore_cr.yaml`, which is stored in the `helper_files` directory:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsRestore
metadata:
  generateName: a7s-restore-
spec:
  indices:
  - ui
  backupID: analytics-all-2020-09-07t03:49:15utc
  enableIgnoreUnavailable: true
  enableOverride: false
```

4. In your copy of the CR, update the following settings:

- `indices` - A list of index names or keywords, indicating which indices you want to back up. If no indices are specified, then all indices are backed up. The following supported keywords are mapped to indices or aliases in Elasticsearch:
  - `all` - Restore all data. This is equivalent to listing all of the remaining keywords (`apievents`, `ui`, `config`).
  - `apievents` - Restore all analytics data.
  - `ui` - Restore all UI visualizations and dashboards.
  - `config` - Restore all configuration information, such as the retention period.
- `backupID` - The ID of the backup to be restored, which you obtained in step 2.
- `enableIgnoreUnavailable` - Default value is `false`. If set to `false`, the restore fails if a specified index is not present in the backup identified by the `backupID`. If set to `true`, missing indices are skipped and the restore continues.
- `enableOverride` - Default value is `false`. If set to `true`, then the restore overrides existing indices. When `enableOverride` is set to `false` and you specified indices that already exist in the database that you are restoring, then the restore fails. The failure prevents you from accidentally replacing or losing data that exists in the current database.

5. Deploy your CR by running the following command to create it in the namespace for your Analytics subsystem:

```
kubectl create -f analyticsrestore_cr.yaml -n namespace
```

where `namespace` is the name of the Analytics namespace.

The restore's name is generated when the restore operation runs.

6. To get a list of restores, run the following command:

```
kubectl get analyticsrestore -n namespace
```

The response looks like the following example.

NAME	STATUS	ID	AGE
a7s-restore-9z4fr	Warning	analytics-all-2020-09-07t03:49:15utc	47h

7. Display the details for a particular restore by running the following command:

Use the restore name from the results in step 6.

```
kubectl get analyticsrestore restore_NAME -n namespace -o yaml
```

The result looks like the following example:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsRestore
metadata:
  creationTimestamp: "2020-10-21T15:06:03Z"
  generateName: a7s-restore-
  generation: 1
  name: a7s-restore-9z4fr
  namespace: my-namespace
  resourceVersion: "975152"
  selfLink: /apis/analytics.apiconnect.ibm.com/v1beta1/namespaces/my-namespace/analyticsrestores/a7s-restore-9z4fr
  uid: fdda9105-17ab-44ac-83de-852620a4dcde
spec:
  backupID: analytics-all-2020-09-07t03:49:15utc
  enableIgnoreUnavailable: false
  enableOverride: true
  indices:
  - ui
status:
  conditions:
  - lastTransitionTime: "2020-10-21T18:07:05Z"
    message: WARNING
    status: Warning
    type: Ready
  details: |
    &{NumberOfDataNodes:1
    Status:yellow
    ActivePrimaryShards:23
    ActiveShards:23
    RelocatingShards:0
    InitializingShards:0
    UnassignedShards:40
    PendingTasks:0}
  id: analytics-all-2020-09-07t18:04:03utc
```

When the restore is successfully started, the **status: condition** section displays **Running**. If the restore does not start correctly, the **status: condition** section displays **Failed**.

The restore process is successful when the storage cluster status is green, there are no unassigned shards, and there are no initializing shards. At that time the **status: condition** section displays **Complete**. If **status: Complete** is not achieved after 3 hours, the status changes to **Warning** and the details are no longer updated.

Important:

- For deployment profiles with fewer than 3 storage nodes, the restore process is never marked as **Complete**. The storage cluster status is expected to be yellow and to have more than 0 unassigned shards. In this situation, the restore process is likely to be complete when there are 0 initializing shards.
- When you restore v2018 data after upgrading the development profile, there will be a short delay before the restored data displays in the Analytics user interfaces.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Troubleshooting Analytics backup and restore

If you encounter problems when backing up or restoring the IBM® API Connect Analytics database on Kubernetes, review the following troubleshooting tips.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

---

### Check the CR status

Look for messages in the **status** section of the backup or restore CR by running the following command:

```
kubectl get analytics[backup|restore] restore|backup_NAME -n namespace -o yaml
```

where:

- You specify whether to retrieve the `analyticsbackup` CR or the `analyticsrestore` CR
- `restore|backup_NAME` is the name that is generated when you initially deploy the backup or restore CR.
- `namespace` is the namespace where Analytics is deployed.

For example:

```
kubectl get analyticsbackup a7s-bup-gb6s5 -n analytics -o yaml
```

## Check the logs

Look for information in the logs of the `ibm-apiconnect` pod:

1. Locate the `ibm-apiconnect` pod by running the following command:

```
kubectl get pods -n namespace
```

2. View the logs with:

```
kubectl logs ibm-apiconnect-pod-NAME -n namespace
```

If there is a problem with your `databaseBackup` configuration, there are messages with the label "error" to indicate the problem

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Backups on OpenShift

You can backup and restore API Connect subsystems on OpenShift and Cloud Pak for Integration.

- [Backing up and restoring the management subsystem on OpenShift and Cloud Pak for Integration](#)  
You can use the following instructions to backup and restore your Management subsystem on OpenShift and Cloud Pak for Integration.
- [Backing up and restoring Developer Portal on OpenShift and Cloud Pak for Integration](#)  
You can back up and restore your Developer Portal service in your OpenShift or Cloud Pak for Integration environment.
- [Backing up and restoring the Analytics database on OpenShift and Cloud Pak for Integration](#)  
The IBM® API Connect Analytics database can be backed up and restored from an S3 repository. S3 compatible object storage is required; for example, IBM Cloud Object Storage.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Backing up and restoring the management subsystem on OpenShift and Cloud Pak for Integration

You can use the following instructions to backup and restore your Management subsystem on OpenShift and Cloud Pak for Integration.

- To complete a backup and restore of your Management subsystem, you must have the `custom resource` configured with the `databaseBackup` subsection in the management subsystem custom resource.
- Backups can be scheduled or generated manually (on-demand). You can then list what backups are available and then use one to restore your Management subsystem if required.
- Postgres replica pods depend on a successful completed backup. If backup configuration is not correct, replica pods won't come up.
- In v10.0.1.1-eus and later, a new parameter called `protocol` is required in `databaseBackup` section
- Restoring a backup restores the registration credentials (`client_ID`, `client_secret`) that were in use at the time that the selected backup was created. For information on the registration credentials, see [Changing the registration client id and client secret for applications](#).

Note: You must backup both the Management and Portal subsystems at the same time, to ensure synchronicity across the services.

## Types of backups supported

- Cloud-based S3 storage
  - IBM Cloud Object Storage
  - AWS S3
- SFTP
  - In v10.0.1.1-eus, SFTP backup/restore procedure is automatically handled by apiconnect operator.
  - In v10.0.1.0 and later, local Backups can be stored remotely on an sftp server, and retrieved later from the sftp server for restore operations. See [Using an sftp server for backup files \(v10.0.1.0\)](#).
- Local storage backups

## Support for Cloud Pak for Integration

IBM Cloud Pak for Integration is deployed on OpenShift, and uses the API Connect distribution for OpenShift. The backup and restore instructions in this section apply to both API Connect on OpenShift, and API Connect within a Cloud Pak for Integration environment.

When you perform configuration tasks you can use either a graphical user interface or a command line. The IBM Cloud Pak Platform UI differs from the OpenShift web console. The configuration topics in this section provide instructions for both interfaces. Note that Cloud Pak for Integration uses the OpenShift command line utility `oc`. Command line instructions for configuration are identical for both platforms.

- [Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)  
You can configure backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment. Use the appropriate instructions for the type of backup that you want to configure:
- [Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration](#)  
You can reconfigure the backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration.
- [Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration](#)  
You can generate a manual (non-scheduled) backup of the management subsystem in your OpenShift and Cloud Pak for Integration environments.
- [Restoring the management subsystem on OpenShift and Cloud Pak for Integration](#)  
You can restore your Management subsystem in your OpenShift and Cloud Pak for Integration environments.
- [Troubleshooting management subsystem backups on OpenShift and Cloud Pak for Integration](#)  
You can troubleshoot failures of the API Connect management subsystem backups in an OpenShift or Cloud Pak for Integration environment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration

You can configure backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment. Use the appropriate instructions for the type of backup that you want to configure:

- [Configuring S3 backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)  
Configure backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment.
- [Configuring SFTP backup settings for fresh install of the Management subsystem on OpenShift and Cloud Pak for Integration](#)  
Beginning with API Connect V10.0.1.1, you can configure SFTP backups for your Management subsystem in your OpenShift and Cloud Pak for Integration environments.
- [Configuring local backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)  
Configure local backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring S3 backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration

Configure backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment.

### Before you begin

---

If the `APIConnectCluster` instance is already created, do not use these instructions. Instead, add the Management backup configuration by following the instructions in [Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration](#).

### About this task

---

When creating an instance of API Connect, use the advanced configuration settings to configure database backups for the Management subsystem. Beginning with v10.0.2, the Management subsystem supports custom S3 solutions such as MinIO.

Important: For S3 backups of the management subsystem, do not use retention features provided by Cloud-based S3 storage providers. Use of such features can result in periodic deletion of archived backups, which can cause backup corruptions which can cause database restores to fail.

### Procedure

---

1. Create a backup secret.  
The backup secret is a Kubernetes secret that contains your username and password for your S3 backup database.

For examples of how to generate the appropriate access key and secret for two of them, see:

- IBM (Cloud Object Storage): [Service credentials](#).
- AWS: [Managing access keys](#).

The secret can be created with the following command:

```
oc create secret generic mgmt-backup-secret --from-literal=key='<YOUR ACCESS KEY>' --from-literal=keysecret='<YOUR ACCESS KEY SECRET>' -n <namespace_of_management_subsystem>
```

2. Configure the Management backup settings.

Create the **APIConnectCluster** installation CR and add the Management backup configuration using one of the following methods:

- OpenShift web console:
  - Navigate to Advanced Configuration, > ManagementSubsystem, > Advanced Configuration, > Database Backups, > Advanced Configuration
  - See the on-screen instructions for how to fill in each field. See also [Management subsystem settings](#).  
Note that there is downtime involved when changing S3 protocol backup configuration.
- IBM Cloud Pak Platform UI:
  - In the Platform UI for the API Connect cluster instance, select Configuration. On the Form UI tab, set Advanced Options to On.
  - See the on-screen instructions for how to fill in values for:
    - Credentials
    - Hostname
    - Path
    - Protocol
    - Restart DB (toggle on)
    - S3 Provider
    - Backup Credentials
    - Backup URI Style
    - Schedule (The timezone for backups is that of the node on which the postgres-operator pod is scheduled.)
    - Repo Retention

For more information, see [Management subsystem settings](#).

- YAML file: Use Table 1 for guidance while you define the backup settings as shown in the following example.

```
spec:
  management:
    databaseBackup:
      protocol: objstore
      s3provider: ibm
      host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
      path: apic-backup
      credentials: mgmt-backup-secret
      schedule: "0 3 * * *"
      repoRetentionFull: 2
```

Note: The `protocol` setting was introduced in v10.0.1.1. Do not specify it on v10.0.1.0 or earlier deployments

Table 1. Backup configuration settings

Setting	Description
<code>protocol</code>	The type of the backup; required in 10.0.1.1-eus and greater. For s3 storage, use <code>objstore</code> . When the parameter is not set, the backup type defaults to local storage backup.  Note: The <code>protocol</code> setting was introduced in v10.0.1.1. Do not specify it on v10.0.1.0 or earlier deployments
<code>s3Provider</code>	Name of the S3 provider to use. You must specify one of the supported values of <code>aws</code> , <code>ibm</code> , or <code>custom</code> . The <code>custom</code> option is supported beginning with 10.0.2 or later. If you use a custom S3 provider, you must also specify the <code>backupCerts</code> . Note: The public certificate on the S3 storage provider must be signed by a known certificate authority that is trusted by API Connect. Use of an untrusted authority can cause the following error during backup upload: <code>x509: certificate signed by unknown authority</code> .

Setting	Description
<b>backupCerts</b>	<p>The name of a custom certificate that contains your upstream custom S3 CA certificate. Supported beginning with 10.0.2. Used only when <b>s3Provider</b> is set to <b>custom</b>. Most of the custom S3 providers are created based on custom CA certificates.</p> <p>This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be <b>ca.crt</b> and the value is the base64-encoded value of the CA certificate.</p> <p>If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Analytics subsystem already trusts the server certificate. You can test this by configuring the Analytics backup to your S3/object-store server without providing the CA certificate.</p> <p>If you do need to provide the CA certificate then you must provide the entire chain in the <b>ca.crt</b> member of the secret, as follows:</p> <pre>intermediate-certificate-1 intermediate-certificate-2 . intermediate-certificate-n root-certificate</pre> <p>Where the first certificate in the <b>ca.crt</b> member (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the <b>ca.crt</b> member is the issuer of the preceding certificate. The root certificate in the <b>ca.crt</b> member must be self-signed.</p> <p>If there are no intermediate certificates involved, then the <b>ca.crt</b> member contains only the root certificate.</p> <p>The following sample bash script creates the Kubernetes secret:</p> <pre>cat &gt;customs3ca.yaml &lt;&lt;EOF apiVersion: v1 data:   ca.crt: \$(base64 &lt;path-to-ca-certificate&gt;   tr -d '\n' ) kind: Secret metadata:   name: custom-server-ca   type: generic EOF kubectl apply -f customs3ca.yaml -n &lt;namespace&gt;</pre>
<b>backups3URIS style</b>	<p>Indicates whether URIs to your S3 backup should use specify a host or a path value. Supported beginning with 10.0.2. Valid values: <b>host</b> and <b>path</b>.</p> <p>Used only when <b>s3Provider</b> is set to <b>custom</b>.</p> <p>Some custom S3 providers require URI style to be set to <b>path</b>. For example, MinIO supports both <b>host</b> and <b>path</b> style setup. You can create a MinIO S3 server to only accept <b>path</b> style client communications.</p> <p><b>Important:</b> Contact your custom S3 administrator before configuring this field. If not properly configured, an upstream custom S3 can reject connections from the client, such as the API Connect Management subsystem.</p>
<b>host</b>	For <b>objstore</b> type backup, specify S3 endpoint with the corresponding S3 region in the format <b>&lt;S3endpoint&gt;/&lt;S3region&gt;</b>
<b>path</b>	<p>The path to the location of the backup: For <b>objstore</b> backups, the name of your S3 bucket to store backup data. For example, <b>bucket-name/folder</b>. The use of subdirectories in the bucket name is not supported.</p> <p>Note: When your deployment includes a management subsystem in two different clusters (with active databases), the two management subsystems cannot use the same s3 bucket name in the database backup configurations. Each management subsystem must use a unique s3 bucket name.</p> <p>Ensure that <b>bucket-name/folder</b> is empty. If the folder was previously used for backups, the folder will not be empty, and stanza create might encounter an error.</p> <p><b>Explanation:</b> Once a folder is used, archive.info and backup.info files are created. During stanza creation, the process compares the database version and database system id between the two info files and the current Postgres database cluster. Stanza creation fails if there is a mismatch. To prevent this possibility, remove all files from the folder before configuring.</p>
<b>credentials</b>	For <b>objstore</b> type backups, the name of the Kubernetes secret containing your S3 Access Key / Key Secret
<b>schedule</b>	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> <li>• *****</li> <li>• -----</li> <li>•        </li> <li>•         +----- day of week (0 - 6) (Sunday=0)</li> <li>•       +----- month (1 - 12)</li> <li>•     +----- day of month (1 - 31)</li> <li>•   +----- hour (0 - 23)</li> <li>• +----- min (0 - 59)</li> </ul> <p>The timezone for backups is that of the node on which the postgres-operator pod is scheduled.</p> <p>There is no default backup schedule set. Be sure to set your backup schedule.</p> <p>All scheduled Management subsystem backups are of type <b>full</b> only.</p>

Setting	Description
repoRetentionFull	<p><b>v10.0.3.0 or later</b> - The number of full S3 backups to retain. When the next full backup successfully completes, and the specified number of retained backups is reached, the oldest full backup is deleted. All incremental backups and archives associated with the oldest full backup also expire. Incremental backups are not counted for this setting. Applies to both manual backups and scheduled backups.</p> <p>Minimum value: 1</p> <p>Maximum value: <b>9999999</b></p> <p>Default: none</p>

3. Verify that the configuration deploys successfully.

When you configure Management subsystem backups, the operator runs a `stanza-create` job. This job creates the stanza (Postgres cluster configuration) on the upstream S3 server, which is used for backup and archive procedures. The job also brings up the necessary pod.

Check the status of the `stanza-create` job:

```
oc get jobs -n <namespace> | grep stanza
```

- On success:

- The `stanza-create` job status is 1/1:

```
oc get jobs | grep stanza
m1-b722e361-postgres-stanza-create      1/1      5s      127m
```

- The `stanza-create` job shows `status: "True"` and `type: Complete`:

```
oc get job m1-b722e361-postgres-stanza-create -o yaml

status:
  completionTime: "2021-04-13T18:38:50Z"
  conditions:
  - lastProbeTime: "2021-04-13T18:38:50Z"
    lastTransitionTime: "2021-04-13T18:38:50Z"
    status: "True"
    type: Complete
  startTime: "2021-04-13T18:38:45Z"
  succeeded: 1
```

- The `stanza-create` pod is in `Completed` state:

```
oc get pods | grep stanza
m1-b722e361-postgres-stanza-create-q4fvp 0/1      Completed 0      127m
```

- Exec into the pod:

```
oc exec -it <backrest-shared-repo-pod> -- bash
```

- The `pgbackrest` command returns the S3 contents in valid JSON:

```
pgbackrest info --output json --repo1-type s3

"backup": {"held": false}, "message": "ok" } } [pgbackrest@m1-b722e361-postgres-backrest-shared-repo-69cdfd5-rs882 /
```

- On failure, see [Troubleshooting the stanza-create job for S3 backup configuration on OpenShift and Cloud Pak for Integration](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring SFTP backup settings for fresh install of the Management subsystem on OpenShift and Cloud Pak for Integration

Beginning with API Connect V10.0.1.1, you can configure SFTP backups for your Management subsystem in your OpenShift and Cloud Pak for Integration environments.

### Before you begin

If the `APIConnectCluster` instance is already created, do not use these instructions. Instead, add the Management backup configuration by following the instructions in [Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration](#).

### About this task

When creating an instance of API Connect, use the advanced configuration settings to configure database backups for the Management subsystem.

### Procedure

1. Create a backup secret.

The backup secret is a Kubernetes secret that contains your credentials for accessing the SFTP backup database. Supported credentials types:

- Username and password (v10.0.2.0 or later).
  - Username and SSH-key (v10.0.3.0 or later). Only OpenSSH keys are supported.<sup>1</sup>
- Use one of the following commands to create the secret:

- Username and password credentials

```
oc create secret generic mgmt-backup-secret --from-literal=username='<YOUR USERNAME>' --from-literal=password='<YOUR PASSWORD>' -n <namespace-of-mgmt-subsystem>
```

- **Version 10.0.3.0 or later:** Username and SSH-key credentials:

```
oc create secret generic mgmt-backup-secret --from-literal=username='<YOUR USERNAME>' --from-file=ssh-privatekey='<YOUR PRIVATEKEY FILE>' -n <namespace-of-mgmt-subsystem>
```

## 2. Configure the Management backup settings.

Create the **APIConnectCluster** installation CR and add the Management backup configuration using one of the following methods:

- OpenShift web console:
  - Navigate to Advanced Configuration, > ManagementSubsystem, > Advanced Configuration, > Database Backups, > Advanced Configuration
  - See the on-screen instructions for how to fill in each field. See also [Management subsystem settings](#).  
The following fields are unique to SFTP backup configuration:
    - Server port. Default is 22.
    - The fields in the Restart Database section. Changing SFTP (protocol) backup configures does not involve any downtime.
    - Retries.
- IBM Cloud Pak Platform UI:
  - In the Platform UI for the API Connect cluster instance, select Configuration. On the Common settings tab, set Advanced Options to On.
  - See the on-screen instructions for how to fill in values for:
    - Credentials
    - Server Hostname
    - Path
    - Server Port
    - Protocol
    - Retries
    - Schedule (The timezone for backups is that of the node on which the postgres-operator pod is scheduled.)  
For more information, see [Management subsystem settings](#).
- YAML file: Use Table 1 for guidance while you define the backup settings as shown in the following example.

```
spec:
  management:
    databaseBackup:
      protocol: sftp
      host: <SFTP-host-name>
      port: <SFTP-port>
      path: apic-backup
      retries: 0
      credentials: mgmt-backup-secret
      schedule: "0 3 * * *"
```

Table 1. Backup configuration settings

Setting	Description
<b>protocol</b>	The type of the backup. For SFTP storage: <b>sftp</b> .
<b>host</b>	The backups host. For <b>sftp</b> type, the SFTP server hostname
<b>port</b>	The SFTP server port. Optional. Default: <b>22</b> .
<b>path</b>	The path to the location of the backup. For <b>sftp</b> type, the folder name on the SFTP server.
<b>retries</b>	The number of times the <b>ibm-apiconnect</b> Operator attempts backups in the event of a failed SFTP backup. Default value: <b>0</b> .
<b>credentials</b>	Name of the Kubernetes secret containing your SFTP Username/password. For Version 10.0.3.0 or later, the Kubernetes secret can contain your SFTP Username and SSH key.
<b>schedule</b>	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> <li>• *****</li> <li>• -----</li> <li>•      </li> <li>•     +----- day of week (0 - 6) (Sunday=0)</li> <li>•    +----- month (1 - 12)</li> <li>•   +----- day of month (1 - 31)</li> <li>•   +----- hour (0 - 23)</li> <li>• +----- min (0 - 59)</li> </ul> <p>The timezone for backups is that of the node on which the postgres-operator pod is scheduled.</p> <p>There is no default backup schedule set. Be sure to set your backup schedule.</p> <p>All scheduled Management subsystem backups are of type <b>full</b> only.</p>

<sup>1</sup> PuTTY style keys can be converted to OpenSSH by using the PuTTY Key Generator (PuTTYgen) application; see <https://www.puttygen.com/>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Configuring local backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration

Configure local backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment.

## About this task

When creating an instance of API Connect, use the advanced configuration settings to configure database backups for the Management subsystem.

## Procedure

Configure the Management section of the top-level `APIConnectCluster` installation CR with the `databaseBackup` subsection. For local backups, only the schedule is required:

```
spec:
  management:
    databaseBackup:
      schedule: "0 3 * * *"
      repoRetentionFull: 2
```

Table 1. Backup configuration settings

Setting	Description
<code>schedule</code>	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"><li>• <code>*****</code></li><li>• <code>-----</code></li><li>• <code>     </code></li><li>• <code>    +-----</code> day of week (0 - 6) (Sunday=0)</li><li>• <code>   +-----</code> month (1 - 12)</li><li>• <code>  +-----</code> day of month (1 - 31)</li><li>• <code>  +-----</code> hour (0 - 23)</li><li>• <code>+-----</code> min (0 - 59)</li></ul> <p>The timezone for backups is that of the node on which the postgres-operator pod is scheduled.</p> <p>There is no default backup schedule set. Be sure to set your backup schedule.</p> <p>All scheduled Management subsystem backups are of type <code>full</code> only.</p>
<code>repoRetentionFull</code>	<p><b>v10.0.3.0 or later</b> - The number of full S3 backups to retain. When the next full backup successfully completes, and the specified number of retained backups is reached, the oldest full backup is deleted. All incremental backups and archives associated with the oldest full backup also expire. Incremental backups are not counted for this setting. Applies to both manual backups and scheduled backups.</p> <p>Minimum value: 1</p> <p>Maximum value: <b>9999999</b></p> <p>Default: none</p>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration

You can reconfigure the backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration.

## About this task

Backup configurations under `management.databaseBackup` in `APIConnectCluster` instance can be modified using the OpenShift web console, IBM Cloud Pak Platform UI, or the command-line utility `oc`.

Note:

Using OpenShift web console or Platform UI can prevent updates because `APIConnectCluster` CR refreshes very quickly. If you encounter this problem, use the command line to modify backup configurations; for example:

```
oc edit apiconnectcluster <name-of-instance>
```

## Procedure

1. Make sure that the management cluster status is `Running` and the READY condition displays the same value before and after the `/`.

For example:

```
oc get mgmt
NAME      READY   STATUS    VERSION      RECONCILED VERSION  AGE
mgmt     16/16   Running   10.0.1-eus   10.0.1.1-eus-0-eus  19h
```

2. Create backup secret for your backup type. See the appropriate instructions:

- [Configuring S3 backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)
- [Configuring SFTP backup settings for fresh install of the Management subsystem on OpenShift and Cloud Pak for Integration](#)

Note that SFTP backups settings are not supported on v10.0.1.0 or earlier.

3. Complete the following steps, based on your storage type:

- S3 storage

In 10.0.1.0 and later, you can change or add the `DatabaseBackup` s3 configuration via the Management section of the API Connect Cluster CR after a fresh install. However, doing so requires a reconfiguration of the database and a brief downtime. The operator restarts the database with the new backup configurations as soon as the new configuration in the management CR is saved.

```
spec:
  management:
    databaseBackup:
      protocol: objstore
      s3provider: ibm
      host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
      path: apic-backup
      credentials: mgmt-backup-secret
      schedule: "0 3 * * *"
      restartDB:
        accept: true
```

Note: Version 10.0.1.0 only: The CR entry does not contain the `protocol` setting:

```
databaseBackup:
  s3provider: ibm
  host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
  path: apic-backup
  credentials: mgmt-backup-secret
  schedule: "0 3 * * *"
  restartDB:
    accept: true
```

Configuration of s3 backups uses a new parameter `restartDB` that is required when changing the backup configuration. `restartDB` is not required for initial deployments, only for modifications after the cluster is deployed.

Table 1. Additional parameter for S3 backup type reconfiguration

Parameter	Description
<code>restartDB:</code> <code>accept: &lt;value&gt;</code>	Required when changing the backup configuration. The parameter <code>accept</code> is a boolean: <code>&lt;value&gt;</code> can be <code>true</code> or <code>false</code> . When <code>accept</code> is <code>true</code> , and a new configuration for management CR is saved, the operator: <ul style="list-style-type: none"> <li>• Stops the database and any dependent services</li> <li>• Applies the change</li> <li>• Restarts the stopped components.</li> </ul> Note: <code>restartDB</code> is not required for initial deployments, only for modifications after the cluster is deployed.

Note: **Reconfiguration on v10.0.1.0 only:**

The operator must create an upgrade CR, because the postgres database is re-created as part of database backup configuration change. The new upgrade CR goes to `Complete` as soon postgres comes up.

Example: When you change database backup configurations after upgrading API Connect from v10.0.0.0-ifix2 to v10.0.1.0, the operator restarts the postgres database-related components. The operator also creates an upgrade CR, and reaches the `Complete` state as soon as all postgres database components (pgbouncer, postgres database) are in `Running` state:

```
NAME      STATUS    MESSAGE
A
GE
managementdbupgrade.management.apiconnect.ibm.com/m1-up-g6lcb Complete Upgrade is Complete (DB Schema/data are
up-to-date) 1
6m
managementdbupgrade.management.apiconnect.ibm.com/m1-up-zqkk5 Complete Fresh install is Complete (DB Schema/data
are up-to-date)
63s5s
```

- SFTP (Version 10.0.1.1-eus or greater only)

In v10.0.1.1-eus and greater, you can change/add the `DatabaseBackup` SFTP configuration via the Management section of the API Connect Cluster CR after a fresh install. This process does not involve any downtime. The same backup settings are used for reconfiguring as for initial configuration. For complete description of backup settings, see [Configuring SFTP backup settings for fresh install of the Management subsystem on OpenShift and Cloud Pak for Integration](#).

```
spec:
  management:
    databaseBackup:
      protocol: sftp
      host: <SFTP-hostname>
      port: <SFTP-port> (Optional, default is 22)
      path: apic-backup
      retries: 0
      credentials: mgmt-backup-secret
      schedule: "0 3 * * *"
```

Note: Handling of SFTP backup taken on v10.0.1.0.

In v10.0.1.0, you can manually send backup tar files to an SFTP server, as described in [Uploading backup files to an sftp server](#).

You can upgrade from v10.0.1.0 to v10.0.1.1-eus, and configure SFTP backup settings, as described previously in [SFTP](#).

API Connect resyncs upstream SFTP backups and creates relevant backup CRs of type `record`.

Note that the latest local backup is also automatically uploaded to the SFTP server if it was not uploaded to SFTP in v10.0.1.0.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration

You can generate a manual (non-scheduled) backup of the management subsystem in your OpenShift and Cloud Pak for Integration environments.

### Procedure

1. Make sure that the management cluster status is Running and the READY condition displays matching values before and after the "\". You can use either the OpenShift web console or the `oc` command line to verify the health. For example:

```
oc get mgmt
NAME   READY   STATUS    VERSION      RECONCILED VERSION  AGE
mgmt   16/16   Running   10.0.1-eus   10.0.1.1-eus-0-eus  19h
```

2. Decide which of the two types of manual backups you want to do:
  - `full`: backs up the entire Management Subsystem database.
  - `incr`: backs up any data that has not been backed up since the last `full` or `incr` backup.
3. You generate a backup manually by creating a `managementBackup` custom resource which is detected by the `ibm-apiconnect` operator that then triggers the backup process.

You can create the `ManagementBackup` custom resource by using either the Form UI or the command line. For example:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementBackup
metadata:
  generateName: mgmt
spec:
  type: full
  crType: create
  clusterName: management
```

Table 1. CR settings for manual backup

Setting	Description
<code>type</code>	The type of backup to be done. Valid arguments are: <ul style="list-style-type: none"><li>• <code>full</code> Backs up the entire Management subsystem database</li><li>• <code>incr</code> Backs up any data that has not been backed up since the last <code>full</code> or <code>incr</code> backup.</li></ul>
<code>crType</code>	Use <code>create</code> to trigger a backup process.
<code>clusterName</code>	The name of the target <code>ManagementCluster</code> you want to backup.

4. Create the `ManagementBackup` custom resource in the namespace of your Management Subsystem to trigger the backup process. Use the Form UI or the following command:

```
$ oc create -f mgmtbackup_cr.yaml -n <APIC_namespace>
```

5. (Optional): You can list current backups by using Form UI to list `ManagementBackup` resources, or by using `oc`:

```
$ oc get managementbackup -n <APIC_namespace> --sort-by=.metadata.creationTimestamp
```

Here is an example of some possible output:

```
NAME           STATUS    ID                CLUSTER  TYPE  CR TYPE  AGE
m1-e46bbac4    Ready    20201023-183005F  m1       full  record   66m
mgmt-backup-dnvxw  Ready    20201023-193137F  m1       full  create   9m37s
```

6. (Optional): You can get a detailed view of a specific backup by using the command:

```
$ oc get managementbackup <bup-name> -n <APIC_namespace> -o yaml
```

Here is an example of some possible output:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementBackup
metadata:
  creationTimestamp: "2020-10-23T18:34:11Z"
  generation: 1
  labels:
    app.kubernetes.io/instance: m1
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: m1-e46bbac4
  name: m1-e46bbac4
```

```

  subsysName: m1

```

7. **Version 10.0.1.0 only:** If a local-backup was performed on v10.0.1.0, and you now wish to upload the local-backup file to an sftp server, see [Uploading backup files to an sftp server](#) for the required steps.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Restoring the management subsystem on OpenShift and Cloud Pak for Integration

You can restore your Management subsystem in your OpenShift and Cloud Pak for Integration environments.

### Before you begin

You must have backups of the management subsystem in order to restore. See [Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#) and [Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration](#).

### About this task

To trigger a restore, you will create a **ManagementRestore** custom resource. When the **ibm-apiconnect** operator detects the new CR, it starts the restore process.

- Ensure that the backup method that you used is complete before you attempt a restore. The backup data that is stored in the remote server is used for restoring the Management subsystem data back to a previous state. Ensure that these backups are on your remote server before you attempt a restore, and that the backup ID in the selected backup exists in remote storage.
- Restoring a backup restores the registration credentials (client\_ID, client\_secret) that were in use at the time that the selected backup was created. For information on the registration credentials, see [Changing the registration client id and client secret for applications](#).
- If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. The backups of the Management and Portal must be taken at the same time to ensure that the Portal sites are consistent with Management database.

Note: There is a known issue where sometimes a restore from the Management subsystem's SFTP backup succeeds but the data is not restored. If this happens, run the restore again.

### Procedure

1. Use the Form UI or the **oc** command to obtain a list of the available backups, and decide which one to restore your Management subsystem:

```
oc get mgmtb -n <APIC_namespace>
```

For example:

```
$ oc get mgmtb
NAME                                STATUS  ID                                CLUSTER  TYPE  CR TYPE  AGE
management-3aa3bebf                 Ready  20200929-152150F                management full record 10h
management-3c4ca8df                 Ready  20200929-115520F                management full record 20h
management-5tbxj                    Ready  20200929-224349F                management full create 17h
management-f10af337                 Ready  20200925-133703F                management full record 5d2h
management-jt1cd                    Ready  20200929-224349F                management full create 25h
management-zxjtz                    Ready  20200929-224349F                management full create 28h
```

Attention: You can restore the Management subsystem from any backup where the STATUS is Ready; however, you should avoid restoring to the initial system backup. During installation, the Management database is used for an initial system backup before certain database schema jobs are complete. Restoring to this backup will result in an unstable system.

You will use one of the values in the **NAME** column.

2. Use the instructions that apply to your release of API Connect:

- Version 10.0.1.1 or later
  - Use the following code as an example:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementRestore
metadata:
  generateName: management-
spec:
  backupName: management-3aa3bebf
```

Note that **backupName** is the name of the backup custom resource you want to restore to. For example, using the output from the previous step:

```
backupName: management-3aa3bebf
```

- Use the Form UI or **oc** to create the ManagementRestore custom resource in the namespace of the Management Subsystem, to trigger the restore process:

```
$ oc create -f mgmtrestore_cr.yaml -n <APIC_namespace>
```

- You can list current restores using the following command, or if using OCP UI you can list all **ManagementResource** list:

```
$ oc get managementrestore -n <APIC_namespace> --sort-by=.metadata.creationTimestamp
```

Example output:

- SFTP:

NAME	STATUS	BACKUP	CLUSTER	MESSAGE
PITR mgmt-restore-ptx6d DRR job)	Complete 6m31s	mgmt-backup-w4h8c	m1	Restore process completed (DB Restore +

- S3

NAME	STATUS	BACKUP	CLUSTER	MESSAGE
PITR mgmt-restore-hr9zx DRR job)	Complete 2020-11-23 23:08:32+00	mgmt-backup-xnjkl 9m8s	m1	Restore process completed (DB Restore +

- Version 10.0.1.0
  - Use the following command to obtain the Point-in-Time-Recovery target for the selected backup:

```
oc get mgmtb <backup_name> -o jsonpath="{..status.info.range}"
```

For example:

```
$ oc get mgmtb management-3aa3bebf -o jsonpath="{..status.info.range}"
2020-09-29 15:21:50 +0000 UTC - 2020-09-29 15:30:56 +0000 UTC
```

The target for recovery is the second half the **range** value in the backup custom resource. In the prior example: **2020-09-29 15:30:56 +0000**.

The custom resource uses the **pitrTarget** setting to specify the Point-in-Time-Recovery target. You must set **pitrTarget** to be later than the value obtained above (such as by one second newer). Use the format **YYYY-MM-DD HH:MM:SS+Z**.

Using the example above, where **2020-09-29 15:30:56 +0000** is the **range**, the **pitrTarget** is **2020-09-29 15:30:57+00**:

```
pitrTarget: "2020-09-29 15:30:57+00"
```

- Use the following code as an example:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementRestore
metadata:
  generateName: management-
spec:
  backupName: management-3aa3bebf
  pitrTarget: "2020-09-30 13:53:21+00" ## Not required in 10.0.1.1-eus and greater
```

- **backupName** - The name of the backup custom resource you want to restore to. For example, using the output from the previous step, **management-3aa3bebf**.
- **pitrTarget** - The time you want to restore to, in format **YYYY-MM-DD HH:MM:SS+Z**.

- Use the Form UI or `oc` to create the `ManagementRestore` custom resource in the namespace of the Management Subsystem, to trigger the restore process:

```
$ oc create -f mgmtrestore_cr.yaml -n <APIC_namespace>
```

- You can list current restores using the following command, or if using Form UI you can list all `ManagementResource` lists:

```
$ oc get managementrestore -n <APIC_namespace> --sort-by=.metadata.creationTimestamp
```

Example output:

NAME	STATUS	BACKUP	CLUSTER	PITR	AGE
management-6nzjr	Complete	mgmt-backup-dg4s4	m1	2020-01-05 19:05:00+01	14m

- The operator creates an upgrade CR when the postgres database is restarted during the restore:

```
managementdbupgrade.management.apiconnect.ibm.com/m1-up-zqkk5 Complete Fresh install is Complete (DB Schema/data are up-to-date) 63s5s
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting management subsystem backups on OpenShift and Cloud Pak for Integration

You can troubleshoot failures of the API Connect management subsystem backups in an OpenShift or Cloud Pak for Integration environment.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

See:

- [Troubleshooting resiliency issues on OpenShift and Cloud Pak for Integration](#)  
Resolve resiliency issues with API Connect management system backups.
- [Troubleshooting the stanza-create job for S3 backup configuration on OpenShift and Cloud Pak for Integration](#)  
Troubleshoot configuration of s3 backups when the stanza-create job fails in an OpenShift or Cloud Pak for Integration environment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting resiliency issues on OpenShift and Cloud Pak for Integration

Resolve resiliency issues with API Connect management system backups.

### pgbackrest-shared-repo resiliency problems

If the Kubernetes node hosting `pgbackrest-shared-repo` pod is down and the PVC attached to the pod has strict zone requirements (for example, in AWS or other clouds) or if the storage class is set to `local-storage`, then `pgbackrest-shared-repo` pod will not get rescheduled to another Kubernetes node.

As a result, there is a single point of failure and the following conditions might occur:

- Backups of the management database fails
- Disk space fills with accumulated Postgres wal (Write-Ahead Logging) files

To avoid this problem, monitor the disk usage, see: [Monitoring Postgres disk usage on OpenShift](#) or [Monitoring Postgres disk usage on Cloud Pak for Integration](#).

When the Kubernetes node comes back up, the pod is scheduled and all the processes should resume properly.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting the stanza-create job for S3 backup configuration on OpenShift and Cloud Pak for Integration

Troubleshoot configuration of s3 backups when the stanza-create job fails in an OpenShift or Cloud Pak for Integration environment.

When you configure Management subsystem backups for s3 providers, the operator runs a `stanza-create` job. This job creates the stanza (Postgres cluster configuration) on the upstream S3 server, which is used for backup and archive procedures. The job also brings up the necessary pod.

Check the status of the `stanza-create` job:

```
oc get jobs -n <namespace> | grep stanza
```

On failure:

- `stanza-create` pods fail, and job status is 0/1:

```
oc get jobs | grep stanza
m1-3bfe12ac-postgres-stanza-create 0/1 32m 32m
```

- Listing all pods brought up by `stanza-create` job shows multiple pods because a job tries `backoffLimit` times to complete the job. By default, there will be 7 pods in error state:

```
oc get pods | grep stanza
m1-3bfe12ac-postgres-stanza-create-726z4 0/1 Error 0 11m
m1-3bfe12ac-postgres-stanza-create-9vq4n 0/1 Error 0 22m
m1-3bfe12ac-postgres-stanza-create-gbtgb 0/1 Error 0 30m
m1-3bfe12ac-postgres-stanza-create-gl5g5 0/1 Error 0 17m
m1-3bfe12ac-postgres-stanza-create-q8qhw 0/1 Error 0 26m
m1-3bfe12ac-postgres-stanza-create-t84zs 0/1 Error 0 8m54s
m1-3bfe12ac-postgres-stanza-create-z8tfs 0/1 Error 0 12m
```

Note: In some cases, the pods are cleaned by Kubernetes and the logs of these pods can be lost.

- Pod log errors show a reason for the failure. For example, when a hostname is not valid:

```
kubectl logs m1-3bfe12ac-postgres-stanza-create-gbtgb

time="2021-04-13T20:01:19Z" level=info msg="pgo-backrest starts"
time="2021-04-13T20:01:19Z" level=info msg="debug flag set to false"
time="2021-04-13T20:01:19Z" level=info msg="backrest stanza-create command requested"
time="2021-04-13T20:01:19Z" level=info msg="s3 flag enabled for backrest command"
time="2021-04-13T20:01:19Z" level=info msg="command to execute is [pgbackrest stanza-create --db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --repol-type=s3]"
time="2021-04-13T20:01:19Z" level=info msg="command is pgbackrest stanza-create --db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --repol-type=s3 "
time="2021-04-13T20:05:21Z" level=error msg="command terminated with exit code 49"
time="2021-04-13T20:05:21Z" level=info msg="output=[]"
```

- Job status is set to `type: Failed` and `status: "True"`, with `reason: BackoffLimitExceeded`:

```
oc get job m1-3bfe12ac-postgres-stanza-create -o yaml

status:
  conditions:
  - lastProbeTime: "2021-04-13T20:28:03Z"
    lastTransitionTime: "2021-04-13T20:28:03Z"
    message: Job has reached the specified backoff limit
    reason: BackoffLimitExceeded
    status: "True"
    type: Failed
    failed: 7
  startTime: "2021-04-13T20:01:18Z"
```

- If pod logs are lost, you can execute a command inside the `backrest-shared-repo` pod:

1. Obtain the `backrest-shared-repo` pod name:

```
oc get pods -n <namespace> | grep backrest-shared-repo
```

For example:

```
oc get pods | grep backrest-shared-repo
m1-eb8edc18-postgres-backrest-shared-repo-98dd46cc6-tw195 1/1 Running
```

2. Exec into the pod:

```
oc exec -it <backrest-shared-repo-pod> -- bash
```

3. Run:

```
pgbackrest info --output json --repol-type s3
```

For example, for invalid hostname:

```
ERROR: [049]: unable to get address for 'test1-v10-backup.s3.exampleaws.com': [-2] Name or service not knownCopy
```

The exact `ERROR`: will vary depending on the misconfiguration. Common errors:

- Invalid access key
- Invalid access key secret
- Invalid bucket region
- Invalid bucket or folder path

- To fix the incorrect settings, see [Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Backing up and restoring Developer Portal on OpenShift and Cloud Pak for Integration

You can back up and restore your Developer Portal service in your OpenShift or Cloud Pak for Integration environment.

### About this task

---

Before you can initiate a backup or restore operation, you must update the Portal CR (custom resource) to configure your settings. Generating a backup for Portal is performed on demand by deploying a backup CR. You can deploy a restore CR to start the restoration of a previously generated backup.

For points to consider when you are backing up and restoring a two data center disaster recovery deployment, see [Backup and restore considerations for a two data center deployment](#).

The default Developer Portal backup schedule is once every 24 hours, but the schedule can be changed in the backup settings. The Developer Portal saves all system and site backups locally, and also saves them remotely based on the configured SFTP and s3 settings.

The local backups are automatically maintained so that the latest three backups of each site and of the system are kept, and older backups are removed. This maintenance means that the Developer Portal retains the latest three backups for each site and for the system however old they are, but there is no deletion of the old backups on the remote server. If a site is deleted, then all of the local backups for that site are also deleted, as otherwise the backup volume might become full of old site backups. For remote backups, you can configure a retention policy on your remote server to remove the old backup files as required.

Important: Backups of the Management and Portal subsystems must be taken at the same time to ensure that the Portal sites are consistent with Management database. When you perform a restore, you must complete the restoration of the Management subsystem first, and then immediately restore the Developer Portal subsystem.

## Configuring backups for Developer Portal on OpenShift and Cloud Pak for Integration

Configure backups for the Developer Portal service in your OpenShift or Cloud Pak for Integration environment.

### About this task

---

Run commands in the namespace where the Developer Portal is installed.

For points to consider when you are backing up and restoring a two data center configuration, see [Backup and restore considerations for a two data center deployment](#).

The default Developer Portal backup schedule is once every 24 hours, but the schedule can be changed in the backup settings. The Developer Portal saves all system and site backups locally, and also saves them remotely based on the configured SFTP and s3 settings.

The local backups are automatically maintained so that the latest three backups of each site and of the system are kept, and older backups are removed. This maintenance means that the Developer Portal retains the latest three backups for each site and for the system however old they are, but there is no deletion of the old backups on the remote server. If a site is deleted, then all of the local backups for that site are also deleted, as otherwise the backup volume might become full of old site backups. For remote backups, you can configure a retention policy on your remote server to remove the old backup files as required.

### Procedure

---

1. Create your Developer Portal backup secret.  
The backup secret is a Kubernetes secret that contains your credentials for accessing the s3 or sftp backup database.
  - S3  
Only password-based authentication is supported for S3, not authentication based on public certificates and private keys. Password-based authentication for S3 requires that you generate an access key and secret. For example:
    - IBM (Cloud Object Storage): [Service credentials](#).
    - AWS: [Managing access keys](#).The secret can be created with the following command:

```
oc create secret generic portal-backup-secret --from-literal=username='Your_access_key-or-user_name'
--from-literal=password='Your_access_key_secret-or-password' -n <Portal_namespace>
```

- SFTP
  - Supported credentials types:
    - User name and password (v10.0.2.0 or later).
    - User name and SSH-key (v10.0.3.0 or later). Only OpenSSH keys are supported.<sup>1</sup>

Use one of the following commands to create the secret:

- User name and password credentials
 

```
oc create secret generic portal-backup-secret --from-literal=username='<Your_user_name>'
--from-literal=password='<Your_password>' -n <Portal_namespace>
```
- Version 10.0.3.0 or later: User name and SSH-key credentials:
 

```
oc create secret generic portal-backup-secret --from-literal=username='<Your_user_name>'
--from-file=ssh-privatekey='<Your_private_key_file>' -n <Portal_namespace>
```

2. Add a `portalBackup` subsection to the `spec.portal` section of the top-level `apiconnectcluster` CR. You can edit the YAML in the UI, or you can run the following command and then add the `portalBackup` block:

```
oc edit apiconnectcluster <Portal_namespace>
```

An example when you use `protocol: objstore`:

```
spec:
  portal:
    portalBackup:
      credentials: portal-backup-secret
      host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
      path: test-bucket/restore-test
      port: 443
      backupCerts: <custom-s3-server-CA-cert>
      backups3URISyle: <host-or-path>
      schedule: '0 2 * * *'
```

An example when you use `protocol: sftp`:

```
spec:
  portal:
    portalBackup:
      credentials: portal-backup-secret
      host: sftp-service.example.com
      path: /home/fvtuser/site-backups
      port: 22
      protocol: sftp
      schedule: '0 2 * * *'
```

Notes about the `portalBackup` entry:

- If `portalBackup` entry is empty or omitted from the API Connect Cluster CR, then `local` backups will be taken if a backup CR is created. If the `schedule` exists, backups are taken at the scheduled time.
- For S3 and SFTP, the `portalBackup` entry must contain host, credentials, protocol, and path.
- For S3, the `portalBackup` section can optionally contain either, or both, of `backupCerts` and `backups3URISyle`.

Table 1. Developer Portal backup settings

Setting	Description
<b>credentials</b>	The name of the secret you created. Supported credential types: <ul style="list-style-type: none"> <li>• S3 Only password-based authentication is supported for S3, not authentication based on public certificates and private keys. Password-based authentication for S3 requires that you generate an access key and secret.</li> <li>• SFTP               <ul style="list-style-type: none"> <li>• User name and password (v10.0.2.0 or later)</li> <li>• User name and SSH-key (v10.0.3.0 or later)</li> </ul> </li> </ul>
<b>host</b>	<ul style="list-style-type: none"> <li>• S3 - <code>host</code>: is the S3 endpoint with the corresponding S3 region in the format <code>&lt;S3endpoint&gt;</code>, or with an optional S3 region in the format <code>&lt;S3endpoint&gt;/&lt;S3region&gt;</code>.</li> <li>• SFTP - the hostname of the sftp server</li> </ul>
<b>path</b>	<ul style="list-style-type: none"> <li>• S3 - the name of your S3 bucket to store backup data, optionally followed by a <code>/</code> and then any subdirectories inside the bucket. Valid examples:           <pre>bucket bucket/path bucket/lots/of/paths</pre> </li> <li>• SFTP - the full absolute path of the folder on the SFTP server, beginning with <code>/</code>.</li> </ul> <p>Attention: Ensure that your backup <code>path</code> has the correct permissions to allow your backup user to be able to read and write to it from within the Developer Portal.</p>
<b>port</b>	The port for the protocol to connect to the host. <ul style="list-style-type: none"> <li>• S3 - Ignored for S3 (because objstore always connects to port 443)</li> <li>• SFTP - Defaults to 22 if not specified</li> <li>• local - Ignored for local</li> </ul>

Setting	Description
<code>protocol</code>	The protocol that is used to communicate with your remote backup endpoint. Specify one of the following values: <ul style="list-style-type: none"> <li><code>sftp</code> - for secure file transfer protocol.</li> <li><code>objstore</code> - for S3 compatible object storage.</li> </ul>
<code>backupCerts</code>	<p>(S3 storage only) <code>backupCerts</code> is the name of a custom certificate that contains your upstream custom S3 CA certificate. Supported beginning with 10.0.2.</p> <p>Note: If you use a public certificate for the S3 storage provider, it must be signed by a known certificate authority that is trusted by API Connect. Use of an untrusted authority can cause the following error during backup upload:</p> <pre>x509:   certificate signed by unknown authority</pre> <p>This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be <code>ca.crt</code> and the value is the base64-encoded value of the CA certificate.</p> <p>If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Portal subsystem already trusts the server certificate. You can test this by configuring the Portal backup to your S3/object-store server without providing the CA certificate.</p> <p>If you do need to provide the CA certificate then you must provide the entire chain in the <code>ca.crt</code> member of the secret, as follows:</p> <pre>intermediate-certificate-1 intermediate-certificate-2 . intermediate-certificate-n root-certificate</pre> <p>Where the first certificate in the <code>ca.crt</code> member (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the <code>ca.crt</code> member is the issuer of the preceding certificate. The root certificate in the <code>ca.crt</code> member must be self-signed.</p> <p>If there are no intermediate certificates involved, then the <code>ca.crt</code> member contains only the root certificate.</p> <p>The following sample bash script creates the Kubernetes secret:</p> <pre>cat &gt;customs3ca.yaml &lt;&lt;EOF apiVersion: v1 data:   ca.crt: \$(base64 &lt;path-to-ca-certificate&gt;   tr -d '\n' ) kind: Secret metadata:   name: custom-server-ca type: generic EOF kubectl apply -f customs3ca.yaml -n &lt;APIC_namespace&gt;</pre>
<code>backups3URIStyle</code>	<p>(S3 storage only) Optional - <code>backups3URIStyle</code> indicates whether URIs to your S3 backup should use specify a host or a path value. When not specified, default to <code>host</code>. Supported beginning with 10.0.2.</p> <p>Valid values: <code>host</code> and <code>path</code>.</p> <p>Some custom S3 providers require URI style to be set to <code>path</code>. For example, MinIO supports both <code>host</code> and <code>path</code> style setup. You can create a MinIO S3 server to only accept <code>path</code> style client communications.</p> <p>Important: Contact your custom S3 administrator before configuring this field. If not properly configured, an upstream custom S3 can reject connections from the client, such as the API Connect Management subsystem.</p>
<code>schedule</code>	<p>The schedule for how often automatic Developer Portal backups are run. The format for the schedule is any valid cron string. The timezone for backups is UTC.</p> <p>Valid for all backup types: S3, SFTP, and local.</p> <pre>spec:   portal:     portalBackup:       credentials: portal-backup-secret       host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard       path: test-bucket/restore-test       port: 443       protocol: objstore       schedule: '0 2 * * *'</pre>

<sup>1</sup> PuTTY style keys can be converted to OpenSSH by using the PuTTY Key Generator (PuTTYgen) application; see <https://www.puttygen.com/>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Backing up Developer Portal on OpenShift and Cloud Pak for Integration

Perform a manual backup of the Developer Portal subsystem in your OpenShift or Cloud Pak for Integration environment.

### About this task

Run commands in the namespace where the Developer Portal is installed.

Important: Backups of the Management and Portal subsystems must be taken at the same time to ensure that the Portal sites are consistent with Management database. When you perform a restore, you must complete the restoration of the Management subsystem first, and then immediately restore the Developer Portal subsystem. The default Developer Portal backup schedule is once every 24 hours, but the schedule can be changed in the backup settings. The Developer Portal saves all system and site backups locally, and also saves them remotely based on the configured SFTP and s3 settings.

The local backups are automatically maintained so that the latest three backups of each site and of the system are kept, and older backups are removed. This maintenance means that the Developer Portal retains the latest three backups for each site and for the system however old they are, but there is no deletion of the old backups on the remote server. If a site is deleted, then all of the local backups for that site are also deleted, as otherwise the backup volume might become full of old site backups. For remote backups, you can configure a retention policy on your remote server to remove the old backup files as required.

## Procedure

1. Required: Backup the Management subsystem as explained in [Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration](#).
2. Create the `PortalBackup` CR (custom resource) as a YAML file with the backup options that you want to use for Developer Portal. You can use `portalbackup_cr.yaml` in the `helper_files` directory as an example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  generateName: portal-bup-
spec:
  crType: create
  type: all
  comment: "test comment"
```

Add the following backup options as needed:

- `crType` - Use `create` to trigger a backup process. When the backup is created, the operator generates another backup CR with `crType`: `record`, which represents the stored backup that you can use for a restore operation.
  - `record` - Includes a backup ID so you can choose it for restoring. If you plan to preserve the backup for use in recovering from a disaster, use the `record` argument to ensure that all necessary data is captured.
  - `type` - The extent of the backup; select one of the following options:
    - `all` - Backup the Developer Portal subsystem and all of the sites
    - `system` - Backup the Developer Portal subsystem
    - `site` - Backup only a specified Developer Portal site
  - `siteName`: Used only when you perform a `site` backup. Valid arguments are:
    - `site uuid` or `url` - back up only the specified site
    - `installed` - backup all installed sites
  - `comment`: Optional. You can optionally add a comment (such as a description or special notes) to the CR before you create a backup.
3. Run the following command to create the backup CR, which triggers the backup operation:

```
oc create -f portalbackup_cr.yaml -n <APIC_namespace>
```

4. Verify that the backup was successful by completing the following steps:
  - a. Run the following command to get a list of backups:

```
oc get portalbackup -n <APIC_namespace>
```

The response looks like the following example, where only `crType`: `record` backups include an ID.

NAME	ID	STATUS	TYPE	CR TYPE	AGE	COMMENT
p1-bup-gqz8f	20200526.142449	Ready	system	record	55m	
p1-bup-jx4vc	20200526.142458	Ready	site	record	54m	
p1-bup-st412		Ready	all	create	56m	y
p1-bup-th2dm		Ready	all	create	4h51m	y

- b. Run the following command to view the details of a particular backup, which is specified using the `<bup-name>` from the `NAME` column in the list of backups:

```
oc get portalbackup <bup-name> -n <APIC_namespace> -o yaml
```

The details of a backup look like the following example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  creationTimestamp: "2020-10-01T10:00:16Z"
  generateName: portal-bup-
  generation: 1
  name: portal-bup-g66gv
  namespace: default
  resourceVersion: "8940"
  selfLink: /apis/portal.apiconnect.ibm.com/v1beta1/namespaces/default/portalbackups/portal-bup-g66gv
  uid: b1d5b295-b966-48f2-b6ef-dfcd1c499741
spec:
  comment: test comment
  crType: create
  siteName: installed
  type: site
status:
  backupId: ""
  commentLeft: "y"
  conditions:
  - lastTransitionTime: "2020-10-01T10:00:18Z"
    reason: BackupFailed
    status: "False"
    type: Error
```

```

- lastTransitionTime: "2020-10-01T10:01:19Z"
  message: |-

```

c. Check the contents of the backup and make sure that it contains the following statements, which indicate a successful operation:

```

. . .
  reason: BackupComplete
  status: "True"
  type: Ready

```

If the operation did not complete successfully, see [Troubleshooting Developer Portal backup and restore on OpenShift and Cloud Pak for Integration](#) for information on reviewing logs to help resolve the problem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Restoring Developer Portal on OpenShift and Cloud Pak for Integration

You can restore the Developer Portal subsystem and sites in your OpenShift or Cloud Pak for Integration environment.

### About this task

Run commands in the namespace where the Developer Portal is installed.

Important: Backups of the Management and Portal subsystems must be taken at the same time to ensure that the Portal sites are consistent with Management database. When you perform a restore, you must complete the restoration of the Management subsystem first, and then immediately restore the Developer Portal subsystem.

### Procedure

1. Required: Restore up the Management subsystem as explained in [Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration](#).
2. Choose which backup you want to restore.
  - a. Run the following command to get a list of available backups:

```
oc get portalbackup -n <APIC_namespace>
```

The response looks like the following example:

NAME	ID	STATUS	TYPE	CR TYPE	AGE	COMMENT
p1-bup-gqz8f	20200526.142449	Ready	system	record	55m	
p1-bup-jx4vc	20200526.142458	Ready	site	record	54m	
p1-bup-st412		Ready	all	create	56m	y
p1-bup-th2dm		Ready	all	create	4h51m	y

Note: You can only restore the Portal subsystem from backups where the **CR TYPE** is **record**.

- b. Run the following command to view the details of a particular backup, which is specified using the `<bup-name>` from the **NAME** column in the list of backups:

```
oc get portalbackup <bup-name> -n <APIC_namespace> -o yaml
```

The details of a backup look like the following example:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  creationTimestamp: "2020-10-01T10:00:16Z"
  generateName: portal-bup-

```

```

generation: 1
name: portal-bup-g66gv
namespace: default
resourceVersion: "8940"
selfLink: /apis/portal.apiconnect.ibm.com/v1beta1/namespaces/default/portalbackups/portal-bup-g66gv

    status: "False"
    type: Warning
  fullBackupName: ""
  id: f8t0ux7z4zfnjnu
  message: ""
  phase: Ready
  state: ""

```

3. Create the `PortalRestore` CR (custom resource) as a YAML file with the backup options that you want to use for Developer Portal. You can use `portalrestore_cr.yaml` in the `helper_files` directory as an example:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  generateName: portal-restore-
spec:
  type: all
  dryRun: true
  timestamp: now
  priorityList:
  - myportal-critical-site.com
  - myportal-important.com

```

Add the following restore options as needed. Table 1 indicates which options are needed for each type of restore operation:

Table 1. The options that are needed for each type of Developer Portal restore operation

Option	Applies to all	Applies to system	Applies to site
<code>type</code>	X	X	X
<code>siteName</code>			X
<code>systemName</code>		X	
<code>timestamp</code>	X		
<code>dryRun</code>	X		
<code>priorityList</code>			

- type:** Indicates the extent of the restore operation; specify one of the following options:
  - all** - Restore the Developer Portal subsystem and all of the sites (supports only remote restores).
  - system** - Restore the Developer Portal subsystem.
  - site** - Restore only a specified Developer Portal site (you will indicate the site with the `siteName` option).
- siteName:** Indicates which site to restore (used only with the `site` option); specify one of the following options:
  - ID** - Restore the backup specified by the ID. The ID must correspond to a Developer Portal backup of `type: site` and `crType: record`.
  - site-1234.tgz** - Restore the site by using this file name (which must exist on the local file system or remote server).
  - myportal.com** - find the latest backup for this URL (locally or remotely) and restore it.
  - all** - Restore all sites that are found on the remote server by using the latest backup.
  - site** - Restore only the site that matches the specified uuid or url.
  - installed** - Restore all installed sites.
- systemName** - Restore from a backup that corresponds to the specified system; use one of the following options:
  - ID** - Restore the backup specified by the ID. The ID must correspond to a Developer Portal backup of `type: site` and `crType: record`.
  - system\_backup-1234.tgz** - Restore the system from the given file that exists on the pod's local file system or the remote server.

- **latest** - Restore from latest subsystem backup that is found on either the local file system or the remote server.
- **timestamp** - Valid arguments are:
  - **now** - Restore using the latest backups available.
  - **< TIMESTAMP >** - Specified in '**YYYYMMDD.HHMMSS**' format to indicate a timestamp to retrieve the backup from. The nearest backup, searching backwards from this timestamp, is used.

Note: From IBM® API Connect Version 10.0.3.0, the timestamp format changed to **YYYYMMDD.HHMMSS**. For Version 10.0.2.0 and earlier, the timestamp format is **YYYY-MM-DD**

**HH:MM:SS**.

- **dryRun**: Indicates whether an actual restore operation is run; use one of the following options:
  - **true** - Execute a test, or dry run, of the command and return the list of actions that will be taken. These actions can be found in the custom resource.
  - **false** - Run a real restore operation, replacing the subsystem files and all sites. Any existing sites are reinstalled.
- **priorityList** - Restore sites in the sequence in which they are listed. The priority sites are queued for restoring first, followed by any remaining sites present in the backup location. Valid arguments are:
  - **myportalsite.com**
  - **mysecondportalsite.com**

4. Run the following command to create the restore CR, which triggers the restore operation:

```
oc create -f portalrestore_cr.yaml -n <APIC_namespace>
```

5. When the restore operation is finished, verify that the restore was successful by completing the following steps:

a. Run the following command to get the name of the most recent restore record:

```
oc get portalrestore -n <APIC_namespace>
```

The response looks like the following example:

NAME	READY	AGE
portal-restore-twjrp	Ready	28s

b. Run the following command to view information about a specific restore operation, which is indicated with the **<portal\_restore\_name>** shown in the **NAME** column:

```
oc get portalrestore <portal_restore_name> -n <APIC_namespace> -o yaml
```

The details of a restore look like the following example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1

message: ""
```

c. Check the contents of the restore and make sure that it contains the following statements, which indicate a successful operation:

```
reason: RestoreComplete
status: "True"
type: Ready
```

If the operation did not complete successfully, see [Troubleshooting Developer Portal backup and restore on OpenShift and Cloud Pak for Integration](#) for information on reviewing logs to help resolve the problem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Troubleshooting Developer Portal backup and restore on OpenShift and Cloud Pak for Integration

Review details on a failed backup or restore operation for Developer Portal backup on OpenShift and Cloud Pak for Integration.

---

### Check the status of a backup operation

1. Run the following command to get a list of backups:

```
oc get portalbackup -n <Portal_namespace>
```

The response looks like the following example, where only `crType: record` backups include an ID.

NAME	ID	STATUS	TYPE	CR TYPE	AGE	COMMENT
p1-bup-gqz8f	20200526.142449	Ready	system	record	55m	
p1-bup-jx4vc	20200526.142458	Ready	site	record	54m	
p1-bup-st412		Ready	all	create	56m	y
p1-bup-th2dm		Ready	all	create	4h51m	y

2. Run the following command to view the details of a particular backup,, which is specified using the `<bup-name>` from the `NAME` column in the list of backups:

```
oc get portalbackup <bup-name> -n <Portal_namespace> -o yaml
```

The details of a backup look like the following example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  creationTimestamp: "2020-10-01T10:00:16Z"
  generateName: portal-bup-
  generation: 1
  name: portal-bup-g66gv
  namespace: default
  resourceVersion: "8940"
  selfLink: /apis/portal.apiconnect.ibm.com/v1beta1/namespaces/default/portalbackups/portal-bup-g66gv

    status: "False"
    type: Running
  - lastTransitionTime: "2020-10-01T10:00:18Z"
```

```
reason: BackupStatusUnknown
status: "False"
type: Warning
fullBackupName: ""
id: f8t0ux7z4zfnnjnu
message: ""
phase: Ready
state: ""
```

3. If the operation failed, check the associated `message` for more information.

## Check the status of a restore operation

---

1. Run the following command to get the name of the most recent restore record:

```
oc get portalrestore -n <Portal_namespace>
```

The response looks like the following example:

```
NAME                READY   AGE
portal-restore-twjrp Ready   28s
```

2. Run the following command to view information about the restore operation; which is indicated with the `<portal_restore_name>` shown in the `NAME` column:

```
oc get portalrestore <portal_restore_name> -n <Portal_namespace> -o yaml
```

The details of a failed restore operation look like the following example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  creationTimestamp: "2020-05-26T13:10:46Z"
  generateName: portal-restore-
  generation: 1
  name: portal-restore-x2bf9
  namespace: portal
  resourceVersion: "1493471"
  selfLink: /apis/portal.apiconnect.ibm.com/v1beta1/namespaces/portal/portalrestores/portal-restore-x2bf9
  uid: 9f6ale22-55ab-4595-8b98-bdfaec40d58c
spec:
  type: site
status:
  backupId: ""
  commentLeft: ""
  conditions:
  - lastTransitionTime: "2020-05-26T13:10:49Z"
    message: |
      Please provide a site to restore. To restore all sites use value 'all' in the CR
    status: Failed
    type: Ready
  fullBackupName: ""
  id: ""
  message: ""
```

3. If the operation failed, check the associated `message` for more information.

## Review the logs for additional information

---

Look for information in the logs of the `ibm-apiconnect` pod:

- Locate the `ibm-apiconnect` pod with:

```
oc get pods -n <Portal_namespace>
```

- View the logs with:

```
oc logs <ibm-apiconnect-pod-NAME> -n <Portal_namespace>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Backing up and restoring the Analytics database on OpenShift and Cloud Pak for Integration

The IBM® API Connect Analytics database can be backed up and restored from an S3 repository. S3 compatible object storage is required; for example, IBM Cloud Object Storage.

## About this task

---

Before you can initiate a backup or restore operation, you must update the Analytics CR (custom resource) to configure your settings. Generating a backup for Analytics is performed on demand by deploying a backup CR. You can deploy a restore CR to start the restoration of a previously generated backup.

- [Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration](#)  
Configure the IBM API Connect Analytics subsystem on OpenShift and Cloud Pak for Integration to support backing up and restoring the Analytics database.
- [Running a backup of the Analytics database on OpenShift and Cloud Pak for Integration](#)  
Deploy the `AnalyticsBackup` CR to initiate a backup of the IBM API Connect Analytics database on OpenShift or Cloud Pak for Integration.
- [Restoring the Analytics database on OpenShift and Cloud Pak for Integration](#)  
Deploy the `AnalyticsRestore` CR to initiate restoration of a backup of the IBM API Connect Analytics database on OpenShift or Cloud Pak for Integration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration

Configure the IBM® API Connect Analytics subsystem on OpenShift and Cloud Pak for Integration to support backing up and restoring the Analytics database.

### About this task

Generating a backup for Analytics is performed on demand by configuring backup settings in the Analytics section of the top-level `APICoconnectCluster` CR. You can create a restore CR to start the restoration of a previously generated backup.

- Backups can be scheduled or generated manually (on-demand), but you can only run one backup or restore process at a time.
- The backup and restore solution for Analytics supports only remote, cloud-based S3 storage (such as IBM Cloud Object Storage, AWS S3, or a custom S3 configuration).

### Procedure

1. Create the analytics backup secret for your S3-compatible storage:

a. Obtain an access key and corresponding access key secret from your S3 provider.

For example, you might obtain the key and secret from one of the following providers, using the instructions found on their sites:

- [IBM Cloud Object Storage](#)
- [AWS](#)

b. Create the Kubernetes secret by running the following command and filling in your access key, access key secret, and namespace:

```
oc create secret generic analytics-backup-secret --from-literal=username='Your_Access_Key' --from-literal=password='Your_access_key_secret' -n Analytics_namespace
```

2. Add the backup configuration to the Analytics section of the top-level `APICoconnectCluster` CR:

You can add or modify the Analytics backup configuration using one of the following methods:

- OpenShift web console:
  - Navigate to `Advanced Configuration > Analytics Subsystem > Advanced Configuration > Database Backups > Advanced Configuration`.
  - Configure the backup settings using the settings described in Table 1.
- IBM Cloud Pak Platform UI:
  - Open the API Connect instance for editing.
  - On the Details page, enable Advanced settings, which allows you to add backup configurations in the Analytics subsystem section.
  - Click Analytics subsystem and configure settings in the "Database backups" section using the settings described in Table 1.
- YAML: Edit the top-level `APICoconnectCluster` CR and add a `databaseBackup` section using the settings described in Table 1; for example:

```
spec:
  analytics:
    databaseBackup:
      credentials: analytics-backup-secret
      host: s3.eu-gb.cloud-object-storage.appdomain.cloud
      path: my-s3-bucket/apic-analytics-backups
      backupCerts: <custom-s3-server-CA-cert>
      schedule: "0 2 * * *"
      enableCompression: true
      chunkSize: 1GB
      enableServerSideEncryption: false
```

Table 1. Backup configuration settings for Analytics

Field name in UI	Field name in YAML	Description
Credentials	<code>credentials</code>	The name of the Kubernetes secret that you created in step 1.
Server hostname	<code>host</code>	The S3 endpoint with the corresponding S3 region in the format <code>s3.s3region.s3domain</code>
Backup path	<code>path</code>	A combination of the S3 bucket and the base path within the bucket, using the format <code>bucket_name/base_path</code>
Schedule	<code>schedule</code>	(Optional) The schedule that determines how often backups will be invoked automatically. The format for the schedule is any valid cron string. The timezone for backups is that of the kube-controller-manager. Backing up once a day is probably sufficient; remember that the more frequently you run backups, the more storage space you need.
Compress	<code>enableCompression</code>	(Optional) Determines whether metadata files are stored in compressed format. Default value is <code>true</code> .

Field name in UI	Field name in YAML	Description
Backup chunk size	<code>chunkSize</code>	(Optional) Specifies how large files are stored. Large files can be stored as chunks when the snapshot is created. This setting specifies the size of the chunks as GB, MB, or KB. Default value is <b>1GB</b> .
Enable server side encryption	<code>enableServerSideEncryption</code>	(Optional) Determines whether files are encrypted. When set to true, files are encrypted on the server side using AES256. Default value is <b>false</b> .
Backup Certs	<code>backupCerts</code>	<p>The name of a custom certificate that contains your upstream custom S3 CA certificate. Supported beginning with 10.0.2. This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be <code>ca.crt</code> and the value is the base64-encoded value of the CA certificate.</p> <p>If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Analytics subsystem already trusts the server certificate. You can test this by configuring the Analytics backup to your S3/object-store server without providing the CA certificate.</p> <p>If you do need to provide the CA certificate then you must provide the entire chain in the <code>ca.crt</code> member of the secret, as follows:</p> <pre>intermediate-certificate-1 intermediate-certificate-2 . . . intermediate-certificate-n root-certificate</pre> <p>Where the first certificate in the <code>ca.crt</code> member (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the <code>ca.crt</code> member is the issuer of the preceding certificate. The root certificate in the <code>ca.crt</code> member must be self-signed.</p> <p>If there are no intermediate certificates involved, then the <code>ca.crt</code> member contains only the root certificate.</p> <p>The following sample bash script creates the Kubernetes secret:</p> <pre>cat &gt;customs3ca.yaml &lt;&lt;EOF apiVersion: v1 data:   ca.crt: \$(base64 &lt;path-to-ca-certificate&gt;   tr -d '\n' ) kind: Secret metadata:   name: custom-server-ca type: generic EOF kubectl apply -f customs3ca.yaml -n &lt;namespace&gt;</pre>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Running a backup of the Analytics database on OpenShift and Cloud Pak for Integration

Deploy the `AnalyticsBackup` CR to initiate a backup of the IBM® API Connect Analytics database on OpenShift or Cloud Pak for Integration.

### Before you begin

[Configure backup settings for Analytics.](#)

### About this task

A backup is triggered by creating the `AnalyticsBackup` CR. The new CR is detected by the `ibm-apiconnect` operator, which requests a new backup.

### Procedure

1. Make sure your analytics cluster status is **Running** and **READY**.

The cluster is ready when the **READY** condition states `x/y` where `x = y`. You can check the status in the OpenShift Form UI, or by running the following command:

```
oc get a7s
```

where `a7s` is the name of your Analytics subsystem. The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
analytics	8/8	Running	10.0.2.0	10.0.2.0-426		19h

2. Create the `AnalyticsBackup` CR using either the IBM Cloud Pak Platform UI, the OpenShift web console, or the CLI.

For example:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsBackup
```

```

metadata:
  name: a7s-bup-01
  generateName: a7s-bup-
  namespace: apic
spec:
  comment: test comment
  crType: create
  enableIgnoreUnavailable: true
  indices:
    - all

```

where:

- **crType** - Use **create** to trigger a backup process. When the backup is created, the operator generates another backup CR with **crType**: **record**, which represents the stored backup that you can use for a restore operation.
- Optional: **comment** - You can use this field to describe the back up for later reference.
- Optional: **indices** - A list of index names or keywords, indicating which indices you want to back up. If no indices are specified, then all indices are backed up. The following supported keywords are mapped to indices or aliases in Elasticsearch:
  - **all** - Backup all data. This is equivalent to listing all of the remaining keywords (**apievents**, **ui**, **config**).
  - **apievents** - Backup all analytics data.
  - **ui** - Backup all UI visualizations and dashboards.
  - **config** - Backup all configuration information, such as the retention period.

Note: If you are creating a backup that will be used to recover from a disaster, set **indices**: **all** to include a complete set of indices. Using a full set of indices ensures that your complete Analytics configuration, event data, and custom UI configuration (such as custom dashboards) can be restored in the event of a disaster.

- Optional: **enableIgnoreUnavailable** - Default value is **false**. If set to **false**, the backup fails if a specified index is not present. If set to **true**, missing indices are skipped and the backup continues.

3. Trigger the backup operation by clicking Create in the UI, or by running the following command to deploy the CR in the namespace for your Analytics subsystem:

```
oc create -f analyticsbackup_cr.yaml -n <Analytics-namespace>
```

The backup's name and ID are generated when the backup operation runs.

4. To get a list of available backups, run the following command:

```
oc get analyticsbackup -n <Analytics-namespace>
```

where **<Analytics-namespace>** is the namespace where the Analytics subsystem is deployed. The response looks like the following example:

NAME	STATUS	ID	CR TYPE	INDICES	AGE	COMMENT
a7s-bup-266p8	Ready		create	[all]	20h	Y
a7s-bup-pffdh	Ready		create	[all]	34h	Y
analytics-bup-kxwq5	Ready	analytics-all-2020-09-07t03:49:15utc	record	[ui apievents config]	34h	
analytics-bup-p29z8	Ready	analytics-all-2020-09-07t18:04:03utc	record	[ui apievents config]	20h	

5. Display the details for a particular backup by running the following command:

Use the backup name from the results in the previous step.

```
oc get analyticsbackup backup_NAME -n <Analytics-namespace> -o yaml
```

The result looks like the following example:

```

apiVersion: analytics.apiconnect.ibm.com/v1beta1

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Restoring the Analytics database on OpenShift and Cloud Pak for Integration

Deploy the **AnalyticsRestore** CR to initiate restoration of a backup of the IBM® API Connect Analytics database on OpenShift or Cloud Pak for Integration.

### Before you begin

[Create a backup](#). If you intend to restore from a recent backup, ensure that the backup is finished before you start the restore operation.

### About this task

A restore operation is triggered by creating the **AnalyticsRestore** CR. The new CR is detected by the **ibm-apiconnect** operator, which requests a restore of the specified backup.

Note: You can only run one backup or restore process at a time.

### Procedure

1. Find the backup that you want to restore.
  - a. Get a list of available backups by running the following command:

```
oc get analyticsbackup -n <APIC_namespace>
```

where **<APIC\_namespace>** is the namespace where the Analytics subsystem is deployed. The response looks like the following example:

NAME	STATUS	ID	CR TYPE	INDICES	AGE	COMMENT
a7s-bup-266p8	Ready		create	[all]	20h	y
a7s-bup-pffdh	Ready		create	[all]	34h	y
analytics-bup-kxwq5	Ready	analytics-all-2020-09-07t03:49:15utc	record	[ui apievents config]	34h	
analytics-bup-p29z8	Ready	analytics-all-2020-09-07t18:04:03utc	record	[ui apievents config]	20h	

Note: You can only restore the Analytics subsystem from backups where the **CR TYPE** is **record**.

- b. Note down the ID of the backup that you want to restore.

Only backups that were created with **crType: record** receive an ID, so you can only restore from **record** type backups. In the previous example, the backups with the "CR TYPE" set to "create" does not have an ID assigned and cannot be used for a restore operation.
2. Create the **AnalyticsRestore** CR using either the IBM Cloud Pak Platform UI, the OpenShift web console, or the CLI. In the CR, specify the ID of the backup that you want to restore. For example:

```

apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsRestore
metadata:
  name: a7s-restore-01
  generateName: a7s-restore-
  namespace: apic
spec:
  backupID: analytics-all-2020-09-07t18:04:03utc
  enableIgnoreUnavailable: true
  enableOverride: true
  indices:
    - all

```

where:

- **indices** - A list of index names or keywords, indicating which indices you want to back up. If no indices are specified, then all indices are backed up. The following supported keywords are mapped to indices or aliases in Elasticsearch:
  - **all** - Restore all data. This is equivalent to listing all of the remaining keywords (**apievents**, **ui**, **config**).
  - **apievents** - Restore all analytics data.
  - **ui** - Restore all UI visualizations and dashboards.

- **config** - Restore all configuration information, such as the retention period.
- **backupID** - The ID of the backup to be restored. In the example, the backup ID is `analytics-all-2020-09-07t18:04:03utc`.
- **enableIgnoreUnavailable** - Default value is `false`. If set to `false`, the restore fails if a specified index is not present in the backup identified by the `backupID`. If set to `true`, missing indices are skipped and the restore continues.
- **enableOverride** - Default value is `false`. If set to `true`, then the restore overrides existing indices. This might result in a loss of data from the current database.  
When `enableOverride` is set to `false` and you specified indices that already exist in the database that you are restoring, then the restore fails. The failure prevents you from accidentally replacing or losing data that exists in the current database.

3. Trigger the restore operation by clicking Create in the UI, or by running the following command to deploy the CR in the namespace for your Analytics subsystem:

```
oc create -f analyticsrestore_cr.yaml -n <APIC_namespace>
```

The restore's name is generated when the restore operation runs.

4. To get a list of restores, run the following command:

```
oc get analyticsrestore -n <APIC_namespace>
```

The response looks like the following example.

NAME	STATUS	ID	AGE
a7s-restore-01	Running	analytics-all-2021-04-01t12:48:49utc	11s

5. Display the details for a particular restore by running the following command:

Use the restore name from the results in the previous step.

```
oc get analyticsrestore <restore_NAME> -n <APIC_namespace> -o yaml
```

The result looks like the following example,:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsRestore
metadata:
  generateName: a7s-restore-
  selfLink: >-
    /apis/analytics.apiconnect.ibm.com/v1beta1/namespaces/apic/analyticsrestores/a7s-restore-01
  resourceVersion: '11267266'
  name: a7s-restore-01
  uid: e772c6c9-754a-45da-a7c7-507a56cbb94a
  creationTimestamp: '2021-04-01T13:48:00Z'
  generation: 1
  namespace: apic
spec:
  backupID: 'analytics-all-2021-04-01t12:48:49utc'
  enableIgnoreUnavailable: false
  enableOverride: true
  indices:
    - config
status:
  backupID: ''
  commentLeft: ''
  conditions:
    - lastTransitionTime: '2021-04-01T13:48:04Z'
      message: ''
      reason: na
      status: 'False'
      type: Warning
    - lastTransitionTime: '2021-04-01T13:48:04Z'
      message: ''
      reason: na
      status: 'False'
      type: Ready
    - lastTransitionTime: '2021-04-01T13:48:04Z'
      message: IN_PROGRESS
      reason: IN_PROGRESS
      status: 'True'
      type: Running
    - lastTransitionTime: '2021-04-01T13:48:04Z'
      message: ''
      reason: na
      status: 'False'
      type: Error
    - lastTransitionTime: '2021-04-01T13:48:04Z'
      message: Restore Pending
      reason: RestorePending
      status: 'False'
      type: Pending
  details: |
    {NumberOfDataNodes:1
    Status:yellow
    ActivePrimaryShards:8
    ActiveShards:8
    RelocatingShards:0
    InitializingShards:0
    UnassignedShards:10
    PendingTasks:0}
  id: 'analytics-all-2021-04-01t12:48:49utc'
  phase: Running
  state: ''
```

When the restore is successfully started, the **status: condition** section displays **Running**. If the restore does not start correctly, the **status: condition** section displays **Failed**.

The restore process is successful when the storage cluster status is green, there are no unassigned shards, and there are no initializing shards. At that time the **status: condition** section displays **Complete**. If **status: Complete** is not achieved after 3 hours, the status changes to **Warning** and the details are no longer updated.

Attention: For deployment profiles with fewer than 3 storage nodes, the restore process is never marked as **Complete**. The storage cluster status is expected to be yellow and to have more than 0 unassigned shards. In this situation, the restore process is likely to be complete when there are 0 initializing shards.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Preparing the management subsystem for disaster recovery

You can prepare a Management subsystem for disaster recovery from S3 or SFTP backups by taking specific steps before and after the installation of the subsystem.

## About this task

- This task must be performed before any disaster event occurs, and also prior to the installation of a replacement Management subsystem during the recovery process. Best practice is to complete these steps immediately after initial configuration of a management subsystem during your original v10 deployment.
- Any `local` backups are presumed to have been lost in the disaster scenario and are non-recoverable in this procedure.

Important: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

## Procedure

1. Prior to initial installation, configure the Management subsystem for database backups:

See [Configuring backup settings for fresh install of the Management subsystem](#).

2. After installation, you must back up essential Kubernetes secrets that are used by the Management subsystem.

The Kubernetes secrets are created during installation. You must save these in case a restore is needed after a disaster has occurred. At that time, you will use them in the setup of the restored Management subsystem:

- a. Obtain and save the Management database encryption secret.

Use the following command to find the name of the secret in the status of the Management Subsystem. Replace `<namespace>` with the namespace used for the subsystem installation:

```
kubectl get mgmt -n <namespace> -o yaml | grep encryption
```

The output of this command shows the name of the Kubernetes secret storing the database encryption key, for example:

```
encryptionSecret: management-enc-key
```

In this case, the name of the Management database encryption secret is `management-enc-key`. Use the following command to back up this secret locally:

```
kubectl get secret management-enc-key -n <namespace> -o yaml > management_enc_key.yaml
```

The secret is stored in a file called `management_enc_key.yaml`, located in the present working directory.

- b. Obtain and save the Management client application credential secrets.

- i. Use the following command to find the names of the secrets in the status of the Management subsystem:

```
kubectl get mgmt -n <namespace> -o yaml | grep CredentialSecret
```

The output of this command shows the names of the Kubernetes Secrets used to store the various client application credentials. For example:

```
atmCredentialSecret: management-atm-cred
consumerToolkitCredentialSecret: management-ccli-cred
consumerUICredentialSecret: management-cui-cred
designerCredentialSecret: management-dsgr-cred
juhuCredentialSecret: management-juhu-cred
toolkitCredentialSecret: management-cli-cred
uiCredentialSecret: management-ui-cred
```

Here, for example, the name of the ATM Client Application Credential Secret is `management-atm-cred`.

- ii. Next, back up all of the secrets locally. Use the following command for each listed Credential Secret, replacing `<secret_name>` with the secret name listed each time:

```
kubectl get secret <secret_name> -n <namespace> -o yaml > <secret_name>.yaml
```

For example, use the following command to backup the ATM Client Credential Secret:

```
kubectl get secret management-atm-cred -n <namespace> -o yaml > management-atm-cred.yaml
```

- iii. Once you have saved each of these client application Credential Secrets locally, open each of the YAML files saved for each secret in turn. Remove both the `ownerReferences` subsection and the `selfLink` property. Re-save the file.

For example, the `ownerReferences` and `selfLink` properties to be removed appear in the YAML files similar to the following:

```
ownerReferences:
- apiVersion: management.apiconnect.ibm.com/v1beta1
  blockOwnerDeletion: true
  controller: true
  kind: ManagementCluster
  name: management
  uid: 623e6b20-7eb8-46ce-94ac-6b64cd71afc4
selfLink: /api/v1/namespaces/default/secrets/management-atm-cred
```

- c. Ensure that all of these YAML files that contain the various backed-up Secrets are stored persistently and safely.

Important: If the files are lost, you cannot restore after a disaster event.

- d. Obtain the endpoints of your Management subsystem.

In Disaster Recovery, the endpoints of the old Management installation *must* match that of the new Management installation:

```
kubectl get managementcluster management -o jsonpath="{..apiManagerEndpoint.hosts[0].name}"
```

```
kubectl get managementcluster management -o jsonpath="{..cloudManagerEndpoint.hosts[0].name}"
```

```
kubectl get managementcluster management -o jsonpath="{..consumerAPIEndpoint.hosts[0].name}"
```

Save this output to a safe place.

e. Take note of the following values in the Management subsystem CR. You will need them to restore the Management subsystem.

Table 1. Management subsystem CR settings

Setting	Used with Protocol	Example value
<code>name</code>	S3 and SFTP	<code>management</code>
<code>siteName</code>	S3 and SFTP	<code>82b290a2</code>
<b>Version 10.0.3.0 or later</b> <code>originalUID</code>	S3 and SFTP	<code>fa0f6f49-b931-4472-b84d-0922a9a92dfd</code> <b>Version 10.0.3.0 or later:</b> During restore, if you do not specify <code>originalUID</code> , the operator automatically sets its value in the new CR to the value of <code>metadata.uid</code> . If the <code>originalUID</code> in the new CR does not match <code>originalUID</code> in the saved CR, the restore will fail.
<b>Version 10.0.2.0</b> <code>metadata.uid</code>	S3 and SFTP	<b>If planning to restore on Version 10.0.3.0 or later:</b> make a note of the subsystem CR <code>metadata.uid</code> . You must use it when performing a restore on v10.0.3 or later, to populate the <code>spec.originalUID</code> value of the CR. Note: If planning to restore on Version 10.0.2, performing a restore may not work if the subsystem CR name exceeds 15 characters.
<code>.databaseBackup.protocol</code>	S3 and SFTP only	<ul style="list-style-type: none"> <li>S3: <code>objstore</code></li> <li>SFTP: <code>sftp</code></li> </ul>
<code>databaseBackup.s3provider</code>	S3 only	<code>aws</code>
<code>databaseBackup.host</code>	S3 and SFTP	<ul style="list-style-type: none"> <li>SFTP <code>&lt;SFTP-host-name&gt;</code></li> <li>S3: <code>s3.amazonaws.com/eu-west-1</code></li> </ul>
<code>databaseBackup.path</code>	S3 and SFTP	<ul style="list-style-type: none"> <li>SFTP <code>&lt;SFTP-path&gt;</code></li> <li>S3: <code>my-bucket/mgmt</code></li> </ul>
<code>databaseBackup.schedule</code>	S3 and SFTP	<code>0 3 * * *</code>
<code>databaseBackup.credentials</code>	SFTP only	<code>secret-containing-SFTP-credentials</code>
<code>databaseBackup.backupCerts</code>	S3 (custom only, v10.0.2.0 or later)	<code>my-custom-s3-ca-cert</code>
<code>databaseBackup.backups3URIStyle</code>	S3 (custom only, v10.0.2.0 or later)	<code>my-s3-uri-style</code>

- The values `name` and `siteName` form the name of the database cluster name, such as `management-82b290a2-postgres` and is needed to synchronize the backups from your old Management subsystem to your new one. The `siteName` is either be a randomly generated alphanumeric ID, or a custom name that was specified by the administrator in the Management Subsystem CR helper YAML file at deploy time. Use the following command to get the `siteName`:

```
kubectl get mgmt -o yaml -n <namespace> | grep siteName
```

- The `databaseBackup.host` and `databaseBackup.path` settings must be identical to what was configured on your old Management subsystem. This is the location of your old Management subsystem backups from where we will recover from.
- Take note of `databaseBackupschedule`. The schedule will be included during the restoration.

3. Make sure that you have a backup that can be used in case of a disaster event:

- If scheduled backups were configured as part of [Configuring backup settings for fresh install of the Management subsystem](#), backups to the specified cloud storage will take place as scheduled.
- You can also perform a manual backup at any time by creating a manual backup CR. See [Generating a manual backup of the management subsystem](#).

## What to do next

You should now complete the preparation steps for the Developer Portal subsystem; see [Preparing the Developer Portal for disaster recovery](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Preparing the Developer Portal for disaster recovery

You can prepare a Developer Portal subsystem for disaster recovery by taking specific steps before and after the installation of the subsystem.

### About this task

- This task must be performed before any disaster event occurs, and also prior to the installation of a replacement Developer Portal subsystem for the recovery process. Best practice is to complete these steps immediately after initial configuration of a Developer Portal subsystem during your original v10 deployment.
- Any `local` backups are presumed to have been lost in the disaster scenario and are non-recoverable in this procedure.

Important: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. For information about preparing the Management subsystem, see [Preparing the management subsystem for disaster recovery on Kubernetes](#). If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

## Procedure

1. Before the initial installation, configure the Developer Portal subsystem for database backups:

- a. Ensure that the Developer Portal backup subsystem secret is created in the cluster.  
This secret contains the credentials (username and password) for the remote storage, such as S3 or IBM Cloud Object Storage, that is used for storing the database backups.
- b. Ensure that the Developer Portal subsystem is configured for database backups.  
Add a `databaseBackups` subsection to the `spec` subsection of the Developer Portal subsystem Custom Resource (CR) YAML file. For example:

```
portalBackup:
  credentials: portal-backup-secret
  host: s3.eu-gb.cloud-object-storage.apptomain.cloud/eu-standard
  path: test-bucket/restore-test
  port: 443
  protocol: objstore
  schedule: ''
```

See also: [Backing up and restoring the Developer Portal in a Kubernetes environment](#)

2. After installation, you must back up essential Kubernetes secrets that are used by the Developer Portal subsystem.  
The Kubernetes secrets are created during installation. You must save these secrets in case a restore is needed after a disaster. Then, you use them in the setup of the restored Developer Portal subsystem:

- a. Obtain and save the Developer Portal database encryption secret.  
Use the following command to find the name of the secret in the status of the Developer Portal Subsystem. Replace `<namespace>` with the namespace used for the subsystem installation:

```
kubectl get portal -n <namespace> -o yaml | grep encryption
```

The output of this command shows the name of the Kubernetes secret that is storing the database encryption key, for example:

```
encryptionSecret: portal-enc-key
```

In this case, the name of the Developer Portal database encryption secret is `portal-enc-key`. Use the following command to back up this secret locally:

```
kubectl get secret portal-enc-key -n <namespace> -o yaml --export > portal_enc_key.yaml
```

The secret is stored in a file that is called `portal_enc_key.yaml`, located in the present working directory.

- b. Obtain the endpoint definitions as they need to stay the same during the restore.  
Get the `portalAdminEndpoint` name:

```
kubectl get portalcluster.portal.apiconnect.ibm.com portal -o jsonpath="{..portalAdminEndpoint.hosts[0].name}"
```

Get the `portalUIEndpoint` name:

```
kubectl get portalcluster.portal.apiconnect.ibm.com portal -o jsonpath="{..portalUIEndpoint.hosts[0].name}"
```

Note: If you have more than one host specified in the `portalUIEndpoint` definition, you must get the name for each one.

- c. Ensure that all of these YAML files that contain the various backed-up Secrets are stored persistently and safely.  
Important: If the files are lost, you cannot restore after a disaster event.

3. Take note of the value of `originalUID` in the Portal subsystem CR. You will need it to restore the Portal subsystem. For example:

```
spec:
  originalUID: "447ea4b3-9514-4a84-a34b-ce0b349838da"
```

Note:

- **Version 10.0.3.0 or later:** During restore, if you do not specify `originalUID`, the operator automatically sets its value in the new CR to the value of `metadata.uid`. If the `originalUID` in the new CR does not match `originalUID` in the saved CR, the restore will fail.
- **Version 10.0.2 backups:** If planning to restore a Version 10.0.2 backup on Version 10.0.3.0 or later, make a note of the subsystem CR `metadata.uid`. You must use it when performing a restore on v10.0.3.0 or later, to populate the `spec.originalUID` value of the CR.
- **Limitation for Version 10.0.2:** If planning to restore on Version 10.0.2, performing a restore may not work if the subsystem CR name exceeds 15 characters.

4. If Scheduled backups are set as part of the `databaseBackup` subsection in the Developer Portal Subsystem CR helper YAML file (`portal_cr.yaml`), backups to the specified cloud storage take place.

You can also complete a manual backup at any time by creating a manual backup CR.

- a. To complete a manual backup, use the Developer Portal backup CR helper YAML file (`portalbackup_cr.yaml`). For example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  generateName: portal-bup-
spec:
  type: all
  crType: create
  comment: "test comment"
```

Run the following command to start a manual backup to the configured cloud storage:

```
kubectl create -f portalbackup_cr.yaml -n <namespace>
```

- b. Use the following command to list the backups:

```
kubectl get portalbackup -n <namespace>
```

For example:

```
loginabc@localhost ibm-apiconnect]$ kubectl get pb
NAME          ID                STATUS  TYPE  CR TYPE  AGE    COMMENT
portal-bup-g66gv  20201001.100021  Ready  site  create   5m27s  y
portal-bup-z7wgk  20201001.100021  Ready  site  record   4m24s
```

With stored backups, secrets and `siteName` saved, the stack is now ready for a restore after a disaster event.

## What to do next

---

To restore the Developer Portal on Kubernetes after a disaster, see [Recovering the Developer Portal after a disaster](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Preparing the Analytics subsystem for disaster recovery

Prepare the API Connect Analytics subsystem for disaster recovery in a Kubernetes environment.

### About this task

---

Preparing for disaster recovery involves backing up data and making a local copy of the Custom Resource (CR) that was used for installing the Analytics subsystem.

### Procedure

---

1. [Perform a backup of the Analytics database](#).

Scheduling automatic backups ensures that a recovery includes recent updates. For more information on configuring backups, see [Configuring backup settings for Analytics](#).

2. Make a copy of the AnalyticsCluster CR (custom resource).

- a. Find the Analytics cluster's name by running the following command and looking for the value in the **NAME** column:

```
kubectl get AnalyticsCluster
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
gj01-analytics	6/6	Running	10.0.1-eus	10.0.1.1-1402-eus		22h

In this example the cluster's name is `gj01-analytics`.

- b. Get the YAML that describes the Analytics cluster, and save it in a file using the following command: Use the name of the AnalyticsCluster that you obtained in the previous step.

```
kubectl get AnalyticsCluster gj01-analytics -o yaml > gj01-analytics.yaml
```

- c. Save the file locally.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Recovering from a disaster

Recover the API Connect subsystems on Kubernetes.

- [Recovering the management subsystem on Kubernetes](#)  
Recover the management subsystem on Kubernetes.
- [Recovering the Developer Portal after a disaster](#)  
You can restore the Developer Portal subsystem after a disaster event.
- [Recovering the Analytics subsystem after a disaster](#)  
Recover the API Connect Analytics subsystem in a Kubernetes environment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Recovering the management subsystem on Kubernetes

Recover the management subsystem on Kubernetes.

The recovery procedures for the management subsystem are specific to the type of backup. Use the instructions for your backup type:

- [Recovering the management subsystem from S3 backups](#)  
You can recover the management subsystem from S3 backups after a disaster event.

- [Recovering the management subsystem from SFTP backups](#)  
You can recover the management subsystem from SFTP backups after a disaster event.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Recovering the management subsystem from S3 backups

You can recover the management subsystem from S3 backups after a disaster event.

### Before you begin

To successfully recover the management subsystem, you must have previously completed the steps in [Preparing the management subsystem for disaster recovery](#). Important: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

### About this task

To recover from a disaster event, you must create a new IBM API Connect installation with a running IBM API Connect Operator.

Note: Limitation for backups created on Version 10.0.2

- If restoring a Version 10.0.2 backup onto a new Version 10.0.2 deployment, performing a restore may not work if the subsystem CR name exceeds 15 characters. This limitation applies only to restoring onto Version 10.0.2.
- Restoration is supported for Version 10.0.2 backups onto a Version 10.0.3.0 or later deployment when subsystem name exceeds 15 characters, as long as the correct `spec.originalUID` is specified upon restore. See Step [3.f](#).

### Procedure

1. Determine which backup to restore from.

- For IBM's Cloud Object Storage, you can check currently stored backups in the COS console. Select Buckets > Objects. See the Object Names displayed on the `<cos_name>/backup/db` panel. For example:

```
20200605-105429F
20200605-100008F
20200605-11040F
```

- For Amazon's AWS, you can check currently stored backups in the S3 console For example, under Amazon S3 > `cluster_name` > old cluster > backup > db:

```
20200606-144315F
20200606-145011F
```

The format of the backup ID is `YYYYMMDD-HHMMSS<F|I>`

Take note of the ID of the backup you wish to restore to. Each ID contains the date, time, and type of the backup stored. This will be used later in the procedure.

- Incremental backups are denoted with a suffix `I` on the ID, ensure each incremental backup has its prior backup also present in storage. You can check this by examining the ID `<prior-backup-id>_<backup-id>`.
- Full backups are denoted with a suffix `F` on the ID.

Note:

During the disaster recovery process, the S3 configuration detail of the older management system is used, but the older management system must be in offline mode. The old subsystem must be offline because you cannot have two management systems simultaneously using the same S3 bucket name in the database backup configurations.

2. Make sure you know the management database cluster name.

You can get this name from the original management subsystem CR. You made note of this name in Step [2.e](#) in [Preparing the management subsystem for disaster recovery](#).

If you are not able to recover the original management subsystem CR, use the following steps to recover the Management database cluster name:

- Open your IBM Cloud Object Storage or AWS S3 console and proceed to the bucket location where the old Management subsystem backups are located.
- Download `backup/db/<backup-id>/pg_data/postgresql.conf.gz`. Open `postgresql.conf` to view the database cluster name:

- IBM Cloud Object Storage

```
.
.
cluster_name = 'm1-a6287572-postgres'
.
.
```

- `m1` - Management subsystem name
- `a6287572` - site name

- AWS S3

```
.
.
```

```
cluster_name = 'm1-c91dc0b9-postgres'
```

- `m1` - Management subsystem name
- `c91dc0b9` - site name

3. Before installing the replacement management subsystem CR:

- a. Apply the YAML file that contains the Management Database Encryption Secret into the cluster. For example, where `encryption-bin-secret.yaml` is the local YAML file containing the backup-up encryption secret:

```
kubectl apply -f encryption-bin-secret.yaml -n <namespace>
```

Replace `<namespace>` with the namespace being used for the management subsystem installation.

This command re-creates the original Management Database encryption secret on the cluster. It will be named as the original name of the secret.

- b. Add the following `encryptionSecret` subsection to the `spec` of the Management CR. For example, if `management-enc-key` is the name of the newly created secret on the cluster containing the original Management Database encryption secret from the previous step:

```
encryptionSecret:
  secretName: management-enc-key
```

- c. For each of the saved YAML Files that contain the Management Client Application Credential Secrets, apply each file into the cluster using the following command:

```
kubectl create -f <secret_name>.yaml -n <namespace>
```

where `<secret_name>` is the local YAML file containing one of the backed-up Credential Secrets.

Repeat this for each of the backed-up Credential Secrets. These are the secrets you saved in Step 2.b in [Preparing the management subsystem for disaster recovery](#).

These commands will re-create the original Management Client Application Credential Secrets on the cluster. Each will be named as the original name of the Secret.

- d. Add the following `customApplicationCredentials` subsection to the `spec` subsection of the Management CR:

```
customApplicationCredentials:
- name: atm-cred
  secretName: management-atm-cred
- name: ccli-cred
  secretName: management-ccli-cred
- name: cli-cred
  secretName: management-cli-cred
- name: cui-cred
  secretName: management-cui-cred
- name: dsgr-cred
  secretName: management-dsgr-cred
- name: juhu-cred
  secretName: management-juhu-cred
- name: ui-cred
  secretName: management-ui-cred
```

For each named credential above, the `secretName` is given as the corresponding name of the newly created secret from Step 3.c.

- e. Add the `siteName` property to the `spec` of the Management CR.

For example, if `a2a5e6e2` is the original `siteName` that was noted after the installation of the original Management Subsystem:

```
siteName: a2a5e6e2
```

- f. **Version 10.0.3.0 or later:** Add the `originalUID` property to the `spec` of the Management CR.

When recreating a system, to restore a backup into it, you must specify the same `spec.originalUID` in the CR as was present in the system that was backed up. If the `spec.originalUID` in the new CR for recreating the system does not match the `spec.originalUID` that was present in the system that was backed up, the restore will fail.

```
spec:
  originalUID: "fa0f6f49-b931-4472-b84d-0922a9a92dfd"
```

Note:

- For Version 10.0.3.0 or later, if you do not specify `spec.originalUID` in the new CR, the operator automatically sets the Management CR value of `spec.originalUID` to match the new CR value `metadata.uid`. In this case, the restore will fail because the `spec.originalUID` in the saved (backed-up) CR does not match `spec.originalUID` in the new CR.
- The originalUID is only essential when the subsystem CR name exceeds 15 characters in length, or 10 characters limit for the API Connect Cluster CR. Recommended practice is that all backups should include the originalUID for Management.
- See also Step 2.e in [Preparing the management subsystem for disaster recovery](#).

- g. Verify that the name of the management subsystem in the CR matches with the old management subsystem name, as described in Step 2.e in [Preparing the management subsystem for disaster recovery](#).

4. Install the Management subsystem CR with the values obtained in Step 2.e in [Preparing the management subsystem for disaster recovery](#).

Important: The hostnames of the endpoints cannot be changed, and must remain the same in the Management CR YAML file used for installation now as they were for the original installation.

To review installation of the management subsystem, see [Installing the Management subsystem cluster](#).

Once the Management subsystem is installed you may notice `backup` job pods and `stanza-create` job pods in `Error` state.

```
m1-82b290a2-postgres-stanza-create-4zcgz          0/1    Error    0    35m
m1-82b290a2-postgres-full1-sch-backup-2g9hm      0/1    Error    0    20m
```

This is expected behavior.

- The **stanza-create** job normally expects buckets or subdirectories within buckets to be empty. However, since we have configured the Management subsystem with a pre-populated bucket (ie. where our backups exist), the job will go into **Error** state.
- Any scheduled or manual backups will go into **Error** state. While we have configured the Management subsystem with our already populated S3 bucket, the new database isn't yet configured to write backups into remote storage.

Important:

For S3, the recovery remains in an intermediate state until the restore is complete, and Postgres wal files might cause serious disk issues. To avoid this possibility, continue immediately with the next step.

Note that if you delay completion of the restore:

- Health check might fail. In this case, you can still proceed to the next step and perform a restore.
  - Postgres wal files might cause problems by consuming all disk space. In this case, you must either:
    - Re-install the system, prepare again for disaster recovery, and perform the restore.
    - Or increase disk space so that the system returns to a stable state, and then proceed with the restore.
5. Get a list of available backups and confirm that the backup ID noted in Step 4 is in the backup list.

The API Connect Operator automatically reads backups from configured remote storage and populates the list of available backups we can restore to.

```
$ kubectl get mgmtb
NAME                STATUS    ID                CLUSTER          SUBSYSTEM  TYPE    CR TYPE    AGE
mgmt-backup-4z87f   Complete  20200606-145011F  m1-82b290a2-postgres  m1         full    record    11m
mgmt-backup-6bms2   Complete  20200606-144315F  m1-82b290a2-postgres  m1         full    record    11m
```

6. Update the Management subsystem CR `databaseBackup.schedule` to what was noted in Step 2.e in [Preparing the management subsystem for disaster recovery](#).
7. Perform a Management Restore using the name of the backup that has the ID you want to restore. For example, as shown in Step 5, for ID `20200606-145011F` the backup name is `mgmt-backup-4z87f`.  
For more info on restoring the management subsystem, see [Restoring the management subsystem \(v10.0.1.1 or later\)](#).
8. Use the following command to check the status of the restore:

```
kubectl get mgmtr -n <namespace>
```

Once the Management Restore has completed and the database is running again, the data of the old Management subsystem will be successfully restored onto the new Management subsystem. Note:

- Manual and scheduled backups should perform as normal once again
  - **stanza-create** jobs will continue to report **Error** state as stated in Step 4.
9. Verify that the Cloud Manager UI can now be logged-in to as before, and that Provider Orgs exist as before.  
The restore from the disaster event is now complete.

## What to do next

You should now complete the recovery steps for the Developer Portal subsystem on Kubernetes, see [Recovering the Developer Portal after a disaster](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Recovering the management subsystem from SFTP backups

You can recover the management subsystem from SFTP backups after a disaster event.

### Before you begin

To successfully recover the management subsystem, you must have previously completed the steps in [Preparing the management subsystem for disaster recovery](#).  
Important: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

### About this task

To recover from a disaster event, you must create a new IBM API Connect installation with a running IBM API Connect Operator.

Note: Limitation for backups created on Version 10.0.2

- If restoring a Version 10.0.2 backup onto a new Version 10.0.2 deployment, performing a restore may not work if the subsystem CR name exceeds 15 characters. This limitation applies only to restoring onto Version 10.0.2.
- Restoration is supported for Version 10.0.2 backups onto a Version 10.0.3.0 or later deployment when subsystem name exceeds 15 characters, as long as the correct `spec.originalUID` is specified upon restore. See Step 3.f.

### Procedure

1. Determine which backup to restore from.  
View the SFTP backups available on your remote storage site:

```

-rw-r--r-- 1 root root 13092333 Aug 26 08:56 20200826-154646F.tgz
-rw-r--r-- 1 root root 18703758 Aug 26 09:10 20200826-160010F.tgz
-rw-r--r-- 1 root root 24318561 Aug 26 09:21 20200826-161301F.tgz

```

Take note of the backup ID of the backup you wish to restore to. Each filename contains the date, time, and type of the backup stored. This will be used later in the procedure.

The format of the backup ID is **YYYYMMDD-HHMMSS<F|I>**. For example, if we want to use the Aug 26, 09:21 backup, its backup ID will be **20200826-161301F**

- a. Incremental backups are denoted with a suffix **I** on the ID, ensure each incremental backup has its prior backup also present in storage. You can check this by examining the ID **<prior-backup-id>\_<backup-id>**.
  - b. Full backups are denoted with a suffix **F** on the ID.
2. Make sure you know the management database cluster name.  
You can get this name from the original management subsystem CR. You made note of this name in Step [2.e](#) in [Preparing the management subsystem for disaster recovery](#).

If you are not able to recover the original management subsystem CR, you can also recover the Management database cluster name and siteName by examining the SFTP backup tar:

- a. Download or move the SFTP backup tar file and decompress (untar) it.
- b. Open **<management-subsystem-name>-<siteName>-postgres-backrest-shared-repo/backup/db/<backup-id>/pg\_data/postgresql.conf.gz** which contains the management subsystem name and siteName. For example:

```

# Do not edit this file manually!
# It will be overwritten by Patroni!
include 'postgresql.base.conf'

archive_command = 'source /opt/cpm/bin/pgbackrest/pgbackrest-set-env.sh && pgbackrest archive-push "%p"'
archive_mode = 'True'
archive_timeout = '60'
autovacuum_vacuum_cost_limit = '1000'
autovacuum_vacuum_scale_factor = '0.01'
cluster_name = 'm1-f785a3e3-postgres'

```

In this example:

- **cluster\_name** has both the management subsystem name and siteName
  - **m1** - Management subsystem name
  - **f785a3e3** - site name
3. Before installing the replacement management subsystem CR:
- a. Apply the YAML file that contains the Management Database Encryption Secret into the cluster. For example, where **encryption-bin-secret.yaml** is the local YAML file containing the backup-up encryption secret:

```
kubectl create -f encryption-bin-secret.yaml -n <namespace>
```

Replace **<namespace>** with the namespace being used for the management subsystem installation.

This command re-creates the original Management Database encryption secret on the cluster. It will be named as the original name of the secret.

- b. Add the following **encryptionSecret** subsection to the **spec** of the Management CR. For example, if **management-enc-key** is the name of the newly created secret on the cluster containing the original Management Database encryption secret from the previous step:

```

encryptionSecret:
  secretName: management-enc-key

```

- c. For each of the saved YAML Files that contain the Management Client Application Credential Secrets, apply each file into the cluster using the following command:

```
kubectl create -f <secret_name>.yaml -n <namespace>
```

where **<secret\_name>** is the local YAML file containing one of the backed-up Credential Secrets.

Repeat this for each of the backed-up Credential Secrets. These are the secrets you saved in Step [2.b](#) in [Preparing the management subsystem for disaster recovery](#).

These commands will re-create the original Management Client Application Credential Secrets on the cluster. Each will be named as the original name of the Secret.

- d. Add the following **customApplicationCredentials** subsection to the **spec** subsection of the Management CR:

```

customApplicationCredentials:
- name: atm-cred
  secretName: management-atm-cred
- name: ccli-cred
  secretName: management-ccli-cred
- name: cli-cred
  secretName: management-cli-cred
- name: cui-cred
  secretName: management-cui-cred
- name: dsgr-cred
  secretName: management-dsgr-cred
- name: juhu-cred
  secretName: management-juhu-cred
- name: ui-cred
  secretName: management-ui-cred

```

For each named credential above, the **secretName** is given as the corresponding name of the newly created secret from Step [3.c](#).

- e. Add the **siteName** property to the **spec** of the Management CR.  
For example, if **a2a5e6e2** is the original **siteName** that was noted after the installation of the original Management Subsystem:

```
siteName: a2a5e6e2
```

f. **Version 10.0.3.0 or later:** Add the `originalUID`: property to the `spec` of the Management CR.

When recreating a system, to restore a backup into it, you must specify the same `spec.originalUID` in the CR as was present in the system that was backed up. If the `spec.originalUID` in the new CR for recreating the system does not match the `spec.originalUID` that was present in the system that was backed up, the restore will fail.

```
spec:
  originalUID: "fa0f6f49-b931-4472-b84d-0922a9a92dfd"
```

Note:

- For Version 10.0.3.0 or later, if you do not specify `spec.originalUID` in the new CR, the operator automatically sets the Management CR value of `spec.originalUID` to match the new CR value `metadata.uid`. In this case, the restore will fail because the `spec.originalUID` in the saved (backed-up) CR does not match `spec.originalUID` in the new CR.
- The originalUID is only essential when the subsystem CR name exceeds 15 characters in length, or 10 characters limit for the API Connect Cluster CR. Recommended practice is that all backups should include the originalUID for Management.
- See also Step 2.e in [Preparing the management subsystem for disaster recovery](#).

g. Verify that the name of the management subsystem in the CR matches with the old management subsystem name, as described in Step 2.e in [Preparing the management subsystem for disaster recovery](#).

4. Install the Management subsystem CR with the values obtained in Step 2.e in [Preparing the management subsystem for disaster recovery](#).

Important: The hostnames of the endpoints cannot be changed, and must remain the same in the Management CR YAML file used for installation now as they were for the original installation.

To review installation of the management subsystem, see [Installing the Management subsystem cluster](#).

5. Get a list of available backups and confirm that the backup ID noted in Step 1 is in the backup list.

The API Connect Operator automatically reads backups from configured remote storage and populates the list of available backups we can restore to.

```
$ kubectl get mgmtb
NAME                STATUS      ID                CLUSTER           SUBSYSTEM  TYPE  CR TYPE  AGE
mgmt-backup-4z87f  Complete   20200606-145011F  m1-82b290a2-postgres  m1         full  record  11m
mgmt-backup-6bms2  Complete   20200606-144315F  m1-82b290a2-postgres  m1         full  record  11m
```

6. Perform a Management Restore using the name of the backup that has the ID you want to restore. For example, as shown in Step 5, for ID `20200606-145011F` the backup name is `mgmt-backup-4z87f`.

For more info on restoring the management subsystem, see [Restoring the management subsystem \(v10.0.1.1 or later\)](#).

7. Use the following command to check the status of the restore:

```
kubectl get mgmtr -n <namespace>
```

Once the Management Restore has completed and the database is running again, the data of the old Management subsystem will be successfully restored onto the new Management subsystem. Manual and scheduled backups should perform as normal once again.

## What to do next

You should now complete the recovery steps for the Developer Portal subsystem on Kubernetes, see [Recovering the Developer Portal after a disaster](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Recovering the Developer Portal after a disaster

You can restore the Developer Portal subsystem after a disaster event.

### Before you begin

Important: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

### About this task

To recover from a disaster event, you must create a new IBM API Connect installation with a running IBM API Connect Operator.

Note: Limitation for backups created on Version 10.0.2:

- If restoring a Version 10.0.2 backup onto a new Version 10.0.2 deployment, performing a restore may not work if the subsystem CR name exceeds 15 characters. This limitation applies only to restoring onto Version 10.0.2.
- Restoration is supported for Version 10.0.2 backups onto a Version 10.0.3.0 or later deployment when subsystem name exceeds 15 characters, as long as the correct `spec.originalUID` is specified upon restore. See Step 1.f.

### Procedure

1. To prepare for the restoration, you must complete some steps before you reinstall the Developer Portal subsystem.

Warning:

- Ensure that the hostnames of the endpoints remain the same in the Developer Portal subsystem that is used for installation now as they were for the original installation. The hostnames for the endpoints cannot be changed.
- a. Ensure that the Developer Portal backup subsystem secret is created in the cluster.  
This secret contains the credentials (username and password) for the remote storage, such as S3 or IBM Cloud Object Storage, that is used for storing the database backups. This secret must be the same secret as used for the original installation.

- b. Ensure that the Developer Portal subsystem is configured for database backups.  
Configuration is done by adding a `databaseBackups` subsection to the `spec` subsection of the Developer Portal subsystem Custom Resource (CR) YAML file, `portal_cr.yaml`. The file is located in the `helper_files` archive that was extracted as part of the preparation for installation. See [Backing up and restoring the Developer Portal in a Kubernetes environment](#).

For example:

```
portalBackup:
  credentials: portal-backup-secret
  host: <backup-host>
  path: <backup-path>
  port: 22
  protocol: sftp
  schedule: ''
```

The `host` and `path` must be the same as was specified for the original installation so that the IBM API Connect Operator can access the saved Developer Portal database backups.

- c. Apply the saved YAML file that contains the Developer Portal database encryption secret into the cluster.  
Use the following command, where `portal_enc_key.yaml` is the local YAML file that contains the backup encryption secret. Replace `<namespace>` with the namespace that is being used for subsystem installation:

```
kubectl apply -f portal_enc_key.yaml -n <namespace>
```

This command re-creates the original Developer Portal database encryption secret on the cluster, which is named as the original name of the secret.

- d. Add the `encryptionSecret` to the Developer Portal subsystem Custom Resource (CR) YAML file, `portal_cr.yaml`.  
For example, add the following `encryptionSecret` subsection to the `spec` section. In this example, `portal-enc-key` is the name of the new created secret on the cluster that contains the original Developer Portal Database Encryption Secret. The name of the secret that is created in Step [1.a](#) is used here:

```
encryptionSecret:
  secretName: portal-enc-key
```

- e. Ensure the name `spec.metadata.name` of the new Developer Portal cluster CR is the same as the previous Developer Portal CR.
- f. **Version 10.0.3.0 or later:** Add the `originalUID` property to the `spec` of the Portal CR.  
When recreating a system, to restore a backup into it, you must specify the same `spec.originalUID` in the CR as was present in the system that was backed up. If the `spec.originalUID` in the new CR for recreating the system does not match the `spec.originalUID` that was present in the system that was backed up, the restore will fail.

```
spec:
  originalUID: "447ea4b3-9514-4a84-a34b-ce0b349838da"
```

Note:

- For Version 10.0.3.0 or later, if you do not specify `spec.originalUID` in the new CR, the operator automatically sets the Portal CR value of `spec.originalUID` to match the new CR value `metadata.uid`. In this case, the restore will fail because the `spec.originalUID` in the saved (backed-up) CR does not match `spec.originalUID` in the new CR.
- The originalUID is only essential when the subsystem CR name exceeds 15 characters in length, or 10 characters limit for the API Connect Cluster CR. Recommended practice is that all backups should include the originalUID for Portal.
- See also [Preparing the Developer Portal for disaster recovery](#).

- g. Ensure that the endpoint definitions are the same as the previous Developer Portal CR.
2. Apply the Developer Portal subsystem custom resource (CR) YAML file (`portal_cr.yaml`) to the cluster as documented as part of the original installation instructions.  
You can do this step now because the secrets are re-created, and additions made to `portal_cr.yaml`.

Note: Wait for the Developer Portal subsystem to become fully up and running before proceeding.

3. Use the following command to check that the Developer Portal database backups that are stored in the configured cloud storage are now present as Developer Portal backup CRs:

Note: You might wait for the cron job at the 10th minute `*/10 * * * *` to re-create your Developer Portal backup CRs.

```
kubectl get portalbackups -n <namespace>
```

For example:

```
loginabc@localhost ibm-apiconnect]$ kubectl get pb
NAME          ID                STATUS  TYPE  CR TYPE  AGE   COMMENT
portal-bup-g66gv  20201001.100021  Ready  site  create   5m27s  y
portal-bup-z7wgk  20201001.100021  Ready  site  record   4m24s
```

The `AGE` of each is new.

4. Perform a Developer Portal restore. See [Backing up and restoring the Developer Portal in a Kubernetes environment](#)

For a disaster recovery scenario, it is advised that you restore all sites and systems. An example restore CR:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  generateName: portal-restore-
spec:
  type: all
  dryRun: false
  timestamp: now
```

```
priorityList:
- myportal-critical-site.com
- myportal-important.com
```

5. When the Developer Portal restore CR is marked as **Ready**, the Disaster recovery is complete for the Developer Portal.

```
kubectl get portalrestore
```

6. Verify that you can access the restored Developer Portal sites and that you are able to log in to each one.  
The restore from the disaster event is now complete.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Recovering the Analytics subsystem after a disaster

Recover the API Connect Analytics subsystem in a Kubernetes environment.

### About this task

---

Recovering the Analytics subsystem involves deploying a new installation of the Analytics subsystem, updating it with a saved copy of the Custom Resource (CR) that was originally used for installing Analytics, and then restoring the Analytics database from a back-up copy.

### Procedure

---

1. Deploy the Analytics subsystem by applying the analytics\_cr.yaml CR to the cluster as explained in [Installing analytics](#).
2. Restore your local copy of the original AnalyticsCluster CR by running the following command:

```
kubectl apply -f gj01-analytics.yaml
```

Replace *gj01-analytics.yaml* with the file name that you used for your saved CR.

3. Restore the Analytics data from a back up, as explained in [Restoring the Analytics database](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Disaster recovery on OpenShift and Cloud Pak for Integration

Prepare for, or recover from, a disaster affecting an API Connect deployment running on OpenShift or Cloud Pak for Integration

You must complete preparation steps prior to a disaster in order to recover API Connect.

- [Preparing for disaster recovery on OpenShift](#)  
Back up data and essential deployment information from each API Connect subsystem so that you can use it to recover your deployment after a disaster.
- [Recovering from a disaster on OpenShift](#)  
Install and configure API Connect, then restore backed up data to recover the deployment after a disaster.
- [Preparing for disaster recovery on Cloud Pak for Integration](#)  
Back up data and essential deployment information from each API Connect subsystem so that you can use it to recover your deployment after a disaster.
- [Recovering from a disaster on Cloud Pak for Integration](#)  
Install and configure API Connect, then restore the backed up data to recover the deployment after a disaster.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Preparing for disaster recovery on OpenShift

Back up data and essential deployment information from each API Connect subsystem so that you can use it to recover your deployment after a disaster.

### About this task

---

To prepare your deployment for disaster, complete this task to copy the API Connect deployment settings, and then proceed to the following tasks to backup additional information for each subsystem.

## Procedure

Complete the following steps to copy the API Connect deployment settings (stored in the APICConnectCluster CR) and save the information in a file.

1. Find the API Connect cluster's name by running the following command and looking for the value in the NAME column:

```
oc get APICConnectCluster
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
apic-cluster	7/7	Running	10.0.3	10.0.3-149		6d4h

2. Get the YAML that describes the API Connect cluster and save it in a file using the following command:

```
oc get APICConnectCluster apic-cluster -o yaml > apic-cluster.yaml
```

## What to do next

Proceed to [Preparing the Management subsystem for disaster recovery on OpenShift](#).

1. [Preparing the Management subsystem for disaster recovery on OpenShift](#)  
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.
2. [Preparing the Portal subsystem for disaster recovery on OpenShift](#)  
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.
3. [Preparing the Analytics subsystem for disaster recovery on OpenShift](#)  
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Preparing the Management subsystem for disaster recovery on OpenShift

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

### About this task

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

## Procedure

1. Save the ID of the Management subsystem.  
If your original CR `name` was 10 characters or longer, you must add the `originalUID` (Version 10.0.3 or later) or `metadata.uid` (Version 10.0.2 or earlier) value from the original Management subsystem into the appropriate section of the installation CR during the recovery process.

When you deployed API Connect using the top-level API Connect Cluster CR, the deployment settings were added to subsystem-specific CRs that are managed by the top-level CR. When you recover the Management subsystem after a disaster, you can locate the subsystem's ID in the saved copy of the Management subsystem CR.

- a. Find the API Connect cluster's name by running the following command and looking for the value in the NAME column:

```
oc get APICConnectCluster
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
apic-cluster-name	7/7	Running	10.0.3	10.0.3-149		6d4h

- b. Get the YAML that describes the Management subsystem CR and save in a file using the following command:

```
oc get mgmt apic-cluster-name-mgmt -o yaml > apic-cluster-name-mgmt.yaml
```

2. Save a copy of the Management database encryption secret.
  - a. Run the following command to get the name of the encryption secret:

```
oc get mgmt -n <APIC-namespace> -o yaml | grep encryption
```

The output of this command shows the name of the secret that is storing the database encryption key, for example:

```
encryptionSecret: management-enc-key
```

- b. Run the following command to save a local copy of the secret as a YAML file:

```
oc get secret management-enc-key -n <APIC-namespace> -o yaml > management-enc-key.yaml
```

3. Save a copy of the Management client application credential secrets.  
Save the credential secrets (the `client_id` and `client_secret`) for client applications provided by the Management subsystem.

- a. Run the following command to get the names of the secrets:

```
oc get mgmt -n <APIC-namespace> -o yaml | grep CredentialSecret
```

The output of this command shows the names of the secrets used to store each of the client application credentials. For example:

```
atmCredentialSecret: management-atm-cred
consumerToolkitCredentialSecret: management-ccli-cred
consumerUICredentialSecret: management-cui-cred
designerCredentialSecret: management-dsgr-cred
juhuCredentialSecret: management-juhu-cred
toolkitCredentialSecret: management-cli-cred
uiCredentialSecret: management-ui-cred
```

- b. Run the following command to save a local copy of each secret as a YAML file, replacing `<secret_name>` with the name of the application credential secret:

```
oc get secret <secret_name> -n <APIC-namespace> -o yaml > <secret_name>.yaml
```

- c. Edit each of the saved YAML files and remove both the `ownerReferences` subsection and the `selfLink` property, and then save the updated file. The information to remove looks like the following example:

```
ownerReferences:
- apiVersion: management.apiconnect.ibm.com/v1beta1
  blockOwnerDeletion: true
  controller: true
  kind: ManagementCluster
  name: management
  uid: 623e6b20-7eb8-46ce-94ac-6b64cd71afc4
  selfLink: /api/v1/namespaces/default/secrets/management-atm-cred
```

4. Save a copy of the Management endpoint definitions.

The endpoints of the recovered Management subsystem must match those of the original Management deployment.

There are three endpoints to capture. Run the following commands to get the names of the Management endpoints, and save the output from each command to a file:

- `oc get managementcluster management -o jsonpath="{..apiManagerEndpoint.hosts[0].name}"`
- `oc get managementcluster management -o jsonpath="{..cloudManagerEndpoint.hosts[0].name}"`
- `oc get managementcluster management -o jsonpath="{..consumerAPIEndpoint.hosts[0].name}"`

5. Run a backup of the Management subsystem database.

a. [Configure the Management subsystem for backups.](#)

b. [Perform a backup of the Management subsystem.](#)

c. Get the name and ID of the newest Management backup and save them for reference during a recovery.

Run the following command to list the Management backups:

```
oc get mgmtb -n <APIC-namespace>
```

The response looks like the following example; the newest backup is the one with the smallest `AGE`:

NAME	STATUS	ID	CLUSTER	TYPE	CR TYPE	AGE
management-3aa3bebf	Ready	20200929-152150F	management	full	record	10h
management-3c4ca8df	Ready	20200929-115520F	management	full	record	20h
management-5tbxj	Ready	20200929-224349F	management	full	create	17h
management-f10af337	Ready	20200925-133703F	management	full	record	5d2h
management-jt1cd	Ready	20200929-224349F	management	full	create	25h
management-zxjtz	Ready	20200929-224349F	management	full	create	28h

6. Save a copy of the username and password for a Cloud Manager administrator.

When you recover the deployment, you will need to log in to the Cloud Manager as an administrator using the Cloud Manager User Registry. Any user with Administrator permission defined in the Cloud Manager User Registry can be used. Before backing up the information, verify that you log in to Cloud Manager using that account.

If you want to backup the secret that contains the administrator password that was created by the API Connect operator during the original deployment, run the following command to get the secret:

```
oc --kubeconfig kubeconfig -n <APIC_namespace> get secret <instance-name>-mgmt-admin-pass -o jsonpath="{.data.password}" | base64 -D
```

It is possible that the password was changed at some point and the secret is now out-of-date. Be sure to verify that you can log in to Cloud Manager with the password contained in the secret. If the password is not valid, then make sure you have another Cloud Manager administrator account in the Cloud Manager User Registry, and back up that username and password instead.

7. Copy all of the information that you saved to a secure location.

## What to do next

Immediately proceed to [Preparing the Portal subsystem for disaster recovery on OpenShift.](#)

Important: Backups of the Management and Portal subsystems must be performed in sequence, and close together in time, to ensure that the Portal sites are consistent with Management database.

**Next topic:** [Preparing the Portal subsystem for disaster recovery on OpenShift](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation.](#)

# Preparing the Portal subsystem for disaster recovery on OpenShift

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

## Before you begin

[Perform a backup of the Management subsystem.](#)

Important: Backups of the Management and Portal subsystems must be performed in sequence, and close together in time, to ensure that the Portal sites are consistent with Management database.

## About this task

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

## Procedure

1. Save the ID of the Portal subsystem.

If your original CR `name` was 10 characters or longer, you must add the `originalUID` (Version 10.0.3 or later) or `metadata.uid` (Version 10.0.2 or earlier) value from the original Portal subsystem into the appropriate section of the installation CR during the recovery process.

When you deployed API Connect using the top-level `APICConnectCluster` CR, the deployment settings were added to subsystem-specific CRs that are managed by the top-level CR. When you recover the Portal subsystem after a disaster, you can locate the subsystem's ID in the saved copy of the Portal subsystem CR.

- a. Find the API Connect cluster's name by running the following command and looking for the value in the `NAME` column:

```
oc get APICConnectCluster
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
<code>apic-cluster-name</code>	<code>7/7</code>	<code>Running</code>	<code>10.0.3</code>	<code>10.0.3-149</code>		<code>6d4h</code>

- b. Get the YAML that describes the Portal subsystem CR and save it in a file using the following command:

```
oc get ptl apic-cluster-name-ptl -o yaml > apic-cluster-name-ptl.yaml
```

2. Back up the Developer Portal database encryption secret.

- a. Run the following command to get the name of the encryption secret:

```
oc get portal -n <APIC-namespace> -o yaml | grep encryption
```

The output of this command shows the name of the secret that is storing the database encryption key, for example:

```
encryptionSecret: portal-enc-key
```

- b. Run the following command to save a local copy of the secret as a YAML file:

```
oc get secret portal-enc-key -n <APIC-namespace> -o yaml > portal-enc-key.yaml
```

3. Back up the Portal endpoint definitions.

Save the information to a file because you must use the same names in the recovered deployment.

- a. Get the `portalAdminEndpoint` definition by running the following command:

```
oc get route | grep portal-director | awk '{print $2}'
```

The response looks like the following example:

```
dr-ptl-portal-director-apic.apps.vlxocp-1556.cp.fyre.ibm.com
```

- b. Get the `portalUIEndpoint` definition by running the following command:

```
oc get route | grep portal-web | awk '{print $2}'
```

The response looks like the following example:

```
dr-ptl-portal-web-apic.apps.vlxocp-1556.cp.fyre.ibm.com
```

4. Back up the Portal subsystem database.

- a. [Configure the Portal subsystem for backups.](#)

- b. [Perform a backup of the Portal subsystem.](#)

Note: Be sure to `type: all` when you backup the Portal database, to ensure that you capture data for the Portal subsystem and all Portal sites.

- c. Get the name of the newest Portal backup and save it for reference during a recovery.

Run the following command to list the Portal backups:

```
oc get portalbackup -n <APIC-namespace>
```

The response looks like the following example; the newest backup is the one with the smallest `AGE`:

NAME	ID	STATUS	TYPE	CR TYPE	AGE	COMMENT
<code>p1-bup-gqz8f</code>	<code>20200526.142449</code>	<code>Ready</code>	<code>system</code>	<code>record</code>	<code>55m</code>	
<code>p1-bup-jx4vc</code>	<code>20200526.142458</code>	<code>Ready</code>	<code>site</code>	<code>record</code>	<code>54m</code>	

p1-bup-st412	Ready	all	create	56m	y
p1-bup-th2dm	Ready	all	create	4h51m	y

5. Copy all of the information that you saved to a secure location.

## What to do next

Proceed to [Preparing the Analytics subsystem for disaster recovery on OpenShift](#).

**Previous topic:** [Preparing the Management subsystem for disaster recovery on OpenShift](#)

**Next topic:** [Preparing the Analytics subsystem for disaster recovery on OpenShift](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Preparing the Analytics subsystem for disaster recovery on OpenShift

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

### About this task

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

### Procedure

1. Backup the Analytics subsystem database.

- a. [Configure the Analytics subsystem for backups](#).
- b. [Perform a backup of the Analytics subsystem](#).

Note: Be sure to specify **indices**: **all** when you backup the Analytics database. Backing up a full set of indices ensures that your complete Analytics configuration, event data, and custom UI configuration (such as custom dashboards) can be restored.

c. Get the name of the newest Analytics backup and save it for reference during a recovery.

Run the following command to list the Analytics backups:

```
oc get analyticsbackup -n <APIC-namespace>
```

The response looks like the following example; the newest backup is the one with the smallest **AGE**:

NAME	STATUS	ID	CR TYPE	INDICES	AGE	COMMENT
a7s-bup-266p8	Ready		create	[all]	20h	y
a7s-bup-pffdh	Ready		create	[all]	34h	y
analytics-bup-kxwq5	Ready	analytics-all-2020-09-07t03:49:15utc	record	[ui apievents config]	34h	
analytics-bup-p29z8	Ready	analytics-all-2020-09-07t18:04:03utc	record	[ui apievents config]	20h	

2. Copy all of the information that you saved to a secure location.

**Previous topic:** [Preparing the Portal subsystem for disaster recovery on OpenShift](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Recovering from a disaster on OpenShift

Install and configure API Connect, then restore backed up data to recover the deployment after a disaster.

### Before you begin

To successfully recover API Connect from a disaster, you must have previously completed the steps to prepare the Management, Portal, and Analytics subsystems for disaster recovery. Make sure that you can access the backups and deployment information because you cannot recover your deployment without it.

Attention: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal.

### About this task

To recover from a disaster event, recreate your API Connect Cluster CR and add recovery details as explained in the following procedure. Use the file containing the original CR (which you saved during the preparation task) as a reference.

Important: Do not install API Connect until you have configured the CR as explained in this task.

## Procedure

1. Make a local copy of the `apiconnectcluster_cr.yaml` template custom resource so that you can customize it for your deployment. Template files are stored in `helper_files.zip`. For both OpenShift and CP4I, you can configure settings directly in the YAML file as explained in this task. In CP4I, you will then copy the YAML code and paste it in using the YAML tab in IBM Cloud Pak Platform UI.
2. Configure backup and restore settings for each subsystem. Remember to create the backup secret for each subsystem as well, using the same name that you used in the original deployment (you can see the name in the `credentials` setting of each subsystem's backup section). The backup and restore settings, including the secrets, must exactly match the settings that you created in the original deployment. See the following topics for instructions on configuring backup and restore settings:

- [Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)
- [Configuring backups for Developer Portal on OpenShift and Cloud Pak for Integration](#)
- [Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration](#)

Note:

During the disaster recovery process, the S3 configuration detail of the older management system is used, but the older management system must be in offline mode. The old subsystem must be offline because you cannot have two management systems simultaneously using the same s3 bucket name in the database backup configurations.

3. Apply the Management and Portal encryption secrets to the cluster.
  - a. Apply the YAML file that contains the Management database encryption secret into the cluster. Run the following command, using the filename of the encryption secret that you saved when you prepared the Management subsystem for disaster recovery:

```
oc apply -f mgmt-enc-key.yaml
```

- b. Apply the YAML file that contains the Portal encryption secret into the cluster. Run the following command, using the filename of the encryption secret that you saved when you prepared the Portal subsystem for disaster recovery:

```
oc apply -f portal-enc-key.yaml
```

4. Important: Make sure that your new version of the API Connect Cluster installation CR uses the same value for the `name` setting as the original CR. Edit the YAML file that you copied from the template in the `helper_files.zip`. In the following steps, you will configure additional deployment and recovery settings in the new API Connect Cluster installation CR before you install API Connect.
5. Add the Management and Portal encryption secrets to the API Connect Cluster CR. Add each secret to the appropriate `spec.subsystem` section of the CR, as shown in the following example:

```
spec:
  management:
    encryption_secret:
      secret_name: mgmt-enc-key
  portal:
    encryption_secret:
      secret_name: portal-enc-key
```

6. Apply each of the Management client application credential secrets to the cluster. Run the following command to apply each secret, using the filename of each client application credential secret that you saved when you prepared the Management subsystem for disaster recovery:

```
oc apply -f <secret_name>.yaml
```

For example, a deployment might use the following names for the secrets:

```
atmCredentialSecret: management-atm-cred
consumerToolkitCredentialSecret: management-ccli-cred
consumerUICredentialSecret: management-cui-cred
designerCredentialSecret: management-dsgr-cred
juhuCredentialSecret: management-juhu-cred
toolkitCredentialSecret: management-cli-cred
uiCredentialSecret: management-ui-cred
```

7. Add the credential secrets to the `spec.management` section of API Connect Cluster CR. For example:

```
spec:
  management:
    customApplicationCredentials:
      - name: atm-cred
        secretName: management-atm-cred
      - name: ccli-cred
        secretName: management-ccli-cred
      - name: cui-cred
        secretName: management-cui-cred
      - name: dsgr-cred
        secretName: management-dsgr-cred
      - name: juhu-cred
        secretName: management-juhu-cred
      - name: cli-cred
        secretName: management-cli-cred
      - name: ui-cred
        secretName: management-ui-cred
```

8. Add the `siteName` property to the `spec.management` and `spec.portal` sections of the API Connect Cluster CR. For example, if the `a2a5e6e2` is the original `siteName` of the Management subsystem, and `890772e3` is the original `siteName` of the Developer Portal subsystem, the CR looks like the following example:

```
spec:
  management:
```

```
siteName: "a2a5e6e2"
portal:
siteName: "890772e3"
```

9. If your original CR name was 10 characters or longer, you must add the `originalUID` or `metadata.uid` value from the original Management and Portal subsystems into the appropriate sections of the installation CR.
- Important: If your original CR name was 10 characters or longer and you do not add this value, the deployments and routes that are generated during installation will include a different UID, which will cause the recovery process to fail.
- The IDs were created with the original deployment of the Management and Portal subsystems, and the recovered subsystems must continue to use the same IDs. You can locate the ID in the Management (`apic-cluster-name-mgt.yaml`) or Portal (`apic-cluster-name-ptl.yaml`) CR that you saved while preparing for disaster recovery. (Do not use the `metadata.uid` setting from the API Connect Cluster CR).

The CR setting that contains the ID depends on the version of API Connect that you are recovering:

- Version 10.0.3 or later: `spec.originalUID`
- Version 10.0.2 or earlier: `metadata.uid`

Locate each of the original settings in the appropriate subsystem CR, and copy them to corresponding sections of the new API Connect Cluster CR using the same key and value.

For example, if you originally deployed version 10.0.2, the setting name was `uid`. If you are deploying Version 10.0.3 as part of disaster recover, copy the original value and use it for the `originalUID` setting in the new CR. For example, in 10.0.3:

```
spec:
  management:
    originalUID: "fa0f6f49-b931-4472-b84d-0922a9a92dfd"
  portal:
    originalUID: "447ea4b3-9514-4a84-a34b-ce0b349838da"
```

10. Verify that you correctly added all of the settings to the API Connect Cluster CR.
- For example, the completed CR might look like the following example:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APICConnectCluster
metadata:
  namespace: apiconnect
  name: apis-minimum
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-minimum
spec:
  license:
    accept: true
    license: L-RJON-C2YLGB
    metric: VIRTUAL_PROCESSOR_CORE
    use: nonproduction
  management:
    originalUID: "fa0f6f49-b931-4472-b84d-0922a9a92dfd"
    encryption_secret:
      secret_name: apis-minim-faaa44bf-enc-key
    siteName: "faaa44bf"
    customApplicationCredentials:
      - name: atm-cred
        secretName: apis-minim-faaa44bf-atm-cred
      - name: ccli-cred
        secretName: apis-minim-faaa44bf-ccli-cred
      - name: cli-cred
        secretName: apis-minim-faaa44bf-cli-cred
      - name: cui-cred
        secretName: apis-minim-faaa44bf-cui-cred
      - name: dsgr-cred
        secretName: apis-minim-faaa44bf-dsgr-cred
      - name: juhu-cred
        secretName: apis-minim-faaa44bf-juhu-cred
      - name: ui-cred
        secretName: apis-minim-faaa44bf-ui-cred

version: 10.0.3

```

11. Prepare your environment for installing API Connect by completing the prerequisites and all components of step 1 in [Installing API Connect](#). After you prepare your environment, continue with this procedure to install API Connect and then restore data.

12. Install API Connect by creating the CR with the following command:  
Replace `<cr_name>` with the value of the `name` setting in the API Connect Cluster CR.

```
oc create -f <cr_name>.yaml
```

13. Wait for **all** subsystems to be created.

When the Management subsystem is installed, you might see `backup` job pods and `stanza-create` job pods in **Error** state; for example:

m1-82b290a2-postgres-stanza-create-4zcgz	0/1	Error	0	35m
m1-82b290a2-postgres-full1-sch-backup-2g9hm	0/1	Error	0	20m

This is expected behavior, for the following reasons:

- The `stanza-create` job normally expects buckets or subdirectories within buckets to be empty. However, since you configured the Management subsystem with your already-populated S3 bucket (where your backups exist), the job will enter the **Error** state.
- Any scheduled or manual backups will enter the **Error** state. Although you configured the Management subsystem with your already-populated S3 bucket, the new database isn't yet configured to write backups into remote storage.

The errors will not prevent a successful restore, so continue to the next step.

Important:

For S3, the recovery remains in an intermediate state until the restore is complete, and Postgres wal files might cause serious disk issues. To avoid this possibility, continue immediately with the next step.

Note that if you delay completion of the restore:

- Health check might fail. In this case, you can still proceed to the next step and perform a restore.
- Postgres wal files might cause problems by consuming all disk space. In this case, you must either:
  - Re-install the system, prepare again for disaster recovery, and perform the restore.
  - Or increase disk space so that the system returns to a stable state, and then proceed with the restore.

14. Restore the subsystems in the following sequence:

a. [Restore the Management subsystem](#).

When you perform a restore, you must complete the restoration of the Management subsystem first, and then immediately restore the Portal subsystem.

Important: Be sure to restore the Management subsystem from the backup whose name and ID of the you noted while preparing for disaster recovery.

b. [Restore the Developer Portal subsystem](#).

Use the restore type `a11` to ensure that you restore the complete subsystem and all Portal sites.

c. [Restore the Analytics subsystem](#).

15. Version 10.0.2 or earlier: Update the Management OIDC credentials as explained in [Configuring the OIDC credentials on OpenShift](#).

16. Verify that the recovery was successful:

- Ensure that you can log in to the Cloud Manager UI.
- Verify that your provider organizations exist.
- Ensure that you can log in to each Developer portal.
- Ensure that the Analytics dashboard contains all of the analytics data that you preserved.

- [Configuring the OIDC credentials on OpenShift](#)

When you recover API Connect V10.0.x, you must manually update the values for the Management OIDC credentials (`client_id` and `client_secret`) in the Common Services User Registry.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring the OIDC credentials on OpenShift

When you recover API Connect V10.0.x, you must manually update the values for the Management OIDC credentials (`client_id` and `client_secret`) in the Common Services User Registry.

### Before you begin

This task is required for all of the 10.0.x releases up to, and including, version 10.0.2 (skip this task for version 10.0.3 and later). The procedure requires you to log in to the Cloud Manager on the new API Connect deployment. Use the Cloud Manager administrator username and password that you saved while preparing for disaster recovery.

## About this task

---

When you deploy API Connect, the OIDC `client_id` and `client_secret` resources are automatically generated and added to the Common Services User Registry. These resources enable single sign-on with the IBM Cloud Pak platform. When you reinstall API Connect as part of disaster recovery, the original versions of those resources are retained but cannot be used. You must update the Common Services User Registry and replace the original values with the values from the new deployment.

## Procedure

---

1. Retrieve the `client_id` and `client_secret` from the stored secret in API Connect.

- a. Run the following command to retrieve the `client_id`:

```
oc -n <APIC_namespace> get secret <instance_name>-oidc-client -o jsonpath="{.data.CLIENT_ID}" | base64 -D
```

- b. Run the following command to retrieve the `client_secret`:

```
oc -n <APIC_namespace> get secret <instance_name>-oidc-client -o jsonpath="{.data.CLIENT_SECRET}" | base64 -D
```

2. Update the Common Services User Registry with the new values.

Using the Cloud Manager UI:

- a. In API Connect, open the Cloud Manager interface.
- b. Select the Cloud Manager User Registry.  
You will use the Cloud Manager User Registry to modify settings for the Common Service User Registry.
- c. Log in to the Cloud Manager User Registry using the administrator username and password that you saved while preparing for disaster recovery.
- d. In Cloud Manager, click Resources, > User Registries and edit Common Services User Registry.
- e. In the Client information section, paste the `client_id` value from step 1 into the Client ID field.
- f. Paste the `client_secret` value from step 1 into the Client secret field.
- g. Save your changes.

Using the toolkit CLI:

- a. Run the following command to determine the `<mgmt_endpoint_url>` that you will use for accessing the management server:

```
oc -n <APIC_namespace> get mgmt <instance_name> -o jsonpath="{.status.zenRoute}" && echo ""
```

- b. Log in to the management server:

- i. Run the following command to start the login process:

```
apic login --server <mgmt_endpoint_url>
```

- ii. Provide your login credentials:

- **Realm?** Type your realm (for example: `admin/default-idp-1`) and press Enter.  
The realm refers to your identity provider. For information on determining your realm value, see [How to determine the identity provider](#).
- **Username?** Type your Cloud Manager administrator username and press Enter.
- **Password?** Type the password for your Cloud Manager administrator account and press Enter.

- c. Run the following command to download the Common Service User Registry as a YAML file:

```
apic user-registries: get common-services --server <mgmt_endpoint_url> -o admin --fields name,configuration
```

- d. Edit the file and update the `client_id` and `client_secret` settings with the values you obtained in step 1.

- e. Save and close the file.

- f. Run the following command to upload the modified file to Cloud Manager:

```
apic user-registries: update common-services --server <mgmt_endpoint_url> -o admin common-services.yaml
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Preparing for disaster recovery on Cloud Pak for Integration

Back up data and essential deployment information from each API Connect subsystem so that you can use it to recover your deployment after a disaster.

### About this task

---

To prepare your deployment for disaster, complete this task to copy the API Connect deployment settings, and then proceed to the following tasks to backup additional information for each subsystem.

Note: Your recovery installation of Cloud Pak for Integration must include the Platform UI if your original deployment used it. In addition, the CR must use the same settings as in the original deployment.

### Procedure

---

Complete the following steps to copy the API Connect deployment settings (stored in the APICConnectCluster CR) and save the information in a file.

1. Find the API Connect cluster's name by running the following command and looking for the value in the NAME column:

```
oc get APICConnectCluster
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
apic-cluster	7/7	Running	10.0.3	10.0.3-149		6d4h

2. Get the YAML that describes the API Connect cluster and save it in a file using the following command:

```
oc get APICConnectCluster apic-cluster -o yaml > apic-cluster.yaml
```

## What to do next

Proceed to [Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration](#).

1. [Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration](#)  
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.
2. [Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration](#)  
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.
3. [Preparing the Analytics subsystem for disaster recovery on Cloud Pak for Integration](#)  
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

## About this task

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

## Procedure

1. Save the ID of the Management subsystem.  
If your original CR `name` was 10 characters or longer, you must add the `originalUID` (Version 10.0.3 or later) or `metadata.uid` (Version 10.0.2 or earlier) value from the original Management subsystem into the appropriate section of the installation CR during the recovery process.  
  
When you deployed API Connect using the top-level API Connect Cluster CR, the deployment settings were added to subsystem-specific CRs that are managed by the top-level CR. When you recover the Management subsystem after a disaster, you can locate the subsystem's ID in the saved copy of the Management subsystem CR.
  - a. Find the API Connect cluster's name by running the following command and looking for the value in the NAME column:

```
oc get APICConnectCluster
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
apic-cluster-name	7/7	Running	10.0.3	10.0.3-149		6d4h
  - b. Get the YAML that describes the Management subsystem CR and save in a file using the following command:

```
oc get mgmt apic-cluster-name-mgmt -o yaml > apic-cluster-name-mgmt.yaml
```
2. Save a copy of the Management database encryption secret.
  - a. Run the following command to get the name of the encryption secret:

```
oc get mgmt -n <APIC-namespace> -o yaml | grep encryption
```

The output of this command shows the name of the secret that is storing the database encryption key; for example:

```
encryptionSecret: management-enc-key
```
  - b. Run the following command to save a local copy of the secret as a YAML file:

```
oc get secret management-enc-key -n <APIC-namespace> -o yaml > management-enc-key.yaml
```
3. Save a copy of the Management client application credential secrets.  
Save the credential secrets (the `client_id` and `client_secret`) for client applications provided by the Management subsystem.
  - a. Run the following command to get the names of the secrets:

```
oc get mgmt -n <APIC-namespace> -o yaml | grep CredentialSecret
```

The output of this command shows the names of the secrets used to store each of the client application credentials; for example:

```
atmCredentialSecret: management-atm-cred
consumerToolkitCredentialSecret: management-ccli-cred
consumerUICredentialSecret: management-cui-cred
designerCredentialSecret: management-dsgr-cred
juhuCredentialSecret: management-juhu-cred
toolkitCredentialSecret: management-cli-cred
uiCredentialSecret: management-ui-cred
```

- b. Run the following command to save a local copy of each secret as a YAML file, replacing `<secret_name>` with the name of the application credential secret:

```
oc get secret <secret_name> -n <APIC-namespace> -o yaml > <secret_name>.yaml
```

- c. Edit each of the saved YAML files and remove both the `ownerReferences` subsection and the `selfLink` property, and then save the updated file. The information to remove looks like the following example:

```
ownerReferences:
- apiVersion: management.apiconnect.ibm.com/v1beta1
  blockOwnerDeletion: true
  controller: true
  kind: ManagementCluster
  name: management
  uid: 623e6b20-7eb8-46ce-94ac-6b64cd71afc4
  selfLink: /api/v1/namespaces/default/secrets/management-atm-cred
```

4. Save a copy of the CP4I credentials secret.

- a. Run the following command to get the name of the encryption secret and save a local copy of the secret as a YAML file:

```
oc get secrets <instance_name>-cp4i-creds -o yaml > <cp4i_creds_secret>.yaml
```

- b. Edit the saved YAML file and remove both the `ownerReferences` subsection and the `selfLink` property, and then save the updated file.

5. Save a copy of the Management endpoint definitions, because the endpoints of the recovered Management subsystem must match those of the original Management deployment.

There are three endpoints to capture. Run the following commands to get the names of the Management endpoints, and save the output from each command to a file:

- ```
oc get managementcluster management -o jsonpath="{..apiManagerEndpoint.hosts[0].name}"
```
- ```
oc get managementcluster management -o jsonpath="{..cloudManagerEndpoint.hosts[0].name}"
```
- ```
oc get managementcluster management -o jsonpath="{..consumerAPIEndpoint.hosts[0].name}"
```

6. Run a backup of the Management subsystem database.

- a. [Configure the Management subsystem for backups.](#)

- b. [Perform a backup of the Management subsystem.](#)

- c. Get the name and ID of the newest Management backup and save them for reference during a recovery.

Run the following command to list the Management backups:

```
oc get mgmtb -n <APIC-namespace>
```

The response looks like the following example; the newest backup is the one with the smallest `AGE`:

| NAME                | STATUS | ID               | CLUSTER    | TYPE | CR TYPE | AGE  |
|---------------------|--------|------------------|------------|------|---------|------|
| management-3aa3bebf | Ready  | 20200929-152150F | management | full | record  | 10h  |
| management-3c4ca8df | Ready  | 20200929-115520F | management | full | record  | 20h  |
| management-5tbxj    | Ready  | 20200929-224349F | management | full | create  | 17h  |
| management-f10af337 | Ready  | 20200925-133703F | management | full | record  | 5d2h |
| management-jt1cd    | Ready  | 20200929-224349F | management | full | create  | 25h  |
| management-zxjtz    | Ready  | 20200929-224349F | management | full | create  | 28h  |

7. Save a copy of the username and password for a Cloud Manager administrator.

When you recover the deployment, you will need to log in to the Cloud Manager as an administrator using the Cloud Manager User Registry. Any user with Administrator permission defined in the Cloud Manager User Registry can be used. Before backing up the information, verify that you can log in to Cloud Manager using that account.

If you want to backup the secret that contains the administrator password that was created by the API Connect operator during the original deployment, run the following command to get the secret:

```
oc -n <APIC_namespace> get secret <instanceName>-mgmt-admin-pass -o jsonpath="{.data.password}" | base64 -d
```

It is possible that the password was changed at some point and the secret is now out-of-date. Be sure to verify that you can log in to Cloud Manager with the password contained in the secret. If the password is not valid, then make sure you have another Cloud Manager administrator account in the Cloud Manager User Registry, and back up that username and password instead.

8. Copy all of the information that you saved to a secure location.

## What to do next

Immediately proceed to [Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration.](#)

Important: Backups of the Management and Portal subsystems must be performed in sequence, and close together in time, to ensure that the Portal sites are consistent with Management database.

**Next topic:** [Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation.](#)

---

# Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

## Before you begin

---

[Perform a backup of the Management subsystem.](#)

Important: Backups of the Management and Portal subsystems must be performed in sequence, and close together in time, to ensure that the Portal sites are consistent with Management database.

## About this task

---

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

## Procedure

---

1. Save the ID of the Portal subsystem.

If your original CR **name** was 10 characters or longer, you must add the **originalUID** (Version 10.0.3 or later) or **metadata.uid** (Version 10.0.2 or earlier) value from the original Portal subsystem into the appropriate section of the installation CR during the recovery process.

When you deployed API Connect using the top-level APICConnectCluster CR, the deployment settings were added to subsystem-specific CRs that are managed by the top-level CR. When you recover the Portal subsystem after a disaster, you can locate the subsystem's ID in the saved copy of the Portal subsystem CR.

- a. Find the API Connect cluster's name by running the following command and looking for the value in the NAME column:

```
oc get APICConnectCluster
```

The response looks like the following example:

| NAME                     | READY | STATUS  | VERSION | RECONCILED | VERSION | AGE  |
|--------------------------|-------|---------|---------|------------|---------|------|
| <i>apic-cluster-name</i> | 7/7   | Running | 10.0.3  | 10.0.3-149 |         | 6d4h |

- b. Get the YAML that describes the Portal subsystem CR and save it in a file using the following command:

```
oc get ptl apic-cluster-name-ptl -o yaml > apic-cluster-name-ptl.yaml
```

2. Back up the Developer Portal database encryption secret.

- a. Run the following command to get the name of the encryption secret:

```
oc get ptl -n <APIC-namespace> -o yaml | grep encryption
```

The output of this command shows the name of the secret that is storing the database encryption key, for example:

```
encryptionSecret: portal-enc-key
```

- b. Run the following command to save a local copy of the secret as a YAML file:

```
oc get secret portal-enc-key -n <APIC-namespace> -o yaml > portal-enc-key.yaml
```

3. Back up the Portal endpoint definitions.

Save the information to a file because you must use the same names in the recovered deployment.

- a. Get the **portalAdminEndpoint** definition by running the following command:

```
oc get route | grep portal-director | awk '{print $2}'
```

The response looks like the following example:

```
dr-ptl-portal-director-apic.apps.vlxocp-1556.cp.fyre.ibm.com
```

- b. Get the **portalUIEndpoint** definition by running the following command:

```
oc get route | grep portal-web | awk '{print $2}'
```

The response looks like the following example:

```
dr-ptl-portal-web-apic.apps.vlxocp-1556.cp.fyre.ibm.com
```

4. Back up the Portal subsystem database.

- a. [Configure the Portal subsystem for backups.](#)

- b. [Perform a backup of the Portal subsystem.](#)

Note: Be sure to **type: all** when you backup the Portal database, to ensure that you capture data for the Portal subsystem and all Portal sites.

- c. Get the ID of the latest **all** Portal backup and save it for reference during a recovery.

Run the following command to list the Portal backups:

```
oc get portalbackup -n <APIC-namespace>
```

The response looks like the following example; the latest backup is the one with a **TYPE** of **all** and the smallest **AGE**:

| NAME         | ID              | STATUS | TYPE   | CR TYPE | AGE   | COMMENT |
|--------------|-----------------|--------|--------|---------|-------|---------|
| p1-bup-gqz8f | 20200526.142449 | Ready  | system | record  | 55m   |         |
| p1-bup-jx4vc | 20200526.142458 | Ready  | site   | record  | 54m   |         |
| p1-bup-st412 |                 | Ready  | all    | create  | 56m   | y       |
| p1-bup-th2dm |                 | Ready  | all    | create  | 4h51m | y       |

5. Copy all of the information that you saved to a secure location.

## What to do next

Proceed to [Preparing the Analytics subsystem for disaster recovery on Cloud Pak for Integration](#).

**Previous topic:** [Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration](#)

**Next topic:** [Preparing the Analytics subsystem for disaster recovery on Cloud Pak for Integration](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Preparing the Analytics subsystem for disaster recovery on Cloud Pak for Integration

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

## About this task

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

## Procedure

1. Backup the Analytics subsystem database.

a. [Configure the Analytics subsystem for backups](#).

b. [Perform a backup of the Analytics subsystem](#).

Note: Be sure to specify **indices: all** when you backup the Analytics database. Backing up a full set of indices ensures that your complete Analytics configuration, event data, and custom UI configuration (such as custom dashboards) can be restored.

c. Get the name of the newest Analytics backup and save it for reference during a recovery.

Run the following command to list the Analytics backups:

```
oc get analyticsbackup -n <APIC-namespace>
```

The response looks like the following example; the newest backup is the one with the smallest **AGE**:

| NAME                | STATUS | ID                                   | CR TYPE | INDICES               | AGE | COMMENT |
|---------------------|--------|--------------------------------------|---------|-----------------------|-----|---------|
| a7s-bup-266p8       | Ready  |                                      | create  | [all]                 | 20h | y       |
| a7s-bup-pffdh       | Ready  |                                      | create  | [all]                 | 34h | y       |

2. Copy all of the information that you saved to a secure location.

**Previous topic:** [Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Recovering from a disaster on Cloud Pak for Integration

Install and configure API Connect, then restore the backed up data to recover the deployment after a disaster.

## Before you begin

To successfully recover API Connect from a disaster, you must have previously completed the steps to prepare the Management, Portal, and Analytics subsystems for disaster recovery. Make sure that you can access the backups and deployment information because you cannot recover your deployment without it.

Attention: Successful disaster recovery depends on recovery of both the Management subsystem and the Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management subsystem first, and then immediately restore the Portal subsystem.

## About this task

To recover from a disaster event, recreate your API Connect Cluster CR and add recovery details as explained in the following procedure. Use the file containing the original CR (which you saved during the preparation task) as a reference.

## Procedure

1. Prepare your Cloud Pak for Integration environment for deploying API Connect as explained in the appropriate version of the [Cloud Pak for Integration documentation](#).

After you prepare your environment, return to this procedure to configure the installation CR, deploy API Connect, and then restore data to the API Connect subsystems.

Important: Do not install API Connect until you have configured the CR as explained in following steps.

2. Apply the Management and Portal encryption secrets to the cluster where you will install API Connect.

- a. Apply the YAML file that contains the Management database encryption secret into the cluster.

Run the following command, using the filename of the encryption secret that you saved when you prepared the Management subsystem for disaster recovery:

```
oc apply -f mgmt-enc-key.yaml
```

- b. Apply the YAML file that contains the Portal encryption secret into the cluster.

Run the following command, using the filename of the encryption secret that you saved when you prepared the Portal subsystem for disaster recovery:

```
oc apply -f portal-enc-key.yaml
```

3. Apply the YAML file that contains the CP4I credentials secret into the cluster.

Run the following command, using the filename of the secret that you saved when you prepared the Management subsystem for disaster recovery:

```
oc apply -f <cp4i_creds_secret>.yaml -n <APIC_namespace>
```

4. Set up the installation CR for deploying API Connect.

In this step, you perform the initial steps for deploying API Connect in Cloud Pak for Integration, but you do not begin the actual installation until step [14](#). Instead, you will complete a series of steps to configure the CR with deployment settings and additional recovery settings.

- a. Log in to the IBM Cloud Pak Platform UI.
- b. On the home page, click Create capability.
- c. Select the API Connect tile and click Next.
- d. On the Create an instance of API Connect cluster page, select the deployment type and click Next.  
Choose the same deployment type that you used when you originally deployed API Connect.

- e. On the deployment settings page, click the YAML tab to edit the installation CR in YAML format.

- f. Copy the content of the saved CR into the YAML tab, replacing the default CR.

Keep the YAML tab open. In the following steps, you will configure additional deployment and recovery settings in the new API Connect Cluster installation CR before you install API Connect.

5. Important: Make sure that your new version of the API Connect Cluster installation CR uses the same value for the **name** setting as the original CR.

6. Verify the backup and restore settings for each subsystem.

For more information on the backup settings, see the following topics for instructions on configuring backup and restore settings:

- [Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)
- [Configuring backups for Developer Portal on OpenShift and Cloud Pak for Integration](#)
- [Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration](#)

7. Generate the Kubernetes secret for each subsystem's backups by running the appropriate command:

For each secret, use the same name that you used in the original deployment (you can see the name in the **credentials** setting of each subsystem's backup section).

- Management subsystem:

- S3:

```
oc create secret generic mgmt-backup-secret --from-literal=username='<Your_access_key-or-user_name>' --from-literal=password='<Your_access_key_secret-or-password>' -n <APIC_namespace>
```

- SFTP with username and password:

```
oc create secret generic mgmt-backup-secret --from-literal=username='<Your_user_name>' --from-literal=password='<Your_password>' -n <APIC_namespace>
```

- SFTP with username and SSH-key

```
oc create secret generic mgmt-backup-secret --from-literal=username='<Your_user_name>' --from-file=ssh-privatekey='<Your_private_key_file>' -n <APIC_namespace>
```

- Portal subsystem:

- S3:

```
oc create secret generic portal-backup-secret --from-literal=username='<Your_access_key-or-user_name>' --from-literal=password='<Your_access_key_secret-or-password>' -n <APIC_namespace>
```

- SFTP with username and password:

```
oc create secret generic portal-backup-secret --from-literal=username='<Your_user_name>' --from-literal=password='<Your_password>' -n <APIC_namespace>
```

- SFTP with username and SSH-key

```
oc create secret generic portal-backup-secret --from-literal=username='<Your_user_name>' --from-file=ssh-privatekey='<Your_private_key_file>' -n <APIC_namespace>
```

- Analytics:

```
oc create secret generic analytics-backup-secret --from-literal=username='<Your_Access_Key>' --from-literal=password='<Your_access_key_secret>' -n <APIC_namespace>
```

8. Add the saved Management and Portal encryption secrets to the installation CR.  
Add each secret to the appropriate `spec.subsystem` section of the CR, as shown in the following example:

```
spec:
  management:
    encryptionSecret:
      secret_name: mgmt-enc-key
  portal:
    encryptionSecret:
      secret_name: portal-enc-key
```

9. Apply each of the Management client application credential secrets to the cluster.  
Run the following command to apply each secret, using the filename of each client application credential secret that you saved when you prepared the Management subsystem for disaster recovery:

```
oc apply -f <secret_name>.yaml
```

For example, a deployment might use the following names for the secrets:

```
atmCredentialSecret: management-atm-cred
consumerToolkitCredentialSecret: management-ccli-cred
consumerUICredentialSecret: management-cui-cred
designerCredentialSecret: management-dsgr-cred
juhuCredentialSecret: management-juhu-cred
toolkitCredentialSecret: management-cli-cred
uiCredentialSecret: management-ui-cred
```

10. Add each of the credential secrets to the `spec.management` section of installation CR.  
For example:

```
spec:
  management:
    customApplicationCredentials:
      - name: atm-cred
        secretName: management-atm-cred
      - name: ccli-cred
        secretName: management-ccli-cred
      - name: cui-cred
        secretName: management-cui-cred
      - name: dsgr-cred
        secretName: management-dsgr-cred
      - name: juhu-cred
        secretName: management-juhu-cred
      - name: cli-cred
        secretName: management-cli-cred
      - name: ui-cred
        secretName: management-ui-cred
```

11. Add the `siteName` property to the `spec.management` and `spec.portal` sections of the installation CR.  
For example, if the `a2a5e6e2` is the original `siteName` of the Management subsystem, and `890772e3` is the original `siteName` of the Portal subsystem, the CR looks like the following example:

```
spec:
  management:
    siteName: "a2a5e6e2"
  portal:
    siteName: "890772e3"
```

12. If your original CR name was 10 characters or longer, you must add the `originalUID` or `metadata.uid` value from the original Management and Portal subsystems into the appropriate sections of the installation CR.  
Important: If your original CR name was 10 characters or longer and you do not add this value, the deployments and routes that are generated during installation will include a different UID, which will cause the recovery process to fail.  
The IDs were created with the original deployment of the Management and Portal subsystems, and the recovered subsystems must continue to use the same IDs. You can locate the ID in the Management (`apic-cluster-name-mgt.yaml`) or Portal (`apic-cluster-name-ptl.yaml`) CR that you saved while preparing for disaster recovery. (Do not use the `metadata.uid` setting from the API Connect Cluster CR).

The CR setting that contains the ID depends on the version of API Connect that you are recovering:

- Version 10.0.3 or later: `spec.originalUID`
- Version 10.0.2 or earlier: `metadata.uid`

Locate each of the original settings in the appropriate subsystem CR, and copy them to corresponding sections of the new API Connect Cluster CR using the same key and value.

For example, if you originally deployed version 10.0.2, the setting name was `uid`. If you are deploying Version 10.0.3 as part of disaster recover, copy the original value and use it for the `originalUID` setting in the new CR. For example, in 10.0.3:

```
spec:
  management:
    originalUID: "fa0f6f49-b931-4472-b84d-0922a9a92dfd"
  portal:
    originalUID: "447ea4b3-9514-4a84-a34b-ce0b349838da"
```

13. Verify that you correctly added all of the settings to the installation CR.  
For example, the completed CR might look like the following example:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APICConnectCluster
```

```

metadata:
  namespace: apiconnect
  name: apis-minimum
  labels:

      credentials: a7s-backup-secret
      host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
      path: ocp-dr-a7s
      schedule: 0 1 * * *
    storageClassName: rook-ceph-block
    profile: nlxc7.m48
    portal:
      adminClientSubjectDN: ""
      portalAdminEndpoint: {}
      portalUIEndpoint: {}
      originalUID: "447ea4b3-9514-4a84-a34b-ce0b349838da"
      encryptionSecret:
        secret_name: apis-minim-913edd20-enc-key
        siteName: "913edd20"
      portalBackup:
        credentials: portal-backup-secret
        host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
        path: ocp-dr-portal
        protocol: objstore
        schedule: 0 1 * * *
  version: 10.0.3

```

Important: If you are restoring your deployment in a different data center, the endpoints that are used in your original deployment must be the same in your new data center. The Platform UI in Cloud Pak for Integration autogenerates the endpoints if they are left empty in the CR, therefore ensure that you explicitly set the endpoints in the CR to match what was set in your original data center. For example:

```

apiManagerEndpoint:
  annotations:
    cert-manager.io/issuer: prod-ingress-issuer
    haproxy.router.openshift.io/timeout: 240s
  hosts:
    - name: prod-api-manager.example.com
    secretName: prod-be787dd3-api-manager

```

14. On the deployment page, install API Connect by clicking Create.

15. Wait for **all** subsystems to be created.

When the Management subsystem is installed, you might see **backup** job pods and **stanza-create** job pods in **Error** state; for example:

|                                            |     |       |   |     |
|--------------------------------------------|-----|-------|---|-----|
| m1-82b290a2-postgres-stanza-create-4zcgz   | 0/1 | Error | 0 | 35m |
| m1-82b290a2-postgres-full-sch-backup-2g9hm | 0/1 | Error | 0 | 20m |

This is expected behavior, for the following reasons:

- The `stanza-create` job normally expects buckets or subdirectories within buckets to be empty. However, since you configured the Management subsystem with your already-populated S3 bucket (where your backups exist), the job will enter the **Error** state.
- Any scheduled or manual backups will enter the **Error** state. Although you configured the Management subsystem with your already-populated S3 bucket, the new database isn't yet configured to write backups into remote storage.
- The configurator job will fail because the CP4I credentials secret that you manually restored does not match the value in the Management database. As a result, the state of new cluster is not "Ready" and will show "6/7". This error will be resolved when you restore the Management subsystem from the backup that you prepared earlier.

The errors will not prevent a successful restore, so continue to the next step.

16. Restore the subsystems in the following sequence:

Important: Make sure that you restore using the backup (locate the one with the correct backup name and ID) that you created when you prepared each subsystem for disaster recovery.

a. [Restore the Management subsystem.](#)

When you perform a restore, you must complete the restoration of the Management subsystem first. Verify that the restoration completed successfully and that the Management subsystem is Ready. When the Management subsystem is healthy, proceed to the next step and restore the Portal subsystem.

b. [Restore the Developer Portal subsystem.](#)

Use the restore type `all` to ensure that you restore the complete subsystem and all Portal sites.

c. [Restore the Analytics subsystem.](#)

17. Force the configurator to run again.

The cluster will still not be ready after restore at this stage because the configurator has yet to successfully complete (refer to point 12). In order for the configurator to run again, delete the associated job so that a new pod will start running:

a. Run the following command to get the list of jobs:

```
oc get jobs -n <APIC_namespace>
```

b. Run the following command to determine the name of your API Connect instance:

```
oc get apiconnectcluster -n <APIC_namespace>
```

c. Run the following command to delete the configurator job:

```
oc -n <APIC_namespace> delete job <instance_name>-configurator
```

18. Version 10.0.2 or earlier: Update the Management OIDC credentials as explained in [Configuring the OIDC credentials on Cloud Pak for Integration](#).

19. Verify that the recovery was successful:

- Ensure that you can log in to the Cloud Manager UI.
- Verify that your provider organizations exist.
- Ensure that you can log in to each Developer portal.
- Ensure that the Analytics dashboard contains all of the analytics data that you preserved.

- [Configuring the OIDC credentials on Cloud Pak for Integration](#)

When you recover API Connect V10.0.x, you must manually update the values for the Management OIDC credentials (`client_id` and `client_secret`) in the Common Services User Registry.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring the OIDC credentials on Cloud Pak for Integration

When you recover API Connect V10.0.x, you must manually update the values for the Management OIDC credentials (`client_id` and `client_secret`) in the Common Services User Registry.

### Before you begin

This task is required for all of the 10.0.x releases up to, and including, version 10.0.2 (skip this task for version 10.0.3 and later). The procedure requires you to log in to the Cloud Manager on the new API Connect deployment. Use the Cloud Manager administrator username and password that you saved while preparing for disaster recovery.

### About this task

When you deploy API Connect, the OIDC `client_id` and `client_secret` resources are automatically generated and added to the Common Services User Registry. These resources enable single sign-on with the IBM Cloud Pak platform. When you reinstall API Connect as part of disaster recovery, the original versions of those resources are retained but cannot be used. You must update the Common Services User Registry and replace the original values with the values from the new deployment.

### Procedure

1. Retrieve the `client_id` and `client_secret` from the stored secret in API Connect.

a. Run the following command to retrieve the `client_id`:

```
oc -n <APIC_namespace> get secret <instance_name>-oidc-client -o jsonpath="{.data.CLIENT_ID}" | base64 -D
```

b. Run the following command to retrieve the `client_secret`:

```
oc -n <APIC_namespace> get secret <instance_name>-oidc-client -o jsonpath="{.data.CLIENT_SECRET}" | base64 -D
```

2. Update the Common Services User Registry with the new values.

Using the Cloud Manager UI:

- a. In API Connect, open the Cloud Manager interface.
- b. Select the Cloud Manager User Registry.  
You will use the Cloud Manager User Registry to modify settings for the Common Service User Registry.
- c. Log in to the Cloud Manager User Registry using the administrator username and password that you saved while preparing for disaster recovery.
- d. In Cloud Manager, click Resources > User Registries and edit Common Services User Registry.
- e. In the Client information section, paste the `client_ID` value from step 1 into the Client ID field.
- f. Paste the `client_secret` value from step 1 into the Client secret field.
- g. Save your changes.

Using the toolkit CLI:

- a. Run the following command to determine the `<mgmt_endpoint_URL>` that you will use for accessing the management server:

```
oc -n <APIC_namespace> get mgmt <instance_name> -o jsonpath="{.status.zenRoute}" && echo ""
```

- b. Log in to the management server:

- i. Run the following command to start the login process:

```
apic login --server <mgmt_endpoint_URL>
```

- ii. Provide your login credentials:

- **Realm?** Type your realm (for example: `admin/default-idp-1`) and press Enter.  
The realm refers to your identity provider. For information on determining your realm value, see [How to determine the identity provider](#).
- **Username?** Type your Cloud Manager administrator username and press Enter.
- **Password?** Type the password for your Cloud Manager administrator account and press Enter.

- c. Run the following command to download the Common Service User Registry as a YAML file:

```
apic user-registries:get common-services --server <mgmt_endpoint_URL> -o admin --fields name,configuration
```

- d. Edit the file and update the `client_ID` and `client_secret` settings with the values you obtained in step 1.

- e. Save and close the file.

- f. Run the following command to upload the modified file to Cloud Manager:

```
apic user-registries:update common-services --server <mgmt_endpoint_URL> -o admin common-services.yaml
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Disabling the Analytics subsystem on Kubernetes

During maintenance of an API Connect cluster, you can shut down the Analytics subsystem by disabling the client, ingestion, and storage microservices so that those processes are not running and there is no way to reach them.

---

### Before you begin

Disabling the Analytics subsystem stops the collection and storage of data as well as making the subsystem unavailable. If you just want to pause data collection without disabling the entire subsystem (for example, while renewing certificates), see [Stopping Analytics data collection](#).

---

### About this task

When you disable Analytics, there will be no data in either the API Manager Dashboards or third-party offloads.

---

## Procedure

1. Back up your Analytics data as explained in [Backing up and restoring the analytics database](#).

2. Disable shard allocation for storage.

Disabling shard allocation is optional, but is recommended because it prevents new shards from being created for replication when a node is unavailable, and helps avoid corruption issues in full system restarts. Disable shard allocation for storage by running the following command:

```
kubectl -n namespace exec -it storage-master|shared_pod -- curl -s -XPUT -d '{"persistent":{"cluster.routing.allocation.enable":"none"}}'
```

where:

- `namespace` is the namespace where the Analytics subsystem is installed.
- `storage-master|shared_pod` is the name of any storage-master or storage-shared pod. You can get the name of your storage pods by running the following command and substituting in the namespace where Analytics is installed:

```
kubectl -n namespace get po
```

When you disable shard allocation, the response looks like the following example:

```
{"acknowledged":true,"persistent":{"cluster":{"routing":{"allocation":{"enable":"none"}}},"transient":{}}
```

3. Unassociate the Analytics service from all gateway services.
  - a. In Cloud Manager, click  Topology.
  - b. In the section for the Availability Zone that contains the Analytics service, locate the Gateway service that the Analytics service is associated with.
  - c. Click  and select Unassociate analytics service.
 For more information, see [Associating an analytics service with a gateway service](#).

4. Unregister the Analytics service from Cloud Manager:
  - a. In Cloud Manager, click  Topology.
  - b. In the section for the Availability Zone that contains the Analytics service, locate the Analytics service and click Delete.
 For more information, see [Registering an analytics service](#).

5. Perform a synced flush of storage.
 

Flushing the storage is optional, but is recommended because it helps to avoid losing the data that was not yet written to disk. This step flushes all current index operations synchronously and attempts to write everything that is in flux to disk. Perform a synced flush of storage by running the following command:

```
kubectl -n namespace exec -it storage-master|shared_pod -- curl_es _flush/synced -XPOST
```

When you flush storage, the response looks like the following example:

```
{"_shards": {"total": 33, "successful": 13, "failed": 0}, ".export-status": {"total": 1, "successful": 1, "failed": 0}, ".apic-config": {"total": 1, "successful": 1, "failed": 0}, ".kibana-6": {"total": 1, "successful": 1, "failed": 0}, "apic-api-2020.06.19-000002": {"total": 15, "successful": 5, "failed": 0}, "apic-api-2020.06.18-1": {"total": 15, "successful": 5, "failed": 0}}
```

The operation often fails, and it is safe to rerun it multiple times until it passes and there are all "failed" counts are zero. If it continues to fail after running multiple attempts over the span of a couple minutes, you can proceed to the next step.

6. Edit the Analytics CR to disable ingestion, storage, and the client.
  - a. Run the following command to open the CR for editing:

```
kubectl edit a7s -n <namespace>
```

- b. Add the `enabled: false` setting to the `ingestion`, `storage`, and `client` sections as in the following example:

```
spec:
  client:
    enabled: false
  ingestion:
    enabled: false
  storage:
    enabled: false
```

- c. Save the change and exit the editor.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Disabling the Analytics subsystem on OpenShift and Cloud Pak for Integration

During maintenance of an API Connect cluster, you can shut down the Analytics subsystem by disabling the client, ingestion, and storage microservices so that those processes are not running and there is no way to reach them.

### Before you begin

Disabling the Analytics subsystem stops the collection and storage of data as well as making the subsystem unavailable. If you just want to pause data collection without disabling the entire subsystem (for example, while renewing certificates), see [Stopping Analytics data collection](#).

### About this task

When you disable Analytics, there will be no data in either the API Manager Dashboards or third-party offloads.

### Procedure

1. Back up your Analytics data as explained in [Backing up and restoring the Analytics database on OpenShift and Cloud Pak for Integration](#).
2. Disable shard allocation for storage.
 

Disabling shard allocation is optional, but is recommended because it prevents new shards from being created for replication when a node is unavailable, and helps avoid corruption issues in full system restarts. Disable shard allocation for storage by running the following command:

```
oc -n namespace exec -it storage-master|shared_pod -- curl_es _cluster/settings -XPUT -d '{"persistent": {"cluster.routing.allocation.enable": "none"}}'
```

where:

- `namespace` is the namespace where the Analytics subsystem is installed.
- `storage-master|shared_pod` is the name of any storage-master or storage-shared pod. You can get the name of your storage pods by running the following command and substituting in the namespace where Analytics is installed:

```
oc -n namespace get po
```

When you disable shard allocation, the response looks like the following example:

```
{"acknowledged": true, "persistent": {"cluster": {"routing": {"allocation": {"enable": "none"}}}}, "transient": {}}
```

3. Unassociate the Analytics service from all gateway services.

- a. In Cloud Manager, click  Topology.
- b. In the section for the Availability Zone that contains the Analytics service, locate the Gateway service that the Analytics service is associated with.
- c. Click  and select Unassociate analytics service.

For more information, see [Associating an analytics service with a gateway service](#).

4. Unregister the Analytics service from Cloud Manager:

- a. In Cloud Manager, click  Topology.
- b. In the section for the Availability Zone that contains the Analytics service, locate the Analytics service and click Delete.

For more information, see [Registering an analytics service](#).

5. Perform a synced flush of storage.

Flushing the storage is optional, but is recommended because it helps to avoid losing the data that was not yet written to disk. This step flushes all current index operations synchronously and attempts to write everything that is in flux to disk. Perform a synced flush of storage by running the following command:

```
oc -n namespace exec -it storage-master|shared_pod -- curl_es _flush/synced -XPOST
```

When you flush storage, the response looks like the following example:

```
{"shards": {"total": 33, "successful": 13, "failed": 0}, ".export-status": {"total": 1, "successful": 1, "failed": 0}, ".apic-config": {"total": 1, "successful": 1, "failed": 0}, ".kibana-6": {"total": 1, "successful": 1, "failed": 0}, "apic-api-2020.06.19-000002": {"total": 15, "successful": 5, "failed": 0}, "apic-api-2020.06.18-1": {"total": 15, "successful": 5, "failed": 0}}
```

The operation often fails, and it is safe to rerun it multiple times until it passes and there are all "failed" counts are zero. If it continues to fail after running multiple attempts over the span of a couple minutes, you can proceed to the next step.

6. Edit the `spec.analytics` section of the of the top-level APICConnectCluster CR to disable ingestion, storage, and the client.

- a. Run the following command to open the CR for editing:

```
oc edit apiconnectcluster <APIC-instance-name> -n <APIC_namespace>
```

- b. Locate the `spec.analytics` section and add the `enabled: false` setting to the `ingestion`, `storage`, and `client` subsections as in the following example:

```
spec:
  analytics:
    client:
      enabled: false
    ingestion:
      enabled: false
    storage:
      enabled: false
```

- c. Save the change and exit the editor.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Maintaining a two data center deployment

How to maintain a two data center disaster recovery (DR) deployment on Kubernetes and OpenShift, including information about normal operation, failure handling, and recovery.

The following information explains how the data flows between the two API Connect subsystems, the API Manager and the Developer Portal, when the two data center DR deployment is running in normal operational mode. Both subsystems have a different internal topology and operate in a slightly different way, and therefore are described separately.

For a general overview of how endpoints and the traffic between ingresses flow in API Connect, see [Deployment overview for endpoints and certificates](#).

For general information about two data center disaster recovery in API Connect, see [A two data center deployment strategy on Kubernetes and OpenShift](#).

---

## Normal operation for the API Manager

In normal operation each data center contains an API Manager service which includes one primary database pod, and some (usually two) secondary pods. As well as the cluster replication that occurs within the data center from the primary to the secondary pods, there is also a Publish/Subscribe logical replication of changes from the active data center to the passive one, as shown in the following diagram.

#### API Manager data flows

The following data flows exist to and from the API Manager.

- Data traffic from the API Manager to the DataPower® gateway director to publish APIs to the gateway via webhooks, as well as to update the gateway with consumer subscriptions, credentials, and so on. This connection does not use mutual TLS (mTLS) by default, but it can be enabled; see [TLS profiles overview](#) for more information.
- Data traffic from the API Manager to the Developer Portal director endpoint. This traffic contains both REST calls to create and delete Portal sites, and also webhook traffic to send the Portal updated data when changes are made in API Manager. This connection is secured by mTLS.
- Incoming data traffic to the consumer API endpoint of the API Manager, in order to carry out consumer actions such as login authentication, create a new application, subscribe to a product, and so on. These calls could come from the Portal, or from direct REST calls made by a consumer or a custom application.
- Incoming data traffic to the platform API endpoint of the API Manager. These calls could come from the Portal, the gateway, and possibly from custom applications.
- Incoming web UI data traffic to the Cloud and Manager UI endpoints of the API Manager.

## Normal operation for the Developer Portal

An API Connect deployment can have multiple Developer Portal services, each of which can be deployed to the primary data center, or the secondary data center, or to both. Obviously if the Developer Portal service is only deployed to a single data center, there is no disaster recovery strategy. So, on the assumption that the Portal service is deployed to both data centers, then there will be multiple Portal pods in each data center. The ideal configuration is to have two or three Portal pods in each data center; any more than three and the costs of data replication outweigh any benefits in additional load handling.

The Developer Portal cluster replication has two components: a database and a filesystem. These components are independent, and both replicate in a star model whereby each pod replicates changes to every other pod. The database also has the added advantage of supporting segment replication, which can be used to optimize the replication across data centers. However, the filesystem replication, which uses CSync2, does not currently support segments.

As all Developer Portal pods are active primary servers, there is no need to be concerned if any writes occur in the passive data center. If any traffic does get routed to the passive data center, this traffic is replicated back to the active data center, and data consistency is maintained.

The following diagram gives an overview of the normal operation for the Developer Portal.

### Developer Portal data flows

The following data flows exist to and from the Developer Portal.

- Data traffic from the API Manager to the Developer Portal director endpoint. This traffic contains both REST calls to create and delete Portal sites, and also webhook traffic to send the Portal updated data when changes are made in API Manager. This connection is secured by mTLS.
- Data traffic from the Developer Portal to the consumer API endpoint of the API Manager, in order to carry out consumer actions such as login authentication, create a new application, subscribe to a product, and so on.
- Data traffic from the Developer Portal to the Analytics client endpoint, in order to display the Portal consumer analytics. However, if there is more than one analytics service in use on a Catalog, then Portal consumer analytics is automatically disabled.
- There is no data traffic from the Developer Portal to the DataPower Gateway, or vice versa.
- Incoming web UI data traffic to the Developer Portal on the Portal UI endpoint. This data is user traffic from the browsers of Developer Portal consumers.
- All calls between the API Manager and the Developer Portal (in either direction), must go via a dynamic router in order to allow for either service to have independent failover between the data centers.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Failure handling of a two data center deployment

How to detect failures, and perform service failover, in a two data center disaster recovery deployment on Kubernetes.

## Before you begin

Ensure that you understand the concepts of two data center disaster recovery in API Connect. For more information, see [A two data center deployment strategy on Kubernetes and OpenShift](#).

## About this task

Failure handling consists of two main concepts; failure detection, and failover of services.

Failure detection is about detecting that a failure has happened, and then alerting the relevant administrator for them to take action. Failure detection is different from system monitoring. Failure detection checks are run often and fast (for example, every 5 seconds). As such they're normally more limited in what they check. In API Connect, failure checks detect only whether the database and web server are online, and nothing more. Whereas monitoring checks typically are run less frequently, but are more likely to check for things such as CPU, memory, and disk space usage. The results of these checks can, for example, be recorded to perform historical trend analysis to spot memory leaks.

If a failure is detected by the system administrator, or any automated monitoring that you are running, it's important to make sure that the cluster or service is definitely offline. So, for example, if data center one (DC1) appears to have an outage, and the plan is to failover to data center two (DC2), then it's important to make sure that the pods in DC1 really are offline. If the DC1 pods are still running, then they might continue to send data to DC2, which would lead DC2 to think it wasn't the active deployment, and then that might lead to split-brain. A fast way to ensure that the cluster or service really is offline, is to drop the network link to those pods in your Kubernetes infrastructure, and then delete them.

The failure detection endpoint must be location-specific and must be exempt from any traffic routing, so that it's possible to explicitly check the health of each data center regardless of how traffic is being routed.

You can failover a specific service, for example `portal_service_1`, or all of the services that are running in a particular data center. The following sections describe how failover is achieved.

The operational states of an API Manager service:

| Operational state      | Description                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------|
| progressing to active  | Pods are progressing to the active state, but none are capable of serving traffic.                |
| active                 | All of the pods are ready and in the correct disaster recovery state for the active data center.  |
| progressing to passive | Pods are progressing to the passive state, but none are capable of serving traffic.               |
| passive                | All of the pods are ready and in the correct disaster recovery state for the passive data center. |

The operational states of a Developer Portal service:

| Operational state                          | Description                                                                                           |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------|
| progressing to active                      | Pods are progressing to the active state, but none are capable of serving traffic.                    |
| progressing to active (ready for traffic)  | At least one pod of each type is ready for traffic. The dynamic router can be linked to this service. |
| active                                     | All of the pods are ready and in the correct disaster recovery state for the active data center.      |
| progressing to passive                     | Pods are progressing to the passive state, but none are capable of serving traffic.                   |
| progressing to passive (ready for traffic) | At least one pod of each type is ready for traffic.                                                   |
| passive                                    | All of the pods are ready and in the correct disaster recovery state for the passive data center.     |
| progressing to down                        | Pods are moving from passive state to down.                                                           |
| down                                       | The multi-site HA mode is deleted from the passive data center.                                       |

You can run the following command to check the operational state of a service:

```
kubect1 describe ServiceName
```

Where `ServiceName` is the name of the API Manager or Developer Portal service.

Important:

- If the active data center is offline, do not remove the multi-site HA CR section from the passive data center, as this action deletes all the data from the databases. If you want to revert to a single data center topology, you must remove the multi-site HA CR section from the active data center, and then redeploy the passive data center. If the active data center is offline, you must first change the passive data center to be active, and then remove the multi-site HA CR section from the now active data center. The passive site must be uninstalled and redeployed as a clean install before it can be used. For more information, see [Removing a two data center deployment](#).
- If the passive data center is offline for more than 24 hours, there can be issues with the disk space on the active data center so you must revert your deployment to a single data center topology. To revert to a single data center topology, you must remove the multi-site HA CR section from the active data center. When the passive site has been redeployed, the multi-site HA CR can be reapplied to the active site. For more information, see [Removing a two data center deployment](#).

## Procedure

- **API Manager service failover**

To initiate a failover from DC1 to DC2 you first must set DC1 to passive, before making the passive data center active. This action is needed to prevent split-brain, as there can't be two active services or clusters at the same time. If the failover is being done because the current active data center has had a complete outage, then you should ensure that the network links to that data center are dropped in your Kubernetes infrastructure, in order to avoid the potential for split-brain occurring. The offline data center must be set to passive before the network links are restored. The following instructions show how to failover DC1 to DC2 for the API Manager service.

1. Set the DC1 API Manager service (in this example, located in Dallas), to be passive.

Edit the DC1 `ManagementCluster` custom resource (CR) file `management_cr` by running the following command:

```
kubect1 edit mgmt <mgmt-cluster-name> -n <namespace>
```

and change the mode to `passive`:

```
multiSiteHA:  
  mode: passive
```

Where:

- `<mgmt-cluster-name>` is the name specified in the subsystem CR at installation time. You can check the name by running `kubect1 get ManagementCluster -n <namespace>`.
- `<namespace>` is the target installation namespace in the Kubernetes cluster.

Note: If DC1 is completely down, and you can't set it to be passive at this point, you must ensure that the network links to DC1 are removed before continuing to set DC2 to be active. You must then not restore the network links to DC1 until you can set DC1 to be passive.

2. Run the following command on DC1 to check that the API Manager service is ready for traffic:

```
kubectl describe <mgmt-cluster-name> -n <namespace>
```

The service is ready for traffic when the **Ha mode** part of the **Status** object is set to **passive**. For example:

```
Status:
...
Ha mode:           passive
...
```

3. Change the DC2 API Manager service (in this example, located in Raleigh), from passive to active.

Edit the DC2 **ManagementCluster** custom resource (CR) file `management_cr` by running the following command:

```
kubectl edit mgmt <mgmt-cluster-name> -n <namespace>
```

and change the **mode** to **active**:

```
multiSiteHA:
mode: active
```

Where:

- **<mgmt-cluster-name>** is the name specified in the subsystem CR at installation time. You can check the name by running `kubectl get ManagementCluster -n <namespace>`.
- **<namespace>** is the target installation namespace in the Kubernetes cluster.

4. Run the following command on DC2 to check that the API Manager services are ready for traffic:

```
kubectl describe <mgmt-cluster-name> -n <namespace>
```

The services are ready for traffic when the **Ha mode** part of the **Status** object is set on DC2 to **active**. For example:

```
Status:
...
Ha mode:           active
...
```

5. Update your dynamic router to redirect all traffic to DC2 instead of DC1. Note that until the DC2 site becomes **active**, the UIs might not be operational.

#### • Developer Portal service failover

To initiate a failover for the Developer Portal from DC1 to DC2 you first must ensure that the existing DC1 is passive, before making the DC2 data center active, in order to prevent split-brain. The following instructions show how to failover DC1 to DC2 for the Developer Portal service. You must repeat these steps for each Developer Portal service that you want to failover.

Note:

- Switching a Developer Portal service to passive mode instantly restarts all of its **portal-db** and **portal-www** pods at the same time. Therefore, if you don't have an active Developer Portal service that is online, there will be an outage of the Developer Portal web sites until the passive data center is ready to accept traffic.
- If you want to monitor the failover process, you can run the following command to check the status of the Portal pods in the **PortalService** CR file:

```
kubectl describe ServiceName
```

- Do not edit the **PortalService** CR file during the failover process.

1. Set the DC1 Developer Portal service (in this example, located in Dallas) to be passive.

Edit the DC1 **PortalCluster** custom resource (CR) file `portal_cr` by running the following command:

```
kubectl edit ptl <ptl-cluster-name> -n <namespace>
```

and change the **mode** to **passive**:

```
multiSiteHA:
mode: passive
```

Where:

- **<ptl-cluster-name>** is the name specified in the subsystem CR at installation time. You can check the name by running `kubectl get PortalCluster -n <namespace>`.
- **<namespace>** is the target installation namespace in the Kubernetes cluster.

Note: If DC1 is completely down, and you can't set it to be passive at this point, you must ensure that the network links to DC1 are removed before continuing to set DC2 to be active. You must then not restore the network links to DC1 until you can set DC1 to be passive.

2. Run the following command on DC1 to check the Developer Portal service status:

```
kubectl describe <ptl-cluster-name> -n <namespace>
```

You can continue to the next step when the **Ha mode** part of the **Status** object is set to **progressing to passive**, or any of the **passive** states. For example:

```
Status:
...
Ha mode:           progressing to passive
...
```

Important: You must not wait for the active DC **Status** to become **passive**, before failing over the passive DC to become **active**. You should change the DC1 **mode** to **passive**, and then run the `kubectl describe ServiceName` command, and as soon as the **Ha mode** is set to **progressing to passive**, you must change DC2 to be **active**.

3. Change the DC2 Developer Portal service (in this example, located in Raleigh), from passive to active.

Edit the DC2 **PortalCluster** custom resource (CR) file `portal_cr` by running the following command:

```
kubectl edit ptl <ptl-cluster-name> -n <namespace>
```

and change the `mode` to `active`:

```
multiSiteHA:  
  mode: active
```

Where:

- `<ptl-cluster-name>` is the name specified in the subsystem CR at installation time. You can check the name by running `kubectl get PortalCluster -n <namespace>`.
  - `<namespace>` is the target installation namespace in the Kubernetes cluster.
4. Update your dynamic router to redirect all traffic to DC2 instead of DC1.
  5. Run the following command to check that the Developer Portal services on DC1 and DC2 are ready for traffic:

```
kubectl describe <ptl-cluster-name> -n <namespace>
```

The services are ready for traffic when the `Ha mode` part of the `Status` object is set on DC1 to `passive`, and is set on DC2 to `active`. For example, on DC2:

```
Status:  
  ...  
  Ha mode: active  
  ...
```

- **Entire data center failover**

To failover an entire data center, follow the previous steps to failover the API Manager service, followed by the steps to failover each Developer Portal service in that data center.

How long it takes to complete the failover varies, and depends on hardware speed, network latency, and the size of the databases. However, here are some approximate timings:

For API Manager:

- `passive` to `active` approximately 5 minutes
- `active` to `passive` approximately 15 minutes

For Developer Portal:

- `passive` to `active` 15 - 40 minutes
- `active` to `passive` approximately 10 minutes

## What to do next

---

As soon as a failure on a data center has been resolved, the failed data center should be brought back online and relinked to the currently active data center to maintain the highest availability; see [Recovering from a failover of a two data center deployment](#) for more information.

# Recovering from a failover of a two data center deployment

How to recover a two data center disaster recovery deployment on Kubernetes.

## Before you begin

---

Ensure that you understand the concepts of two data center disaster recovery in API Connect. For more information, see [A two data center deployment strategy on Kubernetes and OpenShift](#).

## About this task

---

After a failure has been resolved, the failed data center can be brought back online and re-linked to the currently active data center. It's important to do this as soon as possible, in order to reinstate disaster recovery. Otherwise, if another failure occurred before the failed data center is brought back online, there could be a complete outage.

The failed data center can be brought back online as the new active primary data center, or it can be brought back as a passive secondary data center and the currently active data center kept as the primary one. This decision will be based on your own company policies about recovering from a failure.

The amount of data that is sent when recovering from a failover, will depend on how long the outage lasted, and how much activity there was during that period.

The operational states of a Developer Portal service:

| Operational state                          | Description                                                                                           |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------|
| progressing to active                      | Pods are progressing to the active state, but none are capable of serving traffic.                    |
| progressing to active (ready for traffic)  | At least one pod of each type is ready for traffic. The dynamic router can be linked to this service. |
| active                                     | All of the pods are ready and in the correct disaster recovery state for the active data center.      |
| progressing to passive                     | Pods are progressing to the passive state, but none are capable of serving traffic.                   |
| progressing to passive (ready for traffic) | At least one pod of each type is ready for traffic.                                                   |
| passive                                    | All of the pods are ready and in the correct disaster recovery state for the passive data center.     |
| progressing to down                        | Pods are moving from passive state to down.                                                           |
| down                                       | The multi-site HA mode is deleted from the passive data center.                                       |

You can run the following command to check the operational state of a service:

```
kubectl describe ServiceName
```

Where *ServiceName* is the name of the API Manager or Developer Portal service.

Important:

- If the active data center is offline, do not remove the multi-site HA CR section from the passive data center, as this action deletes all the data from the databases. If you want to revert to a single data center topology, you must remove the multi-site HA CR section from the active data center, and then redeploy the passive data center. If the active data center is offline, you must first change the passive data center to be active, and then remove the multi-site HA CR section from the now active data center. The passive site must be uninstalled and redeployed as a clean install before it can be used. For more information, see [Removing a two data center deployment](#).
- If the passive data center is offline for more than 24 hours, there can be issues with the disk space on the active data center so you must revert your deployment to a single data center topology. To revert to a single data center topology, you must remove the multi-site HA CR section from the active data center. When the passive site has been redeployed, the multi-site HA CR can be reapplied to the active site. For more information, see [Removing a two data center deployment](#).

## Procedure

### • Recovering from an API Manager failover

The following instructions show how to bring data center one (DC1) back as the primary (**active**) data center, and assume that DC1 is now online and in the passive **Ha mode**. If you prefer, you can keep DC1 as the secondary data center, and leave data center two (DC2) as the primary (**active**) data center.

1. Change DC2 (in this example, located in Raleigh) to be passive.

Edit the DC2 **ManagementCluster** custom resource (CR) file `management_cr` by running the following command:

```
kubectl edit mgmt <mgmt-cluster-name> -n <namespace>
```

and change the `mode` to `passive`:

```
multiSiteHA:
  mode: passive
```

Where:

- `<mgmt-cluster-name>` is the name specified in the subsystem CR at installation time. You can check the name by running `kubectl get ManagementCluster -n <namespace>`.
- `<namespace>` is the target installation namespace in the Kubernetes cluster.

2. Run the following command on DC2 to check that the API Manager service is ready for traffic:

```
kubectl describe <mgmt-cluster-name> -n <namespace>
```

The service is ready for traffic when the `Ha mode` part of the `Status` object is set to `passive` or `progressing to passive (ready for traffic)`. For example:

```
Status:
...
Ha mode:           passive
...
```

3. Change DC1 (in this example, located in Dallas) to be active.

Edit the DC1 **ManagementCluster** custom resource (CR) file `management_cr` by running the following command:

```
kubectl edit mgmt <mgmt-cluster-name> -n <namespace>
```

and change the `mode` to `active`:

```
multiSiteHA:
  mode: active
```

Where:

- `<mgmt-cluster-name>` is the name specified in the subsystem CR at installation time. You can check the name by running `kubectl get ManagementCluster -n <namespace>`.
- `<namespace>` is the target installation namespace in the Kubernetes cluster.

4. Run the following command on DC1 to check that the API Manager service is ready for traffic:

```
kubectl describe <mgmt-cluster-name> -n <namespace>
```

The service is ready for traffic when the `Ha mode` part of the `Status` object is set to `active` or `progressing to active (ready for traffic)`. For example:

```
Status:
...
Ha mode:           active
...
```

5. Update the dynamic router to redirect all traffic to DC1 instead of DC2. Note that until the DC1 site becomes `active`, the UIs might not be operational.

- **Recovering from a Developer Portal failover**

When recovering from a Developer Portal failover, how much data is sent from the now passive data center (in this example, DC2) back to the newly recovered active data center (in this example, DC1) varies depending on how much time has passed and how many changes have been made in the meantime.

If possible, the Portal sends an Incremental State Transfer (IST), which is a replay of the transactions that have happened since the failed data center, DC1, became unreachable. The IST can grow to be up to 3 GB in size. If the IST grows larger than 3 GB, then the Portal sends a State Snapshot Transfer (SST) instead, which is basically a full copy of the whole database. How long this process takes depends on how many Portal sites there are, how much content in each of those sites, how active they are (as in number of transactions), and how fast the network speed is between the data centers. However, it is likely to take in the range 5 - 60 minutes.

You can check whether the Developer Portal servers are in sync by running the `status` command in the `portal-www` pod admin container. If all servers show as `primary`, then they are in sync and traffic can be directed wherever needed.

The following instructions show how to bring DC1 back as the active primary data center, and switch DC2 to be the passive secondary data center. Again, you can keep DC2 as the active primary data center if you prefer, and leave DC1 to be passive.

1. Set DC2 (in this example, located in Raleigh) to be passive.

Edit the DC2 `PortalCluster` custom resource (CR) file `portal_cr` by running the following command:

```
kubectl edit ptl <ptl-cluster-name> -n <namespace>
```

and change the `mode` to `passive`:

```
multiSiteHA:  
  mode: passive
```

Where:

- `<ptl-cluster-name>` is the name specified in the subsystem CR at installation time. You can check the name by running `kubectl get PortalCluster -n <namespace>`.
  - `<namespace>` is the target installation namespace in the Kubernetes cluster.
2. Run the following command on DC2 to check the Developer Portal service status:

```
kubectl describe <ptl-cluster-name> -n <namespace>
```

You can continue to the next step when the `Ha mode` part of the `Status` object is set to `progressing to passive`, or any of the `passive` states. For example:

```
Status:  
...  
  Ha mode:           progressing to passive  
...
```

Important: You must not wait for the active DC `Status` to become `passive`, before changing the passive DC to become `active`. You should change the DC2 `mode` to `passive`, and then run the `kubectl describe ServiceName` command, and as soon as the `Ha mode` is set to `progressing to passive`, you must change DC1 to be `active`.

3. Set DC1 (in this example, located in Dallas) to be active.

Edit the DC1 `PortalCluster` custom resource (CR) file `portal_cr` by running the following command:

```
kubectl edit ptl <ptl-cluster-name> -n <namespace>
```

and change the `mode` to `active`:

```
multiSiteHA:  
  mode: active
```

Where:

- `<ptl-cluster-name>` is the name specified in the subsystem CR at installation time. You can check the name by running `kubectl get PortalCluster -n <namespace>`.
  - `<namespace>` is the target installation namespace in the Kubernetes cluster.
4. Run the following command on DC1 to check that the Developer Portal service is ready for traffic:

```
kubectl describe <ptl-cluster-name> -n <namespace>
```

The service is ready for traffic when the `Ha mode` part of the `Status` object is set to `active` or `progressing to active (ready for traffic)`. For example:

```
Status:  
...  
  Ha mode:           active  
...
```

5. Update the dynamic router to redirect all traffic to DC1 instead of DC2.

## Backup and restore considerations for a two data center deployment

Points to consider when backing up and restoring a two data center disaster recovery (DR) deployment on Kubernetes and OpenShift.

Full instructions about backing up and restoring your API Connect deployment are contained in the following topics:

- [Configuring backup settings for fresh install of the Management subsystem](#)
- [Backing up and restoring the Developer Portal in a Kubernetes environment](#)

Follow the steps in these topics to back up and restore your two data center DR deployment. However, there are some additional considerations to bear in mind if you have a two data center DR deployment, and these considerations are listed in the [General considerations](#) section that follows.

For general information about two data center disaster recovery in API Connect, see [A two data center deployment strategy on Kubernetes and OpenShift](#).

---

### General considerations

- Best practice is to take regular, scheduled backups of the subsystems in the primary (active) data center, as this is the data center that contains the most valid data.
- The subsystems in the secondary (passive) data center should be backed up only when key updates are made, for example when first deploying a passive data center, and then again before and after applying fix packs. This ensures that all of the endpoints in the deployment remain consistent.
- If a subsystem or entire data center needs to be restored, the data will be retrieved from the backups of the subsystems in the active data center.
- If a passive data center fails, you can either restore before you enable `multiSiteHA` mode on that site. Or, restore your passive data center, then trigger a re-sync of the databases.

Important: If the passive data center is offline for more than 24 hours, there can be issues with the disk space on the active data center so you must revert your deployment to a single data center topology. To revert to a single data center topology, you must remove the multi-site HA CR section from the active data center. When the passive site has been redeployed, the multi-site HA CR can be reapplied to the active site. For more information, see [Removing a two data center deployment](#).

- You can trigger the passive data center to re-sync its databases with the active data center by removing the multi-site HA section from the passive data center CR, and then adding the multi-site HA section back in again. This action triggers a re-sync with the active data center, to ensure that the passive data center contains the latest data.

On Kubernetes, this involves the following steps:

1. Remove the `multiSiteHA` section from the subsystem CR on the passive data center.
2. Apply the updated CR file to the subsystem on the passive data center, for example:

```
kubectl apply -f subsystem_cr.yaml -n <namespace>
```

Where `subsystem_cr.yaml` is the file name of the subsystem CR, and `<namespace>` is the target installation namespace in the Kubernetes cluster for the passive data center.

3. Add the `multiSiteHA` section back into the subsystem CR on the passive data center, for example:

```
multiSiteHA:
  mode: passive
  replicationEndpoint:
    annotations:
      cert-manage.io/issuer: ingress-issuer
    hosts:
      - name: mgrreplicationraleigh.cluster2.example.com
        secretName: raleigh-mgr-replication-worker-1
      replicationPeerFQDN: mgrreplicationdallas.cluster1.example.com
  tlsClient:
    secretName: mgr-replication-client
```

4. Apply the updated CR file to the subsystem on the passive data center again, for example:

```
kubectl apply -f subsystem_cr.yaml -n <namespace>
```

## Upgrading a two data center deployment

How to upgrade a two data center disaster recovery (DR) deployment on Kubernetes and OpenShift.

Full instructions about how to upgrade your API Connect deployment, including upgrade considerations for each deployment type, are contained in the following section:

- [Upgrading API Connect](#)

However, there are some important additional instructions if you have a two data center DR deployment; see the following sections:

- [Key points when upgrading a two data center DR deployment](#)
- [How to upgrade when one data center is down](#)

For general information about two data center disaster recovery in API Connect, see [A two data center deployment strategy on Kubernetes and OpenShift](#).

## Key points when upgrading a two data center DR deployment

Both data centers must be using the same version of API Connect, including down to the specific fix pack and iFix level, as appropriate. Each data center is effectively an identical deployment instance, so they must be kept on identical code level bases. Therefore, both data centers must be upgraded in the same maintenance window.

You must upgrade each subsystem in a particular order, upgrading it on the **passive** (standby) data center first, and then upgrading it on the **active** (primary) data center. This ordering of the upgrade is important, as the replication between the primary and the standby subsystems might fail if the **passive** subsystem is older than the **active** subsystem. Use the following additional instructions to upgrade your subsystems.

### 1. Cert-manager upgrade preparation.

From 10.0.4.0 and later, API Connect uses cert-manager v1.5.1, instead of cert-manager v0.10.1. If you are upgrading from API Connect 10.0.3.0 or earlier, to 10.0.4.0 or later, you must perform the following sub-steps to prepare the cert-manager for the upgrade. Otherwise, go to Step 2 to upgrade the Management subsystem cluster.

The following sub-steps must be performed in both data centers. However, you must upgrade first the data center that contains the **ingress-ca** certificate object, and this data center must be in **passive** mode, so you might need to failover a data center.

- a. Run the following command to identify which data center has the **ingress-ca** certificate:

```
kubectl -n <namespace> get cert ingress-ca
NAME      READY  SECRET  AGE
ingress-ca  True   ingress-ca  30h
```

If you used the original **helper\_files.zip** to create the deployment, only one of the two data centers will contain the **ingress-ca** certificate. If not, please choose the data center where you created the custom **ingress-ca** certificate.

- b. If the data center that contains the **ingress-ca** certificate is in **active** mode, you must failover that data center to be **passive** for both the Management and Portal subsystems. For information about how to failover, see [Failure handling of a two data center deployment](#).
- c. Obtain the 10.0.4.0-ifix3 **helper\_files.zip** from Fix Central for both data centers.
- d. Backup the existing certificates and issuers in both data centers:

```
kubectl get --all-namespaces -o yaml issuer,clusterissuer,cert > backup.yaml
```

- e. Delete the old cert-manager (v0.10.1) resources from the v10.next files, including the namespace, in both data centers:

```
kubectl delete -f helper_files/cert-manager-0.10.1-deploy.yaml
```

- f. Verify that the cert-manager resources have been deleted in both data centers:

```
kubectl get ns cert-manager
Error from server (NotFound): namespaces "cert-manager" not found
```

- g. Install the new cert-manager (v1.5.1) in both data centers:

```
kubectl apply -f helper_files/cert-manager-1.5.1.yaml
```

- h. Apply the new CRDs from the v10.next build in both data centers:

```
kubectl apply -f ibm-apiconnect-crds.yaml
```

- i. Apply the v10.next DataPower operator yaml, in the namespace that the current DataPower operator is running in, in both data centers:

```
kubectl apply -f ibm-datapower.yaml -n <namespace>
```

Note: If your two data center deployment used custom namespaces during the installation, you must ensure that those same namespaces are used in all of the files that are needed for the upgrade that require namespaces, for example the **ibm-datapower.yaml** operator file.

- j. Delete the old webhook configurations from both data centers before deploying the 10.0.4.0-ifix3 API Connect operator:

```
kubectl get mutatingwebhookconfiguration,validatingwebhookconfiguration | grep ibm-apiconnect
kubectl delete mutatingwebhookconfiguration/ibm-apiconnect-<namespace>-mutating-webhook-configuration
kubectl delete validatingwebhookconfiguration/ibm-apiconnect-<namespace>-validating-webhook-configuration
```

- k. Install the new issuers on the **passive** data center, for example:

```
kubectl apply -f helper_files/ingress-issuer-v1-dc1.yaml -n <namespace>
```

- l. Export the **ingress-ca** secret as a yaml file from the **passive** data center:

```
kubectl -n <namespace> get secret ingress-ca -o yaml > ingress-ca.yaml
```

- m. Edit the **ingress-ca.yaml** file to remove all of the **labels**, **managedFields**, **creationTimestamp**, **resourceVersion**, and **uid**.

- n. Copy the **ingress-ca.yaml** from the **passive** data center to the **active** data center, and apply the file to the **active** data center:

```
kubectl -n <namespace> apply -f ingress-ca.yaml
```

- o. Install the new issuers on the **active** data center, for example:

```
kubectl apply -f helper_files/ingress-issuer-v1-dc2.yaml -n <namespace>
```

- p. Apply the v10.next API Connect operator yaml to both of the data centers, in the namespace that the current API Connect operator is running in:

```
kubectl apply -f ibm-apiconnect.yaml -n <namespace>
```

Note: If your two data center deployment used custom namespaces during the installation, you must ensure that those same namespaces are used in all of the files that are needed for the upgrade that require namespaces, for example the `ibm-apiconnect.yaml` operator file. This action is not required if deploying with olm.

## 2. Management subsystem cluster upgrade process.

Note: If you have already completed the cert-manager upgrade preparation, move straight to sub-step [2.g](#).

a. Apply the v10.next CRDs on the **passive** cluster. For example:

```
kubectl apply -f ibm-apiconnect-crds.yaml
```

b. Update the **passive** `ibm-apiconnect` operator image to v10.next (note update only the operator). For example:

```
kubectl apply -f ibm-apiconnect.yaml
```

Note: If your two data center deployment used custom namespaces during the installation, you must ensure that those same namespaces are used in all of the files that are needed for the upgrade that require namespaces, for example the `ibm-apiconnect` operator yaml file.

c. Wait for the Management subsystem status to become **Running**. Note that the new operator should reconcile the old version operand, and this may take some time. For example:

```
kubectl get mgmt -n passive_mgmt_cluster
NAME      READY   STATUS    VERSION      RECONCILED VERSION AGE
management 7/7     Running  10.0.x.0     10.0.x.0-100 4h43m
```

d. Apply the v10.next CRDs on the **active** cluster. For example:

```
kubectl apply -f ibm-apiconnect-crds.yaml
```

e. Update the **active** `ibm-apiconnect` operator image to v10.next (note update only the operator). For example:

```
kubectl apply -f ibm-apiconnect.yaml
```

Note: If your two data center deployment used custom namespaces during the installation, you must ensure that those same namespaces are used in all of the files that are needed for the upgrade that require namespaces, for example the `ibm-apiconnect` operator yaml file.

f. Wait for the Management subsystem status to become **Running**. Note that the new operator should reconcile the old version operand, and this may take some time. For example:

```
kubectl get mgmt -n active_mgmt_cluster
NAME      READY   STATUS    VERSION      RECONCILED VERSION AGE
management 17/17   Running  10.0.x.0     10.0.x.0-100 5h17m
```

g. Remove the multi-site HA CR section from the **passive** Management subsystem. As soon as the multi-site HA configuration is removed, the **passive** Management subsystem converts itself to an independent cluster where you can see all the microservices.

h. Wait for the Management subsystem status to become **Running** on the **passive** Management subsystem. For example:

```
kubectl get mgmt -n passive_mgmt_cluster
NAME      READY   STATUS    VERSION      RECONCILED VERSION AGE
management 16/16   Running  10.0.x.0     10.0.x.0-100 5h2m
```

i. Remove the multi-site HA CR section from the **active** Management subsystem. As soon as the multi-site HA configuration is removed, the **active** Management subsystem converts itself to an independent cluster where you can see all the microservices.

j. Wait for the Management subsystem status to become **Running** on the **active** Management subsystem. For example:

```
kubectl get mgmt -n active_mgmt_cluster
NAME      READY   STATUS    VERSION      RECONCILED VERSION AGE
management 16/16   Running  10.0.x.0     10.0.x.0-100 5h2m
```

At this point you have two independent Management clusters.

k. Now upgrade both clusters to `<version>` in parallel, where `<version>` is the version number that you are upgrading to. For example:

```
kubectl -n $NAMESPACE edit mgmt mgmt_cluster
version: 10.0.4.0
```

l. For both clusters, wait for the Management subsystem status to become **Running**. For example:

```
kubectl get mgmt -n mgmt_cluster
NAME      READY   STATUS    VERSION      RECONCILED VERSION AGE
management 16/16   Running  10.0.x.0     10.0.x.0-2807 5h46m
```

m. Now, add the multi-site HA CR section back into the previously **active** Management subsystem.

n. Wait for the Management subsystem status to become **Running** on the **active** Management subsystem. For example:

```
kubectl get mgmt -n active_mgmt_cluster
NAME      READY   STATUS    VERSION      RECONCILED VERSION AGE
management 17/17   Running  10.0.x.0     10.0.x.0-2807 5h56m
```

o. Add the multi-site HA CR section back into the previously **passive** Management subsystem.

p. Wait for the Management subsystem status to become **Running** on the **passive** Management subsystem. For example:

```
kubectl get mgmt -n passive_mgmt_cluster
NAME      READY   STATUS    VERSION      RECONCILED VERSION AGE
management 7/7     Running  10.0.x.0     10.0.x.0-2807 5h46m
```

You should see a limited set of microservices on the **passive** Management subsystem, for example `7/7`.

q. Run the following command on the **active** Management subsystem to check that the API Manager service is ready for traffic:

```
kubectl describe ServiceName
```

The service is ready for traffic when the `Ha mode` part of the `Status` object is set to **active**. For example:

```
Status:
...
```

```
Ha mode: active
...
```

- r. Update the version, license, and annotations for the cert-manager by editing the CRs for the `passive` cluster.
  - i. Update the endpoint ingress-issuer to the new cert-manager API group by changing the following annotations from:

```
annotations:
  certmanager.k8s.io/issuer: ingress-issuer
```

to

```
annotations:
  cert-manager.io/issuer: ingress-issuer
```

- ii. Change the operand version to the release that you are upgrading to, for example `10.0.4.0`.
- iii. If you see a webhook error like the following message:

```
admission webhook "vmanagementcluster.kb.io" denied the request: ManagementCluster.management.apiconnect.ibm.com
"management" is invalid: spec.license.license: Invalid value: "L-RJON-BYGHM4": License L-RJON-BYGHM4 is invalid
for the chosen version 10.0.4.0.
Please refer license document https://ibm.biz/apiclicenses
```

Go to <https://ibm.biz/apiclicenses>, and select one of the License IDs for the version that you are deploying. Then re-apply your CR with the updated license value, and the CR spec should look similar to the following example:

```
spec:
  license:
    accept: true
    use: production
    license: L-RJON-C2YLGB
```

After the `passive` cluster is upgraded, use the same instructions to update the version, license, and annotations for the cert-manager by editing the CRs for the `active` cluster.

3. The Portal subsystem cluster; upgrade the `passive` data center followed by the `active` data center.

Note:

- If you had to complete the cert-manager upgrade preparation steps, the Portal subsystem cluster will go into a `Pending` state while the certificates are being upgraded.
  - If you upgrade from before Version 10.0.1.1 to Version 10.0.1.1 or later, you must upgrade the passive and active sites in parallel. This method means that both sites are down and then they restart their pods at the new versions in parallel so that they can cluster together.
- a. Wait for the new `ptl-replication` cert to be created in the `active` and `passive` Portal sites, for example:

```
kubectl get cert -n <namespace> | grep ptl-replication
NAME          READY  SECRET  AGE
ptl-replication  True   ptl-replication  31h
```

- b. The new API Connect operator is now reconciling with the old operand (10.0.x), and so you must delete all of the `portal-nginx`, `portal-<remote>-db`, `portal-<remote>-www`, and `portal-tunnel` pods in both the `active` and `passive` Portal sites, as they don't automatically reload the certificates. For example:

```
kubectl -n <namespace> delete pods portal-tunnel-0 portal-tunnel-1 portal-tunnel-2 portal-<remotesite>-db-0 portal-
<remotesite>-db-1
portal-<remotesite>-db-2 portal-<remotesite>-www-0 portal-<remotesite>-www-1 portal-<remotesite>-www-2 portal-nginx-
ab64c64-ayjk portal-nginx-cc75f65b6-56qkn
portal-nginx-cc75f65b6-1chm3
```

- c. Make sure that the Portal CR status is in the `running` state in both the `active` and `passive` Portal sites.

- d. Update the version, license, and annotations for the cert-manager by editing the CRs for the `passive` site.

- i. Update the endpoint ingress-issuer to the new cert-manager API group by changing the following annotations from:

```
annotations:
  certmanager.k8s.io/issuer: ingress-issuer
```

to

```
annotations:
  cert-manager.io/issuer: ingress-issuer
```

- ii. Change the operand version to the release that you are upgrading to, for example `10.0.4.0`.

- iii. If you see a webhook error like the following message:

```
admission webhook "vmanagementcluster.kb.io" denied the request: ManagementCluster.management.apiconnect.ibm.com
"management" is invalid: spec.license.license: Invalid value: "L-RJON-BYGHM4": License L-RJON-BYGHM4 is invalid
for the chosen version 10.0.4.0.
Please refer license document https://ibm.biz/apiclicenses
```

Go to <https://ibm.biz/apiclicenses>, and select one of the License IDs for the version that you are deploying. Then re-apply your CR with the updated license value, and the CR spec should look similar to the following example:

```
spec:
  license:
    accept: true
    use: production
    license: L-RJON-C2YLGB
```

After the `passive` site is upgraded, use the same instructions to update the version, license, and annotations for the cert-manager by editing the CRs for the `active` site.

4. The Gateway subsystem cluster; see [Upgrading Gateway subsystem on native Kubernetes](#).

- a. After upgrading, update the version, license, and annotations for the cert-manager by editing the CRs for the `passive` cluster.

- i. Update the endpoint ingress-issuer to the new cert-manager API group by changing the following annotations from:

```
annotations:
  certmanager.k8s.io/issuer: ingress-issuer
```

to

```
annotations:
  cert-manager.io/issuer: ingress-issuer
```

- ii. Change the operand version to the release that you are upgrading to, for example 10.0.4.0.
- iii. If you see a webhook error like the following message:

```
admission webhook "vmanagementcluster.kb.io" denied the request: ManagementCluster.management.apiconnect.ibm.com
"management" is invalid: spec.license.license: Invalid value: "L-RJON-BYGHM4": License L-RJON-BYGHM4 is invalid
for the chosen version 10.0.4.0.
Please refer license document https://ibm.biz/apiclicenses
```

Go to <https://ibm.biz/apiclicenses>, and select one of the License IDs for the version that you are deploying. Then re-apply your CR with the updated license value, and the CR spec should look similar to the following example:

```
spec:
  license:
    accept: true
    use: production
    license: L-RJON-C2YLGB
```

After the **passive** cluster is upgraded, use the same instructions to update the version, license, and annotations for the cert-manager by editing the CRs for the **active** cluster.

5. The Analytics subsystem cluster; see [Upgrading Analytics subsystem on native Kubernetes](#).
  - a. After upgrading, update the version, license, and annotations for the cert-manager by editing the CRs for the **passive** cluster.
    - i. Update the endpoint ingress-issuer to the new cert-manager API group by changing the following annotations from:

```
annotations:
  certmanager.k8s.io/issuer: ingress-issuer
```

to

```
annotations:
  cert-manager.io/issuer: ingress-issuer
```

- ii. Change the operand version to the release that you are upgrading to, for example 10.0.4.0.
- iii. If you see a webhook error like the following message:

```
admission webhook "vmanagementcluster.kb.io" denied the request: ManagementCluster.management.apiconnect.ibm.com
"management" is invalid: spec.license.license: Invalid value: "L-RJON-BYGHM4": License L-RJON-BYGHM4 is invalid
for the chosen version 10.0.4.0.
Please refer license document https://ibm.biz/apiclicenses
```

Go to <https://ibm.biz/apiclicenses>, and select one of the License IDs for the version that you are deploying. Then re-apply your CR with the updated license value, and the CR spec should look similar to the following example:

```
spec:
  license:
    accept: true
    use: production
    license: L-RJON-C2YLGB
```

After the **passive** cluster is upgraded, use the same instructions to update the version, license, and annotations for the cert-manager by editing the CRs for the **active** cluster.

You must verify that each subsystem has been updated successfully on both the **passive** and the **active** data centers before upgrading the next subsystem.

The Developer Portal upgrade takes place in two stages. Firstly, the system is upgraded, which updates the internal deployment scripts, packages, and so on. Then, as soon as the system upgrade is complete, the individual Portal sites are upgraded to the new level of the Portal UI code. This second stage, the Portal site upgrades, doesn't start until the first stage is complete and all of the pods (in both data centers) have been upgraded to the new version. The upgrade of the sites then starts automatically, a few at a time, spread across both data centers to allow the upgrade to run in parallel.

## How to upgrade when one data center is down

In this scenario, one data centre is down and you have to failover to the other data center in your deployment. So, you are now running a two data center deployment, but only one data center is online and is in active mode. However, a critical fix must be applied before you can recover the failed data center. In this instance, you must apply the upgrade to the remaining active data center. Then, when you are ready to bring the failed data center back online, you must first remove the multi-site HA section from the failed data center CR, and then add the multi-site HA section back in again making that data center passive. This action triggers a re-sync with the active data center, and ensures that the passive data center contains the latest data.

Note: If one data center is completely down, and you cannot set it to be passive, you must ensure that the network links to that data center are removed before continuing to set your other data center to be active. You must then not restore the network links to the failed data center until you can set it to be passive.

On Kubernetes, this involves the following steps:

1. Remove the **multiSiteHA** section from the subsystem CR on the passive data center.
2. Apply the updated CR file to the subsystem on the passive data center, for example:

```
kubectl apply -f subsystem_cr.yaml -n <namespace>
```

Where **subsystem\_cr.yaml** is the file name of the subsystem CR, and **<namespace>** is the target installation namespace in the Kubernetes cluster for the passive data center.

3. Add the **multiSiteHA** section back into the subsystem CR on the passive data center, for example:

```
multiSiteHA:
  mode: passive
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
  hosts:
```

```
- name: mgrreplicationraleigh.cluster2.example.com
  secretName: raleigh-mgr-replication-worker-1
replicationPeerFQDN: mgrreplicationdallas.cluster1.example.com
tlsClient:
  secretName: mgr-replication-client
```

4. Apply the updated CR file to the subsystem on the passive data center again, for example:

```
kubectl apply -f subsystem_cr.yaml -n <namespace>
```

- [Installing a two data center deployment](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Removing a two data center deployment

You can remove your two data center disaster recovery deployment on Kubernetes and OpenShift.

## Before you begin

Ensure that you understand the concepts of two data center disaster recovery in API Connect. For more information, see [A two data center deployment strategy on Kubernetes and OpenShift](#).

## About this task

If you decide to remove your two data center disaster recovery (DR) deployment, you go from two data centers to one. The active data center remains as the only working system. The passive one loses all data as part of the process.

Warning: If the active data center is offline, do not remove the multi-site HA CR section from the passive data center, as this action deletes all the data from the databases. As part of the installation, you included a `multiSiteHA` configuration section in each data center. For example:

|                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>siteName: dallas multiSiteHA:   mode: active   replicationEndpoint:   annotations:     cert-manager.io/issuer: ingress-issuer   hosts:     - name: ptlreplicationdallas.cluster1.example.com       secretName: dallas-ptl-replication-worker-1   replicationPeerFQDN: ptlreplicationraleigh.cluster2.example.com tlsClient:   secretName: ptl-replication-client ...</pre> | <pre>siteName: raleigh multiSiteHA:   mode: passive   replicationEndpoint:   annotations:     cert-manager.io/issuer: ingress-issuer   hosts:     - name: ptlreplicationraleigh.cluster2.example.com       secretName: raleigh-ptl-replication-worker-1   replicationPeerFQDN: ptlreplicationdallas.cluster1.example.com tlsClient:   secretName: ptl-replication-client ...</pre> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

If you want to revert to a single data center topology, or temporarily remove the passive data center from DR, you must remove the multi-site HA CR section from the active data center, and then redeploy the passive data center. If the active data center is offline, you must first change the passive data center to be active, and then remove the multi-site HA CR section from the now active data center.

## Procedure

- Remove the `multiSiteHA` section from the Management and Portal subsystem CRs on the active data center.
- Apply the updated CR files to the subsystems on the active data center, for example:

```
kubectl apply -f portal_cr.yaml -n <namespace>
```

```
kubectl apply -f management_cr.yaml -n <namespace>
```

Where `<namespace>` is the target installation namespace in the Kubernetes cluster for the active data center.

- You must delete your passive data center. For more information, see [Uninstalling API Connect](#).

Monitor your API Connect deployment on OpenShift.
- [Monitoring on Cloud Pak for Integration](#)  
Monitor your API Connect deployment on Cloud Pak for Integration.
- [Obtaining simple health check data of Developer Portal sites by using a REST API call](#)  
Call a simple health check API from your external load balancer to dynamically determine whether a specific Developer Portal site in a cluster is working. This API call can be used by a load balancer to help determine where to route traffic.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Monitoring on Kubernetes

Monitor the API Connect subsystems on Kubernetes.

See:

- [Monitoring subsystems on Kubernetes](#)  
Use `kubect1 get` to check the health of the API Connect clusters in your Kubernetes deployment.
- [Monitoring Postgres disk usage](#)  
Monitor disk usage by the Postgres database in the management subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Monitoring subsystems on Kubernetes

Use `kubect1 get` to check the health of the API Connect clusters in your Kubernetes deployment.

The APICconnect operator controls the life-cycle of management subsystem microservices. When you install, you create the following custom resources (CRs) in order to install API Connect and all subsystems:

- `ManagementCluster` or `mgmt`
  - `AnalyticsCluster` or `a7s`
  - `PortalCluster` or `pt1`
  - `GatewayCluster` or `gw`
- Every CR has a `status` section. The APICconnect operator regularly updates this section with the current status of the subsystem.

For example, use the following command to obtain the status of `ManagementCluster`:

```
kubect1 get mgmt -n <namespace>
```

Example:

```
kubect1 get mgmt
NAME   READY   STATUS    VERSION      RECONCILED VERSION   AGE
m1     16/16   Running   10.0.1-eus   10.0.1.4-ifix1-44-eus 24m
```

Output:

- **NAME:** Name of the Management Subsystem
- **READY:** Current number of management subsystem which are up, followed by the expected number of management subsystem components which should be up. For example: 16/16.

- **STATUS:** Current status of Management Subsystem  
During fresh install, upgrade or any maintenance operation, such as changing configuration for S3 backups, Management CR status can go to different states depending on the action, but ultimately it should **always** reach **Running** status.

If the status says **Warning**, then run `kubectl describe mgmt -n <namespace>` and check for more details in the **Status** section. For example,

```
Status:
...
Conditions:
...
  Message:          WAL Archiving is not working. Last successful archive time: 2022-07-26
20:37:14.456465 +0000 UTC. Last archive failed time: 2022-07-26 21:10:34.172539 +0000 UTC
  Reason:          WALArchiveNotWorking
...
```

Note: If you see the **WAL Archiving is not working** warning message, then verify your S3 backup settings (bucket name, folder name, credentials, certificates), gather logs and open a support request.

- **VERSION:** Version chosen in `spec.version` in the management CR.
- **RECONCILED VERSION:** Current management subsystem version. Includes a build number.
- **AGE:** Age of the management subsystem CR.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Monitoring Postgres disk usage

Monitor disk usage by the Postgres database in the management subsystem.

Postgres Database is the core database used in Management Subsystem. It is important to monitor the Postgres disk usage.

In 10.0.3.0 and greater, the APICoconnect operator tracks the current disk usage of the Postgres components, and regularly updates the **ManagementCluster** status. When one or more of the Postgres components occupy 50% of the PVC (persistent volume claim) capacity, the APICoconnect operator changes the status from **Running** to **Warning**.

APICoconnect operator **brings down** Postgres if the disk allocation reaches **80%**. In this case, you must contact IBM support.

Note that there are various types of storage classes which can be used to deploy Management Subsystem. For example, `local-storage` or `ceph block`.

- [Management Cluster disk stats](#)
- [Warning condition is populated at 50% usage](#)
- [Error condition is populated at 80% usage](#)

## Management Cluster disk stats

The **ManagementCluster** instance has `.status.postgresDataStats` where the operator prints the current disk usage of Postgres components. For example:

```
kubectl get mgmt m1 -o json | jq .status.postgresDataStats
[
  {
    "instanceName": "m1-ed60c42d-postgres",
    "podName": "m1-ed60c42d-postgres-86766f69cb-xs7t5",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres",
    "pvcType": "PostgreSQL",
    "pvcUsed": 60895232,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-backrest-shared-repo",
    "podName": "m1-ed60c42d-postgres-backrest-shared-repo-859484b5f6-r7cv6",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-pgbr-repo",
    "pvcType": "pgBackRest",
    "pvcUsed": 16203776,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres",
    "podName": "m1-ed60c42d-postgres-86766f69cb-xs7t5",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-wal",
    "pvcType": "WAL",
    "pvcUsed": 201338880,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-fqbg",
    "podName": "m1-ed60c42d-postgres-fqbg-84869d976c-49qgc",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-fqbg",
    "pvcType": "PostgreSQL",
    "pvcUsed": 59994112,
    "pvcUsedPercentage": 0
  }
],
```

```

{
  "instanceName": "m1-ed60c42d-postgres-fqbg",
  "podName": "m1-ed60c42d-postgres-fqbg-84869d976c-49qgc",
  "pvcCapacity": 250181844992,
  "pvcName": "m1-ed60c42d-postgres-fqbg-wal",
  "pvcType": "WAL",
  "pvcUsed": 201334784,
  "pvcUsedPercentage": 0
},
{
  "instanceName": "m1-ed60c42d-postgres-cimo",
  "podName": "m1-ed60c42d-postgres-cimo-5769868b75-5z7ln",
  "pvcCapacity": 250181844992,
  "pvcName": "m1-ed60c42d-postgres-cimo",
  "pvcType": "PostgreSQL",
  "pvcUsed": 59994112,
  "pvcUsedPercentage": 0
},
{
  "instanceName": "m1-ed60c42d-postgres-cimo",
  "podName": "m1-ed60c42d-postgres-cimo-5769868b75-5z7ln",
  "pvcCapacity": 250181844992,
  "pvcName": "m1-ed60c42d-postgres-cimo-wal",
  "pvcType": "WAL",
  "pvcUsed": 201334784,
  "pvcUsedPercentage": 0
}
]

```

## Warning condition is populated at 50% usage

When one of the Postgres components occupy 50% usage, the operator marks the overall status of the `ManagementCluster` to `Warning` with an appropriate warning message. The operator also updates the `postgresDataStats` section with the current data usage of the Postgres components.

Example of warning state:

```
kubectl get mgmt m1
```

| NAME | READY | STATUS  | VERSION    | RECONCILED            | VERSION | AGE |
|------|-------|---------|------------|-----------------------|---------|-----|
| m1   | 17/17 | Warning | 10.0.1-eus | 10.0.1.4-ifix1-44-eus |         | 26h |

```
kubectl get mgmt m1 -o json | jq .status.phase
```

```
"Warning"
```

Example of list of warning conditions:

```
kubectl get mgmt m1 -o json | jq .status.conditions
```

```

[
  {
    "lastTransitionTime": "2021-09-08T19:49:51Z",
    "message": "Current WAL disk usage of m1-ed60c42d-postgres is 51 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately",
    "reason": "disk_usage_more_than_50_percent",
    "status": "True",
    "type": "Warning"
  },
  {
    "lastTransitionTime": "2021-09-08T19:42:30Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Ready"
  },
  {
    "lastTransitionTime": "2021-09-08T19:41:35Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Pending"
  },
  {
    "lastTransitionTime": "2021-09-07T17:18:02Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Error"
  },
  {
    "lastTransitionTime": "2021-09-07T17:18:02Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Failed"
  }
]

```

The warning condition explains why the warning condition was set. For example:

```
Current WAL disk usage of m1-ed60c42d-postgres is 51 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately
```

If you encounter the warning, contact IBM support to fix the root cause.

## Error condition is populated at 80% usage

---

An error condition is populated when the operator brings down Postgres because is using 80% of available disk space. Postgres is brought down to avoid problems, such as disk corruption, that can occur if the disk becomes completely filled.

```
- lastTransitionTime: "2021-08-28T01:42:56Z"
  message: Current WAL disk usage of nihar-stac-3955b42d-sitel-postgres is more
           than 70 percent, initiating DATABASE SHUTDOWN
  reason: disk_usage_more_than_70_percent
  status: "True"
  type: Error
```

If you encounter the error, contact IBM support to fix the root cause.

Important:

When `local-storage` is used, it uses the entire disk that is allocated to the worker node. In some cases, Kubernetes itself can face disk pressure before the operator reacts to 80% usage, and will start evicting pods. In these cases, you might need to increase the disk allocated to the worker node, in order to stabilize the worker node, by following [Recovering when disks are filled by the management database](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Monitoring on OpenShift

Monitor your API Connect deployment on OpenShift.

See:

- [Monitoring the API Connect cluster on OpenShift](#)  
Monitor the status of the API Connect cluster on OpenShift using either the command line or the OpenShift web console.
- [Monitoring Postgres disk usage on OpenShift](#)  
In API Connect, you can monitor the disk space that is used by the Postgres database in the Management subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Monitoring the API Connect cluster on OpenShift

Monitor the status of the API Connect cluster on OpenShift using either the command line or the OpenShift web console.

You deploy the API Connect subsystems on OpenShift with the `APICConnect` operator and the `apiconnectcluster` CR. The CR contains a status section that is regularly updated by the operator to display the current status of the all the API Connect subsystems.

When you finish deploying API Connect, you can monitor the status of `apiconnectcluster` using the command line or the OpenShift web console.

- [Monitoring the API Connect cluster using the command line](#)
- [Monitoring the API Connect cluster using the OpenShift web console](#)

Version 10.0.3 and later: You can also monitor the disk usage of Postgres microservices. The `APICConnect` operator continuously tracks the disk usage of postgres microservices and provides useful information in the `ManagementCluster` custom resource. For information on viewing the postgres disk status, see [Monitoring Postgres disk usage on OpenShift](#).

## Monitoring the API Connect cluster using the command line

---

Run the following command to display the status of the API Connect cluster:

```
oc get apiconnectcluster -n <APIC_namespace>
```

The response looks like the following example:

| NAME       | READY | STATUS | VERSION      | RECONCILED        | VERSION | AGE |
|------------|-------|--------|--------------|-------------------|---------|-----|
| production | 7/7   | Ready  | 10.0.1.5-eus | 10.0.1.5-3323-eus |         | 24h |

The following list explains the values in the response:

- **STATUS:** Current status of API Connect.  
If the status says `Warning`, then run `oc describe apiconnectcluster -n <namespace>` and check for more details in the `Status` sections. For example, for the management CR:

```
Status:
...
Conditions:
```

```

...
Message:          WAL Archiving is not working. Last successful archive time: 2022-07-26
20:37:14.456465 +0000 UTC. Last archive failed time: 2022-07-26 21:10:34.172539 +0000 UTC
Reason:          WALArchiveNotWorking
...

```

Note: If you see the **WAL Archiving is not working** warning message, then verify your S3 backup settings (bucket name, folder name, credentials, certificates), gather logs and open a support request.

- **VERSION:** API Connect version specified in the CR's `spec.version` setting.
- **RECONCILED VERSION:** Current API Connect version.
- **AGE:** Age of the `apiconnectcluster` CR.

## Monitoring the API Connect cluster using the OpenShift web console

1. Start the OpenShift web console.
2. Click Installed operators.
3. Locate the namespace (project) where you installed API Connect:
  - If you installed the API Connect operator in all namespaces, select `openshift-operators`
  - if you installed the API Connect operator in a single namespace, select specific project
4. Hover next to the name of the API Connect namespace and click API Connect Cluster.
5. On the API Connect Clusters page, check the Status column.  
The status should display "Ready" as in the following image:

6. Click the instance name (in the example, the instance name is `production`) to display the status overview page.  
The overview page displays high-level information about your deployment, as in the following image:

Also on the overview page, the "Conditions" section displays the list of possible service conditions, as in the following image:

| Conditions |        |                  |         |         |
|------------|--------|------------------|---------|---------|
| Type       | Status | Updated          | Reason  | Message |
| Warning    | False  | Sep 16, 11:18 am | na      | -       |
| Ready      | True   | Sep 16, 8:26 pm  | Running | 7/7     |
| Pending    | False  | Sep 16, 8:26 pm  | na      | -       |
| Error      | False  | Sep 16, 11:18 am | na      | -       |

A healthy deployment displays "True" for the "Ready" status.

During a fresh install, an upgrade or a day-2 operation (such as a Management backup S3 configuration change), the `apiconnectcluster` CR status might change to a different state depending on the action, but ultimately it should always reach the **Ready** status.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Monitoring Postgres disk usage on OpenShift

In API Connect, you can monitor the disk space that is used by the Postgres database in the Management subsystem.

The Postgres database is the core database used in the Management subsystem. It is important to monitor the Postgres disk usage to avoid running out of space and causing an outage in your deployment.

In Version 10.0.3 and later, the **APIConnect** operator tracks the current disk usage of the Postgres components, and regularly updates the **ManagementCluster** CR's status. When one or more of the Postgres components occupy 50% of the PVC (persistent volume claim) capacity, the **APIConnect** operator changes the CR's status from **Running** to **Warning**.

Important: If the Postgres disk usage reaches 80%, then the **APIConnect** operator brings down Postgres. If this situation occurs, contact IBM Support.

Note that there are various types of storage classes which can be used to deploy Management subsystem; for example, **local-storage** or **ceph block**. When **local-storage** is used, the entire disk is allocated to the worker node. In some cases, before the **APIConnect** operator reacts to an 80% usage condition, Kubernetes itself might face disk pressure and start evicting pods. In this situation, you might want to increase the size of the disk allocated to the worker node as explained in [Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database](#).

## Viewing the current disk usage

The **ManagementCluster** instance includes the `.status.postgresDataStats` field, where the operator displays the current disk usage of Postgres components. Run the following command to get the disk usage:

```
ocp get mgmt m1 -n APIC_namespace -o json | jq .status.postgresDataStats
```

The response looks like the following example:

```
[
  {
    "instanceName": "m1-ed60c42d-postgres",
    "podName": "m1-ed60c42d-postgres-86766f69cb-xs7t5",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres",
    "pvcType": "PostgreSQL",
    "pvcUsed": 60895232,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-backrest-shared-repo",

    "pvcUsedPercentage": 0
  }
]
```

```
}  
]
```

## Warning condition is populated at 50% usage

When one of the Postgres components uses 50% of its allocated space, the operator changes the overall status of the **ManagementCluster** to **Warning** with an appropriate warning message. The operator also updates the **postgresDataStats** section with the current data usage of the Postgres components.

Attention: If you encounter the **Warning** condition, contact IBM Support for help correcting the root cause.

To view the status, run the following command:

```
oc get mgmt ml
```

The following example response shows the warning state:

| NAME | READY | STATUS  | VERSION    | RECONCILED VERSION    | AGE |
|------|-------|---------|------------|-----------------------|-----|
| ml   | 17/17 | Warning | 10.0.1-eus | 10.0.1.4-ifix1-44-eus | 26h |

To view just the status, run the following command:

```
oc get mgmt ml -o json | jq .status.phase
```

In this example, the status displayed in the response is "Warning":

```
"Warning"
```

To see the list of current status conditions, run the following command:

```
oc get mgmt ml -o json | jq .status.conditions
```

The following example response displays the list of status conditions. Notice that the **Warning** condition is set to "True" and the other conditions are set to "False":

```
[  
  {  
    "lastTransitionTime": "2021-09-08T19:49:51Z",  
    "message": "Current WAL disk usage of ml-ed60c42d-postgres is 51 percent. DATABASE SHUTDOWN starts at 80 percent  
utilization. Please contact IBM Support immediately",  
    "reason": "disk_usage_more_than_50_percent",  
    "status": "True",  
    "type": "Warning"  
  },  
  {  
    "lastTransitionTime": "2021-09-08T19:42:30Z",  
    "message": "",  
    "reason": "na",  
    "status": "False",  
    "type": "Ready"  
  },  
  {  
    "lastTransitionTime": "2021-09-08T19:41:35Z",  
    "message": "",  
    "reason": "na",  
    "status": "False",  
    "type": "Pending"  
  },  
  {  
    "lastTransitionTime": "2021-09-07T17:18:02Z",  
    "message": "",  
    "reason": "na",  
    "status": "False",  
    "type": "Error"  
  },  
  {  
    "lastTransitionTime": "2021-09-07T17:18:02Z",  
    "message": "",  
    "reason": "na",  
    "status": "False",  
    "type": "Failed"  
  }  
]
```

The warning condition includes an explanation of why the condition was set to "True"; for example:

```
Current WAL disk usage of ml-ed60c42d-postgres is 51 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please  
contact IBM Support immediately
```

## Error condition is populated at 80% usage

When one of the Postgres components uses 80% of its allocated space, the operator changes the overall status of the **ManagementCluster** to **Error** and brings down Postgres avoid problems that can occur if the disk becomes completely filled.

Attention: If you encounter the **Error** condition, contact IBM Support for help correcting the root cause.

In this case, when you run the following command to view the status conditions, you will see that the "Error" condition is set to "True":

```
oc get mgmt ml -o json | jq .status.conditions
```

For example, the following condition shows the **Error** status set to "True" due to disk usage:

```
- lastTransitionTime: "2021-08-28T01:42:56Z"  
  message: Current WAL disk usage of nihar-stac-3955b42d-sitel-postgres is more
```

```
than 70 percent, initiating DATABASE SHUTDOWN
reason: disk_usage_more_than_70_percent
status: "True"
type: Error
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Monitoring on Cloud Pak for Integration

Monitor your API Connect deployment on Cloud Pak for Integration.

See:

- [Monitoring the API Connect cluster on Cloud Pak for Integration](#)  
Monitor the status of the API Connect cluster on Cloud Pak for Integration using either the command line or the IBM Cloud Pak Platform UI.
- [Monitoring Postgres disk usage on Cloud Pak for Integration](#)  
In API Connect, you can monitor the disk space that is used by the Postgres database in the Management subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Monitoring the API Connect cluster on Cloud Pak for Integration

Monitor the status of the API Connect cluster on Cloud Pak for Integration using either the command line or the IBM Cloud Pak Platform UI.

In Cloud Pak for Integration, the API Management capability is provided by API Connect. You deploy the API Connect subsystems on Cloud Pak for Integration with the **APICONNECT** operator and the **apiconnectcluster** CR. The CR contains a status section that is regularly updated by the operator to display the current status of all the API Connect subsystems.

When you finish deploying API Connect, you can monitor the status of **apiconnectcluster** using the command line or the OpenShift web console.

- [Monitoring the API Connect cluster using the command line](#)
- [Monitoring the API Connect cluster using the Platform UI](#)

API Connect 10.0.3 and later: You can also monitor the disk usage of Postgres microservices. The **APICONNECT** operator continuously tracks the disk usage of Postgres microservices and provides useful information in the **ManagementCluster** custom resource. For information on viewing the Postgres disk status, see [Monitoring Postgres disk usage on Cloud Pak for Integration](#).

---

## Monitoring the API Connect cluster using the command line

Run the following command to display the status of the API Connect cluster:

```
oc get apiconnectcluster -n <APIC_namespace>
```

The response looks like the following example:

| NAME       | READY | STATUS | VERSION      | RECONCILED VERSION | AGE |
|------------|-------|--------|--------------|--------------------|-----|
| production | 7/7   | Ready  | 10.0.1.5-eus | 10.0.1.5-3323-eus  | 24h |

The following list explains the values in the response:

- **NAME:** Name of the API Connect instance (in the example, the instance name is "production").
- **READY:** Current number of subsystems and components that are running / Expected number of subsystems and components that should be running.
- **STATUS:** Current status of API Connect.

If the status says **Warning**, then run `oc describe apiconnectcluster -n <namespace>` and check for more details in the **Status** sections. For example, for the management CR:

```
Status:
...
Conditions:
...
Message:          WAL Archiving is not working. Last successful archive time: 2022-07-26
20:37:14.456465 +0000 UTC. Last archive failed time: 2022-07-26 21:10:34.172539 +0000 UTC
Reason:           WALArchiveNotWorking
...
```

Note: If you see the **WAL Archiving is not working** warning message, then verify your S3 backup settings (bucket name, folder name, credentials, certificates), gather logs and open a support request.

- **VERSION:** API Connect version specified in the CR's `spec.version` setting.
- **RECONCILED VERSION:** Current API Connect version.
- **AGE:** Age of the **apiconnectcluster** CR.

## Monitoring the API Connect cluster using the Platform UI

1. Start the Platform UI.
2. Click the Integration instances tab.
3. Locate the "API Connect" capability that uses the instance name that you specified as the Name during installation.  
A healthy API Connect deployment displays "Ready" in the Status column

4. Click the status value to display information about the current conditions, as in the following image:

A healthy deployment displays "True" for the "Ready" status.

During a fresh install, an upgrade or a day-2 operation (such as a Management backup S3 configuration change), the `apiconnectcluster` CR status might change to a different state depending on the action, but ultimately it should always reach the **Ready** status.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Monitoring Postgres disk usage on Cloud Pak for Integration

In API Connect, you can monitor the disk space that is used by the Postgres database in the Management subsystem.

The Postgres database is the core database used in the Management subsystem. It is important to monitor the Postgres disk usage to avoid running out of space and causing an outage in your deployment.

In API Connect 10.0.3 and later, the `APIConnect` operator tracks the current disk usage of the Postgres components, and regularly updates the `ManagementCluster` CR's status. When one or more of the Postgres components occupy 50% of the PVC (persistent volume claim) capacity, the `APIConnect` operator changes the CR's status from **Running** to **Warning**.

Important: If the Postgres disk usage reaches 80%, then the `APIConnect` operator brings down Postgres. If this situation occurs, contact IBM Support.

Note that there are various types of storage classes which can be used to deploy Management subsystem; for example, `local-storage` or `ceph block`. When `local-storage` is used, the entire disk is allocated to the worker node. In some cases, before the `APIConnect` operator reacts to an 80% usage condition, Kubernetes itself might face disk pressure and start evicting pods. In this situation, you might want to increase the size of the disk allocated to the worker node as explained in [Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database](#).

## Viewing the current disk usage

The `ManagementCluster` instance includes the `.status.postgresDataStats` field, where the operator displays the current disk usage of Postgres components. Run the following command to get the disk usage:

```
ocp get mgmt m1 -n APIC_namespace -o json | jq .status.postgresDataStats
```

The response looks like the following example:

```
[
  {
    "instanceName": "m1-ed60c42d-postgres",
    "podName": "m1-ed60c42d-postgres-86766f69cb-xs7t5",

  }
]
```

## Warning condition is populated at 50% usage

When one of the Postgres components uses 50% of its allocated space, the operator changes the overall status of the `ManagementCluster` CR and the `APICConnectCluster` CR to `Warning` with an appropriate warning message. The operator also updates the `postgresDataStats` section with the current data usage of the Postgres components.

Attention: If you encounter the `Warning` condition, contact IBM Support for help correcting the root cause.

To view the status from the command line, run the following command:

- `APICConnectCluster` CR:

```
oc get apiconnect
```

The following example response shows the warning status:

| NAME       | READY   | RECONCILED                                                                                                                                                      | VERSION | AGE                                |
|------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------------------|
| production | Current | WAL disk usage of production-mgmt-31bel1757-postgres is 60 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately. | Warning | 10.0.1.5-eus 10.0.1.5-3394-eus 11d |

- **ManagementCluster** CR:

```
oc get mgmt
```

The following example response shows the warning status:

```
NAME          READY   STATUS    VERSION      RECONCILED VERSION  AGE
production-mgmt 18/18   Warning   10.0.1.5-eus 10.0.1.5-3394-eus  43h
```

Current WAL disk usage of ml-ed60c42d-postgres is 51 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately

To view the status in IBM Cloud Pak Platform UI, click the Integration instances tab to see the status displayed next to the instance name

Click the status value (Warning, for this example) to display the Conditions list where a detailed message explains why the condition was set:

| Type    | Status | Updated       | Message                                                                                                                                                               |
|---------|--------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Warning | True   | 6 minutes ago | Current WAL disk usage of production-mgmt-31be1757-postgres is 60 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately |
| Ready   | False  | 6 minutes ago |                                                                                                                                                                       |
| Pending | False  | an hour ago   |                                                                                                                                                                       |
| Error   | False  | 6 minutes ago |                                                                                                                                                                       |

## Error condition is populated at 80% usage

When one of the Postgres components uses 80% of its allocated space, the operator changes the overall status of the **ManagementCluster** to **Error** and brings down Postgres avoid problems that can occur if the disk becomes completely filled.

Attention: If you encounter the **Error** condition, contact IBM Support for help correcting the root cause.

To view the status from the command line, run the following command:

- **APIConnectCluster** CR:

```
oc get apiconnect
```

The following example response shows the error status:

```
NAME          READY   STATUS    VERSION      RECONCILED VERSION  AGE
production    9/9     Error     10.0.1.5-eus 10.0.1.5-3394-eus  11d
Current disk usage is more than 80 percent. DATABASE will be shutdown. Please contact IBM Support immediately.
```

- **ManagementCluster** CR:

```
oc get mgmt
```

The following example response shows the warning status:

```
NAME          READY   STATUS    VERSION      RECONCILED VERSION  AGE
production-mgmt 9/9     Error     10.0.1.5-eus 10.0.1.5-3394-eus  11d
```

To view the status in the Platform UI, click the Integration instances tab to see the status displayed next to the instance name

Click the status value (Error in this example) to display the Conditions list where a detailed message explains why the condition was set:

| Type    | Status | Updated     | Message                                                                                                        |
|---------|--------|-------------|----------------------------------------------------------------------------------------------------------------|
| Warning | False  | 10 days ago |                                                                                                                |
| Ready   | False  | 11 days ago |                                                                                                                |
| Pending | False  | 2 days ago  |                                                                                                                |
| Error   | True   | 2 days ago  | Current disk usage is more than 80 percent. DATABASE will be shutdown. Please contact IBM Support immediately. |

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Obtaining simple health check data of Developer Portal sites by using a REST API call

Call a simple health check API from your external load balancer to dynamically determine whether a specific Developer Portal site in a cluster is working. This API call can be used by a load balancer to help determine where to route traffic.

### About this task

You can use the site health REST API to determine whether a particular Developer Portal site is running. The site health API returns the current system time of the site if both the database and web server are running. This API is fast and puts no load on the system, so it is ideal for use with load balancers to help them determine where to route traffic.

### Procedure

To call the site health REST API, append `/health` to the end of your Developer Portal site URL in your web browser, as follows:

`site_url/health`

Where `site_url` is the URL of the Developer Portal site that you want to check.

If both the database and web server of the site are running, the web browser returns the current system time. For example:

`1511367695`

If either the database or the web server of the site is not running, the web browser returns an error that the site can't be reached.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Logging

Configure logging for your deployment on Kubernetes.

See:

- [Gathering logs for a Kubernetes environment](#)  
The `generate_postmortem.sh` script gathers all logs for troubleshooting and diagnostics.
- [Changing logging levels](#)  
You can enable logging for entry and exit trace and for large payloads for apim-v2 pods.
- [Configuring logging for a Kubernetes deployment](#)  
Logs must be collected for both running and terminated containers and processes. Logging collection is required for IBM Support to assist with troubleshooting. For container-based deployments (Kubernetes), specific log commands and mechanisms vary depending on a customer's environment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Gathering logs for a Kubernetes environment

The `generate_postmortem.sh` script gathers all logs for troubleshooting and diagnostics.

---

### Before you begin

Review the log rotation recommendations in [Deployment requirements](#).

---

### About this task

When contacting IBM Support, several logs are required to assist in troubleshooting or diagnostics. The `generate_postmortem.sh` script gathers all the required logs using a single shell script.

Note: This article refers to third-party software and documentation that IBM does not control. As such, the software may change and this information may become outdated.

---

### Procedure

1. Install the `kubectl` command line interface for Kubernetes, if it is not already installed.
2. Configure `kubectl` to the Kubernetes cluster by entering the following commands:

```
rm -fr $HOME/.kube
mkdir -p $HOME/.kube
scp root@{kubernetes_master_host}:/etc/kubernetes/admin.conf $HOME/.kube/config
```

3. Download the `generate_postmortem.sh` script. It will be downloaded to the `apicup project` directory. Enter the following command:

```
curl -s -o generate_postmortem.sh https://raw.githubusercontent.com/ibm-apiconnect/v10-postmortem/master/generate_postmortem.sh
```

4. Add execute permissions to the `generate_postmortem.sh` script. Enter the following command:

```
chmod +x generate_postmortem.sh
```

5. Run the postmortem tool using the following command:

```
./generate_postmortem.sh
```

6. (Optional) Currently, log generation is supported for Gateway and Portal subsystems. Specify either `gateway` or `portal`, or all subsystems. Enter the following arguments:

```
All (generates logs for both Portal and Gateway subsystems): ./generate_postmortem.sh --diagnostic-all
Gateway: ./generate_postmortem.sh --diagnostic-gateway
Portal: ./generate_postmortem.sh --diagnostic-portal
```

7. (Optional) If there are errors when running the `generate_postmortem.sh` script, enter the following command:

```
./generate_postmortem.sh --debug &>debug.log
```

For more documentation on the script, see <https://github.com/ibm-apiconnect/v10-postmortem>.

Note:

- Offboarding the logs to an external server is the recommended best practice for long term storage of log data.
- If the logs do not cover far enough back in time, or conversely if they are too large, adjust the log retention size. For further information, see: <https://docs.docker.com/config/containers/logging/json-file/>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Changing logging levels

You can enable logging for entry and exit trace and for large payloads for apim-v2 pods.

### About this task

---

For apim-v2 pods, the default logging settings do not include entry and exit trace and logging of large payloads.

Logging of large payloads is typically needed if you are logging `apim:webhookPayload` or other processes that log large variables.

You can also set the debug level without needing to restart the pods.

You can enable the settings through either the APIM deployment YAML file, the toolkit, or the REST APIs. Note, you must use the toolkit or REST API to set the debug level without restarting the pods.

### Procedure

---

- Updating the settings in the APIM deployment YAML file

Note: This action causes a pod restart.

- The `DEBUG` variable works the same as prior releases.

```
- env:
  - name: DEBUG
    value:
audit,bhendi:error,bhendi:probe,bhendi:flags,apim:server,apim:error,apim:routes:*,apim:routesc:*,apim:oidc,apim:oidc:*
```

To enable entry and exit trace, add `trace:*` to the start of the debug string:

```
- env:
  - name: DEBUG
    value: trace:*,audit,bhendi:error,bhendi:probe,bhendi:flags,bhendi:webhookAudit,bhendi:cassandra-
transactions,apim:server,apim:error,apim:routes:*,apim:routesc:*,apim:oidc,apim:oidc:*,apim:taskmanager:info
```

- To enable large object logging:

```
- env:
  - name: VELOX_LOG_FULL_PAYLOAD
    value: "true"
```

- Updating the settings by using the toolkit

Note: This action does not cause a pod restart. Also, this action is for a single APIM pod environment only.

```
apic log-spec:get
apic log-spec:update LOG_SPEC_FILE
```

Where the spec file contains:

```
{"specification": "apim:routes:log_spec,audit,bhendi:error,apim:server,apim:error", "large_objects": true}
```

- Updating the settings by using the REST API

Note: This action does not cause a pod restart. Also, this action is for a single APIM pod environment only.

```
GET /cloud/api/log-spec
PUT /cloud/api/log-spec
```

For example, to set debug level and large objects logging:

```
curl -k https://172.16.140.212:3003/api/cloud/log-spec -X PUT -H "Authorization: Bearer $BEARER"
-H "Accept: application/json" -d '{"specification":
"apim:routes:log_spec,audit,bhendi:error,apim:server,apim:error","large_objects": true}'
-H "Content-Type: application/json"
```

The command responds with:

```
{
  "specification": "apim:routes:log_spec,audit,bhendi:error,apim:server,apim:error",
  "large_objects": true,
  "message": "Successfully changed the log specification on all apim-v2 pods. Success on IP(s): 172.16.140.212,
172.16.140.213"
}
```

Note: The response might include the following warning, which can be ignored:

```
WARNING: Could not change the log specification on all apim-v2 pods. Success on IP(s): 4.5.6.7 Failed on IP(s): 1.2.3.4
```

To view the REST APIs for logging, go to [API Connect REST APIs](#), and select IBM API Connect Platform - Cloud Management API 2.0.0 reference\_...\_Resource: Log Spec.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring logging for a Kubernetes deployment

Logs must be collected for both running and terminated containers and processes. Logging collection is required for IBM Support to assist with troubleshooting. For container-based deployments (Kubernetes), specific log commands and mechanisms vary depending on a customer's environment.

### About this task

---

For container-based deployments that use Kubernetes, collect logs by using a method suitable for your environment. You can run the following command:

```
kubect1 logs [-f] [-p] (POD | TYPE/NAME) [-c CONTAINER]
```

for each pod in the Kubernetes cluster. For more information about Kubectl documentation, see <https://kubernetes.io/docs/reference/generated/kubectl/kubectl-commands#logs>

However, the logs that are generated by the `kubect1 logs` command do not include terminated pods and processes. Use ELK, or another logging infrastructure, to gather logs that include terminated pods and processes. For more information, see <https://www.elastic.co/elk-stack>.

Specific log commands and mechanisms vary depending on a customer's environment. Log collection must be enabled for all running and terminated containers.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Troubleshooting

Troubleshoot API Connect subsystems on Kubernetes.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

See:

- [Troubleshooting on Kubernetes](#)  
Review the following topics for help in resolving issues with your API Connect deployment on Kubernetes.
- [Troubleshooting on OpenShift and Cloud Pak for Integration](#)  
Review the following topics for help in resolving issues with your API Connect deployment on OpenShift or Cloud Pak for Integration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Troubleshooting on Kubernetes

Review the following topics for help in resolving issues with your API Connect deployment on Kubernetes.

- [Troubleshooting the management subsystem](#)  
Troubleshoot problems with the management subsystem and management subsystem database
- [Troubleshooting Analytics on Kubernetes](#)  
If your API Connect Analytics subsystem encounters problems, review the following topics for help resolving the issue.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Troubleshooting the management subsystem

Troubleshoot problems with the management subsystem and management subsystem database

See:

- [Troubleshooting the management database](#)  
You can troubleshoot the API Connect management database

- [Increasing the PostgreSQL archive timeout on Kubernetes](#)  
Increase change the `archive_timeout` to 3600 (seconds) so that accumulated wal files do not cause a disk-space issue during a network outage.
- [Recovering when disks are filled by the management database](#)  
Resize a PersistentVolumeClaim (PVC) to recover when disks are filled by the management database.
- [Resolving a NATS streaming cluster failed restart](#)  
If the NATS streaming cluster fails to restart automatically, delete the PVC and the failing pod so that a new pod can be generated automatically.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting the management database

You can troubleshoot the API Connect management database

### Database Replica Pods stuck in Unknown or Pending state

In certain scenarios, a postgres replica pod may not recover to a healthy state when a restore completes, a node outage occurs, or after a fresh install or upgrade. In these cases, a postgres pod remains in a **Unknown** or a **Pending** state after a number of minutes. The pod fail to get into a **Running** state.

This situation occurs when the replicas do not initialize properly. You can use the `patronictl reinit` command to reinitialize the replica. Note that this command syncs the replica's volume data from the current Primary pod.

Use the following steps to get the pod back into a working state:

1. Exec onto the failing pod:

```
kubectl exec -it <postgres_replica_pod_name> -n <namespace> -- bash
```

2. List the cluster members:

```
patronictl list
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+---+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | start failed | | unknown |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+---+-----+
```

In the example shown above `fxpk-management-01191b80-postgres-586f899fdf-6s25b` is not in running state.

Note the `clusterName` and `replicaName` which are not up:

- `clusterName` - `fxpk-management-01191b80-postgres`
- `replicaName` - `fxpk-management-01191b80-postgres-586f899fdf-6s25b`

3. Run:

```
patronictl reinit <clusterName> <replicaName-which-is-not-running>
```

Example:

```
patronictl reinit fxpk-management-01191b80-postgres fxpk-management-01191b80-postgres-586f899fdf-6s25b
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+---+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | start failed | | unknown |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+---+-----+
Are you sure you want to reinitialize members fxpk-management-01191b80-postgres-586f899fdf-6s25b? [y/N]: y
Success: reinitialize for member fxpk-management-01191b80-postgres-586f899fdf-6s25b
```

4. Run `patronictl list` again.

You may also observe that the replica is on a different Timeline (TL) and possibly have a Lag in MB. It may take a few minutes for the pod to switch onto the same TL as the others and the Lag should slowly go to 0.

For example:

```
bash-4.2$ patronictl list
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+---+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | running | 1 | 23360 |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+---+-----+
```

5. The pod that previously was in an **Unknown** or **Pending** state or (0/1) **Running** state is now in (1/1) **Running** state.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Increasing the PostgreSQL `archive_timeout` on Kubernetes

Increase change the `archive_timeout` to 3600 (seconds) so that accumulated wal files do not cause a disk-space issue during a network outage.

### About this task

---

PostgreSQL sends its wal archives to the backup location (S3 or local PVC) whenever the configured `archive_timeout` period elapses. By default, the `archive_timeout` is set to 60 seconds. During a network outage, the files cannot be transferred and instead accumulate on the current server, and could cause a disk-space issue. Increasing the `archive_timeout` value helps to mitigate this issue by creating archive files less frequently.

For information on tracking the Postgres disk space, see [Monitoring Postgres disk usage](#).

Complete the following steps to increase the PostgreSQL `archive_timeout` value.

### Procedure

---

1. Get the name of the `pgha` config map by running the following command:

```
kubectl -n <namespace> get cm -l pgha-config=true'
```

The response looks like the following example:

| NAME                                            | DATA | AGE |
|-------------------------------------------------|------|-----|
| apis-prod-d18f3f0-0d18f3f0-postgres-pgha-config | 5    | 22d |

2. Edit the config map by running the following command:

```
kubectl -n <namespace> edit configmap <config-map-name>
```

In the command, replace `<config-map-name>` with the `NAME` returned in step 1.

3. Change the `archive_timeout` value to 3600.

The value must be an integer, and represents the number of seconds that must elapse before the archive file is generated.

4. Save the file and exit the editor.

The configuration is updated automatically; archives will be generated and pushed every 3600 seconds.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Recovering when disks are filled by the management database

Resize a PersistentVolumeClaim (PVC) to recover when disks are filled by the management database.

There are two methods to resize a PVC:

- Expand the PVC.
- Create a new, larger PVC, and copy the PVC contents.

Expansion of the PVC is easier and quicker than creating a new PVC and copying contents. However, some storage classes do not support PVC volume expansion. For these classes, you must create a new PVC.

Note: If you are using local storage, the only way to support increased data size is to add a disk

1. Determine if the StorageClass which provisioned the PVC supports VolumeExpansion. You can only expand a PVC if its storage class `allowVolumeExpansion` field is set to `true`.

```
$ kubectl get sc
```

| NAME            | PROVISIONER                |
|-----------------|----------------------------|
| rook-ceph-block | rook-ceph.rbd.csi.ceph.com |

```
$ kubectl describe sc/rook-ceph-block | grep "AllowVolumeExpansion"
```

```
AllowVolumeExpansion: True
```

2. Choose a resizing method for the storage class:

- If `AllowVolumeExpansion`: is `true`, go to [Resizing a PersistentVolumeClaim for Postgres by volume expansion](#)
  - If `AllowVolumeExpansion`: is not `true`, you cannot expand the PVC. Go to [Resizing a PersistentVolumeClaim for Postgres by moving content to a new PVC](#).
- [Resizing a PersistentVolumeClaim for Postgres by volume expansion](#)  
Resize a PersistentVolumeClaim (PVC) for Postgres that supports volume expansion, on native Kubernetes.

- [Resizing a PersistentVolumeClaim for Postgres by moving content to a new PVC](#)

Resize a PersistentVolumeClaim (PVC) for Postgres by creating a new, larger PVC, and moving content between the PVCs, on native Kubernetes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Resizing a PersistentVolumeClaim for Postgres by volume expansion

Resize a PersistentVolumeClaim (PVC) for Postgres that supports volume expansion, on native Kubernetes.

### Before you begin

Determine whether your storage class supports volume expansion. See [Recovering when disks are filled by the management database](#).

### About this task

You can expand a PVC if your storage provisioner supports volume expansion. This procedure is for use on native Kubernetes.

Note: This procedure is for use only with Postgres.

### Procedure

1. Determine the primary Postgres pod.

```
kubectl get pods --selector role=master | grep -v bootstrapselector=role=master
```

2. Gracefully shutdown Postgres pods.

- a. Exec into the Postgres primary pod.

```
kubectl exec -it <postgres-pod> -- bash
```

- b. Pause Patroni process. Note: you can skip this step if using the **n1** (non-production) profile.

```
patronictl pause
```

- c. Stop the Postgres process gracefully.

```
pg_ctl stop -D /pgdata/<cluster-name>
```

For example:

- **cluster-name** is usually the name of the cluster. If primary pod name is **m1-1b12bf81-postgres-58dfcc5f97-fsvvt**, **cluster-name** is **m1-1b12bf81-postgres**.
- There will be a folder named **cluster-name** located under **/pgdata/**.
- In this example, the command is:

```
pg_ctl stop -D /pgdata/m1-1b12bf81-postgres
```

3. Determine the PVC linked to the primary Postgres pod, and obtain the **claimName** of the PVC.

```
kubectl get pod <postgres-pod> -o json | jq '.spec.volumes[] | select ( has ("persistentVolumeClaim"))'
```

4. Scale down the Postgres deployment.

```
kubectl get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using **n3** profile then you find 3 deployments. Scale them down:

```
kubectl scale deploy <deployment-name> --replicas=0
```

5. Edit the PVC you want to increase.

```
kubectl edit pvc <claimName>
```

6. Update **spec.resources.requests.storage** field value with new size. For example:

```
spec:
  resources:
    requests:
      storage: 20Gi
```

7. Scale up the Postgres deployment.

```
kubectl get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using the **n3** profile then you find 3 deployments. Scale them up:

```
kubectl scale deploy <deployment-name> --replicas=1
```

8. If using the **n3** profile, resume the Patroni process. If using the **n1** profile, skip this step.

- a. Determine the new primary Postgres pod.

```
kubectl get pods --selector role=master | grep -v bootstrapselector=role=master
```

b. Exec into the new Postgres primary pod.

```
kubectl exec -it <postgres-pod> -- bash
```

c. Resume Patroni.

```
patronictl resume
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Resizing a PersistentVolumeClaim for Postgres by moving content to a new PVC

Resize a PersistentVolumeClaim (PVC) for Postgres by creating a new, larger PVC, and moving content between the PVCs, on native Kubernetes.

### Before you begin

Determine whether your storage class supports volume expansion. See [Recovering when disks are filled by the management database](#).

### About this task

Use this procedure when the storage class does not support volume expansion. This procedure is for use on native Kubernetes.

Note: This procedure is for use only with Postgres.

### Procedure

1. Create a new temporary PVC. Ensure the requested storage size is more than the original PVC. For example:

```
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
  name: temp-pvc
spec:
  storageClassName: rook-ceph-block
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 10Gi
```

2. Determine the primary Postgres pod.

```
kubectl get pods --selector role=master | grep -v bootstrapselector=role=master
```

3. Gracefully shutdown Postgres pods.

a. Exec into the Postgres primary pod.

```
kubectl exec -it <postgres-pod> -- bash
```

b. Pause the Patroni process. Note: you can skip this step if using the `n1` (non-production) profile.

```
patronictl pause
```

c. Stop the Postgres process gracefully.

```
pg_ctl stop -D /pgdata/<cluster-name>
```

For example:

- `cluster-name` is usually the name of the cluster. If primary pod name is `m1-1b12bf81-postgres-58dfcc5f97-fsvvt`, `cluster-name` is `m1-1b12bf81-postgres`.
- There will be a folder named `cluster-name` located under `/pgdata/`.
- In this example, the command is:

```
pg_ctl stop -D /pgdata/m1-1b12bf81-postgres
```

4. Determine the PVC linked to the primary Postgres pod, and obtain the `claimName` of the PVC.

```
kubectl get pod <postgres-pod> -o json | jq '.spec.volumes[] | select ( has ("persistentVolumeClaim"))'
```

5. Scale down the Postgres deployment.

```
kubectl get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using `n3` profile then you find 3 deployments. Scale them down:

```
kubectl scale deploy <deployment-name> --replicas=0
```

6. Start a BusyBox pod with the source and destination PVC volumes mounted, to swap the content between PVCs. For example:

```

apiVersion: v1
kind: Pod
metadata:
  name: swap-pvc
spec:
  volumes:
    - name: volume-source
      persistentVolumeClaim:
        claimName: m1-mgmt-35817114-postgres-wal
    - name: volume-destination
      persistentVolumeClaim:
        claimName: temp-pvc
  containers:
    - name: debug
      image: busybox
      command: ['sleep', '3600']
      volumeMounts:
        - name: volume-source
          mountPath: /data-source
        - name: volume-destination
          mountPath: /data-destination

```

7. Exec to the BusyBox pod, and

```

kubectl exec -it <busybox-pod-name> -- sh
cp -r data-source/ data-destination/

```

8. Copy content to the temporary PVC. For example, using the `mountPath` values shown in Step 6:

```

cp -r data-source/ data-destination/

```

9. Delete the BusyBox pod.

```

kubectl delete pod <busybox-pod-name>

```

10. Delete the original PVC.

```

kubectl delete pvc <claimName>

```

11. Create an original PVC with the same name but with increased size. For example:

```

kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: m1-mgmt-35817114-postgres-wal
spec:
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 20Gi
  storageClassName: rook-ceph-block
  volumeMode: Filesystem

```

12. Start the BusyBox pod again and this time copy the content from destination to source PVC.

```

kubectl exec -it <busybox-pod> -- sh
cp -r data-destination/ data-source/

```

13. Delete the BusyBox pod.

```

kubectl delete pod <busybox-pod>

```

14. Delete the temporary PVC that you created for swapping the content.

```

kubectl delete pvc temp-pvc

```

15. Scale up the Postgres deployment.

```

kubectl get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator

```

If you are using the `n3` profile then you find 3 deployments. Scale them up:

```

kubectl scale deploy <deployment-name> --replicas=1

```

16. If using the `n3` profile, resume the Patroni process. If using the `n1` profile, skip this step.

a. Determine the new primary Postgres pod.

```

kubectl get pods --selector role=master | grep -v bootstrapselector=role=master

```

b. Exec into the new Postgres primary pod.

```

kubectl exec -it <postgres-pod> -- bash

```

c. Resume Patroni.

```

patronictl resume

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Resolving a NATS streaming cluster failed restart

If the NATS streaming cluster fails to restart automatically, delete the PVC and the failing pod so that a new pod can be generated automatically.

### About this task

---

Sometimes the NATS streaming cluster is unable to restart automatically if message files are corrupted. Correct the problem by deleting the PCV for the affected node, and then deleting the failing pod. A new pod will automatically be generated and re-join the cluster, recovering the data from the cluster leader. Data loss is not an issue because task manager will pick up any delayed messages and add them back into the queue.

For more information on the NATS Streaming Server, see [NATS documentation](#).

Delete the PVC and then the pod by completing the following steps.

### Procedure

---

1. Get the name of the PVC for the affected pod by running the following command:

```
kubectl describe pod FAILED_POD | grep ClaimName
```

2. Delete the PVC by running the following command:  
Run this as a background task because the deletion not complete until the pod is deleted.

```
kubectl delete pvc PVC_NAME &
```

Attention: The PVC must be deleted before the pod; otherwise the NATS streaming operator automatically recreates the pod with the existing corrupted storage.

3. Delete the pod by running the following command:

```
kubectl delete pod FAILED_POD
```

The NATS streaming operator automatically recreates both the pod and PVC. The pod then joins the NATS streaming cluster and recovers its data from the cluster leader.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Troubleshooting Analytics on Kubernetes

If your API Connect Analytics subsystem encounters problems, review the following topics for help resolving the issue.

- [Analytics start-up issues on Kubernetes](#)  
If you receive an error starting the Analytics service after installing, upgrading, or recovering from a catastrophic failure of IBM® API Connect on Kubernetes, you might be able to resolve it by completing this task.
- [Analytics offload issues on Kubernetes](#)  
If your Analytics offload fails, you can perform checks to help determine the cause. Common causes for an offload failure are connection or security-related issues.
- [Empty Analytics display on Kubernetes](#)  
If your API Connect analytics data doesn't display in the Analytics dashboard, complete the following steps to determine the cause of the problem.
- [Analytics running out of disk space on Kubernetes](#)  
If your Analytics data is taking up too much disk space, complete the following steps to resolve the problem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Analytics start-up issues on Kubernetes

If you receive an error starting the Analytics service after installing, upgrading, or recovering from a catastrophic failure of IBM® API Connect on Kubernetes, you might be able to resolve it by completing this task.

### Uh oh! An error has occurred

---

In rare cases, the Kibana index can fail and the following message displays:

This error typically indicates that the index was corrupted. Complete the following steps to verify the problem and delete the corrupted index.

Before you begin, determine the names of one of the deployment's storage-coordinating pods (called *analytics-storage-coordinating-pod* in the steps that follow) and one of the client pods (called *analytics-client-pod* in the steps). To see the pod names, run the following command:

```
kubectl get pods
```

In the following sample output, a storage-coordination pod is named `r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-btpfq` and a client pod is named `r70eaa1a0f2-analytics-client-68c499d5f9-7g7vm`:

| NAME                                                       | READY | STATUS    | RESTARTS | AGE |
|------------------------------------------------------------|-------|-----------|----------|-----|
| r70eaa1a0f2-analytics-client-68c499d5f9-7g7vm              | 1/1   | Running   | 0        | 37m |
| r70eaa1a0f2-analytics-client-68c499d5f9-hjx22              | 1/1   | Running   | 0        | 82m |
| r70eaa1a0f2-analytics-cronjobs-retention-1559698200-7tjhh  | 0/1   | Completed | 0        | 18h |

| r70eaa1a0f2-analytics-ingestion-7f5d748759-wjvkd           | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-mtls-gw-6988bd8cbf-g80p5             | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-mtls-gw-6988bd8cbf-xxzvb             | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-operator-747f75c4f-7965r             | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-btpfq | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-sr9mg | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-t8djr | 1/1   | Running   | 0        | 82m |
| r70eaa1a0f2-analytics-storage-data-0                       | 1/1   | Running   | 0        | 70m |
| r70eaa1a0f2-analytics-storage-data-1                       | 1/1   | Running   | 0        | 76m |
| r70eaa1a0f2-analytics-storage-data-2                       | 1/1   | Running   | 0        | 80m |
| r70eaa1a0f2-analytics-storage-master-0                     | 1/1   | Running   | 0        | 72m |
| r70eaa1a0f2-analytics-storage-master-1                     | 1/1   | Running   | 0        | 75m |
| r70eaa1a0f2-analytics-storage-master-2                     | 1/1   | Running   | 0        | 80m |

1. Verify that you have both the `.kibana` and `.kibana-6` indexes by running the following command:

```
kubectl exec -it analytics-storage-coordinating-pod -- curl_es /_cat/indices?v
```

In the `index` column of the response, look for `.kibana` and `.kibana-6`:

| health | status | index                      | uuid                    | pri | rep | docs.count | docs.deleted | store.size | pri.store.size |
|--------|--------|----------------------------|-------------------------|-----|-----|------------|--------------|------------|----------------|
| green  | open   | .kibana-6                  | SKVaGvpzTEKZ51VeWa3-g   | 1   | 2   | 39         | 0            | 239.1kb    | 79.7kb         |
| green  | open   | .kibana                    | 9AC2HDC7LUKRLvMOBtoA    | 1   | 2   | 1          | 0            | 9.3kb      | 3.1kb          |
| green  | open   | .spic-config               | WLMq7241STFYRJIep3Vp1Q  | 1   | 2   | 1          | 0            | 14.6kb     | 4.8kb          |
| green  | open   | .export-status             | 41B3BNh-I4GFWmhnEDG3w   | 1   | 2   | 0          | 0            | 573b       | 191b           |
| green  | open   | spic-api-2019.06.05-000002 | 4uvf5SRWRIWJ-L1u1m1-Kcy | 5   | 2   | 148889     | 0            | 350.2mb    | 116.5mb        |
| green  | open   | spic-api-2019.06.04-1      | UMCBp1uQeKHuBSJgRdGQ    | 5   | 2   | 8000       | 0            | 24.7mb     | 8.2mb          |

If the response includes both indexes, it indicates a problem with the index creation. Proceed to the next step.

Note: If you received the "Uh oh! An error has occurred" page and the response to this command only includes the `.kibana-6` index, then something else is wrong with the cluster and you should contact IBM Support for assistance.

2. Set the `.kibana` index to be read-and-write enabled by running the following command, replacing `analytics-storage-coordinating-pod` with the name of the storage-coordinating pod that you determined at the beginning of this task:

```
kubectl exec -it analytics-storage-coordinating-pod -- curl_es -XPUT .kibana/_settings -d '{"index.blocks.write": false}'
```

When you see the following response: `{"acknowledged": true}`, continue to the next step.

Note: If you see a different response, make sure the request was correct and try again. If the command still does not work, then something else is wrong with the cluster and you should contact IBM Support for assistance.

3. Delete the `.kibana-6` index by running the following command:

```
kubectl exec -it analytics-storage-coordinating-pod -- curl_es -XDELETE .kibana-6
```

When you see the following response: `{"acknowledged": true}` to indicate that the deletion was successful, continue to the next step.

Note: If you see a different response, then the index was not deleted. Make sure the request was correct and try again. If the delete operation still fails, then something else is wrong with the cluster and you should contact IBM Support for assistance.

4. Restart a single analytics client pod by running the following command and replacing `analytics-client-pod` with the name of the pod (which you determined at the beginning of this task):

```
kubectl delete pod analytics-client-pod
```

Sample response: pod "analytics-client-pod" deleted

Wait for the response to ensure that the pod was successfully deleted. Then wait a few minutes for a new pod to start automatically. To check the status of the pods, run the following command:

```
kubectl get pods
```

5. Navigate to the Analytics page and refresh to verify that the dashboard now displays correctly.
6. (Optional) If you have a backup of `ui` or `.kibana-6`, you can restore it now as explained in [Backing up and restoring the analytics database](#) and [Backing up and restoring the analytics database \(VMWare\)](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Analytics offload issues on Kubernetes

If your Analytics offload fails, you can perform checks to help determine the cause. Common causes for an offload failure are connection or security-related issues.

When you save the configuration files, their syntax is first validated to verify that it can be applied. However, this does not confirm that other parts of your analytics collection ecosystem are trouble-free, for example, that your endpoints are running, or that the TLS certificates are validated. Errors in these areas may also result in no data output.

To verify issues you will need to examine the logs for one of your Kubernetes analytics ingestion pods. (Note that it may take a few minutes for the pods to pick up changes in the configuration files after edits are applied.)

For information on obtaining logs, refer to [Configuring remote logging for a VMware deployment](#) and [Configuring logging for a Kubernetes deployment](#).

Following are some common checks you can make to troubleshoot the offload:

- Verify that the specified URL or the host and port values for the target system are accurate.
- Verify that the server or cluster of servers in the target system are running and reachable. If applicable, also verify that the connection problems are not caused by firewall settings.
- If you are using Transport Layer Security (TLS) to establish a private and secure communication channel to the target system, investigate whether the issue is caused by SSL certificate errors; for example, untrusted server certificates, certificates that have expired or are not yet valid, or missing intermediate (or chain) certificates. For more information on using TLS, see [Creating a TLS profile](#).
- If offloading to an Elasticsearch or Kafka target, verify that your configuration settings are valid; for example, the user credentials for authenticating to Elasticsearch or the Kafka topic name.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Empty Analytics display on Kubernetes

If your API Connect analytics data doesn't display in the Analytics dashboard, complete the following steps to determine the cause of the problem.

### Procedure

---

1. Run the following command to check the logs of the `mtls-gw` pod:

```
kubectl logs analyt-mtls-gw-7665f5d445-4cx4n -n <APIC_namespace>
```

The response looks like the following example:

```
10.254.6.1 - - [22/Sep/2021:18:05:54 +0000] "POST /x2020/v1/apievent/_bulk HTTP/1.1" 200 2 "-" "-" 2841 0.072 0.070
```

- a. Check the response for any `_bulk` request coming from the gateway, as shown in the example. If there are no `_bulk` requests, then the problem is with the gateway and the `wsm-agent`, which is not sending bulk requests to the Analytics server.
- b. If you see the `_bulk` request., then check the return code in the response. If `_bulk` requests are processed successfully you will see a return code 200 (as in the example), which indicates that the bulk request has been ingested.
- c. If it is any other return code, check the ingestion pod logs for any errors, which will indicate any issues during ingestion:

```
oc logs analyt-ingestion-78d7cff7f7-6pktd
```

2. If everything with the data flow looks fine, and if you are unable to see analytics data, then check the health of Analytics by executing into one of the storage pods:

```
kubectl exec -it <storage_pod> - bash
```

```
d.bash-4.4$ curl_es _cluster/health?pretty=1
```

For example:

```
{
  "cluster_name" : "apic-analytics-cluster",
  "status": "yellow",
  "timed_out": false,
  "number_of_nodes": 3,
  "number_of_data_nodes": 1,
  "active_primary_shards": 258,
  "active_shards": 258,
  "relocating_shards": 0,
  "initializing_shards": 0,
  "unassigned_shards": 510,
  "delayed_unassigned_shards": 0,
  "number_of_pending_tasks": 0,
```

```
"number_of_in_flight_fetch": 0,
"task_max_waiting_in_queue_millis": 0,
"active_shards_percent_as_number": 33.59375
}
```

- a. Check the status of the cluster (red, yellow, green) in the response.  
In the example, the status is set to yellow.

- Green indicates all indices are fine.
- Yellow indicates there are some unassigned shards, which might still be replicating.
- Red indicates there is a problem with one or more of the indices.

- b. Run the following command to get a list of indices:

```
bash-4.4$ curl_es _cat/indices?v
```

- c. In the list, find the red indices.  
d. Delete each red index by running the following command:

```
bash-4.4$ curl_es -XDELETE <index_name>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Analytics running out of disk space on Kubernetes

If your Analytics data is taking up too much disk space, complete the following steps to resolve the problem.

### About this task

---

Analytics indices taking up too much space

### Procedure

---

1. Run the following command to display the indices:

```
curl_es _cat/indices?v
```

2. Find the old and large indices that can be deleted, and delete each index using the following command:

```
curl_es -XDELETE <index_name>
```

3. Reduce the retention period from the Cloud manager:  
a. Open Cloud Manager and click Topology > Analytics Service > Advanced analytics configuration > Storage.  
b. Locate the Oldest Api Call Data Kept field and set it to the lowest feasible value.
4. Verify that the index is rotating as scheduled.  
a. Open Cloud Manager and click Topology > Analytics Service > Advanced analytics configuration > Storage.  
b. Click Index Roll Over > Max age and Max Documents.  
Check the rotation time and number of documents.

5. Verify that the retention and rollover jobs are running properly.  
Run the following command to check the age of the job and the logs, to see whether there is any issue:

```
kubect1 get jobs
```

The output looks like the following example:

| NAME                           | COMPLETIONS | DURATION | AGE |
|--------------------------------|-------------|----------|-----|
| analyt-cj-retention-1632965400 | 1/1         | 17s      | 21h |
| analyt-cj-rollover-1633040100  | 1/1         | 10s      | 15m |

6. Apply a filter to reduce the index size by excluding large fields, such as `response_body`, from being saved in the index.  
For example:

```
filter {
  if "apicapievent" in [tags] {
    mutate {
      remove_field => ["response_body"]
    }
  }
}
```

For information on creating filters for Analytics data, see [Modifying your analytics data](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Troubleshooting on OpenShift and Cloud Pak for Integration

Review the following topics for help in resolving issues with your API Connect deployment on OpenShift or Cloud Pak for Integration.

- [Power-cycling check on OpenShift and Cloud Pak for Integration](#)  
If you cycle the power on an API Connect cluster that is deployed on OpenShift or Cloud Pak for Integration, you might need to reset the IP address for the `kubernetes.io/hostname`.
- [Troubleshooting the Management subsystem on OpenShift and Cloud Pak for Integration](#)  
Troubleshoot problems with the Management subsystem and the management subsystem database.
- [Troubleshooting Analytics on OpenShift and Cloud Pak for Integration](#)  
If your API Connect Analytics subsystem encounters problems, review the following topics for help resolving the issue.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Power-cycling check on OpenShift and Cloud Pak for Integration

If you cycle the power on an API Connect cluster that is deployed on OpenShift or Cloud Pak for Integration, you might need to reset the IP address for the `kubernetes.io/hostname`.

---

### About this task

You will know there is a problem if you cycle the power for the cluster and receive an error, or find that the deployment remains in the `pending` state indefinitely because some of the pods failed to start. Complete the following steps to resolve the problem:

---

### Procedure

1. Run the following command to check the label on the worker nodes:

```
oc get nodes -l kubernetes.io/hostname=localhost
```

If the response shows the following message, then the power cycle did not cause a problem and you can skip the rest of this task:

```
No resources found
```

If the response looks like the following example (the IP address will be different), proceed to the next step:

```
NAME                                STATUS    ROLES    AGE    VERSION
ip-233.252.0.0.us-west-1.compute.internal Ready     worker   27h    v1.19.0+8d12420
```

2. Run the following command to correct the problem:

```
for i in $(oc get nodes -l kubernetes.io/hostname=localhost|grep worker|awk '{print $1}'); do echo $i; oc label nodes $i kubernetes.io/hostname=`echo $i|awk -F'.' '{print $1}'` --overwrite=true; done
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Troubleshooting the Management subsystem on OpenShift and Cloud Pak for Integration

Troubleshoot problems with the Management subsystem and the management subsystem database.

See:

- [Troubleshooting the management database on OpenShift and Cloud Pak for Integration](#)  
You can troubleshoot the API Connect management database by complete the following tasks.
- [Increasing the PostgreSQL archive timeout on OpenShift and Cloud Pak for Integration](#)  
Increase change the `archive_timeout` to 3600 (seconds) so that accumulated wal files do not cause a disk-space issue during a network outage.
- [Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database](#)  
Resize a PersistentVolumeClaim (PVC) on OpenShift to recover when disks are filled by the API Connect management database.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Troubleshooting the management database on OpenShift and Cloud Pak for Integration

You can troubleshoot the API Connect management database by complete the following tasks.

## Database Replica Pods stuck in Unknown or Pending state

In certain scenarios, a postgres replica pod may not recover to a healthy state when a restore completes, a node outage occurs, or after a fresh install or upgrade. In these cases, a postgres pod remains in a **Unknown** or a **Pending** state after a number of minutes. The pod fail to get into a **Running** state.

This situation occurs when the replicas do not initialize properly. You can use the `patronictl reinit` command to reinitialize the replica. Note that this command syncs the replica's volume data from the current Primary pod.

Use the following steps to get the pod back into a working state:

1. Exec onto the failing pod:

```
oc exec -it <postgres_replica_pod_name> -n <namespace> -- bash
```

2. List the cluster members:

```
patronictl list
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+-----+-----+-----+-----+-----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+-----+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | start failed | | unknown |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | 0 |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+-----+-----+
```

In the example shown above `fxpk-management-01191b80-postgres-586f899fdf-6s25b` is not in running state.

Note the `clusterName` and `replicaName` which are not up:

- `clusterName` - `fxpk-management-01191b80-postgres`
- `replicaName` - `fxpk-management-01191b80-postgres-586f899fdf-6s25b`

3. Run:

```
patronictl reinit <clusterName> <replicaName-which-is-not-running>
```

Example:

```
patronictl reinit fxpk-management-01191b80-postgres fxpk-management-01191b80-postgres-586f899fdf-6s25b
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+-----+-----+-----+-----+-----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+-----+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | start failed | | unknown |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | 0 |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+-----+-----+
Are you sure you want to reinitialize members fxpk-management-01191b80-postgres-586f899fdf-6s25b? [y/N]: y
Success: reinitialize for member fxpk-management-01191b80-postgres-586f899fdf-6s25b
```

4. Run `patronictl list` again.

You may also observe that the replica is on a different Timeline (TL) and possibly have a Lag in MB. It may take a few minutes for the pod to switch onto the same TL as the others and the Lag should slowly go to 0.

For example:

```
bash-4.2$ patronictl list
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+-----+-----+-----+-----+-----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+-----+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | running | 1 | 23360 |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | 0 |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+-----+-----+
```

5. The pod that previously was in an **Unknown** or **Pending** state or (0/1) **Running** state is now in (1/1) **Running** state.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Increasing the PostgreSQL `archive_timeout` on OpenShift and Cloud Pak for Integration

Increase change the `archive_timeout` to 3600 (seconds) so that accumulated wal files do not cause a disk-space issue during a network outage.

## About this task

PostgreSQL sends its wal archives to the backup location (S3 or local PVC) whenever the configured `archive_timeout` period elapses. By default, the `archive_timeout` is set to 60 seconds. During a network outage, the files cannot be transferred and instead accumulate on the current server, and could cause a disk-space issue. Increasing the `archive_timeout` value helps to mitigate this issue by creating archive files less frequently.

For information on tracking the Postgres disk space, see [Monitoring Postgres disk usage](#).

Complete the following steps to increase the PostgreSQL `archive_timeout` value.

## Procedure

1. Get the name of the `pgha` config map by running the following command:

```
oc -n <APIC_namespace> get cm -l pgha-config='true'
```

The response looks like the following example:

| NAME                                            | DATA | AGE |
|-------------------------------------------------|------|-----|
| apis-prod-d18f3f0-0d18f3f0-postgres-pgha-config | 5    | 22d |

2. Edit the config map by running the following command:

```
oc -n <APIC_namespace> edit configmap <config-map-name>
```

In the command, replace `<config-map-name>` with the `NAME` returned in step 1.

3. Change the `archive_timeout` value to `3600`.  
The value must be an integer, and represents the number of seconds that must elapse before the archive file is generated.
4. Save the file and exit the editor.  
The configuration is updated automatically; archives will be generated and pushed every `3600` seconds.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database

Resize a PersistentVolumeClaim (PVC) on OpenShift to recover when disks are filled by the API Connect management database.

There are two methods to resize a PVC:

- Expand the PVC.
- Create a new, larger PVC, and copy the PVC contents.

Expansion of the PVC is easier and faster than creating a new PVC and copying contents. However, some storage classes do not support PVC volume expansion. For these classes, you must create a new PVC.

Note: If you are using local storage, the only way to support increased data size is to add a disk.

1. Determine if the StorageClass which provisioned the PVC supports VolumeExpansion.  
You can only expand a PVC if its storage class `allowVolumeExpansion` field is set to `true`.

```
oc get sc

NAME          PROVISIONER
rook-ceph-block  rook-ceph.rbd.csi.ceph.com

oc describe sc/rook-ceph-block | grep "AllowVolumeExpansion"

AllowVolumeExpansion: True
```

2. Choose a resizing method for the storage class:
  - If `AllowVolumeExpansion` is `true`, see [Resizing a PVC for Postgres on OpenShift by using volume expansion](#)
  - If `AllowVolumeExpansion` is not `true`, you cannot expand the PVC. See [Resizing a PVC for Postgres on OpenShift by moving content](#).
- [Resizing a PVC for Postgres on OpenShift by using volume expansion](#)  
Resize a Persistent Volume Claim (PVC) for Postgres that supports volume expansion.
- [Resizing a PVC for Postgres on OpenShift by moving content](#)  
Resize a Persistent Volume Claim (PVC) for Postgres on OpenShift by creating a new, larger PVC, and then moving content between the PVCs.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Resizing a PVC for Postgres on OpenShift by using volume expansion

Resize a Persistent Volume Claim (PVC) for Postgres that supports volume expansion.

## Before you begin

---

This task only applies to the PVC used by Postgres. To determine whether your storage class supports volume expansion, see [Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database](#).

## About this task

---

You can expand a PVC if your storage provisioner supports volume expansion.

## Procedure

---

1. Determine the primary Postgres pod.

```
oc get pods --selector role=master | grep -v bootstrapselector=role=master
```

2. Gracefully shutdown Postgres pods.
  - a. Exec into the Postgres primary pod.

```
oc exec -it <postgres-pod> -- bash
```

- b. Pause Patroni process. Note: you can skip this step if using the `n1` (non-production) profile.

```
patronictl pause
```

- c. Stop the Postgres process gracefully.

```
pg_ctl stop -D /pgdata/<cluster-name>
```

For example:

- `cluster-name` is usually the name of the cluster. If primary pod name is `m1-1b12bf81-postgres-58dfcc5f97-fsvvt`, `cluster-name` is `m1-1b12bf81-postgres`.
- There will be a folder named `cluster-name` located under `/pgdata/`.
- In this example, the command is:

```
pg_ctl stop -D /pgdata/m1-1b12bf81-postgres
```

3. Determine the PVC linked to the primary Postgres pod, and obtain the `claimName` of the PVC.

```
oc get pod <postgres-pod> -o json | jq '.spec.volumes[] | select ( has ("persistentVolumeClaim"))'
```

4. Scale down the Postgres deployment.

```
oc get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using `n3` profile then you find 3 deployments. Scale them down:

```
oc scale deploy <deployment-name> --replicas=0
```

5. Edit the PVC you want to increase.

```
oc edit pvc <claimName>
```

6. Update `spec.resources.requests.storage` field value with new size. For example:

```
spec:
  resources:
    requests:
      storage: 20Gi
```

7. Scale up the Postgres deployment.

```
oc get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using the `n3` profile then you find 3 deployments. Scale them up:

```
oc scale deploy <deployment-name> --replicas=1
```

8. If you are using the `n3` profile, resume the Patroni process. If using the `n1` profile, skip this step.

- a. Determine the new primary Postgres pod.

```
oc get pods --selector role=master | grep -v bootstrapselector=role=master
```

- b. Exec into the new Postgres primary pod.

```
oc exec -it <postgres-pod> -- bash
```

- c. Resume Patroni.

```
patronictl resume
```

---

## Resizing a PVC for Postgres on OpenShift by moving content

Resize a Persistent Volume Claim (PVC) for Postgres on OpenShift by creating a new, larger PVC, and then moving content between the PVCs.

---

### Before you begin

This task only applies to the PVC used by Postgres.

---

### About this task

Use this procedure when the storage class does not support volume expansion.

---

### Procedure

1. Create a new temporary PVC. Ensure the requested storage size is more than the original PVC. For example:

```
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
  name: temp-pvc
spec:
  storageClassName: rook-ceph-block
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 10Gi
```

2. Determine the primary Postgres pod.

```
oc get pods --selector role=master | grep -v bootstrapselector=role=master
```

3. Gracefully shutdown Postgres pods.

- a. Exec into the Postgres primary pod.

```
oc exec -it <postgres-pod> -- bash
```

- b. Pause the Patroni process. Note: you can skip this step if using the `n1` (non-production) profile.

```
patronictl pause
```

- c. Stop the Postgres process gracefully.

```
pg_ctl stop -D /pgdata/<cluster-name>
```

For example:

- `cluster-name` is usually the name of the cluster. If primary pod name is `m1-1b12bf81-postgres-58dfcc5f97-fsvvt`, `cluster-name` is `m1-1b12bf81-postgres`.
- There will be a folder named `cluster-name` located under `/pgdata/`.
- In this example, the command is:

```
pg_ctl stop -D /pgdata/m1-1b12bf81-postgres
```

4. Determine the PVC linked to the primary Postgres pod, and obtain the `claimName` of the PVC.

```
oc get pod <postgres-pod> -o json | jq '.spec.volumes[] | select ( has ("persistentVolumeClaim"))'
```

5. Scale down the Postgres deployment.

```
oc get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using `n3` profile then you find 3 deployments. Scale them down:

```
oc scale deploy <deployment-name> --replicas=0
```

6. Start a BusyBox pod with the source and destination PVC volumes mounted, to swap the content between PVCs. For example:

```
apiVersion: v1
kind: Pod
metadata:
  name: swap-pvc
spec:
  volumes:
    - name: volume-source
      persistentVolumeClaim:
        claimName: m1-mgmt-35817114-postgres-wal
    - name: volume-destination
      persistentVolumeClaim:
```

```

    claimName: temp-pvc
  containers:
  - name: debug
    image: busybox
    command: ['sleep', '3600']
    volumeMounts:
    - name: volume-source
      mountPath: /data-source
    - name: volume-destination
      mountPath: /data-destination

```

7. Exec to the BusyBox pod, and run the following commands:

```

oc exec -it <busybox-pod-name> -- sh
cp -r data-source/ data-destination/

```

8. Copy content to the temporary PVC. For example, using the `mountPath` values shown in Step 6:

```

cp -r data-source/ data-destination/

```

9. Delete the BusyBox pod.

```

oc delete pod <busybox-pod-name>

```

10. Delete the original PVC.

```

oc delete pvc <claimName>

```

11. Create an original PVC with the same name but with increased size. For example:

```

kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: ml-mgmt-35817114-postgres-wal
spec:
  accessModes:
  - ReadWriteOnce
  resources:
    requests:
      storage: 20Gi
  storageClassName: rook-ceph-block
  volumeMode: Filesystem

```

12. Run the following commands to start the BusyBox pod again and copy the content from the destination to the source PVC:

```

oc exec -it <busybox-pod> -- sh
cp -r data-destination/ data-source/

```

13. Delete the BusyBox pod.

```

oc delete pod <busybox-pod>

```

14. Delete the temporary PVC that you created for swapping the content.

```

oc delete pvc temp-pvc

```

15. Scale up the Postgres deployment.

```

oc get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator

```

If you are using the `n3` profile then you find 3 deployments. Scale them up:

```

oc scale deploy <deployment-name> --replicas=1

```

16. If using the `n3` profile, resume the Patroni process. If using the `n1` profile, skip this step.

a. Determine the new primary Postgres pod.

```

oc get pods --selector role=master | grep -v bootstrapselector=role=master

```

b. Exec into the new Postgres primary pod.

```

oc exec -it <postgres-pod> -- bash

```

c. Resume Patroni.

```

patronictl resume

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Troubleshooting Analytics on OpenShift and Cloud Pak for Integration

If your API Connect Analytics subsystem encounters problems, review the following topics for help resolving the issue.

- [>Analytics start-up issues on OpenShift and Cloud Pak for Integration](#)  
If you receive an error starting the Analytics service after installing, upgrading, or recovering from a catastrophic failure of IBM® API Connect on OpenShift, you might be able to resolve it by completing this task.
- [Analytics offload issues on OpenShift and Cloud Pak for Integration](#)  
If your Analytics offload fails, you can perform checks to help determine the cause. Common causes for an offload failure are connection or security-related issues.
- [Empty Analytics display on OpenShift and Cloud Pak for Integration](#)  
If your API Connect analytics data doesn't display in the Analytics dashboard, complete the following steps to determine the cause of the problem.
- [Analytics running out of disk space on OpenShift and Cloud Pak for Integration](#)  
If your Analytics data is taking up too much disk space, complete the following steps to resolve the problem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## >Analytics start-up issues on OpenShift and Cloud Pak for Integration

If you receive an error starting the Analytics service after installing, upgrading, or recovering from a catastrophic failure of IBM® API Connect on OpenShift, you might be able to resolve it by completing this task.

### Uh oh! An error has occurred

In rare cases, the Kibana index can fail and the following message displays:

This error typically indicates that the index was corrupted. Complete the following steps to verify the problem and delete the corrupted index.

Before you begin, determine the names of one of the deployment's storage-coordinating pods (called *analytics-storage-coordinating-pod* in the steps that follow) and one of the client pods (called *analytics-client-pod* in the steps). To see the pod names, run the following command:

```
oc get pods
```

In the following sample output, a storage-coordination pod is named `r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-btpfq` and a client pod is named `r70eaa1a0f2-analytics-client-68c499d5f9-7g7vm`:

| NAME                                                       | READY | STATUS    | RESTARTS | AGE |
|------------------------------------------------------------|-------|-----------|----------|-----|
| r70eaa1a0f2-analytics-client-68c499d5f9-7g7vm              | 1/1   | Running   | 0        | 37m |
| r70eaa1a0f2-analytics-client-68c499d5f9-hjx22              | 1/1   | Running   | 0        | 82m |
| r70eaa1a0f2-analytics-cronjobs-retention-1559698200-7tjjh  | 0/1   | Completed | 0        | 18h |
| r70eaa1a0f2-analytics-cronjobs-roller-1559762100-fnhnd     | 0/1   | Completed | 0        | 24m |
| r70eaa1a0f2-analytics-ingestion-7f5d748759-5cgrs           | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-ingestion-7f5d748759-wjvkd           | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-mtls-gw-6988bd8cbf-g88p5             | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-mtls-gw-6988bd8cbf-xxzvb             | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-operator-747f75c4f-7965r             | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-btpfq | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-sr9mg | 1/1   | Running   | 0        | 83m |
| r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-t8djr | 1/1   | Running   | 0        | 82m |
| r70eaa1a0f2-analytics-storage-data-0                       | 1/1   | Running   | 0        | 70m |
| r70eaa1a0f2-analytics-storage-data-1                       | 1/1   | Running   | 0        | 76m |
| r70eaa1a0f2-analytics-storage-data-2                       | 1/1   | Running   | 0        | 80m |
| r70eaa1a0f2-analytics-storage-master-0                     | 1/1   | Running   | 0        | 72m |
| r70eaa1a0f2-analytics-storage-master-1                     | 1/1   | Running   | 0        | 75m |
| r70eaa1a0f2-analytics-storage-master-2                     | 1/1   | Running   | 0        | 80m |

1. Verify that you have both the `.kibana` and `.kibana-6` indexes by running the following command:

```
oc exec -it analytics-storage-coordinating-pod -- curl_es /_cat/indices?v
```

In the `index` column of the response, look for `.kibana` and `.kibana-6`:

```
health status index      uid      pri rep docs.count docs.deleted store.size pri.store.size
green open   .kibana-6  cXVwGzpe7TKK5lVwMa3-J  1 2 39 0 239.1kb 79.7kb
green open   .kibana    SAC2HDC3TLuKtRlvmOBt0A 1 2 1 0 0.3kb 3.1kb
green open   .apic-config  NLMq7241ST6YKJlEp3Vp1Q 1 2 1 0 14.6kb 4.8kb
green open   .export-status 21h3BNw-T4GFwPmHnBDS3w 1 2 0 0 0 573b 191b
green open   apic-api-2019.06.05-000002 4uvi5QRV1Wj-1sum1-Krg 5 2 148889 0 350.2mb 116.8mb
green open   apic-api-2019.06.04-1 0WCBp1uQeKR6uSSJgrdGQ 5 2 8000 0 24.7mb 8.2mb
```

If the response includes both indexes, it indicates a problem with the index creation. Proceed to the next step.

Note: If you received the "Uh oh! An error has occurred" page and the response to this command only includes the `.kibana-6` index, then something else is wrong with the cluster and you should contact IBM Support for assistance.

2. Set the `.kibana` index to be read-and-write enabled by running the following command, replacing `analytics-storage-coordinating-pod` with the name of the storage-coordinating pod that you determined at the beginning of this task:

```
oc exec -it analytics-storage-coordinating-pod -- curl_es -XPUT .kibana/_settings -d '{"index.blocks.write":false}'
```

When you see the following response: {"acknowledged":true}, continue to the next step.

Note: If you see a different response, make sure the request was correct and try again. If the command still does not work, then something else is wrong with the cluster and you should contact IBM Support for assistance.

3. Delete the `.kibana-6` index by running the following command:

```
oc exec -it analytics-storage-coordinating-pod -- curl_es -XDELETE .kibana-6
```

When you see the following response: {"acknowledged":true} to indicate that the deletion was successful, continue to the next step.

Note: If you see a different response, then the index was not deleted. Make sure the request was correct and try again. If the delete operation still fails, then something else is wrong with the cluster and you should contact IBM Support for assistance.

4. Restart a single analytics client pod by running the following command and replacing `analytics-client-pod` with the name of the pod (which you determined at the beginning of this task):

```
oc delete pod analytics-client-pod
```

Sample response: pod "analytics-client-pod" deleted

Wait for the response to ensure that the pod was successfully deleted. Then wait a few minutes for a new pod to start automatically. To check the status of the pods, run the following command:

```
oc get pods
```

5. Navigate to the Analytics page and refresh to verify that the dashboard now displays correctly.
6. (Optional) If you have a backup of `ui` or `.kibana-6`, you can restore it now as explained in [Restoring the Analytics database on OpenShift and Cloud Pak for Integration](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Analytics offload issues on OpenShift and Cloud Pak for Integration

If your Analytics offload fails, you can perform checks to help determine the cause. Common causes for an offload failure are connection or security-related issues.

When you save the configuration files, their syntax is first validated to verify that it can be applied. However, this does not confirm that other parts of your analytics collection ecosystem are trouble-free, for example, that your endpoints are running, or that the TLS certificates are validated. Errors in these areas may also result in no data output.

To verify issues you will need to examine the logs for one of your Kubernetes analytics ingestion pods. (Note that it may take a few minutes for the pods to pick up changes in the configuration files after edits are applied.)

For information on obtaining logs, refer to [Configuring logging for a Kubernetes deployment](#).

Following are some common checks you can make to troubleshoot the offload:

- Verify that the specified URL or the host and port values for the target system are accurate.
- Verify that the server or cluster of servers in the target system are running and reachable. If applicable, also verify that the connection problems are not caused by firewall settings.
- If you are using Transport Layer Security (TLS) to establish a private and secure communication channel to the target system, investigate whether the issue is caused by SSL certificate errors; for example, untrusted server certificates, certificates that have expired or are not yet valid, or missing intermediate (or chain) certificates. For more information on using TLS, see [Creating a TLS profile](#).
- If offloading to an Elasticsearch or Kafka target, verify that your configuration settings are valid; for example, the user credentials for authenticating to Elasticsearch or the Kafka topic name.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Empty Analytics display on OpenShift and Cloud Pak for Integration

If your API Connect analytics data doesn't display in the Analytics dashboard, complete the following steps to determine the cause of the problem.

### Procedure

1. Run the following command to check the logs of the `mtls-gw` pod:

```
oc logs analyt-mtls-gw-7665f5d445-4cx4n -n <APIC_namespace>
```

The response looks like the following example:

```
10.254.6.1 - - [22/Sep/2021:18:05:54 +0000] "POST /x2020/v1/apievent/_bulk HTTP/1.1" 200 2 "-" "-" 2841 0.072 0.070
```

- a. Check the response for any `_bulk` request coming from the gateway, as shown in the example.  
If there are no `_bulk` requests, then the problem is with the gateway and the `wsm-agent`, which is not sending bulk requests to the Analytics server.
- b. If you see the `_bulk` request., then check the return code in the response.  
If `_bulk` requests are processed successfully you will see a return code 200 (as in the example), which indicates that the bulk request has been ingested.
- c. If it is any other return code, check the ingestion pod logs for any errors, which will indicate any issues during ingestion:

```
oc logs analyt-ingestion-78d7cff7f7-6pktd
```

2. If everything with the data flow looks fine, and if you are unable to see analytics data, then check the health of Analytics by executing into one of the storage pods:

```
oc exec -it <storage_pod> - bash
```

```
d.bash-4.4$ curl_es _cluster/health?pretty=1
```

For example:

```
{
  "cluster_name" : "apic-analytics-cluster",
  "status": "yellow",
  "timed_out": false,
  "number_of_nodes": 3,
  "number_of_data_nodes": 1,
  "active_primary_shards": 258,
  "active_shards": 258,
  "relocating_shards": 0,
  "initializing_shards": 0,
  "unassigned_shards": 510,
  "delayed_unassigned_shards": 0,
  "number_of_pending_tasks": 0,
  "number_of_in_flight_fetch": 0,
  "task_max_waiting_in_queue_millis": 0,
  "active_shards_percent_as_number": 33.59375
}
```

- a. Check the status of the cluster (red, yellow, green) in the response.  
In the example, the status is set to yellow.
  - Green indicates all indices are fine.
  - Yellow indicates there are some unassigned shards, which might still be replicating.
  - Red indicates there is a problem with one or more of the indices.
- b. Run the following command to get a list of indices:

```
bash-4.4$ curl_es _cat/indices?v
```

- c. In the list, find the red indices.
- d. Delete each red index by running the following command:

```
bash-4.4$ curl_es -XDELETE <index_name>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Analytics running out of disk space on OpenShift and Cloud Pak for Integration

If your Analytics data is taking up too much disk space, complete the following steps to resolve the problem.

### About this task

Analytics indices taking up too much space

### Procedure

1. Run the following command to display the indices:
 

```
curl_es _cat/indices?v
```
2. Find the old and large indices that can be deleted, and delete each index using the following command:
 

```
curl_es -XDELETE <index_name>
```
3. Reduce the retention period from the Cloud manager:
  - a. Open Cloud Manager and click Topology, Analytics Service, Advanced analytics configuration, Storage.
  - b. Locate the Oldest Api Call Data Kept field and set it to the lowest feasible value.
4. Verify that the index is rotating as scheduled.
  - a. Open Cloud Manager and click Topology, Analytics Service, Advanced analytics configuration, Storage.
  - b. Click Index Roll Over, Max age and Max Documents.  
Check the rotation time and number of documents.
5. Verify that the retention and rollover jobs are running properly.  
Run the following command to check the age of the job and the logs, to see whether there is any issue:

```
oc get jobs
```

The output looks like the following example:

| NAME                           | COMPLETIONS | DURATION | AGE |
|--------------------------------|-------------|----------|-----|
| analyt-cj-retention-1632965400 | 1/1         | 17s      | 21h |
| analyt-cj-rollover-1633040100  | 1/1         | 10s      | 15m |

6. Apply a filter to reduce the index size by excluding large fields, such as `response_body`, from being saved in the index. For example:

```
filter {
  if "apicapievent" in [tags] {
    mutate {
      remove_field => ["response_body"]
    }
  }
}
```

For information on creating filters for Analytics data, see [Modifying your analytics data](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Uninstalling API Connect

You can uninstall a Kubernetes deployment of API Connect.

### About this task

---

You can choose to uninstall individual API Connect subsystems or you can uninstall the complete API Connect deployment. You can delete Custom Resource Definitions, Persistent Volumes, service accounts, secrets, operators and the namespace. Use one of the following topics.

Note: For information about how to maintain a two data center deployment, see [Maintaining a two data center deployment](#).

- [Uninstalling API Connect subsystems](#)  
You can individually uninstall API Connect subsystems that have been deployed on Kubernetes.
- [Removing API Connect](#)  
You can remove all parts of the API Connect deployment on Kubernetes.
- [Removing API Connect on OpenShift or Cloud Pak for Integration](#)  
Remove your entire API Connect deployment on OpenShift or Cloud Pak for Integration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Uninstalling API Connect subsystems

You can individually uninstall API Connect subsystems that have been deployed on Kubernetes.

### Before you begin

---

If you want to disable the Analytics subsystem without uninstalling it, see [Disabling the Analytics subsystem on Kubernetes](#).

### About this task

---

- To delete the API Connect deployment in a Kubernetes runtime environment, you must use the Kubernetes command-line tool, [kubectl](#).
- The API Connect operator and DataPower operator pods are needed to uninstall subsystems individually.
- If need to retain data to re-use during a re-installation later, follow the backup and restore procedures:
  - [Configuring backup settings for fresh install of the Management subsystem](#)
  - [Backing up and restoring the Developer Portal in a Kubernetes environment](#)
- If you want to delete **all** of API Connect, do not use this topic. Instead, see [Removing API Connect](#).

### Procedure

---

1. Uninstall the Management subsystem
  - a. Save the management subsystem name:

```
kubectl get mgmt -n <namespace> -o yaml
```

This command returns the YAML format of the management custom resource. Make a note of the name.

- b. Delete the Management Subsystem.

```
kubectl delete mgmt --all -n <namespace>
```

Important:

If your deployment uses default namespaces be cautious when using `kubectl delete <entity> --all` commands. There can be other pods, services, and more in the default namespace. When using the default namespace, keep in mind that using `kubernetes delete <entity> --all`, where `<entity>` can delete non-APIC entities, such as `sa` (Service Accounts), `secrets`, `rolebindings`, etc.

The Management CR deletion will take some time because the apiconnect operator must delete the Postgres cluster.

c. Manually delete secrets and PVCs:

- i. Get all of the secrets that use the management subsystem name (which you determined in Step 1.a):

```
kubectl get secrets -n <namespace> | grep <management-subsystem-name>
```

- ii. For each secret that uses the management subsystem name, run the following command to delete the secret:

```
kubectl delete secrets <secret_name> -n <namespace>
```

- iii. Get all the PVCs that use the management subsystem name:

```
kubectl get pvc -n <namespace> | grep <management-subsystem-name>
```

- iv. For each PVC that uses the management subsystem name, run the following command to delete the PVC:

```
kubectl delete pvc <pvc_name> -n <namespace>
```

d. If management subsystem backup and restore CRs are left stale, delete them also:

- i. Get the name of the backup CR:

```
kubectl get mgmtb -n <namespace>
```

- ii. Delete the backup CR:

```
kubectl delete mgmtb <backup_cr_name> -n <namespace>
```

- iii. Get the name of the restore CR:

```
kubectl get mgmtr -n <namespace>
```

- iv. Delete the restore CR:

```
kubectl delete mgmtr <restore_cr_name> -n <namespace>
```

2. Uninstall Analytics subsystem

- a. Delete the Analytics subsystem, and the Analytics backup and restore Custom Resources (CRs).

```
kubectl delete a7s --all -n <namespace>
kubectl delete a7b --all -n <namespace>
kubectl delete a7r --all -n <namespace>
```

- b. Manually delete Analytics secrets:

```
kubectl delete secrets <secret_name> -n <namespace>
```

for each of the following secrets:

```
analytics-ac-endpoint
analytics-ai-endpoint
analytics-ca
analytics-client
analytics-server
```

- c. Manually delete Analytics Persistent Volumes (PVCs):

```
kubectl delete pvc <pvc_name> -n <namespace>
```

for PVCs with the following naming pattern:

```
data-analytics-storage-data-...
data-analytics-storage-master...
```

3. Uninstall the Developer Portal subsystem

- a. Delete the Developer Portal subsystem, and the Portal backup and restore CRs.

```
kubectl delete ptl --all -n <namespace>
kubectl delete pb --all -n <namespace>
kubectl delete pr --all -n <namespace>
```

- b. Manually delete Developer Portal secrets:

```
kubectl delete secrets <secret_name> -n <namespace>
```

for secrets with the following naming pattern:

```
portal-admin
portal-admin-client
portal-ca
portal-client
portal-db-ca
portal-encryption-key-...
portal-server
portal-web
```

c. Manually delete these Developer Portal PVCs:

```
kubectl delete pvc <pvc_name> -n <namespace>
```

for PVCs with the following naming pattern:

```
admin-portal-...-www-...
backup-portal-...-www-...
db-portal-...-db-...
dblogs-portal-...-db-...
web-portal-...-www-...
```

4. Delete the DataPower Gateway subsystem.

```
kubectl delete gw --all -n <namespace>
```

Note: The following entries include both Multi-Protocol Gateway Service (v5-compatible) and API Gateway settings. Names that include "gww5" refer to the Multi-Protocol Gateway Service (v5-compatible), and names that include "gww6" refer to the API Gateway.

a. Delete Service Accounts.

```
kubectl delete sa <service_account> -n <namespace>
```

for each of the following Service Accounts:

```
gww5-datapower
gww6-datapower
```

b. Delete Secrets.

```
kubectl delete secrets <secret_name> -n <namespace>
```

for secrets with the following naming pattern:

```
gww5-datapower-token-...
gww5-dpm-sa-token-...
gww5-endpoint
gww5-manager-endpoint
gww6-datapower-token-...
gww6-dpm-sa-token-...
gww6-endpoint.
gww6-manager-endpoint
```

c. Delete PVCs.

```
kubectl delete pvc <pvc_name> -n <namespace>
```

for PVCs with the following naming pattern:

```
gww5...
gww6...
```

- [Removing Management subsystem postgres resources on Kubernetes](#)

When you remove the API Connect Management subsystem by deleting its files, some postgres resources from Crunchy Data remain, and must be deleted manually before you attempt to re-install the Management subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Removing Management subsystem postgres resources on Kubernetes

When you remove the API Connect Management subsystem by deleting its files, some postgres resources from Crunchy Data remain, and must be deleted manually before you attempt to re-install the Management subsystem.

### About this task

Sometimes when you remove the Management subsystem, some postgres resources remain and must be deleted manually.

To determine whether you need to delete any postgres resources, use the `kubectl get` command and specify `vendor=crunchydata`; as shown in the following example.

```
$ kubectl get pods -n apic -l vendor=crunchydata
NAME                                READY   STATUS    RESTARTS   AGE
backrest-backup-production-mgmt-mymgmtsite123-postgres-k77xj    0/1     Completed 0           17h
production-mgmt-mymgmtsite123-postgres-backrest-shared-repk4kzc  1/1     Running   0           2d21h
production-mgmt-mymgmtsite123-postgres-full-sch-backup-9ktp5     0/1     Completed 0           164m

$ kubectl get deployments -n apic -l vendor=crunchydata
NAME                                READY   UP-TO-DATE   AVAILABLE   AGE
production-mgmt-mymgmtsite123-postgres-backrest-shared-repo     1/1     1             1           2d21h

$ kubectl get sa -n apic -l vendor=crunchydata
No resources found in apic namespace.

$ kubectl get jobs -n apic -l vendor=crunchydata
NAME                                COMPLETIONS   DURATION   AGE
```

```
backrest-backup-production-mgmt-mymgmtsite123-postgres 1/1 10s 17h
production-mgmt-mymgmtsite123-postgres-full-sch-backup 1/1 37s 164m
production-mgmt-mymgmtsite123-postgres-rmdata-cemg 1/1 20s 14m
```

```
$ kubectl get roles -n apic -l vendor=crunchydata
No resources found in apic namespace.
```

```
$ kubectl get rolebindings -n apic -l vendor=crunchydata
No resources found in apic namespace.
```

```
$ kubectl get secrets -n apic -l vendor=crunchydata
```

| NAME                                                        | TYPE   | DATA | AGE   |
|-------------------------------------------------------------|--------|------|-------|
| production-mgmt-7bc754c7-postgres-backrest-repo-config      | Opaque | 9    | 6d23h |
| production-mgmt-7bc754c7-postgres-postgres-secret           | Opaque | 2    | 6d23h |
| production-mgmt-7bc754c7-postgres-primaryuser-secret        | Opaque | 2    | 6d23h |
| production-mgmt-7bc754c7-postgres-testuser-secret           | Opaque | 2    | 6d23h |
| production-mgmt-8aac6b4e-postgres-backrest-repo-config      | Opaque | 9    | 6d22h |
| production-mgmt-8aac6b4e-postgres-postgres-secret           | Opaque | 2    | 6d22h |
| production-mgmt-8aac6b4e-postgres-primaryuser-secret        | Opaque | 2    | 6d22h |
| production-mgmt-8aac6b4e-postgres-testuser-secret           | Opaque | 2    | 6d22h |
| production-mgmt-mymgmtsite123-postgres-backrest-repo-config | Opaque | 9    | 2d21h |
| production-mgmt-mymgmtsite123-postgres-postgres-secret      | Opaque | 2    | 2d21h |
| production-mgmt-mymgmtsite123-postgres-primaryuser-secret   | Opaque | 2    | 2d21h |
| production-mgmt-mymgmtsite123-postgres-testuser-secret      | Opaque | 2    | 2d21h |

```
$ kubectl get cm -n apic -l vendor=crunchydata
```

| NAME                                                | DATA | AGE   |
|-----------------------------------------------------|------|-------|
| production-mgmt-mymgmtsite123-postgres-config       | 0    | 2d21h |
| production-mgmt-mymgmtsite123-postgres-leader       | 0    | 2d21h |
| production-mgmt-mymgmtsite123-postgres-pgbouncer-cm | 2    | 2d21h |
| production-mgmt-mymgmtsite123-postgres-pgha-config  | 5    | 2d21h |

## Procedure

For each type of postgres resource, check to see if any resources are available and if so, delete the resources:

- pods:

```
kubectl get pods -n <namespace> -l vendor=crunchydata
kubectl delete pods -n <namespace> -l vendor=crunchydata
```

- deployments:

```
kubectl get deployments -n <namespace> -l vendor=crunchydata
kubectl delete deployments -n <namespace> -l vendor=crunchydata
```

- Jobs:

```
kubectl get jobs -n <namespace> -l vendor=crunchydata
kubectl delete jobs -n <namespace> -l vendor=crunchydata
```

- roles:

```
kubectl get roles -n <namespace> -l vendor=crunchydata
kubectl delete roles -n <namespace> -l vendor=crunchydata
```

- rolebindings:

```
kubectl get rolebindings -n <namespace> -l vendor=crunchydata
kubectl delete rolebindings -n <namespace> -l vendor=crunchydata
```

- secrets:

```
kubectl get secrets -n <namespace> -l vendor=crunchydata
kubectl delete secrets -n <namespace> -l vendor=crunchydata
```

- cm:

```
kubectl get cm -n <namespace> -l vendor=crunchydata
kubectl delete cm -n <namespace> -l vendor=crunchydata
```

- pgtasks:

```
kubectl get pgtasks.crunchydata.com -n <namespace> -l vendor=crunchydata
kubectl delete pgtasks.crunchydata.com -n <namespace>
```

- pgreplica:

```
kubectl get pgreplica -n <management_namespace> -l vendor=crunchydata
kubectl delete pgreplica -n <management_namespace> -l vendor=crunchydata
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Removing API Connect

You can remove all parts of the API Connect deployment on Kubernetes.

### About this task

---

These instructions completely remove API Connect, including PVCs and secrets.

- To delete the API Connect deployment in a Kubernetes runtime environment, you must use the Kubernetes command-line tool, [kubect1](#).
- You must run the commands in the order shown in the procedure on this page. If you run commands out of order, you might encounter a problem where the deletion of namespaces hangs.
- If you want to retain the PVCs, which contain some of the data you built up when using the application, you must also keep the associated secret used to decrypt the data. To do this, you must backup each subsystem, and then uninstall the subsystems individually. In this case, do not use the instructions on this page. Instead, see [Uninstalling API Connect subsystems](#).

### Procedure

---

1. Delete all API Connect systems.

```
kubect1 delete apic --all -n <namespace>
```

This command is the equivalent of deleting each of the individual subsystems one at a time, and also deleting all of their backup and restore CRs. The commands that run during this step are:

- Subsystem CRs. For example:

```
kubect1 delete mgmt --all -n <namespace>
kubect1 delete a7s --all -n <namespace>
kubect1 delete pt1 --all -n <namespace>
kubect1 delete gwv6 --all -n <namespace>
```

- Backup and restore CRs:

```
kubect1 delete mgmtb --all -n <namespace>
kubect1 delete mgmtr --all -n <namespace>
kubect1 delete pb --all -n <namespace>
kubect1 delete pr --all -n <namespace>
kubect1 delete a7b --all -n <namespace>
kubect1 delete a7r --all -n <namespace>
```

2. Delete the Operator deployments.

```
kubect1 delete deployment datapower-operator ibm-apiconnect -n <namespace>
```

3. Delete all Service Accounts in the namespace.

Important:

If your deployment uses default namespaces be cautious when using `kubect1 delete`

`<entity> --all` commands. There can be other pods, services, and more in the default namespace. When using the default namespace, keep in mind that using `kubernetes delete <entity> --all`, where `<entity>` can delete non-APIC entities, such as `sa` (Service Accounts), `secrets`, `rolebindings`, etc.

```
kubect1 delete sa --all -n <namespace>
```

4. Delete all Secrets in the namespace.

```
kubect1 delete secrets --all -n <namespace>
```

5. Delete all Rolebindings in the namespace.

```
kubect1 delete rolebindings --all -n <namespace>
```

6. Delete all Roles in the namespace.

```
kubect1 delete roles --all -n <namespace>
```

7. Clean up any remaining jobs.

```
kubect1 delete jobs --all -n <namespace>
```

8. Delete all PVCs in the namespace.

```
kubect1 delete pvc --all -n <namespace>
```

9. Delete Issuers in the namespace.

Note that there might be none found.

```
kubect1 delete issuer --all -n <namespace>
```

10. Delete certificates in the namespace.

Note that there might be none found.

```
kubect1 delete certificates --all -n <namespace>
```

11. If you are not using the default namespace, delete the Namespace

Important: If your deployment uses the default namespace, do not delete it. There can be other pods, services, and more in the default namespace.

```
kubectl delete ns <namespace>
```

#### 12. Delete validatingwebhookconfiguration

```
a. kubectl get validatingwebhookconfiguration | awk /<ns>/'{print $1}' | xargs kubectl delete validatingwebhookconfiguration
```

```
b. kubectl delete validatingwebhookconfiguration managements.validator.subsystem.apiconnect.ibm.com
```

#### 13. Delete mutatingwebhookconfiguration

```
a. kubectl get mutatingwebhookconfiguration | awk /$NS/'{print $1}' | xargs kubectl delete mutatingwebhookconfiguration
```

```
b. kubectl get mutatingwebhookconfiguration | awk /apicop-management-defaultler/'{print $1}' | xargs kubectl delete mutatingwebhookconfiguration
```

#### 14. Delete the Apiconnect CRDs (custom resource definitions)

```
kubectl delete crd analyticsbackups.analytics.apiconnect.ibm.com
kubectl delete crd analyticsclusters.analytics.apiconnect.ibm.com
kubectl delete crd analyticsrestores.analytics.apiconnect.ibm.com
kubectl delete crd datapowerservices.datapower.ibm.com
kubectl delete crd gatewayclusters.gateway.apiconnect.ibm.com
kubectl delete crd managementbackups.management.apiconnect.ibm.com
kubectl delete crd managementclusters.management.apiconnect.ibm.com
kubectl delete crd managementrestores.management.apiconnect.ibm.com
kubectl delete crd natsclusters.nats.io
kubectl delete crd natsserverroles.nats.io
kubectl delete crd natsstreamingclusters.streaming.nats.io
kubectl delete crd portalbackups.portal.apiconnect.ibm.com
kubectl delete crd portalclusters.portal.apiconnect.ibm.com
kubectl delete crd portalrestores.portal.apiconnect.ibm.com
```

#### 15. Delete Crunchy CRDs

```
kubectl delete crd pgclusters.crunchydata.com
kubectl delete crd pgpolicies.crunchydata.com
kubectl delete crd pgreplicas.crunchydata.com
kubectl delete crd pgtasks.crunchydata.com
```

#### 16. If you installed Cert-manager and want to remove it now, complete the following steps:

Warning: If you are using shared clusters for API Connect with a common cert manager, be aware that this step removes the components of the cert manager from cluster wide scope.

##### a. Delete the Cert-manager

```
kubectl delete deploy --all -n cert-manager
kubectl delete service --all -n cert-manager
kubectl delete sa -n cert-manager --all
kubectl delete secrets -n cert-manager --all
kubectl delete APIService v1beta1.webhook.cert-manager.io -n cert-manager
kubectl delete MutatingWebhookConfiguration cert-manager-webhook -n cert-manager
kubectl delete ValidatingWebhookConfiguration cert-manager-webhook -n cert-manager
kubectl delete ns cert-manager
```

##### b. Delete Cert-manager CRDs

- If you are using Cert-Manager V1.5.1, delete the Cert-Manager CRDs with the following commands:

```
kubectl delete crd issuers.cert-manager.io
kubectl delete crd certificaterequests.cert-manager.io
kubectl delete crd certificates.cert-manager.io
kubectl delete crd challenges.cert-manager.io
kubectl delete crd clusterissuers.cert-manager.io
kubectl delete crd orders.cert-manager.io
```

- If you are using Cert-Manager V0.10.1, delete the Cert-Manager CRDs with the following commands:

```
kubectl delete crd certificaterequests.certmanager.k8s.io
kubectl delete crd certificates.certmanager.k8s.io
kubectl delete crd challenges.certmanager.k8s.io
kubectl delete crd clusterissuers.certmanager.k8s.io
kubectl delete crd issuers.certmanager.k8s.io
kubectl delete crd orders.certmanager.k8s.io
```

- If you are using Cert-Manager V0.12 for IBM Kubernetes Services (IKS) installations, delete the Cert-Manager CRDs with the following commands:

```
kubectl delete crd certificaterequests.cert-manager.io
kubectl delete crd certificates.cert-manager.io
kubectl delete crd challenges.acme.cert-manager.io
kubectl delete crd clusterissuers.cert-manager.io
kubectl delete crd issuers.cert-manager.io
kubectl delete crd orders.acme.cert-manager.io
```

- [Removing postgres resources on Kubernetes after removing API Connect](#)

When you remove API Connect by deleting its files, some of the postgres resources from Crunchy Data remain and must be deleted manually before you attempt to re-install API Connect.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Removing postgres resources on Kubernetes after removing API Connect

When you remove API Connect by deleting its files, some of the postgres resources from Crunchy Data remain and must be deleted manually before you attempt to re-install API Connect.

### About this task

Sometimes when you remove API Connect, some postgres resources remain and must be deleted manually.

To determine whether you need to delete any postgres resources, use the `kubectl get` command and specify `vendor=crunchydata` as shown in the following example.

```
$ kubectl get pods -n apic -l vendor=crunchydata

production-mgmt-8aac6b4e-postgres-primaryuser-secret           Opaque 2        6d22h
production-mgmt-8aac6b4e-postgres-testuser-secret              Opaque 2        6d22h
production-mgmt-mymgmtsite123-postgres-backrest-repo-config    Opaque 9        2d21h
production-mgmt-mymgmtsite123-postgres-postgres-secret         Opaque 2        2d21h
production-mgmt-mymgmtsite123-postgres-primaryuser-secret      Opaque 2        2d21h
production-mgmt-mymgmtsite123-postgres-testuser-secret         Opaque 2        2d21h

$ kubectl get cm -n apic -l vendor=crunchydata
NAME                                DATA   AGE
production-mgmt-mymgmtsite123-postgres-config                   0       2d21h
production-mgmt-mymgmtsite123-postgres-leader                   0       2d21h
production-mgmt-mymgmtsite123-postgres-pgbouncer-cm            2       2d21h
production-mgmt-mymgmtsite123-postgres-pgha-config              5       2d21h
```

### Procedure

For each type of postgres resources, check to see if any resources are available and if so, delete the resources:

- pods:

```
kubectl get pods -n <namespace> -l vendor=crunchydata
kubectl delete pods -n <namespace> -l vendor=crunchydata
```
- deployments:

```
kubectl get deployments -n <namespace> -l vendor=crunchydata
kubectl delete deployments -n <namespace> -l vendor=crunchydata
```
- Jobs:

```
kubectl get jobs -n <namespace> -l vendor=crunchydata
kubectl delete jobs -n <namespace> -l vendor=crunchydata
```
- roles:

```
kubectl get roles -n <namespace> -l vendor=crunchydata
```

```
kubectl delete roles -n <namespace> -l vendor=crunchydata
```

- rolebindings:

```
kubectl get rolebindings -n <namespace> -l vendor=crunchydata
```

```
kubectl delete rolebindings -n <namespace> -l vendor=crunchydata
```

- secrets:

```
kubectl get secrets -n <namespace> -l vendor=crunchydata
```

```
kubectl delete secrets -n <namespace> -l vendor=crunchydata
```

- cm:

```
kubectl get cm -n <namespace> -l vendor=crunchydata
```

```
kubectl delete cm -n <namespace> -l vendor=crunchydata
```

- pgtasks:

```
kubectl get pgtasks.crunchydata.com -n <namespace> -l vendor=crunchydata
```

```
kubectl delete pgtasks.crunchydata.com -n <namespace>
```

- pgreplica:

```
kubectl get pgreplica -n <management_namespace> -l vendor=crunchydata
```

```
kubectl delete pgreplica -n <management_namespace> -l vendor=crunchydata
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Removing API Connect on OpenShift or Cloud Pak for Integration

Remove your entire API Connect deployment on OpenShift or Cloud Pak for Integration.

### About this task

These instructions completely remove API Connect, including PVCs and secrets. Because API Connect was deployed using a single, top-level CR, you cannot delete individual subsystems.

Attention: Run the commands in the sequence shown on this page. If you run commands out of sequence, you might encounter a problem where the deletion of namespaces hangs.

### Procedure

1. Run the following command to determine the name of your Event Endpoint Management instance:

```
oc get eem -n <APIC-namespace>
```

Note: Depending on the integration capabilities you created it is possible that you do not have any Event Endpoint Management instance and only have an API Connect instance. Equally it is possible that you only have an Event Endpoint Manager and no API Connect instance.

2. Run the following command to determine the name of your API Connect instance:

```
oc get apiconnectcluster -n <APIC-namespace>
```

3. Run the following command to delete the API Connect operands (subsystems):

```
oc delete apiconnectcluster <name_of_apic_instance> -n <APIC-namespace>
```

4. Run the following command to delete the API Connect backup and restore CRs:

```
oc delete apic --all -n <APIC-namespace>
```

5. If you intend to completely remove API Connect, delete the operator deployments by completing the following steps:

The API Connect operator might have created a number of operand requests with IBM Cloud Pak foundational services (previously called Common Services) to deploy services such as Cert-Manager. In addition, API Connect requires the use of a DataPower gateway, so the DataPower operator might be installed in the API Connect namespace. If those artifacts are no longer needed, uninstall them individually.

Note: DataPower can be deployed on its own without API Connect. It is possible that the DataPower operator was installed for another purpose and not for use with API Connect, so make sure you know why the DataPower operator was installed before removing it.

- a. Open the OpenShift web console and navigate to Installed Operators in the API Connect namespace.

- b. For each operator, click on the options menu, and select Uninstall Operator.

Deleting the operators from the web console ensures that related subscriptions, CSVs, and install plans are also removed.

6. Run the following command to delete the secrets associated with your deleted API Connect cluster:

```
oc get secrets --no-headers -n <APIC-namespace> | cut -d' ' -f1 | grep "^<first_10_characters_of_apic_instance_name>-" | xargs oc delete secret -n <APIC-namespace>
```

where `<first_10_characters_of_apic_instance_name>` refers to the name of your API Connect instance.

Note: This step assumes that any secrets that you want to keep in your namespace do not have a name that starts with the same 10 first characters of the API Connect Cluster name.

7. Run the following command to delete the secrets associated with your deleted Event Endpoint Management instance:

```
oc get secrets --no-headers -n <APIC-namespace> | cut -d' ' -f1 | grep "^<first_10_characters_of_eem_instance_name>-" | xargs oc delete secret -n <APIC-namespace>
```

where `<first_10_characters_of_eem_instance_name>` refers to the name of your Event Endpoint Manager instance.

Note: This step assumes that any secrets that you want to keep in your namespace do not have a name that starts with the same 10 first characters of the Event Endpoint Manager name.

8. Run the following command to delete the PVCs associated with your deleted API Connect cluster:

Important: Only run this command if there is nothing other than API Connect deployed in the namespace.

```
oc delete pvc -n <APIC-namespace> -l app.kubernetes.io/managed-by=ibm-apiconnect
```

9. Run the following command to delete the CrunchyData Postgres cluster associated with your deleted API Connect cluster:

```
oc delete pvc -n <APIC-namespace> -l vendor=crunchydata
```

Note: This assumes that there is no other CrunchyData Postgres cluster in the same namespace.

10. Run the following commands to delete the API Connect secret rotation CRs for the cluster:

```
oc delete mgmtsr -n <APIC-namespace> --all
oc delete ptlsr -n <APIC-namespace> --all
```

11. If you intend to completely remove API Connect and you created a namespace specifically for API Connect, you can delete the namespace.

Deleting the namespace removes any remaining certificates and secrets.

Attention: Do not delete a shared namespace.

- [Removing postgres resources on OpenShift and Cloud Pak for Integration](#)

When you remove API Connect by deleting its files, some of the postgres resources from Crunchy Data remain and must be deleted manually before you attempt to re-install API Connect.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Removing postgres resources on OpenShift and Cloud Pak for Integration

When you remove API Connect by deleting its files, some of the postgres resources from Crunchy Data remain and must be deleted manually before you attempt to re-install API Connect.

### About this task

Sometimes when you remove API Connect, some postgres resources remain and must be deleted manually.

To determine whether you need to delete any postgres resources, use the `oc get` command and specify `vendor=crunchydata` as shown in the following example.

```
$ oc get pods -n apic -l vendor=crunchydata
NAME                                     READY   STATUS    RESTARTS   AGE
backrest-backup-production-mgmt-mymgmtsite123-postgres-k77xj    0/1     Completed 0           17h
production-mgmt-mymgmtsite123-postgres-backrest-shared-repk4kzc  1/1     Running   0           2d21h
production-mgmt-mymgmtsite123-postgres-full-sch-backup-9ktp5    0/1     Completed 0           164m

$ oc get deployments -n apic -l vendor=crunchydata
NAME                                     READY   UP-TO-DATE   AVAILABLE   AGE
production-mgmt-mymgmtsite123-postgres-backrest-shared-repo    1/1     1             1           2d21h

$ oc get sa -n apic -l vendor=crunchydata
No resources found in apic namespace.

$ oc get jobs -n apic -l vendor=crunchydata
NAME                                     COMPLETIONS   DURATION   AGE
backrest-backup-production-mgmt-mymgmtsite123-postgres          1/1           10s        17h
production-mgmt-mymgmtsite123-postgres-full-sch-backup          1/1           37s        164m
production-mgmt-mymgmtsite123-postgres-rmdata-cemg             1/1           20s        14m

$ oc get roles -n apic -l vendor=crunchydata
No resources found in apic namespace.

$ oc get rolebindings -n apic -l vendor=crunchydata
No resources found in apic namespace.

$ oc get secrets -n apic -l vendor=crunchydata
NAME                                     TYPE   DATA   AGE
production-mgmt-7bc754c7-postgres-backrest-repo-config          Opaque  9       6d23h
production-mgmt-7bc754c7-postgres-postgres-secret              Opaque  2       6d23h
production-mgmt-7bc754c7-postgres-primaryuser-secret           Opaque  2       6d23h
production-mgmt-7bc754c7-postgres-testuser-secret               Opaque  2       6d23h
production-mgmt-8aac6b4e-postgres-backrest-repo-config          Opaque  9       6d22h
production-mgmt-8aac6b4e-postgres-postgres-secret               Opaque  2       6d22h
```

```

production-mgmt-8aac6b4e-postgres-primaryuser-secret    Opaque 2 6d22h
production-mgmt-8aac6b4e-postgres-testuser-secret      Opaque 2 6d22h
production-mgmt-mymgmtsite123-postgres-backrest-repo-config Opaque 9 2d21h
production-mgmt-mymgmtsite123-postgres-postgres-secret Opaque 2 2d21h
production-mgmt-mymgmtsite123-postgres-primaryuser-secret Opaque 2 2d21h
production-mgmt-mymgmtsite123-postgres-testuser-secret Opaque 2 2d21h

```

```

$ oc get cm -n apic -l vendor=crunchydata
NAME                                DATA  AGE
production-mgmt-mymgmtsite123-postgres-config  0      2d21h
production-mgmt-mymgmtsite123-postgres-leader  0      2d21h
production-mgmt-mymgmtsite123-postgres-pgbouncer-cm  2      2d21h
production-mgmt-mymgmtsite123-postgres-pgha-config  5      2d21h

```

## Procedure

For each type of postgres resource, check to see if any resources are available and if so, delete the resources:

- pods:
 

```
oc get pods -n <APIC_namespace> -l vendor=crunchydata
```

```
oc delete pods -n <APIC_namespace> -l vendor=crunchydata
```
- deployments:
 

```
oc get deployments -n <APIC_namespace> -l vendor=crunchydata
```

```
oc delete deployments -n <APIC_namespace> -l vendor=crunchydata
```
- Jobs:
 

```
oc get jobs -n <APIC_namespace> -l vendor=crunchydata
```

```
oc delete jobs -n <APIC_namespace> -l vendor=crunchydata
```
- roles:
 

```
oc get roles -n <APIC_namespace> -l vendor=crunchydata
```

```
oc delete roles -n <APIC_namespace> -l vendor=crunchydata
```
- rolebindings:
 

```
oc get rolebindings -n <APIC_namespace> -l vendor=crunchydata
```

```
oc delete rolebindings -n <APIC_namespace> -l vendor=crunchydata
```
- secrets:
 

```
oc get secrets -n <APIC_namespace> -l vendor=crunchydata
```

```
oc delete secrets -n <APIC_namespace> -l vendor=crunchydata
```
- cm:
 

```
oc get cm -n <APIC_namespace> -l vendor=crunchydata
```

```
oc delete cm -n <APIC_namespace> -l vendor=crunchydata
```
- pgtasks
 

```
oc get pgtasks.crunchydata.com -n <APIC_namespace> -l vendor=crunchydata
```

```
oc delete pgtasks.crunchydata.com -n <APIC_namespace>
```
- pgreplica:
 

```
oc get pgreplica -n <APIC_namespace> -l vendor=crunchydata
```

```
oc delete pgreplica -n <APIC_namespace> -l vendor=crunchydata
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## VMware

Use the instructions in this section to install, upgrade, and maintain API Connect on VMware.

- [Planning your deployment](#)  
Before you install API Connect, understand deployment options and requirements for endpoints, load balancing, certificates, and firewalls.
- [Installing API Connect](#)  
Use these instructions to install or upgrade a deployment of API Connect on VMware.
- [Upgrading API Connect](#)  
Upgrade API Connect on VMware to a newer version.

- [Maintaining API Connect](#)

You can use utilities to complete maintenance tasks such as backup, restore, and certificate management in a VMware environment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Planning your deployment

Before you install API Connect, understand deployment options and requirements for endpoints, load balancing, certificates, and firewalls.

- [Deployment overview for endpoints and certificates](#)  
When deploying API Connect, you will create one or more endpoints for the subsystems and then configure certificates or mutual TLS for most endpoints.
- [Firewall requirements on VMware](#)  
Diagram for port configuration, and list of active ports, for an IBM® API Connect deployment on VMware.
- [Load balancer configuration in a VMware deployment](#)  
When deploying API Connect for High Availability, it is recommended that you configure a cluster with at least three nodes and a load balancer. A sample configuration is provided for placing a load balancer in front of your API Connect OVA deployment.
- [A two data center deployment strategy on VMware](#)  
An overview of the two data center disaster recovery deployment strategy in API Connect.
- [Planning your Analytics deployment](#)  
Plan your IBM API Connect Analytics deployment by reviewing options for topology, data modifications, and storage.
- [Working with certificates](#)  
Use the `certs` command included in the APICUP installer to set and manage certificates for each subsystem. Default certificates are automatically applied, but defaults can be overridden by user-supplied custom certificates.
- [Webhooks deployed and managed by the API Connect Operator](#)  
The API Connect Operator deploys and manages various Kubernetes API webhooks in the cluster to assist in management of its custom resources.
- [Tips and tricks for using APICUP](#)  
The APICUP installer in Install Assist contains built-in time saving functions.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Deployment overview for endpoints and certificates

When deploying API Connect, you will create one or more endpoints for the subsystems and then configure certificates or mutual TLS for most endpoints.

### Configuring endpoints

| Subsystem  | Endpoints           | Description                                                                                                                                                                                  | Certificates            |
|------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| Management | cloud-admin-ui      | Configured using APICUP installer. Endpoint on the management server for communication with the Cloud Manager user interface.                                                                | cloud-admin-ui          |
|            | api-manager-ui      | Configured using APICUP installer. API Manager URL endpoint on the management server for communication with the API Manager user interface.                                                  | api-manager-ui          |
|            | consumer-api        | Configured using APICUP installer. Platform REST API endpoint for running consumer APIs on the management server.                                                                            | consumer-api            |
|            | platform-api        | Configured using APICUP installer. Platform REST API endpoint for running admin and provider APIs on the management server.                                                                  | platform-api            |
|            | hub                 | Automated Testing Behavior UI and API endpoint. External Frontend/Ingress, port 443                                                                                                          | hub-endpoint            |
|            | turnstile           | Automated Testing Behavior UI and API endpoint. External Frontend/Ingress, port 443                                                                                                          | turnstile-endpoint      |
| Portal     | portal-admin        | Configured using APICUP installer. Corresponds to Management Endpoint entered in Cloud Manager. Requires a TLS profile configured with mutual TLS.                                           | mutual TLS              |
|            | portal-www          | Configured using APICUP installer. Portal Web site URL entered in Cloud Manager. Used publicly to access Portal.                                                                             | portal-www-ingress      |
| Analytics  | analytics-client    | Configured using APICUP installer. Corresponds to Management Endpoint entered in Cloud Manager. Requires a TLS profile configured with mutual TLS.                                           | mutual TLS              |
|            | analytics-ingestion | Configured using APICUP installer. The analytics-ingestion endpoint is used by the Gateway service to push data to the Analytics service. Requires a TLS profile configured with mutual TLS. | mutual TLS              |
| Gateway    | apic-gw-service     | Configured using APICUP installer. This is the endpoint the gateway uses for network communication. Enter this endpoint as the Management Endpoint entered in Cloud Manager.                 | apic-gw-service-ingress |
|            | api-gateway         | Configured using APICUP installer. This is the endpoint the gateway uses for API traffic. Enter this endpoint as the API Invocation Endpoint in Cloud Manager.                               | api-gateway-ingress     |

The endpoints are configured by the installation Operator. They are set for each subsystem. Endpoints are also entered when configuring the Topology for the Gateway, Portal, and Analytics subsystems in Cloud Manager.

For instructions on configuring endpoints and installing into an OVA environment, see [Installing API Connect](#).

## Configuring certificates

---

The certificates are configured by the Install Assist program using the `api.cup` installer. The certificates for the endpoints are usually configured as custom certificates as described in [Setting custom certificates](#).

## Configuring mutual TLS

---

Mutual TLS is configured for TLS profiles in Cloud Manager. See [Creating a TLS Server Profile](#).

## Configuring a proxy

---

If a Developer Portal is deployed externally to the management server zone, it does not have access to the consumer and product APIs. You need to configure a proxy to enable communication. For more information, see [Configuring a proxy](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Firewall requirements on VMware

Diagram for port configuration, and list of active ports, for an IBM® API Connect deployment on VMware.

### Required Ports between zones

---

The following network diagram example helps to explain which ports must be configured in an API Connect network. Specific ports must be configured to enable the communication between the various zones, both public and private, in a network.

The ports specified in the diagram are default ports. Check your deployment to understand which communication, if any, is configured to use non-default ports.

Table 1. Key for the network diagram example.  
The following table lists the port numbers with a usage description.

|    | Usage description                                                                                         | Default port number                                                                                                                                                                                                                                                                                                                 |
|----|-----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  | API request/response – Users invoking the provided APIs.                                                  | 443 HTTPS from Public zone to Gateway zone                                                                                                                                                                                                                                                                                          |
| 2  | DataPower® administration – Internal operators who are managing the Gateway servers.                      | 22 SSH, 9090 HTTPS from Protected zone to Gateway zone                                                                                                                                                                                                                                                                              |
| 3  | API Manager – Internal business users who are defining and monitoring APIs.                               | 443 HTTPS from Protected zone to Management zone                                                                                                                                                                                                                                                                                    |
| 4  | Cloud Manager – Internal operators who are administering the Cloud.                                       | 22 SSH, 443 HTTPS from Protected zone to Management zone                                                                                                                                                                                                                                                                            |
| 5  | Developer Portal administration – Internal operators who are managing the Portal servers.                 | 22 SSH, 443 HTTPS from Protected zone to Management zone                                                                                                                                                                                                                                                                            |
| 6  | Gateway servers post traffic to Analytics service.                                                        | 443 HTTPS from Gateway servers to Analytics service                                                                                                                                                                                                                                                                                 |
| 7  | Push configuration – Management servers communicate bi-directionally with Gateway servers.                | 3000 and 443 HTTPS Management servers to and from Gateway servers for webhook delivery. Port 3000 is the default port for apic-gw-service, and this is the port Management uses to communicate with Gateway. Port 443 is the default port for the platform-api endpoint, which apic-gw-service uses to communicate with Management. |
| 8  | Push configuration/webhooks – Management servers push configuration and webhooks to the Developer Portal. | 443 HTTPS Management servers to Developer Portal servers for webhook delivery                                                                                                                                                                                                                                                       |
| 9  | Pull configuration/make API calls – Developer Portal servers pull configuration and call REST APIs.       | 443 HTTPS from Developer Portal servers to Management servers within Management zone                                                                                                                                                                                                                                                |
| 10 | Developer Portal – External developers who are accessing the Developer Portal.                            | 443 HTTPS from Public zone to Developer Portal management zone. The reverse proxy/DataPower WAF for incoming web traffic to the Developer Portal cluster must be a transparent proxy - no modification of the portal URL, port, host name or path is allowed.                                                                       |
| 11 | Push API definition to Management server. Pick up credential for microservice code push.                  | 443 HTTPS from Protected zone to Management zone                                                                                                                                                                                                                                                                                    |

|    | Usage description                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Default port number                                                                                                             |
|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| 12 | Analytics offload                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Port will depend on type of plugin and protocol used for the offload. Some possible protocols are: HTTP, HTTPS, TCP, UDP, KAFKA |
| 13 | Analytics accesses NTP                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Standard NTP                                                                                                                    |
| 14 | Analytics access DNS                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Standard DNS                                                                                                                    |
| 15 | Management service queries Analytics service                                                                                                                                                                                                                                                                                                                                                                                                                                  | 443 HTTPS within Management zone                                                                                                |
| 16 | The Portal service invokes an API (GET) on the Analytics service to retrieve data.                                                                                                                                                                                                                                                                                                                                                                                            | 443 HTTPS within Management zone                                                                                                |
| 17 | External billing service – Management cluster connecting to external billing service (when configured for billing). If you are using Stripe as your external billing service, you must enable connections with the Stripe API at: <a href="https://stripe.com/files/jps/jps_api.json">https://stripe.com/files/jps/jps_api.json</a> . You can also view the Stripe IP addresses at the following URL: <a href="https://stripe.com/docs/jps">https://stripe.com/docs/jps</a> . | 443 HTTPS from Management zone to Public zone                                                                                   |
| 18 | Developer Portal cluster must be able to access its own site endpoints.                                                                                                                                                                                                                                                                                                                                                                                                       | 443 HTTPS from Portal zone to Public zone                                                                                       |

## Firewall port requirements on VMware

The following tables lists ports that must be open in both cluster and non-clustered deployments.

Note that clustered VMware environment deployments require additional ports. See [Firewall enabled ports for clustered OVA deployments](#)

Table 2. Firewall port requirements common to all subsystems

| Subsystem                                             | Ports and description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ports that must be open on all API Connect subsystems | <p>The following ports must be open on the Management Server, Analytics, and Developer Portal subsystems, whether in a cluster or not.</p> <ul style="list-style-type: none"> <li>• 53 (outbound) DNS</li> <li>• 123 (outbound) NTP</li> <li>• 179 (inbound and outbound) BIRD routing daemon - VMware environments (OVA) deployments. Used for communication over TCP between servers either within the same subsystem or across different subsystems.</li> <li>• 443 (inbound and outbound) Used by all subsystems for communication with other subsystems</li> <li>• 2020 (inbound) status request. Used for communication over TCP between servers within the same subsystem.</li> <li>• 9177 (inbound and outbound) Member list (group membership) for API Connect <code>apic</code> daemon communication. Used for communication over both TCP and UDP, between servers within the same subsystem.</li> <li>• 9178 (inbound and outbound) API server, for API Connect <code>apic</code> daemon communication. Used for communication over TCP from between servers, both within the same subsystem and across different subsystems. Also used for communication between the <code>apicup</code> configuration utility and servers the <code>apicup</code> configuration utility and servers (this is the only port used by <code>apicup</code>).</li> </ul> |

Each subsystem uses ports in addition to the ports in [Table 2](#). See the following table.

Table 3. Additional firewall port requirements for each subsystem

| Subsystem          | Ports and description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Management Service | <p>Management Service uses the ports in <a href="#">Table 2</a> plus:</p> <ul style="list-style-type: none"> <li>• 22 remote backup server port (inbound, configurable)<br/>If backups are configured to use another port, ensure that the port is open. See <a href="#">Backing up the management subsystem in VMware environments</a>.</li> </ul> <p>Note: this port does not have to be open between the management server and the portal server.</p> <ul style="list-style-type: none"> <li>• SMTP server port (outbound), typically 25</li> <li>• 161 (inbound) SNMP. Over UDP.</li> <li>• LDAP server port (if using LDAP user registry), typically 389 (outbound)</li> <li>• In a clustered deployment, the Management Services uses additional ports. See <a href="#">Firewall enabled ports for clustered OVA deployments</a>.</li> </ul> <p>The Automated test behavior application must be able to invoke (outbound) any port that a test system might present an API on. It can be bound to a particular port (if it is the same in all environments) or to a range of ports (to cover all of the ports it might invoke).</p> |
| Developer Portal   | <p>The Developer Portal uses the ports listed in <a href="#">Table 2</a>, plus:</p> <ul style="list-style-type: none"> <li>• 22 - A remote backup server port (inbound, configurable)<br/>If backups are configured to use another port, ensure that the port is open. See <a href="#">Backing up and restoring the Developer Portal in a Kubernetes environment</a>.</li> </ul> <p>Note: this port does not have to be open between the management server and the portal server.</p> <ul style="list-style-type: none"> <li>• 25 - (outbound) SMTP server port.</li> <li>• In a clustered deployment, the Developer Portal uses additional ports. See <a href="#">Firewall enabled ports for clustered OVA deployments</a>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                   |
| Analytics          | <p>The Analytics subsystem uses the ports listed in <a href="#">Table 2</a>, plus:</p> <ul style="list-style-type: none"> <li>• 161 for SNMP is required for both non-clustered and clustered deployments. UDP, inbound only.</li> <li>• In a non-clustered deployment, no additional ports are required.</li> <li>• Analytics supports an optional configuration for offload of data. This configuration might require additional outbound ports to be open.</li> <li>• In a clustered deployment, the Analytics subsystem uses additional ports. See <a href="#">Firewall enabled ports for clustered OVA deployments</a>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Subsystem      | Ports and description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Gateway Server | <p>The Gateway Server uses these ports in both non-clustered and clustered deployments:</p> <ul style="list-style-type: none"> <li>• 161 (inbound) SNMP. UDP protocol. Not needed if SNMP not enabled.</li> <li>• 162 (outbound) SNMP traps</li> <li>• 3000 (inbound) Gateway Service local port (configurable)</li> <li>• 5550 (inbound) XML management port (configurable)</li> <li>• 5554 (inbound) REST management port (if enabled; configurable)</li> <li>• 9022 (inbound) Gateway SSH (if enabled; configurable)</li> <li>• 9090 (inbound) Web GUI console (if enabled; configurable)</li> <li>• 9443 (inbound) Gateway local port (configurable)</li> <li>• In a clustered deployment, the Gateway Server uses additional ports. See <a href="#">Firewall enabled ports for clustered OVA deployments</a>.</li> </ul> |

## Communications inside the Gateway cluster

There are a number of important points to note regarding the communications within the Gateway cluster.

- We advise that you use the same port for all Gateway servers within a cluster.
- Gateway servers communicate with each other to synchronize invocation counts.
- All Gateway servers in a Gateway cluster must be able to reach all of the other Gateway servers in the same Gateway cluster.
- Gateway servers in a Gateway cluster do not directly communicate with Gateway servers in a different Gateway cluster.
- All Gateway servers must be able to reach the management subsystem platform API endpoint, which was configured during the installation of your API Connect environment.

## Ethernet interface usage

To separate network traffic, you can use two or more Ethernet interfaces on the DataPower appliance on which a Gateway server is installed. For example, you can use one interface for internal IBM API Connect communications, and another for processing incoming API calls.

## Port requirement for Stripe billing service

All Management servers and Developer Portal servers must be able to communicate HTTPS content with the external billing service when billing is configured. If you are using Stripe as your external billing service, you must enable HTTPS communication on port 443 with the Stripe API: [https://stripe.com/files/ips/ips\\_api.json](https://stripe.com/files/ips/ips_api.json). Note: API Connect does not support using webhooks with Stripe. You can see a list of the Stripe IP addresses at: <https://stripe.com/docs/ips>.

- [Firewall enabled ports for clustered OVA deployments](#)  
In a clustered OVA deployment of API Connect, specific ports must be configured for communication between members of each API Connect subsystem.
- [Load balancer ports for clustered OVA deployments](#)  
When you deploy a load balancer with a clustered deployment, in a VMware environment, you must ensure that the necessary ports are open.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Firewall enabled ports for clustered OVA deployments

In a clustered OVA deployment of API Connect, specific ports must be configured for communication between members of each API Connect subsystem.

OVA deployments require the common ports that are listed in [Firewall requirements on Kubernetes](#). When the VMs are clustered, additional ports are used for communication between the members of the subsystems in the cluster.

All ports must be enabled inbound and outbound.

Table 1. Firewall enabled ports for clustered VMware environment deployments

| Subsystem                                                         | Ports                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ports that must be open between all subsystem VMs                 | <p>442, 2379, 2380, 6443, 6444, 9099, 10248, 10249, 10250, 10251, 10252, 10254, 10256, 10257, 10259</p> <p>These ports must be open between all servers within a given subsystem. For example, from management server to management server, or from portal server to portal server, or from analytics server to analytics server. These ports are not used for communication between subsystems.</p> <p>You might need additional ports for Kubernetes-proxied services. The default range is 30000 – 32767. Since the ports in use can change dynamically, ensure that the default range is open.</p> |
| Additional ports that must be open between Management Service VMs | <p>Port 8088 is required if the Automated testing behavior application is deployed for the Management Service VMs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Subsystem                                                       | Ports                                                 |
|-----------------------------------------------------------------|-------------------------------------------------------|
| Additional ports that must be open between Developer Portal VMs | 3009, 3010, 3306, 3307, 4443, 4444, 4567, 4568, 30865 |
| Additional ports that must be open between Gateway Service VMs  | 16380, 16381, 26380, 26381                            |
| Additional ports that must be open between Analytics VMs        | No additional ports are needed.                       |

These internal ports are not used for communication between VMs. Ensure that they are open on the VM server locally.

Table 2. Internal ports reserved by API Connect

| Subsystem                                 | Ports                                                                                                                                          |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Reserved local ports on all subsystem VMs | 8383, 8686, 8080, 8443, 30000:59999                                                                                                            |
| Management Service VMs                    | 2000, 2001, 2002, 2005, 2006, 2007, 2008, 2022, 3003, 3004, 3006, 3007, 3011, 3023, 4150, 4151, 4171, 4222, 5432, 6222, 7777, 8084, 8222, 8404 |
| Portal Service VMs                        | 3058, 3059, 3060, 3061                                                                                                                         |
| Analytics VMs                             | 4443, 5000, 5601, 9200, 9300                                                                                                                   |

Note: The ports should support IP-in-IP (protocol 4), per <https://docs.projectcalico.org/getting-started/kubernetes/requirements>.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Load balancer ports for clustered OVA deployments

When you deploy a load balancer with a clustered deployment, in a VMware environment, you must ensure that the necessary ports are open.

The load balancer needs port 443 for all API Connect subsystems (Management, Analytics, Developer Portal, DataPower Gateway).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Load balancer configuration in a VMware deployment

When deploying API Connect for High Availability, it is recommended that you configure a cluster with at least three nodes and a load balancer. A sample configuration is provided for placing a load balancer in front of your API Connect OVA deployment.

### About this task

API Connect can be deployed on a single node cluster. In this case the ingress endpoints are host names for which the DNS resolution points to the single IP address of the corresponding node hosting a particular subsystem, and no load balancer is required. For high availability, it is recommended to have at least a three node cluster. With three nodes, the ingress endpoints cannot resolve to a single IP address. A load balancer should be placed in front of an API Connect subsystem to route traffic.

Because it is difficult to add nodes once endpoints are configured, a good practice is to configure a load balancer even for single node deployments. With the load balancer in place, you can easily add nodes when needed. Add the node to the list of servers pointed to by the load balancer to avoid changing the ingress endpoints defined during the installation of API Connect.

To support Mutual TLS communication between the API Connect subsystems, configure the load balancer with **SSL Passthrough** and **Layer 4** load balancing. In order for Mutual TLS to be performed directly by the API Connect subsystems, the load balancer should leave the packets unmodified, as is accomplished by Layer 4. Following is a description of the communication between the endpoints that are configured with Mutual TLS:

- API Manager (with the client certificate portal-client) communicates with the Portal Admin endpoint portal-admin (with the server certificate portal-admin-ingress)
- API Manager (with the client certificate analytics-client-client) communicates with the Analytics Client endpoint analytics-client (with the server certificate analytics-client-ingress)
- API Manager (with the client certificate analytics-ingestion-client) communicates with the Analytics Ingestion endpoint analytics-ingestion (with the server certificate analytics-ingestion-ingress)

Set endpoints to resolve to the load balancer

When configuring a load balancer in front of the API Connect subsystems, the ingress endpoints are set to host names that resolve to a load balancer, rather than to the host name of any specific node. For an overview of endpoints, see [Deployment overview for endpoints and certificates](#).

Use this example configuration as a guideline to determine the best way to configure the load balancer for your deployment.

## Procedure

- **Appliance deployment**

In this example configuration, the API Connect Management, Portal, Analytics and Gateway subsystems are deployed as three node clusters in Standard mode. An HAProxy load balancer is used. The load balancer is configured with ssl-passthrough and with upstream selection based on SNI. DNS resolution is configured to resolve the endpoints to the IP address of the load balancer. If a single HAProxy node is used, then all endpoints must resolve to the IP address of the single HAProxy. The following example endpoints require DNS resolution for this example:

- o api-manager-ui.sample.example.com
- o cloud-admin-ui.sample.example.com
- o consumer-api.sample.example.com
- o platform-api.sample.example.com
- o admin.portal.sample.example.com
- o web.portal.sample.example.com
- o analytics.client.sample.example.com
- o analytics.ingestion.sample.example.com
- o api-gateway.sample.example.com
- o apic-gw-service.sample.example.com

Following is an example HAProxy configuration for one HAProxy node distributing traffic to Management and Portal clusters:

Note:

- o When you configure a load balancer in front of a Management subsystem, specify timeouts of at least 240 seconds. Note that large deployments might need larger values.

The default timeout is typically 50 or 60 seconds, which is not long enough to avoid **409**

**Conflict** or **504 Gateway Timeout** errors. The **409 Conflict** error can occur when the time needed to complete an operation is sufficiently long that a second request gets issued.

For example, to specify 240 seconds when using HAProxy as a load balancer, set `timeout client` and `timeout server` to `240000`.

- o Ensure that the load balancer is configured to support the cipher `TLS_ECDHE_RSA_WITH_AES256_GCM_SHA384 (0xc030)`. When the Developer Portal, as a client, calls back to platform-api-endpoint or consumer-api-endpoint of the management subsystem, it sends only a single cipher in the Client Hello. The cipher is `TLS_ECDHE_RSA_WITH_AES256_GCM_SHA384 (0xc030)`. The SSL Handshake will fail if this cipher is not configured (supported) on the client's load balancer.

```
# This sample HAProxy configuration file configures one HAProxy node to distribute traffic to
# Management, Portal, Analytics, and Gateway clusters. Another option is to configure one HAProxy
# node per cluster.

option ssl-hello-chk

#
# One entry per Gateway node.
# Hostname and TCP Port for the Gateway node.
#
server gateway0 gateway1.sample.example.com:443 check
server gateway1 gateway2.sample.example.com:443 check
server gateway2 gateway3.sample.example.com:443 check

```

- The following diagram depicts a typical layout for a load balancer in front of three API Connect subsystems, with each subsystem containing three Appliance/OVA

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## A two data center deployment strategy on VMware

An overview of the two data center disaster recovery deployment strategy in API Connect.

## High availability versus disaster recovery

High availability is concerned with configuring a system so that it continues to operate, and the users and any using systems don't experience any loss of service, in the event of hardware or software failures. Whereas, disaster recovery (DR) is concerned with the configurations and procedures that allow a system to be recovered following a catastrophic hardware, software, or operator failure that's led to a loss of service. The following two important metrics should be considered for DR solutions:

#### Recovery Time Objective (RTO)

The RTO is the time that it is acceptable for a system to be unavailable for during a disaster.

#### Recovery Point Objective (RPO)

As DR solutions are usually based on some sort of data copy or backup, it is possible that a system might be recovered to a state prior to the disaster occurring, rather than the state it was in at the actual instant of the disaster. The RPO measures how far back in time the recovery point will be, and therefore how much data might be lost. An RPO of zero would assert that no data will be lost, but such a solution is often a compromise against the cost and performance of the system.

To achieve high availability in your API Connect deployment, a minimum of three data centers are required. This configuration creates a quorum of data centers, allowing automated failover in any direction, and enabling all three data centers to be active. The quorum *majority voting* algorithm, allows for a single data center to be offline, and yet still maintain data consistency and availability across the remaining two data centers as they continue to represent a majority in the deployment (avoiding split-brain syndrome). However, when having three data centers is not possible, a two data center deployment provides a disaster recovery solution that has both a low Recovery Time Objective (RTO), and a low Recovery Point Objective (RPO). The following information provides an overview of the concepts and architecture required for configuring a two data center deployment in API Connect.

## High-level notes about the two data center disaster recovery (DR) solution

---

- Two data center DR is strictly an Active/Passive deployment for the API Manager and Developer Portal services, and must use manual failover.
- Two DataPower® gateway subsystems must be deployed to provide high availability for the gateway service. However, this scenario doesn't provide high availability for the analytics service.
- If high availability is required for the analytics service, two analytics subsystems must be configured, one per gateway subsystem, but with this configuration Developer Portal analytics isn't possible.
- Data consistency is prioritized over data availability.
- Each data center must be setup within its own Kubernetes cluster (OpenShift and VMWare are hosted on Kubernetes).
- Latency between the two data centers must be less than 80ms.
- Replication of the API Manager is asynchronous so, depending on the amount of latency between the two data centers, there is a small possibility that recent updates are not transferred in the event of a failure.
- Replication of the Developer Portal is synchronous, and therefore the latency is limited to 80ms or less.
- The API Manager and the Developer Portal services in the two data centers must either all be highly available, or none of them highly available, and the number of nodes on each data center must match.
- The deployment in each data center is effectively an instance of the same API Connect deployment - therefore, the endpoints, certificates, and Kubernetes secrets must all be the same.

## Deployment architecture

---

A two data center deployment model is optimized for data consistency ahead of data availability, and must use manual failover when a fault occurs. If data availability is also a priority, three data centers are required, and a quorum can be used for automatic failover. It is not possible to have automatic failover with only two data centers.

To have a single Kubernetes cluster span the two data centers the latency must be less than 6ms. However, as it is likely that the two data centers will be geographically disparate, a single Kubernetes cluster cannot be used to span both data centers, instead each data center must be set up within its own Kubernetes cluster. To achieve data replication in a reasonable time frame in this scenario, latency between the two data centers must still be less than 80ms, and database replication is handled outside of Kubernetes.

To achieve high availability for the DataPower Gateway, you must deploy two gateway subsystems; one subsystem in the active data center, and a separate subsystem in the standby passive data center, and then publish all Products and APIs to both gateway subsystems. The gateway subsystems are independent, and so are insulated if an issue occurs in one of them. A global dynamic router can then be used to route traffic to one gateway subsystem or the other. If high availability is also required for the analytics service, two analytics subsystems must be configured, one per gateway subsystem, but with this configuration Developer Portal analytics isn't possible.

A Catalog can have only a single Developer Portal service associated with it, and so this service needs to be highly available across both data centers. The requirement for a highly available service across both data centers also applies to the API Manager service, as it forms the core of API Connect, and is used for all user authentication and application/subscription operations in the Developer Portal.

There can be multiple Developer Portal services in an API Connect deployment (although still only one Developer Portal per Catalog), and those Developer Portal services can be in different data centers to API Manager (for example, Hybrid Cloud), so there must be the ability to monitor and failover individual services.

The deployment in each data center is effectively an instance of the same API Connect deployment – as the database is shared, all of the configuration is also shared. Therefore, the endpoints, certificates, and Kubernetes secrets all need to be the same.

#### Active/Passive configuration

The data centers are run with an Active/Passive failover configuration.

#### Dynamic routing

Note: A dynamic routing device, such as a load balancer, is required to route traffic to either data center. However, neither this device nor its configuration is part of the API Connect offering. Contact IBM Services if you require assistance with configuring a dynamic router.

The dynamic router configuration must handle the traffic between the subsystems, as well as between the data centers. For example, the consumer API calls from the Developer Portal to API Manager must transfer via a dynamic router so that the Developer Portal can use a single endpoint regardless of which data center API Manager is active in. The same is needed for calls to the Platform and Admin APIs from the other subsystems, as well as for incoming UI traffic for the Developer Portal UI, Cloud Manager UI, and API Manager UI.

The dynamic router must support SSL passthrough, so that it also routes the Mutual TLS (mTLS) connections between API Manager and the Developer Portal, and between API Manager and the DataPower Gateway. There should be no need to do TLS termination on the router, as it should be able to do layer 4 based routing by using SNI.

#### Service status

When a failure occurs, it is common practice to display an interstitial system outage web page. The dynamic router can be configured to display this web page when there is a failure, while the manual failover to the passive data center is taking place.

#### Deployment-profiles - Dev and Prod

Two data center DR deployment architecture is possible whether the Kubernetes clusters in each data center have a Dev or a Prod profile. In other words, you can still configure a two data center DR topology when there is only 1 pod of each type, as well as when there are 3 pods of each type. For more information about the deployment-profiles, see [Installing the API Connect subsystems](#) on Kubernetes, and [Requirements for initial deployment on VMWare](#).

For more information about a two data center DR deployment, see the following topics:

VMware

- [Installing a two data center deployment](#)
- [Maintaining a two data center deployment](#) (including information about normal operation data flows)
  - [Failure handling of a two data center deployment](#)
  - [Recovering from a failover of a two data center deployment](#)
  - [Backup and restore considerations for a two data center deployment](#)
  - [Upgrading a two data center deployment](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Planning your Analytics deployment

Plan your IBM® API Connect Analytics deployment by reviewing options for topology, data modifications, and storage.

Planning your Analytics topology is an important step in ensuring a successful and scalable solution. After you plan your overall API Connect topology, you should plan the Analytics subsystem deployment by choosing a topology, planning any data modifications, and estimating the amount internal storage that is needed for the deployment.

- [Planning the Analytics profile and storage](#)  
Begin planning your IBM API Connect Analytics deployment by choosing a deployment profile and a storage class.
- [Planning your topology](#)  
Determine the topology of your IBM API Connect Analytics deployment to take advantage of the microservices that are best suited to your needs.
- [Planning to modify your analytics data](#)  
Review how you can optionally customize the analytics data in your IBM API Connect Analytics deployment before storing it.
- [Estimating internal storage space](#)  
If you plan to store data locally in your IBM API Connect Analytics deployment, estimate disk space requirements.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Planning the Analytics profile and storage

Begin planning your IBM® API Connect Analytics deployment by choosing a deployment profile and a storage class.

### Deployment profile

The first decision you must make is which **deployment-profile** you want to use. There are two choices:

- **n1xc2.m16**: development profile
- **n3xc4.m16**: production profile

The development profile describes a hardware profile of 1 node, 2 cores, and 16 GB memory. This profile deploys a single-node, non-HA, non-scalable Analytics solution. The development profile is only recommended for the most basic analytics validation.

The production profile describes a hardware profile of 3 nodes, 4 cores, and 16 GB memory. This profile deploys a three-node, HA, scalable Analytics solution. The production profile requires at least 3 nodes to work properly, and is the recommended option for production environments.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Planning your topology

Determine the topology of your IBM® API Connect Analytics deployment to take advantage of the microservices that are best suited to your needs.

Each Analytics topology provides a set of the Analytics microservices as well as external integrations.

### Default topology

The default topology for Analytics is useful for many organizations. It provides you with business analytics and metrics in API Manager, and consumer analytics in Portal. It is suitable for production environments and is easily scalable.

The default topology contains the following microservices:

- client: Kibana-based service for serving the Analytics UI and REST API
- cj-retention: Storage data retention service cronjob
- cj-rollover: Storage index management rollover service cronjob
- ingestion: Logstash-based data pipeline for receiving and routing data to internal or external storage
- mtls-gw: Openresty-based service for routing ingress traffic to client or ingestion
- storage-coord: Elasticsearch based service for routing and aggregating requests
- storage-data: Elasticsearch-based service for writing, reading and storing the data
- storage-master: Elasticsearch-based service for managing and monitoring cluster state and health

For the complete list of available microservices, see [Reference: Analytics microservices](#).

- [Reference: Analytics microservices](#)  
See the complete list of microservices provided by IBM API Connect Analytics.
- [Planning to add a message queue](#)  
Review how a message queue increases reliability in the analytics data pipeline in your IBM API Connect Analytics deployment.
- [Planning to offload data to a third-party system](#)  
Review the considerations for offloading data from your IBM API Connect Analytics deployment to a third-party system for additional storage and analysis.
- [Planning to scale storage](#)  
Review considerations in scaling the data storage in your IBM API Connect Analytics deployment.
- [Planning to disable internal storage](#)  
Review considerations for disabling local storage and offloading all data in your IBM API Connect Analytics deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Reference: Analytics microservices

See the complete list of microservices provided by IBM® API Connect Analytics.

Table 1 provides the name, class, and a brief description of each microservice

Table 1. Analytics microservices

| Name           | Class     | Description                                                                                                                             |
|----------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| client         | client    | Elastic Kibana-based service for serving the analytics UI and REST API                                                                  |
| cj-retention   | cronjobs  | Storage data retention service cronjob                                                                                                  |
| cj-rollover    | cronjobs  | Storage index management rollover service cronjob                                                                                       |
| ingestion      | ingestion | Elastic Logstash-based data pipeline for receiving and routing data to internal or external storage                                     |
| mq-kafka       | mq        | Optional Apache Kafka-based data message queuing for temporarily buffering data in the pipeline.                                        |
| mq-zk          | mq        | Optional Apache Zookeeper-based service for managing distributed mq-kafka configuration.                                                |
| mtls-gw        | mtls-gw   | Openresty-based service for routing ingress traffic to client or ingestion                                                              |
| storage-coord  | storage   | Elastic Elasticsearch-based service for routing and aggregating requests                                                                |
| storage-data   | storage   | Elastic Elasticsearch-based service for writing, reading and storing the data                                                           |
| storage-master | storage   | Elastic Elasticsearch-based service for managing and monitoring cluster state and health                                                |
| storage-shared | storage   | Elastic Elasticsearch-based service that combines the workload of storage-coord, storage-data, and storage-master into a single service |

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Planning to add a message queue

Review how a message queue increases reliability in the analytics data pipeline in your IBM® API Connect Analytics deployment.

The message queue microservices are an optional component that provide additional reliability in the data pipeline. The message queue components split the ingestion data pipeline from 1 to 3 internal pipelines. The first pipeline receives the data from the Gateway and pushes this data into two topics in the mq-kafka service. Then, the other two pipelines pull data out of these topics separately and push data into internal or external storage as required.

This separation of pipelines add greater reliability in the event that either the internal or external storage service is unresponsive. Additional benefits include better handling of unexpected traffic spikes and a larger buffer to handle temporary internal storage issues (red indices). The disadvantage is that adding these optional components requires additional memory and CPU in your Analytics deployment.

Enabling the message queue adds the following microservices to your topology:

- mq-kafka
- mq-zk

For instructions on enabling the message queue, see [Adding a message queue](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Planning to offload data to a third-party system

Review the considerations for offloading data from your IBM® API Connect Analytics deployment to a third-party system for additional storage and analysis.

The analytics event data that is generated by the Gateway and collected by the analytics subsystem can be offloaded to a third-party service in real-time. The third-party service can provide enhanced monitoring, alerting, storage, and/or analysis, in addition to what the built-in Analytics subsystem provides. Multiple target systems are supported, and the data can be modified prior to offloading.

APIC supports offloading analytics data to the following third-party systems:

- HTTP(s) endpoints
- Elastic Elasticsearch v6, v7
- Apache Kafka v1.0.0
- Syslog servers

For instructions on configuring your offload settings, see [Offloading data to a third-party system](#).

If you just want to extend the existing analytics functionality by integrating with the third-party system, consider [adding a message queue](#) to your deployment. Enabling a message queue ensures that if either the internal or external storage becomes unavailable, it does not affect the other system.

If you do not need internal storage and only want to use the third-party system for working with your analytics data, consider disabling internal storage entirely as explained in [Planning to disable internal storage](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Planning to scale storage

Review considerations in scaling the data storage in your IBM® API Connect Analytics deployment.

By default, the Analytics subsystem deploys on VMware using shared storage.

If you anticipate storing large amounts of data, you can configure the use of unique storage roles instead. The unique storage roles manage data using three separate microservices:

- The storage-coord service manages the routing and aggregating of requests.
- The storage-data service manages the reading and writing of data, and executes complex queries and aggregations.
- The storage-master service manages cluster state and health.

This distribution allows each service to manage a finite set of tasks, and reduces the workload for individual services, thus improving performance. This distribution also allows you to scale each of the services independently. For example, if you only need to improve disk I/O performance, you could only scale the storage-data service, which manages the disk.

Although having the services split into unique roles provides benefits, it also requires additional resources and adds complexity to running and managing the internal storage datastore. For example, with unique roles, a production deployment has 3 instances of storage-coord, 3 instances of storage-data, and 3 instances of storage-master, all running at the same time.

The shared role that is configured by default reduces this complexity and scales down the amount of services running under the storage microservices set by having each service perform all three roles. Using the same example, the product deployment that uses shared storage has only 3 instance of storage-shared running. This approach greatly decreases the amount of memory and CPU that you need to run analytics storage effectively, without compromising your entire deployment by downgrading to the development topology.

Although it is recommended to run with unique roles for each storage microservice for performance gains, it is not a requirement and in some cases, it might be more than you need.

If you do change your storage type to unique roles, the storage-shared microservice is disabled and the storage-coord, storage-data, and storage-master microservices are enabled instead.

For instructions on configuring roles for storage microservices, see [Declaring your storage type](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Planning to disable internal storage

Review considerations for disabling local storage and offloading all data in your IBM® API Connect Analytics deployment.

The Analytics subsystem provides a complete solution for routing, storing and viewing the analytics data. However, you might not need the internal storage and viewing solution, especially if you are primarily using a third-party system for data offloading. In this scenario, you can greatly reduce your CPU and memory costs by disabling the internal storage and viewing components.

With this approach, data that is offloaded is not viewable in the Analytics UI in API Manager and Developer Portal, so those components can be disabled as well.

When you disable internal storage for analytics data, the following microservices are disabled:

- client
- cj-retention
- cj-rollover
- storage-coord
- storage-data
- storage-master
- storage-shared

For more information on disabling internal storage, see [Disabling internal storage](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Planning to modify your analytics data

Review how you can optionally customize the analytics data in your IBM® API Connect Analytics deployment before storing it.

You can create filters to customize the analytics data before storing in external or internal storage. Filters allow you to add new fields, modify existing fields, or remove fields from the data. You can do this globally for the entire Analytics subsystem, or you can do it conditionally for a specific API. By default, filters are defined at the global level, so unless you include conditionals, changes are applied to every piece of data flowing through the pipeline.

For information on adding filters to the Analytics CR to modify your data, see [Modifying your analytics data](#).

---

## What fields can you modify?

The fields that are available for you to interact with are described in [API event record fields](#). Each API defined in the Management subsystem and published to your Gateway has its own success and error log policies. The log policy settings determine what data is available for customization. Be sure to verify the existence of a field before trying to modify it; otherwise your pipeline might fail.

Modifying fields is a complex operation and can cause problems with your data. It is highly recommended that you remove fields entirely (instead of modifying them) if you need to sanitize data. If you want to change the format of an existing field, you should create a new, unique field.

**Important:** Do not change the data type of existing fields or modify fields critical to the Analytics subsystem's operations and access control. Doing so can cause problems with retrieving or storing data. The following fields are restricted (note that there might be other fields that are not included in this list):

- org\_id
- catalog\_id
- space\_id
- developer\_org\_id
- datetime
- @timestamp

The service for the data pipeline is based on Elastic Logstash, which provides [a set of predefined filter plugins](#) that you can use for modifying data. However, the plugins are third-party software that IBM does not control, so IBM cannot guarantee support for them.

---

## Which pipeline is affected by the filter?

The message queue and offload **enabled** settings determine which pipeline's data is affected by filters. Table 1 specifies which pipeline's data is affected when the message queue and offload settings are enabled in different combinations.

Table 1. Settings that determine which pipeline is affected by filters

|                           | Offloading is enabled                                                                                                                          | Offloading is disabled                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Message queue is enabled  | <ul style="list-style-type: none"><li>• Offload.filter applies to offloaded data</li><li>• Ingestion.filter applies to internal data</li></ul> | <ul style="list-style-type: none"><li>• Offload.filter is ignored</li><li>• Ingestion.filter applies to internal data</li></ul> |
| Message queue is disabled | <ul style="list-style-type: none"><li>• Offload.filter applies to all data</li><li>• Ingestion.filter applies to all data</li></ul>            | <ul style="list-style-type: none"><li>• Offload.filter is ignored</li><li>• Ingestion.filter applies to all data</li></ul>      |

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Estimating internal storage space

If you plan to store data locally in your IBM® API Connect Analytics deployment, estimate disk space requirements.

This information applies only to data that is stored in API Connect Analytics and not to data that is offloaded to a third-party system. The formula and guidelines are based on known information about how the Analytics service stores data, and cannot be directly applied to any other storage system.

Use the following guidelines to calculate a rough estimate of the amount disk space you need for storing stateful data in the API Connect Analytics microservices.

## Data storage: calculate how much data you want to store

---

This section applies if you have chosen a topology that uses the storage-data or storage-shared microservices.

The amount of disk space needed for storing analytics data is determined by the following factors:

Number of copies of the analytics data

Each copy of the analytics data must live on a separate node. The number of nodes in your deployment (based on your chosen profile in [Planning the Analytics profile and storage](#)) determines the number of copies of analytics data that is stored in your deployment. With the **production** deployment profile, analytics data is replicated to three nodes (two replicas and one primary copy of the data) for storage. In the **development** profile, you only need to store one copy of the data.

Number of copies of data:

```
Copies of data = [1 | 3]
```

Number of days that data is retained

By default, analytics data is retained for 90 days, but you can [modify the retention setting](#) as needed. Make sure you know how long you want to store the data before attempting to calculate required disk space.

Number of days that data is retained:

```
Data retention = [90 days | preferred length]
```

Amount of each type of data stored

The required storage space for each type of logging is highly dependent on your APIs and usage. For each API, you can [configure logging](#) for the API activity, header, and payload. You can also [customize the data](#) to add, redact, or remove fields, which also impacts the amount of data that you store.

To estimate storage needs, calculate the average size of each type of log. When calculating your estimates, remember that the header logging size is the sum of activity logging size and the average size of your headers. The payload logging size is the sum of the header logging size and the average size of your payloads. Typically the average size of an activity logged event is 600-1000 bytes depending on the uniqueness and complexity of your analytics data. This number is highly dependent on your APIs and your implementations. For a rough estimate, you can use an average of 800 bytes per activity logged event.

If you choose to add fields, calculate the average size of the new fields as well, and add that number to all types of log policies. If you choose to remove fields, you should not subtract this size from the log policies unless you are also removing headers and/or payloads.

Amount of each type of data that is stored:

```
Activity log bytes per call = [600-1000 bytes]
Header log bytes per call = Activity log bytes per call + Average size of headers
Payload log bytes per call = Header log bytes per call + Average size of payloads
```

Percentage of each type of data

Estimate the percentage of each type of log (activity, header, payload) for all API calls.

If you follow best practices of using only activity logging for production environments and using only payload logging for test environments, this number is easy to determine. If you use different log policies per API, and they depend on "success" or "error" factors, the percentage is more difficult to determine. Typically, if you do not use an all-or-nothing method for logging, error rates range from 3% to 25% with subsequent payload logging in test and production environments. However, this is entirely dependent on your use case and your APIs.

Percentage of each type of data that is stored:

```
% of Activity log = [0, 100 or other estimate]
% of Header log = [0, 100 or other estimate]
% of Payload log = [0, 100 or other estimate]
```

Estimated number of API calls per month

When planning your API Connect deployment, this number is helpful. When estimating analytics storage, this number is vital because it is directly correlated to how much storage you need for your deployment.

If you do not know the number of calls per month, but you do know the number of calls per second, use the following formula to convert it to calls per month:

```
Calls per month = Calls per second * 86400 seconds per day * 30 days per month
```

Number of API calls per month:

```
Calls per month = [any estimate]
```

## Calculating your disk space requirement

---

Estimate the disk space requirement for each storage node by completing following calculations.

Formula

```
Bytes per call = (% of Activity Log * Activity Log bytes per call) + (% of Header Log * Header Log bytes per call) + (% of
Payload Log * Payload Log bytes per call)
Calls per retention period = Calls per month * (Number of days retained / 30 days per month)
Storage for API calls = Calls per retention period * Bytes per call * Copies of data
Total storage = Storage for API calls + Overhead
Storage per node = Total storage / Nodes
```

Details

1. Bytes per call:

Estimate the number of bytes that are logged for a single copy of each API call. This can be calculated from the prerequisites of the percentage of each data type and the amount of each data type stored.

**Bytes per call = (% of Activity Log \* Activity Log bytes per call) + (% of Header Log \* Header Log bytes per call) + (% of Payload Log \* Payload Log bytes per call)**

2. Calls per retention period:

Calculate the anticipated number of API calls per retention period. This can be calculated from the prerequisites of the estimated calls per month and your desired data retention.

**Calls per retention period = Calls per month \* (Number of days retained / 30 days per month)**

3. Storage for API Calls:

Calculate the storage needed for all copies of your api calls for your retention period. This can be calculated from steps 1 and 2, as well as the prerequisite of your total copies of your data.

**Storage for API calls = Calls per retention period \* Bytes per call \* Copies of data**

4. Total Storage:

Calculate the total storage you need by adding buffer space to the value from step 3. The Analytics service requires some overhead space to complete its operations; for example, to contain system data and temporary debug header or payload logging. In addition, allowing extra space provides a buffer in case you underestimated the number of calls, or experience an unexpected increase.

There is no specific value for the buffer because it's based on your own situation. One approach is to use a value that rounds the Storage for API calls result from step 3 to the next whole number. Make sure the rounding leaves you with a comfortable amount of additional space. For example, if the result from step 3 is 380 GB, then adding 20 GB to reach 400 GB is probably not sufficient and you should consider rounding to a larger value such as 500 GB.

**Total storage = Storage for API calls + Buffer**

5. Storage per node:

Calculate the total storage amount required per storage node. The number of storage nodes is dependent on your deployment profile. For the **development** profile, use 1. For the **production** profile, it defaults to 3. If you manually scaled the storage-data or storage-shared microservices to be greater than 3, use your actual values.

**Storage per node = Total storage / Nodes**

Remember: This result is only an estimate. You should monitor the use of space over time and adjust storage as needed.

Save this information for when you are updating the Analytics CR for your installation. For more information on configuring the volume sizes of these services, see [Defining your internal storage space](#).

Example

Deployment information:

**Copies of data = 3**  
**Data retention = 90 days**  
**Activity log bytes per call = 850 bytes**  
**Header log bytes per call = 15k bytes**  
**Payload log bytes per call = 30.5k bytes**  
**% of Activity log = 100%**  
**% of Header log = 0%**  
**% of Payload log = 0%**  
**Calls per month = 64 million**

Formula:

**Bytes per call = (% of Activity Log \* Activity Log bytes per call) + (% of Header Log \* Header Log bytes per call) + (% of Payload Log \* Payload Log bytes per call)**  
**Calls per retention period = Calls per month \* (Number of days retained / 30 days per month)**  
**Storage for API calls = Calls per retention period \* Bytes per call \* Copies of data**  
**Total storage = Storage for API calls + Overhead**  
**Storage per node = Total storage / Nodes**

Details:

1. Bytes per call = 850 bytes

**(100% of Activity Log \* 850 bytes) + (0% of Header Log \* 15k bytes) + (0% of Payload Log \* 30.5 bytes)**

2. Calls per retention period = 192 million calls

**64 million calls per month \* (90 days retained / 30 days per month)**

3. Storage for API calls = 489.6 GB

**192 million calls per period \* 850 bytes per call \* 3 copies of data**

4. Total storage = 600 GB

**489.6GB storage + Buffer**

Since rounding to 500 GB only provides 10.4 GB of extra space, consider rounding to 600 GB instead.

5. Storage per node = 200 GB

**600GB Total storage / 3 nodes**

In this example, the estimated disk needed on each node for storage-data and storage-shared microservices is 200GB.

## Master storage: estimate disk space needs

This section applies if you are planning a topology with the storage-master microservice enabled.

For the storage-master microservice, estimating the amount of disk space you need is much easier. For a production environment, set this value to 10GB. For a development environment, you can optionally reduce the value to 5GB.

Save this information for when you are updating the Analytics CR for your installation. For more information on configuring the volume sizes of these services, see [Defining your internal storage space](#).

## MQ storage: estimate disk space needs

The section applies if you are planning a topology with the message queue, which uses the mq-kafka and mq-zk microservices.

For the mq-zk microservice, For a production environment, set this value to 10GB. For a development environment, you can optionally reduce the size to 5GB.

For the mq-kafka microservice, set this value to 5GB for both development and production deployments. If you want to allocate a larger temporary buffer, or are logging a significant amount of large payloads, consider increasing this volume as necessary.

Save this information for when you are updating the Analytics CR for your installation. For more information on configuring the volume sizes of these services, see [Defining your internal storage space](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Working with certificates

Use the `certs` command included in the APICUP installer to set and manage certificates for each subsystem. Default certificates are automatically applied, but defaults can be overridden by user-supplied custom certificates.

### About this task

- [Certificate management: Read This First](#)  
Requirements and best practices for managing API Connect certificates.
- [Setting and managing certificates](#)  
Default certificates are automatically applied, but defaults can be overridden by custom certificates.
- [Reference for certificates, commands, and validations](#)  
This section contains the reference information for certificates, commands for working with certificates, and validations.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Certificate management: Read This First

Requirements and best practices for managing API Connect certificates.

Important: Customization of public certificates and public user-facing certificates is recommended. Customization of internal certificates is strongly discouraged. For management purposes, API Connect certificates can be grouped by type (default, custom, and common) and by usage (public, public and user-facing, and internal). Understand each type and usage before you change any certificates.

- A default certificate is a private certificate that is uniquely generated by the installer for the current project directory, and will pass validation. Default certificates are automatically generated for each subsystem by the `apicup subsys install` command, unless the certificates were explicitly set by using the `apicup certs set` command. Note that the default certificates are self-signed, so they might not provide a level of trust suitable for external communication.
- For optimal trust levels, we recommend that you explicitly set all public and user-facing certificates by creating custom certificates.
- Some certificates are common across subsystems. Subsystems require the common certificates to allow them to register with the management subsystem. When installing any one subsystem, the common certificates are set for that subsystem and for all the other subsystems. If you use custom certificates for the common certificates, the custom certificates must be set prior to setting any other custom certificates.
- We do not recommend the explicit setting of internal certificates. The changing of internal certificates creates a risk of incompatibility with other internal certificates.

To review the usage (public, public and user-facing, or internal) of each certificate, see the following [Certificate management best practice](#) table.

Table 1. Certificate management best practice

| Certificate usage      | Certificate name                                                                                                                                                                                       | Best practice management                                                                                                                                                                             |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Public and User-facing | <ul style="list-style-type: none"><li>• platform-api, api-manager-ui, cloud-admin-ui</li><li>• consumer-api</li><li>• portal-www-ingress</li><li>• hub-endpoint</li><li>• turnstile-endpoint</li></ul> | For optimal trust levels, set these explicitly. Recommended to be explicitly set as custom certificates because they are presented to an end user through a browser or Command Line Interface (CLI). |

| Certificate usage | Certificate name                                                                                                                                                                                                                                                                                              | Best practice management                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Setting and managing certificates

Default certificates are automatically applied, but defaults can be overridden by custom certificates.

### About this task

- [Setting default certificates](#)  
Default certificates are automatically generated by APICUP when the subsystem is installed.
- [Setting custom certificates](#)  
Use the APICUP installer `certs` commands to set custom certificates.
- [Replacing custom certificates](#)  
Use the APICUP installer `certs` commands to replace existing certificates.
- [Setting common certificates](#)  
Common certificates are set for one subsystem, but are applied to all subsystems. Use the APICUP installer `certs` commands to set the common certificates.
- [Setting the encryption-secret for the management database](#)  
Use the APICUP installer `certs` commands to set the encryption-secret for the management database.
- [Clearing certificates](#)  
Certificates can be cleared in order to set new certificates.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Setting default certificates

Default certificates are automatically generated by APICUP when the subsystem is installed.

### About this task

Important:

- Customization of public certificates and public user-facing certificates is recommended. Customization of internal certificates is strongly discouraged.
- To view a list of public, public user-facing, and internal certificates, see [Certificate management: Read This First](#). For details on each certificate, see [Certificate reference](#).

Default certificates are generated for each subsystem by the `apicup subsys install` command. If certificates are not explicitly set by using the `apicup certs set` command, then default certificates are automatically generated by APICUP. The default certificates are self-signed, so they might not provide a level of trust suitable for external communication.

### Procedure

1. Enter the settings for the subsystem by using `apicup subsys set <SUBSYS>` and validate the subsystem settings by using `apicup subsys get <SUBSYS> --validate`. The subsystem must pass validation before setting the certificates.
2. Install the subsystem by using the `apicup subsys install` command.
3. The default certificates are created for the subsystem. A default certificate is a private certificate that is uniquely generated by the installer for this project directory, they are self-signed and always pass validation.
4. List all certificates that are set for a subsystem by using the `apicup certs list` command.

```
apicup certs list -help
```

List all configured certificates

Usage:

```
apicup certs list SUBSYS [flags]
```

Flags:

```
-h, --help help for list
```

Global Flags:

```
--accept-license Accept the license for API Connect
--debug           Enable debug logging
```

Following is example output from the `apicup certs list` command:

Common certificates

=====

| Name                       | Summary                                                                                                                                                            | Validation errors |

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Setting custom certificates

Use the APICUP installer `certs` commands to set custom certificates.

### About this task

Important:

- Customization of public certificates and public user-facing certificates is recommended. Customization of internal certificates is strongly discouraged.
- To view a list of public, public user-facing, and internal certificates, see [Certificate management: Read This First](#). For details on each certificate, see [Certificate reference](#).

The APICUP installer can be used to set certificates for each subsystem during installation. If certificates are not explicitly set by using the `apicup certs set` command, then default certificates are generated by APICUP. The default certificates are self-signed, so they might not provide a level of trust suitable for external communication.

Requirements for custom certificates:

- Extended Key Usage (EKU), either serverAuth or clientAuth depending upon the type of certificate. Certificates of type *Server* must have an Extended Key Usage with serverAuth purpose. Certificates of type *Client* must have an Extended Key Usage with clientAuth purpose.
- Subject Alternative Name (SAN) for the required hosts
- Any custom common certificates that are being used must be set prior to setting any custom certificates for a subsystem.

See [Certificate reference](#) to view the list of common certificates and to determine whether an EKU is needed for a certificate and which type of EKU (serverAuth or clientAuth).

Certificates and identical endpoints:

The Management subsystem has four public endpoints: *api-manager-ui*, *cloud-admin-ui*, *platform-api*, and *consumer-api*. Distinct TLS certificates can be set for each endpoint. However, if any two endpoints are identical, only one TLS certificate will be effective. When 2 or more endpoints are set to the same host, the secrets associated with the endpoints should be the same or contain the same certificate files.

Note: Once API Connect has been installed (meaning that the `apicup subsys install SUBSYS` command has been executed) with a given set of certificates, only the certificates for the public ingress endpoints (portal-www, api-manager-ui, cloud-admin-ui, platform-api, consumer-api) can be modified. The TLS certificates involved in mutual authentication (portal-admin-ingress, portal-client, analytics-ingestion-ingress, analytics-ingestion-client, analytics-client-ingress, and analytics-client-client) cannot be modified after the install command has been executed.

## Procedure

1. Set up and validate the subsystem. Enter the settings for the subsystem using `apicup subsys set <SUBSYS>` and validate the subsystem settings using `apicup subsys get <SUBSYS> --validate`. The subsystem must pass validation before setting the certificates.
2. Generate the custom certificate with the appropriate EKU and SAN. You will need to obtain the private key, public certificate, and CA certificates in non-password-protected PEM format for the custom certificate. Following is an example for how to generate a certificate (platform-api-example) with an EKU serverAuth and SAN using openssl:

```
openssl x509 -req -days 360 -in platform-api-example.csr -CA root-ca.pem -CAkey root-ca-key.pem -CAcreateserial -out platform-api-cert -sha256 -extfile <(cat /etc/ssl/openssl.cnf <(printf "\n[SAN]\nsubjectAltName=DNS:fqdn.myserver.com\nextendedKeyUsage=serverAuth")) -extensions SAN
```

where

- `DNS:fqdn.myserver.com` is the fully qualified domain name of the endpoint the certificate applies to. This matches the endpoints entered in the APICUP installer. See [Deploying the Management subsystem](#)
- `platform-api-example.csr` is the file name for the certificate signing request

Following is an example for how to generate a certificate (portal-client) with an EKU clientAuth and SAN using openssl:

```
openssl x509 -req -days 360 -in portal-client-example.csr -CA root-ca.pem -CAkey root-ca-key.pem -CAcreateserial -out portal-client-cert -sha256 -extfile <(cat /etc/ssl/openssl.cnf <(printf "\n[SAN]\nkeyUsage=critical,digitalSignature,keyEncipherment\nextendedKeyUsage = clientAuth\nbasicConstraints=critical,CA:FALSE\nsubjectKeyIdentifier=hash\n")) -extensions SAN
```

3. Once the certificate has been created, set the certificate by entering the following command:  
`apicup certs set SUBSYS CERT_NAME [CERT_FILE KEY_FILE CA_FILE] [KEY_FILE] [flags]`

If the certificate is signed by an intermediate CA, the `CA_File` argument must point to a file that concatenates the intermediate CA, followed by the root CA, in that order.

You can find definitions for commands at the following location: [Command reference](#)

If the certificate was generated with an EKU serverAuth, it must be assigned to a server certificate. If the certificate was generated with an EKU clientAuth, it must be assigned to a client certificate.

4. Repeat for additional custom certificates.
5. After setting the custom certificates, you can optionally generate the remaining default certificates prior to installation by entering the `apicup certs generate` command. The `generate` command generates any certificates that have not been set, so it will create default certificates for all remaining certificates. It will not overwrite any custom certificates you have set. You can review the certificates prior to installation.
6. List all certificates with `apicup certs list SUBSYS`. The results will include the generated default certificates and the custom certificates that you set.

Following is example output from the `apicup certs list` command:

### Common certificates

| Name                       | Summary                                                                                                                                                            | Validation errors |

                   SubjectKeyId: DE:84:86:40:4F:1E:30:A6:16:0E:CD:5B:8E:0C:1A:46
                   AuthorityKeyId: 6E:5A:6C:82:BA:F2:62:CF:B3:85:54:23:B6:26:9A:3F
encryption-secret  A9:F3:28:0E:1E:AA:D9:5E:86:02:A4:95:69:83:94:30
k8s-ca             CN: k8s-ca
                   SubjectKeyId: 60:D9:B2:37:0B:17:FB:CD:FC:49:29:32:F6:A6:49:7C
                   AuthorityKeyId:
platform-api       CN: platform-api
                   SubjectKeyId: AC:EF:88:78:01:A1:4D:8E:95:95:7D:3E:C5:43:F9:48
                   AuthorityKeyId: 6E:5A:6C:82:BA:F2:62:CF:B3:85:54:23:B6:26:9A:3F

```

7. Install the subsystem with the certificates using `apicup subsys install SUBSYS`. Any missing certificates will be generated. The installation will not proceed if there are any validation issues with the certificates. See [Validation reference](#).
8. Repeat for other subsystems.
9. If necessary, you can replace custom certificates after installation is complete. See [Replacing custom certificates](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Replacing custom certificates

Use the APICUP installer `certs` commands to replace existing certificates.

### About this task

Important:

- Customization of public certificates and public user-facing certificates is recommended. Customization of internal certificates is strongly discouraged.
- To view a list of public, public user-facing, and internal certificates, see [Certificate management: Read This First](#). For details on each certificate, see [Certificate reference](#).

The APICUP installer can be used to update certificates for each subsystem after installation.

Requirements for custom certificates:

- Extended Key Usage (EKU), either `serverAuth` or `clientAuth` depending upon the type of certificate. Certificates of type `Server` must have an Extended Key Usage with `serverAuth` purpose. Certificates of type `Client` must have an Extended Key Usage with `clientAuth` purpose.
- Subject Alternative Name (SAN) for the required hosts
- Any custom common certificates that are being used must be set prior to setting any custom certificates for a subsystem.

See [Certificate Reference](#) to view the list of common certificates and to determine whether an EKU is needed for a certificate and which type of EKU (`serverAuth` or `clientAuth`).

Certificates and identical endpoints:

The Management subsystem has four public endpoints: `api-manager-ui`, `cloud-admin-ui`, `platform-api`, and `consumer-api`. Distinct TLS certificates can be set for each endpoint. However, if any two endpoints are identical, only one TLS certificate will be effective. When 2 or more endpoints are set to the same host, the secrets associated with the endpoints should be the same or contain the same certificate files.

## Procedure

1. Generate the custom certificate with the appropriate EKU and SAN. You will need to obtain the private key, public certificate, and CA certificates in non-password-protected PEM format for the custom certificate. Following is an example for how to generate a certificate (`platform-api-example`) with an EKU `serverAuth` and SAN using `openssl`:

```

openssl x509 -req -days 360 -in platform-api-example.csr -CA root-ca.pem -CAkey root-ca-key.pem -CAcreateserial -out
platform-api-cert -sha256
-extfile <(cat /etc/ssl/openssl.cnf <(printf
"\n[SAN]\nsubjectAltName=DNS:fqdn.myserver.com\nextendedKeyUsage=serverAuth"))
-extensions SAN

```

where

- `DNS:fqdn.myserver.com` is the fully qualified domain name of the endpoint the certificate applies to. This matches the endpoints entered in the APICUP installer. See [Installing the Management subsystem into a Kubernetes environment](#)
- `platform-api-example.csr` is the file name for the certificate signing request

Following is an example for how to generate a certificate (`portal-client`) with an EKU `clientAuth` and SAN using `openssl`:

```

openssl x509 -req -days 360 -in portal-client-example.csr -CA root-ca.pem -CAkey root-ca-key.pem -CAcreateserial -out
portal-client-cert
-sha256 -extfile <(cat /etc/ssl/openssl.cnf <(printf "\n[SAN]\nkeyUsage=critical,
digitalSignature,keyEncipherment\nextendedKeyUsage = clientAuth\nbasicConstraints=critical,
CA:FALSE\nsubjectKeyIdentifier=hash\n")) -extensions SAN

```

2. Once the certificate has been created, set the certificate by entering the following command:

```
apicup certs set SUBSYS CERT_NAME [CERT_FILE KEY_FILE CA_FILE]
```

You can find definitions for commands at the following location: [Command reference](#)

If the certificate is signed by an intermediate CA, the `CA_File` argument must point to a file that concatenates the intermediate CA, followed by the root CA, in that order.

If the certificate was generated with an EKU `serverAuth`, it must be assigned to a server certificate. If the certificate was generated with an EKU `clientAuth`, it must be assigned to a client certificate.

3. Install the subsystem with the new certificate using `apicup subsys install SUBSYS`. Any missing certificates will be generated. The installation will not proceed if there are any validation issues with the certificates. See [Validation reference](#).
4. Repeat for other subsystems requiring new certificates.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Setting common certificates

Common certificates are set for one subsystem, but are applied to all subsystems. Use the APICUP installer `certs` commands to set the common certificates.

### About this task

Important:

- Customization of public certificates and public user-facing certificates is recommended. Customization of internal certificates is strongly discouraged.
- To view a list of public, public user-facing, and internal certificates, see [Certificate management: Read This First](#). For details on each certificate, see [Certificate reference](#).

The common certificates are identical across subsystems. Subsystems require the common certificates to allow them to register with the management subsystem. When installing any one subsystem, the common certificates will be set for that subsystem and for all the other subsystems. If you are using custom certificates for the common certificates, they must be set prior to setting any custom certificates. See [Certificate reference](#) for a description of the common certificates.

Common certificates cannot be changed between subsystem installs. For example, you cannot set a common certificate for the management subsystem, install the management subsystem, then change a common certificate for the analytics subsystem, then install the analytics subsystem. This scenario will result in a failed installation because the common certificates are not identical.

### Procedure

Follow these steps to set custom common certificates. If using default certificates, the common certificates will be set for you. See [Setting default certificates](#).

1. Set up and validate all subsystems. Enter the settings for the subsystem using `apicup subsys set <SUBSYS>` and validate the subsystem settings using `apicup subsys get <SUBSYS> --validate`. The subsystem must pass validation before setting the certificates.
2. Generate a custom certificate with the appropriate EKU and SAN. You will need to obtain the private key, public certificate, and CA certificates in non-password-protected PEM format for the custom certificate. Following is an example for how to generate a certificate (platform-api) with an EKU `serverAuth` and SAN using openssl:

```
openssl x509 -req -days 360 -in platform-api.csr -CA root-ca.pem -CAkey root-ca-key.pem -CAcreateserial -out platform-api-sha256 -extfile <(cat /etc/ssl/openssl.cnf <(printf "\n[SAN]\nsubjectAltName=DNS:ac-msntest.myserver.com,DNS:ac2-msntest.myserver.com\nextendedKeyUsage=serverAuth")) -extensions SAN
```

Following is an example for how to generate a certificate (portal-client) with an EKU `clientAuth` and SAN using openssl:

```
openssl x509 -req -days 360 -in portal-client.csr -CA root-ca.pem -CAkey root-ca-key.pem -CAcreateserial -out portal-client-cert -sha256 -extfile <(cat /etc/ssl/openssl.cnf <(printf "\n[SAN]\nkeyUsage=critical,digitalSignature,keyEncipherment\nextendedKeyUsage = clientAuth\nbasicConstraints=critical,CA:FALSE\nsubjectKeyIdentifier=hash\n")) -extensions SAN
```

3. Once the certificate has been created and you have a `.pem` file, set the custom common certificates in one of your subsystems. After setting the custom certificates for one subsystem, they will take effect for all subsystems. The command is targeted at a specific subsystem, but the common certificates are copied to all subsystems regardless of which subsystem they are originally set in. Following is an example for setting the `portal-client` certificate:  
`apicup certs set mgmt portal-client myCertFile.pem myKeyFile.key myCAFile.crt`
4. Set the remaining certificates for each subsystem, default or custom. See [Setting default certificates](#) and [Setting custom certificates](#).
5. List and validate the certificates for each subsystem. See [Validation reference](#).
6. Install each subsystem using `apicup subsys install SUBSYS`.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Setting the encryption-secret for the management database

Use the APICUP installer `certs` commands to set the encryption-secret for the management database.

### About this task

---

The encryption-secret is a secure random bytes password used for field level encryption in the management database. You can generate 128 random bytes using the following command in openssl:

```
openssl rand -out /path/to/secret/encryption-secret.bin 128
```

### Procedure

---

1. Enter the `apicup certs set SUBSYS CERT_NAME [KEY_FILE]` command and complete the following values:
  - SUBSYS - The subsystem for the `encryption-secret` is the name of your management subsystem, because it is used for field-level encryption for the management database.
  - CERT\_NAME - The certificate name is `encryption-secret`.
  - KEY\_FILE - Enter the file name for a secure random bytes string that is 128 bytes in length, for example `encryption-secret.bin`.
2. Set the remaining certificates if using custom certificates and install the management subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Clearing certificates

Certificates can be cleared in order to set new certificates.

### About this task

---

Existing certificates must be cleared in order to set new certificates. When using default certificates, new certificates are created only for those certificates that are not set. Some of the use cases for clearing certificates are: expired certificates and configuration changes. For example, if endpoints are changed, the existing certificates must be cleared and new certificates created.

### Procedure

---

1. Enter the `apicup certs set SUBSYS CERT_NAME --clear` command and complete the following values:
  - SUBSYS - The name of the subsystem
  - CERT\_NAME - The name of the certificate that you want to clear.
2. The certificate will be cleared and can be reset, either as a default or custom certificate.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Reference for certificates, commands, and validations

This section contains the reference information for certificates, commands for working with certificates, and validations.

### About this task

---

- [Certificate reference](#)  
The Certificate reference provides a description of all the certificates required in API Connect.
- [Command reference](#)  
The APICUP installer includes the `certs` commands to set and manage certificates.
- [Validation reference](#)  
Certificates are validated using several parameters.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Certificate reference

The Certificate reference provides a description of all the certificates required in API Connect.

### Before you begin

APICUP sets default certificates for each subsystem during installation. The default certificates are self-signed so may not provide a level of trust suitable for external communication. Custom certificates can be set and managed following the steps described in [Setting custom certificates](#).

The Certificates reference topic lists all certificates that are set by the `apicup certs` commands. The default certificates can be used for the majority of these certificates. The certificates that are marked as *public and user-facing* are recommended to be explicitly set as custom certificates because they are presented to an end user through a browser or Command Line Interface (CLI).

The certificates that are described as *TLS certificate used by ingress* are also considered *public* in the sense that they interact with a client that sits outside of an API Connect cluster.

Certificates that are listed as *auto-generated* cannot be set using the `apicup certs set` command. For example, the common certificate `ingress-ca` is auto-generated and used as an intermediate CA for all default ingress certificates. If you set an ingress certificate as a custom certificate, you will need to configure an intermediate CA if desired.

Important:

When setting custom certificates, additional steps must be taken to provide an Extended Key Usage (EKU) serverAuth and ClientAuth and a Subject Alternative Name (SAN) for the required hosts. These certificates are generated automatically by the `apicup certs` command when using the default certificates.

- For custom certificates of type *server*, an additional extended key usage client authentication (EKU serverAuth) certificate is required.
- For custom certificates of type *client*, an additional extended key usage server authentication (EKU clientAuth) certificate is required.

### Procedure

1. **Common certificates** - The following certificates are common to all subsystems in a deployment. Subsystems require the common certificates to allow them to register with the management subsystem. The common certificates are identical across subsystems. When installing any one subsystem, the common certificates will be set for that subsystem and for all the other subsystems. Custom common certificates must be set prior to setting any custom subsystem certificates. Common certificates cannot be changed between subsystem installs. For example, you cannot set a common certificate for the management subsystem, install the management subsystem, then change a common certificate for the analytics subsystem, then install the analytics subsystem. This scenario will result in a failed installation because the common certificates are not identical.

Table 1. Common certificates

| Certificate name (value used in <code>apicup certs</code> ) | Usage  | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| root-ca                                                     | CA     |                                                                                                                                                                                                                                                                                                                                                                                                                                        | CA certificate which forms the root of the certificate chain                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ingress-ca                                                  | CA     | signed by: root-ca                                                                                                                                                                                                                                                                                                                                                                                                                     | Auto-generated intermediate certificate used to generate certificates for subsystem ingress endpoints if not provided by user. The <code>ingress-ca</code> intermediate certificate cannot be set explicitly, it is always only generated. TLS certificates for the ingresses are not required to use <code>ingress-ca</code> as an intermediate certificate, but if a given ingress TLS certificate remains to be auto-generated then it will be signed by this <code>ingress-ca</code> . |
| portal-client                                               | Client | Must be signed by the same authority as the one used for the matching ingress TLS certificate <code>portal-admin-ingress</code> . For a two data center deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <code>CN=portal-admin-client</code> , or they could both be <code>CN=ptl-adm-client, O=cert-manager</code> , but they must be identical.               | Client certificate used by management subsystem to authenticate with the Portal admin endpoint. Requires EKU clientAuth.                                                                                                                                                                                                                                                                                                                                                                   |
| analytics-client-client                                     | Client | Must be signed by the same authority as the one used for the matching ingress TLS certificate <code>analytics-client-ingress</code> . For a two data center deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <code>CN=a7s-client-client</code> , or they could both be <code>CN=a7s-client-client, O=cert-manager</code> , but they must be identical.          | Client certificate used by management subsystem to authenticate with analytics client endpoint. Requires EKU clientAuth.                                                                                                                                                                                                                                                                                                                                                                   |
| analytics-ingestion-client                                  | Client | Must be signed by the same authority as the one used for the matching ingress TLS certificate <code>analytics-ingestion-ingress</code> . For a two data center deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <code>CN=a7s-ingestion-client</code> , or they could both be <code>CN=a7s-ingestion-client, O=cert-manager</code> , but they must be identical. | Client certificate used by gateway subsystem to authenticate with analytics ingestion endpoint. Requires EKU clientAuth.                                                                                                                                                                                                                                                                                                                                                                   |

2. **Management certificates**

These certificates apply to a single Management subsystem.

The Management subsystem has four public endpoints: `api-manager-ui`, `cloud-admin-ui`, `platform-api`, and `consumer-api`. Distinct TLS certificates can be set for each endpoint. However, if any two endpoints are identical, only one TLS certificate will be effective. When 2 or more endpoints are set to the same host, the secrets associated with the endpoints should be the same or contain the same certificate files.

The encryption-secret certificate is unique in that it is a secure random number. It is used to provide field level encryption in management (Cassandra) database. To set the encryption secret for the management database, use the following command: `apicup certs set SUBSYS CERT_NAME [KEY_FILE]` For example: `apicup certs set mgmt1 encryption-secret /path/to/keyfile`. See [Setting the encryption-secret for the management database](#)

Table 2. Management certificates

| Certificate name   | Usage               | Requirements                                                                                                                                                                                                                                                                                                                  | Description                                                                            |
|--------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| encryption-secret  | secure random bytes | length: 128 bytes                                                                                                                                                                                                                                                                                                             | Encryption secret used to do field level encryption in management (Cassandra) database |
| platform-api       | Server              | The host names for which the certificate is valid must include the platform-api endpoint. A wildcard certificate can be used as the first element in a host name, for example, if the endpoint is: <code>store.acme.com</code> , the certificate can be one that is valid for host names matching <code>*.acme.com</code> .   | TLS certificate used by ingress. Requires EKU serverAuth. Public and user-facing.      |
| consumer-api       | Server              | The host names for which the certificate is valid must include the consumer-api endpoint. A wildcard certificate can be used as the first element in a host name, for example, if the endpoint is: <code>store.acme.com</code> , the certificate can be one that is valid for host names matching <code>*.acme.com</code> .   | TLS certificate used by ingress. Requires EKU serverAuth. Public and user-facing.      |
| api-manager-ui     | Server              | The host names for which the certificate is valid must include the api-manager-ui endpoint. A wildcard certificate can be used as the first element in a host name, for example, if the endpoint is: <code>store.acme.com</code> , the certificate can be one that is valid for host names matching <code>*.acme.com</code> . | TLS certificate used by ingress. Requires EKU serverAuth. Public and user-facing.      |
| cloud-admin-ui     | Server              | The host names for which the certificate is valid must include the cloud-admin-ui endpoint. A wildcard certificate can be used as the first element in a host name, for example, if the endpoint is: <code>store.acme.com</code> , the certificate can be one that is valid for host names matching <code>*.acme.com</code> . | TLS certificate used by ingress. Requires EKU serverAuth. Public and user-facing.      |
| hub-endpoint       | Server              |                                                                                                                                                                                                                                                                                                                               | Automated Testing Behavior UI and API endpoint                                         |
| turnstile-endpoint | Server              |                                                                                                                                                                                                                                                                                                                               | Automated Testing Behavior UI and API endpoint                                         |

### 3. Portal certificates

These certificates apply to a single portal subsystem.

Table 3. Portal certificates

| Certificate name     | Usage  | Requirements                   | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|--------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| portal-admin-ingress | Server | host must match admin endpoint | TLS certificate used by ingress. The <code>portal-client</code> common certificate must be set prior to setting the <code>portal-admin-ingress</code> certificate. Requires EKU serverAuth. The <code>portal-admin-ingress</code> TLS certificate does not have any specific requirement on the authority signing it. If the certificate is auto-generated, it is signed by the <code>ingress-ca</code> . |
| portal-www-ingress   | Server | host must match www endpoint   | TLS certificate used by ingress. Requires EKU serverAuth. Public and user-facing.                                                                                                                                                                                                                                                                                                                         |

### 4. Analytics certificates

These certificates apply to a single analytics subsystem.

Table 4. Analytics certificates

| Certificate name            | Usage  | Requirements                                                                                                                                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| analytics-ingestion-ingress | Server | Required hosts: <ul style="list-style-type: none"> <li>ingestion ingress endpoint</li> <li>*.<br/>&lt;namespace&gt;<br/>&gt;</li> <li>*.<br/>&lt;namespace&gt;.svc<br/>&gt;</li> <li>*.<br/>&lt;namespace&gt;.svc.cluster.local</li> </ul> | TLS certificate used by ingress. The <code>analytics-ingestion-client</code> common certificate must be set prior to setting the <code>analytics-ingestion-ingress</code> certificate. Requires EKU serverAuth. The <code>analytics-ingestion-ingress</code> TLS certificate does not have any specific requirement on the authority signing it. If the certificate is auto-generated, it is signed by the <code>ingress-ca</code> . |

### 5. OVA/Appliance certificates

These certificates apply only to an appliance in a VMware environment. The `k8s-ca` and `appliance-client` certificates are auto-generated and cannot be set as custom certificates. These are used to set up the Kubernetes cluster in an OVA/Appliance.

Table 5. OVA/Appliance certificates

| Certificate name | Usage  | Requirements      | Description                                                                                                                |
|------------------|--------|-------------------|----------------------------------------------------------------------------------------------------------------------------|
| k8s-ca           | CA     |                   | Auto-generated CA certificate that forms the root of the certificate chain for the Appliance/Kubernetes cluster components |
| appliance-client | Client | signed by: k8s-ca | Auto-generated client certificate used to communicate with the Appliance API server. Requires EKU clientAuth.              |

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Command reference

The APICUP installer includes the `certs` commands to set and manage certificates.

### About this task

The APICUP installer can be used to set certificates for each subsystem during installation. If certificates are not explicitly set using the `apicup certs set` command, then default certificates are generated by APICUP. We recommend that certificates be set at installation time only (or carried over from an upgrade). The default certificates are self-signed, so they may not be optimal for external communication.

For a description of the certificates that can be set, see [Certificate reference](#). We recommend that all public and user-facing certificates be explicitly set, including `portal-www-ingress` and `api-gateway-ingress`, and the four management endpoints (`platform-api`, `consumer-api`, `api-manager-ui`, and `cloud-admin-ui`). Following is the help reference for the `apicup certs set` command:

```
apicup certs set --help
Set or clear certificates and keys

Usage:
apicup certs set SUBSYS CERT_NAME [CERT_FILE KEY_FILE CA_FILE] [KEY_FILE] [flags]

Flags:
--clear    Clear out a certificate or key entry
-h, --help help for set

Global Flags:
--accept-license Accept the license for API Connect
--debug         Enable debug logging
```

### Procedure

To set and clear certificates, complete the following steps:

1. Enter the `apicup certs set` command and complete the following values:

Table 1. `apicup certs set`

| Command                                                                                                                | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Result                                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>apicup certs set SUBSYS CERT_NAME [CERT_FILE KEY_FILE CA_FILE] [KEY_FILE] [flags]</code>                         | Parameters are: <ul style="list-style-type: none"> <li>SUBSYS - name of the subsystem to which the certificate applies</li> <li>CERT_NAME - name of the certificate; see <a href="#">Certificate reference</a> for a list of certificates that can be set for each subsystem.</li> <li>CERT_FILE - Path to the certificate file in PEM format.</li> <li>KEY_FILE - Path to the private key file in PEM format.</li> <li>CA_FILE - Path to the Certificate Authority (CA) file. The contents of the file may be the concatenation of an intermediate CA and the root CA (in that order). <b>Note:</b> When setting the <code>root-ca</code> certificate, omit the <code>CA_FILE</code> parameter.</li> </ul> | Applies the certificate when the subsystem is installed.                                                                                                                                     |
| <code>apicup certs set SUBSYS CERT_NAME [KEY_FILE] [flags]</code>                                                      | <code>KEY_FILE</code> - The file containing the encryption-secret for field level encryption in the management database. Applies only to the management subsystem. The certificate name is <code>encryption-secret</code> . The type is secure random bytes with a length of 128 bytes. For example, <code>apicup certs set mgmt1 encryption-secret /path/to/encryption-secret.bin</code> . <b>Note:</b> Do not specify any of the <code>[CERT_FILE KEY_FILE CA_FILE]</code> parameters when setting the encryption-secret.                                                                                                                                                                                 | Applies the <code>encryption-secret</code> when the management subsystem is installed.                                                                                                       |
| <code>flags</code> <ul style="list-style-type: none"> <li><code>--clear</code></li> <li><code>--help</code></li> </ul> | Flags are: <ul style="list-style-type: none"> <li><code>--clear</code> - Clears the specified certificate. For example, <code>apicup certs set mgmt1 encryption-secret --clear</code></li> <li><code>--help</code> - Displays help for the command.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                              | The specified certificate will be cleared. When making configuration changes such as changing endpoints, the corresponding certificate must be cleared so that a new certificate can be set. |

2. The `apicup certs get` command retrieves a specific certificate for the specified subsystem.

```
apicup certs get --help
Get a certificate

Usage:
apicup certs get SUBSYS CERT_NAME [flags]

Flags:
-h, --help help for get
-o, --output string output to file or - (stdout) (default "-")
-t, --type string type of object to return: cert, key, ca (default "cert")

Global Flags:
--accept-license Accept the license for API Connect
--debug         Enable debug logging
```

Table 2. `apicup certs get`

| Command | Values | Result |
|---------|--------|--------|
|---------|--------|--------|

| Command                                                                                                                                                      | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Result                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>apicup certs get SUBSYS CERT_NAME [flags]</code>                                                                                                       | Parameters are: <ul style="list-style-type: none"> <li>SUBSYS - name of the subsystem to which the certificate applies</li> <li>CERT_NAME - name of the certificate to retrieve; see <a href="#">Certificate reference</a> for a list of certificates</li> </ul>                                                                                                                                                                                                                                                   | Returns the specified certificate for the specified subsystem.                                                                                                                                                                                                             |
| <b>flags</b> <ul style="list-style-type: none"> <li><code>--output string</code></li> <li><code>--type string</code></li> <li><code>--help</code></li> </ul> | Flags are: <ul style="list-style-type: none"> <li><code>--output string</code> - Specify a file for the retrieved values, or specify "-" to send to stdout. Default is "-" to send to stdout. For example, <code>apicup certs get mgmt1 --output myCertsFile</code></li> <li><code>--type string</code> - Returns only the specified type. If not specified, the type is cert. For example, <code>apicup certs get mgmt1 --type ca</code></li> <li><code>--help</code> - Displays help for the command.</li> </ul> | <ul style="list-style-type: none"> <li>For <code>--output</code>: The specified certificate will be retrieved and sent to stdout or saved to the specified file</li> <li>For <code>--type</code>: Certificates will be retrieved that match the type specified.</li> </ul> |

3. List all certificates that have been set for a subsystem using the `apicup certs list` command. You can list the certificates at any time to summarize the certificates that have been set.

```
apicup certs list -help
```

```
List all configured certificates
```

```
Usage:
```

```
apicup certs list SUBSYS [flags]
```

```
Flags:
```

```
-h, --help help for list
```

```
Global Flags:
```

```
--accept-license Accept the license for API Connect
--debug Enable debug logging
```

Table 3. apicup certs list

| Command                                                                            | Values                                                                                                                                   | Result                                                                |
|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| <code>apicup certs list SUBSYS [flags]</code>                                      | Parameters are: <ul style="list-style-type: none"> <li>SUBSYS - name of the subsystem for which you want to list certificates</li> </ul> | Returns a list of certificates that are configured for the subsystem. |
| <b>flags</b> <ul style="list-style-type: none"> <li><code>--help</code></li> </ul> | Flags are: <ul style="list-style-type: none"> <li><code>--help</code> - Displays help for the command.</li> </ul>                        | Help text is displayed.                                               |

Following is example output from the `apicup certs list` command:

```
Common certificates
```

4. The `apicup certs generate` command generates and sets default certificates. The `generate` command only generates and sets a certificate if it is not already set; it only sets the missing default certificates that have not been explicitly set using the `set` command. Execute the `generate` command before running the

`apicup subsys install <SUBSYS>` command to confirm the certificates are correct before installing. It allows you to validate all certificates before performing the installation. The `generate` command is used as a tool to assist you when entering a combination of default and custom certificates. If you need to set specific certificates you can set them upfront (using `set`) and then generate the missing ones with default certificates. Or you can generate all certificates upfront and then override specific certificates to set custom certificates. Using `generate` helps to avoid validation errors during the installation procedure. Note that you must configure the subsystems and pass the `--validate` option before generating the default certificates.

```
apicup certs generate -help
Generate all unset certificates
```

Usage:

```
apicup certs generate SUBSYS [flags]
```

Flags:

```
-h, --help help for generate
```

Global Flags:

```
--accept-license Accept the license for API Connect
--debug Enable debug logging
```

Table 4. apicup certs generate

| Command                                                                                  | Values                                                                                                                                       | Result                                                                                                  |
|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|

| <code>flags</code> <ul style="list-style-type: none"> <li><code>--help</code></li> </ul> | Flags are: <ul style="list-style-type: none"> <li><code>--help</code> - Displays help for the command.</li> </ul>                            | Help text is displayed.                                                                                 |

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Validation reference

Certificates are validated using several parameters.

The validations described in the following table are applied for all certificates, but are most helpful for custom certificates. For default certificates, the certificate validations will always pass, as the required elements are generated by APICUP. However, with custom certificates, some of the required elements may be missing or incorrect.

| Validation                                                                                                                                                                                                                                                                                                                                 | Messages                                                                     | Error                                                                                                                                                                   | See also/Action                                                                                                                                                                                                                |

| Verify that a certificate that is being used as a CA is actually a CA.                                                                                                                                                                                                                                                                     | <code>unable to verify cert &lt;cert&gt;: certificate is not a CA</code>     | The certificate is not a valid CA.                                                                                                                                      |                                                                                                                                                                                                                                |
| Verify client certificate match. The <code>portal-client</code> , <code>analytics-client-client</code> , and <code>analytics-ingestion-client</code> certificates are verified against the CA of, respectively, <code>portal-admin-ingress</code> , <code>analytics-client-ingress</code> , and <code>analytics-ingestion-ingress</code> . | <code>a CA certificate must be provided for this certificate</code>          | The CA certificate is missing for one of the <code>portal-admin-ingress</code> , <code>analytics-client-ingress</code> , and <code>analytics-ingestion-ingress</code> . | The common certificates <code>portal-client</code> , <code>analytics-client-client</code> , and <code>analytics-ingestion-client</code> must be set prior to setting any custom certificates.                                  |
|                                                                                                                                                                                                                                                                                                                                            | <code>client cert cannot be verified against provided CA certificate</code>  | The verification failed.                                                                                                                                                |                                                                                                                                                                                                                                |

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Webhooks deployed and managed by the API Connect Operator

The API Connect Operator deploys and manages various Kubernetes API webhooks in the cluster to assist in management of its custom resources.

The webhooks included admission controllers and conversion webhooks.

---

### Defaulting webhook

- **Purpose**  
The defaulting webhook is a type of [Mutating Admission Webhook](#) which runs against Custom Resources (CRs) at **CREATE** or **UPDATE** time to populate default values in the CR's **spec**.
- **Creation**  
Currently the defaulting webhook runtime is part of the API Connect Operator runtime, that is it exists within the API Connect Operator pod and container. When the operator boots, it creates **MutatingWebhookConfiguration** resources for each CRD (listed below). This **MutatingWebhookConfiguration** is a cluster-scope resource, but the configuration within will be specific to the namespace and operator instance which created it. If more than one instance of the API Connect Operator is deployed across a cluster (in different namespaces) there will be a set of webhook configurations for each API Connect Operator instance and namespace.

The name for the **MutatingWebhookConfiguration** resource for each CRD will take the following form:

```
<namespace>.<crd-name>.defaulter[.<component>].apiconnect.ibm.com
```

The following CustomResourceDefinitions utilize a defaulting webhook:

```
AnalyticsCluster
ApiconnectCluster
GatewayCluster
ManagementBackup
ManagementCluster
ManagementDBUpgrade
ManagementRestore
PortalCluster
```

- **Lifecycle**  
While the defaulting webhook runtime itself lives within the API Connect Operator pod, the **MutatingWebhookConfiguration** is a cluster-scope resource and is stand-alone. When it is created, an **ownerReference** is set on it that references the API Connect Operator's **ClusterRole**. Thus, the lifecycle of the **MutatingWebhookConfiguration** resources will be linked with the **ClusterRole**, which is linked with the installation of the operator itself.

When the operator is uninstalled, the **MutatingWebhookConfiguration** resources for that operator instance are also removed.

- **Example**  
The below output shows the defaulting webhook configurations created for an operator deployed in the **apiconnect-operator** namespace. One can be seen for each CRD.

```
$ oc get mutatingwebhookconfiguration
NAME
apiconnect-operator.analyticsclusters.defaulter.analytics.apiconnect.ibm.com      1      4d4h
apiconnect-operator.apiconnectclusters.defaulter.apiconnect.ibm.com              1      4d4h
apiconnect-operator.gatewayclusters.defaulter.gateway.apiconnect.ibm.com        1      4d4h
apiconnect-operator.managementbackups.defaulter.management.apiconnect.ibm.com   1      4d4h
apiconnect-operator.managementclusters.defaulter.management.apiconnect.ibm.com  1      4d4h
apiconnect-operator.managementdbupgrades.defaulter.management.apiconnect.ibm.com 1      4d4h
apiconnect-operator.managementrestores.defaulter.management.apiconnect.ibm.com  1      4d4h
apiconnect-operator.portalclusters.defaulter.portal.apiconnect.ibm.com          1      4d4h
```

---

### Validating webhook

- **Purpose**  
The validating webhook is a type of [Validating Admission Webhook](#) which runs against Custom Resources (CRs) at **CREATE** or **UPDATE** time to validate the CR contains a configuration which will yield an operable cluster. The CustomResourceDefinitions use OpenAPI schema validation for basic property checks (such as integer bounds and non-empty strings), but more complex validation of the configuration is done via the webhook.
- **Creation**  
Currently the validating webhook runtime is part of the API Connect Operator runtime, i.e. it exists within the API Connect Operator pod and container. When the operator boots, it creates **ValidatingWebhookConfiguration** resources for each CRD (listed below). This **ValidatingWebhookConfiguration** is a cluster-scope resource, but the configuration within will be specific to the namespace and operator instance which created it. If more than one instance of the API Connect Operator is deployed across a cluster (in different namespaces) there will be a set of webhook configurations for each API Connect Operator instance and namespace.

The name for the **ValidatingWebhookConfiguration** resource for each CRD will take the following form:

```
<namespace>.<crd-name>.validator[.<component>].apiconnect.ibm.com
```

The following CustomResourceDefinitions utilize a validating webhook:

```
AnalyticsCluster
ApiconnectCluster
GatewayCluster
ManagementBackup
ManagementCluster
ManagementDBUpgrade
ManagementRestore
PortalCluster
```

- Lifecycle

While the validating webhook runtime itself lives within the API Connect Operator pod, the `ValidatingWebhookConfiguration` is a cluster-scope resource and is stand-alone. When it is created, an `ownerReference` is set on it that references the API Connect Operator's `ClusterRole`. Thus, the lifecycle of the `ValidatingWebhookConfiguration` resources will be linked with the `ClusterRole`, which is linked with the installation of the operator itself.

When the operator is uninstalled, the `ValidatingWebhookConfiguration` resources for that operator instance are also removed.

- Example

The below output shows the validating webhook configurations created for an operator deployed in the `apiconnect-operator` namespace. One can be seen for each CRD.

```
validatingwebhookconfiguration
NAME
apiconnect-operator.analyticsclusters.validator.analytics.apiconnect.ibm.com    1    4d4h
apiconnect-operator.apiconnectclusters.validator.apiconnect.ibm.com           1    4d4h
apiconnect-operator.gatewayclusters.validator.gateway.apiconnect.ibm.com      1    4d4h
apiconnect-operator.managementbackups.validator.management.apiconnect.ibm.com 1    4d4h
apiconnect-operator.managementclusters.validator.management.apiconnect.ibm.com 1    4d4h
apiconnect-operator.managementdbupgrades.validator.management.apiconnect.ibm.com 1    4d4h
apiconnect-operator.managementrestores.validator.management.apiconnect.ibm.com 1    4d4h
apiconnect-operator.portalclusters.validator.portal.apiconnect.ibm.com         1    4d4h
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Tips and tricks for using APICUP

The APICUP installer in Install Assist contains built-in time saving functions.

## Introduction

This section describes tips and techniques for working with the APICUP installation commands. The APICUP installer creates charts and secrets that are then managed by Helm.

- [Running Tiller with APICUP](#)
- [Entering multiple settings per command](#)
- [Entering multiple values](#)
- [Viewing the settings for a subsystem](#)
- [Validating the settings for a subsystem](#)
- [Output an installation plan](#)
- [Getting help for commands](#)
- [Getting help on a specific command](#)

---

## Running Tiller with APICUP

To run Tiller in a namespace:

```
export TILLER_NAMESPACE=apic
```

---

## Entering multiple settings per command

To configure multiple settings per command, enter a space between each setting and enter an equals sign (=) to configure the setting.

In the following examples, be sure to replace [spc] with an actual space.

You can set multiple database parameters on one line:

```
apicup subsys set mgmt cassandra-max-memory-gb=9 [spc] cassandra-cluster-size=3 [spc] cassandra-volume-size-gb=16 [spc] cassandra-backup-protocol=sftp
```

You can set all endpoints on one line:

```
apicup subsys set mgmt platform-api=my.platform.com [spc] api-manager-ui=my.apim.com [spc] cloud-admin-ui=my.cloud.com [spc] consumer-api=my.consumer.com
```

---

## Entering multiple values

Separate multiple values for a key/value pair with commas.

```
apicup subsys set mgmt dns-servers=8.8.8.8,4.4.4.4 search-domains=a.com,b.com
```

## Viewing the settings for a subsystem

To view the current values that are set for a subsystem, enter the following command: `apicup subsys get <subsys_name>`. For example: `apicup subsys get mgmt` outputs the current values for the subsystem named `mgmt` and provides a description of each value. It is organized into Kubernetes settings and Subsystem settings. Following is an example of the output from the `get` command

Figure 1. Output for the `get` command

```
Endpoints
=====

Name          Value          Description
----          -
api-manager-ui  FQDN of API manager UI endpoint
cloud-admin-ui  FQDN of Cloud admin endpoint
consumer-api    FQDN of consumer API endpoint
platform-api    FQDN of platform API endpoint

Error: Subsystem validation failure. Run with --validate to see details
```

## Validating the settings for a subsystem

The values set for a subsystem can be validated for syntax by entering the `--validate` option for the `get` command: `apicup subsys get <subsys_name> --validate`. For example: `apicup subsys get mgmt --validate` validates the current values for the subsystem named `mgmt`. In the following example of the output for the `--validate` option, the check mark indicates a valid setting. The `x` indicates an invalid setting with an error message provided.

Figure 2. Output for the `--validate` option

```
Endpoints
=====

Name          Value          Description
----          -
api-manager-ui  X api-manager-ui is not a valid hostname
cloud-admin-ui  X cloud-admin-ui is not a valid hostname
consumer-api    X consumer-api is not a valid hostname
platform-api    X platform-api is not a valid hostname
```

## Output an installation plan

Using APICUP, you can generate an installation plan and confirm it is correct prior to running the installation. You can then install the subsystem from the plan.

To output an installation plan, enter the following command:

```
apicup subsys install SUBSYS --out=install-plan
```

where `<install-plan>` is the name of the directory where the installation plan will be stored.

In the example, a directory named `install-plan` is created in the project directory. The `myProject/install-plan` directory contains the configuration parameters for the subsystem.

To install the subsystem from the install-plan, enter the following command from the project directory:

```
apicup subsys install SUBSYS --plan-dir=<full-path-to-plan-directory>
```

where `<full-path-to-plan-directory>` is the full qualified path to the plan directory.

Following are general rules for installing from the installation plan:

- Never edit the files in the output directory directly. Instead, if changes are needed, update the parameters using APICUP and generate a new plan.
- Always run APICUP commands from the original project directory created during the initial product installation. The project directory contains the `apiconnect-up.yml` file.
- You can generate the plan in any location, but the install command must be run from the project directory. Enter the full path to the plan as the argument to `--plan-dir` to perform an installation.

The plan must be current with the project and the certificates. If the plan is older than the last modification date of the project or certificates, you will receive an error message such as:

```
the project was modified since the plan was generated, regenerate plan or skip this check
with a --skip-health-check flag in the command
```

or

```
the certs were changed since the plan was generated, regenerate plan or skip this check with
a --skip-health-check flag in the command
```

## Getting help for commands

You can get help for all commands by entering: `apicup --help`. Following is an example of the output:

Figure 3. Help for Install Assist `apicup` commands

```

APIConnect Install Assist
Usage:
  apicup [command]

Available Commands:
  certs          Subsystem certificates
  completion     Generates bash or zsh completion scripts
  help          Help about any command
  hosts         Commands to configure subsystem hosts
  iface        Commands to configure hosts interfaces
  init          Create a new APIConnect UP project
  registry-upload Retag and upload images to custom registry
  server        Starts the APIConnect cluster operator
  subsys       Subsystem commands
  version       Get the APIConnect UP version

Flags:
  --accept-license  Accept the license for API Connect
  --debug           Enable debug logging
  -h, --help        help for apicup

Use "apicup [command] --help" for more information about a command.

```

## Getting help on a specific command

For help on a specific command, enter `--help` after the command. For example, `apicup subsys get mgmt --help` prints out the usage and flags for the `get` command. For example:

Figure 4. Help for `get` command

```

Get subsystem properties

Usage:
  apicup subsys get SUBSYS [flags]

Flags:
  --endpoints  List endpoints (default true)
  -h, --help   help for get
  --platform  List platform settings (default true)
  --subsystem  List subsystem settings (default true)
  --validate   Validate settings

Global Flags:
  --accept-license  Accept the license for API Connect
  --debug           Enable debug logging

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Installing API Connect

Use these instructions to install or upgrade a deployment of API Connect on VMware.

- [IBM API Connect Version 10 software product compatibility requirements](#)  
Ensure that you install the minimum API Connect operating system requirements. Use the IBM® Software Product Compatibility Reports site to generate a requirements report appropriate for your API Connect version and environment.
- [Requirements for initial deployment on VMware](#)  
Review the requirements and considerations for deploying in a VMware environment.
- [API Connect licenses](#)  
When you install a new version of API Connect on VMware, you must accept a new license.
- [What's new for v10 installation](#)  
Summary of installation changes for API Connect v10 on VMware.
- [First steps for deploying in a VMware environment](#)  
The first steps in deploying in a VMware environment are to obtain the API Connect distribution files and to create a project directory.
- [Signature verification by using PGP](#)  
You can verify the integrity of files to ensure that they originated from IBM and are not modified.
- [Deploying the Management subsystem](#)  
You can create a virtual server by deploying the relevant IBM API Connect OVA file on a VMWare virtual server. Create all of the virtual servers that you want to use in your cloud.
- [Installing the Analytics subsystem](#)  
Install the IBM API Connect Analytics subsystem.
- [Deploying the Developer Portal](#)  
You create a Developer Portal node by deploying the Developer Portal OVA template. After you deploy the Developer Portal OVA template, you can install the Developer Portal.
- [Deploying DataPower Gateway](#)  
API Connect uses IBM DataPower® Gateway to provide the gateway service.
- [Post-deployment steps](#)  
When all subsystems are deployed, use the admin account to access the Cloud Manager administrative console and begin configuration. Optionally, take VMware snapshots of the VMs.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## IBM API Connect Version 10 software product compatibility requirements

Ensure that you install the minimum API Connect operating system requirements. Use the IBM® Software Product Compatibility Reports site to generate a requirements report appropriate for your API Connect version and environment.

To generate an API Connect requirements report, complete the following steps:

1. Open the [Detailed system requirements for a specific product](#) page on the IBM Software Product Compatibility Reports site.
2. Search for the IBM API Connect product.
3. In the Search results list, select IBM API Connect.
4. From the Version list, select the required version.
5. Use the Filters to refine the contents of the requirements report.
6. Click Submit to generate your requirements report.

The following tables provide a quick reference of the supported Kubernetes and Openshift versions for each API Connect release:

Table 1. API Connect and Kubernetes (K8S) compatibility matrix

| API Connect version     | K8S 1.19 | K8S 1.20 | K8S 1.21 | K8S 1.22 |
|-------------------------|----------|----------|----------|----------|
| 10.0.2.0                | ✓        | ✓        |          |          |
| 10.0.3.0                | ✓        | ✓        |          |          |
| 10.0.4.0                |          | ✓        | ✓        | ✓        |
| 10.0.4.0-ifix2 or later |          | ✓        | ✓        | ✓        |

Table 2. API Connect and OpenShift Container Platform (OCP) compatibility matrix

| API Connect version     | OCP 4.6 | OCP 4.7 | OCP 4.8 | OCP 4.9 | OCP 4.10 |
|-------------------------|---------|---------|---------|---------|----------|
| 10.0.2.0                | ✓       | ✓       |         |         |          |
| 10.0.3.0                | ✓       | ✓       |         |         |          |
| 10.0.4.0                | ✓       | ✓       | ✓       |         |          |
| 10.0.4.0-ifix2 or later | ✓       | ✓       | ✓       | ✓       | ✓        |

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Requirements for initial deployment on VMware

Review the requirements and considerations for deploying in a VMware environment.

- [Deployment requirements on VMware](#)
- [Disk space requirements](#)
- [API Connect configuration on VMware](#)
- [Passwords and certificates](#)
- [Setting and using a hashed default password](#)
- [DataPower Gateway for API Connect on VMware](#)

## Deployment requirements on VMware

- Ensure you have supported software requirement versions. See [IBM API Connect Version 10 software product compatibility requirements](#)
- Do not change the hardware version of the OVA during installation. Do not attempt to use an unsupported version, even if VMware indicates compatibility with other versions. For example, when deploying IBM API Connect, the VMware UI for the APIC OVAs might show information like:

Table 1.

| Property      | Value                              |
|---------------|------------------------------------|
| Guest OS      | Ubuntu Linux (64-bit)              |
| Compatibility | ESXi 5.5 and later (VM version 10) |
| VMware Tools  | Yes                                |
| CPUs          | 4                                  |
| Memory        | 16 GB                              |

Although the **Compatibility** field shows **ESXi 5.5 and later (VM version 10)**, API Connect supports only the versions listed in [IBM API Connect Version 10 software product compatibility requirements](#). Do not change the VM version of the OVA. Ensure that the **Compatibility** field values are not changed, and remain **ESXi 5.5 and later (VM version 10)**.

Attempts to modify the VMware compatibility may typically result in failure to boot the OVA, as per <https://kb.vmware.com/s/article/52683>.

- Ensure that your operating system has one of the supported utilities for creating ISOs. The apicup installer uses **mkisofs** on Linux, and **hdiutil** on macOS. For Windows, you need software that creates ISO files using **mkisofs**, such as CDRTools. Verify that the utility you will use is located in a directory that is referenced by

the PATH environment setting for your operating system. When creating the ISO, if you encounter the message **Error: unable to create config ISO for host**, verify that you have sufficient permissions to run the command.

- **Important:** Use a single **apicup** project for all subsystems, even those in a different cluster. Multiple projects will result in multiple certificate chains which will not match.

The original project directory created with **apicup** during the initial product installation (for example, *myProject*) is required to both restore the database and to upgrade your deployment. You cannot restore the database or perform an upgrade without the initial project directory because it contains pertinent information about the cluster. Note that the endpoints and certificates cannot change; the same endpoints and certificates will be used in the restored or upgraded system. A good practice is to back up the original project directory to a location from where it can always be retrieved.

Endpoints for the components cannot change between deployments. However, the endpoints for the VMware hosts can be modified for the new deployment.

- For each subsystem, gather the following networking settings, which you will need to supply during configuration:

Table 2.

| Required information                                                      | Value for your system |
|---------------------------------------------------------------------------|-----------------------|
| IP address of the server                                                  |                       |
| IP address of the server                                                  |                       |
| Domain of the server                                                      |                       |
| IP addresses of the name servers                                          |                       |
| IP address of the network gateway (not DataPower® gateway) for the server |                       |
| Name of the Ethernet interface                                            |                       |
| VLAN                                                                      |                       |

Some virtualization environments require additional information when you create and configure virtual machines. For example, it might be necessary to assign a specific VLAN ID, Resource Pool, or Datastore. Please refer to information provided by your virtualization environment administrators.

## Disk space requirements

- For Version 10, the data disk requirement for the management server is 200 GB. The boot disk requires 100 GB, so a minimum of 300 GB is needed for the management subsystem. You specify the data disk size in [Deploying the management subsystem OVA file](#) when you deploy the OVF template in the VMware vSphere Web Client.
- The Developer Portal disk requirements vary with usage scenarios. See [Table 1](#).
- Before you install, review all the minimum hardware requirements listed on the Hardware tab in the Software Product on the Compatibility Reports for API Connect. Follow the instructions in [IBM API Connect Version 10 software product compatibility requirements](#).

## API Connect configuration on VMware

- API Connect cannot be deployed on NFS.
- The timezone for API Connect pods is set to UTC. In API Connect deployments on VMware, the operating system timezone is also set to UTC. Do not change the timezone for the pods or the operating system.
- Ensure that the time settings match (within a few seconds) between the machine running **apicup** and the VMware **Host** clock. To verify the VMware host clock setting, see <https://kb.vmware.com/s/article/1003736>.

If the clocks are too different, the installation can fail because of invalid certificates due to time discrepancies.

- Deploying multiple similar subsystems in a single namespace is not supported. For example, deploying two management subsystems, **mgmt1**, **mgmt2** in a single namespace where **apiconnect** operator is installed.
- API Connect requires a dedicated IP range for deployment of the Kubernetes pod and Kubernetes service networks. These IP addresses cannot conflict with IP addresses used by other resources in your deployment, such as SMTP servers or user registries. The default values are 172.16.0.0/16 and 172.17.0.0/16, respectively. If a /16 subnet overlaps with existing IPs on the network, a CIDR as small as /22 is acceptable. If the default ranges conflict with other programs, you can modify the API Connect ranges during initial installation. Note that you cannot modify them once an appliance has been deployed. Follow the instructions for your subsystem if you want to modify either of the IP ranges.

- Only static IP addresses that are specified during the **apicup** project configuration before the installation of the OVAs are supported.
- Designated host names must have wildcard aliases or host aliases, which ensures that the different endpoints work together. For example, `*.hostname.mycompany.com`.
- Endpoints cannot contain the underscore character "\_" or uppercase characters.
- Host names that are used to create endpoints cannot contain the underscore character "\_" or uppercase letters.
- Kubernetes ingress limits the character set for DNS names to not support the underscore character "\_". This means you cannot specify underscores in domain names that are used as endpoints. For example, `my_domain.bar.com` and `my.domain_abc.com` are not supported for `<xxx>.<hostname>.<domainname>`, and will cause an error. For example:

```
Invalid value: "my_domain.bar.com": a DNS-1123 subdomain must consist of lowercase alphanumeric characters, '-' or '.', and must start and end with an alphanumeric character (e.g. 'example.com', regex used for validation is '[a-z0-9]([-a-z0-9]*[a-z0-9])?(\.[a-z0-9]([-a-z0-9]*[a-z0-9])?)*')
```

- Note that you cannot change host names or DNS names on a running cluster.
- For Analytics, the installer specifies a default value of 16 GB for `es-max-memory-gb`. The minimum value for this setting is 12 GB.
- Decide the *deployment-profile* to use for the installation.

Table 3. Deployment profiles

| deployment-profile | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Development        | Development (non-production) deployment-profile deploys a subsystem with the scale of one. Development deployment-profile is recommended for development, testing, and demonstration purposes. Values are specific to each subsystem. The development deployment-profile is not recommended for production environments because it does not provide high availability.<br><code>apicup subsys set mgmt deployment-profile=n1xc4.m16</code> |

| deployment-profile | Description                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Production         | Production deployment-profile deploys in high availability deployment-profile for a production environment. Values are specific to each subsystem. For example, for the management subsystem:<br><code>apicup subsys set mgmt deployment-profile=n3xc4.m16</code> |

Use of production deployment-profile is supported only on installations with three or more nodes. Installations with less than three nodes must use a development deployment-profile. If you install in a production deployment-profile with only a single node, some pods can remain in a pending state. To avoid having pods remain pending, either install in development deployment-profile or add additional nodes.

Note that a deployment-profile is set for each subsystem type: Management, Analytics, and Developer Portal.

- For additional considerations for configuring clusters, see [Configuring API Connect subsystems in a cluster](#). Important: For best performance it is recommended that the network latency between any 2 nodes be as low as possible. Do not configure nodes from the same subsystem cluster across multiple data centers with a high latency network. A high latency network is one that experiences more than 30ms latency between nodes.
- Configure a remote server for logging. Follow these instructions: [Configuring remote logging for a VMware deployment](#). Pods are terminated during an upgrade, and the logs will be lost if not stored remotely.

## Passwords and certificates

- When creating configuration files for use in generating an ISO image for VMware, ensure that your working directories are secure. The VMware configuration requires an ISO image that contains a plain text password to be used to unlock the VMware data disk. This means that the API Connect project configuration file `apiconnect-up-v10.yml`, and the `/user-data` directory for each host, contain the passwords you specified. This configuration information is used to create the ISO image that you combine with the `..ova` distribution files when deploying (unlocking) the VMware data disk.
- You can use `apicup` to specify an `ssh` keyfile that contains a public certificate for using `ssh` to log in to a virtual machine. Logging in through `ssh` is preferred because it is more secure than password-based login.
- Default certificates are generated for each subsystem by the `apicup subsys install` command. If certificates are not explicitly set using the `apicup certs set` command, then default certificates are automatically generated by `apicup`. The default certificates are self-signed, so they may not provide a level of trust suitable for external communication. See [Working with certificates](#).

## Setting and using a hashed default password

During configuration of the Management, Analytics, and Developer Portal subsystems, you create a password to use to log in to the management console for the first time. You must use a password hashing utility to hash the password. You then use `apicup` to assign this hashed password to the subsystem. These configuration steps ensure that the password is not stored in plain text on the data disk.

The syntax of the `apicup` command is:

```
apicup subsys set mgmt default-password='hashed_password'
```

Usage notes:

- The `default-password` is for the `apicadm` user account on the Appliance.
- The password for `apicadm` can be used **only** to log in through the VMware console. You cannot use it to `ssh` into the Appliance as an alternative to using the `ssh-keyfiles`. Interactive login for `ssh` is disabled.
- The `default-password` value configured is only used during initial installation (first boot) of each virtual appliance. Changing the value, then regenerating the ISO, and attaching the new ISO to the virtual appliance does not change the `apicadm` password.
- The `default-password` must be hashed. If it is plain text, you will not be able to log into the Appliance through the VMware console. When you use `apicup` to set or get `default-password`, `apicup` ensures that the hash type of the password is one of the following:
  - MD5
  - SHA1
  - SHA256
  - SHA512
  - BCRYPT
  - MD5-Crypt
- When using `apicup` to set a default password for a subsystem, be aware of syntax differences between operating systems. Windows requires double-quotes. Linux and OSX require single quotes.

| Operating system | Command syntax                                                         |
|------------------|------------------------------------------------------------------------|
| Linux or OSX     | <code>apicup subsys set mgmt default-password='hashed_password'</code> |
| Windows          | <code>apicup subsys set mgmt default-password="hashed_password"</code> |

- You can use the `passwd` command (on the appliance) to change the `apicadm` password.
- When using the VMware Remote console to login to the appliance, be aware that the keyboard layout is English. This can cause a problems with hashed passwords, if you created the ISO on a system with a different keyboard layout and you used special characters or symbols. Passwords are hashed when you set the password that you enter to log into your Management appliance for the first time, and when you create hosts.

## DataPower Gateway for API Connect on VMware

- Installation and configuration of DataPower Gateway on an appliance (physical or virtual) is completed after you install the API Connect subsystems. For the gateway service in a VMware environment, use the instructions in [Deploying DataPower Gateway](#).
- Ensure that DataPower Gateway firmware version you plan to install is compatible with the API Connect Management server version.

Note:

For API Connect Version 10.x, DataPower and API Connect releases must be within one release of each other. For example, API Connect v10.0.n runs with DataPower Gateway 10.0.n, v10.0.n-1, or v10.0.n+1.

However, before you install, best practice is to review the latest compatibility support for your version of API Connect. To view compatibility support, follow the instructions in [IBM API Connect Version 10 software product compatibility requirements](#) to access API Connect information on the Software Product Compatibility Reports website. Once you access information for your version of API Connect, select Supported Software...>Integration Middleware, and view the list of compatible DataPower Gateway versions.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API Connect licenses

When you install a new version of API Connect on VMware, you must accept a new license.

### Setting the License ID on VMware

Each license has a unique identifier called a **License ID**. Use `apicup` to accept the license. License acceptance is stored in `apiconnect-up-v10.yml`. Each accepted **License ID** is passed into subsystem CRs.

```
apicup licenses accept <License_ID>
```

For example:

```
apicup licenses accept L-RJON-BZ5LSE
```

- Use `apicup licenses list` displays licenses available for current version. Also shows all accepted licenses, including prior versions. `apicup licenses list` has a `-o yaml|json` flag to make script based usage easier.
- If an invalid value is passed to `apicup licenses accept`, an error is displayed showing the valid values:

```
Error: Must run `apicup licenses accept ID` with one of [L-RJON-BV7JN8, L-RJON-BXWP45, .....]
```

- If you run other `apicup` commands, such as `apicup subsys get <subsystem_name>` from within a project directory, without first accepting a license, those commands will fail. Once you accept the license, the commands will succeed.

You accept the license during [First steps for deploying in a VMware environment](#).

Use the following tables to located the License ID for your version of API Connect:

- [API Connect 10.0.4.0 licenses](#)
- [API Connect 10.0.3.0 licenses](#)
- [API Connect 10.0.2.0 licenses](#)

### API Connect 10.0.4.0 licenses

| License ID    | Program Name                                                                                                                                                                                                                                                                                                   | URL                                                         |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## What's new for v10 installation

Summary of installation changes for API Connect v10 on VMware.

- Changes to **apicup** settings:
  - license-use.** Values changed: **Production** is now **production**. **Nonproduction** is now **nonproduction**.
  - licenses accept** added for setting Program license. See [API Connect licenses](#)
  - mode** is deprecated and replaced by **deployment-profile**. Each subsystem (Management, Analytics, Portal) has separate values for development profile and production profiles.
  - v2018 settings that are deprecated:
    - az-name - no longer used with the Management subsystem
    - cross-az-peers - no longer used with the Management subsystem
    - cassandra-max-memory-gb - no longer used with the Management subsystem
    - es-memory-gb - no longer used with the Analytics subsystem.
    - All cassandra-backup-\* settings are no longer used with the Management subsystem. The Cassandra database is deprecated and replaced by Postgres.
      - cassandra-backup-auth-pass
      - cassandra-backup-auth-user
      - cassandra-backup-host
      - cassandra-backup-path
      - cassandra-backup-port
      - cassandra-backup-protocol
      - cassandra-backup-schedule
- The minimum size data disk for the Management system increases from 150 GB in v2018 to 200 GB in v10. When combined with the 100 GB requirement for the root disk (unchanged), you need 300 GB for the Management subsystem.
- Upon reboot, any extra disk that was added to the VM is picked up and added to the secure storage (data disk).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## First steps for deploying in a VMware environment

The first steps in deploying in a VMware environment are to obtain the API Connect distribution files and to create a project directory.

### Before you begin

- Review [Requirements for initial deployment on VMware](#).
- See [What's new for v10 installation](#)
- See also [Configuring API Connect subsystems in a cluster](#).

### About this task

In these First Steps, you will use Install Assist (**apicup**) to create a project directory that contains the configuration file **apiconnect-up-v10.yml**. When you configure the first subsystem, such as the Management Service, the subsystem configuration settings are placed in the file.

When you want to configure a second subsystem, it is important that you reuse the same project directory. This means that you only need to download Install Assist once, and create a project directory once. The configuration settings for the second subsystem are added to the existing **apiconnect-up-v10.yml**. In this way, the second subsystem, such as Developer Portal, can access the configuration information needed to interact with the first subsystem.

After completing these First Steps, follow the links to instructions for configuring your subsystem. You will specify configuration settings, create an ISO of the subsystem configuration, and then use VMware to deploy the distribution file (.ova file) for the subsystem with your ISO. Note that you create a separate ISO for each subsystem.

Installation and configuration of DataPower® Gateway on an appliance (physical or virtual) is completed after you install the API Connect subsystems. For the gateway service in a VMware environment, use the instructions in [Deploying DataPower Gateway](#).

Note:

- For upgrades, do not use the procedures on this page. See [Upgrading API Connect](#).
- Some `apicup` commands have changed from previous versions of API Connect. See [What's new for v10 installation](#).
- When maintaining API Connect, do not use `kubect1 exec` commands to access API Connect pods unless advised by IBM. Do not make any changes on the deployed VMs unless documented here or otherwise advised by IBM. Attempting to manually update packages, adding new users, or installing new software will likely cause problems. Operating system updates are handled by API Connect fix packs.

## Procedure

1. Obtain the API Connect files.

The following files are used for initial deployment on VMware:

IBM® API Connect <version> Management for VMware  
Management subsystem files

IBM® API Connect <version> Developer Portal for VMware  
Developer Portal subsystem files

IBM® API Connect <version> Analytics for VMware  
Analytics subsystem files

IBM® API Connect <version> Install Assist for <operating\_system\_type>  
The `apicup` installation utility. Required for all installations on VMware.

IBM® API Connect <version> Toolkit for <operating\_system\_type>

Toolkit command line utility. Packaged standalone, or with API Designer or Loopback:

- IBM® API Connect <version> Toolkit for <operating\_system\_type>
- IBM® API Connect <version> Toolkit with Loopback for <operating\_system\_type>
- IBM® API Connect <version> Toolkit Designer with Loopback for <operating\_system\_type>

Not required during initial installation. After installation, you can download directly from the Cloud Manager UI and API Manager UI. See [Installing the toolkit](#).

IBM® API Connect <version> Local Test Environment

Optional test environment. See [Testing an API with the Local Test Environment](#)

IBM® API Connect <version> Security Signature Bundle File

Checksum files that you can use to verify the integrity of your downloads.

Note: The Fix Pack page contains two copies of the files for each subsystem. One copy is for new installations and one is for upgrades of existing installations. For new installations, do not use files with *Upgrade* in the file name.

2. Select one of the following actions:

- If you are configuring your first subsystem, go to step [3](#).
- If you have already configured a subsystem, go to step [5](#).

3. Install the installation utility.

- a. Locate the `apicup` installation utility file for your operating system, and download it:
- b. Rename the file for your OS type to `apicup`. Note that the instructions in this documentation refer to `apicup`.
- c. OSX and Linux® only: Make the `apicup` file an executable file by entering the following command:

```
chmod +x apicup
```

- d. Set your path to the location of your `apicup` file.
  - For the OSX and Linux operating systems:

```
export PATH=$PATH:/Users/your_path/
```

- For the Windows operating system:

```
set PATH=c:\your_path;%PATH%
```

4. Create a project called `myProject` and copy the `apicup` executable into the project directory:

- a. Create a project:

```
apicup init myProject
```

- b. Copy the `apicup` executable into the `myProject` directory or folder created by the `apicup init` command.
- c. From within your project directory, specify the API Connect license:

```
apicup licenses accept <License_ID>
```

The <License\_ID> is specific to the API Connect Program Name you purchased. To view the supported license IDs, see [API Connect licenses](#).

Important:

Use a single APICUP project for all subsystems, even those in a different cluster. Multiple projects will result in multiple certificate chains which will not match.

The original project directory created with APICUP during the initial product installation (for example, `myProject`) is required to both restore the database and to upgrade your deployment. You cannot restore the database or perform an upgrade without the initial project directory because it contains pertinent information about the cluster. Note that the endpoints and certificates cannot change; the same endpoints and certificates will be used in the restored or upgraded system. A good practice is to backup the original project directory to a location from where it can always be retrieved.

Endpoints for the components cannot change between deployments. However, the endpoints for the VMware hosts can be modified for the new deployment.

The `apiconnect-up-v10.yml` file is created in that directory.

Important: The apiconnect-up-v10.yml file must be in a secure and permanent location. The file contains password information and other information that is exposed in text format. Ensure that the project directory is secure.

5. Continue with the configuration steps for your subsystem:

- [Deploying the Management subsystem](#)
- [Deploying the Analytics subsystem](#)
- [Deploying the Developer Portal](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Signature verification by using PGP

You can verify the integrity of files to ensure that they originated from IBM and are not modified.

### About this task

---

You can use code signatures to verify that a downloaded file was created by IBM and that no bits in the file were changed. The signature files that are used are \*.asc. The key/cert file is APICHURSLEY.pub.gpg.

### Procedure

---

1. Import the public key.

```
$ gpg --import APICHURSLEY.pub.gpg
gpg: key D43AB29897005BF2: public key "APICHURSLEY" imported
gpg: Total number processed: 1
gpg:          imported: 1

$ gpg --list-key --fingerprint APICHURSLEY
pub  rsa2048 2020-02-17 [SCEA]
     1467 C004 A754 4718 7C6B 19DF D43A B298 9700 5BF2
uid          [ unknown] APICHURSLEY
```

When the key is imported, it does not need to be imported again. It is not signed, but you should make a note of the fingerprint so you can compare to make sure that the key is IBM's:

```
1467 C004 A754 4718 7C6B 19DF D43A B298 9700 5BF2
```

2. Verify the files.

```
$ gpg --verify helper_files.zip.asc
gpg: assuming signed data in 'helper_files.zip'
gpg: Signature made Mon 28 Sep 17:35:17 2020 PDT
gpg:          using RSA key D43AB29897005BF2
gpg: Good signature from "APICHURSLEY" [unknown]
gpg: WARNING: This key is not certified with a trusted signature!
gpg:          There is no indication that the signature belongs to the owner.
Primary key fingerprint: 1467 C004 A754 4718 7C6B 19DF D43A B298 9700 5BF2
```

The verification shows that the key matches the signature and that shows the fingerprint of the key, which should match the import:

```
1467 C004 A754 4718 7C6B 19DF D43A B298 9700 5BF2
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Deploying the Management subsystem

You can create a virtual server by deploying the relevant IBM® API Connect OVA file on a VMWare virtual server. Create all of the virtual servers that you want to use in your cloud.

### Before you begin

---

Before you deploy:

- Review the [Deployment requirements on VMware](#).
- Review the [API Connect configuration on VMware](#).
- Review [What's new for v10 installation](#)
- For information on deploying a cluster, see [Configuring API Connect subsystems in a cluster](#)
- If you are upgrading from a previous version, see [Upgrading API Connect](#).

### About this task

---

You must deploy the API Connect OVA template to create each Management virtual server that you want in your cloud.

Attention: The following settings apply to features that are currently not supported, and should not be modified:

- Subsystem settings: test-and-monitor-enabled
- Certificate settings: hub, turnstile

## Procedure

---

Complete each of the following tasks in order:

1. [Configuring the management subsystem](#)
2. [Deploying the management subsystem OVA file](#)
3. [Verify installation of the management subsystem](#)

## What to do next

---

If you want to deploy an API Connect Analytics OVA file, continue with [Deploying the Analytics subsystem](#).

If you want to deploy an API Connect Developer Portal OVA file, continue with [Deploying the Developer Portal](#).

Identify the DataPower® appliances to be used as gateway servers in the API Connect cloud and obtain the IP addresses.

- [Configuring the management subsystem](#)  
Specify configuration properties for your management subsystem, and create an ISO.
- [Deploying the management subsystem OVA file](#)  
After you have specified configuration settings and created an ISO, deploy the subsystem OVA into an appliance VM.
- [Verify installation of the management subsystem](#)  
Verify that deployment of the management subsystem OVA file succeeded.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring the management subsystem

Specify configuration properties for your management subsystem, and create an ISO.

## Before you begin

---

Review [Deploying the Management subsystem](#)

## About this task

---

Use the `apicup` installation utility to specify configuration settings for your management subsystem.

## Procedure

---

1. Ensure that you obtained the distribution file and have a project directory, as described in [First steps for deploying in a VMware environment](#).
2. Change to the project directory.

```
cd myProject
```

3. Create a management subsystem.

```
apicup subsys create mgmt management
```

Where:

- `mgmt` is the name of your management server that you are creating. You can assign it any name, as long as the identifier consists of lowercase alphanumeric characters or '-', with no spaces, starts with an alphabetic character, and ends with an alphanumeric character.
- `management` indicates that you are creating a management microservice.

The API Connect Helm charts are deployed into the default namespace. You do not need to specify a namespace.

Tip: At any time, you can view the current management subsystem values in the `apiconnect-up-v10.yml` by running the `apicup subsys get` command:

```
apicup subsys get mgmt
```

If you have not yet configured the subsystem, the command might return errors. Also, if you have not updated the value, a default value is listed, if there is one that is available.

After configuration is complete, you can view output similar to the following sample:

```
Appliance settings
```

```
=====
Name           Value
Description    -----
-----
```

```

-----
additional-cloud-init-file
(Optional) Path to additional cloud-init yml file
data-device                sdb
VM disk device (usually `sdb` for SCSI or `vdb` for VirtIO)
default-password
$6$rounds=4096$vtcqpAVK$dzqrOeYP33WTVTug38Q4Rld518TmdQgezzTnkX/PFwkzTiZ2S0CqNRr1S4b08tOc4p.OEg4BtzBe/r8RAk.gW/
(Optional) Console login password for `apicadm` user, password must be pre-hashed
dns-servers                 [8.8.8.8]
List of DNS servers
extra-values-file
(Optional) Path to additional configuration yml file
k8s-pod-network            172.16.0.0/16
(Optional) CIDR for pods within the appliance
k8s-service-network       172.17.0.0/16
(Optional) CIDR for services within the appliance
public-iface               eth0
Device for API/UI traffic (Eg: eth0)
search-domain              [subnet1.example.com]
List for DNS search domains
ssh-keyfiles               [/home/vsphere/.ssh/id_rsa.pub]
List of SSH public keys files
traffic-iface              eth0
Device for cluster traffic (Eg: eth0)

```

| Name                                                                                                                         | Value      |
|------------------------------------------------------------------------------------------------------------------------------|------------|
| Description                                                                                                                  | -----      |
| deployment-profile                                                                                                           | n1xc4.m16  |
| Deployment profile (n1xc2.m16/n3xc4.m16) for analytics, (n1xc4.m16/n3xc4.m16) for management, (n1xc2.m8/n3xc4.m8) for portal |            |
| license-use                                                                                                                  | production |
| License use (production/nonproduction)                                                                                       |            |
| multi-site-ha-enabled                                                                                                        | false      |
| Multi site HA enabled                                                                                                        |            |
| multi-site-ha-mode                                                                                                           | active     |
| Multi site HA mode (active/passive)                                                                                          |            |
| replication-peer-fqdn                                                                                                        |            |
| Replication peer fully qualified name (replication endpoint of active mode site)                                             |            |
| site-name                                                                                                                    |            |
| Site name, used in k8s resource names                                                                                        |            |
| test-and-monitor-enabled                                                                                                     | false      |
| Test and Monitor enabled                                                                                                     |            |

Endpoints  
=====

| Name                                                                                      | Value                                          |
|-------------------------------------------------------------------------------------------|------------------------------------------------|
| Description                                                                               | -----                                          |
| api-manager-ui                                                                            | api-manager-ui.testsrv0231.subnet1.example.com |
| FQDN of API manager UI endpoint                                                           |                                                |
| cloud-admin-ui                                                                            | cloud-admin-ui.testsrv0231.subnet1.example.com |
| FQDN of Cloud admin endpoint                                                              |                                                |
| consumer-api                                                                              | consumer-api.testsrv0231.subnet1.example.com   |
| FQDN of consumer API endpoint                                                             |                                                |
| hub                                                                                       |                                                |
| FQDN of Test and Monitor hub endpoint, only required if Test and Monitor is enabled       |                                                |
| management-replication                                                                    |                                                |
| FQDN of Management replication endpoint, only required if HA is enabled                   |                                                |
| platform-api                                                                              | platform-api.testsrv0231.subnet1.example.com   |
| FQDN of platform API endpoint                                                             |                                                |
| turnstile                                                                                 |                                                |
| FQDN of Test and Monitor turnstile endpoint, only required if Test and Monitor is enabled |                                                |

- For production environments, specify `deployment-profile=n3xc4.m16`.

```
apicup subsys set mgmt deployment-profile=n3xc4.m16
```

The `deployment-profile=n3xc4.m16` parameter indicates that you are deploying in high availability (HA) mode for a production environment. The `deployment-profile=n1xc4.m16` indicates a system for use in development and testing. For more information, see [Requirements for initial deployment on VMware](#).

- Specify the license version you purchased.

```
apicup subsys set mgmt
license-use=<license_type>
```

The `license_type` must be either `production` or `nonproduction`. If not specified, the default value is `nonproduction`.

- Optional: Configure backups of the subsystem. Note that once you set up scheduled backups, you can also run backups on-demand. Follow the instructions in [Configure your Management subsystem backup](#).  
Important: It is highly recommend that you configure backups and also take additional steps to ensure that your configuration and data can be restored in the event of a disaster event. See [Disaster recovery of the management subsystem on VMware](#).
- Optional: Configure your logging.  
Logging can be configured at a later time, but you must enable it before installation to capture the log events from the installation.
  - Complete the procedure at [Configuring remote logging for a VMware deployment](#).

- b. Enter the following command to create the log file:

```
apicup subsys set mgmt additional-cloud-init-file=config_file.yml
```

8. Enter the following commands to update the apiconnect-up-v10.yml with the information for your environment:

- a. Set your search domain. Multiple search domains should be separated by commas.

```
apicup subsys set mgmt search-domain=your_search_domain
```

Where *your\_search\_domain* is the domain of your servers, entered in all lowercase. Setting this value ensures that your searches also append these values, which are based on your company's DNS resolution, at the end of the search value. A sample search domain is *mycompany.example.com*.

Ensure that the value for *your\_search\_domain* is resolved in the system's */etc/resolv.conf* file to avoid "502" errors when accessing the Cloud Manager web site. For example:

```
# Generated by resolvconf
search your_search_domain ibm.com other.domain.com
```

- b. Set your domain name servers (DNS).

Supply the IP addresses of the DNS servers for your network. Use a comma to separate multiple server addresses.

```
apicup subsys set mgmt dns-servers=ip_address_of_dns_server[,ip_address_of_another_dns_server_if_necessary]
```

DNS entries may not be changed on a cluster after the initial installation.

- c. Use **apicup** to set your endpoints.

You can use wildcard aliases or host aliases with your endpoints.

Optionally, you can specify all endpoints with one **apicup** command.

Note: You cannot specify the underscore character "\_" in domain names that are used in endpoints. See [API Connect configuration on VMware](#).

Table 1. Management subsystem endpoints

| Setting        | Endpoint host description                                                                                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| platform-api   | Platform API endpoint. The host where your platform API calls are routed.<br><code>apicup subsys set mgmt platform-api=platform-api.hostname.domain</code>                                                 |
| consumer-api   | Consumer API endpoint. The host where your consumer API calls are routed.<br><code>apicup subsys set mgmt consumer-api=consumer-api.hostname.domain</code>                                                 |
| cloud-admin-ui | Cloud admin user interface API endpoint. The host where your cloud administrator user-interface API calls are routed.<br><code>apicup subsys set mgmt cloud-admin-ui=cloud-admin-ui.hostname.domain</code> |
| api-manager-ui | API Manager user interface endpoint. The host where your API Manager API calls are routed.<br><code>apicup subsys set mgmt api-manager-ui=api-manager-ui.hostname.domain</code>                            |
| hub            | The core microservice components for the Automated API behavior testing capability.<br><code>apicup subsys set mgmt hub hub.hostname.domain</code>                                                         |
| turnstile      | Allows for communication between the Test pods and the API Management subsystem.<br><code>apicup subsys set mgmt turnstile turnstile.hostname.domain</code>                                                |

9. Set a Public key.

```
apicup subsys set mgmt ssh-keyfiles=path_to_public_ssh_keyfile
```

Setting this key enables you to use **ssh** with this key to log in to the virtual machine to check the status of the installation. You will perform this check in later in [Deploying the management subsystem OVA file](#).

10. Set the password that you enter to log into your Management appliance for the first time.

- a. **Important:** Review the requirements for creating and using a hashed password. See [Setting and using a hashed default password](#).

- b. If you do not have a password hashing utility, install one.

| Operating system    | Command                                                                                                                                                                                               |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ubuntu, Debian, OSX | If the <b>mkpasswd</b> command utility is not available, download and install it. (You can also use a different password hashing utility.) On OSX, use the command: <code>gem install mkpasswd</code> |
| Windows, Red Hat    | If necessary, a password hashing utility for the Windows operating system, like OpenSSL                                                                                                               |

- c. Create a hashed password

| Operating system    | Command                                                                                                                                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ubuntu, Debian, OSX | <code>mkpasswd --method=sha-512 --rounds=4096 password</code>                                                                                                                                                              |
| Windows, Red Hat    | For example, using OpenSSL: <code>openssl passwd -1 password</code> . Note that you might need to add your password hashing utility to your path; for example, on Windows:<br><code>set PATH=c:\cygwin64\bin;%PATH%</code> |

- d. Set the hashed password for your subsystem:

```
apicup subsys set mgmt default-password='hashed_password'
```

11. Optional: If the default IP ranges for the API Connect Kubernetes pod and the service networks conflict with IP addresses that must be used by other processes in your deployment, modify the API Connect values.

You can change the IP ranges of the Kubernetes pod and the service networks from the default values of 172.16.0.0/16 and 172.17.0.0/16, respectively. In the case that a /16 subnet overlaps with existing IPs on the network, a Classless Inter-Domain Routing (CIDR) as small as /22 is acceptable. You can modify these ranges during initial installation and configuration only. You cannot modify them once an appliance has been deployed. See [API Connect configuration on VMware](#).

- a. Update the IP range for the Kubernetes pod

```
apicup subsys set mgmt k8s-pod-network='new_pod_range'
```

Where *new\_pod\_range* is the new value for the range.

- b. Update the IP range for Service networks.

```
apicup subsys set mgmt k8s-service-network='new_service_range'
```

Where *new\_service\_range* is the new value for the range.

12. Add your hosts.

```
apicup hosts create mgmt hostname.domainname hd_password
```

Where the following are true:

- *hostname.domainname* is the fully qualified name of the server where you are hosting your Management service, including the domain information.
- *hd\_password* is the password that the Linux Unified Key Setup uses to encrypt the storage for your Management service. This password is hashed when it is stored on the server or in the ISO. Note that the password is base64 encoded when stored in `apiconnect-up-v10.yml`.

Repeat this command for each host that you want to add.

Note: Host names and DNS entries may not be changed on a cluster after the initial installation.

13. Create your interfaces.

```
apicup iface create mgmt hostname.domainname physical_network_id host_ip_address/subnet_mask network_gateway_ip_address
```

Where *physical\_network\_id* is the network interface ID of your physical server. The value is most often `eth0`. The value can also be `ethx`, where *x* is a number identifier.

The format is similar to this example: `apicup iface create mgmt myHostname.domain eth0 192.0.2.10/255.255.255.0 192.0.2.1`.

Note: The *network\_gateway\_ip\_address* is the network gateway (not a DataPower Gateway). If you are creating multiple network interfaces, each one must be on a different subnet with a different gateway.

14. Optional: Use `apicup` to view the configured hosts:

```
apicup hosts list mgmt
testsrv0231.subnet1.example.com
  Device  IP/Mask  Gateway
  eth0    1.2.152.231/255.255.254.0  1.2.152.1
```

Note: This command might return the following messages, which you can ignore:

```
* host is missing traffic interface
* host is missing public interface
```

Note: If you are configuring two data center deployment, continue with the installation instructions in [Installing a two data center deployment](#).

15. Optional: Verify that the configuration settings are valid.

```
apicup subsys get mgmt --validate
```

The output lists each setting and adds a check mark after the value once the value is validated. If the setting lacks a check mark and indicates an invalid value, reconfigure the setting. See the following sample output.

```

16. Create your ISO file.

```
apicup subsys install mgmt --out mgmtplan-out
```

The `--out` parameter and value are required.

In this example, the ISO file is created in the `myProject/mgmtplan-out` directory.

If the system cannot find the path to your software that creates ISO files, create a path setting to that software by running a command similar to the following command:

| Operating system | Command                                                        |
|------------------|----------------------------------------------------------------|
| OSX and Linux    | <code>export PATH=\$PATH:/Users/your_path/</code>              |
| Windows          | <code>set PATH="c:\Program Files (x86)\cdrtools";%PATH%</code> |

17. Deploy the subsystem ISO. Continue with [Deploying the management subsystem OVA file](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Deploying the management subsystem OVA file

After you have specified configuration settings and created an ISO, deploy the subsystem OVA into an appliance VM.

### Before you begin

You must have completed the configuration of the project file entries for the management subsystem, in [Configuring the management subsystem](#).

### About this task

### Procedure

1. Log into the VMWare vSphere Web Client.
2. Using the VSphere Navigator, navigate to the directory where you are deploying the OVA file.
3. Right-click the directory and select Deploy OVF Template.
4. Complete the Deploy OVF Template wizard.
  - a. Select the Management subsystem .OVA file template by navigating to the location where you downloaded the file in [First steps for deploying in a VMware environment](#).
  - b. Enter a name and location for your file.
  - c. Select a resource for your template.
  - d. Review the details for your template.
  - e. Select the size of your configuration.
  - f. Select the storage settings.
 

Important: Select at least 200 GB for the data disk size. Note that the boot disk needs 100 GB, so you need a total of 300 GB for the API Connect management subsystem.
  - g. Select the networks.
  - h. Customize the Template, if necessary.
  - i. Review the details to ensure that they are correct.

- j. Select Finish to deploy the virtual machine.

Note: Do not change the OVA hardware version, even if the VMware UI shows a Compatibility range that includes other versions. See [Requirements for initial deployment on VMware](#).

The template creation appears in your Recent Tasks list.

5. Select the Storage tab in the Navigator.
6. Navigate to your datastore.
7. Upload your ISO file.
  - a. Select the Navigate to the datastore file browser icon in the icon menu.
  - b. Select the Upload a file to the Datastore icon in the icon menu.
  - c. Navigate to the ISO file that you created in your project.  
It is the `myProject/mgmtplan-out`
  - d. Upload the ISO file to the datastore.
8. Leave the datastore by selecting the VMs and Templates icon in the Navigator.
9. Locate and select your virtual machine.
10. Select the Configure tab in the main window.
11. Select Edit....
  - a. On the Virtual Hardware tab, select CD/DVD Drive 1.
  - b. For the Client Device, select Datastore ISO File.
  - c. Find and select your datastore in the Datastores category.
  - d. Find and select your ISO file in the Contents category.
  - e. Select OK to commit your selection and exit the Select File window.
  - f. Ensure that the Connect At Power On check box is selected.  
Tip:
    - Expand the CD/DVD drive 1 entry to view the details and the complete Connect At Power On label.
    - Note that VMware related issues with ISO mounting at boot may occur if Connect At Power On
  - g. Select OK to commit your selection and close the window.
12. Start the virtual machine by selecting the play button on the icon bar.  
The installation might take several minutes to complete, depending on the availability of the system and the download speed.
13. Verify the API Connect installation. Continue with [Verify installation of the management subsystem](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Verify installation of the management subsystem

Verify that deployment of the management subsystem OVA file succeeded.

---

### Before you begin

You must have completed [Deploying the management subsystem OVA file](#).

---

### About this task

After you configure an ISO and deploy it with the management subsystem ova, as described in [Deploying the management subsystem OVA file](#), verify that the subsystem installed correctly and is functional.

---

### Procedure

1. Log in to the virtual machine by using an SSH tool to check the status of the installation:
  - a. Enter the following command to connect to `mgmt` using SSH:

```
ssh ip_address -l apicadm
```

You are logging in with the default ID of `apicadm`, which is the API Connect ID that has administrator privileges.

- b. Select Yes to continue connecting.  
Your host names are automatically added to your list of hosts.
- c. Run the `apic status` command to verify that the installation completed and the system is running correctly.  
Note that after installation completes, it can take several minutes for all servers to start. If you see the error message `Subsystems not running`, wait a few minutes, try the command again, and review the output in the `Status` column.

The command output for a correctly running Management system is similar to the following lines:

```
apicadm@testsys0181:~$ sudo apic status
INFO[0001] Log level: info

| testsys0164 Running | kube-system | tiller-deploy-84f4c8bb78-xxfds                         | 1/1   |

d. If you configured backups, create the management backup secret:

```
$ kubectl create secret generic mgmt-backup-secret --from-literal=key='<YOUR ACCESS KEY>' --from-literal=keysecret='<YOUR ACCESS KEY SECRET>'
```

For more information, see [Configure your Management subsystem backup](#).

2. Ensure that you have saved all the necessary artifacts to enable you to restore the management subsystem in case of a disaster event. See [Preparing the management subsystem for disaster recovery on VMware](#).
3. Verify you can access the API Connect Cloud Manager. Enter the URL in your browser. The syntax is `https://<hostname.domain>/admin`. For example:

```
https://cloud-admin-ui.testsrv0231.subnet1.example.com/admin
```

The first time that you access the Cloud Manager user interface, you enter `admin` for the user name and `7iron-hide` for the password. You will be prompted to change the Cloud Administrator password and email address. See [Accessing the Cloud Manager user interface](#).

4. If you configured an S3 backup during installation, verify that the configuration succeeded. See [Verify configuration for s3 backup](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Installing the Analytics subsystem

Install the IBM® API Connect Analytics subsystem.

### Before you begin

Review the section on [Planning your Analytics deployment](#) to ensure that you understand the choices for configuring the topology, disk space, and other elements of the Analytics subsystem. It is important to follow these steps in sequence, finishing with *Deploying the Analytics subsystem*.

- [Creating the analytics-extra-values file](#)  
Create the installation extra-values file for IBM API Connect Analytics so that you can deploy the Analytics subsystem with additional configuration settings on VMware.
- [Configuring your topology](#)  
Update the `analytics-extra-values.yaml` file to configure the topology of your IBM API Connect Analytics deployment.
- [Modifying your analytics data](#)  
Update the `analytics-extra-values.yaml` file to customize data in your IBM API Connect Analytics deployment.
- [Defining your internal storage space](#)  
If you don't want to use the shared storage that's configured by default for VMware, update the `analytics-extra-values.yaml` file for your IBM API Connect Analytics deployment.
- [Deploying the Analytics subsystem](#)  
You can add analytics data collection by deploying the IBM API Connect Analytics OVA file on a VMware virtual server.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating the analytics-extra-values file

Create the installation extra-values file for IBM® API Connect Analytics so that you can deploy the Analytics subsystem with additional configuration settings on VMware.

### Before you begin

You only need to create the `analytics-extra-values` file if you plan to add configuration options while installing the Analytics subsystem. For information on the available configuration options, see [Planning your Analytics deployment](#).

### About this task

To apply configuration options to the Analytics subsystem during installation, create an extra-values file where you can specify your settings. You can name the file anything you want but you must save it as a `.yaml` file. The examples in the installation documentation call the file `analytics-extra-values.yaml`. Use the `analytics-extra-values.yaml` file to apply configuration settings when you install, upgrade, and update the configuration of your Analytics subsystem.

### Procedure

1. Create a file called `analytics-extra-values` and open it for editing.
2. For the first line in the file, add:

```
spec:
```

All of your configuration options must follow this line, and must be indented with 2 spaces (or more for nested values).

3. Save the file.

## What to do next

Add configuration options to the `analytics-extra-values` as explained in the following topics.

- [Reference: Fields in the analytics-extra-values](#)  
Use the table of Analytics-specific fields to configure the `analytics-extra-values` for installing your IBM API Connect Analytics subsystem.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Reference: Fields in the analytics-extra-values

Use the table of Analytics-specific fields to configure the `analytics-extra-values` for installing your IBM® API Connect Analytics subsystem.

Table 1 lists the Analytics-specific fields that you can set in the `analytics-extra-values` file and describes each field. In Table 1, fields are shown using dot notation to indicate nested sections. For example, the field specified in Table 1 as `storage.data.volumeClaimTemplate.volumeSize` should be formatted in the `analytics-extra-values` file as follows:

```
storage:
  data:
    volumeClaimTemplate:
      volumeSize:
```

Table 1. Fields that you can set in the `analytics-extra-values` file

| Field                                   | Type                    | Required                                  | Default value            | Description                                                                           | Comments                                                                                                                                                                              |
|-----------------------------------------|-------------------------|-------------------------------------------|--------------------------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>client.enabled</code>             | boolean                 | no                                        | <code>true</code>        | Whether to deploy this microservice                                                   | This microservice serves the Analytics UI and REST API. Only disable it if you do not need the Analytics views in API Connect.                                                        |
| <code>client.endpoint</code>            | object                  | if <code>client.enabled == true</code>    | -                        | FQDN and TLS Secrets for client endpoint                                              | Identifies the endpoint that enables the Cloud Manager, API Manager, and Developer Portal to communicate with the Analytics subsystem.                                                |
| <code>client.clientSubjectDN</code>     | string                  | if <code>client.enabled == true</code>    | -                        | Subject DN (distinguished name) for authenticating with client endpoint (RFC 2253)    |                                                                                                                                                                                       |
| <code>client.style</code>               | <code>carbon, bx</code> | no                                        | <code>carbon</code>      | UI style for Analytics views                                                          | Setting to <code>bx</code> reverts the Analytics UI styles to the v2018 styles. Not recommended.                                                                                      |
| <code>client.rateLimitEnabled</code>    | boolean                 | no                                        | <code>false</code>       | Enabled saved object creation rate limiting                                           | Saved objects refer to dashboards, visualizations, and searches in the UI. This setting enforces a limit on how many can be created per provider organization.                        |

Not recommended.                                                                            |
| <code>client.clientAuthEnabled</code>   | boolean                 | no                                        | <code>true</code>        | Whether to enable client auth                                                         | Changing this to false causes security issues with the Analytics service. Not recommended.                                                                                            |
| <code>cronjobs.enabled</code>           | boolean                 | no                                        | <code>true</code>        | Whether to deploy this microservice                                                   | This microservice manages indexes and data retention in storage. Only disable it if internal storage is also disabled.                                                                |
| <code>cronjobs.retentionSchedule</code> | string                  | no                                        | <code>30 1 * * *</code>  | Cron schedule for <code>cj-retention</code> cronjob                                   | This cronjob cleans up all indices older than the configured data retention age. If you need to run this more or less often based on your data retention settings, configure it here. |
| <code>cronjobs.rolloverSchedule</code>  | string                  | no                                        | <code>15,45 * * *</code> | Cron schedule for <code>cj-rollover</code> cronjob                                    | This cronjob attempts to rollover the storage index. If you need to run this more or less often based on your index rollover settings, configure it here.                             |
| <code>ingestion.enabled</code>          | boolean                 | no                                        | <code>true</code>        | Whether to deploy this microservice                                                   | This microservice routes analytics data to internal or external storage. There is no supported topology of Analytics that disables this microservice.                                 |
| <code>ingestion.endpoint</code>         | object                  | if <code>ingestion.enabled == true</code> | -                        | FQDN and TLS Secrets for client endpoint                                              | Identifies the endpoint that enables the Gateway to push your analytics data. Must be different from the <code>client.endpoint</code>                                                 |
| <code>ingestion.clientSubjectDN</code>  | string                  | if <code>ingestion.enabled == true</code> | -                        | Subject DN (distinguished name) for authenticating with ingestion endpoint (RFC 2253) |                                                                                                                                                                                       |

| Field                                               | Type                   | Required | Default value | Description                                                           | Comments                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------|------------------------|----------|---------------|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ingestion.geoIPEnabled                              | boolean                | no       | false         | Whether to decorate API event data with geoip data                    | This populates the client_geoip and gateway_geoip fields using the IPs in client_ip and gateway_ip, respectively.                                                                                                                                                                                                               |
| ingestion.filter                                    | string                 | no       | " "           | Filter to modify all API event data                                   | See <a href="#">Modifying your analytics data</a> for more information.                                                                                                                                                                                                                                                         |
| ingestion.pipelineWorkers                           | 4 <= integer <= 128    | no       | 24            | Number of pipeline workers                                            | More workers means more CPU and memory requirements, but gives you the benefit of additional threads to pull data off the ingestion http interface and process it for storage. This has diminishing returns as the size increases, and should usually be multiple of the number of cores on your hardware. Adjust with caution. |
| ingestion.pipelineBatchSize                         | 10 <= integer <= 10000 | no       | 250           | Batch size of a pipeline worker                                       | Pulling more or less data off the http interface per worker can have benefits. Ideally this would limit impedance on match batches sent from the gateway, but that is not a proven result. Recommended values are 125, 250, and 500. Increasing the value requires more memory. Adjust with caution.                            |
| ingestion.pipelineBatchDelay                        | 10 <= integer <= 5000  | no       | 50            | Batch delay of a pipeline worker                                      | How long to wait for the batch size to fill before leaving the http interface to process for storage. Having threads wait too long causes idle threads in your system; however, setting this value too low decreases performance. Adjust with caution.                                                                          |
| ingestion.pipelineUnsafeShutdown                    | boolean                | no       | false         | Whether to allow unsafe shutdown of the pipeline                      | Typically, the pipeline attempts to empty all workers' batches before shutting down, to prevent data loss. You might need to enable this setting if the pipeline is badly configured and refuses to respond to kill requests (extremely uncommon). Adjust with caution.                                                         |
| ingestion.configReloadAutomatic                     | boolean                | no       | true          | Whether to automatically reload the pipeline on configuration changes | Typically, when the underlying files for the pipeline are modified, the pipeline process automatically reloads and picks up the changes. However, in Kubernetes environments where the pipeline is mapped to configmaps, this is unreliable. Ingestion microservice restarts are usually required.                              |
| ingestion.clientAuthEnabled                         | boolean                | no       | true          | Whether to enable client auth                                         | Setting this to false does not improve performance and makes Analytics extremely insecure. Not recommended at this time.                                                                                                                                                                                                        |

| databaseBackup.enableServerSideEncryption           | boolean | no       |               |                                                                                         | See <a href="#">Configuring backup settings for Analytics</a>                                                         |

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring your topology

Update the `analytics-extra-values.yaml` file to configure the topology of your IBM® API Connect Analytics deployment.

### About this task

Based on the decisions you made while [defining your topology](#), configure your the deployment options by completing the steps in the following topics to add a message queue, configure data offloading, and reduce storage complexity.

- [Adding a message queue](#)  
Update the `analytics-extra-values.yaml` file to enable a message queue and increase reliability in the analytics data pipeline in your IBM API Connect Analytics deployment.
- [Offloading data to a third-party system](#)  
Update the `analytics-extra-values.yaml` file to configure data offloading from your IBM API Connect Analytics deployment to a third-party system.
- [Declaring your storage type](#)  
Update the `analytics-extra-values.yaml` file to assign a storage type in your IBM API Connect Analytics deployment.
- [Disabling internal storage](#)  
Update the `analytics-extra-values.yaml` file to offload all data and disable local storage in your IBM API Connect Analytics deployment.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding a message queue

Update the `analytics-extra-values.yaml` file to enable a message queue and increase reliability in the analytics data pipeline in your IBM® API Connect Analytics deployment.

### Before you begin

This task is only needed if you do not want to enable the message queue using the default values:

- `storageClassName` set to `local-storage`
- `volumeSize` set to `5Gi`

If you want to use the default values, skip this task.

### About this task

For information about using a message queue in your Analytics deployment, see [Planning to add a message queue](#).

### Procedure

1. Open the `analytics-extra-values.yaml` file for editing.
2. Add the `mq` section to the file as shown in the following example:

```
mq:
  enabled: true
  kafka:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
  zk:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
```

where `$STORAGE_CLASS` is the Kubernetes storage class to be used for persistent volume claims (for more information, see [Planning the Analytics profile and storage](#)).

3. Save the file.
4. Optional: If you want to increase the message size limit for the message queue, see [Overriding size limits for message queue on VMware](#).

### What to do next

If you do not want to add any more configuration options, skip to the topic on [Defining your internal storage space](#), which is the last step before running the installation.

Otherwise, continue adding configuration options to the file as explained in the following topics.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Offloading data to a third-party system

Update the `analytics-extra-values.yaml` file to configure data offloading from your IBM® API Connect Analytics deployment to a third-party system.

### About this task

For information about offloading data from your Analytics deployment, see [Planning to offload data to a third-party system](#).

### Procedure

1. Open the `analytics-extra-values.yaml` file for editing.  
Remember: All additions to the file must appear after the `spec:` statement.
2. Add the following section to the file:

```
spec:
  external:
    offload:
      enabled: true
      output: |
        $EXTERNAL_OFFLOAD_OUTPUT
```

where `$EXTERNAL_OFFLOAD_OUTPUT` is the plugin output for the target third-party system.

For example, the following example enables offloading to HTTP:

```
spec:
  external:
    offload:
      enabled: true
      output: |
        http {
          url => "example.com"
          http_method => "post"
          codec => "json"
          content_type => "application/json"
          id => "offload_http"
        }
      }
```

For examples of output plugins, see [Sample output plugins for offloading data](#).

- Optional: Modify the output plugin to include certificates for connecting to a secure endpoint.

Important: Certificates can only be applied after the Analytics subsystem is deployed. If you want to configure an output plugin that references a certificate, you must install the Analytics subsystem first, then create a secret and apply it to the Analytics deployment, configure the output plugin, and re-install Analytics. For instructions on the correct procedure for applying a certificate to the Analytics deployment, see [Providing a custom certificate for Analytics offload](#). If your third-party endpoint requires a particular certificate, you can configure the certificate and then reference it in the offload plugin. Include the `secretName` as well as the `cacert`, `client_cert`, and `client_key` settings.

For example, the following output plugin enables offloading to HTTP and provides information on the certificate that is needed for authenticating with the endpoint:

```
spec:
  external:
    offload:
      secretName: offload-certificates
      enabled: true
      output: |
        http {
          url => "https://example.com:443"
          http_method => "post"
          codec => "json"
          content_type => "application/json"
          id => "offload_http"
          cacert => "/etc/velox/external_certs/offload/cacert.pem"
          client_cert => "/etc/velox/external_certs/offload/client.pem"
          client_key => "/etc/velox/external_certs/offload/client.key"
        }
      }
```

The secret and its defined files are mounted to the `/etc/velox/external_certs/offload` directory.

- Optional: Add a `filter` after the output plugin to modify data prior to offloading it.

The following example filter removes the `query_string` field:

```
spec:
  external:
    offload:
      enabled: true
      output: |
        http {
          url => "example.com"
          http_method => "post"
          codec => "json"
          content_type => "application/json"
          id => "offload_http"
        }
      }
    filter: |
      ruby {
        remove_field => ["query_string"]
      }
    }
```

For information about modifying offloaded data, see [Planning to modify your analytics data](#).

- Save the file.

## What to do next

If you do not want to add any more configuration options, skip to the topic on [Defining your internal storage space](#), which is the last step before running the installation.

Otherwise, continue adding configuration options to the file as explained in the following topics.

Attention: The third-party endpoint must be available at all times to prevent the loss of analytics data.

- [Sample output plugins for offloading data](#)  
Review sample output plugins to see how to code your own plugins for offloading data from IBM API Connect Analytics.
- [Providing a custom certificate for Analytics offload](#)  
Prepare a private or self-signed certificate for use when offloading data, and then re-install IBM API Connect Analytics deployment on VMware to apply the certificate.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Sample output plugins for offloading data

Review sample output plugins to see how to code your own plugins for offloading data from IBM® API Connect Analytics.

Configure output plugins that direct analytics data to your third-party systems. An output plugin specifies where analytics data is offloaded, plus any information required to access that system, such as certificate information. The output plugin for displaying analytics data in the Analytics user interface is configured by default.

---

## Referencing a certificate in an output plugin

If your third-party system requires a private or self-signed certificate, you can include a reference to the certificate in your output plugin. See the second HTTP output plugin for an example showing how to reference the certificate.

Important: Analytics must be deployed before you attempt to use the certificate. If you want to configure an output plugin that references a certificate, you must install the Analytics subsystem first, then create a secret and apply it to the Analytics deployment, configure the output plugin, and re-install Analytics. For instructions on the correct procedure for applying a certificate to the Analytics deployment, see [Providing a custom certificate for Analytics offload](#).

---

## HTTP

To configure data offload to an HTTP server, you must provide the server URL. You can optionally add standardized or custom HTTP headers to define additional operating parameters.

The following example configures an HTTP output plugin.

```
http {
  url => "example.com"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  id => "offload_http"
}
```

The following example configures an HTTP output plugin that references a custom certificate for accessing the third-party endpoint.

```
http {
  url => "https://example.com:443"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  id => "offload_http"
  cacert => "/etc/velox/external_certs/offload/cacert.pem"
  client_cert => "/etc/velox/external_certs/offload/client.pem"
  client_key => "/etc/velox/external_certs/offload/client.key"
}
```

For more information on offloading to HTTP, refer to the Logstash documentation on configuring the [HTTP output plugin](#).

---

## Elasticsearch V6, V7

To configure data offload to an Elasticsearch cluster, you must provide one or more server URLs, define how indices should be created by specifying a dynamically configured name, specify the number of primary shards for storing the indexed documents, and specify a number of replica shards for redundancy. You can optionally specify server authentication credentials.

The naming syntax that you specify for your indices determines how many indices are created and how they are characterized. For example, you can define indices that are created based on a date pattern (for example, daily or weekly), or indices that are created to store data by provider organization or by API name.

The following example configures an Elasticsearch output plugin.

```
elasticsearch {
  hosts => "https://example.com:443"
  index => "apiconnect"
  ssl => true
  cacert => "/etc/pki/tls/cert.pem"
}
```

For more information on offloading to Elasticsearch, refer to the Elasticsearch documentation on the [Elasticsearch output plugin](#).

---

## Apache Kafka V1.0.0

To configure data offload to a Kafka cluster, you must provide host and port connection details for one or more servers, and the name of the Kafka topic to which you want to publish the offloaded data. For logging and monitoring purposes within Kafka, you can optionally specify a string identifier by which API Connect can be uniquely identified.

The following example configures a Kafka output plugin.

```
kafka {
  topic_id => "test"
  bootstrap_servers => "example.com:9093"
  codec => "json"
  id => "kafka_offload"
  ssl_truststore_location => "/usr/lib/jvm/jre/lib/security/cacerts"
```

```

ssl_truststore_password => "changeit"
ssl_truststore_type => "JKS"
security_protocol => SSL
}

```

For more information on offloading to Apache Kafka, refer to the Logstash documentation on the [Kafka output plugin](#). Note that the Logstash plugin is based on kafka-client version 2.3.1 and not v2.1.0 as specified in the Logstash documentation.

## Syslog

To configure data offload to Syslog, you must provide host and port connection details for the server.

Restriction: Syslog does not support the use of chained client certificates for TLS profiles.

The following example configures a Syslog output plugin.

```

syslog {
  host => "example.com"
  port => 601
  protocol => "ssl-tcp"
  id => "offload_syslog"
  appname => "apiconnect"
  msgid => "%{org_id}"
  facility => "log_audit"
  severity => "informational"
  codec => "json"
  ssl_cacert => "/etc/pki/tls/cert.pem"
}

```

Attention: Due to a third-party issue with Logstash, most of the facility values are not set correctly on the offload server. As a temporary workaround, set the facility to "user-level" to ensure that the corresponding value is correctly sent to the offload server. When Logstash corrects this problem, you must update the offload configuration to change the value to a more appropriate setting.

For more information on offloading to Syslog, refer to the Logstash documentation on the [Syslog output plugin](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Providing a custom certificate for Analytics offload

Prepare a private or self-signed certificate for use when offloading data, and then re-install IBM® API Connect Analytics deployment on VMware to apply the certificate.

### Before you begin

Install the Analytics subsystem on VMware as explained in [Deploying the Analytics subsystem](#). Analytics must be deployed before you attempt to use the certificate.

When you re-install Analytics after applying the certificate, you can upload the analytics-extra-values.yaml file to include additional configuration options.

### Procedure

1. Use SSH to log into the virtual machine on a server that has kubectl access to the Kubernetes cluster where API Connect Analytics is deployed.
  - a. Run the following command to connect as the API Connect administrator.

```
ssh ip_address -l apicadm
```

- b. When prompted, select Yes to continue connecting.

2. Encode the certificate file in base64.

You can use either JKS files or text-based files such as PEM files:

- If you use a JKS file for certificate, you must encode the file now, before proceeding to the next step.
- If you use a text-based file such as PEM, then you can choose between encoding the file now or skipping this step and adding the keys to the secret in the next step.

There are several ways to encode the file. If `cat` and `base64` are available, then you can run the following command to encode the file:

```
cat keystore.jks | base64
```

Copy the output so that you can paste it into the secret in the next step.

3. Create a Kubernetes secret to contain the certificate.

- a. Create a YAML file to contain the secret; for example, you can call the file `analytics_certs.yaml`.

The secret's name that you specify in the file does not have to match the file name. In this example, the secret's name is `offload-certificates`. Do not use the underscore character (`_`) in the secret name.

Add as many keys as you want, using any field names that you want. For each key, a file based on the corresponding field name is created in the container at `/etc/velox/external_certs/offload`. For example, if you paste a certificate in the `cacert` field as shown in the following example, then a file named `cacert.pem` is stored in the `/etc/velox/external_certs/offload` location.

```

apiVersion: v1
kind: Secret
metadata:
  # Change value of name to be whatever you wish secret to be called
  name: offload-certificates

```

```
# Only base64 encoded data should be placed in data section; JKS keys would go here
data:
  keystore.jks: "output_of_base64_encoded_jks"
stringData:
  cacert: |-
    -----BEGIN CERTIFICATE-----
    MIIDIDCCAomgAwIBAgIEND70zzANBgkqhkiG9w0BAQUFADBOMQswCQYDVQGEwJVUzEQMA4GA1UE
    CHMHRXFlawZheDEtMCsGA1UECzMkRXFlawZheCBTZWN1cmUgQ2VydG1maWNhdGUGQXV0aG9yaXR5
    MB4XDTE4MDgyMjE2NDE1MVoXDTE4MDgyMjE2NDE1MVoWtjELMAkGA1UEBhMCVVMxEDAoBgNVBAoT

    spXXR9gjIBBPM5iQn9wHQYDVR0OBBYEFjmaPkr0rKV10fYIyAQZtOYkKJ/UMAwGA1UdEwQFMAMB
    Af8wGgYJKoZIhvcZ9B0EABA0wCxsFVjmuMGMDAgbAMA0GCSqGSIs3DQEBBQUAA4GBAFjOKer89961
    zqK5F7WF0bnj4JXMJTENAKaSbn+2kmOeUJXRmm/kEd5jhW6Y7qj/WsjTvbJmcVfewCHRPSqnI0kB
    BIZCe/zuf6IWUrVnZ9NA2zsmWLIodz2uFHdh1voqZiegDfqcnc1zqcPGUIWVEX/r87y1loqaKHee95
    70+sB3c4
    -----END CERTIFICATE-----
```

b. Paste the certificate into the file.

The method for adding the certificate to the secret depends on whether you encoded the file in the previous step:

- Base64-encoded file: In the **data** section of the secret, type a name for the field (you can choose the name). Paste the encoded output from the previous step (enclosed in `" "`) as the value.
- Plain text file: In the **stringData** section of the secret, type a name for the key or certificate (you can choose the name), and paste the value.

c. Save the file.

4. Apply Kubernetes secret it to the cluster where the Analytics subsystem is deployed.

Run the following command to update the cluster:

```
kubectl apply -f file_name_of_secret.yaml -n namespace
```

where:

- `file_name_of_secret.yaml` is the secret's file name.
- `namespace` is the name of the namespace where Analytics is deployed.

5. Edit the Analytics CR and add a reference to the secret in the **offload** section; for example:

```
offload:
  enabled: true
  output: |
    kafka {
      ...
    }
  secretName: offload-certificates
```

6. If you want to reference the certificate in an **offload plugin**, configure the plugin now.

Step 3 of that procedure shows how you can include the certificate information in the plugin.

7. Install the Analytics subsystem again as explained in [Deploying the Analytics subsystem](#), making sure to upload the analytics-extra-values.yaml file that contains your offload configuration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Declaring your storage type

Update the `analytics-extra-values.yaml` file to assign a storage type in your IBM® API Connect Analytics deployment.

### About this task

By default, Analytics uses shared storage on VMware. Edit the `analytics-extra-values.yaml` file and add a **storage** section with the specific setting as explained in the following instructions.

### Procedure

1. Open the `analytics-extra-values.yaml` file for editing.
2. Add a **storage** section as shown in the following example:

```
storage:
  type: shared
  shared:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
```

where `$STORAGE_CLASS` is the Kubernetes storage class to be used for persistent volume claims (for more information, see [Planning the Analytics profile and storage](#)).

3. Save the file.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Disabling internal storage

Update the `analytics-extra-values.yaml` file to offload all data and disable local storage in your IBM® API Connect Analytics deployment.

### About this task

---

For information about disabling internal storage in your Analytics deployment, see [Planning to disable internal storage](#).

### Procedure

---

1. Required: Configure data offloading as explained in [Offloading data to a third-party system](#). Before you disable internal storage, ensure that data is offloading properly to your third-party system. Then complete the remaining steps to disable internal storage of analytics data.
2. Open the `analytics-extra-values.yaml` file for editing.
3. Add the `client` section as shown in the following example:

```
client:
  enabled: false
```

4. Add the `cronjobs` section as shown in the following example: You can append the new section to the end of the file. Be sure to follow the spacing that is already in use in the file.

```
cronjobs:
  enabled: false
```

5. Add the `storage` section as shown in the following example:

```
storage:
  enabled: false
```

6. Save the file.

### What to do next

---

If you do not want to add any more configuration options, skip to the topic on [Defining your internal storage space](#), which is the last step before running the installation.

Otherwise, continue adding configuration options to the file as explained in the following topics.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Modifying your analytics data

Update the `analytics-extra-values.yaml` file to customize data in your IBM® API Connect Analytics deployment.

### Before you begin

---

Review the use of filters for modifying analytics data, and make sure that you understand the restrictions. For information about customizing data, see [Planning to modify your analytics data](#).

### About this task

---

Customizing the analytics data is optional. You can enable the inclusion of geoIP information, and define filters that add, modify, or remove other fields.

Upgrade note: In V2018, multiple configuration files were used for defining filters that were applied at different points in the ingestion pipeline. In V10, you define filters in the `analytics-extra-values.yaml` file.

### Procedure

---

1. Open the `analytics-extra-values.yaml` file for editing. Remember: All additions to the file must appear after the `spec` statement.
2. Enable the inclusion of geoIP fields in your analytics data by adding the following lines:

```
spec:
```

```
ingestion:
  geoIPEnabled: true
```

By default the `client_geoip` and `gateway_geoip` fields are not included in the analytics data. These are calculated from the `client_ip` and `gateway_ip` fields, respectively. Setting `geoIPEnabled` to `true` enables this feature.

### 3. Add a `filter` definition.

You can add filters for `ingestion` and for `offloading`. Add the appropriate section name for the filter. If the section already exists in the file, add your filter into the existing section. For information about where to add filters for local data and offloaded data, see [Which pipeline is affected by the filter?](#)

For example filters, see [Sample filters for modifying analytics data](#).

For example, you can add a filter into the `ingestion` section defined in the previous step. The following example filter removes the `query_string` field:

```
spec:
  ingestion:
    ...
    geoIPEnabled: true
    filter: |
      mutate {
        remove_field => ["query_string"]
      }
```

### 4. Save the file.

## What to do next

Proceed to the topic on [Defining your internal storage space](#), which is the last step before running the installation.

- [Sample filters for modifying analytics data](#)

Review sample filters to see how to code your own filters for refining IBM API Connect Analytics data by adding fields, removing fields, or modifying field contents.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Sample filters for modifying analytics data

Review sample filters to see how to code your own filters for refining IBM® API Connect Analytics data by adding fields, removing fields, or modifying field contents.

You can use these sample filters in the `ingestion.filter` and the `external.offload.filter` configurations.

## Adding a new field

You can add custom data to API event data by adding a field to the logging document. For example, if you want to search or visualize data that is stored in request and response headers, you can add fields to a filter to include that information.

To avoid naming conflicts with future or current analytics fields, include a prefix that ensures your new field name is unique. For example, instead of naming the field `employee_num` you might name it `x_mycompany_employee_num`.

The following example copies the contents of the `X-Employee-Num` field from the request header and adds it to the `x_mycompany_employee_num` field in the event data. Adding the field to the event data enables you to use the information in visualizations.

```
if [request_http_headers] {
  ruby {
    code => "event.get(['request_http_headers']).collect {|i| event.set(['x_mycompany_employee_num'], i['X-Employee-Num']) if i.has_key?('X-Employee-Num')}"
  }
}
```

## Modifying an existing field

Sometimes you don't want to remove a field entirely from your data, you just want to redact sensitive information such as IDs to prevent them from being exposed in visualizations. You can modify the contents of a field and replace information with a symbols or a message.

Remember: The following fields should not be modified if the data is being written to internal analytics storage: `org_id`, `catalog_id`, `space_id`, `developer_org_id`, `datetime`, and `@timestamp`.

The following example replaces sensitive information in the `X-Employee-Name` and `X-Employee-ID` request headers with the string: `*****sanitized*****`.

```
if [request_http_headers] {
  ruby {
    code => "headers=['X-Employee-Name','X-Employee-ID']; newHeaders = event.get(['request_http_headers']).collect {|i| headers.each {|header| i[header] = '*****sanitized*****' if i.has_key?(header)}; i}; event.set(['request_http_headers'], newHeaders)"
  }
}
```

## Removing an existing field

Use the mutate `remove_field` operation to delete a field from the Analytics data. To remove multiple fields, delimit the field names with commas.

The following example removes multiple fields (`request_http_headers`, `response_http_headers`, `request_body`, `response_body`, and `query_string`) from the Analytics data:

```
mutate {
  remove_field => ["request_http_headers", "response_http_headers", "request_body", "response_body", "query_string"]
}
```

## Filter and output plugin for splunk

When you create a filter for use with splunk, you must also create an output plugin for it.

Filter:

```
if "apicapievent" in [tags] {
  ruby {
    code => "event.set('@metadata[newevent]', event.to_json)"
  }
}
```

Output plugin:

```
http {
  url => "http://your-domain/services/collector/event"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  id => "offload_http"
  format => "message"
  message => '{"event": "%{[@metadata][newevent]}", "index": "applications-int-ms", "sourcetype": "json:apimlogs"}'
  headers => ["Authorization", "Splunk XXXX"]
}
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining your internal storage space

If you don't want to use the shared storage that's configured by default for VMware, update the `analytics-extra-values.yaml` file for your IBM® API Connect Analytics deployment.

### Before you begin

This task only applies to deployments that use internal storage or have a message queue enabled. If you disabled internal storage but did not enable the message queue, then skip this task.

Review [Estimating internal storage space](#) to make sure you know how much disk space to allocate for internal storage. If you disabled internal storage, skip this task.

### About this task

For information about offloading data from your Analytics deployment, see [Planning to offload data to a third-party system](#).

The steps that you complete to define your internal storage allocations depend on the deployment options that you configured.

Data & Master storage

Complete the following steps only if you did retain the default shared storage configuration (described in [Declaring your storage type](#)).

1. Open the `analytics-extra-values.yaml` file for editing.  
Remember: All additions to the file must appear after the `spec:` statement.
2. In the file, add the `storage.data` section as shown in the following example:

```
storage:
  data:
    volumeClaimTemplate:
      storageClassName: ...
      volumeSize: $DATA_VOLUME_SIZE
```

Replace `$DATA_VOLUME_SIZE` with the value that you calculated for **Storage per node** in [Data storage: calculate how much data you want to store](#).

3. Next, add the `storage.master` section and add the `volumeSize` field as shown in the following example:

```
storage:
  master:
    volumeClaimTemplate:
      storageClassName: ...
      volumeSize: $VOLUME_SIZE
```

Replace `$VOLUME_SIZE` with the value that you calculated in [Master storage: estimate disk space needs](#).

4. Save the file.

5. Skip to the section for MQ storage.

#### Shared storage

If you are using shared storage (the default setting), complete the following steps to allocate disk space for the share storage.

1. Open the `analytics-extra-values.yaml` file for editing.  
Remember: All additions to the file must appear after the `spec:` statement.
2. In the file, add the `storage.shared` section as shown in the following example:

```
storage:
  shared:
    volumeClaimTemplate:
      storageClassName: ...
      volumeSize: $STORAGE_PER_NODE
```

Replace `$STORAGE_PER_NODE` with the value that you calculated for `Storage per node` in [Data storage: calculate how much data you want to store](#).

3. Save the file.
4. Continue to the section for MQ storage.

#### MQ storage

Complete this procedure only if you added a message queue to your Analytics topology by setting `mq.enabled: true` as explained in [Adding a message queue](#).

1. In the file, add the `mq:` section.
2. Add the `mq.zk` section as shown in the following example:

```
mq:
  zk:
    volumeClaimTemplate:
      storageClassName: ...
      volumeSize: $VOLUME_SIZE
```

Replace `$VOLUME_SIZE` with the value that you calculated for `mq-zk` in [MQ storage: estimate disk space needs](#).

3. Add the `mq.kafka` section as shown in the following example:

```
mq:
  kafka:
    volumeClaimTemplate:
      storageClassName: ...
      volumeSize: $VOLUME_SIZE
```

Replace `$VOLUME_SIZE` with the value that you calculated for `mq-kafka` in [MQ storage: estimate disk space needs](#).

4. Save and close the file.

## What to do next

---

Your Analytics configuration is complete. Proceed to [Deploying the Analytics subsystem](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Deploying the Analytics subsystem

You can add analytics data collection by deploying the IBM® API Connect Analytics OVA file on a VMware virtual server.

### Before you begin

---

Before you deploy:

- Review the [Deployment requirements on VMware](#).
- Review the [API Connect configuration on VMware](#).
- Review [What's new for v10 installation](#)
- For information on deploying a cluster, see [Configuring API Connect subsystems in a cluster](#)
- If you are upgrading from a previous version, see [Upgrading API Connect](#).

### About this task

---

You must deploy the API Connect OVA template to create each Analytics virtual server that you want in your cloud.

### Procedure

---

Complete the following steps in order:

1. Specify configuration settings for the Analytics subsystem and create an ISO. See [Configuring the Analytics subsystem](#)

2. Deploy the subsystem OVA into an appliance VM. See [Deploying the Analytics subsystem OVA file](#).
3. Verify the deployment. See [Verifying deployment of the Analytics subsystem](#)

## Results

An analytics installation starts the following Kubernetes pods:

- Full installation in **Prod** deployment-profile:  
Table 1. Kubernetes pods in a full Analytics installation

| Number                       | Pod                     |
|------------------------------|-------------------------|
| 2                            | client                  |
| 2                            | ingestion               |
| 2                            | mtls                    |
| 1                            | operator                |
| equal to the number of nodes | analytics-storage-basic |

Note that for all pod types except analytics-storage-basic, there is only one of each pod when installed with **dev** deployment-profile. For analytics-storage-basic, the number of pods always matches the number of nodes in the subsystem, regardless of installation mode.

- Message queue deployment in **Prod** mode: All of the pods shown in Table [Table 1](#), plus:  
Table 2. Additional pods used for Message Queue deployments

| Number                       | Pod          |
|------------------------------|--------------|
| equal to the number of nodes | mq-kafka     |
| equal to the number of nodes | mq-zookeeper |

Note that the number of pods for mq-kafka and mq-zookeeper always match the number of nodes in the subsystem, regardless of installation mode.

- Ingestion-only installation in **Prod** deployment-profile:  
Table 3. Kubernetes pods in an ingestion-only Analytics installation

| Number | Pods      |
|--------|-----------|
| 2      | ingestion |
| 2      | mtls      |

Note that in **Dev** deployment-profile there is only one of each pod.

## What to do next

Identify the DataPower® appliances to be used as gateway servers in the API Connect cloud and obtain the IP addresses.

Define your API Connect configuration by using the API Connect cloud console. For more information, see [Defining the cloud](#).

- [Configuring the Analytics subsystem](#)  
Specify configuration properties for your Analytics subsystem, and create an ISO.
- [Deploying the Analytics subsystem OVA file](#)  
After you have specified configuration settings and created an ISO, deploy the subsystem OVA into an appliance VM.
- [Verifying deployment of the Analytics subsystem](#)  
Verify that deployment of the Analytics OVA file succeeded.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring the Analytics subsystem

Specify configuration properties for your Analytics subsystem, and create an ISO.

### Before you begin

Review the requirements. See [Deploying the Analytics subsystem](#).

### About this task

Use the `apicup` installation utility to specify configuration settings for your Analytics subsystem.

### Procedure

1. Ensure that you obtained the distribution file and have a project directory, as described in [First steps for deploying in a VMware environment](#).
2. Change to the project directory.

```
cd myProject
```

3. Create an analytics subsystem.

```
apicup subsys create analyt analytics
```

Where:

- *analyt* is the name of the analytics server that you are creating. You can assign it any name, as long as the identifier consists of lowercase alphanumeric characters or '-', with no spaces, starts with an alphabetic character, and ends with an alphanumeric character.
- *analytics* indicates that you want it to create an Analytics microservice.

The apiconnect-up-v10.yml file that is in that directory is updated to add the analytics-related entries.

Tip: At any time, you can view the current analytics subsystem values in the apiconnect-up-v10.yml by running the `apicup get` command:

```
apicup subsys get analyt
```

If you have not updated the value, a default value is listed, if there is one that is available.

Sample output from `apicup subsys get`, after configuration is completed:

```
apicup subsys get analyt
```

```
Appliance settings
```

```
=====
```

| Name                       | Value                                                                                                                  | Description                                                 |
|----------------------------|------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| ----                       | -----                                                                                                                  | -----                                                       |
| additional-cloud-init-file |                                                                                                                        | (Optional) Path to additional cloud-init yml file           |
| data-device                | sdb                                                                                                                    | VM disk device (usually `sdb` for SCSI or `vdb` for VirtIO) |
| default-password           | \$6\$rounds=4096\$iMCJ9cfhFJ8X\$pbmAl9ClWzcYzHZFoQ6n7OnYcf/owQZiiCpAtWazs/FUn/uE8uLD.9jwHE0AX4upFSqx/jf0ZmDbHPZ9bU1CY1 | (Optional) Console login password for `apicadm` user        |
| dns-servers                | [1.2.136.11]                                                                                                           | List of DNS servers                                         |
| k8s-pod-network            | 172.16.0.0/16                                                                                                          | (Optional) CIDR for pods within the appliance               |
| k8s-service-network        | 172.17.0.0/16                                                                                                          | (Optional) CIDR for services within the appliance           |
| deployment-profile         | n3xc4.m16                                                                                                              |                                                             |
| public-iface               | eth0                                                                                                                   | Device for API/UI traffic (Eg: eth0)                        |
| search-domain              | [subnet1.example.com]                                                                                                  | List for DNS search domains                                 |
| ssh-keyfiles               | [/home/vsphere/.ssh/id_rsa.pub]                                                                                        | List of SSH public keys files                               |
| traffic-iface              | eth0                                                                                                                   | Device for cluster traffic (Eg: eth0)                       |
| license-use                | production                                                                                                             |                                                             |

```
Endpoints
```

```
=====
```

| Name                | Value                                      | Description                          |
|---------------------|--------------------------------------------|--------------------------------------|
| ----                | -----                                      | -----                                |
| analytics-client    | a7s-client.testsrv0233.subnet1.example.com | FQDN of Analytics client/UI endpoint |
| analytics-ingestion | a7s-in.testsrv0233.subnet1.example.com     | FQDN of Analytics ingestion endpoint |

4. Specify your `deployment-profile`.

```
apicup subsys set analyt deployment-profile=profile_type
```

Use one of the following values for the `profile_type`, based on the decision you made while [Planning the Analytics profile and storage](#):

- For development use: `n1xc2.m16`
- For production use: `n3xc4.m16`: production profile

For example, to deploy using the a production profile, run the following command:

```
apicup subsys set analyt deployment-profile=n3xc4.m16
```

5. Specify the license use that you purchased.

```
apicup subsys set analyt license-use=license_type
```

The `license_type` must be either `production` or `nonproduction`. If not specified, the default value is `nonproduction`.

6. Optional: Configure backups of the subsystem. Follow the instructions in [Backing up and restoring the Analytics database on VMware](#).

Important: It is highly recommend that you configure backups and also take additional steps to ensure that your configuration and data can be restored in the event of a disaster event. See [Preparing the Analytics subsystem for disaster recovery on VMware](#).

7. Optional: Enable the message queue microservice with the default values.

If you did not previously enable message queue with custom settings, you can enable it now with the following default values:

- `storageClassName` set to `local-storage`
- `volumeSize` set to `5Gi`

a. List the settings of your Analytics subsystem by running the following command:

```
apicup subsys get Analytics_subsystem_name
```

Confirm that the `enable-message-queue` field is set to `false` (the message queue is not enabled by default).

b. Enable the message queue by running the following command to set `enable-message-queue` to `true`:

```
apicup subsys set Analytics_subsystem_name enable-message-queue=true
```

8. Optional: Configure your logging.

Logging can be configured at a later time, but you must enable it before installation to capture the log events from the installation.

- Complete the procedure at [Configuring remote logging for a VMware deployment](#).
- Enter the following command to create the log file:

```
apicup subsys set analyt additional-cloud-init-file=config_file.yml
```

9. Enter the following commands to update the apiconnect-up-v10.yml with the information for your environment:

a. Use **apicup** to set your endpoints.

The endpoints must be unique host names that both point to the IP address of the OVA (single node deployment), or to the IP of a load balancer configured in front of the OVA nodes.

| Setting             | Endpoint host description                                                                                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| analytics-client    | Your <i>unique_hostname</i> identifies the endpoint that enables the Cloud Manager, API Manager, and Developer Portal to communicate with the Analytics subsystem.<br><pre>apicup subsys set analyt analytics-client=<i>unique_hostname</i>.<i>domain</i></pre><br>If you plan to disable internal storage for Analytics data, omit this setting. |
| analytics-ingestion | Your <i>unique_hostname</i> identifies the endpoint that enables the Gateway to push your analytics data. The values for the analytics-ingestion and analytics-client must be different.<br><pre>apicup subsys set analyt analytics-ingestion=<i>unique_hostname</i>.<i>domain</i></pre>                                                          |

b. Set your search domain. Multiple search domains should be separated by commas.

```
apicup subsys set analyt search-domain=your_search_domain
```

Where *your\_search\_domain* is the domain of your servers, entered in all lowercase. Setting this value ensures that your searches also append these values, which are based on your company's DNS resolution, at the end of the search value. A sample search domain is *mycompany.example.com*.

Ensure that the value for *your\_search\_domain* is resolved in the system's */etc/resolv.conf* file to avoid "502" errors when accessing the Cloud Manager web site. For example:

```
# Generated by resolvconf
search your_search_domain ibm.com other.domain.com
```

c. Set your domain name servers (DNS).

Supply the IP addresses of the DNS servers for your network. Use a comma to separate multiple server addresses.

```
apicup subsys set analyt dns-servers=ip_address_of_dns_server
```

DNS entries may not be changed on a cluster after the initial installation.

10. Set a Public key.

```
apicup subsys set analyt ssh-keyfiles=path_to_public_ssh_keyfile
```

Setting this key enables you to use **ssh** with this key to log in to the virtual machine to check the status of the installation. You will perform this check later in [Verifying deployment of the Analytics subsystem](#).

11. You can set the password that you enter to log into your Analytics server for the first time.

a. Review the requirements for creating and using a hashed password. See [Setting and using a hashed default password](#).

b. If you do not have a password hashing utility, install one.

| Operating system    | Command                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ubuntu, Debian, OSX | If the <b>mkpasswd</b> command utility is not available, download and install it. (You can also use a different password hashing utility.) On OSX, use the command: <b>gem install mkpasswd</b> . |
| Windows, Red Hat    | If necessary, a password hashing utility for the Windows operating system, like OpenSSL                                                                                                           |

c. Create a hashed password

| Operating system    | Command                                                                                                                                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ubuntu, Debian, OSX | <b>mkpasswd --method=sha-512 --rounds=4096 <i>password</i></b>                                                                                                                                                            |
| Windows, Red Hat    | For example, using OpenSSL: <b>openssl passwd -1 <i>password</i></b> . Note that you might need to add your password hashing utility to your path; for example, on Windows:<br><br><b>set PATH=c:\cygwin64\bin;%PATH%</b> |

d. Set the hashed password for your subsystem:

```
apicup subsys set analyt default-password='hashed_password'
```

Notes:

- The password is hashed. If it is in plain text, you cannot log into the VMWare console.
- Note that the password can only be used to login through the VMware console. You cannot use it to SSH into the Appliance as an alternative to using the **ssh-keyfiles**.
- On Linux or OSX, use single quotes around *hashed\_password*. For Windows, use double quotes.
- If you are using a non-English keyboard, understand the limitations with using the remote VMware console. See [Requirements for initial deployment on VMware](#).

12. Optional: If the default IP ranges for the API Connect Kubernetes pod and the service networks conflict with IP addresses that must be used by other processes in your deployment, modify the API Connect values.

You can change the IP ranges of the Kubernetes pod and the service networks from the default values of 172.16.0.0/16 and 172.17.0.0/16, respectively. In the case that a /16 subnet overlaps with existing IPs on the network, a Classless Inter-Domain Routing (CIDR) as small as /22 is acceptable. You can modify these ranges during initial installation and configuration only. You cannot modify them once an appliance has been deployed. See [API Connect configuration on VMware](#).

a. Update the IP range for the Kubernetes pod

```
apicup subsys set analyt k8s-pod-network=new_pod_range'
```

Where *new\_pod\_range* is the new value for the range.

b. Update the IP range for Service networks.

```
apicup subsys set analyt k8s-service-network='new_service_range'
```

Where *new\_service\_range* is the new value for the range.

13. Add your hosts.

```
apicup hosts create analyt hostname.domainname hd_password
```

Where the following are true:

- *hostname.domainname* is the fully qualified name of the server where you are hosting your Analytics service, including the domain information.
- *hd\_password* is the password of the Linux Unified Key Setup uses to encrypt the storage for your Analytics service. This password is hashed when it is stored on the server or in the ISO. Note that the password is base64 encoded when stored in `apiconnect-up-v10.yml`.

Repeat this command for each host that you want to add.

Note: Host names and DNS entries may not be changed on a cluster after the initial installation.

14. Create your interfaces.

```
apicup iface create analyt hostname.domainname physical_network_id host_ip_address/subnet_mask gateway_ip_address
```

Where *physical\_network\_id* is the network interface ID of your physical server. The value is most often `eth0`. The value can also be `ethx`, where *x* is a number identifier.

The format is similar to this example: `apicup iface create analyt myHostname.domain eth0 192.0.2.1/255.255.1.1 192.0.2.1`

15. Optional: Use `apicup` to view the configured hosts:

```
apicup hosts list analyt
testsrv0233.subnet1.example.com
  Device  IP/Mask  Gateway
  eth0    1.2.152.233/255.255.254.0  1.2.152.1
```

16. Verify that the configuration settings are valid.

```
apicup subsys get analyt --validate
```

The output lists each setting and adds a check mark after the value once the value is validated. If the setting lacks a check mark and indicates an invalid value, reconfigure the setting. See the following sample output.

```
apicup subsys get analyt --validate
```

Appliance settings

Endpoints

=====

| Name                | Value                                     |   |
|---------------------|-------------------------------------------|---|
| analytics-client    | a7s-client.testsrv0233.subnet1.example.co | ✓ |
| analytics-ingestion | a7s-in.testsrv0233.subnet1.example.com    | ✓ |

17. If you configured additional deployment options in an extra-values file, run the following command to make the file available during installation:

```
apicup subsys set analyt extra-values-file path/analytics-extra-values.yaml
```

where *analytics-extra-values.yaml* is the name of the file containing your deployment settings.

18. Create your ISO file.

```
apicup subsys install analyt --out analytplan-out
```

The `--out` parameter and value are required. In this example, the ISO file is created in the `myProject/analytplan-out/node-config` directory.

If the system cannot find the path to your software that creates ISO files, create a path setting to that software by running a command similar to the following command:

| Operating system | Command                                                        |
|------------------|----------------------------------------------------------------|
| OSX and Linux    | <code>export PATH=\$PATH:/Users/your_path/</code>              |
| Windows          | <code>set PATH="c:\Program Files (x86)\cdrtools";%PATH%</code> |

19. Next, use the ISO to deploy the OVA file. Continue with [Deploying the Analytics subsystem OVA file](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Deploying the Analytics subsystem OVA file

After you have specified configuration settings and created an ISO, deploy the subsystem OVA into an appliance VM.

### Before you begin

---

You must have completed the configuration of the project file entries for the Analytics subsystem, in [Configuring the Analytics subsystem](#).

### Procedure

---

1. Log into the VMWare vSphere Web Client.
2. Using the VSphere Navigator, navigate to the directory where you are deploying the OVA file.
3. Right-click the directory and select Deploy OVF Template.
4. Complete the Deploy OVF Template wizard.
  - a. Select the Analytics subsystem .OVA file template by navigating to the location where you downloaded the file in [First steps for deploying in a VMware environment](#).
  - b. Enter a name and location for your file.
  - c. Select a resource for your template.
  - d. Review the details for your template.
  - e. Select the size of your configuration.
  - f. Select the storage settings.
  - g. Select the networks.
  - h. Customize the Template, if necessary.
  - i. Review the details to ensure that they are correct.
  - j. Select Finish to deploy the virtual machine.

Note: Do not change the OVA hardware version, even if the VMware UI shows a Compatibility range that includes other versions. See [Requirements for initial deployment on VMware](#).

The template creation appears in your Recent Tasks list.

5. Select the Storage tab in the Navigator.
6. Navigate to your datastore.
7. Upload your ISO file.
  - a. Select the Navigate to the datastore file browser icon in the icon menu.
  - b. Select the Upload a file to the Datastore icon in the icon menu.
  - c. Navigate to the ISO file that you created in your project.  
It is the myProject/analytplan-out/node-config
  - d. Upload the ISO file to the datastore.
8. Leave the datastore by selecting the VMs and Templates icon in the Navigator.
9. Locate and select your virtual machine.
10. Select the Configure tab in the main window.
11. Select Edit...
  - a. On the Virtual Hardware tab, select CD/DVD Drive 1.
  - b. For the Client Device, select Datastore ISO File.
  - c. Find and select your datastore in the Datastores category.
  - d. Find and select your ISO file in the Contents category.
  - e. Select OK to commit your selection and exit the Select File window.
  - f. Ensure that the Connect At Power On check box is selected.  
Tip:
    - Expand the CD/DVD drive 1 entry to view the details and the complete Connect At Power On label.
    - Note that VMware related issues with ISO mounting at boot may occur if Connect At Power On
  - g. Select OK to commit your selection and close the window.
12. Start the virtual machine by selecting the play button on the icon bar.  
The installation might take several minutes to complete, depending on the availability of the system and the download speed.
13. Next, verify the deployment. Continue with [Verifying deployment of the Analytics subsystem](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Verifying deployment of the Analytics subsystem

Verify that deployment of the Analytics OVA file succeeded.

### Before you begin

---

You must have completed [Deploying the Analytics subsystem OVA file](#).

### About this task

---

After you configure an ISO and deploy it with the Analytics subsystem OVA, as described in [Deploying the Analytics subsystem OVA file](#), verify that the subsystem installed correctly and is functional.

## Procedure

1. Log in to the virtual machine by using an SSH tool to check the status of the installation:
  - a. Enter the following command to connect to *analyt* using SSH:

```
ssh ip_address -l apicadm
```

You are logging in with the default ID of *apicadm*, which is the API Connect ID that has administrator privileges.

- b. Select Yes to continue connecting.  
Your host names are automatically added to your list of hosts.
- c. Run the **apic status** command to verify that the installation completed and the system is running correctly.  
The command output for a correctly running Analytics system is similar to the following lines:

```
#sudo apic status
INFO[0000] Log level: info

Cluster members:
- testsrv0233.subnet1.example.com (1.2.152.233)
  Type: BOOTSTRAP_MASTER
